Academic adjustment is an important component of students' educational experience, encompassing satisfaction with school, perceived success, and academic motivation, and influencing achievement and well-being. Motivational self-regulation strategies — mastery self-talk, personally referred performance self-talk, self-enhancing self-talk, self-defeating self-talk, work-avoidance self-talk, self-efficacy enhancement, self-consequating, cost appraisal, enhancement of personal significance, and enhancement of situational interest— may contribute to this process. Examining the relationship between these constructs might be of particular importance for students with special educational needs (SEN), who often face challenges that can affect adaptation and long-term outcomes. This study analysed the association between motivational self-regulation strategies and academic adjustment in adolescents with SEN. Participants were 236 secondary school students (44.5% girls; Mage = 13.7; SDage = 1.3), enrolled in different compulsory secondary education grades (32.6% in 1st, 35.6% in 2nd, 14.8% in 3rd, and 16.9% in 4th). Data were collected using diverse subscales of the Scale of Learning Motivational Strategies – Secondary and of the Spanish version of the Motivational Regulation Survey and various items from the academic adjustment subscale of the Spanish version of the Student Adaptation to College Questionnaire (SACQ). A regression analysis was conducted to test the effect of ten motivational self-regulation strategies on academic adjustment, controlling for sex and grade level. Results showed that self-efficacy enhancement ($\beta = .297$, $p \leq .001$) and cost appraisal ($\beta = .160$, $p \leq .05$) were positively associated with academic adjustment, whereas work-avoidance self-talk ($\beta = -.234$, $p \leq .001$) was negatively associated. The model explained 24.7% of the variance ($F(5, 212) = 15.238$, $p \leq .001$). These findings indicate that motivational self-regulation contributes to academic adjustment among adolescents with SEN and offer valuable insights for designing targeted interventions that foster engagement, resilience, and adaptive learning behaviours in inclusive contexts.

Abstract 2640

THE RELATIONSHIP BETWEEN PERCEIVED SOCIAL SUPPORT AND WORK-AVOIDANCE SELF-TALK IN STUDENTS WITH SPECIAL EDUCATIONAL NEEDS

Silva N.*[1], Mayo Pais M.E.[2], Martínez--López Z.[2], Real J.E.[3], Tinajero Vacas C.[2]

[1]University of Santiago de Compostela ~ Santiago de Compostela ~ Spain, [2]Institute of Psychology (IPsiUS), University of Santiago de Compostela ~ Santiago de Compostela ~ Spain, [3]Department of Social, Basic and Methodological Psychology, University of Santiago de Compostela ~ Santiago de Compostela ~ Spain

Work-avoidance self-talk strategy reduces students' effort, limits the use of deep processing strategies and fostering amotivation, ultimately undermining self-regulated learning. Identifying factors that can counteract these tendencies is essential for promoting adaptive motivational patterns. Perceived social support has been highlighted in different studies as a key resource for strengthening inner motivational processes and promoting engagement; however, evidence regarding its role among students with special educational needs (SEN), who may encounter additional challenges in sustaining motivation, remains scarce. The present study aimed to examine the relationship between perceived social support and work-avoidance self-talk among adolescents with SEN. A total of 236 secondary school students (44.5% girls; Mage = 13.7; SDage = 1.3), enrolled in different academic courses (32.6% in 1st grade, 35.6% in 2nd grade, 14.8% in 3rd grade, and 16.9% in 4th grade), participated in the research. Data were collected using various subscales from the Spanish adaptation of the Relational Support Inventory – Adolescence and the Scale of Learning Motivational Strategies – Secondary. To assess the influence of different sources and types of perceived social support—emotional support, guidance, and reassurance of worth—from teachers, family, and peers on work-avoidance self-talk, we performed a linear regression analysis. Sex and academic course were entered as control variables in the first step. The model was significant, explaining 16.6% of the variance in work-avoidance self-talk ($F(5, 221) = 10.024$, $p \leq .001$). Emotional support from teachers and family, as well as teacher guidance, showed significant negative associations ($\beta = -.149$, $p \leq .05$; $\beta = -.196$, $p \leq .01$; $\beta = -.185$, $p \leq .01$, respectively). These findings highlight the protective role of perceived social support in promoting self-regulated learning and reducing maladaptive motivational patterns, reinforcing its importance for designing interventions that foster academic engagement and well-being in adolescence whit SEN.

GENDER-BASED VIOLENCE SYSTEMS RESPONSE CAPACITY: CONTRIBUTIONS FROM COMMUNITY PSYCHOLOGY RESEARCH AND INTERVENTION

Thursday 23 July 2026 from 17:30 to 19:00

(D-Spadolini)

Maria Vargas Moniz (ISPA, Instituto Universitário APPsyCI –), Chair and Presenter

Community-based response to violence against women received substantive attention from community psychology scientific production over the past decades. The cross-cultural and intercontinental exchanges on research, training and action have provided us with a consistent body of knowledge for informed systems analysis and practices recommendations. The first contribution addresses the contributions of the capabilities approach to understand the long-term impacts and systems response regarding violence against women; a second contribution is focused on the narratives of women on IPV in public services; a third contribution specifically analyses the recovery from homelessness, a fourth on the community accountability approach to ending violence against women and the fifth contribution address men on the prevention of violence against women. We probe to analyse the intertwined effects of gender-based violence, through different lenses, with a rich and transnational series of contributions seeking the universal appeal to address gender-based violence.

Abstract 4327

THE CAPABILITIES FRAMEWORK FOR THE ANALYSIS OF COMMUNITY-BASED SYSTEMS RESPONSE TO GENDERED-BASED VIOLENCE

Vargas--Moniz M.*, Conde M.J.

ISPA, Instituto Universitário APPsyCI – Applied Psychology Research Center Capabilities and Inclusion, Lisboa ~ Lisbona ~ Portugal

The presentation is inspired by Community Psychology contributions from scholars, researchers, practitioners and survivors of gendered-based violence, and their reflections regarding systems response (e.g., Nnawulezi, et al., 2022; Sullivan, 2018; Goodman, et al, 2017). These contributions are articulated with information gathered (2020- 2024) through a PAR (Participatory Action Research) Project Peer Networks: Gender Violence and Empowerment, implemented through a University-Community Partnership (Vargas-Moniz, et al., 2024). Probing to expand our vision and response capacity to foster good governance and positive interactions among public and private stakeholders, we present lessons learned with the contribution of the Capabilities Theory (Nussbaum, 2000), that supports a broad reflection on ten domains (life, health, ontological security, imagination and thought, emotions, practical reason, affiliation, other species, play, control over environment), regarding challenges and strengths of survivors' on systems advancement and sustainability. Despite the international treaties and conventions, demanding governmental response to structural and conjunctural violence against women, stakeholder's advance critiques about pre-determined paths of service provision, "… shelters a sort of probation system where their lives are very heavy and in suspended mode" (e.g., DN Portuguese Journal, 2025), reflecting the inability for effective and quality response in community-based articulated resources. We aim to present a survivor's and advocates-based analysis on how the community stakeholders, and service-systems would need to articulate to generate effective, accountable and sustainable responses to the women, their families (including children, youth, elders and pets). Moreover, we discuss how the recurrent psychopathologizing of violence is damaging women in their full citizenship rights, and freedoms generating new forms of dependency on professional reports to certify individual basic capacities, and the need to advance other community based supports, including crisis intervention to foster protective factors against continued and prolonged forms of violence reiterated by social and community-based systems (e.g., court decisions, housing instability, employment, educational barriers).

Abstract 4328

STORIES OF INTIMATE PARTNER VIOLENCE IN A PUBLIC SERVICE: EXPECTATIONS AND NEEDS OF WOMEN VICTIMS OF VIOLENCE

Di Napoli I.*, Bellanca N., Arcidiacono C.

University Federico II, Naples ~ Naples ~ Italy

Gender-based violence against women represents one of the most serious forms of human rights violations (EIGE, 2024), with devastating physical, psychological, and social consequences (García-Moreno et al., 2013). The extent of this phenomenon within family and intimate relationships emerges clearly (Istat, 2020). The aim of this study is to analyze the factors and dynamics associated with the perpetration of gender-based violence, examining stories of violence against women. The analysis included 100 case histories, completed by properly trained operators, for women aged between 19 and 78 who sought help at a Neapolitan anti-violence center from 2022 to 2024. This center aids both Italian and foreign national women. The thematic analysis was conducted following the model proposed by Braun and Clarke (2006). The results highlight the need for a multidimensional approach to tackle the issue of gender-based violence effectively. The consequences for women who have experienced violence are underscored. The importance of the link between precarious socio-economic conditions and violent behaviour emerged as central to consider. The role of the intergenerational transmission of violence is emphasized, as 50% of the women reported that the perpetrators of the violence had been victims of witnessed violence during childhood. The criminal records of the perpetrators were present in 32% of the case history, linked to forms of violence such as stalking and economic violence. The latter is particularly prevalent. This data requires further specific investigation, as it significantly deviates from the national data generally reported. Additionally, differences in violent dynamics between women who are mothers and those who are not are considered, along with the role children play in prompting women to seek help. Finally, services, institutions, and social networks that can be protective factors or represent risks in combating the phenomenon are analyzed. Implications and possible interventions are discussed.

Abstract 4329

"I'VE NEVER HAD A HOME": WOMEN'S EXPERIENCES OF RECOVERY FROM HOMELESSNESS AND SUBSTANCE USE ISSUES IN IRELAND.

O'shaughnessy B.*[1], Mayock P.[2]

[1]Dept. of Psychology, York St. John University, York, United Kingdom. ~ York ~ United Kingdom, [2]School of Social Work and Social Policy, Trinity College Dublin, Dublin, Ireland ~ Dublin ~ Ireland

The complex relationship between homelessness and substance use issues (SUI), and recovery from homelessness and SUI are only partially captured in existing research. Women experiencing homelessness and SUI are at heightened risk of victimization, traumatization, and family separation. Thus, women's unique experiences of the pursuit of recovery in the context of substance use issues and homelessness warrants further study. In this talk, we present the accounts of women who participated in a longitudinal examination of the recovery experiences of homeless service users in Ireland. At two time points, semi-structured interviews took place with a sample of 14 women with experiences of long-term homelessness and SUI. Participant profiles indicated high rates of concurrent SUI and mental health issues, engagement with domestic violence services and criminal justice involvement. Themes identified from thematic analysis included the complexity of relationships, unconditional housing as a shot at life, and recovery supports and signifiers. Findings reflect women's strategies to have their basic needs met, to overcome cumulative adversity, and to construct and pursue their personal recovery trajectories. Findings are discussed in respect of policies and programmes for supporting women and their families engaged with homelessness and treatment services.

Abstract 4330

CHARTING NEW HORIZONS FOR A COMMUNITY ACCOUNTABILITY APPROACH TO ENDING GENDER-BASED VIOLENCE

Allen N.*, Harris A., Sowell V.D.S.

Vanderbilt University ~ Nashville, Tennessee, ~ United States of America

The community response to gender-based violence has long been characterized by two broad goals: survivor safety and perpetrator accountability. The latter has aim has been elusive. In the United States context, accountability has centered criminal processing including a robust first response from law enforcement (e.g., mandated arrest policies; policies against dual arrest), prosecution (e.g., evidence-based led by the state), protection orders (e.g., co-locating advocates in court houses; moving orders efficiently from emergency to longer-term plenary orders). Yet, a reliance on a retributive justice movement has been critiqued almost for as long as it has been pursued. Women of color, especially, have noted the “double binds” created by an emphasis on criminal processing, a system that disproportionately targets men of color. As an alternative, restorative justice approaches are increasingly articulated. While promising, these efforts are nascent, with various complexities being explored including the voluntariness of participation, when and where restorative opportunities should be offered (in universities adjudication? in lieu of criminal prosecution?), and the outcomes associated with this process for survivors and for perpetrators. Finally, notions of a community accountability have surfaced over the years, posing questions regarding the role of bystanders, the transformation of rape culture, the re-education of generations of students regarding consent and healthy relationships and the role of faith- and civic-organizations. The current study provides a comprehensive empirical literature review of the status of the gender-based violence movements (including intimate partner and sexual assault) approaches to perpetrator accountability accompanied by interviews with a wide range of cardholders in the community response to gender-based violence including survivors, advocates, researchers, policy makers, and state/regional coalition members. The aim is to chart a new horizon for the pursuit accountability in the 21stcentury that is embedded in a robust community response, centered in community rather than outsourced to criminal processing.

Abstract 4331

MEN AND THE PREVENTION OF VIOLENCE AGAINST WOMEN

Ornelas J.*

ISPA, Instituto Universitário APPsyCI – Applied Psychology Research Center Capabilities and Inclusion, Lisboa ~ Lisbona ~ Portugal

Men are the population cohort with the highest level of responsibility on the incidence and prevalence of the designated pandemic of violence against women, girls, and children. Despite incommensurable numbers of international treaties and recommendations, the feminicide numbers and severe violence reported situations persist with no substantive changes. The 2025 global statistics reported by the United Nations reiterate that around 1 in 3 women worldwide experience physical or sexual violence in their lifetime, mostly perpetrated by an intimate partner. Men must take responsibility for the severity of this social issue and commit to proactive intervention in the prevention of violence. This is not just the problem of a few—those who are “bad,” who are violent, who drink, who use drugs, or who have mental illnesses. This labelling runs in parallel to the “Blaming the Victim” narrative that is often applied to women. This connection only isolates “some” men—the aggressors—and removes from the social context and the social basis of the repeated acts of violence; it compartmentalises the reality by placing aggressors on one side and victims on the other. In the course of my recent involvement and support for research in the field of violence against women and children, I concluded that if our goal is genuinely to work on the universal prevention of violence, we need to change the focus of research. Research should no longer be solely focused on demonstrating the causes and consequences of victimisation but directly address the problems and dilemmas of contemporary heterosexual men and promote a global strategy. Most studies on men and masculinity focus on perpetrators of violence involved in the judicial system, a restricted group that limits our perspectives on men and excludes the majority who should be a fundamental part of an innovative field of social intervention.

LOCAL COMMUNITIES AND MODERN TECHNOLOGIES: UNRAVELING SOCIAL RELATIONSHIPS AND PARTICIPATORY PROCESSES IN UBIQUITOUS COMMUNITIES

Friday 24 July 2026 from 08:00 to 09:30

(D-Spadolini)

Flora Gatti (Università degli Studi di Napoli Federic), Chair and Presenter
Procentese Fortuna (Università degli Studi di Napoli Federic), Discussant

Modern communities (e.g., neighborhoods, cities) are undergoing deep transformations due to the increasingly pervasive uses of new technologies. Indeed, these technologies allow individuals to experience local places and relationships in a ubiquitous way (e.g., Gatti & Procentese, 2021, 2024). These changes – and the resulting intertwinement of online and offline experiences, relationships, and interactions – are significantly reshaping the social processes and dynamics characterizing them at different levels (individual, interpersonal, intergroup, and collective) as well as the paths towards participatory processes. This produces effects on local social relationships, but also on the opportunities citizens have to experience urban spaces and meanings and engage for them.
In light of this, the present symposium aims to unravel such impacts by addressing the role social media and other community-related technologies play in shaping social and community relationships and processes within contemporary communities. Specifically, the contributions will address the role of modern technologies in shaping relational phenomena, social interactions, and participatory and community building processes.

Abstract 3590

CYBER DATING ABUSE: UNFAIR SOCIOCULTURAL ROOTS AND INJUSTICE THROUGH TECHNOLOGIES

Bellanca N.*[1], Agueli B.[1], Esposito C.[2], Esposito C.[3], Di Napoli I.[3]

[1]Università degli Studi di Modena e Reggio Emilia ~ Modena ~ Italy, [2]Università degli Studi di Foggia ~ Foggia ~ Italy, [3]Università degli Studi di Napoli Federico II ~ Napoli ~ Italy

INTRODUCTION

Information and Communications Technology (ICT) has become a constitutive element of contemporary relational dynamics, extending the intensity of interactions. Far from being a neutral medium, ICT affords specific affordances - like constant connectivity, anonymity, surveillance - that can facilitate coercive and aggressive behaviours within intimate relationships. In this context, digital technologies enable manifestations of Cyber Dating Abuse (CDA), including control, monitoring, and direct aggression (Borrajo et al., 2015). These practices are rooted in sociocultural injustice and gender inequalities that structure offline relationships and find new spaces for reproduction and amplification online (Marganski & Melander, 2018; Peskin et al., 2017).

PURPOSE

The study examines factors that can contribute to the negative use of technologies, leading to CDA.

METHOD

1084 young adults (69,4% female), aged between 18 and 30 (M_age= 23.89, SD = 3.01) participated in an online survey. Using Mplus, a Structural Equation Model (SEM) was tested to investigate the predictive contribution of General (G-BJW) and Personal (P-BJW) Beliefs in a Just World on Control and Overt Aggression, manifestations of CDA. The mediating effect of Acceptance of Victim-Blaming Myths, Benevolent and Hostile Sexism was tested.

RESULTS

G-BJW had a positive effect on all mediators and a direct and negative effect on Control. P-BJW had a negative effect on all mediators. Benevolent Sexism was associated only with Control, while Hostile Sexism had an effect only on Overt Aggression. Victim-Blaming Myths had a positive effect on both outcomes. G-BJW was indirectly and positively associated with Overt Aggression through Hostile Sexism and Victim-Blaming Myths, and with Control through Benevolent Sexism and Victim-Blaming Myths. P-BJW was indirectly and negatively associated with Overt Aggression only through Hostile Sexism, and with Control through Benevolent Sexism.

CONCLUSIONS

Interventions should focus on the conscious use of technologies to end CDA, exploiting their potential to reduce and combat unequal models.

Abstract 3592

THE ROLE OF ACTIVE AND PASSIVE SOCIAL MEDIA IN RESTORING SENSE OF COMMUNITY IN THE LOCAL NEIGBORHOODS

Schouten A.*[1], Gatti F.[2], Fortuna P.[2]

[1]Tilburg University ~ Tilburg ~ Netherlands, [2]Università degli Studi di Napoli Federico II ~ Napoli ~ Italy

It is often said that social media is detrimental to local social communities as many people flock to online spaces based on interest or social group. As a consequence, people may be less inclined to talk to their neighbours, venture outside in their neigbourhood, and in general participate less in their local community. This may lead to a decline in social cohesion and sense of community. However, social media may also positively affect local community involvement. Several social media applications and uses exist specifically for local community interaction. People may actively communicate with their local community members such as via WhatsApp neighbourhood groups, or they may use local social media passively, by following or participating in local Facebook groups or specific neighborhood apps such as Nextdoor. We pose that participation in these local social media may increase bridging and bonding social capital in the local community. This, in turn, may restore sense of community and community identity. A survey among 1852 Dutch and Italian participants indeed showed that both passive and active local social media use affect bridging and bonding social capital. Bridging and bonding social capital, in turn affect people's sense of community and community identity. Active social media use affects bridging and bonding to a larger extent than more passive social media use. The effects of social media use on bridging and bonding social capital were stronger for people who experience local community loss. That is, people who feel that their local community affords few physical spaces for local community interaction may restore their sense of community through the use of local social media.

Abstract 3593

CAN NEIGHBORHOOD-RELATED SOCIAL MEDIA STRENGTHEN LOCAL COMMUNITIES? UNRAVELING THEIR EFFECTS ON LOCAL COMMUNITY EXPERIENCES AND COMMUNITY RESILIENCE

Gatti F.*, Fortuna P.

Università degli Studi di Napoli Federico II ~ Napoli ~ Italy

The spread of neighborhood-related uses of locative social media has complexified how citizens can experience their local communities (i.e., neighborhoods and cities), making the latter ubiquitous social ecosystems. Indeed, these social media produce further social opportunities that have become easily available to citizens, integrating the social processes that characterize local communities. Based on this, the present study addressed the impact of these technologies on users' local community experiences, with reference to social capital, Sense of Community (SoC), Sense of Responsible Togetherness (SoRT), and community resilience. An online questionnaire was administered to 965 Italian citizens aged between 18 and 64 (Mage = 22.80; SD = 4.88) being involved in WhatsApp or Facebook neighborhood groups. A multiple sequential mediation model was run using Structural Equation Modeling (SEM). The results show that the use of these social media supports users' bridging and bonding social capital; additionally, it can support their SoC through both bridging and bonding social capital, and their SoRT through bridging social capital. Last, through the sequential mediations of bridging social capital and SoRT, and of bonding social capital and SoRT, these applications can sustain users' perception of their community as resilient. This suggests that neighborhood-related technologies may hold potential to strengthen the local social fabric, supporting citizens' tie to and responsibility-taking for their neighborhood. By doing so, their use may sustain the perception about that community being resilient, based on citizens feeling that there are practical as well as social resources to rely on when in need, and that community members are tied to that neighborhood and actively take responsibility for its improvement. This highlights the complexities related to modern local community experiences, showing that neighborhood-based technologies could represent tools allowing the activation and enjoyment of local resources. Theoretical and practical implications stem and will be discussed.

Abstract 3594

A PHYGITAL APPROACH TO COMMUNITY ENGAGEMENT IN URBAN REGENERATION: INSIGHTS FROM EXP-EIA CASE STUDIES

Boffi M.*[1], Piga B.[2], Stancato G.[2], D"Antonio G.[1], Colonna C.[1], Rainisio N.[1]

[1]University of Milan ~ Milano ~ Italy, [2]Politecnico di Milano ~ Milano ~ Italy

Individuals and communities increasingly inhabit an onlife condition, in which digital and physical dimensions are inseparably intertwined (Floridi, 2015). Within this scenario, hybrid technologies are profoundly reshaping community dynamics and participation, though not without critical concerns. The digital divide and socio-economic disparities may undermine inclusivity, excluding vulnerable groups or reducing participation to tokenistic practices (Condie & Richards, 2022). These risks become particularly salient in urban regeneration, where top-down approaches have historically produced displacement and limited benefits for well-being (Lees & Hubbard, 2020). At the same time, such hybrid environments have been found able to broaden engagement, reinforce social ties, and enable novel forms of activism (Greijdanus et al., 2020). Moreover, locative media could reconnect digital representations with physical places, fostering new collective identities (Schwartz & Hochman, 2014). To promote equitable and meaningful community participation in today's ubiquitous communities (Gatti & Procentese, 2024) while advancing social justice, it is essential to develop innovative methodologies that integrate digital tools with the recognition of local needs, emerging identities, and knowledge. Grounded in psychology, the exp-EIA methodology responds to this challenge by integrating emotional, cognitive, and community identity dimensions to capture nuanced experiences of urban environments (Rainisio et al., 2024). In this contribution, results from participatory studies carried out in university campuses and natural areas—using digital apps and the luminous planning table, part of the exp-EIA ecosystem—will be presented, showing the potential of a phygital approach to citizen engagement and the co-construction of community-based urban regeneration processes.

03 - Division 3: Psychology and Societal Development

ADDRESSING GLOBAL GENDER VIOLENCE: INCIDENCE, PREVENTION AND SOLUTIONS

Friday 24 July 2026 from 09:30 to 11:00

(D-Spadolini)

Jill Bloom (William James College ~ Boston ~ United), Chair and Presenter

The UN defines violence against women as “any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or summering to women.” Gender-based violence (GBV) is present in every society around the world and takes many forms ranging from human trafficking, sexual abuse to domestic violence (WHO, 2018). GBV has long been recognized as a human rights issue that has serious implications for public and mental health, yet most gender violence not only goes unpunished but is tolerated in silence. One major obstacle in combating GBV is the fragmentation of efforts, highlighting the need for more coordinated and innovative interventions. The six presentations that make up this Symposium address GBV across global populations, in widely varying contexts, and from a range of perspectives, each proposing strategies and interventions that address the pervasiveness of GBV. The first two presentations on the incidence of Intimate Partner Violence in Oceania and GBV towards gender and sexual minorities in Canada, respectively call for culturally grounded mental health support to achieve gender equality in Oceania, and trauma informed gender affirming care for Two- Spirited, Lesbian, Gay, Bisexual, Trans, Queer, Intersexed sexual minorities in Canada. The following two presentations focus on human trafficking, first, addressing the role of shame in gender violence, demonstrating how shame can be co-constructed in dialogic exchange between self, perpetrator, family members. Second, the intersectionality of war and human trafficking in war torn countries is presented. Next, domestic violence among refugees populations is addressed, utilizing transnational feminist and intersectional approaches to address the unnuanced binary of victim/perpetrator. The final presentation focuses on climate change and weather related disasters exacerbate gender-based violence (GBV), disproportionately affecting women and girls. Understanding these dynamics is essential for advancing psychological science and practice in global contexts.

Abstract 3568

COLONIAL LEGACIES, CULTURAL NORMS, AND GENDER-BASED VIOLENCE IN OCEANIA

Sidun N.*

Independent Scholar ~ Honolulu ~ United States of America

Gender-based violence is one of the most pervasive human rights violations facing women in Pacific Island Countries (Oceania). Rates of intimate partner violence (IPV) and sexual assault across the region far exceed global averages, with lifetime prevalence of physical partner violence reported at 61% in Fiji, 59% in Kiribati, and 46% in the Solomon Islands. Women are subjected not only to physical abuse, but also to emotional violence, coercive control, and sexual assault by both partners and non-partners. In Vanuatu, for example, 68% of women report emotional violence, while in Nauru, 47% have experienced sexual violence outside of intimate partnerships. Cultural stigma, the preservation of family honor, and religious interpretations that reinforce patriarchal authority frequently discourage disclosure and help-seeking. This silence perpetuates cycles of abuse and contributes to women's heightened vulnerability to depression, anxiety, and post-traumatic stress. Colonial histories and missionary influences have further entrenched gender hierarchies and shaped norms that justify violence against women. In Samoa, customary governance structures and biblical interpretations have excluded women from decision-making, while also reinforcing the perception that domestic and sexual violence is a result of women's failure to meet prescribed roles. Such attitudes normalize abuse and obscure structural inequalities that place women at risk. The consequences of gender-based violence are profound, extending beyond immediate physical harm to affect women's educational attainment, economic participation, political representation, and overall well-being. Addressing these challenges requires not only culturally grounded mental health support and survivor-centered services but also systemic reforms that empower women in governance, increase access to justice, and challenge entrenched social norms. Without these interventions, gender-based violence will remain a significant barrier to achieving gender equality and sustainable development in Oceania.

Abstract 3569

GENDER BASED VIOLENCE: THE INTERGENERATIONAL EXPERIENCES OF GENDER AND SEXUAL MINORITIES

Sinacore A.*

McGill University ~ Montreal ~ Canada

The history of gender-based violence (GBV) towards gender and sexual minorities in Canada is well documented. However, physical and sexual violence toward members of the 2SLGBTQI+ (Two- Spirited, Lesbian, Gay, Bisexual, Trans, Queer, Intersexed) individuals and communities is widespread with incidents increasing in recent years. A 2024 EGALE Canada report indicated that hate crimes targeting gender diversity and sexual orientation increase by 69% since 2023 and by 388% over the course of 2016 to 2023. These crimes were extremely violent targeting individuals as young as 15 with many experiencing violence more than once. According to the Canadian Psychological association position paper, addressing the prevention of gender-based harm 78 TO 85 percent of two-spirited people experience physical and/or sexual assault. As well, older people who identify as a gender and/or sexual minority have experienced GBV more than three times in their lifetime with victimization reported on average 6.5 times across their lifetime. In Canada, GBV is a public health concern that disproportionately effects 2SLGBTQI+ people and their communities. This violence is pervasive and fueled by transphobia, biphobia, homophobia and lesbophobia. Moreover, when reviewing the literature on GBV toward 2SLGBTQI+ individuals and their communities the experiences of violence are further compounded when one takes into account intersecting identities (e.g. race, age, disability). Moreover, current anti-trans political rhetoric has resulted in an increase in violence against trans and gender diverse individuals. Thus in this presentations the speaker will provide an analysis of the past and current situation of GBV faced by 2SLGBTQI+ individuals and communities and offer insights on how to offer trauma informed gender affirming care.

Abstract 3570

THE ROLE OF SHAME IN GENDER VIOLENCE PERPETUATED AGAINST VICTIMS OF SEX TRAFFICKING

Dryjanska L.*

University of Cardinal Stefan Wyszynski ~ Warsaw ~ Poland

Using the theoretical perspective of Fairbairn's object relations theory, integrated with the dialogical approach to social representations, the presenter will discuss the role of shame in gender violence inherent in sex trafficking. Drawing from a qualitative, phenomenological research study with 18 men and women survivors (of various intersecting identities in terms of race, ethnicity, and age) asked to describe their experiences, this presentation will feature cases that correspond to different types of shame. In the spirit of dialogical analysis, it will demonstrate how shame can be co-constructed in a dialogical exchange of self and different counterparts, including the perpetrator, family members, officials, and a more generalized notion of others as an expression of a given culture. Paying attention to words might provide some insight into a dimension of shame, while noticing and systematically recording non-verbal cues can enrich that perspective. Pauses, incomplete sentences, smiles, and tears, to mention just a few, might indicate shame not explicitly shared with the researcher who has a choice on how to respond to it. Similarly, an exchange with another interlocutor could elicit a different reaction. That response could in turn shape the subsequent reaction and partially explain certain phenomena common in anti-trafficking response, such as the frequent survivor's preference for a peer mentor rather than a professional therapist (if a person is forced to choose, as emerging from the data). The presentation will include examples of how shame might impact the self-concept and the figures that have been perceived as neglectful shamers in the lives of survivors of gender violence impacted by sex trafficking. It will conclude with a discussion of specific interventions aimed at shame reduction, not only from a therapeutic perspective, but also in the social arena, recognizing the role of stigma in fueling and perpetuating shame.

Abstract 3571

HUMAN TRAFFICKING IN A CLIMATE OF CONFLICT

Rajan I.*

Independent Scholar ~ Anaheim ~ United States of America

We live in a time in which war & international hostilities are becoming the norm. The Russian attack on Ukraine, and now the escalating war between Israel and HAMAS, are creating global waves of fear, animosity, and suffering, causing war-torn peoples to scatter in every direction in search of asylum. Political leaders from local, national, and international platforms have become consumed with defending borders from bombs and refugees, and xenophobia rules the day. In this socio-political reality, in which the exploitation of vulnerable human beings is becoming a worldwide standard, what is the fate of human trafficking victims? Recently, the United States Institute of Peace reported that the humanitarian crisis caused by Russia's war in Ukraine is rapidly turning into a human trafficking crisis in which women and children, who make up the majority of the refugees fleeing the war, are being exploited. Further, U.S. Ambassador to the U.N. Linda Thomas-Greenfield told the U.N. Security Council that "it is on Russia to stop rape, violence, and atrocities from within its ranks." As of 2020, the UN estimates that over 2 billion people live in conflict-affected countries, and as of 2023, the World Economic Forum estimates that 339 million largely war-torn people need humanitarian assistance. More vulnerable, exploitable communities are created by war, as a lack of food, water, & shelter creates vulnerability for families stuck in areas of conflict or attempting to flee from those areas. Evidence shows that because war ravages communities without prejudice, even those who once had economic, familial, and socio-cultural protections are at risk of being trafficked. These risks dramatically increase among those marginalized because of race or gender-based inequities. This presentation will focus on the intersectionality of war & human trafficking, as well as the mental health effects on refugees forced to seek asylum.

Abstract 3572

UNDERSTANDING DOMESTIC VIOLENCE AMONG REFUGEE POPULATIONS: TRANSNATIONAL FEMINIST & INTERSECTIONAL APPROACHES

Bloom J.*

William James College ~ Boston ~ United States of America

The literature on Domestic Violence (DV) and refugees settling in developed countries is sparse, despite concerns from service providers and policy makers that communities are experiencing DV that it is negatively affecting wellbeing and the chances of successful settlement.

There is general consensus among researchers that DV is not more prevalent among immigrant and refugee groups than native-born American women. While many dynamics of DV are similar, specific factors inherent to displacement and refugee and immigration status exacerbate risks and shape experiences of DV among refugee and other forcibly displaced women.

Of note, the majority of the literature on refugees and DV has focused on women, not men, perpetuating a unnuanced binary of victim/perpetrator. Among the few studies that have addressed the experience of refugee men, violence was explained contextually as a means of gaining control and re-establishing power following the trauma and violence experienced in their home countries. What is needed, and what this presentation addresses, is a more nuanced approach to understanding DV among refugee men and women. Transnational feminist and intersectional approaches acknowledge that gender oppression is modified by intersections with other forms of inequality and oppression. For example, not all men benefit equally from patriarchy, and cannot be categorized solely as privileged or oppressed. In short, there is a different meaning to male domination when it is refracted through the lens of race, colonization and class oppression. In conclusion, analysis of DV in the refugee context requires a specific appreciation of patriarchy as it manifests through cultures as a way of ensuring that critiques remains focused on factors that place both women and men at risk. There is ample consensus that, although violence against women has historically been viewed as a feminist issue, the solution must ultimately involve both women and men.

Abstract 2599

UNDERSTANDING THE PSYCHOLOGICAL AND LINGUISTIC DETERMINANTS OF MUTUAL INTELLIGIBILITY

Jagelkova L.*

Dartmouth College ~ Hanover ~ United States of America

Which psychological and linguistic factors allow a person to understand related, but different, languages? In 2012, the European Commission called for research to investigate the mutual intelligibility among closely related European languages to improve communication within the EU. Existing correlational evidence suggests that mutual intelligibility may depend not just on linguistic determinants (e.g., lexical, syntactic, pronunciation similarities) but also on extra-linguistic determinants (e.g., exposure, cognitive skills, personality). I devised an innovative questionnaire which includes not only tasks to measure the level of mutual intelligibility, but also cognitive games and questions to measure personal attributes, as well as proxies for respondents' effort. The survey design allows me to identify the causal impact of language itself, of cultural exposure, and of personal attributes on an individual's ability to understand related, but different, languages. I distributed the survey to 200 students in Slovakia divided into three groups: native speakers, non-native speakers, and heritage speakers (individuals who have grown up in a home where a language other than Slovak is spoken). I tested their ability to understand listening and reading tasks in Slavic languages of the European Union (Polish, Czech, Slovak, Slovene, Croatian, Bulgarian). Looking across these groups allows me to tease out the role of language itself in mutual intelligibility (which is equal for all respondents) and the impact of extra-linguistic determinants such as exposure, which is not present for heritage or non-native speakers. Controlling for a person's score on tasks in their native language, as well as for response times, and audio replays – proxies for exerted effort – allows me to obtain unbiased estimates of the determinants of mutual intelligibility. I provide recommendations that lay the foundation for an improved pedagogical approach to the teaching of languages which emphasizes the factors, skills, and personal attributes that facilitate mutual intelligibility.

Abstract 1599

GENDER STEREOTYPES AND THE CONSTRUCTION OF FEMALE IDENTITY: A SYSTEMATIC REVIEW AND PLANNED META-ANALYSIS

Destro B.*, Marchioro D.M.

IUSVE Istituto Universitario Salesiano Venezia (VE) ~ Venezia Mestre (VE) ~ Italy

Gender stereotypes shape women's self-perception and identity development, yet empirical evidence is dispersed across subfields, measures, and designs.

This systematic review and planned meta-analysis synthesize associations between stereotype internalization/ambivalent sexism and female identity-related outcomes (self-concept clarity, self-esteem, identity distress), and examine mechanisms (self-objectification; pressure to conform to gender roles) and moderators (feminist identification, social support, exposure to sexist events, media context).

Following PRISMA 2020, PsycINFO, PubMed, Scopus, and Web of Science will be searched (1987–2025) for peer-reviewed studies on women (≥16 years) using validated measures (e.g., Ambivalent Sexism Inventory, Objectified Body Consciousness, Self-Concept Clarity Scale, Rosenberg Self-Esteem, Identity Distress Survey, Multidimensional Scale of Perceived Social Support). Eligible designs include cross-sectional, longitudinal, and experimental studies. Two independent reviewers will screen, extract, and appraise risk of bias (adapted NOS/ROBINS-I), resolving disagreements by consensus. Random-effects models will estimate pooled associations; robustness will be examined via leave-one-out analyses, influence diagnostics, meta-regression, and publication-bias tests (funnel asymmetry, trim-and-fill, p-curve).

The review will quantify links between sexism/stereotype internalization and identity indicators, evaluate indirect effects through self-objectification and normative role pressure, and identify conditions that amplify or buffer impacts. We will report pooled correlations or standardized mean differences with 95% confidence intervals and heterogeneity (τ^2, I^2), isolate methodological sources of variance, and summarize evidential quality and reproducibility. Subgroup analyses will compare developmental stages, measurement approaches, and media exposure.

By integrating results across disciplines, this review will clarify how gendered beliefs are internalized and translated into female identity processes, and under what conditions their effects are strengthened or mitigated. Anticipated implications include guidance for gender-aware psychoeducational and clinical interventions (e.g., stereotype literacy,

identity-clarity training, self-compassion and objectification-reducing practices) and priorities for future longitudinal and experimental research suited to causal inference. PROSPERO registration will be sought prior to data extraction; full findings will be available for presentation.

Abstract 4538

WAR AS A CONTEXT FOR SHAPING SPECIAL CONDITIONS FOR THE FORMATION OF IDENTITY AMONG YOUNG PEOPLE IN DONBAS

Morozova Z.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction
Identity formation - the central task of youth - is profoundly complicated by war, displacement, and the loss of territory. For young people from the Donetsk region, this process since 2014 has involved the challenge of integrating collective trauma and a radically changed social context into a stable sense of "self".
Purpose
This study aims to explore the lived experience of identity formation among young people from Donbas and to interpret how they make sense of their personal development within the context of prolonged conflict and social instability.
Method
The research used a qualitative approach to the studied phenomenon: interpretive phenomenological analysis. This involves two: a phenomenological description of the participants' experiences and the researcher's interpretation of these experiences. The data were collected by semi-structured interviews with three young men aged 18-19 who had lived in the Donetsk region since birth and were there in 2014, meaning they grew up in the context of a protracted conflict. Since 2022, all three have experienced displacement within or outside the region, including as a result of changes in the security situation and educational opportunities.
Results
The experience of identity formation in a war environment is summarized in two main categories, each containing specific subordinate themes:
1. Perception of war as a distant background (dominance of denial and avoidance coping strategies; lack of familial reflection or open discussion);
2. Adaptability as a core identity mechanism (development of psychological defense against social hostility; identity as fluid social capital and a tool for integration); and Strategic control over uncertainty (hyperplanning as a substitute for existential safety; identity suspension and the transition to a moratorium status).
Conclusions
Identity among young people in Donbas has been forged through a dynamic

interplay of trauma and adaptation to war-related instability, manifesting in a complex struggle between denial, survival strategies, and the search for self-definition. This process highlights the importance of theoretical frameworks, such as social identity, moratorium status, social capital, and hidden identity, in understanding how individuals reconstruct themselves during ongoing conflict.

Abstract 1284

EXPLORING FORGIVENESS, EMPATHY AND PSYCHOLOGICAL WELL-BEING AMONG YOUNG ADULTS

Kaur H.[2], Sharma M.*[2], Kaur S.A.[1]

[1]Birla Institute of Technology & Science ~ Pilani ~ India, [2]Punjabi University ~ Patiala ~ India

Forgiveness is considered a significant construct of positive psychology fostering well-being among adults. It is an intentional emotional and multidimensional process that involves overcoming resentment and negative emotions and further fostering reconciliation with oneself or others. Empathy is an affective response and ability to share and understand the perspectives of others, which notably promotes overall positive functioning known as well-being. While prior research highlights the benefits of forgiveness, there has been a research gap examining how empathy and gender differences influence forgiveness. Thus, the study seeks to investigate the impact of empathy and gender in shaping forgiveness while contributing to overall well-being. This study advances the need to understand interpersonal and intrapersonal components of forgiveness. A cross-sectional survey design was used, collecting data from 100 university students using standardized scales—the Heartland Forgiveness Scale (Kravchuk, 2022), the Ryff Psychological Well-being Scale (Ryff, 1989), and the Emotional Empathic Drive Short Scale (Karlstetter, 2017). Statistical analysis was performed employing a regression model and inferential statistics (t-test, correlation). The present study hypothesizes that higher empathy will be positively correlated with forgiveness and gender will serve as a moderator.The results of the current study will be discussed in the presentation. The outcomes of this research have both practical and theoretical implications and interventions focusing on young adults, enhancing counselling practices and mental health initiatives promoting social connectedness, resilience, and well-being. This research will help bridge gap in literature by promoting psychoeducational modules that focus on forgiveness and empathic sensitivity.

Abstract 3349

NEGOTIATING VALUES AND IDENTITIES IN THE AGE OF GLOBALIZATION: INSIGHTS FROM INDIA

Babik I.*[1], Biswas U.N.[2]

[1]Boise State University ~ Boise ~ United States of America, [2]Delhi University ~ Delhi ~ India

Background: Globalization accelerated cross-cultural exchange, exposing young people to new ideas, lifestyles, and belief systems. While this process has created opportunities for modernization and social progress, it has also intensified tensions between traditional values and global perspectives (Rao et al., 2013). The goal of this study was to better understand how individuals negotiate traditional and modern identities in the context of globalization.

Methods: Semi-structured interviews were conducted in-person with 60 young adults from India (equal gender representation, ages 20-30) representing diverse regions. Each interview included questions about the perceived positive and negative effects of globalization, its influence on everyday life and parenting practices, and the coexistence of old and new values within one's personal identity. Responses were thematically coded using NVivo software.

Results: Globalization was seen as a catalyst for eliminating oppressive practices and embracing self-respect, independence, and exploration. However, many reported experiencing an inferiority complex and growing pressure to embrace modern lifestyles. Participants noted the clash between traditional and modern values and expectations, which produced identity conflict. Some participants reported maintaining two identities (one for parents and one for friends) to avoid open confrontation. This compartmentalization of identity often led to shame, guilt, anxiety, and emotional strain. At the same time, many expressed a growth mindset in response to globalization pressures, viewing the clash between old and new values as an opportunity for personal development, consciously selecting humanistic values while discarding the limiting ones.

Conclusions: The study revealed that globalization is experienced as both liberating and destabilizing. It facilitates empowerment by providing tools for critical reflection, fostering mental health literacy, and encouraging gender equality. At the same time, it generates psychosocial tension, identity fragmentation, and pressure to abandon cultural traditions. Mental health practitioners should recognize the identity conflicts created by globalization and support clients in exploring ambivalence without judgment.

Abstract 1236

OUTGROUP MEMBERS' SOCIAL RELATIONSHIPS AND OUTGROUP DEHUMANIZATION: EGOCENTRIC SOCIAL NETWORK ANALYSES

Jia Y.[1], Zuo B.[1], Zhang B.*[2]

[1]Department of Psychology, Sun Yat-sen University ~ Guangzhou ~ China, [2]School of Psychology, Shaanxi Normal University

Perceiving outgroup members as lacking humanness (outgroup dehumanization) undermines social harmony and equality. Because humanness often manifests in social interactions, outgroup dehumanization may be influenced by both perceivers' own cross-group ties and their knowledge of outgroup members' relationships with others. However, existing research on the humanizing effects of outgroup members' social relationships has focused primarily on the former, with little attention to the latter. Therefore, the present research aimed to examine, within an egocentric social network framework, how first-party ties to outgroup contacts and third-party knowledge of connections among these contacts and other contacts were related to outgroup humanness attribution.

Study 1 (N = 683) examined men's and women's perceptions of the other gender; Study 2 (N = 349) investigated how residents of megacities in China perceived migrants. We collected data on participants' egocentric networks and adopted a profile correlation approach to index their attributions of human nature (HN) and human uniqueness (HU) to the outgroup. The overall strength of first-party ties to the outgroup contacts and the closeness centrality of these contacts (an index of third-party relationships) were assessed via social network analysis. In Study 2, we also measured perceived social status of and closeness to the outgroup as potential mediators.

Multilevel regression and mediation analyses revealed that stronger ties to other-gender contacts were associated with attribution of more HN but not HU to the gender outgroup, whereas higher closeness centrality of other-gender contacts was related to greater outgroup HU but not HN attribution. Among mega-city residents, these direct associations did not emerge; however, the closeness centrality of migrant contacts was indirectly linked to greater HU attribution toward migrants through higher perceived social status of this social group. These findings suggest that interventions strengthening intergroup ties and increasing outgroup contacts' closeness centrality may help reduce outgroup dehumanization.

Abstract 2577

BRIDGING THE GAP: PEER ATTACHMENT AS A BUFFER AGAINST PARENTAL TECHNOFERENCE AND SMARTPHONE ADDICTION IN ADOLESCENTS

Gauttam K.*

Department of Psychology, University of Delhi ~ Delhi ~ India

Parental technoference, refers to the interruptions and interference caused by the technological devices in the parent-child communication, is one of the factors that leads to smartphone addiction among adolescents. The present research will examine how parental technoference is associated with adolescent smartphone addiction with moderating effects of peer attachment. Based on the social learning theory and Compensatory Internet Use Theory, the study hypothesised (1) there is a positive relationship between parental technoference and smartphone addiction, (2) parental technoference and peer attachment have a moderating relationship and (3) there are important differences between early (ages 12-13) and late adolescents (ages 18-19) in parental technoference, peer attachment and smartphone addiction. There were 140 adolescents who took part in the study. The interaction effects were analyzed through moderation analysis through Smart PLS. Findings revealed that technoference on the part of parents had a positive relationship with addiction to smartphones. This correlation was moderated by peer attachment, whereby the stronger the peer attachment, the weaker the relationship between parental technoference and smartphone addiction. Moreover, the adolescents in later stages of the adolescence phase showed higher smartphone addiction and peer attachment than those in early stages of the adolescence phases. These findings highlights the importance of technology to reduce parental technoference and strengthen peer attachment to counterbalance the effect of technology-related disturbances on adolescents' well-being.

Abstract 159

THE INFLUENCE OF BIG FIVE TRAITS AND AGE COHORTS ON EMOTIONAL RESPONSES TO AI

Vanhara A.*, Labriola M., Salapska--Gelleri J.

Florida Gulf Coast University ~ Fort Myers ~ United States of America

Artificial intelligence (AI) sparks diverse opinions on its benefits and consequences. How people feel about the use of AI can vary across personality traits, including individuals with higher levels of neuroticism being more likely to endorse more strict regulation of AI (Bartneck et al., 2023). Additionally, individuals in different age cohorts also reported varying emotional impacts related to AI use, including older adults being more likely to endorse negative attitudes towards AI than younger cohorts (Stein et al., 2024). This study examines how perceptions of AI vary across personality traits and generational cohorts.

A total of 250 participants aged 18 and older will complete an online survey. Participants will complete questions related to their demographic variables, their knowledge, opinions, and emotions about AI, alongside the BFI-10 (Rammstedt & John, 2007) to assess Big Five personality traits.

Pearson correlations will examine the relationships between age cohorts, negative emotions toward AI, and personality traits. A multiple linear regression will assess how neuroticism and age predict negative attitudes toward AI, with negative emotions serving as the dependent variable. It is hypothesized that older adults with higher levels of neuroticism will report more negative attitudes and emotions toward AI.

Understanding how AI impacts society is critical. Results obtained from this research can inform how various age cohorts may impact individuals connection and understanding of AI. Strategies such as AI literacy and education can support and promote a better understanding of AI's role in society and how individuals determine its role and interactions.

Abstract 1420

THE PREVALENCE AND FACTORS INFLUENCING PROBLEMATIC SHORT-VIDEO USE AMONG ADOLESCENTS: A SYSTEMATIC SCOPING REVIEW

Hu Y.*, Zhu S.

The Hong Kong Polytechnic University ~ Hong Kong ~ China

Introduction: Short-video platforms like TikTok are increasingly popular among adolescents, raising concerns about problematic use impacting mental health and daily functioning.

Purpose: This review aims to map current evidence regarding prevalence, risk and protective factors, and conceptualizations of problematic short-video use (PSVU) among adolescents.

Method: A systematic scoping review was conducted following PRISMA-ScR guidelines. Eight databases were searched for peer-reviewed empirical studies on adolescent PSVU published between 2015 and 2025. Studies focusing on individuals aged 10-19 and assessing PSVU were included. Data were extracted and factors were synthesized using Bronfenbrenner's Ecological Systems Theory (EST) framework.

Results: Twenty-seven studies met the inclusion criteria, predominantly from China. Most studies used cross-sectional quantitative designs, with a few qualitative and longitudinal studies. Reported prevalence of PSVU among adolescents ranged from about 7% to over 40%, reflecting differences in definitions and measurement tools. Using Bronfenbrenner's EST, risk and protective factors influencing PSVU were systematically categorized across multiple ecological levels: individual (e.g., psychological distress, poor self-control), microsystem (e.g., family dynamics, peer influence, school environment, academic pressure, bullying), and exosystem (e.g., nature exposure, community environment, platform information and system quality). This ecological categorization provides a comprehensive understanding of the multifactorial influences on adolescent PSVU. Conceptual ambiguity and methodological heterogeneity were noted across studies.

Conclusions: PSVU among adolescents is a multifaceted behavior influenced by diverse ecological factors. Future research should standardize definitions, adopt validated measurement tools, diversify methods including qualitative and longitudinal studies, and explore under-researched ecological levels. Findings inform the development of multi-level interventions that engage coordination among individuals, families, schools, communities, and broader stakeholders to prevent adolescent problematic use and

promote digital well-being.

Abstract 775

DEVELOPMENTAL AND SOCIO-CULTURAL INFLUENCES ON GENDER DIFFERENCES IN DIGITAL LITERACY: A SYSTEMATIC AND META-ANALYTIC REVIEW

Guo Z.*[1], Chen L.L.[1], Liang Q.[2]

[1]The University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]Jinan University ~ Guangzhou ~ China

Gender disparities in digital literacy (DL) are a well-documented phenomenon across diverse developmental stages and socio-cultural contexts, yet they remain inadequately addressed in DL education. A potential underlying reason may lie in the measurement approaches employed, as self-reported measures are susceptible to bias and may not accurately reflect actual DL performance. Therefore, this systematic and meta-analytic review investigates gender disparities in performance-based DL and its developmental trajectory from Grade 3 to Grade 12 by synthesizing empirical evidence from 43 studies across 31 regions since 2005. Notably, the Gender Inequality Index was intentionally incorporated to examine the interplay between DL and socio-cultural contexts. The analysis adopted a mixed-method approach, integrating thematic and content analysis with the meta-analysis under the Bayesian framework — chosen for its robustness to small sample sizes and capacity to incorporate prior information. The cross-sectional meta-analysis revealed a consistent girl advantage (k = 67, g = +0.14, 95% CI[0.11, 0.18]). However, the longitudinal meta-analysis (k = 6) showed comparable growth rates for girls (d = 1.48, p < .001) and boys (d = 1.29, p < .001). Triangulated qualitative findings revealed that gender differences were most pronounced in upper primary and lower secondary education and were unexpectedly larger in highly developed regions than in developing ones. These findings contradict the gender stratification theory, which predicts smaller disparities in more gender-equal societies. Instead, they support the gender-equality paradox, suggesting that socio-cultural and developmental factors interact to shape DL outcomes. Methodological variations such as test modality and psychometric modeling were also identified as sources of inconsistencies across studies. This review extends traditional gender difference theories into the domain of DL education. It underscores the urgent need for international collaboration in research and pedagogical reform to promote gender equality in DL education, thereby fostering equitable career opportunities and advancing human well-being.

Abstract 921

RELATIONSHIP BETWEEN CONSCIENTIOUSNESS, PROCRASTINATION AND SMARTPHONE ADDICTION AMONG INDIAN YOUNG ADULTS

Yadav A.K.*, Srivastava N.

Banaras Hindu University ~ Varanasi ~ India

The smartphone has gradually become inseparable part of lives for many young adults worldwide, and brought certain undesirable consequences as well. Procrastination identified as a prevalent issue amongst students reflects failure of self-control and linked with addictive behaviours, including smartphone addiction. Whereas, conscientiousness, characterized by self-discipline and goal-directed behaviour, has been identified as a protective factor against maladaptive behaviours such as procrastination. Given the importance of these factors in academic performance and overall development of young adults and lack of studies in the Indian context, the present study aimed to explore the relationship between conscientiousness, procrastination and smartphone addiction among Indian students. In this study 110 college students (43 males, 67 females), aged 18-26 years were engaged through purposive sampling. The Smartphone Addiction Scale (Kwon et al., 2013), Big Five Inventory-Conscientiousness items (John & Soto, 2017), and the Lay Procrastination Scale (Lay, 1986) were administered. A correlational research design was employed, and data were analyzed using correlation, regression, and mediation analyses. Results indicated that conscientiousness was negatively correlated with both procrastination ($r = –0.53$, $p < 0.01$) and smartphone addiction ($r = –0.39$, $p < 0.01$). Mediation analysis further revealed that procrastination partially mediated the relationship between conscientiousness and smartphone addiction, with an indirect effect of conscientiousness on smartphone addiction through procrastination ($\beta = –0.85$, 95% CI: –1.85, –0.10, $p < 0.05$). The findings suggested that individuals with lower levels of conscientiousness were relatively prone to procrastination and increasingly susceptible to smartphone addiction. Present survey study emphasized the need of fostering self-regulatory skills and employ strategies to reduce procrastination in order to reduce smartphone addiction in young adults. Future researches may examine smartphone addiction along with procrastination and conscientiousness in the light of empirical and qualitative data.

Abstract 1172

BETWEEN DISTRACTION AND CONNECTION – PRESCENCE OF SMARTPHONES IN EARLY FAMILY LIFE. A QUALITATIVE INTERVIEW STUDY

Braune--Krickau K.*[1], Schneebeli L.[1], Gemperle M.[2], Joliat A.[1], Von Wyl A.[1]

[1]Zurich University of Applied Sciences ~ Zurich ~ Switzerland, [2]~ Zurich ~ Switzerland

Introduction

For today's young children, parental smartphone use forms part of their earliest environments. As toddlers develop, they not only notice but increasingly engage with smartphones. This shared digital presence introduces opportunities for technoference – moments where smartphone use disrupts parent-child interactions (McDaniel & Coyne, 2016). Quantitative studies link technoference to reduced parental sensitivity (Braune-Krickau et al., 2021) and adverse child outcomes, yet little is known about how parents themselves experience and interpret these dynamics. Understanding parental perspectives is essential for providing nuanced, effective guidance.

Purpose

This qualitative study explores mothers' experiences, attitudes, and ambivalences regarding the presence of smartphones within the parent-toddler relationship.

Method

The study is part of the multi-methods project Smart Toddlers (Swiss National Science Foundation, grant nr. 10001C_192820). Twenty-nine mothers of children aged 14–16 months participated in semi-structured interviews. Data were analyzed using reflexive thematic analysis (Braun & Clarke, 2022).

Results

Six themes each captured mothers' experiences of their own smartphone use and of their toddlers' own smartphone use. Mothers reported setting boundaries to protect key interactions, such as joint play and meals, yet described seeking "me-time" on smartphones. Smartphones also provided valued social connection, helping mothers manage feelings of isolation. Many became acutely aware of serving as role models for their observant toddlers. Regarding children's engagement, mothers described the "magnetic pull" of smartphones but expressed uncertainty about appropriate exposure. Most sought to delay device use to protect natural learning and creativity, rejecting smartphones as tools for soothing or distraction.

Conclusions

Mothers experience a high amount of ambivalence, striving to balance digital connectedness and real-live connection to their child. They aim to minimize technoference while also acknowledging the challenges they face in this respect. This underscores a need for parental guidance that considers the complex functions portable

digital devices fulfill for parents of young children.

03 - Division 3: Psychology and Societal Development

PSYCHOLOGICAL AND SOCIAL CONSEQUENCES OF WIDENING INEQUALITIES AND ITS IMPACT ON WELLBEING

Friday 24 July 2026 from 11:30 to 13:00

(S-Monumentale)

Purnima Singh (Department of Humanities and Social Scie), Chair

Widening inequalities undermine well-being of people across nations. More than ever before, today it has become pertinent for all societies and nations that inequality related issues need to be addressed on a priority basis. Wellbeing of people can be ensured only if issues of economic inequality, deprivations, discrimination, prejudice, conflict and climate and sustainability related issues are adequately addressed as such issues tend to exacerbate the consequences of inequalities. Despite various attempts to address these issues in nations being made, the issue of inequality still persists impacting people's lives, their growth , health and wellbeing and creating a context which allows individuals and groups to flourish. It is important to understand the complex nature of inequality and the ways in which ethnicity, gender and socioeconomic class, geographical location interact across various nations and societies. This symposium will discuss the psychological and social consequences of inequalities in various contexts and focus on developing a broad and holistic framework for understanding widening nature of inequalities and their amelioration.

Abstract 3735

FROM MARGINS TO MEANING: UNDERSTANDING THE WELL-BEING OF DEVIANT ADOLESCENTS IN OBSERVATION HOMES

Kohli N.*[1], Banerjee A.[2], Chawla S.K.[2], Sonoo S.[3]

[1]Department of Psychology, University of Allahabad, Prayagraj, India ~ Uttar Pradesh ~ India, [2]Department of Liberal Arts, Humanities & Social Sciences,Manipal Academy of Higher Education, Manipal, India. ~ Manipal ~ India, [3]Department of Psychology, K. S. Saket Post Graduate College, Ayodhya, India ~ Uttar Pradesh ~ India

The present qualitative study aimed to: (1) understand adolescents' perceptions of antisocial behaviour in observation homes, (2) examine the underlying causes of such behaviour, and (3) explore its consequences. Using purposive sampling, data were collected from 20 adolescents (aged 10–18 years) residing in the RajkeeyaSamprekshan Grih (Kishore), Prayagraj, India. Given the sensitive institutional context, particular care was taken in engaging participants. Thematic analysis identified three broad categories of contributing factors: (a) social factors such as broken homes, parental neglect, peer pressure and influence, criminal facilitation by peers, street life, and slum living; (b) individual factors such as gambling, drug abuse, and lack of education; and (c) psychological factors such as negative self-concept, emotional instability, impulsivity, child abuse, stress, and sensation-seeking behaviour. In terms of consequences, adolescents and their families experienced anxiety, suicidal ideation, feelings of revenge, social rejection, shame, guilt, pride, loneliness, financial burden, and social discrimination. The study underscores the complex challenges faced by this vulnerable population and highlights the need for targeted interventions and policies to mitigate the risks associated with adolescent antisocial behaviour.

Abstract 3737

EARLY LIFE ADVERSITY AND ANGER IN INDIA

Suchday S.*

Pace University ~ New York ~ United States of America

Inequity is the underbelly of Globalization and has grown exponentially with accelerated pace of globalization. Inequity has increased between people, communities, and even nations. Early life adversity(ELA) frequently accompanied by paucity of resources is enhanced by inequity. Both ELA and inequity may lead to increased anger and resentment among young people, particularly as they are exposed to inequity in their proximal environment and distant lands through the internet. The current presentation will discuss data from our lab collected among undergraduate students in Mumbai, India (n = 317; age = 19 years; 243 females; 131 Hindu, 123 Christian/Catholic/Protestant, Islam 20, Jain 14, Zoroastrian 9, Buddhist 5, Jewish 1, Others 12, missing 2). Participants completed measures of anger and ELA. Data indicated that early life adversity was associated with multiple aspects of anger including trait anger, anger rumination, and the regulation of anger – both expression and suppression. In a related study in our lab (Santoro et al, 2020), data indicated that early life adversity predicted anger, stress, and health among young Asian Indian immigrants (n=132; Mean Age=23.5 years). Increased anger among young people may have significant repercussions in their personal lives leading to isolation and poor health. Impact of anger on communities is multifaced, with direct effects including the rise of conflict and indirect effects such as increased health care costs and loss of productive life years.

Abstract 3738

IMPACT OF FINANCIAL INEQUALITY IN CANCER TREATMENT ON DECISION-MAKING, RELATIONSHIPS AND DISTRESS: PERSPECTIVES FROM CANCER PATIENTS AND FAMILY CAREGIVER IN INDIA AND THEIR WELLBEING

Jain N.*[1], Singh P.[2]

[1]O.P. Jindal Global University ~ Haryana ~ India, [2]Indian Institute of Technology, Delhi ~ Delhi ~ India

Financial toxicity in cancer treatment extends far beyond economic calculations, revealing deep psychological and societal inequalities that shape the experiences of patients and caregivers in India.Financial strain of treatment is increasingly recognized as a critical challenge for patients and family caregivers in low- and middle-income countries, including India. This study explores the impact of financial toxicity on decision process in cancer treatment, relationships and psychosocial distress from the perspectives of both cancer patients and their family caregivers. A sample of 47 participants (20 cancer patients; 27 primary caregivers) was selected via purposive sampling. Using interpretative phenomenological analysis, four major themes were culled out: high cost of treatment, overhead expenses and debts; impact on little big decisions; influence on family dynamics and atmosphere; and moral distress. Addressing financial toxicity holistically is essential not only to improve treatment adherence and outcomes but also to safeguard the psychological well-being and relational stability of patients and their families in India.

Abstract 3739

STRUCTURAL INEQUALITIES AND WELL-BEING: IMPLICATIONS FOR GENDER JUSTICE

Siddiqui N R.*

Aligarh Muslim University ~ Uttar Pradesh ~ India

Structural inequalities prevalent in society perpetuate cycles of disadvantage impacting the wellbeing of those who are victims of such inequalities. Despite concerted effort to address the inequalities on account of gender, age, minorities, and other marginalized groups the prevalent unequal power and resource distribution, profoundly impacts individuals' well-being.Across societies, irrespective of whether it is developed or developing nation, gender inequality is quite pervasive. Gender inequality refers to the unequal division of power and resources between women and men. These inequalities are assigned, reproduced and maintained at the individual as well as societal level. Structural gender inequality takes into account the widespread, but often masked or invisible patterns of gendered practices. It also encompasses the social, economic and cultural background that are entrenched in a system that creates and perpetuates disadvantage relative to the other groups. The prevalent norms, values and practices lead to clear distinctions between the sexes resulting in allocating women as subordinated to men. This tendency to stratify groups by superior–inferior positioning in structural inequality is exemplified by the gender segregation of occupations. The injustice and discrimination faced on account of these practices not only affects the wellbeing of females but does not augur well for gender justice. For gender justice, the root causes of these inequalities—like patriarchal systems and discriminatory norms—needs to be addressed. In essence, gender justice calls for structural reform that creates equitable social, economic, and cultural conditions.

Abstract 3740

GENDER-BASED VIOLENCE IN UNEQUAL SOCIETIES: A CRITICAL DISCOURSE ANALYSIS OF RAPE MYTHS AND THEIR PSYCHOLOGICAL CONSEQUENCES

Singh T.*[1], Mittal S.[2]

[1]Department of Psychology, Banaras Hindu University, Varanasi, India ~ Uttar Pradesh ~ India, [2]Bennette University ~ Greater Noida ~ India

Gender-based violence disproportionately targets women and gender minorities. While its prevalence and psychological consequences are well documented, less attention has been given to how discourses surrounding such violence shape these consequences and impact survivors' well-being. This study argues that language does not only describe gender-based violence but actively maintains gender hierarchies and perpetuates these crimes. This study situates rape myths within Foucauldian framework and frames them as discursive regimes that delegitimize survivor narratives and normalize violence. By examining rape myths as discursive power tools, the present study highlights their role in exacerbating the psychological consequences for the victims.

The study examined the role of rape myths in shaping and controlling ideas about rapes and to explore how these myths harm survivors by causing shame, silence, and loss of control, reinforcing social inequality. By employing the critical discourse analysis framework legal judgments, media narratives, and policy discourses were analysed. The analysis was informed by Foucault's insights into power/knowledge nexus, disciplinarity, governmentality and subjectivity. The analysis revealed that rape myths are deeply entrenched in the criminal justice systems globally. These myths operate at multiple levels leading to victim blaming, lower prosecution rates and revictimization. The myths normalize unrealistic expectations of victim behaviour and silence alternative voices. Rape myths are not only the product of unequal societies but also contribute to inequalities in the society. These perpetuate psychological harm by power imbalances and normalizing victim blaming. According to Foucault, this psychological harm may feel like 'second rape' to the victims. Beyond psychological harm, these processes significantly undermine survivors' overall well-being, restricting their ability to regain agency, resilience, and a sense of security.

Recognizing rape myths as tools of power can help create laws, policies, and therapy that care for survivors, prioritize well-being, restore agency, and foster equitable structures of care and justice.

MARGINALIZED GROUPS AND ENGAGEMENT FOR (SOCIAL AND ECOLOGICAL) SUSTAINABILITY: IS IT SUSTAINABLE?

Friday 24 July 2026 from 12:00 to 13:00

(C- Spadolini)

Angela Fedi (University of Torino – Dept. of Psycholo), Chair and Presenter

Marginalized groups (who are traditionally underrepresented) are by definition or by their impact - more often
or more than other groups - victims of social injustice and climate change. Minorities are particularly
vulnerable to environmental and social justice challenges, and their participation in these struggles is not only
a matter of fairness, but also critical to their effectiveness. The civic opportunity gap is rooted in ethnic, age,
gender, sexual, socio-economic and geographic differences, which mean that the more affected groups are
less likely to be heard.
The full participation of marginalized groups in the struggles for social and environmental sustainability is
essential to understand motivations, resources, constraints and decision-making processes and to develop
truly inclusive sustainability programmes that genuinely contribute to social, economic and environmental
equity and cultural vitality in minority communities (Lakhan, 2024).
As explicitly addressed in the 2030 Agenda for Sustainable Development, special attention should be paid
to the participation of vulnerable groups and developing countries (SDG target 10.6) in the decision-making
process to “ensure responsive, inclusive, participatory and representative decision-making at all levels” (SDG
target 16.7).
If we know that we can work towards a future that is not only environmentally sustainable, but also socially
just and culturally vibrant by placing the voices, knowledge and leadership of minority communities at the
centre of our sustainability efforts, then the way we go about working out problems and co-creating solutions
should not only be more equitable, but also more effective and resilient in the face of global challenges.
Therefore, an intersectional perspective can be useful to link social and environmental sustainability, but also
to address the challenges of participation of marginalized groups (migrants,Fernandes-Jesusetal.,youth,Menezes et al.,LGBTQ+persons,Rollèetal.)andin educationalorparticipatorycontextsasprivilegedenvironmentsforparticipation(e.g.active participation,Fedi et al., school, Albanesi et al.). The symposium offers the opportunity to analyse different research and experiences with regard to the question:Howsustainableisparticipationforsustainabilityrecognisingthatonlythroughequitableengagementcantrulyviablesolutionstoglobalchallengesbefound.

Abstract 4470

AGENCY IN CLIMATE MOBILITIES: MOZAMBICAN MIGRANTS CONSTRUCTING AGENCY AND POLITICAL POWER IN RELATION TO CLIMATE CHANGE

Fernandes--Jesus M.*[1], Palmary I.[2], Barnes B.[2]

[1]University of Sussex, UK ~ Sussex ~ United Kingdom, [2]University of Johannesburg, South Africa ~ Johannesburg ~ South Africa

There is an increasing recognition that climate change is shaping migration patterns, particularly in contexts that are disproportionately and unfairly affected by climate-related events. In this study, we focus on the lived experiences of internal and international migrants from/in Mozambique – a country highly affected by climate change – to understand the factors and processes that shape their agency and political power. Their experiences are examined following an intersectional climate mobility justice framework and the aspirations-capabilities model. Specifically, we focus on how Mozambican migrants exert and perceive their sense of agency in relation to climate change, at two levels: (1) migratory agency (e.g., decision to migrate; where to migrate) and (2) political power in relation to climate change (e.g., ability to respond to climate change; participate in climate policies; contribute to build alternative futures). Between February and April 2025, we conducted 42 semi structured interviews with Mozambican migrants from different socio-economic backgrounds who have moved from Mozambique to South Africa and Portugal or internally within Mozambique. The interviews explored their migration experience, views and modes of engagement with climate change, and their sense of agency and power in relation to migration and climate change. Using Reflexive Thematic Analysis, in this talk, we focus our analysis on how participants exert agency and power in relation to climate change and how such experiences are shaped by factors such as gender, age, and education. The ability to make decisions and act politically in relation to climate change is key for achieving climate justice. By understanding the barriers that constrain the construction of agency and political power, our study has practical implications for developing more inclusive policies and programmes that recognise the nuanced and complex migration experiences in the context of climate change.

Key-words: climate justice; migration; agency; aspirations-capabilities

Abstract 4472

ACKNOWLEDGING BARRIERS AND DESIGNING PATHWAYS TOWARDS SUSTAINABLE LGBTQI- INCLUSION IN HIGHER EDUCATION

Rollè L.*[1], Trombetta T.[1], Santoniccolo F.[1], Paradiso M.N.[1], Papathanasiou N.[2], Christidi E.O.[2]

[1]Department of Psychology, University of Turin, Turin, Italy ~ Turin ~ Italy, [2]3Orlando LGBT+ ~ ATHENS ~ Greece

The numerous funding opportunities provided by National Agencies and co funded by the European Commission (e.g. ER+ Higher Education HEi), as well as the recent report by the European Union Agency for Fundamental Rights (FRA, 2024), underline that LGBT+ people are increasingly exposed to bullying, dropping out or discrimination on campus and in classrooms.
It is well established that various kinds of homophobia and transphobia, both direct and indirect, that accompanies the experience of being a LGBT+ person, as well as other kinds of discrimination hinder in various ways other minority groups, are proven risk factors regarding equal and sustainable access to education, healthcare and social welfare.
In the last 10 years, studies have highlighted several initiatives to develop sustainable HEi, but a significant gap persists in terms of studies focusing on LGBT+ individuals. There is a growing urgency to rethink the concept of HEi as something attentive, sustainable, inclusive, rather than serving to silence diversity, which is an all-too-common occurrence in some contexts.
The lack of specific training courses on LGBT+ themes, such as the lack of “Safe Space” in HEi, contributes to increasing discrimination based on sexual identity and, consequently, to the well-being of all people: LGBT+ rights are the rights of everyone and the community.
Cembranel et al. (2023) remind us of the need to validate different identities and give a voice to different singularities through an educational experience capable to represent LGBT+ people, rethinking University programs and Doctorates, addressing intersectional issues and providing good practices and recommendations.
Creating sustainable international networks can lead to pathways and research for inclusive and sustainable HEi. This will only be possible through further research on Diversity and Inclusion, with support for researchers and recognized and multidisciplinary support programs and Safe Spaces, while also recognizing and actively moving towards eliminating existing obstacles.

Abstract 4473

IS PARTICIPATION FOR SUSTAINABILITY SUSTAINABLE? AN INSIGHT FROM FOCUS GROUPS ON ENVIRONMENTAL ONLINE AND IN-PERSON PARTICIPATION

Fedi A.*[1], Martini M.[1], De Jong A.[1], Albanesi C.[2], Compare C.[2], Tzankova I.[2], La Barbera F.[3], Coppola S.[3]

[1]University of Torino – Dept. of Psychology ~ Torino ~ Italy, [2]University of Bologna – Dept. of Psychology ~ Bologna ~ Italy, [3]University of Napoli – Dept. of Political Sciences ~ NAPOLI ~ Italy

In recent years, interest in climate change and environmental sustainability has increased in public opinion, in the new and old media and among scientists. There are important changes in attitudes towards environmental protection and a great involvement in environmental movements, especially among young people. Moreover, online interactions have also reached most areas of life, including collective activation.
The present study is part of a research project investigating the differences in perceptions of online participation compared to face-to-face environmental engagement and the characteristics that make participation effective.
Ten focus groups were conducted in three geographical areas of Italy (Turin, Bologna, Naples), involving 96 participants (64 F, age 18-40, mean 39.11). The FGs discussion were based on the following topics: personal experiences of environmental participation; meaning and balance of participation; comparison between online and face-to-face participation; individual and social identity changes that may be associated with participation.
The FG transcripts were subjected to thematic analysis, which we propose here on the aspects that make participation - in its various forms - sustainable. The results suggest that face-to-face participation seems to benefit from a more visible activist identity and a greater attribution of efficacy, sometimes linked to the possibility of taking concrete action and having direct relationships with people. Considerations of personal, social, material and symbolic costs and risks were also discussed and help to clarify the difference between the forms of participation and the perception of their sustainability.

Keywords: participation, climate change, sustainability, focus group

Abstract 4474

CHALLENGING EXCLUSION, FOSTERING INCLUSION: INTERSECTIONAL PERSPECTIVES FROM THE HORIZON EUROPE SINCRONY PROJECT

Albanesi C.*, Compare C., Tzankova I., Cecconi A., Cicognani E.

University of Bologna – Dept. of Psychology ~ Bologna ~ Italy

Introduction: Research shows that participatory innovations rarely adopt an intersectional perspective (Wojciechowska, 2019) and even less frequently address intergenerational and intragenerational social justice. While youth activism and participatory mechanisms are key resources for social change, young people's perspectives are often marginalized in schools and communities (Collins, 2017). Purpose: As part of the Horizon Europe SINCRONY project, this study aims to examine power dynamics, internalised biases, and barriers to participation, seeking to identify paths to inclusive democratic processes through intergroup dialogue (Schoem & Hurtado, 2001). More specifically, it investigates youth narratives on intersectional inclusion and exclusion in school and community participation processes. Method: To achieve the research objectives, five focus groups were conducted in school and community contexts in the Emilia-Romagna region, Italy, involving 47 participants (28 cisgender women, 17 cisgender men, 2 non-binary persons, aged 16–28). Three groups consisted of high school students, and two involved members of youth community organisations. Discussions explored dominant narratives, personal experiences of inclusion and exclusion in participatory settings, and perspectives on youth organisations as spaces of participation. The discussions were recorded and transcribed verbatim with participants' consent. A thematic analysis of the transcripts was conducted. Results: Findings reveal contrasting perspectives, largely shaped by the participants' contexts. High school students tended to frame inclusion and exclusion in terms of individual traits and interpersonal experiences, emphasising personal agency and the role of action versus inaction. In contrast, members of youth organisations highlighted systemic and sociocultural barriers, underscoring the structural and institutional forces that create privilege-oppression dynamics. Participants also reflected on the complexities of youth participation across various forms—from formal representation to collective protest—identifying both its challenges and strengths. Conclusions: The study provides insights into perceptions of youth participation barriers, creating opportunities to define strategies for fostering inclusive democratic participation in schools and communities.Keywords:Youth participation,intersectionality,inclusion,deliberation,socialjustice

APPLIED PSYCHOLOGY IN THE DOMAIN OF INTIMATE RELATIONSHIPS: ENHANCING THE MENTAL HEALTH AND WELL-BEING OF SINGLE AND COUPLED INDIVIDUALS

Friday 24 July 2026 from 13:30 to 15:00

(D-Spadolini)

Katarzyna Adamczyk (Adam Mickiewicz University ~ Poznan, Wie), Chair and Presenter

Intimate relationships are one of the strongest predictors of mental health and well-being. Therefore, intimate relationships represent an essential domain of creating positive changes for individuals and society. Notably, the significant changes in the sociohistorical context of modern, intimate relationships, such as the increasing rates of single adults and cohabitation, or the occurrence of external adverse factors, such as the outbreak of the COVID-19 pandemic, confront us with the pressing need to seek interventions that will enhance well-being and reduce ill-being of single and coupled individuals. This symposium addresses that need by inviting speakers who will share unique insights.

In the first paper, Chiarolanza and colleagues will report the results of their study assessing stress associated with the outbreak of COVID-19 among 108 heterosexual couples. Based on their findings, which show that the COVID-19 pandemic was a global stressor for the quality of romantic relationships, the authors will discuss the targeted interventions finalized to reduce relational stress.

In the second paper, da Silva and colleagues will present their longitudinal, cross-cultural study findings on a sample of 351 coupled adults from Brazil and the UK. Based on their results, the authors will highlight the need for culturally informed, attachment-based interventions to improve relationship satisfaction and, by extension, mental health.

In the third paper, Rodrigues will present the results of his study performed in U.S. and Portugal samples and elaborate on targeted interventions aimed at enhancing sexual and relational well-being among single individuals across different cultural contexts.In the fourth paper, Van Gasse and Mortelmans will present the results of their qualitative interview-based study with 40 single individuals and discuss how their findings showing the role of the narratives of self and love,the experience of personal growth, relational confusion, lingering regret, or validation of their single status may constitute of areas of practical interventions.

Abstract 4421

AFTER THE OUTBREAK OF COVID-19: ACKNOWLEDGING THE COMPLEXITY OF DYADS IN MANAGING STRESS

Chiarolanza C.*, Cavalli R.G., Velotti P., Barile M.

Department of Dynamic and Clinical Psychology and Health Studies, Sapienza University of Rome ~ Rome ~ Italy

COVID-19 has left significant sequelae in many people from the physical and psychological point of view, reporting growth rates for affective, anxiety, and depression diseases. Stress associated with the outbreak of COVID-19 made mental health a significant topic for public health. Analysis of recent literature reported that family life crossed many difficulties, such as facing the illness and the death of family members, especially older ones, the risky blending in sharing family and job time in one unique space, and the constant interplay between closeness and emotional distance. Therefore, we designed the present study - Analysing marital and family STrEss in post-Pandemic Scenario (STEPS) for the evaluation of stress, its impact on personal and relational well-being, the role of individual and dyadic factors in facing marital, parenting, and work balance life. We assessed the fluctuations of work and home stress for one month in 108 heterosexual romantic couples using an intensive longitudinal approach. Preliminary results highlighted that COVID-19 represented a global stressor for the quality of romantic relationships, only if we considered the partner effect in the APIMeM model. Besides, we found that negative dyadic coping strategies amplified the negative impact on the perceived quality of the relationship. Finally, the lack of dyadic awareness, which is a relevant factor in the dyadic dysregulation in couple relationships appears related to the conflict between family and work. Results will be discussed in terms of targeted interventions finalized to reduce the relational stress.

Abstract 4422

UNDERSTANDING RELATIONSHIP SATISFACTION THROUGH ATTACHMENT INSECURITY AND MATE-RETENTION BEHAVIOURS IN BRAZIL AND THE UK: IMPLICATIONS FOR CULTURALLY INFORMED INTERVENTIONS

Nascimento B.*[1], Adair L.[2], Ferenczi N.[3], Shishane K.[3]

[1]University of Bristol ~ Bristol ~ United Kingdom, [2]Brunel University London ~ London ~ United Kingdom, [3]University of Bedfordshire ~ Bedford ~ United Kingdom

Partnered individuals typically report greater well-being than singles; however, poor-quality relationships can be more harmful to mental health than singlehood. Relationship satisfaction, therefore, plays a central role in psychological well-being. Attachment insecurity—marked by anxiety and avoidance—has been consistently linked to lower relationship satisfaction, in part due to its influence on adaptive interpersonal behaviours. Mate retention (MR) strategies, aimed at maintaining relationships, may mediate this link. These include benefit-provisioning (BP) strategies (e.g., affection, gift-giving) and cost-inflicting (CI) strategies (e.g., jealousy induction, autonomy restriction). While previous research has largely relied on cross-sectional designs and is limited in cultural scope, our study used a longitudinal, cross-cultural approach to address these gaps.

Participants (N = 351; 53.5% from Brazil), aged 19–84 and in committed relationships, completed measures of attachment insecurity and perceived partner MR strategies at Time 1 (T1). Relationship satisfaction was measured one month later at Time 2 (T2). Controlling for gender, we found that the associations between anxious attachment and relationship satisfaction was mediated by perceived benefit-provisioning (BP) and cost-inflicting (CI) mate-retention strategies, whereas only BP strategies mediated the path from avoidant attachment. Importantly, these mediation paths were moderated by country (Brazil vs. UK). Specifically, the indirect effect of anxious attachment on relationship satisfaction through CI was negative in Brazil, but positive in the UK, whereas the indirect effect through BP was only significant in Brazil. In turn, the indirect effect of avoidant attachment on relationship satisfaction through BP was negative in Brazil but positive in the UK.

These findings underscore cultural differences in how attachment and MR strategies influence relationship outcomes over time. They highlight the need for culturally informed, attachment-based interventions in applied psychology to improve relationship satisfaction and, by extension, mental health.

Abstract 4424

“SHE COULD HAVE BEEN THE ONE”: MAKING SENSE OF IN-BETWEEN RELATIONSHIPS IN SINGLEHOOD NARRATIVES

Van Gasse D.*, Mortelmans D.

University of Antwerp, Centre for Population, Family and Health (CPFH), Faculty of Social Sciences ~ Antwerp, ~ Belgium

Contemporary romantic life increasingly includes ambiguous relationships beyond traditional committed partnerships. Terms such as "situationships," casual dating, and "almost relationships" highlight the emotional and social complexity of modern romance. These forms of connection often do not match all dimensions of Sternberg’s triangular theory of love and are frequently overlooked or treated as failed attempts in relationship studies.

This paper explores how single adults interpret and narrate these "in-between" romantic experiences, examining their impact on personal identity, relational expectations, and emotional understanding.

Qualitative interviews were conducted with 40 single individuals aged 25–35 in Belgium. Participants reflected on emotionally significant yet unresolved romantic episodes, such as casual dating, unexpressed attraction, mismatched timing, and situationships. Additionally, each participant’s closest friend provided complementary insights into these experiences, enriching the analysis with a multi-actor perspective.

Preliminary analysis indicates that "in-between" relationships significantly shape singles' self-narratives, influencing personal growth, relational uncertainty, lingering regret, and affirmation of singlehood. Participants described these episodes as emotionally impactful and often pivotal to their relational outlook. Friends often supported these interpretations but occasionally offered more pragmatic or critical views.Initial findings suggest that "in-between" relationships are meaningful identity-shaping experiences rather than relational failures. They function as mirrors for self-reflection and emotional milestones within singlehood. Recognizing these experiences challenges traditional binary frameworks and highlights the nuanced emotional realities of contemporary romantic life.

Abstract 4425

ENHANCING MENTAL HEALTH AMONG SINGLE ADULTS: PRACTICAL IMPLICATIONS BASED ON INTRA- AND INTERPERSONAL FACTORS

Adamczyk K.*, Kotus M., Frydrychowicz M.

Adam Mickiewicz University, Faculty of Psychology and Cognitive Science ~ Poznan, Wielkopolska, ~ Poland

In recent years, the increasing prevalence of single adults in many countries has prompted intensified scientific efforts aimed at understanding single people's mental health outcomes. Notably, the newest research line in single studies is intended to determine the circumstances in which singlehood is related to coping or thriving and answer the question of Who is well adapted to single status?

Previous studies revealed that higher mental health among singles is related to such intrapersonal factors as attachment security, social-avoidance goals, lower desire for a partner, older age, higher satisfaction with singlehood and relationship congruency, positive religious coping and positive religious attribution, higher spiritual well-being, and attachment to a pet. In turn, the following example interpersonal factors are recognized as related to higher singles' mental health: stronger perceived social support and integration, high quality of friendships, and lower sexual desire.

This presentation aims to provide a comprehensive review of previous literature to indicate the intra-and interpersonal factors related to enhanced mental health among single adults. This review serves as a basis for formulating the practical implications for psychotherapeutic and educational work with single clients who may encounter in their work single individuals experiencing adverse mental health outcomes as a function of remaining single.

PARENTAL REPRESENTATIONS OF THE INFANT: THE CONTRIBUTION OF PREMATURITY AND PARENTING STRESS

Karni--Visel Y.*, Ben--Yaakov O., Taubman – Ben--Ari O.

Bar-Ilan University ~ Ramat Gan ~ Israel

Background:
Parental perceptions of the infant play a critical role in shaping parenting behavior and child development. Understanding the role of prematurity in these perceptions during early development is crucial for addressing emotional needs and providing timely support. This study examined parental representations of the infants among parents of preterm and full-term infants.
Methods:
A total of 146 parents (mean age = 32.19, SD = 5.31) of firstborn, single children aged 15–24 months (mean age = 19.45 months, SD = 2.90) participated in the study. The sample included parents of preterm infants (n = 73) and full-term infants with no reported developmental concerns (n = 73), matched on parents' gender, age, socioeconomic status, and child's age. Participants completed the Mothers' Object Relations Scale–Short Form (MORS-SF) and the Parental Stress Index (PSI).
Results:
Parents of preterm infants reported higher levels of parental stress. In a multivariate model, parental stress was negatively associated with parents' perceptions of the infant's warmth and positively with perceptions of the infant's invasiveness. Parental stress significantly mediated the association between the research group (preterm, full-term) and both the infant's warmth and invasiveness, while the direct effects of the research group on the infant's representations were not significant.
Conclusions:
The study highlights parental stress as a central mechanism through which prematurity influences early parent–infant relationship dynamics. Interventions aimed at reducing parental stress may promote more positive parental representations and improve the quality of early bonding. Strengthening the relational foundation during this sensitive period is crucial for supporting both the infant's and the parents' well-being.

RELATIONSHIPS WITH PARENTS AND PSYCHOLOGICAL WELL-BEING OF ADOLESCENTS FROM IMMIGRANT FAMILIES

Chebotareva E.*

Moscow State University od Psychology and Education, HSE University, RUDN University ~ Moscow ~ Russian Federation

As the migration crisis unfolds, increasing attention is being paid to the challenges faced by immigrant families and children. Adaptation to a new country is particularly difficult for adolescents, as the separation processes typical for this age can reduce their adaptive capacity.

We conducted a study in Russia aimed at analyzing the relationship between adolescents' relationships with their parents and their psychological well-being in the context of immigration.

The participants were: 47 Russian adolescents and 44 adolescents from immigrant families. Among the latter group, 21 adolescents had migrated to the Russia with their parents about 3 years ago, while 23 adolescents were born in the Russia to immigrants' families. All respondents were proficient in Russian.

The following methods were used: Ryff's PWB, ADOR by Matejcek, Rican, PSI by Hoffman.

The results showed that adolescents from immigrant families have lower levels of psychological well-being than those living in their home country and adolescents born in the host country demonstrate the lowest levels.

Immigrant adolescents born I the host country tend to characterize their mothers as inconsistent and their fathers as distant. Adolescents who moved to a new country with their parents are more likely to report positive interest from their fathers. No significant differences were found between the groups in psychological separation.

Overall, the well-being of all adolescents is positively associated with the quality of their relationships with their parents, their independence from their parents and the harmonious separation process. However, for adolescents who recently immigrated, the ability to receive functional support from parents is positively associated with their well-being.

Thus, relationships with parents are an important factor in the socio-psychological adaptation of immigrant adolescents, but this varies depending on whether the child was born in the host or the country of origin. Understanding these nuances will allow for more effective psychological support for migrant families.

MARIA OR CAPTAIN VON TRAPP? PENSION AND YOUNG PARENTS

Yan J.*

Peking University ~ Beijing ~ China

This paper investigates whether the expectation of future sufficient eldercare provided by the pension system would influence current parenting styles. Using China's New Rural Pension Scheme (NRPS) as a quasi-natural experiment, we conducted a staggered triple difference model on the county-by-county level. We found that the launch of NRPS increased permissive parenting by 7.3% and decreased authoritarian parenting by 5.0%. Mechanism analysis suggested that this phenomenon may be attributed to parents' lowered expectations of receiving elder care from their children. Changes in parenting styles would lead to improved children's mental health. Cross-national comparisons further validate the universal association between the social pension and the democratization of child-rearing approaches. This paper provides micro-level evidence for understanding the transformative effects of pension policies on intergenerational family dynamics.

Abstract 937

ROMANTIC RELATIONSHIPS ACROSS GENERATIONS: A PSYCHOLOGICAL PERSPECTIVE ON GENERATIONS X, Y, AND Z

Walecka--Matyja K.*

University of Lodz, Institute of Psychology, Al. Rodziny Scheiblerow 2, 90-128 Lodz, Poland ~ Lodz ~ Poland

Introduction: Sternberg's (1986) theory of love identifies passion, intimacy, and commitment as central components of romantic relationship quality. However, contemporary research highlights additional psychological factors influencing relationship satisfaction, such as empathy, openness, sexual satisfaction, communication, financial stability, health, career development, and overall quality of life. Sternberg's model also emphasizes the dynamic nature of romantic relationships, encouraging exploration of how they evolve over time and across generations.

Purpose: The present study aimed to examine generational differences in psychological determinants of romantic relationship quality among individuals from Generations X, Y, and Z.

Method: A total of 174 participants (88 women and 86 men), aged 18 to 63 years, took part in the study. A quantitative, longitudinal, self-report design was employed. Four standardized instruments with strong psychometric properties were used: the Affective Communication Index (Floyd & Morman, 1998), the Forgiveness Scale (Toussaint et al., 2001), the Sexual Satisfaction Questionnaire (Nomejko & Dolińska-Zygmunt, 2011), and the Interpersonal Commitment Questionnaire (Stanley & Markman, 1992), along with a demographic survey.

Results: Results indicated that Generation X participants reported higher levels of affective communication, forgiveness, and interpersonal commitment. In contrast, Generation Z participants demonstrated significantly greater sexual satisfaction compared to Generations X and Y. Additionally, longer relationship duration was associated with increased affective communication and forgiveness, but decreased sexual satisfaction. Greater interpersonal commitment was also observed among individuals in longer relationships.

Conclusions: These findings offer practical implications for couple therapy, particularly in tailoring interventions to the emotional and communicative needs of different age groups. The observed intergenerational differences underscore the importance of flexible, age-sensitive therapeutic approaches aimed at enhancing relationship quality.

Abstract 1017

ESTABLISHED ADULTHOOD IN INDIA: A PHENOMENOLOGICAL STUDY OF WORK–LIFE BALANCE, FAMILY OBLIGATIONS, AND IDENTITY NEGOTIATION

Singh V.*, Cherian J.

Christ University ~ Bengaluru ~ India

Established adulthood, typically spanning ages 30 to 45, is an emerging developmental phase that has received limited attention compared to adolescence and emerging adulthood. In the Indian context, this life stage is uniquely shaped by the simultaneous negotiation of professional demands, family obligations, and evolving personal goals within a rapidly transforming socio-cultural landscape. This study aimed to explore how Indian adults navigate established adulthood while balancing collectivist traditions with the pressures of neoliberal urban life.

A qualitative phenomenological design was adopted, using in-depth semi-structured interviews with 30 adults (15 men and 15 women) residing in four major metropolitan cities: Delhi, Mumbai, Bengaluru, and Kolkata. Participants were purposively sampled to represent diverse socio-economic backgrounds and family structures. Interviews explored experiences of work–life balance, role strain, intergenerational caregiving, expectations from family and society, and identity development. Data were analyzed thematically using a hybrid of deductive and inductive coding.

Four overarching themes emerged: (1) Duty versus desire, reflecting the constant negotiation between personal aspirations and cultural/familial responsibilities; (2) Role overload, with participants simultaneously managing careers, childcare, and eldercare; (3) Mobility and disconnection, highlighting emotional consequences of urban migration and the nuclearization of families; and (4) Adaptive resilience, encompassing coping strategies that supported well-being and continuity of identity.

Findings suggest that established adulthood in India represents a culturally distinct life stage, shaped by the enduring influence of collectivist values (dharma) alongside the demands of modern urban living. By foregrounding the lived realities of Indian adults, this study broadens global developmental theory and underscores the importance of cultural context in understanding adulthood. The results also highlight implications for counseling, workplace policies, and social support systems that can foster resilience, trust, and well-being during midlife.

Abstract 1020

EXAMINING THE EFFECTS OF CHILDHOOD PARENTIFICATION EXPERIENCES ON ADULT ROMANTIC RELATIONSHIPS: A QUALITATIVE STUDY

Dogruyol S.*, Taskin I.

Çag University ~ Mersin ~ Turkey

The present study aims to explore how individuals from diverse socio-economic backgrounds who experienced parentification in childhood perceive these experiences and to examine how such early parentification behaviors influence the dynamics of their romantic relationships in adulthood. In the present study, 10 adults over the age of 18 who were currently involved in a romantic relationship and had experienced parentification during childhood were included. To explore participants' perceptions of childhood parentification, data were collected using the interview method, a qualitative research approach. Semi-structured interviews, designed by the researcher, were conducted, and—with participants' informed consent—audio recordings were obtained. Prior to the interviews, participants' levels of parentification were assessed with The Parentification Inventory (Köyden & Uluç, 2018). Furthermore, participants' socio-demographic characteristics (e.g., age, gender, education status, level of income, sibling status, type of relationship, and relationship duration) were gathered through a Demographic Information Form prepared by the researcher.The findings indicated that adults' experiences of parentification in childhood had a negative impact on their later romantic relationships. In particular, the loss or absence of the father was found to play a significant role in shaping the experience of parentification during childhood.

Abstract 593

THEY ARE ALL STRUGGLING-NOT SAYING IT LOUD, AND NOWHERE TO GO: YOUTH IN HIGHER EDUCATION INSTITUTIONS(HEIS) IN INDIA.

Biswas U.N.*

Department of Psychology, University of Delhi ~ Delhi ~ India

Research on student mental health has gained momentum following a World Health Organisation report stating that 30% of university students globally suffer from mental health issues. In India, this has become a public health emergency, particularly as increasing reports of suicides and breakdowns emerge from professional institutions. It has also necessitated the understanding of mental health issues and health-seeking behaviour among students in broader public higher educational institutions (HEIs). The implementation of the National Education Policy (NEP) has led to significant stress and anxiety among teachers and students, often without available support services. The mixed-method research focused on the prevalence of mental health issues—such as stress, depression, anxiety, and perceived discrimination among 2,194 students from the University of Delhi, which represents students from all states and the social strata of India. Standardised tools were used to assess the prevalence of these factors, as well as students' awareness of mental health support and health-seeking behaviour. The analyses revealed a high prevalence of mental health issues, with over 70% of students unaware of available support services. Many students indicated a need for safe spaces to discuss their mental health. While 55% reported hidden mental health problems, 41.1% experienced changes in their mental health after starting college. Perceived social support was found to mediate the relationship between stress, academic pressure, and perceived discrimination, impacting overall well-being. The findings suggest that fostering social support through peer mentoring and creating wellness spaces, alongside professional counselling, could make it more acceptable to ask for help within the campus ecosystem. These results empirically support the Supreme Court's recommendations for establishing mental health support systems in Indian campuses to promote student well-being.

Abstract 4555

THE ROLE OF ATTACHMENT ANXIETY ON ENDORSEMENT OF GENERAL AND COVID-19-RELATED CONSPIRACY BELIEFS

Kural Baskan A.I.*[1], Kovacs M.[2]

[1]Slovak Academy of Sciences, Institute of Experimental Psychology ~ Bratislava ~ Slovakia, [2]Eötvös Lorand University ~ Budapest ~ Hungary

Belief in conspiracy theories has been linked to various psychological factors, including threat perception, anxiety, and the need for control. However, little is known about the role of attachment orientations in shaping susceptibility to conspiracy beliefs. Drawing on attachment theory, the present research investigated whether adult attachment insecurity—particularly attachment anxiety—is associated with greater endorsement of conspiracy theories. Across two studies, we examined both correlational and experimental evidence for this relationship. In Study 1 (N = 192), attachment anxiety and attachment avoidance were assessed as dispositional predictors of generalized conspiracy belief, while controlling for well-established correlates, including right-wing authoritarianism, social dominance orientation, general anxiety, need for control, and relevant demographic variables. Results showed that attachment anxiety, but not attachment avoidance, significantly predicted conspiracy belief above and beyond these controls. In Study 2 (N = 149), we employed an experimental priming paradigm to test the causal effect of attachment anxiety on conspiracy belief. Participants exposed to attachment anxiety priming reported higher levels of belief in both generalized conspiracy theories and COVID-19–specific conspiracy theories compared to participants in a neutral priming condition. Together, these findings suggest that attachment anxiety constitutes a meaningful individual difference factor associated with susceptibility to conspiracy beliefs. The results support the notion that heightened threat sensitivity, difficulties in emotion regulation, and an increased need for control characteristic of attachment anxiety may predispose individuals toward conspiracy ideation, particularly in contexts marked by uncertainty and perceived threat. The present research extends existing models of conspiracy belief by integrating attachment-based processes and highlights the relevance of relational and affective factors in understanding why individuals differ in their endorsement of conspiracy theories.

Abstract 196

CONFRONTING ACCULTURATIVE STRESS: INTERNATIONAL FRESHMEN AND SENIORS' COPING MECHANISMS THROUGH A MIXED-METHODS LENS

Eggers Gorab M.*, Kepir--Sávoly D.

Webster Vienna Private University ~ Vienna ~ Austria

Acculturative stress is a common challenge for many international students worldwide, as they attempt to navigate a new environment, create social bonds, understand new languages and balance it with academic demands. Despite growing interest in international students' well-being, little is known about how coping mechanisms for acculturative stress evolve over time. This study aims to compare acculturative stress and its coping mechanisms between freshmen and seniors. Specifically, it explores the following research questions: 1) Does the academic year (freshmen vs. seniors) impact the kind of language and coping mechanisms used in the interviews? 2) Does gender mediate the presence of coping mechanisms for acculturative stress? 3) How does being raised in a collectivist country affect the level of acculturative stress experienced? To address these questions, semi-structured interviews (n=30) were conducted, and a mixed-methods approach was employed. Data was analyzed using quantified content analysis focusing on participants' use of positive and negative language, coping strategies, and the influence of gender and cultural background as mediating factors. The results showed that seniors had a slightly higher frequency of negative language use, indicating higher levels of acculturative stress compared to freshmen (p=0.0521). Regarding the mediating variables, gender presented no effect on language use, while collectivistic countries approached statistical significance on increased negative language use (p=0.0647). Coping mechanisms were not more developed in seniors than in freshmen (p=0.3787), however, freshmen showed a higher frequency of social strategies, whereas seniors favored more reflective coping style. These findings challenge previous assumptions about stress trajectories in international students and highlight the need for sustained support across all academic years.

Abstract 4554

ATTACHMENT AND PREJUDICE TOWARDS SYRIAN IMMIGRANTS: THE ROLE OF SECURITY SCHEMA ACTIVATION

Kural Baskan A.I.*[1], Kovacs M.[2]

[1]Slovak Academy of Sciences ~ Bratislava ~ Slovakia, [2]Eötvös Lorand University ~ Budapest ~ Hungary

We examined the assumption that empathy, perceiving outgroup members as threat (i.e., perceived threat), self-esteem, feelings towards outgroups (e.g., feelings thermometer), and ingroup identification are mechanisms through which the relationship between attachment patterns and prejudice can be explained. Primed attachment security (vs. neutral prime), empathy, perceived threat, identification with Turkish identity and prejudice towards Syrian immigrants. Total number of 421 (19-76) Turkish citizens (323 female, 76.7%) with a mean age of 42.85 (SD= 12.65) participated. Participants were first attended to either secure or neutral priming conditions, answered felt-security questions as a manipulation check, and then they completed whole questionnaire. Felt-security levels were significantly higher for security priming group (t(419)= 11.816, p<.001) meaning that our priming manipulation activated secure attachment schemas successfully. Individuals in security priming condition indicated lower levels of perceived threat (M=3.23, SD= 1.26), in-group identification (M= 3.08, SD=1.01) and prejudice (M=2.96, SD=.78) whereas they indicated higher levels of empathy (M= 3.61, SD =.41) and positive feelings towards Syrian Immigrants (M=5.14, SD= 2.39) when compared to their counterparts in neutral priming condition (M= 3.55, SD= 1.20; M= 3.26, SD=1.05; M=3.51, SD= .51 and M= 4.61, SD= 2.43 respectively). We included, age, gender, education levels, income, satisfaction with life and exposure to Syrian immigrants as covariates. Priming, empathy, perceived threat, feelings towards outgroups and ingroup identification significantly predicted prejudice (R^2= 0.61; F (12, 416) =52.54, p<.001)). Only age was a significant covariate. Perceiving Syrians as a threat (b =0.039, CI[0.002, 0.810]) and feelings towards Syrian Immigrants (b= 0.106, CI[0.023, 0.193]) partially mediated the relationship between attachment security priming and prejudice towards Syrian immigrants. These findings suggest that enhancing felt security (e.g., by fostering attachment security) may lead to lower levels of perceived threat as well as more positive feelings toward outgroups and in-turn reduced prejudice.

Abstract 468

PREDICTING DIFFERENT RISK LEVELS OF EMOTIONAL AND BEHAVIORAL DIFFICULTIES IN YOUNG CHILDREN FROM FAMILY INTERACTION PATTERNS: AN INTERPRETABLE MACHINE LEARNING APPROACH

Hong L.*[1], Chen L.[2], Ip P.[1]

[1]The University of Hong Kong ~ Hong Kong ~ China, [2]Wenzhou Medical University ~ Wenzhou ~ China

Background: Early-onset emotional and behavioral difficulties (EBD) in children are a significant concern. Yet early identification remains a major challenge, especially for children with emerging or sub-clinical issues who may be overlooked and are at high risk for worsening difficulties if their vulnerabilities go unrecognized.

Objective: This study aims to develop and validate an interpretable machine learning model to predict different risk levels of EBD in young children. By integrating observable and objective interaction factors, the model seeks to facilitate the early detection and monitoring of children's mental health.

Methods: A cross-sectional study was conducted among 1,034 mothers with children aged 1–4 years, recruited from 10 community vaccination centers in Zhejiang, China. Socio-demographic, interparental and parent-child interaction factors, and child EBD risks were assessed. Six machine learning algorithms were applied to develop predictive models, which were interpreted using SHapley Additive exPlanations.

Results: The Random Forest model achieved the best overall performance, demonstrating strong discriminative power (AUC = 0.892) with well-balanced sensitivity (0.72) and specificity (0.74). The model was highly effective at identifying both high-risk (AUC = 0.90) and low-risk (AUC = 0.91) children. “Parents being easily provoked by children's negative behaviors” was the most important feature in all models. Other important features included difficulty forming warm parent-child bonds, interparental problems due to emotional volatility, fewer child smiles during interactions, and intimate partner violence.

Conclusions: This study suggests the optimal models hold promise for screening young children at different EBD risk levels, not only those with clear difficulties or well-adjusted profiles, but also those with latent vulnerabilities who may benefit from early support. Preventive strategies should emphasize family interaction patterns to improve early identification and subsequent intervention.

Abstract 628

MITIGATING THE RISK OF IMPOSTER PARTICIPANTS IN APPLIED QUALITATIVE RESEARCH: EVIDENCE-BASED GUIDANCE FOR RESEARCHERS AND ORGANISATIONS

Husted M.*[1], Gray D.[2]

[1]University of Winchester ~ Winchester ~ United Kingdom, [2]University of Kingston ~ Kingston-Upon-Thames ~ United Kingdom

Background: The issue of “imposter” participants within qualitative research has become increasingly prevalent. The problem raises specific concerns for qualitive research around research inclusivity and diversity, alongside the challenge to data integrity and methodological rigour. Existing literature is dominated by case studies and commentaries. There is a lack of evidence-based guidance for researchers or research organisations with prior recommendations based on subjective experience or localised perspectives.

Purpose: This aim is to provide robust and adaptive multi-disciplinary guidelines that reflect the specific challenges and context of qualitative research.

Method: This study adopted a two-stage expert and evidence-based approach to develop guidance for researchers and organisations. Stage 1 was a mixed-method study with 184 qualitative researchers to establish the reach and impact of the problem, perspectives on the associated issues, and potential solutions across disciplines, career stage and locality. Stage 2 involved a series of expert and public workshops to develop and refine guidelines through an iterative analytical process.

Results: The resulting guidance for researchers and organisations is a flexible, supportive tool to enable a systematic and evidence-informed approach within research practice. The guidance provides a framework for considering ethical, epistemological, methodological and practical considerations when determining how to mitigate the risk of imposter participants within qualitative research.

Conclusions: The guidance provides a means to maintain high quality research practice, data integrity, and ensure the ongoing contribution of applied qualitative research whilst not restricting the ability to engage in research that is diverse and inclusive. The aim is for the guidance to be adopted across disciplines and research contexts with a goal for the guidance to evolve to reflect the needs of researchers and the changing research landscape. The guidelines will inform wider understanding of the issue of imposter

participants in qualitative research and encourage the adoption of evidence-based policies and processes.

Abstract 2550

THE DUAL FACE OF AWE: EXPANSION AND REFLECTION AS TRANSFORMATIVE PROCESSES

Mal D.*, Mohanty A., Mukhopadhyay S.

Indian Institute of Technology, Kharagpur, West Bengal ~ Kharagpur ~ India

Introduction:
Awe is the overwhelming feeling that arises when individuals encounter stimuli that exceed their existing mental schema, leading to a sense of incomprehension and a need for accommodation. Awe can be experienced as a purely pleasurable state or accompanied by threat, fear, or dread. It also encompasses a cognitive-transformative dimension that can reshape one's understanding of oneself and the world. However, the extant literature has predominantly focused on the positive valence of awe, leaving its negative valence comparatively underexplored, especially in terms of its transformative dimension. Most studies in this domain have been conducted in Western populations, despite evidence indicating that cultural frameworks shape how awe is experienced and articulated.
Purpose:
To explore how individuals make sense of their lived awe experiences and how these experiences contribute to transformative shifts in self-view and worldview.
Method:
This study employs a qualitative approach, using semi-structured interviews with 16 participants from India. Reflexive thematic analysis was used to identify key themes within their subjective experiences.
Results:
The findings suggest that the cognitive-transformative component of awe follows two distinct pathways, depending on emotional valence. When awe entails positive valence, it unfolds through immersion and absorption, evoking a heightened sense of connectedness and shifting attention outward. This outward focus often prompts a longing to re-experience the feeling and fosters curiosity and exploration. In contrast, when awe carries a negative valence, attention turns inward, producing awareness of one's limitations in power, control, and knowledge. This inward focus leads to reflective awareness and humility.
Conclusions:
Awe leads to transformation in both its positive and negative forms, but the route of transformation differs. This study expands the broaden-and-build theory by demonstrating that psychological broadening can arise not only through uplift and openness but also through discomfort-mediated reflection, contributing to understanding how awe supports well-being, particularly through the integrative role of negative

valence.

Abstract 4758

Pathways to Impact: A Diagnostic Tool for Evaluating Shared Responsibility in Societal Interventions

Veenstra E.*[2], Van Nunspeet F.[1], Ellemers N.[1]

[1]Faculty of Social and Behavioural Sciences, Utrecht University; SCOOP Research Consortium, The Netherlands ~ Netherlands ~ Netherlands, [2]Postdoctoral Researcher - Faculty of Social and Behavioural Sciences, Utrecht University; SCOOP Research Consortium, The Netherlands ~ Netherlands ~ Netherlands

Societal interventions aim to achieve a certain effect: to shift behaviour and inspire engagement towards a valued collective outcome. Yet many fail to generate the societal impact they envision. A public health campaign may increase knowledge but not change daily habits. A citizen engagement initiative may spark initial dialogue but lose momentum when funding ends. A social safety program may raise awareness but not transform everyday practices.

To understand why, we approach interventions as part of a change process. Their success depends not only on immediate behavioural shifts, but on whether they build the foundations for sustainable societal engagement. We introduce a diagnostic tool to assess this.

The tool evaluates three core conditions. First, shared identity and purpose: is the collective goal experienced as “ours,” shaped through inclusive co-definition and shared language? Second, mutual trust and confidence: can people rely on one another and the process, supported by clear roles and fair procedures? Third, internalised group norms: are responsible actions upheld voluntarily, reinforced by relevant peers, and actively revisited through reflection?

When any of these conditions is weak, the intervention’s pathway to lasting societal impact becomes unstable. Application of the diagnostic tool to real-world cases illustrates how these risks may arise and where redesign can strengthen effective impact realization.

This analysis converges on a central insight: interventions are more likely to realise their envisioned societal impact when they succeed in inviting shared responsibility—a self-endorsed commitment to act together, as co-owners of the change pursuit. This psychological state does not arise by default. It emerges when identity, trust, and norms are aligned. The tool makes this alignment visible, offering a practical way to evaluate and strengthen interventions for sustainable societal commitment.

Abstract 2735

CULTIVATING YOUTH POSITIVE ATTITUDES TOWARD MENTAL HEALTH AND NATURE RELATEDNESS THROUGH SOCIAL PSYCHOLOGY, ARTS, AND NATURE

Cosmas G.*

UNIVERSITI MALAYSIA SABAH ~ KOTA KINABALU ~ Malaysia

Integrating social psychology principles with arts- and nature-based activities may foster more positive mental health attitudes among youth. To examine this phenomenon, an attitude change program was implemented to assess its impact on youths' attitudes toward mental health. The study involved 33 youths (mean age = 16.06 years, SD = 1.95) residing in a girls' hostel under a Catholic mission in the Bantayan village, Tamparuli, Sabah. A quasi-experimental design was employed, featuring structured activities categorized into social psychology (mental health talk), nature (green planting), and arts (eco-printing and edible flower chocolate making). All activities were designed in accordance with the Yale Model of Persuasion, which emphasizes the components of communication;who delivers the message, what is communicated, to whom, and with what effect. Paired-sample t-test analyses revealed a significant improvement in youths' attitudes toward mental health following the intervention (pre-test: M = 72.94, SD = 5.74; post-test: M = 77.18, SD = 6.32). In addition, participants demonstrated a significant increase in nature connectedness after the program (pre-test: M = 23.03, SD = 3.59; post-test: M = 24.09, SD = 3.58). These findings offer valuable insights for policymakers, educators, and mental health practitioners in designing initiatives to enhance youth mental well-being. The results further underscore the importance of adopting a multidisciplinary approach to ensure that mental health programs are inclusive, engaging, and effective.

Abstract 235

ADVANCING CULTURAL INTELLIGENCE (CQ): MULTIDISCIPLINARY STRATEGIES FOR WORKPLACE INCLUSION, COMMUNITY COHESION, AND COMPETENT CARE FOR VICTIMS OF HATE

Van Wyk H.[1], Carter T.*[2]

[1]University of South Africa ~ Tswane ~ South Africa, [2]CIC ~ Wellington ~ New Zealand

In an era marked by increasing cultural diversity and rising incidents of hate-motivated harm, applied psychology must chart new directions that integrate multidisciplinary approaches to both prevention and victim care. This presentation situates Cultural Intelligence (CQ) as a pivotal construct for fostering inclusive workplaces and cohesive communities, while also addressing the urgent need for culturally competent support for victims of hate.

Drawing on research and case studies from psychology, law enforcement, education, and social services, we demonstrate how coordinated CQ interventions—such as cross-sector training, inclusive leadership development, and diversity frameworks—can disrupt bias, enhance intercultural collaboration, and promote social harmony. We emphasise the importance of multidisciplinary planning, which involves justice agencies, schools, advocacy groups, and community leaders, in developing strategic responses to hate crimes and bias-motivated incidents.

Central to our analysis is the imperative for culturally competent care for victims. We examine how a lack of cultural competency among professionals can exacerbate harm, reduce reporting, and undermine trust in institutions. Evidence-based recommendations include embedding cultural competence in victim support services and mental health care, ensuring that victims are understood, respected, and effectively assisted.

By integrating CQ development with multidisciplinary collaboration and victim-centred care, this presentation offers actionable strategies and a forward-looking perspective for applied psychologists seeking to address the complex challenges of diversity, inclusion, and hate in contemporary society.

Abstract 237

INTEGRATING PSYCHOLOGICAL SCIENCE AND SYSTEMS APPROACHES TO ADDRESS HATE VICTIMISATION

Van Wyk H.*

University of South Africa ~ Tswane ~ South Africa

Introduction

Hate victimisation is a complex societal issue requiring more than simplistic remedies. Recent research from the Global South reveals that 68% of victims experience compounded psychological trauma from systemic re-victimisation, yet only 12% receive adequate psychosocial support. The escalation of hate-related incidents worldwide highlights the need for a multifaceted approach that combines psychological insights with broader complex systems frameworks.

Purpose

This study aims to develop an international framework that integrates psychological science with complex systems strategies to address hate victimisation. The framework seeks to raise the profile of organised psychology, encourage cross-disciplinary collaboration, and provide practical guidance for combating hate and supporting victims.

Method

A context design approach was employed, synthesising psychological theory with systems thinking. The research reviewed existing literature on hate victimisation and drew on principles from critical community psychology. The framework was operationalised through four key channels: structural power (policy advocacy and legislative reform), cultural power (shifting social narratives via media partnerships), interpersonal power (community-based restorative justice programmes), and personal power (trauma-informed victim support systems).

Results

The analysis identified gaps in current institutional responses to hate-based violence, notably the lack of an integrative framework in psychology to address hate victimisation. The proposed framework provides a structured, context-sensitive model that bridges these gaps by aligning psychological practice with complex systems strategies. It offers actionable pathways for professionals, policymakers, and communities to address hate victimisation at multiple levels collaboratively.

Conclusions

Psychology, as a discipline and profession, cannot remain neutral in the face of societal challenges such as hate victimisation. The study's framework demonstrates the potential for organised psychology to lead global efforts against hate, moving beyond condemnation to proactive, evidence-based intervention. By integrating psychological science with systemic strategies, this approach offers a comprehensive model for

reducing hate victimisation and supporting affected individuals and communities.

Abstract 3140

EXPLORING LEADERSHIP MINDSET AND BEHAVIOR IN CULTURAL CONTEXTS: INSIGHTS FROM SOUTH AFRICA FOR THE GLOBAL LEADERSHIP DISCOURSE

Neumann S.*

Zurich University of Applied Sciences ~ Zurich ~ Switzerland

Leadership is inherently shaped by cultural, historical, and socio-economic factors, influencing how individuals in different regions lead, collaborate, and make decisions. While much of contemporary leadership theory is rooted in Western paradigms emphasizing individualism, efficiency, and hierarchical structures, leadership in other cultural contexts, such as South Africa, offers valuable perspectives that challenge and enrich mainstream leadership discourse.

South Africa's leadership landscape is shaped by its complex history, diverse cultural composition, and the philosophy of Ubuntu, a deeply embedded worldview emphasizing interconnectedness, collective well-being, and relational leadership (Ncube, L. B., 2010; Winkler-Titus, 2024). This approach stands in contrast to many Western leadership models, which often prioritize transactional relationships and short-term performance metrics (Ly, 2020). Ubuntu-based leadership fosters inclusivity, resilience, and adaptive problem-solving, crucial skills for today's volatile, uncertain, complex, and ambiguous world (Lutz, D. W., 2009).

Beyond Ubuntu, South Africa's leadership environment provides unique insights into leading in transition and crisis. From post-apartheid nation-building to navigating contemporary socio-economic challenges, South African leaders have honed approaches that emphasize transformation, ethical leadership, and reconciliation (Yawson, 2017). These principles offer valuable lessons for Western leaders facing increasing challenges related to diversity, equity, sustainability, and social responsibility.

By studying leadership within South Africa's context, Western leadership scholars and practitioners can gain fresh perspectives on current and emerging leadership approaches such as Ethical Leadership, Authentic Leadership, Transformational Leadership and recently Responsible Leadership (de Klerk, J. J., & Jooste, M., 2023). As globalization continues to redefine leadership dynamics, embracing cross-cultural insights will be essential for fostering more inclusive, resilient, and sustainable leadership practices worldwide.

This presentation aims to offer practical insights and theoretical reflections on leadership in South Africa, contributing to a richer, more holistic understanding of

leadership that transcends traditional Western frameworks and incorporates globally relevant perspectives.

Abstract 3141

RETHINKING THE INTEGRATION OF “FOREIGN” PRACTICES IN PSYCHOLOGY

Zirkler M.*

Zurich University of Applied Sciences ~ Zurich ~ Switzerland

Psychological researchers and practitioners have been and continue to be fascinated by “indigenous” approaches and have integrated ideas and practices from other cultural areas into their own schools. Laypeople interested in psychology also often share an interest in corresponding offerings (e.g., yoga), even if the deeper background often remains largely misunderstood.

In Western science, there is often a low appreciation of “indigenous” approaches, combined with a form of discrimination that considers Western knowledge and associated practices to be superior.

This contribution will explore the question of integration of knowledge and practices embedded in foreign cultures exactly could mean theoretically on the one hand and pragmatically on the other. Theoretically, this raises the fundamental problem of commensurability, which is well described in philosophy of science. On the other hand, “foreign” practices are often only partially compatible with the normal expectations of one's own culture.

Even if the gaps in understanding cannot be completely overcome and closed, mutual learning can take place under certain conditions. These conditions will be further explored.

POLITICAL ANXIETY AMONG LGBTQIA+ PERSONS: AN EXPLORATIVE QUALITATIVE STUDY IN GERMANY

Kulcar V.*, Matthes S., Haumayr A.V.

University of Innsbruck ~ Innsbruck ~ Austria

Political developments can represent both a source of security and a psychosocial stressor. The rights and safety of marginalized groups, such as LGBTQIA+ persons, are particularly dependent on political decision-making and societal attitudes. Research in the USA has shown that political dynamics can result in political anxiety significantly affecting LGBTQIA+ persons' mental health. Although a rise right-wing parties and politics increases risks of potential impacts on minorities, little is known about mental health consequences in Europe. This qualitative explorative study aims at addressing this research gap. It examined the 2025 governmental election in Germany as an event potentially causing political anxiety and election stress in LGBTQIA+ persons. Using a longitudinal design, narratives were collected from 43 participants one week before and directly after the election to allow the investigation of anticipatory and post-election experiences. Based on preliminary results, seven follow-up interviews were conducted for in-depth insights.

Participants expressed shock and distress at the electoral success of right-wing parties, despite these results being anticipated both publicly and individually. Two main experiential stressors were identified through qualitative analysis: First, the anticipated and manifested election outcomes resulted in future anxiety regarding LGBTQIA+ rights, social inclusion, and civic participation. Participants worried about personal safety and legal rights, both for themselves and other queer individuals. Second, participants experienced moral distress in response to citizens' voting behaviour and politicians' statements and policy decisions. Participants expressed outrage and irritation towards close social contacts, public figures, and unknown others. As a result, many of the LGBTQIA+ participants reported psychological strain throughout the election period. Community and shared experiences were crucial protective factors to navigate the stress.

These findings highlight the psychological impact of political developments on minority populations and emphasize the need for further research and interventions that address political anxiety and election stress.

Abstract 1202

ECONOMIC, SOCIAL, SOCIETAL, AND PSYCHOLOGICAL PREDICTORS OF SUBJECTIVE WELL-BEING AMONG THE FORCED UKRAINIAN MIGRANTS IN FRANCE

Komarynska--Diament O.*

Kryvyi Rih State Pedagogical University ~ Kryvyi Rih ~ Ukraine

Introduction. The 2022 Russian invasion of Ukraine forced millions of Ukrainians to migrate abroad, including to Europe. By the end of 2024, 56,314 Ukrainian citizens had been granted temporary protection permits in France. For these individuals, adaptation was accompanied by economic issues, cultural challenges, and psychological stress (Figueiredo & Dimitri, 2025). Subjective well-being (SWB) is known as a key indicator of successful integration and resilience among forced migrants (Kienzler et al., 2024; Peiris, 2024), although empirical evidence regarding Ukrainian refugees remains limited.

Purpose. This study aimed to examine socio-economic conditions, social integration, and broader societal predictors of the subjective well-being of forced Ukrainian migrants residing in France.

Method. An online survey was conducted among Ukrainian migrants in France (n = 302). A sample of participants who arrived after February 24, 2022 (n = 230) was classified as forced migrants and included in the analysis.

SWB was measured using the Modified BBC Subjective Well-Being Scale (BBC-SWB), while other measures used 7-point Likert scales.

Multiple linear regression analyses were performed via Jamovi software (version 2.6.45.0). Independent variables included a range of socio-economic, social, societal, and psychological factors.

Results. The prediction model explained 26.4% of the variance in subjective well-being ($R^2 = .264$, $p < .001$) with four predictors as follows: income level ($\beta = 1.94$, $p = .016$), language proficiency ($\beta = 1.78$, $p = .023$), positive attitudes perceived from the host society ($\beta = 1.65$, $p = .002$), and current life satisfaction ($\beta = 4.75$, $p < .001$).

Conclusions. Together, these results underscore the interdependent nature of economic security and social integration reflected in the subjective well-being of forced Ukrainian migrants in France. This knowledge can support further development of targeted interventions and support programs aimed at fostering resilience, integration, and long-term well-being.

Abstract 4940

CONTACT ACCULTURATION, TREATMENT-SEEKING, AND TREATMENT DECISION-MAKING BEHAVIORS OF WOMEN IN A CULTURALLY CHANGING KHARWAR ADIVASI COMMUNITY

Awasthi Purnima S.*

Professor, Department of Psychology, Banaras Hindu University, Varanasi-221005

Contact acculturation and treatment behaviors emphasize an individual's understanding of their illness experience as a key factor in health and well-being. The study examines treatment behaviors (e.g., treatment-seeking and treatment decision-making) and health outcomes among women aged 21 to 65 from the culturally changing Kharwar Adivasi community, as well as their contact acculturation to health issues. The study was conducted in the Naugarh region of Chandauli district, Uttar Pradesh, and the sample comprised 225 women participants. The study focuses on health issues, such as diarrhea, jaundice, malaria, pneumonia, and eczema, impacting these women's daily activities. Measures of contact acculturation, treatment-seeking behavior (e.g., clinical care & folk healing), treatment decision-making (e.g., decisional-conflict & defensive avoidance), and health outcomes (e.g., pain, hope, & severity) were administered to the women. Analysis revealed that women who exhibited greater clinical care, lesser decisional conflict, and defensive avoidance treatment decision-making scored higher on the contact acculturation measure. In contrast, those who sought more folk healing, exhibited greater decisional conflict and defensive avoidance treatment decision-making, scored lower on the contact acculturation measure. High-contact acculturation was linked to lower pain and severity and greater hope for positive health outcomes. The findings are discussed within the sociocultural context of the Kharwar Adivasi Community, highlighting their implications for developing psychoeducational interventions tailored to Kharwar women's health-related behaviors.

HUMOR ACROSS CULTURES, CONTEXTS, AND TECHNOLOGIES: PSYCHOLOGICAL MECHANISMS AND SOCIAL IMPLICATIONS

Saturday 25 July 2026 from 08:00 to 09:00

(D-Spadolini)

Yi Cao (Yi Cao ~ Beijing ~ China), Chair and Presenter
Li-Jun Ji (Li-Jun Ji ~ Kingston ~ Canada), Co-Chair

This symposium examines how humor functions across diverse psychological and social contexts—from workplace stress and financial hardship to cultural norms and artificial intelligence. While humor is often considered a universal human experience, its expression and impact are shaped by situational, cultural, and technological factors. Miao explores how leader humor styles—affiliative versus aggressive—affect employee adaptive performance through job anxiety and security, particularly under conditions of technostress. Jiang introduces financial disadvantage as a novel factor that dampens humor appreciation, showing that economic hardship impairs the cognitive resolution processes essential for “getting” humor. Cao investigates GPT-4o’s humor generation capabilities, revealing that AI can outperform humans in humor-based coping and conflict resolution, especially in negative social contexts. The final two presentations focus on cultural influences. Ji presents cross-national evidence that cultural tightness—but not collectivism—predicts lower humor production, highlighting how strong social norms suppress humorous expression across societies. Wu builds on this by demonstrating that cultural tightness constrains creative thinking, which in turn reduces humor production, offering causal evidence for the cognitive mechanisms behind this effect. Together, these talks offer an interdisciplinary perspective on humor, integrating organizational, social, cognitive, and cross-cultural psychology with emerging insights from human-AI interaction. The symposium is highly relevant to applied psychology, with practical implications for leadership, education, mental health, and innovation. Each presenter contributes a distinct lens, making this session timely and impactful for a global audience.

Abstract 3193

HOW HUMOROUS IS AI? EXPLORING CHATGPT'S ROLE IN HUMOR GENERATION AND HUMAN-AI INTERACTION

Cao Y.*[1], Cao J.[2], Hou Y.[3], Ji L.[4]

[1]Yi Cao ~ Beijing ~ China, [2]Jiahao Cao ~ Beijing ~ China, [3]Yubo Hou ~ Beijing ~ China, [4]Li-Jun Ji ~ Kingston ~ Canada

The rapid evolution of artificial intelligence has raised important questions about its ability to replicate nuanced human cognitive functions -- particularly humor generation. This research investigates GPT-4o, an advanced language model, focusing on its capacity to generate humor, how it compares to human-created humor, and its potential applications in human-AI interaction. The main variables include humor generation, coping, strategy, and interpersonal conflict. We hypothesize that GPT-4o outperforms humans in humor generation and can help individuals manage interpersonal conflicts by effectively using humor, based on a theoretical framework that integrates humor theory and human-AI interaction models. Drawing on data from a racially diverse sample from the U.S., the research employs experimental methods across four studies. Study 1 compares GPT-4o and human humor generation using textual and visual prompts. Study 2 examines how social context (positive vs. negative) influences humor coping strategies in both AI and human responses. Study 3 identifies the most effective humor types in negative social contexts. Study 4 explores GPT-4o's role in managing interpersonal conflict through humor in human-AI interaction. Findings reveal that GPT-4o excels in generating sentence-based humor, particularly in response to negative social contexts, and outperforms humans in humor coping strategies. In response to negative contexts, both humans and GPT-4o identify self-enhancing humor as the most effective strategy. Furthermore, GPT-4o demonstrates effectiveness in conflict resolution, as evidenced by positive feedback from both humor senders and recipients. These results offer theoretical and practical insights into AI's emerging role in emotional support, stress reduction, and socially sensitive communication.

Abstract 3194

CULTURAL TIGHTNESS REDUCES HUMOR PRODUCTION: EVIDENCE FROM MULTIPLE COUNTRIES

Cao Y.[2], Hou Y.[4], Wang Y.[3], Ji L.*[1]

[1]Li-Jun Ji ~ Kingston ~ Canada, [2]Yi Cao ~ Beijing ~ China, [3]Yijiang Wang ~ Beiijing ~ China, [4]Yubo Hou ~ Beijing ~ China

We hypothesized and tested that cultural tightness -- the strength of social norms in a culture -- would influence people's sense of humor, particularly humor production. We found that participants from a tight culture (China) scored lower on humor production compared to participants from a loose culture (U.S.). The results are generalized to a broader sample involving four tight and three loose countries, including a tight (but individualist) culture and a loose (but collectivist) culture. A mini meta-analysis showed that humor production is negatively related to cultural tightness but unrelated to collectivism. Furthermore, we observed in experiments that cultural tightness hinders humor production. Drawing on cross-cultural evidence, the research unpacks culture and presents the first causal evidence of how cultural tightness influences humor. The findings have important implications for education, business, and innovation.

Abstract 3195

CULTURAL TIGHTNESS AND HUMOR PRODUCTION: THE MEDIATING ROLE OF CREATIVE THINKING

Wu Y.*

Yang Wu ~ Beijing ~ China

Culture shapes human cognition and behavior, profoundly influencing humor production. The mechanisms still require investigation. The present research examines the impact of cultural tightness on humor production and tests the mediating role of creative thinking. Specifically, Study 1 compared participants from five tight and five loose provinces in China and found that individuals from tight regions were less proficient in humor production than those from loose regions. Studies 2 and 3 experimentally primed perceived cultural tightness and further demonstrated its effect on humor production in everyday contexts. Studies 4 and 5 provided causal evidence that cultural tightness constrains creative thinking, which in turn reduces humor production. These findings provide compelling evidence that cultural tightness impacts humor production through creative thinking. They further offer the broader implications for education, organizational management, and innovation, highlighting how cultural norms shape both creative processes and humor production.

Abstract 2706

EFFECTS OF OPPORTUNITY BELIEF ON FERTILITY INTENTION AMONG CHINESE YOUTH: THE MEDIATING ROLE OF STATE HOPE

He N.*, Yue Y.

Shaanxi Normal University ~ Xi'an ~ China

Introduction：As China faces a persistent decline in fertility rates, identifying effective strategies to boost fertility intentions among reproductive-age youth is a critical societal challenge. While prior research has explored various antecedents, the role of subjective cognitive frameworks—specifically opportunity belief—remains overlooked.

Purpose： The primary objective of this research was to investigate whether opportunity belief significantly predicts fertility intention among Chinese youth and to identify the mediating role of hope (both state and trait hope) in this psychological process.

Method：This research comprised three studies: Study 1 utilized large-scale empirical data from the China Family Panel Studies (CFPS) to establish initial correlations; Study 2 employed an online questionnaire with 305 unmarried young adults (aged 18–35) to measure opportunity belief, fertility intention, and state hope; and Study 3 utilized an experimental priming task to manipulate participants' opportunity belief and trait hope, thereby testing the causal relationship and the mediating effect in a controlled setting.

Results：The findings consistently demonstrated that opportunity belief significantly and positively predicts fertility intention across all three studies. Data analysis revealed that state hope (Study 2) and trait hope (Study 3) both function as significant mediators, indicating that opportunity belief enhances fertility intention by fostering a positive sense of hope for the future.

Conclusions：Collectively, these findings demonstrate that the fertility intention of Chinese youth is significantly influenced by their opportunity belief. This relationship is driven by a psychological mechanism where opportunity beliefs enhance fertility intentions through the cultivation of hope, suggesting that fostering future-oriented optimism is key to addressing fertility declines.

Abstract 2211

HOW UNSUPPORTIVE EMOTIONAL PARENTING AFFECTS PRESCHOOLERS' MENTAL HEALTH AND PROSOCIAL DEVELOPMENT?

Hong L.*, Ip P.

The University of Hong Kong ~ Hong Kong ~ China

Background: Emotional and behavioral problems (EBPs) in preschool-aged children are a growing concern worldwide, posing significant challenges in developmental psychopathology.

Objective: This study aimed to examine the bidirectional longitudinal associations between emotion socialization parenting practices (supportive and unsupportive) and preschoolers' EBPs (internalizing, externalizing, and prosocial behaviors).

Methods: A three-wave longitudinal study was conducted from 2018 to 2019, involving 1,246 preschool children (mean age 3.28 years, 53.8% boys) in Hong Kong. Parents reported on their emotion socialization practices using the Emotion-related Parenting Styles Questionnaire and on children's EBPs using the Strengths and Difficulties Questionnaire. Cross-lagged panel modeling tested directional associations between parenting and child outcomes over time.

Findings: Emotion-related parenting practices and children's EBPs showed significant stability across time points. Unsupportive emotional parenting significantly predicted later internalizing problems ($\beta = 0.08$ [95% CI, 0.03–0.13], $p < .01$) and decreased prosocial behavior ($\beta = -0.08$ [95% CI, -0.12 to -0.04], $p < .001$), while supportive emotional parenting predicted increased prosocial behavior ($\beta = 0.09$ [95% CI, 0.04-0.14], $p < .01$). No significant effects were found for externalizing problems, and supportive emotional parenting showed no effects on internalizing problems. The reverse paths from children's emotional and behavioral problems to parenting were not significant, suggesting unidirectional effects from emotion-related parenting to child development.

Conclusions: Unsupportive emotional parenting contributes to children's internalizing problems and reduced prosocial behaviour, while supportive emotional parenting promotes prosocial behaviour. Enhancing parents' supportive emotion socialization practices may be a promising target for future interventions to reduce preschool children's emotional and behavioural difficulties.

Abstract 4569

HELP-SEEKING FOR MENTAL HEALTH CONCERNS AMONG ADOLESCENTS IN HIGH SOCIOECONOMIC STATUS CONTEXTS: INTERPRETATIVE PHENOMENOLOGICAL ANALYSIS

Matar J.*, Laletas S., Savic M., Lubman D.

Monash University ~ Melbourne ~ Australia

Objective

Adolescents in high socioeconomic status (SES) contexts have emerged as an at-risk subgroup for certain mental health concerns, including substance use. However, there is limited international evidence examining whether and how these adolescents seek help. This study aimed to explore the factors influencing adolescents' decisions to engage in, or avoid, help-seeking for mental health concerns in high SES contexts.

Method

Semi-structured interviews were conducted with ten adolescents aged 15–19 years attending independent or government schools in high SES contexts. Participants shared their lived experiences and perspectives on help-seeking for mental health concerns. Data were analysed using Interpretative Phenomenological Analysis (IPA) as outlined by Jonathan Smith.

Results

Two overarching themes were identified: Complex Power and Authority and Sociocultural Influences on Perceived Social Norms. Findings revealed that perceived and experienced breaches of confidentiality were a central and influential factor shaping adolescents' reluctance to seek help. Participants described concerns related to ethical frameworks and policy, particularly confidentiality and mandatory reporting, as well as power imbalances, dual relationships, and fears of loss of control. These experiences were compounded by strong sociocultural expectations to maintain privacy, reputation, and self-reliance, contributing to secrecy and delayed help-seeking.

Discussion

This presentation will concentrate on adolescents' accounts of confidentiality breaches and the ways these experiences undermine trust in school-based systems. The implications for future practice will be discussed, with particular attention to ethical decision-making, school policy, and the management of dual relationships. Opportunities for system-level change and early intervention will be highlighted to strengthen duty of care, promote ethical practice, and support help-seeking across

adolescence and emerging adulthood.

Abstract 2345

REFRAMING RISK: ADOLESCENTS' RISK-TAKING CAN BE POSITIVE TOO; A STRENGTH-BASED APPROACH

Tyagi K.*

O.P. Jindal Global University ~ Sonipat ~ India

Adolescence is a critical period for exploring risk-taking behaviors, which can have both positive and negative consequences. Decades of research on risk-taking have predominantly focused on negative risk behaviors, leaving a notable gap in positive discourses on risk-taking. Despite increasing interest, limited research exists on the conceptualization of positive risk-taking. This study aimed to expand the theoretical understanding of positive risk-taking by constructing a conceptualization and model of positive risk-taking grounded in qualitative findings and prior literature.

A mixed-method approach was used, including 12 online focus group discussions (n = 65) across three age groups (10–14, 15–19, and 20–24 years) with adolescents (n = 38) and college students (n = 27) from Delhi-NCR. Qualitative data were analyzed using NVivo 12 software and thematic analysis, identifying several defining features of positive risk-taking, including growth, positive emotions, rewarding outcomes, and a deliberative thinking style. Simultaneously, a literature review was conducted using databases such as Scopus and Google Scholar. Inclusion criteria included theoretical and empirical articles, published between 1980 and 2022, in English, peer-reviewed, focusing on exploratory and constructive risk-taking, and positive risk-taking in adolescents.

The study conceptualized positive risk-taking with six defining characteristics: (a) opportunities for growth, (b) promotion of well-being, (c) long-term benefits, (d) potential for high rewards, (e) varying magnitude of loss, and (f) uncertainty regarding outcomes. Unlike negative risk-taking, positive risks emphasize well-being and benefits outweighing potential costs. They also involve reflective, deliberate decision-making.

This refined conceptualization shifts the narrative around risk-taking from a negative perspective to a strength-based perspective. By framing risk-taking as a behavior that fosters growth, well-being, and calculated risk management, this study provides a foundational framework for understanding and assessing positive risks for future studies.

Abstract 2429

PASSIVITY, RECEPTIVITY, AND ATTUNEMENT: APPLYING PHENOMENOLOGICAL PSYCHOLOGY TO SOCIAL RESPONSIBILITY PROJECTS

Tsai Y.*, Wu K.

Research Center for Humanities and Social Sciences, National Chang Kung University, Taiwan ~ Tainan ~ Taiwan

Social responsibility (SR) projects increasingly aim to promote sustainable community engagement, yet many remain constrained by top-down, outcome-oriented models that overlook the lived experiences of participants. Drawing on phenomenological psychology, this study examines how passivity, receptivity, and attunement—three modes of embodied perception and intersubjective awareness—can inform more human-centered approaches to social engagement. From a psychological perspective, these constructs describe how individuals open themselves to world and others, enabling empathy, mutual recognition, and shared meaning-making.

The study combines conceptual analysis with a qualitative case study of a University Social Responsibility (USR) initiative in Taiwan. The USR project has focused on Guantian, one of Taiwan's major agricultural regions, and has collaborated with local farmers for nearly a decade to navigate challenges such as labour shortages, water scarcity, and agricultural policy shifts. Over the years, the project has implemented diverse methods to gather local opinions and build consensus and advocacy, which have in turn attracted attention from mainstream media and government bodies, leading to repeal of regulations detrimental to farmers. In this research, field observations and interviews with university and community participants were analyzed to understand how psychological openness and attuned perception shape the process of collaboration. Results reveal three recurring psychological dynamics: (1) Reflective passivity—participants suspend judgment to better perceive local meanings; (2) Receptivity—teams cultivate empathic understanding before problem definition; and (3) Attunement—university and residents co-regulate their goals and rhythms through sustained interaction. These processes correspond to known mechanisms of psychological flexibility, empathy, and relational attunement in community psychology.

The findings suggest that phenomenological psychology provides a valuable framework for transforming SR projects into reciprocal and evolving partnerships, shifting from organisational control toward community empowerment. This study highlights the potential of psychological concepts of perception and intersubjectivity to deepen ethical and practical engagement in real-world social innovation.

Abstract 2320

CATALYZING CARE REFORM: A MICROGRANT LEARNING COHORT TO STIMULATE MOVEMENT FROM RESIDENTIAL TO FAMILY CARE IN CHILD WELFARE

Wilke N.*[1], Mena D.[1], Howard A.[2]

[1]CAFO Center on Applied Research for Vulnerable Children and Families ~ Arequipa ~ Peru, [2]Samford University ~ Birmingham ~ United States of America

Introduction: Millions of children worldwide remain in long-term residential care despite global evidence that family care promotes optimal development. While policy and research advocate for deinstitutionalization, little is known about practical strategies residential programs require to transition to family care models, particularly in resource-constrained, high-risk contexts. Supporting locally tailored solutions is critical, as effective care reform must align with cultural, social, and community realities.

Purpose: This study explored whether an integrated approach combining microgrants, individualized coaching, and peer learning cohorts could catalyze progress toward family care, strengthen capacity, and maintain child well-being across international contexts.

Method: Five residential care organizations from East Africa, West Africa, Eastern Europe, and Latin America participated in a one-year microgrant and learning cohort program. Organizations received $10,000–$20,000 microgrants, completed an eight-week foundational care transition course, and participated in monthly coaching sessions and cohort meetings. Data were collected via documentation, case files, stakeholder reports, and program evaluations to track reintegration, foster care preparation, family strengthening, staff training, and stakeholder engagement.

Results: All five organizations demonstrated measurable progress in transitioning children into family care. Across projects, 74 children were moved to family care, 111 families were supported, and 292 staff and community stakeholders were trained in alternative care approaches. Success was facilitated by leadership buy-in, collaboration, community mobilization, and culturally informed strategies. Challenges included political instability, resource constraints, and conflict-related disruptions, which required adaptive strategies. Targeted microgrants, structured coaching, and peer learning enabled organizations to navigate obstacles, replicate promising practices, and maintain a child-centered focus.

Conclusions: Findings indicate that an integrated microgrant learning cohort can create conditions conducive to sustainable care reform, improving readiness, collaboration,

and child and family outcomes. This scalable model demonstrates how modest financial investments combined with structured peer learning and coaching can catalyze transitions from residential to family care globally, even in complex, resource-limited contexts.

Abstract 3353

ASPIRING TO RAISE CULTURALLY GROUNDED GLOBAL CITIZENS: INDIAN YOUTH PERSPECTIVES ON PARENTING IN A GLOBALIZED WORLD

Biswas U.N.*[1], Babik I.[2]

[1]Delhi University ~ Delhi ~ India, [2]Boise State University ~ Boise ~ Uruguay

Background: Globalization is reshaping parenting practices worldwide by exposing families to diverse cultural values and lifestyles. Parents today navigate a complex interplay of traditional cultural norms, socio-economic conditions, and rapid advancements in technology and media, all complicating the task of child-rearing (Rajput, 2024). This study examined how young adults in India view current parenting practices and their future parenting values, offering valuable insights into the evolution of parenting in a globalized world.

Methods: Sixty young adults from across India (ages 20-30, 50/50 gender distribution) participated in face-to-face, semi-structured interviews, answering the following questions: 1) How do you think other countries influence the way people raise their children in India? 2) If you were a parent, what values would you like to instill in your children? Thematic analysis in NVivo software explored participants' perceptions of current parenting practices and their aspirations for future parenting.

Results: Participants noted the spread of Western values (gender equality, individual freedom, and scientific thinking) in Indian society, which encouraged more democratic parent-child relationships, greater openness to children's opinions, and more flexible approaches to discipline, career expectations, and marriage arrangements. However, many were concerned that these developments might erode culture, with children losing respect for their elders, disconnecting from their families, and forgetting their roots. When envisioning their own parenting, youth often blended traditional and global orientations, planning to instill in their children respect for elders, compassion, and cultural pride, along with modern values of critical thinking, independence, and gender equality.

Conclusion: The current findings suggest that young adults in India view parenting as a dynamic process of balancing global influences with cultural continuity, which aims to raise children rooted in tradition who are also equipped to thrive in a globalized world. These results highlight the adaptive and reflective nature of parenting in the age of globalization.

03 - Division 3: Psychology and Societal Development

YOUNG PEOPLE IN RURAL CONTEXTS: MULTIDISCIPLINARY PERSPECTIVES ON CHALLENGES AND RESILIENCE

Saturday 25 July 2026 from 09:00 to 10:30

(D-Spadolini)

Elena Marta (Università Cattolica del sacro Cuore, Ce), Chair and Presenter

Rural youth often face distinct challenges—such as limited access to education, employment, and healthcare—that significantly shape their well-being, opportunities, and future aspirations. These constraints intersect with social isolation and infrastructural gaps, placing rural young people at a disadvantage compared to their urban counterparts. Yet many benefit from strong community ties, intergenerational connections, and vibrant cultural traditions, all of which bolster resilience and a sense of belonging. This symposium will examine how territorial, socio-cultural, and developmental factors converge to influence the daily lives and trajectories of rural youth, offering multidisciplinary insights that can inspire practical interventions and collaborative approaches.

The topic is particularly novel and relevant because it addresses the complex interplay of psychological, economic, social, and cultural dimensions affecting rural young people—a group often overshadowed in mainstream youth research. In line with the European Rural Youth Observatory's commitment to research-based knowledge and international collaboration, the symposium aims to foster evidence-driven solutions that empower rural youth across diverse contexts.

Each presenter provides a unique angle on this overarching theme. The first explores the school-to-work transitions of NEET rural adolescents through the Psychology of Working Theory, identifying context-specific personal and structural factors. The second highlights youth participation in Romania, revealing mechanisms that exclude rural youth from decision-making processes and proposing more inclusive policy strategies. The third examines the digital divide in Bulgaria's South-West region, emphasizing "smart village" initiatives that enhance connectivity and educational equity. The fourth focuses on mountain communities in Italy, investigating school dropout rates, work-based learning, and risk/protective factors through a mixed-methods research design. Finally, the fifth centers on well-being in small Italian rural communities, examining how sense of belonging, trust, and mattering shape youth resilience.

Together, these contributions enrich our understanding of rural youth realities, bridging diverse academic fields and offering pathways for empowering young people in peripheral areas across Europe.

Abstract 4334

RURAL YOUTH INCLUSION THROUGH PARTICIPATION – CHALLENGES AND OPPORTUNITIES

Petrescu C.*, Negut A., Mihalache F., Tufa L.

Research Institute for Quality of Life, Romanian Academy, Euryo, European Rural Youth Observatory ~ Bucarest, ~ Romania

Youth participation represents a cornerstone of democratic governance, enabling young people to be involved in the decisions that shape their future. In Romania, there are various degrees of young people participation in decision making process that range from informing to consultation, involvement and even, collaboration. Despite the development of various institutional structures to enable youth participation in education, social protection, civic life, environment, policy, not all young people have equal access to participation. This presentation explores the youth participation in Romania, focusing on the main challenges faced by young people from rural areas. It examines the factors contributing to the exclusion of rural youth and assesses the effectiveness of existing mechanisms in promoting meaningful and inclusive participation. The article is based on a comprehensive study on youth participation in Romania carried out in 2022. The research methodology included desk research and qualitative data collection. The document analysis focused on identifying the institutional and organizational frameworks that regulate the participation of young people in decision-making and on identifying the specific challenges rural youth face. Qualitative data collection included interviews and focus groups with young people, relevant non-governmental organizations, public institutions, and professionals working with youth. Main barriers to rural youth participation identified in the research include low awareness of youth's rights, especially the right to participate, which often leads to a lack of support from adults, low support from the family, lack of a culture of communication and consultation in schools, which leads to decisions being made without the input of students, low level of training regarding youth participation for staff working with young people, compounded by a shortage of youth workers, especially in rural areas. Atthesametime,limitedopportunitiesforparticipationforyoungpeopleinruralareasarelinkedtovariouspracticalandorganizationalchallengessuchasthelackofaccessiblespacesforactivitiesortransportoptions.Inaddition,financialconstraintsdiscourageinitiativesthatpromoteyouthinvolvementandlimitaccesstoresourcesforruralyouth.Thepresentationdiscussestheunevenrepresentationofyoungpeoplebasedongeographic,socio-economic,andeducationalfactorsandemphasizestheneedformoreinclusiverecruitmentandretentionstrategies.

Abstract 4335

DIGITAL ACCESS AND EDUCATION FOR RURAL YOUTH: INNOVATIONS FOR A MORE INCLUSIVE FUTURE

Vladislava L.*, Dimitrova I.

Sociology Department of South-West University Neofit Rilski, and Psychology Department of South-West University Neofit Rilski, Euryo, European Rural Youth Observatory ~ Blagoevgrad, ~ Bulgaria

Rural youth in Bulgaria face significant educational challenges due to limited access to digital infrastructure, technology, and online learning resources. These limitations deepen educational disparities, constraining their progress and limiting opportunities for professional development in a rapidly evolving digital environment. This paper explores how innovative strategies, including the smart village concept, are addressing the digital divide among rural Bulgarian youth, with a particular focus in rural areas from the South-West region. Smart villages utilize digital technologies and community-driven initiatives to enhance education, connectivity, and socio-economic opportunities. By integrating advanced infrastructure and digital services, they provide sustainable pathways to improved educational access and career development in rural areas.

Our analysis focuses on the comparative effectiveness of nonprofit-led digital literacy initiatives and formal educational strategies in mitigating socioeconomic disparities. Employing a qualitative approach, the research gathers data through semi-structured interviews with key stakeholders—policymakers, educators, and community leaders—and interactive workshop with rural youth (aged 18–29) in rural areas from the South-West region. These methods offer in-depth insights into both systemic challenges and the lived experiences of young people navigating digital education. The study aims to generate evidence-based recommendations for policies and programs that promote digital access and foster digital competency development, thereby facilitating a more inclusive future. In this vision, rural youth are empowered to thrive in the digital economy and to fully participate in both the labour market and civic life.

Abstract 4336

RISK AND PROTECTIVE FACTORS IN THE SCHOOL TO WORKS TRANSITION: A MIXED METHODS RESEARCH IN AN ITALIAN RURAL AREA

Marta E.*[1], Ellena A.M.[1], Marzana D.[1], Mutti M.[1], Chicco M.[2], Oliviero M.[2]

[1]Università Cattolica del Sacro Cuore- Cerisvico – Istituto Toniolo ~ Milano-Brescia ~ Italy, [2]Euryo, European Rural Youth Observatory ~ Trento ~ Italy

This study examines the challenges and opportunities of school-to-work transitions in an Italian mountain area classified as rural, focusing on their impact on school dropout among young people. Conducted by the Youth Observatory (Osservatorio Giovani) of the Istituto Giuseppe Toniolo and by the Provincial Institute for Educational Research and Experimentation (Istituto provinciale per la ricerca e la sperimentazione educative; IPRASE), it adopts a participatory action research design in two phases: quantitative and qualitative. In the quantitative phase, an online questionnaire explores academic motivation, skill development, future aspirations, and educational trajectories of secondary school students and a group of young people who have turned to the PES. Special attention is given to the effects of work-based learning experiences on student engagement, investigating both risk and protective factors in the transition from school to work. Socio-demographic data are also gathered to contextualize outcomes and detect dropout patterns in rural environments. The qualitative phase consists of 20 focus groups: 18 with secondary school students from different educational tracks and 2 with young people who have experienced difficulties transitioning to employment and are currently NEET. These discussions capture participants' perceptions of work-based learning programs, including alignment with labor market demands, the role of mentors and support networks, and how these experiences influence persistence in school and career aspirations. Thematic analysis is employed to interpret the qualitative data, highlighting shared experiences, protective factors, and perceived barriers. By engaging stakeholders in continuous dialogue, this research aims to develop more inclusive and effective educational and vocational programs, ultimately reducing dropout rates and fostering youth employment. It contributes to understanding the roots of educational disengagement while advocating for policies that support student retention and professional development.

Abstract 4337

WELLBEING AND MATTERING IN RURAL YOUTH

Di Napoli I.*[1], Bellanca N.[2], Arcidiacono C.[1]

[1]University of Naples, Federico II ~ Naples ~ Italy, [2]University of Modena Reggio Emilia ~ Modena- Reggio Emilia ~ Italy

Community well-being is related to several different factors related to the feature of the context: history, location, population size and characteristics, environment, mobility, education, GDP (gross domestic product), etc., are at stake. All these elements contribute to the identity, sense of belonging, and sense of community of a specific area, as well as to the well-being of the inhabitants. In this vein, this contribution will detect what happens in Italian small rural areas characterized by youth disaffection and relational uneasiness and discomfort. Therefore, in these contexts, social, economic, and relational variables, capabilities and their integrated actions will be explored, especially related to youth needs. The main aim will be to investigate the sense of belonging, trust and mattering as predictors of well-being. Sense of mattering is a multidimensional construct resulting from the perception of being valued by the private network and community members. Its components are feeling value and added value. Trust expresses the opportunity to realize oneself in the community of belonging, considering future expectations. Focus groups with adolescents, young people and community stakeholders, and an extensive survey, will be undertaken. The mixed method methodology will explore the protective and risk factors for young generations living in rural communities.

The results of this project carried out to deepen youth mattering and well-being in Italian little territorial communities and rural communities will be presented. The well-being and trust in the future of rural communities with a population of less than 5000 are, in fact, the main priorities of the Italian Association of Municipalities, with an ongoing collaboration. Implications and possible interventions will be discussed.

Abstract 2458

DISABLING EXPERTISE: IMMERSIVE PERSPECTIVE-TAKING TRANSFORMS POVERTY ATTRIBUTIONS

Bos S.*, Brüggen L., Van Der Werf M., Heller J.

Maastricht University ~ Maastricht ~ Netherlands

Introduction/Purpose: Empathy gaps between policy makers and those experiencing poverty limit effective intervention design. This study examines how an immersive virtual reality simulation, co-designed with lived-experience experts, transforms municipal professionals' understanding of poverty through perspective-taking.
Method: Nine iterative activities with lived-experience experts, financial specialists, and citizen groups produced a virtual reality simulation guiding users through impossible trade-offs, bureaucratic complexity, and immediate social consequences. Five focus groups with Dutch public policy professionals (N=47) experienced the simulation before discussion, with follow-up surveys five weeks later (n=15). Thematic analysis examined perspective-taking and meaning-making processes.
Results: Systematic constraints within the narrative enabled perspective transformation through two mechanisms. First, accumulated pressures depleted the analytical processing capacity professionals typically use to maintain interpretive distance. When educated professionals could not navigate welfare forms despite their competence, explanations based on individual responsibility lost credibility. Participants shifted to structural explanations through experiencing barriers rather than receiving information. Second, limiting access to problem-solving tools exposed how expertise functions as an interpretive barrier. Professionals possessed solution knowledge but could not apply it within the simulation's constraints, revealing how their problem-solving orientation assumes agency that clients often lack.
Conclusions: Emotional engagement alone proves insufficient for attribution change in expert populations with analytical frameworks enabling cognitive distancing. Strategic limitation of expertise makes professional assumptions visible for critical examination. The participatory design process demonstrates how collaborative narrative construction addresses ethical concerns while maintaining psychological authenticity. Implications include professional training protocols incorporating experiential constraint and design principles for narrative interventions targeting attributions.

Abstract 2579

THE IMPACT OF EXPOSURE TO IDEALIZED CONTENT ON SOCIAL MEDIA AND SUBJECTIVE WELL-BEING: TESTING A CONDITIONAL INDIRECT EFFECT

Kaynak B.D.*

TED University ~ Ankara ~ Turkey

The increase in social media use has raised concerns about its potential effects on users' subjective well-being, and researchers have extensively studied this topic. However, most studies are correlational, and the primary goal of this study is to examine whether social media exposure influences individuals' well-being using an experimental design. We hypothesized that exposure to academic achievement-oriented social media content (academic achievement vs. running achievement) would reduce positive emotions and life satisfaction while increasing negative emotions through malicious and benign envy. Additionally, the relevance of academic performance to self-definition is expected to moderate this indirect effect. Specifically, exposure to academic achievement-oriented social media content will increase negative emotions and decrease positive emotions and life satisfaction through malicious and benign envy, but only for participants whose self-definition is related to academic achievement. To test this, we conducted an experimental study using the Qualtrics platform. 326 participants (279 Female, 45 Male, and two did not report) first completed the Demographic Information Form and the Relevance of Academic Performance to Self-Definition Scale. They were then randomly assigned to one of two experimental conditions (an Academic achievement-oriented social media post vs. a running achievement-oriented social media post). They completed the PaDe State Malicious and Benign Envy Scale, the Positive and Negative Affect Schedule (PANAS), and the Satisfaction with Life Scale. Results showed that exposure to academic achievement-focused social media posts decreased positive emotions by lowering benign envy. Namely, academic achievement-oriented social media posts decreased benign envy, and as benign envy decreased, positive affect decreased as well. Also, malicious envy predicted negative emotions negatively and life satisfaction negatively, but the mediation effect was not significant. Also, the relevance of academic achievement to self-definition did not moderate either indirect effect. The findings are discussed in the context of how social media use impacts subjective well-being.

Abstract 2686

LONGITUDINAL ANALYSIS OF THE IMPACT OF ANTHROPOMORPHIC AI PERCEPTION ON USER ATTITUDES AND SELF-CONGRUENCE

Kolanska--Stronka M.*[1], Mamcarz P.[2]

[1]SWPS University ~ Warsaw ~ Poland, [2]The John Paul II Catholic University of Lublin ~ Lublin ~ Poland

The integration of AI in education underscores the need to understand the psychological mechanisms governing student-AI interactions. A central construct is self-congruence—the alignment between an individual's self-concept and their perception of a system—which promotes satisfaction and engagement. Research suggests that anthropomorphic AI systems enhance this alignment (Waytz et al., 2014). Drawing on the Technology Acceptance Model (TAM; Davis, 1989), this study investigates how attitudes toward technology, shaped by perceived usefulness and ease of use, influence self-congruence.

A longitudinal study was conducted among 185 university students (mean age = 20.73, SD = 3.09) with assessments in February 2025 (T1) and May 2025 (T2). During this period, students reported a significant increase in weekly AI usage, from 2.55 hours (SD = 3.54) to 4.24 hours (SD = 6.64). Participants completed the AISE Anthropomorphic Interaction scale, the AI Attitude Scale (AIAS-4), and the Self-Congruence Scale. All measures demonstrated high internal consistency (Cronbach's α between 0.81 and 0.90).

We hypothesized that: (H1) higher anthropomorphic perception at T1 predicts greater self-congruence at T1; (H2) AI attitudes at T1 predict self-congruence at T2; and (H3) AI attitudes mediate the longitudinal effect of anthropomorphic perception on self-congruence.

Path analysis revealed strong stability in AI attitudes (β = 0.499) and anthropomorphic perception (β = 0.440). Anthropomorphic perception at T1 had a significant direct effect on self-congruence at T1 (β = 0.289) and influenced T2 self-congruence indirectly via AI attitudes (total indirect effect β = 0.292). The model explained substantial variance in T2 self-congruence (R^2 = 0.362) with good fit indices (SRMR = 0.067, NFI = 0.935).

These findings highlight self-congruence as a vital component of student–AI interactions. In educational contexts, designing AI tools with anthropomorphic features may enhance students' motivation and learning outcomes by fostering positive attitudes and alignment with their self-concept.

Abstract 4558

MAPPING RISK DOMAINS FROM NATURAL LANGUAGE AND DERIVING MULTIDIMENSIONAL RISK PROFILES

Zheng R.*, Yan R.

Institute of Psychology, Chinese Academy of Sciences ~ Beijing ~ China

Background: Risk attitudes are widely recognized as domain-specific, as reflected in frameworks such as DOSPERT. Yet most domain taxonomies remain top-down and may lag behind lived experience. Recent advances in natural language processing (NLP) enable a bottom-up approach by extracting domain structure from how people describe risks in their own words.

Objectives: We aim to (1) derive contemporary risk domains from free-text descriptions of everyday risks and risk decisions, and (2) develop and validate a typology of risk preference by deriving a parsimonious set of multidimensional risk profiles (Frey et al., 2023) that complements variable-centered accounts.

Methods: We collected open-ended responses from 860 chinese adults describing personally salient risks and risk decisions. Texts were embedded using a state-of-the-art sentence model (e.g., bge-large-zh-v1.5). We applied UMAP for dimensionality reduction and HDBSCAN for density-based clustering to construct an interpretable semantic map of risk themes. Guided by the resulting domain structure, we adapted and administered a domain-specific risk preference measure. We then conducted model-based clustering (latent profile analysis and other clustering solutions) to identify a parsimonious set of risk profiles, and characterized them via cognitive patterns, decision tendencies, and sociodemographic correlates.

Results: We obtained an interpretable and updateable taxonomy of risk domains that includes both classic domains (e.g., health/safety, finance) and emergent themes (e.g., online fraud, novel technology risks). We also identified a small number of robust multidimensional risk profiles that capture systematic heterogeneity in risk preference across domains for most individuals, providing a scalable typological framework for risk research and applied risk governance.

Abstract 4605

THE DETERIORATION OF MORAL SELF: DIGITAL AGE DILEMMA

Kvitsiani M.*

Ivane Javakhishvili Tbilisi State University ~ Tbilisi ~ Georgia

Smartphones and social networking sites (SNSs) have become deeply embedded in everyday life, profoundly reshaping adolescents' social environments and behavioral patterns, with growing concerns about their mental and moral development. As outlined in Jonathan Haidt's recent work, the rise in adolescent mental health problems closely coincides with the expansion of the digital era since the early 2010s. Building on this body of research, the present project examines how excessive SNS use may negatively affect the moral capacities of adolescents and young adults.

Empirical evidence across disciplines indicates that increased SNS use is associated with higher levels of depression, anxiety, and antisocial behavior among youth. This project specifically explores whether problematic social media use threatens moral sensitivity, weakens engagement with moral dilemmas, and promotes moral disengagement. Additionally, exposure to violent or weapon-related content for entertainment purposes may hinder moral identity development by reducing sensitivity to harm and increasing aggressive tendencies.

Methodologically, the study integrates findings from psychology, sociology, and media studies to develop a conceptual model illustrating how SNS use may contribute to the erosion of moral standards and the escalation of aggressive behavior, both online and offline. By addressing gaps in current knowledge on digital influences during adolescence, the study aims to inform evidence-based interventions that promote healthier social media use and support robust moral development during critical periods of identity formation.

Abstract 819

THE INTERPLAY BETWEEN DIGITAL DEPENDENCY AND STUDENT ADJUSTMENT IN UNIVERSITIES: AN INDIAN CASE STUDY

Kaur S.A.*[1], Choubisa R.[1], Sharma M.[2], Dhiman S.[1]

[1]Birla Institute of Technology and Science, Pilani, Pilani Campus ~ pilani ~ India, [2]Panjabi University ~ Patiala ~ India

University students experience major transition difficulties when they move from school to university because their digital dependency keeps growing. The research indicates that college adjustment consists of three interconnected elements, which include academic performance management, university social life adaptation, institutional commitment, and personal well-being (Baker & Siryk, 1999; Ribbe, Cyrus, & Langan, 2016). The research field lacks sufficient studies about how college students adapt to university life when their internet and gaming addiction levels rise. Our research investigates how excessive internet and gaming use affects university students during their transition to college life. We obtained survey responses from N≥250 sophomores of a large residential university through stratified sampling. We used the Inventory of New College Student Adjustment (INCA), Young's Internet Addiction Test (IAT), and the Internet Gaming Disorder Scale-Short Form (IGDS9-SF) to obtain the dataset. We used the structural equation modeling (SEM) approach to analyze our research model. We strongly believe that students who spend more time on the internet and gaming systems face greater challenges in their college adaptation process. Our research found that students need help managing their technology use because it affects their ability to build strong relationships and develop confidence in their academic performance during college. We then provide theoretical and practical implications of our research.

BEHIND THE MYTHS: HOW HIERARCHICAL SOCIAL VALUES AND SEXISM CONDONE INTIMATE PARTNER VIOLENCE AGAINST WOMEN

Contreras--Merino A.M.*[1], Aguilera--Martín Á.[3], Farhane Medina N.Z.[3], De La Mata--Agudo C.[2], Castillo--Mayén R.[3], Luque B.[3]

[1]Department of Psychology, University of Cordoba ~ Cordoba ~ Spain, [2]Department of Education, University of Cordoba ~ Cordoba ~ Spain, [3]Department of Psychology, University of Cordoba / Maimonides Biomedical Research Institute of Cordoba (IMIBIC), University of Cordoba, Reina Sofia University Hospital ~ Cordoba ~ Spain

Introduction: Attitudes and beliefs play a crucial role in sustaining intimate partner violence against women (IPVAW). Hierarchical and non-egalitarian ideologies can legitimize or minimize such violence, underscoring the importance of examining the psychological and value-based foundations of IPVAW myth acceptance. Purpose: This work tested an integrative model combining three theoretical frameworks: Social Dominance Theory, the Theory of Ambivalent Sexism, and Schwartz's Theory of Basic Human Values, to explain individual differences in the endorsement of IPVAW myths. Specifically, it examined the role of social dominance orientation (SDO), hostile sexism, and support for universalism as predictors. Method: Data from over 1,700 valid responses (68% women) were analyzed. Validated instruments were used to assess SDO, ambivalent sexism, universalism values, and IPVAW myth acceptance. Structural equation modeling was employed to test the hypothesized pathways. Results: Higher SDO and lower societal concern predicted increased hostile sexism, which in turn elevated acceptance of IPVAW myths. Universalism emerged as a mitigating factor, reducing support for these distorted beliefs. Although men reported higher levels of IPVAW myth acceptance than women, the explanatory model showed consistent patterns across both groups. Conclusions: These findings highlight the central role of hierarchical ideologies and sexist attitudes in sustaining distorted beliefs about IPVAW and underscore the importance of universalist and egalitarian values as protective factors. The consistency of psychopolitical mechanisms across men and women points to the influence of gender socialization processes and adherence to group-based dominance or sexist ideologies. The results provide actionable insights for interventions aimed at challenging such beliefs. By connecting psychological theories with practical strategies for promoting equity and reducing violence, this research aligns with applied psychology's societal mission, contributing to sustainable social well-being and the reinforcement of democratic and equitable values.

Abstract 2539

DECENTRING 'CHILD UTOPIA': TOWARDS AN ADAPTATION-FOCUSED LENS FOR CHILDREN IN STREET SITUATIONS

Arora D.*, Mohanty A.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Introduction: For over a decade now, it has been argued that mainstream developmental psychology has been dominated by Euro-American research conducted with “WEIRD” populations (Western, Educated, Industrialized, Rich, and Democratic). This has led to the academic marginalization of many child development pathways, especially those from the developing regions of the world. This is a theoretical study that integrates the perspectives of prominent researchers who point toward the urgent need to study vulnerable childhoods (particularly children in street situations) as one theoretical corrective.

Theoretical problem and argument: The widely accepted conceptualization of “child utopia,” positing that children exist at the centre of an admiring circle of adults, stands in stark contrast to the lived reality of children in street situations. Departing from the normative image has often led to the perception of the children as “deviants” or “miscreants.” The tendency has resulted in an overemphasis on deficits and an underemphasis on their capacities. Children in street situations experience a plethora of psychosocial hardships and develop exceptional capacities in the face of the same. Yet the intervention efforts continue to be largely founded on remediation, rather than recognizing existing strengths.

The study argues for a re-evaluation of core developmental constructs through an adaptation-focused lens. It is posited that concepts such as “communal agency” may offer a more contextually relevant view as compared to the standard “psychological autonomy” theorizations.

Implications: Decentring “child utopia,” this work contributes to the ongoing paradigm shift towards an inclusive and decolonial psychological science. The proposed direction serves as a foundation for strengths-based and culturally relevant interventions, building on the capacities of marginalized children. The findings highlight the importance of bringing context-specific adaptation to the centre of vulnerability frameworks and re-emphasize the crucial role of applied psychology in influencing societal impact.

Abstract 2685

ADDRESSING GLOBAL VIOLENCE: INCIDENCE, PREVENTION AND SOLUTIONS

Bloom J.*

William James College ~ Boston ~ United States of America

The UN defines violence against women as “any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or summering to women.” Gender-based violence (GBV) is present in every society around the world and takes many forms ranging from human trafficking, sexual abuse to domestic violence (WHO, 2018). GBV has long been recognized as a human rights issue that has serious implications for public and mental health, yet most gender violence not only goes unpunished but is tolerated in silence. One major obstacle in combating GBV is the fragmentation of efforts, highlighting the need for more coordinated and innovative interventions. The six presentations that make up this Symposium address GBV across global populations, in widely varying contexts, and from a range of perspectives, each proposing strategies and interventions that address the pervasiveness of GBV.

The first two presentations on the incidence of Intimate Partner Violence in Oceania and GBV towards gender and sexual minorities in Canada, respectively call for culturally grounded mental health support to achieve gender equality in Oceania, and trauma informed gender affirming care for Two- Spirited, Lesbian, Gay, Bisexual, Trans, Queer, Intersexed sexual minorities in Canada. The following two presentations focus on human trafficking, first, addressing the role of shame in gender violence, demonstrating how shame can be co-constructed in dialogic exchange between self, perpetrator, family members. Second, the intersectionality of war and human trafficking in war torn countries is presented. Next, domestic violence among refugees populations is addressed, utilizing transnational feminist and intersectional approaches to address the unnuanced binary of victim/perpetrator. The final presentation focuses on climate change and weather related disasters exacerbate gender-based violence (GBV), disproportionately affecting women and girls. Understanding these dynamics is essential for advancing psychological science and practice in global contexts.

Abstract 2527

IS EVERYONE WELCOME HERE? LGBT BELONGING IN PORTUGAL'S TOP FIVE BUSINESS SCHOOLS

Falé L.*, Jalali M., Costa S.

ISCTE - instituto universitário de Lisboa ~ Lisbon ~ Portugal

Are business schools creating environments where all faculty and students can thrive? That stakes the problem as both managerial, regarding school performance and talent development, and societal, regarding the leaders universities produce. We examine how faculty in Portugal's five Financial Times–ranked business schools perceive institutional climates for lesbian, gay, and trans (LGBT) people, foregrounding neo-institutional decoupling, psychological safety, and disclosure regimes as meso-level mechanisms. Because business schools model managerial norms for future leaders, faculty attitudes shape expectations for pedagogy, research, and student experience.

We analyzed 75 semi-structured interviews across disciplines and ranks using Gioia procedures. Credibility was supported via an audit trail, coder dialogue on edge cases, and reflexive statements on positionality. We theorize how policy signals translate (or fail to translate) into everyday interaction, specify difference-denying universalism as a distinct workload-shifting mechanism, and delineate an inference-driven disclosure regime that produces strategic silence.

Our analysis yields a three-dimensional structure.

(1) Policy–practice decoupling and ceremonial DEI. Inclusion policies aligned with national law signal progress outwardly yet remain weakly coupled to daily routines; "civility" functions as impression management that licenses back-stage mockery and strategic compliance.

(2) Difference-denying universalism and interactional accountability. Appeals to "blindness" equate identical treatment with equity while reallocating institutional learning costs to marginalized colleagues through uneven "diversity work."

(3) Heteronormative disclosure norms. Heterosexuality and cisgenderism structure visibility: LGB status is inferred from topics, self-presentation, or social cues, whereas heterosexuality is presumed via openly shared family status. Heightened legibility amplifies reputational risk, prompting self-monitoring and strategic silence.

Consistent with evidence on psychological safety and accountability, departments should translate policy into enforceable interaction norms, assign climate responsibility to middle leadership, and formalize fair service rotation/recognition to curb presentation policing and strengthen everyday belonging. Findings reflect Portugal's business-school sector; transferability to comparable higher-education settings will be discussed.

Abstract 3318

COLLECTIVE IMPACT APPROACHES TO POVERTY REDUCTION, HEALTH EQUITY, AND MULTISECTORAL PARTNERSHIPS IN PUERTO RICO

Melendez Olmo F.*

Grupo Nexos ~ San Juan ~ Puerto Rico

Structural poverty is a key driver of health disparities in Puerto Rico, contributing to limited access to healthcare, high school dropout rates, unemployment, and inadequate housing. The ComPASS needs assessment across 21 municipalities underscored these inequities, documenting persistent socio-economic vulnerabilities and their impact on child and family well-being. To address these systemic challenges, the ComPASS-PR initiative adopted the Collective Impact (CI) Model to align multisectoral agendas and foster long-term collaboration. The CI Model emphasizes five conditions for large-scale social change: a common agenda, shared measurement systems, mutually reinforcing activities, continuous communication, and backbone support. Guided by these principles, ComPASS-PR convened over 70 stakeholders from government, academia, community-based organizations, and the private sector to co-develop strategies addressing poverty and health disparities. Nine strategic planning tools—including problem tree analysis, empathy mapping, collaboration spectrum, and multi-stakeholder forums—were applied to structure collaboration and prioritize actions. A steering committee was established to guide the process and ensure accountability. Through this collective work, participants defined a shared vision to eradicate child poverty, identifying critical barriers such as lack of affordable housing, unemployment, dropout rates, and fragmented healthcare access. Findings highlight both the potential and the challenges of sustaining multisectoral collaboration. Key facilitators include the strong engagement of community organizations and the use of structured participatory tools, while barriers include resource constraints and institutional silos. This initiative illustrates how applied psychology can inform strategies for systemic change by fostering trust, dialogue, and shared ownership among diverse actors. The CI Model provides a replicable framework for building sustainable infrastructures that promote equity, well-being, and social justice in Puerto Rico and beyond.

Abstract 2530

FROM NORMALIZATION TO AWARENESS: SEXISM AND THE PSYCHOLOGICAL BURDEN OF STREET HARASSMENT FOR WOMEN

Contreras--Merino A.M.*[1], López--Povedano F.[3], Castillo--Mayén R.[2], Farhane Medina N.Z.[2]

[1]Department of Psychology, University of Cordoba ~ Cordoba ~ Spain, [2]Department of Psychology, University of Cordoba / Maimonides Biomedical Research Institute of Cordoba (IMIBIC), University of Cordoba, Reina Sofia University Hospital ~ Cordoba ~ Spain, [3]University of Cordoba ~ Cordoba ~ Spain

Introduction: Street harassment represents a pervasive form of violence that undermines women's freedom, safety, and psychological well-being. Its normalization has contributed to the limited research on its prevalence and psychological consequences, particularly within European contexts. Beyond individual experiences, ideological factors, such as sexist beliefs and tolerance toward inequality, are key factors in maintaining this social problem. Purpose: The present work examined the prevalence, contextual characteristics, and psychological consequences of street harassment, as well as the influence of sexist attitudes on its occurrence and perception, drawing on evidence from complementary quantitative and qualitative data collected from women in Spain. Method: Data were collected from nearly 250 women through survey-based measures assessing harassment prevalence, anxiety, fear of rape, avoidance behaviours, and self-esteem, alongside qualitative daily-diary records from over sixty participants, documenting daily harassment experiences, emotional reactions, and coping strategies. Validated instruments were used to assess sexist beliefs and related variables. Results: Street harassment was highly prevalent: most women reported experiencing it at least once in their lives, and many on a monthly basis. Quantitative analyses revealed significant associations between harassment frequency and higher anxiety, fear of rape, and avoidance, as well as lower self-esteem. Qualitative data highlighted feelings of discomfort, anger, and insecurity, showing that most coping strategies were passive. Sexist ideology influenced the perception and normalization of harassment but appears not to reduce its psychological impact. Conclusions: Findings underscore the need to address street harassment as a serious form of violence affecting women's psychological health and everyday freedom. Tackling its ideological roots through education, awareness, and applied psychological interventions is essential for promoting equity, supporting sustainable well-being, and fostering safer, more equitable public spaces for women.

THE POWER OF STORIES: USING LIVED EXPERIENCES AND STORY-TELLING TO BUILD BRIDGES IN AN ERA OF GLOBAL ISOLATIONISM

Saturday 25 July 2026 from 10:30 to 12:00

(D-Spadolini)

Indhushree Rajan (The Conscious Life Psychological Service), Chair and Presenter

We are living during a time in which our stories are judged, and our identities are assumed before many of us even speak. The broad brushstrokes of global isolationism are becoming more defined by the day. As populist and nationalist narratives gain popularity worldwide, "the term and the concept of isolationism are not consigned to the past anymore" (Elving, 2024). The truth of our individual and collective lived experiences forms the tension point in a growing mix of narratives that threaten to 'other' and marginalize those who challenge the prejudices and xenophobic views that have dampened the basic human right of authentic self-expression for countless people all over the world. Within this context, "collaborative autoethnography can be a valuable method for lived experience research that challenges power dynamics and subjectivities […] a safe space […] even amidst the sharing of difficult stories. (Hislop, et al. 2023) Using an autoethnographic account of three different professional contexts, clinical, educational, and mediated communication, this oral presentation will highlight the role played by stories and first-hand experiences in the lives of five women, with the intention of building bridges and encouraging the establishment of alliances between participants in each context. We argue here that before any professional communication takes place, it is first important to make space for the sharing of personal experiences, ensuring that those in dialogue feel seen and heard. This becomes particularly important when working with individuals from marginalised social groups whose voices are silenced and suppressed within mainstream communication practices. In analysing our own lived experiences as women from minoritized social groups, we will highlight the role stories and the sharing of lived experiences within a real or perceived 'safe space' play in bridging the gaps between different individuals and communities in increasingly atomised global social contexts.

Abstract 3397

IMMIGRANT IDENTITIES IN THEORY AND PRACTICE: UNDERSTANDING MY ALIENATION AS A STUDENT AND NEW RESEARCHER

Magioglou T.*

Westminster University ~ Westminster ~ United Kingdom

One of our students at the University of Westminster, a brilliant mixed-race Greek woman, told me about her feelings of alienation owing to her bi-racial identity, and prejudices that inform academic culture in Greece. I realized that despite our differences, her experience was very relatable to me. I come from a different life path, but I still struggled to claim a voice in my academic work in a way that is authentic to my cultural identity, while navigating the alienation that I have felt in academic systems. My contribution in this collective lived experience study will be to show how my Greek and Turkish immigrant heritage seemed to equip me with meanings that were not visible in the mainstream school system, nor in my adopted academic cultures. From my experience and life in Greece, France, Switzerland, and the UK, trying to be an authentic co-author, rather than a consumer of meanings and identities, didn't seem an easy path. Mainstream psychology was alienating in my eyes, and along with this, I had to navigate the risk and fear of not being taken seriously. Most of all, I felt lost in translation, having adopted tools and methods without questioning whether they aligned with my life experience. Or it was a price too high to pay to get published and hired. This presentation proposes that validating and honoring the perspectives of individuals from marginalized social groups, whose voices are often silenced and suppressed within mainstream communication practices, is crucial for finding solutions to contemporary challenges.

Abstract 3398

WHISPERING THROUGH THE FOG: THE POWER OF RECLAIMING MY VOICE AND USING IT TO ELICIT CHANGE

Lawrence L.*

Protect Your Peace ~ Buckeye ~ United States of America

As a Black woman socialized in the United States, I liken navigating predominantly white professional spaces to whispering my way through a forest with the pervasive fog of white supremacy distorting my reality. This visual distortion often resulted in the muting of my voice during adverse racial incidents and internalizing false beliefs, which, over time, contributed to my walking in fear instead of sovereignty. After years of blindly struggling to traverse this forest, I am excited that the fog is beginning to dissipate. I am reclaiming the truth of who I am, whose I am, and how I may utilize my voice to assist others in reclaiming their self-determination and sovereignty. Hence, my symposium contribution includes personal accounts of my evolution toward confidently utilizing my voice in predominantly white professional spaces and highlights the benefits of engaging in difficult conversations and the consequences of remaining silent.

Abstract 3399

SUPPORTING BLACK WOMEN: ALLY VS. ACCOMPLICE

Eugene D.*

NYU Abu Dhabi, Saadiyat Campus ~ Abu Dhabi ~ United Arab Emirates

This discussion aims to address a major public health concern: safety in the workplace for black women. Institutions often position themselves as advocates for social justice, proudly advertising their commitment to inclusivity and equality. However, behind scholarly excellence lies a dark legacy of systemic inequities rooted in white supremacy. Policies, practices, and structures have historically been intertwined with the ideals of privilege, elitism, and whiteness, deliberately constructed to uphold the existing social order. Blackness, by its very nature, is rejected. Apart from personal experience like a loss of identity and a sense of disconnection from own communities, women are faced with feeling “not enough.” We will create the space to explore the historical systems of power that have perpetuated white privilege and systemic discrimination worldwide. This session intends on discussing the systemic racialization of power that has shaped institutions, resulting in the exclusion and discrimination faced by black individuals across various geographical and cultural contexts. Discussion will include the complexities of the lived experiences of black women in academia, emphasizing the intersectional oppression that arises from the convergence of womanhood and blackness.

Abstract 3400

OUR STORIES MATTER MOST: UNDERSTANDING THE CONNECTION BETWEEN AUTHENTIC STORY-TELLING AND THE THERAPEUTIC ALLIANCE

Rajan I.*

The Conscious Life Psychological Services ~ Los Angeles ~ United States of America

As clinicians, recognizing our clients' need for human connection and meaning-making is more important than the depth of professional knowledge and perceived expertise we bring to the treatment space. We need our stories. We need to feel like our stories matter. In clinical work with clients, research shows that the therapeutic alliance is the most significant predictor of healing & therapeutic success. "There is consistent evidence that the quality of the therapeutic alliance is linked to the success of psychotherapeutic treatment across a broad spectrum of patients, treatment modalities, presenting problems, contexts, and measurements" (Stubbe, 2018). Central to the trust borne of this alliance is the clinician's ability to hold the client's story in a non-judgmental way, creating a safe space in which they can express themselves authentically. Using a narrative framework in therapy fosters a sense of human connectedness in a way that helps clients realize that their stories are important. They are empowered to discover self, relationship, and a vision for the future that extends beyond their experiences of trauma and fear; "[…] people's lives and relationships are shaped by the stories they develop to give meaning to experiences (Etchison & Kleist, 2000). In addition, invisibility and othering are prevalent in non-dominant peoples, so we must strive to see, accept, and honor the person in front of us, within the authentic cultural, ethnic, and communal experiences that have shaped them, before we see them through a treatment lens. This presentation will consider the importance of authentic storytelling and a lived experience perspective, to trust and healing in the treatment space, as evidenced in excerpts from three clinical cases.

Abstract 3402

THROUGH THE LOOKING GLASS: CONNECTION AND SOCIAL INTERACTION THROUGH SOCIAL MEDIA

Coen S.*

University of Salford ~ Salford ~ United Kingdom

Drawing on my experience of isolation during the COVID -19 pandemic, this autoethnographic contribution explores my experiences as an Italian migrant in the UK, and an environmental activist in the STOP HS2 campaign. Building on lived experiences that incorporate technology for connection, I will reflect on the role played by the internet and social media in bridging communities and loved ones, and the 'affective paradoxes' emerging from this practice (Leurs, 2019). This presentation highlights the tensions between mediated connectedness and feelings of exclusion, silencing, and self-censoring. In addition, I will consider the phenomena documented in current literature, speaking to the potential of online platforms to aid in fostering inclusivity and empathy, bridge cultural divides, and challenge dominant representations (Montgomery, 2018). I will also consider the role that online (and offline) communities have to play in developing mitigating strategies to minimise exclusivity (Nyabuto, 2023).

Abstract 1408

AUGMENTED AND VIRTUAL REALITY IN MUSEUMS: NEUROSCIENCE INSIGHTS ON ENGAGEMENT AND DONATIONS

Rossi C.*[1], Russo V.[1], Zito M.[1], Zak P.J.[2]

[1]Department of Business, Law, Economics and Consumer Behaviour "Carlo A. Ricciardi", Università IULM, Milan, Italy ~ Milano ~ Italy, [2]Center for Neuroeconomics Studies, Claremont Graduate University, Claremont, California, USA ~ Claremont ~ United States of America

Introduction

Museum attendance has dropped substantially in recent years. Some museums are seeking to increase interest and engagement by creating experiences in Augmented Reality (AR) and Virtual Reality (VR). Nevertheless, very few studies have investigated their neurophysiological and behavioral effects on visitors.

Purpose

This study examines whether implementing AR/VR museum experiences enhances visitors' neurophysiological immersion and, in turn, fosters deeper engagement with art and a greater propensity to donate within the cultural sector.

Method

Fifty participants were randomly assigned to either a control group (n=25), which took a traditional museum tour, or an experimental group, which experienced a museum visit enriched with AR and VR content. The VR content consisted of two 360° environments on Meta Quest 3, while the five AR experiences consisted of informational videos that could be activated via tablet by scanning markers. Both groups visited a museum in Milan. Neurologic immersion, measured using a wearable device connected to Immersion Neuroscience software, captured the value the brain derived from the experience. Pre and post-visit questionnaires measured visitors' attitude toward donating and their engagement with art.

Results

The experimental group had 42% higher peak immersion (M=0.54, SD=0.03) than the control group (M=0.38, SD=0.07; p< .001). This result was robust to covariates for age and gender, which, however, did not differ between the two groups. A mediation model indicated a significant indirect effect of peak immersion on the attitude to donate money (β=0.148, p= .033), which was mediated by behavioral engagement with art.

Conclusions

The analysis shows that AR/VR technology may offer greater neurological immersion value than traditional museum visits. This indirectly affects the attitude to donate through increased behavioral engagement with art. The results support the use of AR and VR content in museum contexts to promote cultural participation and prosocial donation behaviors.

Abstract 2027

LARGE LANGUAGE MODELS AND THEIR PSYCHOMETRIC PERSONALITY PROFILE: RESULTS OF A SYSTEMATIC REVIEW

Klaps A.*[1], Landrichter B.[2], Stetina B.U.[1]

[1]Sigmund Freud University Vienna ~ Vienna ~ Austria, [2]Codara ~ Vienna ~ Austria

Introduction and Purpose: Large language models (LLMs) are increasingly integrated into human-facing domains, yet a thorough understanding of their underlying functionality, particularly during autonomous interactions with humans, remains limited. Consequently, questions regarding their psychological characteristics, especially personality traits, have become more prominent. The purpose of this paper is to synthesize existing findings on the personality profiles of LLMs using validated personality inventories.

Methodology: A systematic review was conducted in accordance with PRISMA guidelines, focusing on studies from 2019 to 2025 to capture recent developments in information and communication technology. A search of PubMed identified 36 results, with 4 meeting the criteria for quantitative analysis using validated instruments. An additional search of Xiv.org yielded 53 results, of which 3 met the inclusion criteria.

Results: Most instruction-tuned models produce stable, prosocial, and emotionally resilient personality profiles. However, results vary considerably across software versions, prompting strategies, and architectural configurations. Temporal stability is limited, and human-like biases such as social desirability are evident. Certain LLMs also display elevated levels of dark traits, such as Machiavellianism, which raises ethical concerns.

Conclusion: This analysis underscores both the diagnostic potential and the limitations of psychometric methods in evaluating artificial intelligence. Methodological heterogeneity, construct validity, and the effects of fine-tuning warrant further investigation. Implications for AI alignment, psychological safety, and the responsible design of personality-driven AI agents are discussed, including an overview of an emerging legal application for end-users. Future research should employ experimental designs to further examine the dynamics of change in LLMs and the subjective experiences of users.

Abstract 1516

ENHANCING CUSTOMER SERVICE PERFORMANCE THROUGH LLM-BASEDMULTIMODAL ROLE-PLAY TRAINING

Konno T.*[1], Iwasaki S.[1], Shidara K.[1], Yoshioka T.[1], Kiriu M.[2]

[1]Fujitsu Limited ~ Kanagawa ~ Japan, [2]Toyo University ~ TOKYO ~ Japan

Customer service employees frequently face emotionally demanding interactions, including unreasonable customer behavior and high-pressure communication, which can lead to elevated stress and reduced workplace performance. To address these challenges, we developed a multimodal training system utilizing large language models (LLMs) to simulate realistic customer interactions and provide personalized feedback. The system integrates two core components: a role-play agent that generates psychologically grounded customer scenarios, and a feedback agent that delivers individualized conversational guidance based on social psychology principles.

We conducted a four-week field study with 12 call center employees to evaluate the system's effectiveness in a real-world setting. Participants reported notable improvements in interpersonal communication skills, increased motivation to engage in further skill development, and enhanced overall productivity. To ensure psychological safety during training, we also explored a non-invasive stress measurement method using millimeter-wave signals from a contactless sensor. The collected data enabled the construction of a stress estimation model with high accuracy, allowing adaptive support during emotionally intense role-play sessions.

Our findings suggest that LLM-based multimodal role-play systems can serve as effective tools for improving customer service competencies while supporting employee well-being. This research contributes to the design of psychologically informed AI training environments and offers practical implications for scalable, personalized skill development in high-stress occupations.

Abstract 1969

BRIDGING BARRIERS WITH TECHNOLOGY: VIRTUAL REALITY-BASED REHABILITATION FOR REFUGEE PROBATIONERS

Yeniceri Z.*[1], Erkunt Kanoglu A.C.[2]

[1]Baskent University, Department of Psychology ~ Ankara ~ Turkey, [2]Justice Academy of Turkiye ~ Ankara ~ Turkey

With the rising number of refugees and immigrants globally, these populations' unique and pressing needs necessitate responsible actions by authorities. Refugees often face unmet physical and psychological needs, placing them at higher risk of engaging in substance use and criminal activities. To address such vulnerabilities, the Council of Europe adopted the Recommendation on Probation [Rec(2011)13], emphasizing the removal of barriers to health service accessibility for migrants. Yet, probation professionals continue to encounter significant challenges -particularly language barriers- hindering effective stress management support for refugee probationers.

Virtual reality (VR) has recently emerged as a therapeutic tool for psychological disorders and skill training, including emotion regulation, problem-solving, and communication. Building on this potential, the international project was developed through collaboration between Türkiye, Portugal, Romania, and Germany, and supported by the Erasmus+ Strategic Partnership Programme. The project leverages VR to provide specialized, safe, and culturally sensitive training to refugee probationers, focusing not only on reducing substance use but also on strengthening coping skills such as stress management, decision-making, and moral reasoning. Four VR scenarios have been designed for this purpose.

An initial pilot study with fifteen substance-using refugee offenders in Türkiye and Portugal, demonstrated the feasibility of VR-based interventions within probation settings. Currently, a follow-up phase is underway at the Probation Directorate, collecting additional data to evaluate the longer-term impact of VR-based training. This phase allows assessment of sustained changes in coping skills, substance use behavior, and reoffending risk among refugee probationers.

Preliminary findings from the pilot implementation and ongoing follow-up indicate that VR-based training can enhance coping skills, support stress management, and potentially reduce substance use and reoffending risk. These results highlight the promising role of VR technology as an innovative tool for rehabilitation in probation systems and underscore its potential for culturally sensitive, scalable interventions.

Abstract 211

TRUST, RISK, AND CULTURAL VULNERABILITY: UNDERSTANDING THE IMPACT OF TELECOM SCAMS ON CHINESE COMMUNITIES IN THE UK

Li Y.*, Liu X.

University of Strathclyde ~ Glasgow ~ United Kingdom

Telecommunication fraud is a rapidly growing threat in the digital era, yet its effects on culturally minoritized communities remain underexplored. Chinese diaspora populations in the UK are often framed as particularly vulnerable, but existing accounts tend to emphasize individual-level deficits such as digital illiteracy or naivety. This literature-based project challenges these assumptions by investigating how scam susceptibility is structured by broader cultural, institutional, and relational contexts.

Drawing on practice theory, vulnerability is conceptualized not as a static trait but as an emergent property of routinized interactions shaped by linguistic barriers, cultural norms, and fragmented institutional trust. Through a critical synthesis of interdisciplinary literature spanning psychology, migration studies, and digital sociology, the review identifies key dynamics—such as symbolic shame, diaspora positioning, and risk communication practices—that condition responses to fraudulent contact. The resulting conceptual framework, to be completed by the time of presentation, aims to reframe scam vulnerability as culturally and socially embedded. This theoretical contribution offers implications for culturally responsive policy, preventative interventions, and future empirical design.

Abstract 1726

ANALYSIS OF PHYSIOLOGICAL AND PSYCHOLOGICAL CHARACTERISTICS IN SPECIAL FRAUD VICTIMS

Yoshioka T.[1], Awai S.[1], Konno T.*[1], Kiriu M.[2]

[1]Fujitsu Limited ~ Kanagawa ~ Japan, [2]Toyo University ~ Tokyo ~ Japan

Recently, the significant increase in special fraud cases has highlighted the critical need to understand the psychological and physiological characteristics of victims to enhance prevention. This research aimed to shed light on these aspects, particularly among elderly individuals, by reproducing simulated special fraud scenarios. The objectives were to identify changes in physiological indicators, such as heart rate and respiration rate, and psychological states like tension and confusion, and subsequently, to unravel the mechanisms by which elderly individuals fall prey to fraud. A deception-based experiment was conducted involving 28 elderly participants (mean age 74.4 years). Participants were first exposed to a "daily conversation" audio, followed by a "fraudulent conversation" that offered increased rewards in exchange for personal information for the experimental group. During these interactions, physiological responses were measured, and psychological states were assessed using the Profile of Mood States 2 (POMS2) questionnaire. We also recorded whether participants were "deceived," i.e., whether they were willing to provide personal information for the promised reward. Statistical analysis revealed that the experimental group exhibited significantly higher heart rates and a tendency towards increased tension during the simulated fraud. Further analysis showed that deceived individuals initially experienced agitation, marked by elevated heart rates, but later showed lower heart rates and reduced tension as they seemingly came to trust the fraudulent claims. Applying this detailed understanding of the principles of individual deception, we developed a generative AI-powered dialogue training system for preventing specialized fraud.

ONTOPSYCHOLOGICAL PEDAGOGY AND THE CHALLENGES OF TODAY'S ADOLESCENTS: HIKIKOMORI, IDLENESS, AND DIGITAL FRAGILITY

Saturday 25 July 2026 from 11:00 to 12:30

(S-Monumentale)

Pamela Bernabei (Antonio Meneghetti Scientific and Humani), Chair and Presenter
Gabriella Palumbo (International Ontopsychology Association), Discussant

Adolescence today faces conditions of profound disorientation. One widespread phenomenon is Hikikomori - severe social withdrawal in which adolescents refuse to leave their rooms, cutting themselves off from school, work, and community life. Others embody the NEET condition - neither studying, nor working, nor training - drifting into indolence and dependence. Still others experience crises of identity and fragility, amplified by digital hyperconnection and the pressure of virtual models.

This symposium presents the ontopsychological pedagogy founded by Antonio Meneghetti as a framework to address these challenges. Its method is based on the recognition of the ontic In Sé as criterion of authenticity, and on pedagogical principles such as overcoming social memetics, educating to the harmonization of natural intentionality with social norms - and cultivating a renewed scale of values to orient youth in contemporary society.

Ontopsychological pedagogy offers a formation that integrates knowledge, responsibility, and creativity, aiming at the full realization of the person in his or her historical and social context. By restoring adolescents to their initiative and natural intentionality, it transforms withdrawal into participation, passivity into responsibility, and fragility into resilience.

The symposium is relevant to ICAP 2026 because it introduces an original pedagogy that responds to urgent global youth crises while aligning with SDG 4 (Quality Education). It offers a model of integral formation that equips adolescents to face contemporary challenges not as passive recipients of societal pressure, but as protagonists of their own development.

Presentations will cover:

1. The theoretical framework of ontopsychological pedagogy
2. The potential of digital mental health to advance the SDGs
3. Responses to adolescent isolation (Hikikomori)
4. Education against indolence and NEET dynamics
5. Identity and digital hyperconnection
6. Strategies for forming adults capable of leadership and service

Abstract 3425

THEORETICAL FOUNDATIONS OF ONTOPSYCHOLOGICAL PEDAGOGY

Linde N.*

Baltic Ontopsychology Association ~ Riga ~ Latvia

Ontopsychological pedagogy is grounded in the recognition of the ontic In Sè as criterion of authenticity and growth. A central principle is the capacity to harmonize natural intentionality with the social rules of one's context. For adolescents, this means neither rejecting society nor passively conforming, but learning to discern choices that serve both authentic self-realization and civic responsibility. The pedagogy educates to responsibility, creativity, and the ability to act within history. It does not impose abstract doctrines; rather, it offers a practical method to recover the signals of one's own nature and apply them in daily choices. This contribution shows how these principles provide a solid theoretical framework to confront the disorientation and fragmentation experienced by many young people today.

Abstract 3426

OVERCOMING ADOLESCENT ISOLATION (HIKIKOMORI)

Bianchi P.*, Bernabei P.

Antonio Meneghetti Scientific and Humanistic Research Foundation ~ Lugano ~ Switzerland

The phenomenon of Hikikomori—adolescents who withdraw completely from social life, refusing school, work, and even leaving their room—has become a global challenge. Ontopsychological pedagogy interprets this retreat as the effect of social memetics and external stereotypes that divert young people from their natural intentionality.

A preventive strategy highlighted in this pedagogy is the creation of social nests, educational contexts introduced since early childhood to foster authentic contact with reality and a positive relationship between the individual and society. Such environments help prevent children from remaining closed within familistic logics or conditions of isolation. By learning to interact in constructive social contexts, children develop resilience and responsibility that protect them from later withdrawal.

At the adolescent stage, strategies include experiential learning, responsibility for concrete tasks, and recovery of presence in daily life, transforming closure into openness and participation.

Abstract 3427

FROM IDLENESS TO RESPONSIBILITY: REBUILDING A SCALE OF VALUES

Palumbo G.*

International Ontopsychology Association ~ Rome ~ Italy

Many adolescents today experience indolence or the NEET condition, drifting without motivation for study or work. This disengagement often reflects the absence of a meaningful scale of values that can guide choices and energize commitment. Ontopsychological pedagogy proposes re-educating youth to values rooted in vitality, responsibility, and constructive presence in society. By recognizing the difference between imposed stereotypes and authentic intentionality, adolescents can learn to identify values that increase life, creativity, and dignity. The presentation highlights practical pedagogical pathways that help young people assume responsibility, discover personal vocation, and transform passive attitudes into constructive action. Rebuilding a scale of values is not moralistic prescription but the rediscovery of criteria that orient adolescents toward a life of self-realization and effective contribution to their community.

Abstract 3428

DIGITAL FRAGILITY AND THE IMPORTANCE OF EVERYDAY MIRICISM

Russo G.*

Sociedade Brasileira De Hipnose ~ Belo Horizonte ~ Brazil

Digital hyperconnection exposes adolescents to anxiety, comparison, and fragile identity. The virtual world often imposes models that distract from authentic growth, creating dependency on external validation. Addressing this challenge entails embracing a pedagogy that cultivates everyday miricism—the ability to perceive beauty, meaning, and vitality in ordinary actions and relationships. By training attention toward reality and valuing small daily achievements, adolescents can strengthen their sense of self and resist the illusions of virtual recognition. This presentation shows how miricism counters dispersion and superficiality, helping youth to root identity in lived experience rather than digital projection. Pedagogical practices that emphasize presence, concreteness, and the joy of simple action allow adolescents to rediscover equilibrium and resilience in a time marked by digital overstimulation.

Abstract 3429

FROM ADOLESCENTS TO LEADERS: RESPONSIBILITY AND HISTORICAL VOCATION

Bernabei P.*[1], Ai M.[2]

[1]Antonio Meneghetti Scientific and Humanistic Research Foundation ~ Lugano ~ Switzerland, [2]International Ontopsychology Association ~ Beijing ~ China

This presentation examines how ontopsychological pedagogy prepares adolescents to become responsible adults and, for some, future leaders. Central is education to responsibility and historical vocation: understanding that one's existence gains meaning when translated into action within society. Pedagogy in this sense cultivates initiative, autonomy, and the courage to take charge of one's life. Within this framework, certain individuals—according to their vocation and commitment—may grow into leaders capable of serving society and building human-centered communities. The focus is not on producing leaders uniformly, but on forming resilient and constructive personalities so that each adolescent can realize his or her potential and contribute meaningfully to the common good.

PREVENTION IN PRACTICE: THE 'VOIES' PROJECT TO SAFEGUARD CHILDREN WITH SPECIAL NEEDS FROM SEXUAL ABUSE

Allard--Cobetto P.*, Hébert M.

Université du Québec à Montréal ~ Montreal ~ Canada

Childhood sexual abuse (CSA) is a serious public health issue associated with harmful consequences. Children with cognitive challenges, such as intellectual disabilities, are 3.5 times more likely to experience CSA than their neurotypical peers, and the impact on their mental and physical health can be amplified (Daigneault et al., 2023). In response to this critical issue, the 'Voies' project was developed to train professionals to deliver sexuality education and sexual violence prevention workshops to these children. To assess the impact of the project, as well as the perspectives and recommendations of trained practitioners regarding the tools and training, 12 individual interviews were conducted with practitioners (M = 32.7 years; SD = 9.2). Thematic analysis revealed that participants reported feeling more confident and better prepared to respond to disclosures and problematic sexual behaviors, as well as to facilitate prevention workshops in their workplace. The training and tools were commended for their adaptability, clarity, and relevance across diverse professional settings. However, professionals emphasized the need for clearer guidelines when working with non-verbal children and those with severe disabilities. Key recommendations include the development of tailored tools for non-verbal children and the enhancement of parental support resources. Overall, the findings suggest that the 'Voies' project fosters collective awareness, strengthens intervention practices, and holds promise for improving the safety and well-being of vulnerable children.

Abstract 1399

SECONDARY VICTIMIZATION IN THE CONTEXT OF CHILD PROTECTION: PROFESSIONAL PRACTICES AFFECTING IPV SURVIVORS AND THEIR CHILDREN

Cecconi A.*[1], Albanesi C.[2], Tomasetto C.[2]

[1]Department of Psychology, University of Bologna ~ Bologna ~ Italy, [2]Department of Psychology, University of Bologna ~ Cesena ~ Italy

Most research on secondary victimization in the context of intimate partner violence (IPV) has focused on the criminal justice system. However, some studies have shown that post-separation and custody arrangements also emerge as critical settings where secondary victimization can affect both women and their children. Nevertheless, literature still lacks a systematic analysis that examines its specific manifestations in this context, as well as its potential causes and implications.

This exploratory study aims to provide an in-depth understanding of the secondary victimization experienced by IPV survivors and their children, perpetrated by service providers involved in child protection services. We conducted semi-structured interviews with 26 professionals from Italian gender-based violence (GBV) services, collecting their professional perspectives as privileged witnesses. A thematic analysis was performed.

The results reveal that, beyond well-known forms of victim-blaming or minimization (e.g., labeling IPV as "marital conflict"), service providers involved in post-separation arrangements may perpetrate secondary victimization through specific dynamics. These include constant scrutiny and questioning of the survivor's maternal competence, gendered expectations around parenting, and misinterpretation of trauma-related responses and distress. Children exposed to IPV also experience secondary victimization, including dismissal of their perspectives, inadequate interview procedures, and enforced co-parenting arrangements that overlook safety concerns. Moreover, survivors with a migration background and/or disabilities face distinct challenges. Consequences include trauma, confusion, and disempowerment for both women and children, which may lead to disengagement from services. In addition, interagency cooperation remains inconsistent, partly due to lack of GBV-specific training, legal ambiguities and professionals' personal biases, with GBV practitioners often compensating for these shortcomings.

In conclusion, these findings illustrate specific manifestations of secondary victimization in post-separation contexts and its impact on both IPV survivors and their children. Strengthening service providers' awareness through targeted training is essential to prevent secondary victimization, improve GBV services, and promote safer outcomes and survivors' wellbeing.

Abstract 524

ADAPTING AN EDUCATIONAL PROGRAM ON INTIMATE PARTNER VIOLENCE FOR ADOLESCENT GIRL SURVIVORS OF SEXUAL ABUSE: THE PERSEID PROJECT

Guyon R.*[1], Hébert M.[2], Moran--Novash J.[2], Brodeur G.[3], Fernet M.[2]

[1]Laval University ~ Québec ~ Canada, [2]University of Quebec at Montreal ~ Montreal ~ Canada, [3]~ Montreal ~ Canada

Adolescent survivors of sexual abuse are at an increased risk of experiencing violence in their first romantic relationships, making them a priority population for targeted prevention efforts. Exposure to multiple forms of violence during adolescence often results in distinct yet cumulative psychological consequences, including post-traumatic stress disorder, difficulty recognizing unhealthy relationship dynamics, and impaired sense of self. These consequences necessitate tailored psychoeducational interventions that go beyond universal prevention programs. This project aimed to adapt the evidence-based program Sparx, originally designed to promote positive romantic relationships among youth and delivered in high schools, to meet the specific needs of adolescent girl survivors of sexual abuse in a clinical setting. The adapted version, named Perseid, was developed in collaboration with the Intervention Center on Sexual Abuse for Families, where it is implemented. Based on the intervention mapping approach (Bartholomew et al., 2016), the adaptation followed six steps: (1) a need assessment with adolescents and clinicians; (2) development of a theoretical adaptation matrix; (3) selection of relevant psychological and trauma frameworks; (4) redesign of workshop activities; (5) pilot implementation in clinical group interventions; and (6) preliminary evaluation and adjustment of activities. Data sources included focus groups with adolescent girls and clinicians and observation notes from pilot sessions. Preliminary feedback highlights the program's relevance, the importance of using a trauma-informed approach, and the need to reduce the number and length of prevention activities to allow more time for personal reflection for vulnerable youth. The Perseid project illustrates how psychological theory and applied methods can inform the adaptation of universal prevention programs for vulnerable youth populations. Recommendations will be formulated for practitioners and researchers seeking to design or adapt trauma-informed, evidence-based programs for adolescent survivors of sexual abuse.

Abstract 1385

REIMAGINING RESILIENCE: DEVELOPING A CULTURALLY GROUNDED INDEX FOR MEASURING RESILIENCE IN KENYA

Onyancha C.*[1], Karanja M.[2], Musili L.[3], Muyela L.[4], Blackmon K.[5]

[1]Catherine Bikeri ~ Nairobi ~ Kenya, [2]Mary Karanja ~ Nairobi ~ Kenya, [3]Litha Musili ~ Nairobi ~ Kenya, [4]Levi Muyela ~ Nairobi ~ Kenya, [5]Karen Blackmon ~ Nairobi ~ Kenya

Introduction:
Standard resilience scales often overlook culturally embedded constructs critical to mental health assessments, particularly in non-Western contexts. In Kenya, findings from qualitative research highlight the role of social and spiritual support in shaping resilience, dimensions underrepresented in existing gold standard assessment tools.
Purpose:
This study introduces the Kenya Resiliency Index (KRI), a culturally grounded instrument designed to capture indigenous understandings of psychosocial strength and well-being.
Method:
Using data from 272 healthy participants enrolled into the Brain Resilience Kenya and AD-DETECT Kenya studies, we extracted and recoded items from validated instruments and interview-derived indicators. The KRI comprises six indicators that probe marital/partner support, religiosity/spirituality, loneliness, and satisfaction with social relationships. Internal consistency was assessed with McDonald's omega. Correlational analyses were used to assess associations between the KRI and a measure of resilience (Connor-Davidson Resilience Scale-10), depression (PHQ-9) and anxiety (GAD-7).
Results:
54% of participants were married/partnered and 53% reported low loneliness. Satisfaction with friendships, intimacy, and personal relationships was high in 39-55% and very high in 11-20%. Spiritual engagement was somewhat high in 47% and very high in 22%. Internal consistency was marginal (ω = 0.65). The KRI correlated positively with the CD-RISC-10 ($r = 0.225$, $p < .001$). Higher KRI scores were associated with lower depression (PHQ-9; $r = –.164$, $p = .007$) and lower anxiety (GAD-7; $r = –.404$, $p < .001$), with stronger effect sizes than observed when correlating the CDRS-10 with depression (r=-.077, p=.186) and anxiety (r=-.136. p=.018).
Conclusion:
Capture of relational and spiritual domains of resilience, often overlooked by gold-standard scales, may be more strongly associated with depression and anxiety in the Kenyan context. Although limited by retrospective index construction, the KRI presents a promising direction for prospective scale development. Future studies aim to leverage

these results to design a novel resiliency scale that may better reflect constructs essential to African resilience.

Abstract 1697

VISITING AS A METHOD IN CRITICAL PSYCHOLOGY – LESSONS FROM A RESEARCH PROJECT ABOUT URBAN INUIT EXPERIENCING HOMELESSNESS

Nweze N.*, Wendt D.

McGill University ~ Montréal ~ Canada

Critical psychology broadly aspires to engage researchers, practitioners, and the field as a whole in understanding and responding to the ways that psy-disciplines are exercised towards oppressive aims and reorienting them towards liberatory ones. However, the specific ways that researcher-practitioners can do so without re-imposing limiting dichotomies can be difficult to discern and effectuate.

The proposed presentation draws on the researchers' current project, "Understanding the Social Worlds of Unhoused Urban Inuit," to describe methods that align with critical psychology theory. Specifically, we will describe the organic web of diverse relationships from which the project has grown and “Visiting” as a method of nurturing these foundational relations. As described by Indigenous feminist scholars, “Visiting is a relating that is imbued with accountability, vulnerability, and mutuality”. Visiting was a necessary opportunity for us to enter street and shelter spaces and be questioned, known, and, if earned, invited into deeper levels of mutual knowing. These encounters could not be more invaluable to the quality of the work and the process. The proposed presentation will discuss the lessons and insights gained from practicing Visiting as a research method, its connection to critical psychology, and invite participants to explore how Visiting can be integrated across other topics.

Abstract 4970

SELF-COMPASSION AND POSTTRAUMATIC GROWTH AMONG UKRAINIANS DURING WAR: AN EMPIRICAL INVESTIGATION

Naydonova G.*, Pohorilska N.

Taras Shevchenko National University of Kyiv, Ukraine - National Psychological Association of Ukraine, Ukraine

Introduction. Contemporary research considers self-compassion an important internal resource for coping with the consequences of traumatic experiences and maintaining mental health. Empirical evidence indicates that self-compassion can function as a protective factor against post-traumatic stress symptoms, particularly among individuals with adverse childhood experiences (Kitano et al., 2024). Meta-analytic findings further demonstrate a significant inverse relationship between self-compassion and psychopathology ($r = -0.54$), supporting its role as a key explanatory variable in psychological adaptation, resilience, and recovery processes (MacBeth & Gumley, 2012).

Purpose. To identify psychological resources associated with post-traumatic growth among Ukrainians during the ongoing war.

Method. A quantitative cross-sectional design was employed using correlational and regression analyses. Participants included 167 Ukrainians aged 17 to 72 years (median age = 36 years) (December 2024 - March 2025). We used the Posttraumatic Growth Inventory, the Self-Compassion Scale (SCS-SF), and the Spiritual Health Assessment Scale.

Results. Significant associations were found between self-compassion and post-traumatic growth. Positive components of self-compassion (self-kindness, common humanity, and mindfulness) were associated with higher levels of post-traumatic growth, whereas negative components (self-judgment, isolation, and over-identification) showed inverse relationships. Self-kindness demonstrated the strongest links with new possibilities ($r = 0.473$), relating to others ($r = 0.418$), and personal strength ($r = 0.353$), as well as appreciation of life ($r = 0.322$) and spiritual change ($r = 0.251$). Common humanity was related to new possibilities ($r = 0.303$) and personal strength ($r = 0.264$). Mindfulness was associated with relating to others ($r = 0.261$), new possibilities ($r = 0.359$), personal strength ($r = 0.336$), appreciation of life ($r = 0.288$), and spiritual change ($r = 0.222$).

Conclusions. Self-compassion appears to be an important psychological resource associated with post-traumatic growth and adaptive meaning-making in the context of war-related adversity. Developing a supportive, non-judgmental attitude toward oneself may be a key focus for psychological support programs to strengthen resilience and facilitate positive post-traumatic change.

Abstract 1865

EXPLORING EXPERIENCES OF MICROAGGRESSIONS AGAINST MIGRANTS LIVING IN ITALY: A QUALITATIVE STUDY

Falcone M.*[1], Giuliani C.[1], Barni D.[2]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Università degli Studi di Bergamo ~ Bergamo ~ Italy

Racial microaggressions are brief and commonplace daily verbal, behavioral, or environmental indignities, whether intentional or unintentional, that communicate hostile, derogatory, or negative racial slights and insults toward migrant groups (Sue et al., 2007). Despite the constant increase in migration flows and the number of people forced to leave their countries of origin, there is still relatively little empirical research exploring the lived experiences of migrants in Europe (Piccinelli et al., 2024). This study aims to explore perceptions, narratives, and recurring themes related to microaggressions and discrimination reported by first and second-generation migrants residing in Lombardy. Adopting a qualitative design, the study is based on 30 semi-structured interviews conducted with adult participants selected to reflect diverse migratory backgrounds (including age, gender, ethnicity, and area of origin) in order to explore both direct and indirect experiences of discrimination and microaggressions, as well as their impacts on identity, daily life, and integration processes. The interview grid was designed to investigate direct and indirect experiences of microaggressions, focusing on whether such phenomena occur in migrants' lives, how they develop, and affect daily life. . A thematic analysis of the material collected through the interviews was conducted using NVivo software. This allowed for a systematic and in-depth exploration of the different forms and patterns of microaggressions, offering initial insights into the dynamics and common experiences among participants interviewed. This exploratory phase serves as the foundation for a future quantitative study aimed at systematically analyzing the forms and psychosocial consequences of microaggressions against the migrant population.

FEMALE JOB TITLES INCREASE TRUST IN FEMALE PHYSICIANS AMONG GERMAN PARTICIPANTS

Komlenac N.*[1], Stankovic--Komlenac S.[2], Bader A.[3], Hochleitner M.[4]

[1]Medical University of Innsbruck ~ Innsbruck ~ Austria, [2]University of Vienna ~ Vienna ~ Austria, [3]Tirol Kliniken ~ Innsbruck ~ Austria, [4]Innsbruck ~ Innsbruck ~ Austria

In German, the masculine form is traditionally used generically, even though gender-inclusive language is an established approach to reducing discrimination against women in male-dominated professions. The present experimental vignette study investigated whether trust in a female physician was influenced by the grammatical gender of the job title (feminine vs. masculine). A total of 142 participants (48.0% identified as cisgender men and 52.0% as cisgender women; age: M = 35.1, SD = 11.1) from Germany and Austria each read four case vignettes in which a female physician treated either a woman or a man, with treatment outcomes being either successful or unsuccessful. Of the participants, 52.0% received vignettes referring to the physician with feminine job titles, while 48.0% received masculine job titles. Before reading the vignettes, participants completed the Benevolent Sexism in the Workplace (BSW) scale; after each vignette, they rated their trust in the physician's competence and compassion using the Trust in Physician Scale. To analyze the data, a mixed-design ANCOVA with within- and between-subject factors was conducted. Results showed that participants expressed greater trust in female physicians when feminine job titles were used in vignettes with favorable outcomes, particularly among male participants. Additionally, stronger endorsement of benevolent sexist beliefs was associated with higher trust ratings. These findings suggest that the use of feminine job titles for female physicians can enhance trust. However, this increase in trust – especially among men – may partly reflect stereotypical associations of women with compassion rather than genuine perceptions of medical competence.

THE INFLUENCE OF LOBOLA PRACTICE IN GENDER BASED VIOLENCE IN SOUTH AFRICA: AN AFRO-CENTRIC PERSPECTIVE

Muleya A.*, Adewoye S.E.

UNIVERSITY OF SOUTH AFRICA ~ Pretoria ~ South Africa

South Africa is faced with high levels of Gender Based Violence (GBV) and femicide killings. Conflict among couples has been reported to be one of the highest contributors to gender-based violence. Culture and traditions continue to be an important part of our society, especially in relation to marriage. In most parts of Africa, 'Lobola' (bride-price) is of paramount significance in setting up a joint household between a man and a woman. The concept of a "purchased wife" reinforces patriarchal power structures, while high lobola costs can lead to relationship instability and hinder women from leaving abusive marriages. This study looked at the influence of lobola practice in black African marriages. The intersectionality theory was utilized as a lens to understand the phenomenon under study. Data was collected by means of semi-structured interviews. Eighteen couples who met the criteria were selected randomly as research participants. A focus group of black married men and women were chosen to provide insight into the phenomenon. The Creswell model of data analysis was used to analyse the data. From an Afro-centric perspective, the findings indicated that lobola practice influences gender-based violence (GBV) in South Africa by exacerbating existing inequalities, fostering patriarchal power dynamics where women's value is tied to the financial exchange of marriage, and creating economic pressures on men that may lead to frustration and violence when they are unable to meet these obligations. While lobola is a cultural practice meant to strengthen family ties, its modern commercialization and the financial burden it places on men can contribute to a sense of entitlement and control over women within the marriage, thereby increasing the risk of abuse. To decrease and eliminate Gender based violence, it is important to understand how culture is being twisted to abuse and suppress women

Abstract 1915

WHEN INEQUALITY SHAPES THE FUTURE: VULNERABILITIES OF CHILDREN AND ADOLESCENTS TO CLASS-BASED BARRIERS

Pereira Da Costa L.*[1], Farias A.R.[1], Cabral J.[1], Borges Rodrigues R.[2], Luís S.[1], Silva V.H.[1]

[1]HEI-Lab: Digital Human-Environment Interaction Labs, Lusófona University ~ Lisbon ~ Portugal, [2]Centro de Investigação e Intervenção Social (CIS-IUL), Instituto Universitário de Lisboa (ISCTE-IUL) ~ Lisbon ~ Portugal

Children and adolescents growing up in socioeconomically disadvantaged contexts face multiple, interrelated, and overlapping risks. Among these risks are reduced well-being, poorer academic performance, and increased exposure to discrimination and social exclusion. From early childhood, children—regardless of their socioeconomic background—tend to engage in peer comparisons based on material possessions. Experiences of deprivation are context-dependent and shaped by prevailing social norms, while social comparisons and experiences of exclusion may occur across different socioeconomic strata. These dynamics can significantly shape interpersonal relationships and carry important implications for children's well-being. The aim of this study is to examine how relative deprivation and class-based discrimination increase the vulnerability of children and adolescents to lower well-being and more limited future aspirations.

The study was conducted with a representative sample of 2,580 Portuguese children and adolescents (49% female), aged between 10 and 15 years (M = 12.6), from 40 public schools, 6 private schools, and 10 Educational Territories of Priority Intervention schools. A correlational design was employed, and a serial mediation model was tested to examine the indirect effects of relative deprivation on well-being and future aspirations through class-based discrimination. Results indicate that relative deprivation and class-based discrimination were both associated with lower well-being and reduced future aspirations. Discrimination accounted for the effects of relative deprivation on both well-being and aspirations. Stronger feelings of relative deprivation predicted higher perceptions of discrimination, which in turn reduced well-being and aspirations, showing a significant total indirect effect. The discussion highlights on how relative deprivation and class-based discrimination contribute to a cycle of disadvantage, emphasizing their implications for youth development, well-being, and the need for inclusive school strategies.

Abstract 2139

CASTE-BASED MICROAGGRESSIONS IN INDIA: AN INTERSECTIONAL PERSPECTIVE

Narain S.*

Patna University ~ Patna ~ India

The caste system, a hierarchical social structure determined by birth, remains deeply rooted in Indian culture. Historically overt, its influence persists in subtle ways, shaping societal perceptions and fostering biases, stereotypes, and discrimination against marginalized communities. This subtle, often unconscious discrimination manifests as microaggressions. Grounded in social identity theory, this research examines caste-based microaggressions and their interplay with other identity factors, including gender, socioeconomic class, geographic region, sexual orientation, and disability. Employing a mixed-methods approach, the study involved 850 participants (553 females & 297 males), aged 14 to 53 (M= 28.47). Data were collected through surveys and semi-structured interviews. Results revealed that caste-based microaggressions, often expressed through verbal insults or non-verbal acts such as practices of untouchability, remain prevalent in Indian society. These microaggressions are exacerbated when intersecting with gender, class, region, and sexual orientation, intensifying the marginalization experienced by individuals with multiple disadvantaged identities. While disability was associated with significant prejudice and discrimination, it did not show a specific correlation with caste-based microaggressions. The findings emphasize the persistent influence of caste on social interactions and highlight the compounded effects of intersecting identities. This study contributes to understanding how microaggressions, as subtle forms of discrimination, perpetuate social inequalities in contemporary India, calling for further research and interventions to address these complex dynamics.

BUILDING INDIVIDUAL AND COMMUNITY RESILIENCE THROUGH NATURE-BASED THERAPIES: RESULTS FROM THE RESONATE PROJECT

Wednesday 22 July 2026 from 08:00 to 09:30

(F-Spadolini)

Mathew White (University of Vienna ~ Vienna ~ Austria), Chair

Numerous mechanisms have been proposed to explain why natural environments are beneficial for psychological health and well-being. According to nature-based biopsychosocial resilience theory (NBRT) nature promotes health/wellbeing by building and maintaining biological (e.g. healthy immune system), psychological (e.g. adaptive emotion regulation strategies), and social (e.g. local social capital) resilience-related resources, that can be utilized at three stages in the homeostatic-stress cycle, i.e. preventive resilience, response resilience, and recovery resilience. We presents five papers which test different aspects of NBRT as part of the EU-UK funded 'Building individual and community RESilience thrOugh NATurE-based therapies' (RESONATE) project. Paper 1 describes the theory and the development of a scale to measure its central tenets. Paper 2 presents cross-sectional data from > 30,000 participants in the UK which explores how spending time in gardens, and especially pro-environmental gardening, can build biopsychosocial resilience resources that can be used to mitigate the negative impact of low income on well-being. Paper 3 uses a 10-year longitudinal prospective cohort study to test how older adults in England coped during the Covid-19 pandemic as a function of the biopsychosocial resilience resources they had built up before the pandemic started. Paper 4 tests the theory using a two-arm randomized controlled study for people with metabolic syndrome which compared engaging in a 5-week nature-based mindfulness intervention with a wait-list control arm. Paper 5 tests the theory using a four-arm randomized controlled study for people with high stress levels which compared engaging in a 5-week nature-based mindfulness intervention with a 5-week nature-contact (no mindfulness) condition, a 5-week mindfulness (no nature) condition and a wait-list control arm. Combined, the results of the studies highlight the benefits of using novel theory to develop a coherent research framework to help design and conduct studies that have direct impact in terms of research, practice, and policy.

Abstract 3237

NATURE-BASED BIOPSYCHOSOCIAL RESILIENCE: SCALE DEVELOPMENT AND PRELIMINARY RESULTS

Hampejs V.*[1], Tran U.[1], Voracek M.[1], Pahl S.[1], Astell--Burt T.[2], Dzhambov A.[3], Egger J.[1], Hartig T.[4], Kabisch N.[5], Lymeus F.[4], Mammadova A.[6], Martin L.[7], Pichler C.[8], Poole A.[9], Steininger M.[1], Van Den Bosch M.[10], Wells N.[11], White M.[1]

[1]Vienna University ~ Vienna ~ Austria, [2]School of Architecture, Design and Planning, University of Sydney, New South Wales ~ Sydney ~ Australia, [3]10Department of Hygiene, Faculty of Public Health, Medical University of Plovdiv ~ Plovdiv ~ Bulgaria, [4]Institute for Housing and Urban Research, Uppsala University, ~ Uppsala ~ Sweden, [5]Institute of Earth System Sciences, Physical Geography and Landscape Ecology Section, Leibniz University, ~ Hannover ~ Germany, [6]Department of Territorio e Sistemi Agro-Forestali (TESAF), University of Padua, ~ Padua ~ Italy, [7]European Centre for Environment & Human Health, University of Exeter ~ Exeter ~ United Kingdom, [8]Institute of Ecomedicine, Paracelsus Medical University, ~ Salzburg ~ Austria, [9]Department of Philosophy, University of Twente, ~ Twente ~ Netherlands, [10]ISGlobal ~ Barcelona ~ Spain, [11]Department of Human Centered Design, College of Human Ecology, Cornell University ~ Ithaca ~ United States of America

Resilience, often defined as the capacity to withstand and recover quickly from adversity while persisting despite obstacles, is a well-researched topic. The recently developed nature-based biopsychosocial resilience (NBRT) framework argues that nature contact can build and maintain biopsychosocial resilience-related resources across four distinct phases: (1) preventive, (2) response, (3) recovery, and (4) growth. However, extant resilience scales do not address or differentiate between all four phases. We therefore developed the Comprehensive Resilience Scale (CRS), building on 589 items from 31 existing resilience scales that were identified in a scoping review. Items were analysed for their suitability, revised, and mapped onto the NBRT framework. New items were developed to cover all four phases. Item contents of the resulting pool of 78 items were then refined through a Delphi survey involving N = 15 experts. To explore the CRS's psychometric properties and optimize its item composition, four online surveys were conducted with English- and German-speaking general population samples (total N ~ 1,600). These surveys assessed the scale's structure, convergent and divergent validity, incremental validity, and test-retest reliability. The current talk will present preliminary findings which suggest that the optimized 30-item CRS has good psychometric properties and captures the four distinct resilience phases as outlined by NBRT. Future studies, including longitudinal designs, are needed to further validate the scale and explore the scale's full potential.

Abstract 3239

RESILIENCE BLOOMS IN THE GARDEN: TIME IN GARDENS AND PRO-NATURE GARDENING BUFFERS THE NEGATIVE EFFECTS OF LOW INCOME ON SUBJECTIVE WELL-BEING

Lindenbauer J.*, Steiner S., Hiseni B., Egger J., White M.

University of Vienna ~ Vienna ~ Austria

Low incomes are a chronic stressor for many people and consistently associated with negative health and well-being outcomes. Nevertheless, there is evidence that living near and/or interacting with publicly accessible nature (e.g. parks, woods, coasts) can reduce, or buffer, the negative effects of low income on mental health and well-being with resilience-related processes used to explain these effects. Using data from over 30,000 participants in the UK's People and Nature Survey (PaNS), we explored the potential role of private nature, i.e. gardens, in buffering the negative effects of low income on subjective well-being. Specifically, we modelled the extent to which time spent in private gardens, and degree to which people engaged in pro-nature gardening (e.g. feeding birds, encouraging pollinators, etc.) might moderate the relations between income and evaluative, eudaimonic, and positive and negative hedonic well-being. Supporting predictions, lower incomes were associated with lower well-being (on all four outcomes), but this pattern was moderated by time in gardens, and degree of pro-nature gardening at least for evaluative, eudaimonic, and positive hedonic well-being. Spending more time in the garden, and engaging in more pro-nature gardening both reduced the association between low incomes and well-being. The results for negative well-being (i.e. anxiety yesterday) were more mixed, potentially reflecting reverse causality. Results support nature-based resilience theory (NBRT), and highlight that private, as well as public, nature can build and maintain resilience resources that mitigate the effect of stressors on well-being. Given the cross-sectional nature of the data, we encourage more longitudinal work to confirm these findings, and of course recognize equity issues in terms of garden access. Nonetheless, given that gardens may be particularly important for certain population sections (e.g. older adults, small children, those with mobility issues), efforts to support pro-nature gardening, in particular, can potentially play a role in reducing well-being inequalities.

Abstract 3240

NATURE-BASED BIOPSYCHOSOCIAL RESILIENCE DURING A NATIONAL CRISIS: RESULTS FROM TWO LONGITUDINAL STUDIES IN ENGLAND

Martin L.*[1], Grellier J.[1], Wheeler B.[1], Bu F.[2], Corbett A.[1], White M.[3]

[1]University of Exeter ~ Exeter ~ United Kingdom, [2]University College London ~ London ~ United Kingdom, [3]University of Vienna ~ Vienna ~ Austria

Research linking nature contact to reduced stress responses (Berto, 2014), better well-being (White et al., 2019) and healthier sleep outcomes (Martin et al., 2024) indicates potential for greater contact with the natural world to attenuate adverse sleep trajectories during times of stress. Yet, with prior research tending to be cross-sectional in nature, little is known about the links between nature, wellbeing and sleep over time amongst individuals experiencing chronic societal stressors (e.g. Covid-19). Using nature-based biopsychosocial resilience theory (NBRT, White et al., 2023) as a conceptual framework, we will present secondary data from two UK longitudinal studies: the UCL Covid-19 Social Study (N = 12, 900) and PROTECT (N~ 20,000). Preliminary latent growth curve models found that access to a private garden was particularly important at both the response and recovery resilience phases for mitigating the adverse effects of the Covid-19 pandemic on healthy sleep patterns and mental health. Ongoing analyses are investigating the mediating processes behind these findings. Our results have important implications for both environmental conservation and public health policies.

Abstract 3241

BUILDING BIOPSYCHOSOCIAL RESILIENCE THROUGH GUIDED NATURE-BASED MINDFULNESS: A CONTROLLED TRIAL WITH PEOPLE AT RISK OF METABOLIC SYNDROME

Moe A.*[1], Bolognesi M.[1], Pazzaglia F.[1], Secco L.[2], Bellini S.[1], Bottaro G.[2], Vedovetto D.[2], Todesco M.[2], Lanciano F.[1], Doimo I.[3], White M.[4]

[1]Department of General Psychology, University of Padua, ~ Padua ~ Italy, [2]Department of Land, Environment, Agriculture and Forestry, University of Padua ~ Padua ~ Italy, [3]Etifor ~ Padua ~ Italy, [4]University of Vienna ~ Vienna ~ Austria

Metabolic syndrome (MetS) affects up to 30% of the adult population (Noubiap et al., 2022) and is characterized by the presence of at least 3 of the following: high blood pressure and triglycerides levels, hyperglycemia, low HDL-cholesterol, and abdominal obesity. Linked with urbanization and a sedentary lifestyle, it is a major risk factor for cardiovascular diseases, type 2 diabetes, and premature death. Due to its relevance and prevalence, many strategies have been developed to cope with it, mostly based on medication and lifestyle changes including diet. Nature-based Therapies (NbT) have been proposed for both the prevention and treatment of MetS, because they are easily accessible, free (or very inexpensive), and are associated with a range of psychophysiological, social, and environmental benefits. To explore these possibilities in more detail, we conducted a two-arm randomized intervention vs. waitlist-controlled study (n = 68 so far, final target end October 2025 = 100). The intervention consisted of a 5-week nature-based mindfulness intervention in Padua's urban parks consisting of three 1-hr sessions a week alternating light walking and mindfulness exercises in guided (first week) and then self-directed group sessions (weeks 2 to 5), ensuring one guided session per week. Pre, post and delayed post (+ 5 weeks) measures of health-related quality of life and biopsychosocial resilience were taken and compared across groups. The talk will present headline results of the efficacy of the intervention as well as further data such as wider social acceptability of the intervention, possible impact on environmental issues and equity. The discussion will focus on the potentialities of NbT to prevent and mitigate diseases in the general population mostly in urban areas where sedentary lifestyles are more frequent and contact with nature reduced.

Abstract 3242

ASSESSING COGNITIVE AND PSYCHOPHYSIOLOGICAL RESILIENCE IN NATURE-BASED THERAPIES: TEST CASE EVALUATION OF AN RCT FOR STUDENTS WITH COMMON MENTAL HEALTH SYMPTOMS

Lymeus F.*[1], Toth A.L.[2], Hartl A.[3], Hampejs V.[4], White M.[4]

[1]Institute for Housing and Urban Research, Uppsala University ~ Uppsala ~ Sweden, [2]Cognitive Neuroscience and Applied Data Science Lab, Universitat Oberta de Catalunya ~ Barcelona ~ Spain, [3]Dept of Ecomedicine, Paracelsus Medical University ~ Salzburg ~ Austria, [4]University of Vienna ~ Vienna ~ Austria

Nature based biopsychosocial resilience theory (NBRT) suggests that nature can build and maintain biological, psychological and social resilience resources that can be used at the preventive, response and recovery stages in stress management. Nature-based therapies may have advantages over common evidence-based alternatives for building such resources and supporting healthier coping. We present a factorial randomized controlled trial comparing two established nature-based health interventions – one with and one without mindfulness training as a core therapeutic component – against conventional mindfulness training indoors and a passive waitlist condition. Participants were university students with high rates of stress, depression and anxiety connected to pressures in their academic work combined with life transitions and contextual stressors. The nature-based interventions involved weekly group activities in a campus-adjacent nature preserve while the indoor mindfulness group had activities in a rearranged classroom. Qualified instructors led the groups. Before and after the 5 intervention weeks, a subsample of 83 students were asked to come to a small classroom, typically used for group work and seminars, and complete an individually calibrated task designed to induce cognitive fatigue and psychophysiological stress, with the intention to model high-pressure work under cognitive load. The stressor was followed by a restoration phase consisting of a realistic 20-minute break spent either indoors or outdoors in the university's botanic garden. A combination of task performance patterns, continuous heart-rate monitoring, and subjective ratings measured theorized resilience processes related to each stress stage. Additionally, the factorial pre-/post-intervention design allowed comparative evaluation of the respective therapeutic effects of the nature-based and mindfulness-based intervention components. Data were collected in autumn 2024 and spring 2025, pending analysis in autumn 2025. We will present the resilience-related intervention outcomes and discuss possibilities for further development of the procedure as a standardized yet adaptable evaluation paradigm for therapeutic interventions targeting resilience processes.

THE POWER OF NORMS: HARNESSING SOCIAL INFLUENCE FOR PRO-ENVIRONMENTAL ACTION

Wednesday 22 July 2026 from 08:00 to 09:30

(I-Spadolini)

Alessandro Milani (Department of Psychology of Developmenta), Chair and Presenter

This symposium brings together presentations examining how social norms function as influential mechanisms to promote pro-environmental behavior across individual, organizational, and societal levels. Often overlooked, social norms are a powerful force shaping environmental action. Drawing on diverse methodologies and cultural contexts, the symposium explores how perceptions of what others do, or what is expected, trigger meaningful changes in sustainable behaviors and attitudes.

Wesley Schultz illustrates how normative influence operates as a powerful yet frequently undetected driver of behavior change. He shows that this underdetection makes norms particularly effective among resistant audiences, fosters durable change by promoting perceived intrinsic motivation, and increases the likelihood of spillovers across related pro-environmental actions.

Kim-Pong Tam investigates how perceptions of global norms, such as climate actions by national governments, increase support for similar domestic policies. Using survey and experimental data from China and the United States, he demonstrates that framing global trends activates normative and efficacy-based pathways to enhance policy support.

Alessandro Milani presents research on Corporate Environmental Responsibility (CER) norms, showing how organizational actions and priorities shape employees' perceptions of workplace norms. Cross-cultural findings reveal that CER norms affect organizational outcomes and spillovers into pro-environmental behaviors at home, with cultural tightness as a key moderator.

Geertje Schuitema examines how pro-environmental identity moderates the impact of norms on sustainable consumer choices. Across experiments on plant-based diets, she compares motivational congruency and self-determination mechanisms, finding that congruency is more effective for behavioral losses, while self-determination drives gains.

Magnus Bergquist introduces the Sender-Message-Receiver (SMeR) framework, which explains how communicator features, message content, and audience characteristics determine the effectiveness of norm-based climate interventions. The model highlights how underdetection of normative influence reduces resistance and fosters long-term change.

These contributions illustrate social norms' dynamic, context-sensitive power in fostering environmental action and provide a foundation for designing effective, culturally responsive interventions.

Abstract 3521

SOCIAL NORMS AS UNDERCOVER AGENTS OF GREEN INFLUENCE

Schultz P.W.*

Claremont Graduate University ~ Claremont, CA ~ United States of America

Social norms are one of many agents of influence on human behavior. They are widely recognized as an instigator of behavior change, yet their influence often goes undetected. Research has consistently shown that communications highlighting the large number of people who engage in a behavior can effectively promote change. Yet even when there is clear evidence for normative social influence, individuals downplay the degree to which they were affected.

Building on prior research showing underdetection, this talk highlights three potential advantages of being a secret agent of influence. First, because they are largely underdetected, normative social influence is particularly useful at reaching people who are likely to be resistant to the target behavior. For example, individuals who are low in environmental concern, or politically conservative, are often a challenge for efforts to promote proenvironmental behavior. Yet they can be influenced through normative messages. Second, because normative influence is not typically seen as influential, once they cause change, individuals are likely to attribute the behavior to an intrinsic motivation, rather than extrinsic. For this reason, normative influence can produce lasting change. And finally, because normative social influence is underdetected, it is more likely to result in behavioral spillover, whereby engaging in one behavior increases the likelihood of a person engaging in a related behavior.

Taken together, normative social influence has been shown to be an effective tool for promoting green behavior. Yet it is widely underdetected, and individuals typically discount the degree to which they are influenced by the behavior of others. This underdetection makes it an effective tool for reaching individuals who are likely resistant to the target behavior. In addition, normative social influence is likely to exhibit lasting effects, and it is more likely to induce behavior spillover. Directions for future research, and implications for application are discussed

Abstract 3522

PERCEPTION OF GLOBAL NORM OF GOVERNMENT CLIMATE ACTION AND SUPPORT FOR DOMESTIC CLIMATE POLICIES

Tam K.*[1], Chan H.[2]

[1]The Hong Kong University of Science and Technology ~ Hong Kong ~ Hong Kong, [2]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong

As public support is important for policy changes, it is crucial to understand how citizens construct their views toward climate policies. Based on the widely documented effect of descriptive social norms on human behavior, we hypothesized that individuals' support for climate policies to be implemented in their own country would be stronger when they perceive greater prevalence of climate action by national governments worldwide. Findings from two surveys with respondents from China and the United States provide supportive evidence for this hypothesis. In addition, four mediators underlying this effect (including informational influence, normative influence, and two forms of efficacy beliefs) were identified. In an experiment, with participants from the United States, we further found that a fact-based informational intervention effectively increased participants' perceptions of global prevalence of coal power phaseout, which, in turn, led to stronger support for a similar action in their own country. These findings introduce novel perspectives to the understanding of public attitudes toward climate policies and the study of climate change opinions. They also imply that communicators and policymakers can leverage the power of social influence, through messages built around narratives of a global norm, to garner public support for domestic climate efforts.

Abstract 3523

WHEN ORGANIZATIONS SET THE NORM: HOW CORPORATE ENVIRONMENTAL RESPONSIBILITY (CER) NORMS SHAPE PRO-ENVIRONMENTAL BEHAVIORS ACROSS CONTEXTS

Milani A.*[1], Bonaiuto F.[2], Cicero L.[3], Ganucci Cancellieri U.[4], Liu X.[1], Mao Y.[5], Mura A.L.[6], Tseng Tzuhui A.[7], Vitiello M.C.[8], Xie M.[1], Bonaiuto M.[1]

[1]Department of Psychology of Developmental and Socialization Processes, Sapienza University of Rome ~ Rome ~ Italy, [2]Department of Human and Social Sciences, Universitas Mercatorum, Italy ~ Rome ~ Italy, [3]Department of Theoretical and Applied Sciences, eCampus University, Novedrate (Como), Italy ~ Novedrate (Como) ~ Italy, [4]University for Foreigners "Dante Alighieri" of Reggio Calabria, Italy ~ Reggio Calabria ~ Italy, [5]Southwest Jiaotong University, China ~ Chengdu ~ China, [6]Department of Education, Psychology, Philosophy, University of Cagliari, Italy ~ Cagliari ~ Italy, [7]National Tsing Hua University, Taiwan ~ Hsinchu ~ Taiwan, [8]Studio Saperessere Srl, Italy ~ Rome ~ Italy

According to the Focus Theory of Normative Conduct, social norms can be categorized as descriptive (perceptions of what is commonly done in a given situation) and injunctive (perceptions of what is widely approved/disapproved within a culture). Although the theory's definition does not explicitly restrict these beliefs to peers' behaviors and attitudes, the literature primarily focuses on norms as perceptions of what others within a specific reference group do and approve of.

Shifting this perspective, the present research considers how, within organizational settings, actions taken by the organization and what the organization promotes or deems important may be perceived by employees as descriptive and injunctive norms. A series of experimental and correlational studies investigates Corporate Environmental Responsibility (CER) norms, i.e., employees' beliefs about their organization's engagement in environmentally protective practices and what the organization values in terms of environmental sustainability.

The research explores the influence of CER norms on group- and organization-related outcomes such as collective efficacy regarding pro-environmental behaviors and affective organizational commitment. Similarly, the research explores the influence of CER norms on pro-environmental outcomes (attitudes and intentions) in the workplace, and whether promoting pro-environmental outcomes in the workplace, may lead to positive spill over in the domestic setting.

Finally, by surveying employees from public and private organizations across the Italian and Chinese (China Mainland and Taiwan) language contexts, the study analyzes how participants' cultural tightness/looseness may influence the impact of CER norms on organizational and domestic outcomes. These normative behaviors, indeed, may differ in countries like China, where adherence to norms is generally stricter than in Western countries.

Results show CER norms do not always directly influence pro-environmental outcomes.

Instead, by fostering specific group-level dynamics within the organization, these norms indirectly promote the enactment of pro-environmental outcomes in the organizational and domestic contexts.
Participant’s cultural tightness influences these relationship.

Abstract 3525

COMMUNICATING NORMS FOR CLIMATE ACTION: A SENDER-MESSAGE-RECEIVER FRAMEWORK FOR BEHAVIORAL CHANGE

Bergquist M.*

Department of Psychology, University of Gothenburg ~ Gothenburg ~ Sweden

Social norms are widely regarded as effective drivers of proenvironmental behavior. Yet their impact is rarely straightforward. While normative influence is well-established in behavioral science, its effectiveness is often bounded by the characteristics of the norm's communicator (Sender), the content and delivery of the norm (Message), and the traits of the person receiving it (Receiver). In this talk, I present a SMeR (Sender-Message-Receiver) framework for understanding and designing persuasive social norms in the context of climate change mitigation.

Building on current literature, this framework identifies key conditions under which normative appeals succeed—or fail. For example, norms communicated by a proximal in-group are more likely to be persuasive than those from distant or rival groups. Likewise, messages that align injunctive and descriptive components, or that emphasize what others avoid doing, can increase persuasive impact. Receivers, meanwhile, are more likely to conform in situations marked by ambiguity, or when personal norms are weak. Importantly, normative influence tends to be underdetected: individuals often fail to recognize the role social norms play in shaping their choices. This underdetection presents both a challenge and an opportunity. While it may limit self-awareness, it can also reduce psychological reactance, enhance perceived autonomy, and promote enduring behavior change.

Taken together, the SMeR framework provides a structured lens for examining the boundary conditions of normative influence. It highlights the interplay of identity, message framing, emotional response, and situational ambiguity in determining behavioral outcomes. Implications for designing more nuanced, culturally sensitive, and impactful climate interventions are discussed, along with directions for future research.

04 - Division 4: Environmental Psychology

PSYCHOLOGICAL PROCESSES AND CLIMATE CHANGE ADAPTATION IN THE EUROPEAN SOCIETY

Wednesday 22 July 2026 from 09:30 to 11:00

(F-Spadolini)

Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Discussant
Giuseppe Carrus (Roma Tre University ~ Roma ~ Italy), Co-Chair
Christoph Steinebach (Zurich University of Applied Science ~ Z), Chair

This symposium will discuss the issue of adaptation to climate change, and its psychological correlates. From a psychological perspective, we argue that adapting to climate change and its consequences involves processes of both assimilation and accommodation. In both processes, the adaptation task requires an optimal development under more difficult conditions. Understanding adaptation to climate change, and its underlying psychological factors, requires solid and evidence-based psychological research as well as an interdisciplinary dialogue with other sciences, in parallel to a self-reflective effort on the changed self-image of psychology as a science and a profession. Therefore, processes and paths to climate change adaptation can be understood, from a psychological perspective, with a focus on individual, communities and the global environment, and with a wide range of concepts, theories, methods and interventions.

Abstract 3197

ADAPTING TO CLIMATE CHANGE: THE CONTRIBUTION OF PSYCHOLOGICAL SCIENCE AND PRACTICE

Steinebach C.*[1], Carrus G.[2]

[1]Zurich University of Applied Science ~ Zurich ~ Switzerland, [2]Roma Tre University ~ Roma ~ Italy

It is globally recognized that Climate change represents one of the most crucial challenges that human societies and the entire planet are facing in current times. Even if notable efforts are being made at the political, scientific and public opinion levels to counter global environmental change (and in particular to lower the pace of global warming, through a significant reduction of carbon emissions at the global level), the solution to the problem is far away from being found, and important programs such as the UN Agenda 2030 and its Sustainable Development goals are still in the table as an international priority. In this scenario, psychological science can contribute not only to understand how human societies can shift from more to less carbon-intensive lifestyles, but also to better understand how individuals, groups and communities may adapt to ongoing global environmental change in their daily lives. In this presentation we will review and discuss a wide range of psychological theories, approaches, concepts, principles and empirical findings that could be of help to achieve an optimal adaptation to climate change, and a mitigation of its consequences on the wellbeing of human beings and non-human species

Abstract 3199

THE MULTIDIMENSIONAL ASSESSMENT SCALE ON ENERGY CITIZENSHIP: A PRELIMINARY EVALUATION

Kirchler B.*[1], Massullo C.[2], Kollman A.[1], Carrus G.[2]

[1]Johannes Kepler University ~ Linz ~ Austria, [2]Roma Tre University ~ Roma ~ Italy

The concept of energy citizenship is raising greater attention among researchers. However, even if some definitions of the concept have been provided, until now there is no consensus over the definition and operationalization of energy citizenship. In this study, we propose the Energy Citizenship scale (ECs), a self-report scale based on a multidimensional operational definition of energy citizenship and explore the factor structure of its subscales. A survey has been shared with N=679 respondents' resident in the U.K. stratified for gender and recruited with Prolific. The ECs was developed to include the following main dimensions: emotions, attitudes, beliefs, perceived behavioral control, behaviors, behavioral intentions, identity, norms, engagement, perceived political and institutional management of energy issues in the form of trust in institutions, perceived energy democracy and perceived justice in achieving energy transition. Preliminary statistical analyses revealed satisfactory structures for each subscale. Internal consistency indexes were also satisfactory for the subscales except the one on sustainable energy behaviors of the behavioral dimension. The theoretical and practical implications of the findings are discussed

Abstract 3200

THE EFFECT OF THE ENDPOINT BIAS ON PREDICTIONS OF GLACIER ICE DECLINE

Hartmann C.*

Zurich University of Applied Science ~ Zurich ~ Switzerland

Underestimating the effects of climate change can reduce the perceived urgency to take action. However, people tend to interpret recent short-term fluctuations in a long-term trend as a reversal of the trend. This tendency is called endpoint bias. In two studies, we explored whether the endpoint bias affects the prediction of glacier ice melting and how a pro-ecological worldview is associated with these estimations. In Study 1, 282 participants were randomly assigned to two conditions in which they read a news report and a graph highlighting either a large decline or a small incline in glacier ice in the last year. Participants predicted a greater decline (-28%) in glacier ice by 2040 if there was a large decline in glacier ice the previous year than if there was a small incline (-18%). In addition, people with a higher pro-ecological worldview score predicted a greater decline. Study 2, with 507 participants, replicated the findings of Study 1. Additionally, a control group was added that had no context information (i.e., the graph and media coverage were not explicitly about glacier ice). This group's predictions of the trend were not influenced by their pro-ecological worldview. The results show that people's perception of climate trends is affected by their worldviews and the results highlight the effect of media coverage that emphasizes only recent events and not the long-term trend.

Abstract 3198

EXPLORING POST-PANDEMIC PERCEPTIONS AND ATTITUDES TOWARDS FOREST LANDSCAPES: AN INVESTIGATION IN ITALY

Spano G.[1], Clemente D.[2], Panno A.[2], Sanesi G.[3], Carrus G.*[4]

[1]Pegaso University ~ Napoli ~ Italy, [2]European University of Rome ~ Roma ~ Italy, [3]University of Bari ~ Bari ~ Italy, [4]Roma Tre University ~ Roma ~ Italy

This study explores how Italian adults perceive, value, and interact with forest landscapes in the post-pandemic context, with a particular focus on environmental knowledge, perception, perceived connections, and mutual benefits between people and forests. Using an online questionnaire disseminated among adults across Italy, we investigate how participants describe their attitudes, preferences, and needs regarding forest environments. Key topics include the subjective utility of forests, emotional and sensory experiences in natural settings, awareness of ecological functions, and perceived changes in the personal significance of nature following the pandemic. The study also aims to uncover how these perceptions relate to broader constructs such as environmental identity, nature connectedness, and awareness of possible effects of climate change. Preliminary analyses suggest the presence of rich, multifaceted narratives in which forests are perceived not only as spaces of recreation and escape, but also as restorative and emotionally significant places. Participants report an increased appreciation for natural environments post-COVID, accompanied by a heightened awareness of ecological interdependence. Although environmental knowledge appears variable, emotional engagement with forests remains a consistent theme. This research can contribute to a deeper understanding of human-forest relationships and their implications for fostering sustainable behavior in a post-pandemic world

04 - Division 4: Environmental Psychology

VALUES, BELIEFS, AND PRACTICES RELATED TO NATURE-BASED SOLUTIONS

Wednesday 22 July 2026 from 09:30 to 11:00

(I-Spadolini)

Ferdinando Fornara (University of Cagliari, Department of Ed), Chair and Presenter

The European Commission (2020, p. 5) defines NBS as solutions providing environmental, social
and economic benefits, and helping to build resilience, through the insertion of more natural
features into places.
This symposium addresses NBS with a focus on those values,beliefs,attitudes,experiences,
and practices that may promote individual and community well-being. Such focus is consistent with the empirical evidence concerning the importance of the natural features in contrasting
climate change effects,from one side,and triggering positive outcomes for individual well-being,
from the other side. In this regard, constructs such as connectedness to nature, restorativeness,
biospheric values, and environmental identity, just to name a few, have received increasing attention in the field of environmental psychology.
Six contributions are included in this symposium,each of them addressing nature-based solutions
and related issues from different perspectives, expressing a broad range of methods in the quantitative-qualitative continuum,from experimental to ethnographic.
Fornara and coll. focus on intentions to support NBS and their socio-psychological antecedents
through a survey study carried out in eight EU countries.
Ojala and coll. run an experiment studying the effect-in knowledge workers - of the exposure to
virtual nature on stress, well-being and nature connectedness in winter season.
Frankó and coll. examine the self-regulatory function of the experience of nature in workers facing
burnout and quiet quitting.
Townsend and coll. use interviews and ethnographic field observations – including virtual nature
tours-for a comparison in terms of behaviours, nature connectedness and forest stewardship
between two rural communities (Scotland and Peru), both living alongside forests.
Mishra and coll. explore the relationships between place practices and affordances provided to
humans and other-than-human species in a neighbourhood of Turku(Finland), through the use of
various qualitative methods, such as affordance mapping, “umwelt” analysis, behavioural observation, and citizens’ storytelling.
Kluvankova and coll.focus on nature-based governance through the proposal of a role board
game (Ecopoly) - tested in thirteen different EU regions - aiming at increasing awareness about

environmental risks and injustice in a multi-actor arena also including other-than-human species.

Abstract 4482

VALUES, BELIEFS, AND INTENTIONS TO SUPPORT NATURE-BASED SOLUTIONS: A SURVEY STUDY IN EIGHT EU COUNTRIES

Fornara F.*

University of Cagliari, Department of Education, Psychology, Philosophy ~ Cagliari ~ Italy

This study is included in the Coevolvers project, funded by the Horizon Europe program, and focuses on the socio-psychological antecedents of intentions to support Nature-Based Solutions (NBS), i.e. those interventions that use the insertion of natural spots (or the improvement/requalification of the existing ones).
The theoretical framework includes well-known reference models, such as the Value-Belief-Norm (VBN) theory (Stern, 1999) and the Social Identity Model Pro-Environmental Action (SIMPEA; Fritsche et al., 2018), that have been used in literature for the explanation of pro-environmental behaviours. Specifically, socio-psychological dimensions more individual-based (e.g., biospheric values and beliefs, personal norm) and more group-based (e.g., social norms, in-group identification and emotions, collective self-efficacy) were selected as possibleantecedents of intentions to support NBS initiatives in a multivariate prediction model.
About 3000 participants from panels recruited by an external agency in eight EU countries - Catalunya (Spain), Czechia, Estonia, Finland, Hungary, Italy, Scotland (UK), Slovakia – have to fill in an online questionnaire including the measures of the selected constructs, including different measures of intentions to support NBS. The data collection is planned for June 2025.
Expected outcomes are the confirmation of the key role played by both more individual-based variables (e.g., personal norm) and more group-based variables (e.g, collective self-efficacy) in promoting intention to be involved in actions for nature promotion and preservation. These findings should be taken into account for campaigns aiming at fostering individual and community action toward the creation of nature spots and the promotion of nature experiences.

Abstract 4484

NATURE-BASED SOLUTIONS TO AVOID BURNOUT AND QUIET QUITTING AT WORK

Frankó L.*

ELTE Eötvös Loránd University, Budapest, Hungary Institute of Psychology, Department of Organisational and Leadership Psychology ~ Budapest, ~ Hungary

In recent years, an important framework in organizational psychological research has been the idea that we live in a polycrisis period, where the world around us can be described using the acronym BANI (Brittle, Anxious, Nonlinear, Incomprehensible). The crises of the last five years (pandemics, climate crises, wars, etc.) often make employees feel helpless and insecure, which has led to an increase in the frequency of burnout and the emergence of another demotivated state known as "quiet quitting." This term describes a situation where an employee does not leave the organization legally but disengages psychologically. In our research, we tested whether nature use during office hours has a preventive effect on the development of quiet quitting and burnout. According to our results, nature use was associated with a high level of burnout and quiet quitting; therefore, we realized that there is an inverse cause-and-effect relationship here. The path analysis showed that while quiet quitting indirectly influenced nature use through burnout, burnout directly boosted the frequency of nature use ($t = 0.237$; $p < 0.01$).
We conclude that in the case of burnout, natural environments within the office space can serve as a so-called favorite place (Korpela, 1989), the visitation of which has an environmental self-regulatory function. We did not find a direct effect of quiet quitting on nature use, which may strengthen the theory that quiet quitting in itself may not be dysfunctional but can even be considered a shortterm coping strategy. The examination of the possible positive effects of the natural environment in the workplace is still significantly under-researched. In the BANI world, it would be important for the characteristics of the workplace not to reinforce the uncertainty described during the polycrisis period but to protect employees from it as a kind of shield.

Abstract 4485

CONTRASTING NATURE CONNECTEDNESS AND STEWARDSHIP IN FOREST SETTINGS IN SCOTLAND AND PERU

Townsend L.*

James Hutton Institute ~ Aberdeen, Scotland, ~ United Kingdom

This presentation reflects on contrasting studies exploring ways of living alongside nature in Peru and Scotland. The research was carried out as part of the Horizon Europe-funded project Coevolvers which is co-developing naturebased solutions (NBS) in seven European regions as well as with two “overseas cousins” in Peru and Carriacou. The researchers explored how local communities live alongside forests. In Scotland, the research focused on a community-owned woodland in rural Aberdeenshire. In Peru the focus was on the Amazonian rainforest native community of Nueva Alianza de Banõs. The research involved speaking with members of each community regarding typical activities in the forests, and perceptions regarding nature connectedness and stewardship. Ethnographic field observations were also recorded. In both communities, audio visual outputs were co-produced in the form of Virtual Nature Tours (VNTs) and digital stories.

In this presentation we draw on the interview and ethnographic data from each study to explore each community’s sense of connection to nature. At first glance the two communities seem culturally worlds apart. Whereas the native community in Peru rely entirely upon the rainforest for their survival (through the collection of forest resources such as food, medicine, timber and other materials), the Scottish community engage with the woodland largely on a recreational basis. In the rainforest, each member of the community feels a deep sense of stewardship for the forest. In Aberdeenshire it is largely members of the woodland Trust who feel this sense of stewardship. Yet parallels can be seen - both communities have members who engage on a deeper level - especially through foraging for food and medicine. In Aberdeenshire, a governance shift promises to foster stewardship more widely across the community. We discuss how these seemingly contrasting studies help us to understand nature connectedness and its role in nature stewardship.

Abstract 4486

CO-CREATING ECO-SOCIAL RECOVERY THROUGH NATURE-BASED SOLUTIONS AS A PROCESS OF NICHE CONSTRUCTION

Himansu Sekhar M.*

Natural Resources Institute Finland (Luke) ~ Helsinki, ~ Finland

Nature-based solutions (NBS) may be viewed as processes of eco-social niche construction, wherein humans and non-human species jointly shape dynamic environments, through cultural, ecological and evolutionary interactions and interlinked cognitive and affective engagements. Urban landscapes, understood as evolving multispecies niches, illustrate the human role as active niche constructors, both limiting certain species while creating new possibilities for others (Downey, 2016; Niesner et al., 2021). This activity influences evolutionary pathways for both humans and non-humans, alongside natural selection (Odling-Smee et al., 2003; Laland et al., 2016). By combining the notion of affordances with the biosemiotic concept of umwelt, we understand urban landscapes as multispecies habitats formed through reciprocal perception-action systems that are cognitive and affective in nature. Affordances, which represent the potential actions an environment provides an organism (Gibson, 2014), differ based on the species' own capacities and intentions, supporting a relational approach to perception (Heras-Escribano, 2020). Humans engage with and design environments via culturally shaped affordances (Norman, 1999), while non-human species interpret the same spaces through their own species-specific umwelten, grounded in unique perceptual and behavioural frameworks (Gibson, 2014). These processes, though distinct, are mutually reliant and together create adaptive, shifting niches that enable both human well-being and non-human thriving, contributing to ecosocial recovery amid environmental pressures (Kaaronen & Strelkovskii, 2020; Nagatsu et al., 2023). This research draws on empirical evidence from the Pansio-Perno Living Lab in Turku, Finland, employing affordance mapping, umwelt assessment, behavioural observation, and citizen storytelling to reveal how affordance-rich settings sustain social practices and non-human inhabitation. Rather than fixed interventions, this view treats NBS as ongoing niche-making processes, where design and perception co-direct outcomes (Matthews et al., 2014). By recognising urban environments as perceptually active and shared systems (Gibson, 2014; Council of Europe, 2000; Downey, 2016), we emphasise co-liveability, agency, and multispecies justice across species.

Abstract 4487

VALUES, RISKS AND DECISION ROLES IN NATURE-BASED GOVERNANCE

Kluvankova T.*

SlovakGlobe, Slovak Academy of Sciences and CETIP network ~ Bratislava ~ Slovakia

Governance has been identified by IPBES 2024 transformative change assessment as one of the key indirect drivers of biodiversity loss, considered human domination over nature and domination of the powerful over other people. We stress that if we want to transform the world and tackle the challenges identified by IPBES, we need to transform the way how we imagine and practice governance, and to bridge anthropocentric and eco-centric dualism into a perspective where human and ecosystem well-being are tightly coupled and recognised equally in the decision-making arena. In sum, our aim is to enrich discussion on the new roles that can be imagined for governance as a key lever for transformative change. Key question is how to navigate transformative change for biodiversity and sustainability by integrating multispecies agency as a new dimension aiming for multispecies co-existence and justice in biodiversity governance. We build on comparative behavioural studies from Horizon Europe projects Coevolvers and Innoforest, bringing examples of learning communities in 13 EU regions and following development of interactive agent-based modeling and common pool resource games. Specifically, we developed the Ecopoly game, based on a semi-digital decision model that simulate multi-actors action decision arena to trigger governance innovations for sustainability, leading potentially to social learning in collective gaming situations. Whether and what kind of change takes place is defined by processes within the action arena. Ecopoly was played in the context of 13 comparable nature-related multispecies communities to simulate governance situations which include co-evolution of values, beliefs, and interests. Results based on comparison of sessions with vs. without nature as a governance agency will be presented to provide argumentation for introducing a new governance mode called “nature-based governance”. It considers multispecies actors and physical environments as active parts of governance arrangements to be adaptive and reflexive for transformative change.

04 - Division 4: Environmental Psychology

IMPACTS OF CLIMATE CHANGE ON MENTAL HEALTH AND WELLBEING IN DIVERSE COMMUNITIES

Wednesday 22 July 2026 from 11:00 to 12:30

(F-Spadolini)

Susan Clayton (The College of Wooster ~ Wooster ~ Unite), Chair and Presenter

Growing research on the psychology of climate change has increased awareness of the variety of ways in which it threatens mental health and wellbeing. These impacts are differentially experienced by communities that differ in terms of geographic and/or social vulnerability. This symposium describes climate change impacts on wellbeing in a range of communities. In addition to their geographic range, the papers present a variety of methods, including surveys, interviews, global data on temperature and sleep, and a systematic literature review, to explore the direct geophysical impacts of climate change as well as some of the social processes that moderate those impacts.
Haemin Park presents a survey of research on climate change impacts in Pacific Island Countries, some of the most vulnerable areas globally, describing some of the social and cultural variables that promote or impede coping. Africa is also both highly vulnerable and understudied; Erinn Cameron shows that African women with HIV who experience water insecurity due to climate change have greater levels of depression and climate anxiety, , and that water insecurity is also associated with reduced healthcare engagement. Using a qualitative approach, Charles Ogunbode looks at Black and South Asian immigrants in the UK, how they construct an understanding of climate change, and how this understanding affects the impacts. Adlai Terreros Rodriguez also uses qualitative data to explore emotional responses to climate change experiences among Mexican fishing communities. Using data from an online survey, Susan Clayton examines the ways in which concerns about climate change are affecting current experiences as well as future plans in the US, and how these impacts are affected by demographic characteristics. At a global level, Kelton Minor presents an estimate of the impact of global warming on sleep loss. This symposium will deepen understanding of the diverse impacts of climate change on well-being.

Abstract 3150

MENTAL HEALTH IMPACTS ASSOCIATED WITH EXPOSURE TO CLIMATE-SENSITIVE HAZARDS IN PACIFIC ISLAND COUNTRIES: A SCOPING REVIEW

Park H.*, Hess J., Ebi K., Clayton S.*

University of Washington ~ Seattle ~ United States of America

Pacific Island Countries (PICs) face some of the most severe health risks from climate change, with associated mental health impacts that remain underrecognized. This scoping review synthesizes English-language peer-reviewed literature published by Feb 2025, to examine the mental health consequences of exposure to climate-related hazards across 22 PICs. The search identified 193 studies, of which 19 were included. Most studies employed qualitative or mixed methods, focusing on storms, droughts, sea-level rise, planned relocation, and environmental changes. Reported mental health outcomes included increased depression, anxiety, grief, and distress, often linked to direct exposure and secondary effects such as displacement, resource insecurity, and social disruption. Risk and protective factors emphasized broader social, cultural, spiritual, and environmental influences mediating the relationships between climate-sensitive hazard exposures and mental health outcomes in PICs. Cultural mediators such as traditional knowledge, land connection, and community cohesion shaped both vulnerability and resilience. Common coping strategies included relocation, community-based support, and leadership-driven actions. However, access to mental health care remained limited due to a shortage of trained professionals, stigma, and preference for traditional healing methods. To address these challenges, it is essential to integrate mental health into national public health frameworks, enhance disaster preparedness, increase access to mental health services, and conduct context-specific research.

Abstract 3152

RACIAL PATTERNING OF CLIMATE STRESS AND MENTAL HEALTH IN GREAT BRITAIN

Ogunbode C.*

University of Nottingham ~ Nottingham ~ United Kingdom

The environmental justice framework predicts that racially marginalised communities bear
disproportionate climate stress exposure, which in turn drives racially patterned mental health inequalities. We tested this prediction using the Stress Process Model in a large, quota-stratified survey of British adults (N = 2,160) across six ethnic groups (White British,
Black African, Black Caribbean, Indian, Pakistani, Bangladeshi), with deliberate minority oversampling. Pre-registered analyses examined whether cumulative climate stress (CCS)
was racially patterned and whether it contributed to racial inequalities in depression (PHQ-
9), generalised anxiety (GAD-7), wellbeing (SWEMWBS), and climate anxiety (CCAS). CCS was not racially patterned (F = 0.57, p = .722), and the null held after controlling for
income, education, and area deprivation. By contrast, cumulative socioeconomic stress (CSES) was strongly patterned by ethnicity (F = 15.26, p < .001) and dominated the prediction of all mental health outcomes. We also observed a dissociation between climate
exposure and climate anxiety where, despite equal CCS, every minority group reported significantly higher climate anxiety (F = 16.34, p < .001), and this gap was not attenuated by
socioeconomic controls. Race × CCS interactions were non-significant for depression, anxiety, and climate anxiety. A borderline interaction for wellbeing (p = .049) ran opposite
to prediction — Black African and Black Caribbean respondents showed more positive CCS–wellbeing slopes, with mediated moderation analyses indicating protective pathways
through self-esteem and mastery respectively.
These results suggest that the environmental justice mechanism does not hold for climate
stress in the current British context. Racial mental health inequalities are driven by socioeconomic pathways, not climatic ones. However, minority communities are more anxious about climate change despite equal exposure, pointing to appraisal-level rather than exposure-level inequity.

Abstract 3153

AN INTERDISCIPLINARY COMMUNITY-BASED STUDY TO UNDERSTAND THE PSYCHOSOCIAL IMPACTS AND ADAPTATION IN SMALL-SCALE FISHERIES

Terreros Rodriguez A.*[1], Banuet--Martinez M.[1], Hernandez--Velasco A.[2], Harper S.[1]

[1]University of Alberta ~ Alberta ~ Canada, [2]communidad y biodiversidad ~ Guaymas ~ Mexico

Small-scale fishing communities are experiencing complex and multifaceted impacts of climate change that extend beyond economic and ecological dimensions, deeply affecting social and emotional well-being. This study aimed to characterize the diverse experiences and emotions of fishing community members related to climate change and the implementation of sustainable practices. Using an interdisciplinary community-based approach, we partnered with two Mexican fishing communities. We conducted 54 open-ended filmed interviews and analyzed them using reflexive thematic analysis. Based on community member's experiences and local knowledge, we defined three overlapping experiential domains related to climate emotions: 1) direct experiences: tangible encounters with environmental change (e.g., differences in water temperature, quantity and size of species such as sea urchins), 2) anticipatory experiences: environment-related emotions arising from anticipated negative changes or imagined futures (e.g., concerns regarding the impacts of climate change on marine species because they are their source of income), and 3) vicarious experiences: internalized climate-related experiences of others (e.g., intragenerational observations regarding El Niño and La Niña phenomena). Several community members described experiences that spanned multiple domains, highlighting the complexity behind how people cope with climate change and its multiple impacts on well-being. Hope emerged as a cross-cutting theme and was firmly embedded in adaptation strategies already implemented by the communities, such as ecosystem monitoring, aquaculture, marine protected areas, fishing closure and livelihood diversification. This "hopeful" emotion emerging from local adaptation initiatives highlights how the local knowledge and sustainable practices can contribute to building community well-being and resilience. Our study offers critical insights into the emotional responses of fishing communities to climate change, and how local adaptation strategies and collective work can serve as protective factors for mental health and well-being in the context of climate disruption, as well as for more culturally grounded and emotionally responsive adaptation policies.

Abstract 3154

PLANNING FOR AN UNCERTAIN FUTURE: HOW CLIMATE CHANGE IS PERCEIVED TO AFFECT CURRENT AND FUTURE LIVES IN A US SAMPLE.

Clayton S.*

The College of Wooster ~ Wooster ~ United States of America

Concern about climate change is widespread, especially among young people. How might these concerns be affecting plans for the future, such as decisions about childbearing and financial planning? This paper examines impacts of climate change concerns on future planning among U.S. residents. First, we examined the ways in which people were engaging with these questions with an AI analysis of social media posts (using AskPolly). In social media posts, people who engaged with the topic mostly expected profound impacts, and they reported that it was leading them to seek information and to be more politically engaged. We then present the results of an online study of 324 U.S. respondents. In survey responses, concern about climate change was high, especially among younger, better educated, more leftwing, and Black respondents; people high in climate anxiety, and more future-oriented, also showed greater concern. People expected more negative than positive impacts, more negative impacts in the future than in the present, and more negative impacts to others than to themselves. They reported that their concerns were having some impact on their future planning, especially about where to live. Although people on the left were more likely to think about, and worry about, climate change, political orientation had little influence on reported impacts; younger age, higher level of education, and degree of climate anxiety were the strongest predictors of both felt and anticipated impacts as well as the degree to which concerns were affecting future plans. Results suggest that climate change concerns are significantly affecting people's lived experience and decisions about the future.

Abstract 3178

NIGHTTIME WARMING AND HUMAN SLEEP LOSS: A PRELIMINARY GLOBAL INDICATOR

Minor K.*

University of Copenhagen ~ Copenhagen ~ Denmark

Introduction:
Both daytime and nighttime temperatures are rising with the latter exceeding the former in magnitude across most global settings. An accumulating body of globally extensive, longitudinally deep, and plausibly causal evidence confirms that unseasonably warm ambient temperatures harm human sleep and reduce time slept. This within-person relationship generally persists in sign but decreases in magnitude when temperature is measured outdoors vs. indoors, during winter vs. summer, and when measured in rich vs. poor socioeconomic contexts.
Purpose: While both national and global population sleep data remain elusive, there is a need to provide an evidence-based accounting of the annual human sleep loss attributable to nighttime warming to inform global policy.
Method: We couple globally gridded ERA5 reanalysis meteorological and climate data over land from 1986-2023 with temperature attributable sleep loss damage functions from a recent wearables-based global temperature and sleep individual panel analysis spanning 68 countries (n=47,628) to hindcast the additional annual cumulative sleep loss attributable to recent nocturnal warming in 2023 and prior five years (2019-2023) compared to the 1986-2005 climate normal baseline.
Results: We estimate that nighttime warming attributable sleep loss has increased by an average of 5% over the last five years (reaching a record 6% in 2023) compared to the average annual sleep loss during the 1986-2005 baseline. Absolute impact estimates vary widely globally.
Conclusions: Nighttime warming attributable sleep loss is likely already a pervasive phenomenon, even among those with socioeconomic adaptive advantages. We conclude by outlining emerging evidence that suggests these absolute estimates may indeed be highly conservative.

04 - Division 4: Environmental Psychology

SYSTEMIC BARRIERS, CIVIC RESILIENCE, AND NEW SOLUTIONS: PSYCHOLOGY'S ROLE IN DRIVING COLLECTIVE ACTION ON SOCIETAL CHALLENGES

Wednesday 22 July 2026 from 11:00 to 12:30

(I-Spadolini)

Anandita Sabherwal (Princeton University and Boston College), Chair and Presenter
Danielle Goldwert (New York University ~ New York City ~ Un), Co-Chair

Addressing urgent global challenges requires co-ordinated efforts from individuals and key societal entities such as politicians, media, and scientists. These systemic actors can serve as barriers—creating gridlock, deepening divides, and undermining motivation—but they also hold great potential for unlocking large-scale solutions. This symposium examines the dual role of systemic factors as both obstacles and drivers of collective action on societal challenges.

Talk 1 investigates how barriers to bipartisan climate action are rooted in systemic dynamics across citizens, politicians, media, and activists. It highlights how entrenched identities, polarized narratives, and institutional incentives perpetuate inaction. Talk 2 illuminates that civil society is not powerless in the face of systemic opposition. Using large-scale conjoint and behavioral experiments, it shows that when scientific experts and social consensus align, they can spur widespread support for environmental, health, and technology initiatives—even amidst opposition from governments and corporations.

The next three talks then uncover how systemic factors can drive collective action. Talk 3 demonstrates the promise of emerging technological solutions, evaluating how generative AI, equipped with climate knowledge and personalized guidance, can correct public misperceptions about climate action and increase intentions to adopt high-impact behaviors. Talk 4 presents results from a megastudy testing 17 interventions to mobilize climate advocacy, showing that emphasizing efficacy and emotional benefits provides scalable pathways to engagement. Talk 5, also from the megastudy, finds that confidence in the government's ability to act effectively (i.e., governmental response efficacy) is especially powerful in motivating climate advocacy across partisan groups.

Together, these talks illuminate how systemic forces can both stall and accelerate social change. By envisioning systemic actors as influences, barriers, and solutions, this research pushes psychology beyond the individual, showing how the field can engage with complex systems to help address challenges that may be too large for individuals alone.

Abstract 3682

SOCIAL CLIMATE: PSYCHOLOGICAL BARRIERS TO CLIMATE POLICY

Sherman D.*[1], Van Boven L.[2]

[1]University of California, Santa Barbara ~ Santa Barbara ~ United States of America, [2]University of Colorado, Boulder ~ Boulder ~ United States of America

The IPCC states that the time is “now or never” to address global warming. But despite a history of bipartisan success on environmental issues within the US, where the two major political parties enacted laws to protect the planet, the American political system has largely failed. With this backdrop, I present research that has sought to understand psychological barriers to bipartisan climate policy. I examine four interconnected actors that both reflect and perpetuate the conflict: 1) the populace, that recognizes the existence and importance of the climate crisis, but who are influenced by identity and norms; 2) the politicians, who make policy within their own social psychological context; 3) the media, who advance narratives of extremity; and 4) the activists, who try to influence the other actors to act with the urgency that is required. Through analyses of quantitative data and interviews collected from these four actors, the talk will highlight the relevance of social psychological research to ongoing conflicts, while, at the same time, reflecting on its impact at affecting change commensurate with the urgency of the moment.

Abstract 3684

SIGNALS FROM SCIENTISTS AND THE PUBLIC MATTER MOST FOR MOTIVATING ACTION ON SOCIETAL CHALLENGES EVEN IF POLITICIANS AND PRIVATE STAKEHOLDERS OPPOSE

Sabherwal A.*[2], Sparkman G.[1]

[1]Boston College ~ Boston ~ United States of America, [2]Princeton University and Boston College ~ Princeton ~ India

Public response to social problems is guided by signals from many entities: the government, scientists, industry, and salient norms. But people do not encounter these signals in isolation. In daily life, they are simultaneously exposed to cues from multiple entities that may at times converge on a shared message and at other times provide diverging guidance or signal different levels of urgency. In such cases, which entities are most influential in mobilizing the public? And which entities remain influential even if other groups appear apathetic or stand in opposition? In two conjoint experiments spanning 21,000 decisions and one behavioral experiment (Ns = 1,500; 2,000; 1,600; quota-matched to national demographics in the U.S.), we show the relative and combined influence of government bodies, scientific experts, industry stakeholders, and public consensus in driving responses to 12 issues across environmental, health and technology domains. Across domains, support from scientists and social consensus was most influential in shaping decisions about which solutions are preferable, and influencing behavior like donations to a cause. These effects held even when the government and industry opposed the actions proposed. Together, scientists and the public can mobilize action on contemporary societal challenges, even amidst systemic inaction or opposition.

Abstract 3685

ADDRESSING CLIMATE ACTION MISPERCEPTIONS WITH GENERATIVE AI

Remshard M.*[1], Kyrychenko Y.[1], Savoia E.[2], Roozenbeek J.[1]

[1]University of Cambridge ~ Cambridge ~ United Kingdom, [2]Harvard University ~ Boston ~ United States of America

Mitigating climate change requires widespread behavior change. However, even climate-concerned individuals often hold misperceptions about which actions most effectively reduce carbon emissions. We recruited 1204 climate-concerned participants to examine whether discussing climate actions with a large language model (LLM) equipped with climate knowledge and tailored to provide personalized responses would promote more accurate impact perceptions and greater intentions to engage in high-impact behaviors, compared to using web search, a default LLM, or no intervention. The results show that participants in the personalized LLM condition produced more accurate impact assessments than those in the control and default LLM conditions, but did not differ from web search. However, the personalized LLM also increased intentions to perform high-impact behaviors relative to both the control and web search. The findings suggest that while LLMs might not outperform web searches in improving knowledge of climate action impacts, their ability to deliver personalized, actionable responses might more effectively motivate impactful pro-climate behavior change.

Abstract 3686

A MEGASTUDY OF BEHAVIORAL INTERVENTIONS TO CATALYZE PUBLIC, POLITICAL, AND FINANCIAL CLIMATE ADVOCACY

Vlasceanu M.*

Stanford University ~ Palo Alto ~ United States of America

Addressing climate change depends on large-scale system changes, which require public advocacy. Here, we identified and tested 17 expert-crowdsourced theory-informed behavioral interventions designed to promote public, political, and financial advocacy, in a large quota-matched sample of U.S. residents (N=31,324). The most consistently effective intervention emphasized both the collective efficacy and emotional benefits of climate action. This was also the top intervention among participants identifying as Democrats. Appealing to binding moral foundations, such as purity and sanctity, was also among the most effective interventions, showing positive effects even among participants identifying as Republicans. These findings provide critical insights to policymakers and practitioners aiming to galvanize the public behind collective action and advocacy on climate change with affordable and scalable interventions.

Abstract 3687

THE CENTRAL ROLE OF GOVERNMENTAL RESPONSE EFFICACY BELIEFS IN MOBILIZING COLLECTIVE ACTION

Goldwert D.*[1], Sabherwal A.[2], Vlasceanu M.[3]

[1]New York University ~ New York City ~ United States of America, [2]Princeton University and Boston College ~ Princeton ~ United States of America, [3]Stanford University ~ Palo Alto ~ United States of America

Tackling global challenges such as climate change requires not only the capacity to act but also the belief that action will be effective. Across two large, nationally representative U.S. samples (Study 1: N = 1,197; Study 2: N = 31,324), we show that response efficacy—the belief that actions will work—plays a central role in mobilizing climate engagement. Study 1 demonstrates that governmental response efficacy is the strongest predictor of climate action across behavioral domains, including public advocacy, political participation, financial contributions, and lifestyle change. While Republicans reported lower efficacy overall, their engagement was especially responsive to efficacy beliefs, highlighting a cross-partisan pathway to mobilization. Study 2 evaluates 17 candidate communication strategies and identifies a single, scalable mechanism: emphasizing the collective efficacy and emotional benefits of climate action. This approach consistently increased personal, collective, and governmental efficacy across ideological groups. Together, these findings reveal governmental response efficacy as a key psychological driver of climate action and provide a practical intervention for strengthening it. By clarifying the structure of efficacy beliefs and demonstrating how to enhance them, this research offers new insight into how societies can foster broad-based public engagement in addressing urgent environmental crises.

Abstract 1230

BETWEEN NATURE AND WELLBEING: THE IMPACT OF EMOTION REGULATION AND NATURE CONNECTEDNESS

Domaradzka E.*[1], Bajkowska K.[1], Rycielska L.[2], Modlinska K.[1]

[1]Institute of Psychology, Polish Academy of Sciences ~ Warsaw ~ Poland, [2]Educational Research Institute - National Research Institute ~ Warsaw ~ Poland

Introduction&Purpose: A growing body of research shows that contact with nature brings numerous benefits for human functioning, especially regarding psychological wellbeing. Contact with nature has been shown to lower stress levels, improve coping and regulation of emotions, and increase general wellbeing. However, the mechanisms of this relationship are still largely unknown. In order to address this gap, we propose a theoretical model including two mediators in the nature-wellbeing link: nature connectedness and emotion regulation.

Nature connectedness - an affective bond with the natural world - has been associated with higher life satisfaction and eudaimonic wellbeing. Emotion regulation, which relates to the ability to manage emotional states and expressions, is a well-established factor in reducing anxiety and depression. Within our positive psychology framework, wellbeing is conceptualized in a comprehensive manner, including anxiety, depression, stress, life satisfaction, sleep quality, psychological functioning, and physical health.

Method: In two large-scale studies involving Polish national representative samples (N=1038; N=2668), we tested mediation models where nature connectedness and emotion regulation strategies mediated the association between contact with nature and wellbeing. The participants filled out questionnaires assessing the amount of contact with nature, nature connectedness, emotion regulation strategies, and indicators of wellbeing.

Results: The results show how nature connectedness and emotion regulation strategies differentially affect the relationship between contact with nature and various aspects of wellbeing. Among others, the results indicate that the relationship between contact with nature and general wellbeing is mediated by nature connectedness, while adaptive emotion regulation strategies mediate the effects on symptoms of anxiety and depression.

Conclusions: This research enhances our understanding of the nature-wellbeing association by exploring the mechanisms involved in this complex relationship. In times of increasing urbanization and mental health crisis, research advancing our understanding of the human-nature interactions is crucial for the development of evidence-based interventions and informed urban planning.

Abstract 1173

LEVERAGING NATURAL BEAUTY TO PROMOTE PRO-ENVIRONMENTAL INTENTIONS: INSIGHTS FROM A FIELD STUDY

Belloni G.*, Gabbiadini A., Sacchi S.

Università degli Studi di Milano-Bicocca ~ Milano ~ Italy

Introduction

Environmental communication often employs catastrophic climate change scenarios to raise awareness. While effective in emphasizing urgency, these approaches can trigger avoidance and defensive reactions. Exploring alternative methods that foster pro-environmental behaviors without relying on fear is essential.

Purpose

This study aimed to examine whether experiencing the beauty of nature (specifically, a blue space), as well as exposure to polluted environments, can effectively promote pro-environmental behavioral (PEB) intentions. Additionally, it sought to identify the psychological mechanisms underlying these effects. Previous research suggests that restorativeness and emotions such as awe are linked to pro-environmental behavior, leading to the hypothesis that aesthetic experiences of nature may foster PEB intentions through pathways distinct from those triggered by negative or threatening environmental cues.

Methods

A field experiment was conducted at Camping Esperidi (in Tuscany), where participants were randomly assigned to one of two conditions: a polluted beach or an unspoiled beach. The experience was timed at sunset to enhance aesthetic perception. Participants were approached at the beach and instructed to focus on their surroundings. Measures included restorativeness, solastalgia, aesthetic emotions, and ecological emotions.

Results

Statistical analyses reveal that the psychological mechanisms underpinning pro-environmental intentions differed sharply between conditions: while restorativeness and aesthetic emotions were the key mediators on the unspoiled beach, solastalgia played the central mediating role in the polluted beach context. Interestingly, this processual divergence emerged even though the overall level of pro-environmental intentions did not differ significantly between conditions.

Conclusions

These findings suggest that environmental communication can effectively leverage both positive and negative emotional pathways. Importantly, emphasizing nature's beauty can be as potent as highlighting ecological degradation, but through different psychological mechanisms. The field setting strengthens the ecological validity of the

results, providing valuable insights for applied psychology in environmental communication.

Abstract 470

EXPLORING THE CORRELATES OF TRAIT MINDFULNESS IN INDIAN YOUNG ADULTS: A FOCUS ON NATURE AND GRATITUDE

Gupta S.*, Pradhan R.K.

IIT Kharagpur ~ Kharagpur ~ India

In today's fast-paced, technologically advanced world, the pursuit of material success often compromises physical and mental well-being, particularly among young adults facing academic and societal pressures. With the rising global demand for mental health services, there is an urgent need to explore proactive, scalable, and accessible approaches to mental health management. Trait mindfulness, known for its personal and professional benefits associated with wellbeing, can be cultivated not only through traditional meditation but also through practices such as nature connectedness and gratitude. This study builds on positive activity model to examine the relationship between nature connectedness, gratitude, and trait mindfulness. Data will be collected from a sample of Indian young adults aged 18 - 29 using convenience sampling and standardized self-report measures. Findings may support the development of simple, practical self-regulation strategies to enhance mental health at the individual level.

Abstract 1518

LIVING BETWEEN NATURE AND CONCRETE: EMOTIONAL IMPACTS OF URBAN ENVIRONMENTS

Kaplan Mintz K.*[3], Katz D.[1], Ben--Zvi D.[2]

[1]ELTE Eötvös Loránd University ~ Budapest ~ Hungary, [2]University of Haifa ~ Haifa ~ Israel, [3]University of Kiryat Shmona in the Galillee

Introduction

The global urban population is rapidly increasing. While urban living provides cultural and economic benefits, it is also associated with elevated stress and mental health challenges. Stress in urban settings not only affects psychological well-being but also dysregulates immune, metabolic, and cardiovascular systems. Exposure to natural elements has consistently been shown to buffer these effects and enhance emotional well-being. Nevertheless, less scientific attention is drawn to urban-nature dynamics and how related singular components may influence short-term environmental exposures and enhance well-being.

Purpose

By adopting the Experience Sampling Method (ESM), we sought to capture how everyday exposure to natural and urban features influences individuals' momentary emotions.

Method

Thirty participants provided a total of 392 reports through smartphone-based ESM over one week period. Data were collected in a metropolitan area. Participants completed multiple daily questionnaires assessing their immediate physical surroundings alongside their emotional states. Environmental variables included exposure to natural and urban components, while emotional well-being was captured through measures of positive affect, negative affect, and stress. Multi-level regression analyses were conducted to examine within- and between-person effects.

Results

Findings indicate that exposure to natural components such as vegetation and blue view was significantly associated with increased positive affect and reduced stress. In contrast, exposure to urban components such as traffic and noise predicted lower emotional well-being. These associations were consistent across participants and robust to contextual variations.

Conclusions

The study highlights the distinct contributions of natural and urban elements to the psychological impact of city living. The results support calls for urban planning that prioritizes the integration of natural elements into cityscapes to enhance mental well-being. More broadly, this work demonstrates the utility of ESM in capturing fine-grained,

real-time interactions between environments and emotions.

Abstract 730

COMMUNITY COHESION AS A MEDIATOR OF NATURE VISITS AND SUBJECTIVE WELL-BEING

Heske A.*[1], White M.[1], Pahl S.[1], Elliott L.[2], Taylor J.[3], Astell--Burt T.[4]

[1]University of Vienna ~ Vienna ~ Austria, [2]University of Exeter ~ Exeter ~ United Kingdom, [3]University of the Sunshine Coast ~ Sippy Downs, Queensland ~ Australia, [4]University of Sydney ~ Sydney, New South Wales ~ Australia

Introduction: Research indicates that rapid urbanisation contributes to a loss of connection with both the natural world and other people, both of which can undermine human well-being. By contrast, making an effort to maintain contact with nature, e.g. through voluntary nature visits, promotes well-being, at least in part due to greater perceptions of local community cohesion (e.g. due to seeing others engaging in similar/collective activities in neighbourhood parks). However, several questions remain, including the generalisability of these findings to different contexts and the role of existing social contacts in these processes.

Purpose & Methods: Using cross-sectional data from 704 Australians in the BlueHealth International Survey, the current study aimed to build on existing research by exploring the effect of visits to local green spaces on subjective well-being, via the mediating mechanism of perceived community cohesion, while also considering the potential moderating role of regular social contact (i.e., whether these mechanisms might be more important for those with less frequent contact with close others).

Results: Structural equation modelling found, as predicted, that: a) frequency of visits to local green spaces positively predicted subjective well-being; and b) this was partially mediated by perceived community cohesion. It did not, however, find support for the hypothesis that this may be moderated by general social contacts.

Conclusions: Findings reiterate the role of community cohesion in mediating the relationship between contact with local green spaces and subjective well-being but suggest further research is needed to explore potential moderators of these associations.

Abstract 1140

NATURAL SOUNDSCAPES AS A PATHWAY TO RESTORATION: COGNITIVE, AFFECTIVE, AND PHYSIOLOGICAL OUTCOMES

Withers S.*[1], Wynne R.[1], Pammer K.[2]

[1]The University of Newcastle ~ Newcastle ~ Australia, [2]The University of Melbourne ~ Melbourne ~ Australia

The restorative effects of natural environments on health and well-being are well-established, yet applied psychology must continue to explore innovative and accessible pathways to restoration in increasingly urbanised societies. One promising direction lies in the use of natural soundscapes, which may provide low-cost, scalable interventions for enhancing well-being in settings where immersive contact with nature is limited.

This study examined the impact of auditory environments on cognitive performance, affect and physiological responses. Participants (n = 80) completed a 40-minute cognitive task battery while passively listening to one of three conditions, natural soundscapes, urban soundscapes or silence. Following this, participants underwent a 10-minute restoration period where they listened to natural soundscapes, before repeating a cognitive task. Measures included performance on sustained attention tasks, self-reported mood and arousal, as well as physiological indices of restoration (electrodermal activity and heart rate).

Preliminary analyses revealed limited effects of soundscape condition on sustained attention. However, affective and physiological outcomes indicate participants in the natural soundscape condition reported greater increases in happiness and calmness post-task and show reduced electrodermal activity relative to the urban and silence conditions.

These findings suggest that while soundscapes may not directly enhance cognitive performance in the short term, they play a meaningful role in buffering against negative mood shifts and promoting emotional and physiological restoration. This highlights the need for further investigation into the emerging field of soundscapes and their potential to promote well-being and sustainability in urban contexts, where access to restorative natural environments is often unequal.

REAL-WORLD EXPERIMENTS IN ENVIRONMENTAL PSYCHOLOGY: APPROACHES, INSIGHTS, AND CHALLENGES

Wednesday 22 July 2026 from 14:00 to 15:30

(U-Monumentale)

Celina Kacperski (Seeburg Castle University ~ Salzburg ~ A), Co-Chair
Mona Bielig (Seeburg Castle University ~ Salzburg ~ A), Chair and Presenter
Kutzner Florian (Seeburg Castle University ~ Salzburg ~ A), Discussant

Real-world experiments in environmental psychology have become a cornerstone of climate behavior research. They take many forms: field trials introduce interventions in real-world contexts and track actual behaviors (e.g., energy consumption), while other studies leverage and experimentally manipulate real-world circumstances and examine psychological outcomes such as attitudes, perceptions, or acceptance. Across designs, such experiments share the goal of moving beyond lab settings to study how people act within authentic settings, enhancing ecological validity and causal inference. Yet all these approaches face substantial challenges arising from the applied, interdisciplinary, and often unpredictable nature of research in real world contexts.

Our symposium offers a meta-perspective on how such work can enrich psychology, while also addressing the trade-offs and constraints involved. This is relevant for ICAP: a strong real-world focus and application-centered orientation carry important methodological implications. Accordingly, we highlight considerations for design, measurement, partnerships, ethics, and scalability in applied settings.

Mona Bielig will present the Total Experimental Field Trial Error framework, drawing on experience from 12 experimental field trials conducted in energy-transition-focused projects. This lays groundwork for methodological reflections. Jordana Composto will present field experiments with companies in event-management settings in Canada, with a focus on challenges of interdisciplinary grant writing involving non-academic partners. Emily Bringmann will demonstrate a longitudinal study of a collaboration with an initiative that founded hundreds of energy communities in Austria in the last two years, using exposure as an independent variable. She discusses challenges in impact assessment. Josianne Kollmann will report results from an experimental study on optimized configurations for wastewater use in India, highlighting challenges of intercultural fieldwork. Finally, Celina Kacperski will present a study about aligning electric-vehicle charging with renewables via smartboard integration, with a real-world quasi-experimental pre–post design in Belgium, focusing on the methodological challenges of measuring behavior and identifying a suitable control group.

Abstract 3540

REDUCING ERRORS IN BEHAVIORAL SUSTAINABILITY DATA: A TOTAL ERROR FRAMEWORK FOR EXPERIMENTAL FIELD TRIALS

Bielig M.*, Kacperski C., Kutzner F.

Seeburg Castle University ~ Salzburg ~ Austria

Experimental field trials are a powerful means to advance behavioral research. This is especially urgent in the sustainability context, where causal conclusions are needed about the effects of real-world interventions on individual and collective responses such as energy or water consumption. Behavioral measurements can complement traditional survey-based approaches - however, unique challenges and sources of scientific error are posed by both collection procedures and the multidimensional nature of the data.
Drawing on insights from >10 experimental field trials conducted across three Horizon 2020 projects, we adapt the original Total Survey Error (TSE) framework developed for survey methodology to provide a comprehensive approach to systematically identify, categorize, and mitigate sources of error in (quasi-)experimental field trials. We illustrate how researchers can proactively design studies that balance internal and external validity while maintaining practical feasibility, examining each stage of the research process—from design and data collection to processing and interpretation. Our framework highlights key sources of scientific error in four main areas: measurement, sampling, experimental implementation, and data engagement. We underscore the importance of providing a standardized terminology, and suggest tailored strategies to address the defined errors based on experience from our previously conducted field trials. This roadmap for conducting high-quality experimental field trials will allow for more robust and actionable behavioral insights.

Abstract 3541

SMARTBOARDS FOR SMARTER CHARGING: FIELD EVIDENCE FROM ALIGNING EV USE WITH RENEWABLE ENERGY PEAKS

Kacperski C.*, Bielig M., Kutzner F.

Seeburg Castle University ~ Salzburg ~ Austria

This field trial tested whether a simple, non-financial intervention could influence real-world charging behavior of electric vehicle users. In collaboration with a housing cooperative in Ghent, Belgium, we installed a “smartboard” displaying real-time signals about renewable energy availability. Charging activity in this garage was compared to a control site without the intervention, using a pre-/during-trial baseline and a linear regression model with a triple interaction (intervention × trial period × lamp signal), equivalent to a difference-in-differences-in-differences design.

Across the trial period (Aug 2023–Apr 2024), we observed 9,854 charging operations (88 MWh) from 563 badges, in addition to 5,353 operations (44 MWh) from 382 badges in the pre-trial year. The analysis shows that, relative to both its own pre-trial baseline and the control garage, the smartboard garage shifted charging significantly toward renewable-abundant hours and away from carbon-intensive times. Emission calculations indicate that this behavioral change reduced charging-related emissions, a 16–22% decrease compared to counterfactual patterns.

Beyond results, the trial offers practical lessons: the importance of close collaboration with local partners, the need to ensure signal salience, and the trade-offs between research design and day-to-day system operation. We find that visible, real-time informational cues when salient and convenient can complement financial demand-response measures and support sustainable mobility transitions.

Abstract 3542

UNDERSTANDING USER PERCEPTIONS OF WASTEWATER TREATMENT AND REUSE: AN EXPERIMENTAL STUDY IN BENGALURU

Kollmann J.*[1], Contzen N.[2]

[1]Eawag: Swiss Federal Institute of Aquatic Science and Technology ~ Dübendorf ~ Switzerland, [2]University of Groningen ~ Groningen ~ Netherlands

In Bengaluru, as in many places worldwide, rapid urban population growth and climate-change induced water scarcity raise the need for ensuring access to safe water sources and for increasing the capacity to treat wastewater. One solution for both challenges is to treat wastewater close to its source of generation with so-called 'on-site wastewater treatment systems' and to directly reuse it. To increase the use of such systems, the local government of Bengaluru has issued a policy mandating their adoption for part of the population. However, many of the subsequently installed systems are not maintained well, indicating a lack of user acceptance. As user acceptance is crucial for a successful implementation of technologies, investigated how different socio-technical configurations of on-site wastewater treatment and reuse are perceived and accepted by (potential) users, and for which configuration acceptance is highest. In a first step, we conducted stakeholder interviews and workshops to better understand the local context, including the technological systems, the policy environment, the business options, and user perceptions. These insights led to the design of an online experiment conducted with residents of Bengaluru (N = 707), in which a set of different configurations was presented to participants. These configurations varied in terms of: the quality of the water treatment, the financial investments and gains, the reuse purposes, the amount of freshwater saved through reuse (environmental benefit), and the increased water security for users (reduced dependence on unreliable water deliveries by tankers). The analyses revealed that better water treatment quality was related to lower perceived disgust and health risk, but not to higher acceptance, potentially due to the higher financial costs. Moreover, participants were generally open also to close-contact reuse, but only if safety was ensured. I will complete the presentation by showcasing challenges and lessons learned of interdisciplinary and intercultural field work.

Abstract 3543

THE SOCIAL IMPACT OF ENERGY COMMUNITIES IN CONTEXT: LESSONS FROM A LONGITUDINAL STUDY IN UPPER AUSTRIA

Bringmann E.*, Kacperski C., Bielig M., Kutzner F.

Seeburg Castle University ~ Seeburg ~ Austria

This study presents accompanying research on the social and behavioural impacts of residents' exposure to newly established energy communities (ECs). Over the past two years, we collaborated with an organization supporting the local founding of ECs in three regions in Upper Austria. To capture the impact of the initiative, inhabitants of these regions participated in a three-wave panel survey (N = 360). The focus was on exposure to ECs, measured through regional presence (binary and membership numbers) as logged by the local organization, self-reported personal contacts, or self-reported direct membership. We measured how exposure shapes both psychological and behavioural outcomes: target variables included collective efficacy and support for climate policies, as well as self-reported energy-saving behaviour and community engagement. Multilevel models with repeated measurements nested within individuals are used to trace changes over time. We discuss the challenges of conducting applied, longitudinal research in partnership with community organizations, comparability between intervention and control regions, and limitations such as uneven exposure across regions, and the constraints of working with ongoing implementation processes.

Abstract 3544

PARTNERSHIP-DRIVEN FIELD INTERVENTIONS

Composto J.*, White K., Appelt K., Zhao J.

Sauder School of Business, University of British Columbia ~ Vancouver ~ Canada

Field experiments require alignment and coordination between researchers, organizations, and communities to address real-world challenges effectively. Insufficient stakeholder engagement and contextual understanding is a common challenge to researchers developing field interventions. The integration of partnership frameworks with behavioral science methodology represents a critical advancement in applied psychology research. I will discuss how strategic partnerships enhance the identification, design, implementation, and scalability of behavioral field interventions. The primary objective is to demonstrate key lessons learned from field studies focusing on sustainable consumer behavior. While one illustrative field experiment will be presented, insights derive from multiple partnership-driven studies.

A randomized controlled field experiment is being conducted at Vancouver's largest sports arena, examining behavioral interventions to support reusable cup adoption aligned with the venue's zero waste objectives. The target behavior is individual cup-returning behavior. Three conditions are being tested: a control condition, a lottery incentive offering cash prizes, and a lottery incentive offering participants choice between cash prizes or equivalent charitable donations.

Data collection will occur during September and October 2025 across multiple events. Data analysis will be completed prior to the conference. The study evaluates return rates across experimental conditions, economic viability metrics, and cash versus donation preferences. Results will provide recommendations for reusable cup programs and insights into which incentive types promote sustainable behavior. Partnership challenges and successes will be discussed.

The partnership approach identified a critical intervention point: the venue would discontinue the program if return rates fell below the required threshold. While the behavioral intervention targets individual cup-returning behavior, achieving the collective threshold enables system-level change, program continuation and potential expansion to stadiums nationwide. Strategic partnerships fundamentally enhance the effectiveness and scalability of behavioral field interventions, enabling researchers to design interventions where individual behavior change directly supports broader organizational and environmental goals.

BOTANICAL GARDENS: VITAL SETTINGS FOR ENVIRONMENT-BEHAVIOR RESEARCH IN A TIME OF POLYCRISIS

Wednesday 22 July 2026 from 14:00 to 15:30

(F-Spadolini)

Terry Hartig (Institute for Housing and Urban Researc), Chair and Presenter
Giuseppe Carrus, Discussant

We live in troubled times, with severe problems of pollution, climate change, and biodiversity loss compounded by geopolitical tensions. In this dismal context, botanical gardens offer solace in the present and hope for the future. As peaceful places, they afford enjoyment of nature's beauty, support psychological restoration, and open for learning about biodiversity and threats to the environment. As purposeful places, they serve the conservation of plant resources and support ecological restoration efforts in distant habitats, thereby demonstrating trust in possibilities for a better future. Botanical gardens thus offer distinctive possibilities for research at the intersection of nature experience, environmental education, ecological behavior and biological conservation. This symposium aims to raise the visibility of such possibilities; it will show how applied psychology can serve the conservation and public outreach missions of botanical gardens. The chair, Terry Hartig, will introduce the symposium and present a conceptual model that relates experiences available in a botanical garden to intermediate and distal outcomes such as psychological restoration, place attachment, ecological behavior, and mental health. The following four presenters will describe empirical research involving botanical gardens. All of these presentations refer to components of the conceptual model presented in the symposium introduction. First, Freddie Lymeus will describe the use of the botanical gardens at Uppsala University as a setting for research on several topics, some in the behavioral medicine tradition of Linnaeus. Second, Niels van Doesum, will describe studies of the psychologically restorative influence of physical design features in the Hortus botanicus at Leiden University,withafocusongreenhousefeatures.Third,AshbySachsandBethanyHarrieswilldescribethecooperationbetweentheRoyalHorticulturalSociety'sWisleyGardenandtheUniversityofSurreyinresearchontheinfluenceofspecificplantandgardendesignfeaturesonemotionalresponsesandrestorativeexperiencesofvisitors.Thefourthpresenter,XinxinWang,willdescribestudiesofnaturebasedtherapeuticinterventionsforstressandanxietyconductedatNanjingAgriculturalUniversity,withaviewtoimplementationinbotanicalgardens.Finally,GiuseppeCarrusfromRomaTreUniversitywilldiscussthepresentationsdrawinguponhisexperiencewithpsychologicalresearchinanItalianbotanicalgarden.

Abstract 4160

EXPLOITING OPPORTUNITIES FOR BEHAVIORAL RESEARCH IN BOTANIC GARDENS: EXAMPLES FROM THE UPPSALA LINNAEAN GARDENS

Lymeus F.*

Institute for Housing and Urban Research, Uppsala University ~ Uppsala ~ Sweden

Botanic gardens shelter life and hope in this time of mass extinction. They support biopsychosocial aspects of resilience by providing urban populations with needed opportunities for stress relief, psychological restoration, and social contact; and contribute to socioecological resilience through learning, motivating and connecting processes. As cities grow and visitation patterns shift, however, many botanic gardens themselves face adaptation pressures. The behavioral sciences offer theory and methods by which botanic gardens and their host communities may better understand who visits, why, what they experience, and how their visits affect them. This presentation describes how a behavioral research program was
established in the Linnaean Gardens of Uppsala (Sweden) and gives several examples of completed and ongoing studies. It aims to inspire development of more impactful research about how botanic gardens can harness their role as modern, urban resilience hubs, and to give an impetus for exchange between researchers and gardens that seek to implement such programs. The Linnaean Collaboration has so far generated over 40 advanced-level
student theses, many of them contributing to one of six overarching themes and associated research designs. The themes include coherent lines of study that use the gardens as a field laboratory for examining broadly relevant aspects of human-nature relations; that build on particular amenities in the garden to promote learning and therapeutic processes; and that map naturalistic patterns of visitor behavior and experience in relation to specific environmental features. Collating data within themes, we have collaborated with the involved students in publishing seven peer-reviewed articles, given numerous conference presentations, and secured major grant funding for extended research efforts.These examples and the simple yet effective and sustainable operations of the
Linnaean Collaboration can guide similar endeavors elsewhere and spark global collaboration for behavioral research in botanic gardens.

Abstract 4161

GARDEN OR GREENHOUSE? PSYCHOLOGICAL RESTORATION IN THE HORTUS BOTANICUS

Van Doesum N.J.*, Staats H.

Social, Economic and Organisational Psychology, Leiden University ~ LEIDEN ~ Netherlands

Can a visit to a botanical garden not only be interesting and educational, but also psychologically restorative? Intuitively as well as based on a handful of studies conducted in this area, one would expect the answer to be confirmative. At the very least, a botanical garden should be the kind of green space that can help dealing with the stress that often comes with urban life. However, botanical gardens are more than just beautiful green parks: They serve many different functions in terms of collecting and preserving plant life, resulting in several different and highly specialized environments. For example, the Hortus botanicus in Leiden – the oldest botanical garden in the Netherlands – contains a series of greenhouses that harbor unique collections requiring specific climate-controlled environments. Compared to walking through the gardens, entering the controlled mini climate of a clearly delimited greenhouse may give people an even stronger feeling of stepping away from daily life while enjoying the specific environment. In collaboration with the Hortus botanicus in Leiden, we are conducting a series of field and laboratory studies to explore the general restorative potential of a botanical garden while specifically focusing on strictly delineated key design elements like the greenhouses on the terrain. In this presentation we will discuss the project background and the general study design, and will present some preliminary results.

Abstract 4163

OUTCOMES AND MECHANISMS OF NATURE-BASED INTERVENTIONS FOR STRESS AND ANXIETY WITH ALTERNATIVE SETTING-ACTIVITY COMBINATIONS

Wang X.*[1], Lymeus F.[2], Yu W.[1], Hartig T.[2]

[1]Department of Landscape Architecture, Nanjing Agricultural University ~ Nanjing ~ China, [2]Institute for Housing and Urban Research, Uppsala University ~ Uppsala ~ Sweden

Restorative experiences derived from nature-based interventions can help address resource inadequacies that lead to stress and anxiety. Understanding how setting–activity combinations generate restorative experiences that produce immediate relief and long-term outcomes allows us to optimize interventions for individuals seeking anxiety relief.

This presentation covers studies that assessed the effects of therapeutic recreation and therapeutic horticulture interventions on Chinese university students who frequently experience anxiety symptoms. The studies aimed to explore how nature-based interventions in small groups can provide restorative experiences in the therapeutic process and to examine potential mediating factors.

In two randomized trials (N1 = 40; N2 = 205), we compared outcomes of three different nature-based interventions for stress and anxiety, including one characteristic of therapeutic recreation (forest activities) and two characteristic of therapeutic horticulture interventions (activities with plant materials, either indoors or outdoors). In contrast to the first trial, the second trial included a self-selected activity control group. The study design and measures enabled analyses of changes in acute stress and state anxiety from before to after each of five sessions held across the weeks of intervention (with restorative quality as mediator), changes in generalized anxiety across the sessions (with acute de-stressed feelings as mediator), and changes in social anxiety across the sessions (with group cohesion as mediator).
Both trials showed significant reductions in acute stress and state anxiety, particularly for the outdoor setting–activity combinations. In the second trial, intervention groups exhibited greater reductions in state, general, and social anxiety than the self-selected activity group, with restorative quality, acute de stressed feelings, and group cohesion mediating these effects. We discuss how these studies can guide both the development and evaluation of nature based interventions in botanical gardens.

BECOMING AN INTERIOR DECORATOR: THE ACQUISITION AND APPLICATION OF MINDFULNESS IN ECOLOGY AND MENTAL HEALTH.

Bassman S.*

Bassman Mental Health Services ~ Cincinnati, Ohio ~ United States of America

Counseling that focuses on the synthesis of ecology and mental health provides an opportunity for the participant to recognize and integrate personal and environmental factors through interaction and daily meaningful applications. One such application is the interaction of the ecological concept of recycling with the internal process of mindfulness. Ecological Recycling has been a priority in terms of understanding impermanence and the consequences of our choices for the present and future. While internal mindfulness has been an integral facet of acquiring introspective acceptance and cultivating mental health, in this workshop, Dr. Bassman will address and facilitate a didactic and experiential presentation that has been designed to address how the interplay of mindfulness and recycling can become a resource for enhanced awareness within the evolving ecological relationship. Accordingly, he will explore the complexity of thoughts, feelings and behaviors when one is attached to "unhealthy processes" as well as how to cultivate healthy and mindful recycling within one's inner and outer world.

Program Description and Objectives:

The purpose of the workshop is to provide the participants with an opportunity to learn how to deepen their self understanding by considering mindfulness and recycling as a component of an evolving mutually enhancing framework to promote health and wellness. Through lectures, demonstrations and experiential activities, the participants will be able to practice empathy, acceptance and detachment as an aspect of growth.

Abstract 4596

THE INFLUENCE OF IMMERSIVE URBAN GREEN SPACES ON STRESS RECOVERY AND RISK-TAKING

Dorri S.[1], Kosonogov V.[1], Kerimova N.[1], Meidenbauer K.L.[2], Kliucharev V.*[1]

[1]International Laboratory of Social Neurobiology, HSE university ~ Moscow ~ Russian Federation, [2]Washington State University ~ Pullman, WA ~ United States of America

Introduction & Purpose

As urban expansion continues, restricted access to natural environments has become a significant driver of stress among city populations. Immersive 360° panoramic videos offer a scalable and innovative medium for simulating natural settings, providing a potential tool for stress mitigation within controlled environments. This study investigated whether brief exposure to different virtual urban landscapes facilitates stress recovery and impacts subsequent risk-taking behavior.

Method

Using a within-subjects design, sixty-six participants underwent stress induction via the threat-of-shock paradigm (ToS). During each ToS block, a red square (stimulus duration = 8 s) appeared on the screen (23-inch LG monitor) six times, with interstimulus intervals ranging from 8 to 20 s. An electrical shock followed the stimulus in 50% of the trials. Participants then viewed 360° monoscopic videos featuring an urban park, a high-traffic highway, or a minimal-stimulation control condition. During the VR exposure, we recorded physiological markers, including heart rate and skin conductance responses. Additionally, self-reported stress levels were collected, and risk-taking was assessed using the Balloon Analogue Risk Task (BART).

Results

The results demonstrated that self-reported stress was significantly lower following the urban park exposure compared to both the highway and control conditions. Physiologically, heart rate and skin conductance responses were significantly reduced during the park condition relative to the highway. However, the virtual environments exerted no significant effect on heart rate variability or risk-taking behavior.

Conclusions

These findings suggest that while brief immersion in virtual green spaces effectively supports physiological and psychological recovery following acute stress, these benefits may not extend to shifting decision-making under risk. The effects were more robust for subjective stress than for physiological measures, highlighting potential differences in sensitivity across outcome domains.

Abstract 2055

AN INDIRECT PATHWAY VIA BIOSPHERIC VALUES BETWEEN NATURE RELATEDNESS AND PRO-ENVIRONMENTAL BEHAVIORS

Akbas Uslu G.[1], Korkmaz L.[2], Simsek Y.*[2], Gökkaya B.[3]

[1]Ankara Medipol University ~ Ankara ~ Turkey, [2]Middle East Technical University ~ Ankara ~ Turkey, [3]Selçuk University ~ Konya ~ Turkey

Introduction

In the literature, significant relationships between nature relatedness and pro-environmental behaviors have been reported. Some studies have also demonstrated the mediating role of biospheric values in the relationship between connectedness to nature and pro-environmental behavior. This study aims to contribute to the literature by focusing specifically on nature relatedness and examining six distinct categories of pro-environmental behaviors. Furthermore, this study is unique in examining this relationship with a Turkish community sample.

Purpose

The present study examines the indirect pathway via biospheric values in the relationship between nature relatedness and pro-environmental behavior across six categories: collective action, consumer behavior, energy conservation, water consumption, household appliance use, and transportation.

Method

The study comprised 375 Turkish individuals aged 18 and over who financially contributed to their household. They were recruited via convenience sampling. Participants completed a demographic form, the Nature Relatedness Scale, biospheric values items from the Values Orientation Scale, and the Pro-Environmental Behavior Scale. We conducted six separate mediation analyses using PROCESS MACRO Model 4 with 5,000 bootstrap samples.

Results

Controlling for age, gender, and education, the mediating role of biospheric values was significant for consumer behavior (b = 0.13, 95% CI [0.05, 0.23]), energy conservation (b = 0.13, 95% CI [0.03, 0.25]), water consumption (b = 0.20, 95% CI [0.08, 0.33]), household appliance use (b = 0.18, 95% CI [0.07, 0.30]), and transportation (b = 0.15,

95% CI [0.03, 0.28]); the indirect effect for collective action was not significant (b = 0.05, 95% CI [−0.04, 0.14]). Direct effects were significant across all six domains; partial mediation emerged in five.

Conclusions

Nature relatedness promotes pro-environmental behaviors both directly and through biospheric values across distinct categories, whereas collective action may depend more on sociopolitical factors and structural opportunities. Accordingly, interventions that enhance nature relatedness may be a promising way to increase pro-environmental behaviors.

Abstract 1530

EGOISTIC VALUE ON CIVIL ACTIONS FOR SUSTAINABILITY TRANSITIONS

Itoi K.*, Kaida N.

University of Tsukuba ~ Tsukuba city, Ibaraki prefecture ~ Japan

Introduction: Addressing climate change requires structural policy changes that realize sustainable societies. To promote such transitions, pro-environmental behaviors (PEB) in the public sphere, such as political actions, play a crucial role. Value orientations are considered fundamental determinants of PEB, whereas egoistic value has often been regarded as a barrier to PEB, especially in the private sphere. However, its role in the public-sphere PEB has not been sufficiently examined under the current climate crisis. This study examined how egoistic value affect PEB across both the private and public spheres.

Methods: A questionnaire survey was conducted in February 2025 with 1,200 Japanese adults, collecting their responses on value orientations and intentions of 16 types of PEB in the public and private spheres. Factor analysis identified three PEB domains in each sphere. Regression models were estimated for each PEB domain, with egoistic value as a mean-centered predictor. Quadratic egoistic value terms were included to examine their linear and U-shaped patterns.

Result: PEBs in the public sphere (e.g., voting, petition signing) showed significant positive linear and quadratic associations, suggesting that individuals with higher egoistic value tended to engage in these actions. In contrast, PEBs in the private sphere exhibited different patterns: a U-shape for sustainable consumption with the lowest intentions at moderate egoistic value levels, a negative linear relation for resource conservation, and communication similar to PEBs in the public sphere.

Discussion: These findings suggest that the role of egoistic value depends on the behavioral context, specifically whether it is in the private or public sphere. Stronger egoistic value could promote collective engagement, accelerating sustainable transitions. This may reflect the growing self-relevance of the climate crisis, as evidenced by recent extreme weather events. This study highlights the need to reconsider how egoistic value shapes PEBs across behavioral contexts.

Abstract 1090

SALIENCE OF GROUP IDENTITY PROMOTES COOPERATION AROUND SHARED NATURAL RESOURCES: EXPERIMENTAL EVIDENCE FROM AGRO-PASTORALIST COMMUNITIES IN TANZANIA

Rabinovich A.*[1], Drury J.[1], Borgerhoff Mulder M.[2], Leal A.[1], Mtei K.[3]

[1]University of Sussex ~ Brighton ~ United Kingdom, [2]University of California, Davis ~ Davis ~ United States of America, [3]NM-AIST ~ Arusha ~ Tanzania, United Republic of

Cooperative management of shared natural resources is one of the most urgent challenges the world is facing today. Addressing this challenge requires understanding of group process involved in willingness to cooperate across cultural contexts. We explore this issue in the context of shared land management among agro-pastoralists in Northern Tanzania. In an experimental study (N = 209) we tested whether salience of community (rather than household) identity and shared threat from land degradation is related to stronger willingness to protect communal land. The study used a mixed design with salience of community vs household identity as a between-subject IV (with random assignment), and outcome measures completed before and after the experimental manipulation (within-subject IV). Dependent variables included community efficacy and perceived support, intentions to protect communal (and household) land, and perceived community norms related to communal land protection. Participants were also asked to divide a fixed number of seeds between their household and village communal land. The results demonstrated that there was a significant interaction between the experimental condition and time (pre vs post) on community identification, perceived community support and efficacy, trust, and intentions to protect communal land – post manipulation (but not pre-manipulation) participants in the community condition reported higher scores on these outcomes than those in the household condition. In addition, participants in the community condition donated more seeds for planting on the communal land compared to those in the household condition. The results offer a critical field-based validation of the social identity approach to supporting cooperation around shared resources and suggest practical implications for promoting sustainable resource management.

Abstract 795

DOES ENGAGING FOR BIODIVERSITY ENCOURAGE CLIMATE PROTECTION? A CITIZEN SCIENCE INTERVENTION IN PRIVATE GARDENS

Seebauer S.*[1], Ellmer H.P.[1], Janisch J.[2], Trcka--Rojas C.[3], Dreisiebner--Lanz S.[1], Thaler T.[2], Neuwirth G.[3]

[1]JOANNEUM RESEARCH Forschungsgesellschaft mbh ~ Graz ~ Austria, [2]BOKU University, Institute for Landscape Planning ~ Vienna ~ Austria, [3]Naturschutzbund ~ Salzburg ~ Austria

Biodiversity loss and climate change are interlinked and mutually reinforcing. However, many people perceive both crises as abstract and psychologically distant threats. Citizens may struggle with translating these global crises into imminent concerns they can act on in their local livelihood. The present study engages private homeowners to reflect on the interrelation between biodiversity loss and climate change and the role they personally play in a familiar environment – their own garden. Private gardens may bridge species habitats and can help people to build a connection to the natural world; at the same time, the single-family home lifestyle generally implies a large carbon footprint. More than 300 Austrian households have signed up to implement biodiversity-promoting elements and techniques in their garden. As citizen scientists, they monitor changes in selected indicator species and report them via a nature observation app. As intervention participants, they complete the first wave of a longitudinal survey to determine whether the experiences, competences and knowledge acquired by engaging with the own garden are transferred to biodiversity- and climate-friendly consumption. Preliminary results show a self-selective sample of households who already plant native species and apply natural fertilisers and weed control. Many participate in other nature conservation or citizen science formats and have extensive biodiversity knowledge. Biodiversity-friendly consumption is weakly associated with a vegetarian, local, seasonal and organic diet and frugal clothing consumption, but mostly unrelated to other climate-relevant everyday behaviours. Self- and collective efficacy beliefs for protecting biodiversity and the climate are highly intercorrelated, however the correlation with collective efficacy for climate protection is weaker. At the conference, further results after the first growing season are presented. We provide recommendations how to better align activities for biodiversity preservation and climate action.

Abstract 1900

NATURE AS A BUFFER FOR RISK - EXPLORING NATURE-BASED MODERATORS OF SOCIOECONOMIC RISK IN OVER 15,000 CHILDREN

Egger J.*, Haas N., Hampejs V., White M.

University of Vienna ~ Vienna ~ Austria

Children from socioeconomically disadvantaged backgrounds face heightened risks of mental illness, emotional dysregulation, and educational challenges (Walsh et al., 2019; Yoshikawa et al., 2012). For adults, evidence suggests that nature contact—through time spent in green spaces, nature connectedness, and perceived quality—can act as a resilience factor, supporting mental health, emotional development, and social inclusion (White et al., 2023; Garrett et al., 2023; Fian et al., 2024). Wells (2021) proposed that nature may similarly buffer the effects of socioeconomic adversity on children's well-being, but the exact mechanisms remain underexplored.

Using data from over 15,000 children and adolescents in the UK's Children's People and Nature Survey (C-PaNS), this study investigates how aspects of nature contact moderate the relationship between socioeconomic status (SES) and well-being in children. Specifically, we examine whether children who have more contact with nature are better protected from the negative effects of low SES and identify key moderators, such as nature connectedness, time spent in nature, indirect nature contact, and a perceived sense of welcome in natural spaces. Unlike most studies that treat SES as a control variable, we focus on its interaction with nature contact to uncover potential buffering and resilience promoting effects.

The study is conducted in two phases: Phase 1 involves exploratory analyses to identify moderators of the SES–well-being relationship using half the dataset (n=7,665), while Phase 2 tests these moderators in confirmatory analyses with the other half (n=7,607). Preliminary findings suggest that nature connectedness, as measured by the Inclusion of Nature in Self scale, significantly mitigates the effects of low SES on well-being.

The C-PaNS design uniquely includes children's self-reports during both school and holiday periods, capturing the realities of their daily lives. By identifying nature-based factors that promote resilience, this study aims to inform equitable, nature-integrated policies to support mental health and well-being in socioeconomically disadvantaged children.

Abstract 4557

SCHOOL GREENSPACE CAN MITIGATE ADOLESCENT ANXIETY: A LARGE-SCALE GEOSPATIAL ANALYSIS ACROSS 98 SECONDARY SCHOOLS

Strygina K.[1], Salamatin M.*[1], Kerimova N.[1], Malych S.[2], Schmeleva I.[3], Chichkova N.[3], Medvedev A.[4], Panidi K.[5], Kliucharev V.[1]

[1]International Laboratory of Social Neurobiology, Institute of Cognitive Neuroscience, HSE University ~ Moscow ~ Russian Federation, [2]Psychological Institute of the Russian Academy of Education ~ Moscow ~ Russian Federation, [3]Institute of Design and Urbanism, ITMO ~ Saint Petersburg ~ Russian Federation, [4]Institute of Geography Russian Academy of Sciences ~ Moscow ~ Russian Federation, [5]Centre for Cognition and Decision Making, Institute for Cognitive Neuroscience, HSE University ~ Moscow ~ Russian Federation

Introduction:
As adolescent anxiety reaches unprecedented levels, can the strategic integration of nature into urban schoolyards offer a scalable intervention? While it is well-established that urban stressors like noise and pollution degrade student well-being, the specific restorative capacity of school-adjacent "green" and "blue" spaces remains poorly quantified across diverse urban contexts.
Purpose:
This study examines the interplay between environmental assets (vegetation and water proximity), urban pressures (roads, industrial surroundings), and academic demands (curriculum intensity and school hours) to identify their combined impact on the state anxiety of secondary school students.
Method:
We conducted a large-scale analysis of 3,631 students (aged 13–18) from 98 provincial schools in Eastern Europe. State anxiety was measured using the State-Trait Anxiety Inventory (STAI). Using multilevel linear regression and geospatial modeling, we assessed natural exposure within 100–5000m buffers while controlling for nearby roads, industrial buildings, and socio-demographic factors.
Results:
Our findings confirm that female students exhibit significantly higher baseline anxiety than males (45.33 vs 41.95). However, females also demonstrate the highest sensitivity to natural "buffers": size of green and blue spaces within a 250–500m radius significantly reduce state anxiety specifically in female students. Furthermore, unlike their male counterparts, female students showed a significant linear reduction in anxiety associated with the visibility of trees within their immediate school surroundings. Despite these natural restorative effects, school-related workload remains the primary driver of stress. Anxiety levels increase non-linearly with the amount of time spent on homework, with proficiency in exact sciences is associated with a decrease in anxiety, unlike humanitarian subjects performance.
Conclusions:

Our results suggest that in order to protect adolescent well-being, urban planning must prioritize accessible "blue-green" buffers within 500m of schools. Our results advocate for gender-sensitive environmental design and optimized academic schedules, emphasizing that nature-based interventions are most effective when considering the volume of students' academic workload.

Abstract 554

VIEWS OF NATURE FOR MENTAL HEALTH: THE CONCEPTUAL STRUCTURE ACROSS MODERN AND ANCIENT CHINA

Xiao H.*, Zhou G.

Peking University ~ Beijing ~ China

Introduction: apart from objective nature contact, people's subjective view are a crucial individual factor for the psychological effects of nature to take hold. While most studies are based on Western cultural contexts, the ancient and contemporary content of nature-related views among the Chinese people has yet to be deeply explored.

Purpose and methods: this study aims to (1) conduct Chinese BERT-based machine learning model and Latent Dirichlet Allocation (LDA) on 68,461 nature-related posts (year range: 2009–2025) from popular contemporary Chinese social media platforms (Sina Weibo, RedNote, Zhihu, and Bilibili); and (2) use Large Language Model (LLM) to extract core themes of views of nature from a random selection of 242 ancient Chinese text (year range: 1st BCE – 18th CE).

Results: (1)the machine learning pre-trained model was well performed, and the LDA extracted four themes from contemporary Chinese views of nature: Adapting to Nature (e.g., acceptance, mind-body health), Protecting Nature, Affection for Nature (e.g., strength, joy, freedom, gratitude), and Nature-based Healing (e.g., meaning, tranquility, mindfulness, stress coping, sleep aid). (2) Snow NLP(Natural Language Processing) showed the general affection towards nature was positive (score = 0. 94). (3) LLM extracted four themes of ancient Chinese views of nature: Conforming to Nature (unity of heaven and humanity), Caring for Nature (concern and affection), Peace of Mind (emotion regulation), and Self-Transcendence (meaning making). (4) Despite China's rapid urbanization and industrialization, the unique views of nature nurtured by Chinese civilization over millennia are similar.

Conclusions and implications: This study provides evidence from ancient and contemporary China to enrich the biophilia hypothesis and stress reduction theory, highlighting the potential benefits of Chinese views of nature for mental health. These findings offer new directions for developing nature-based psychological interventions that utilize views and emotions related to nature, as well as inform the conceptual measurement of the dimensions.

EXCESSIVE WORD-DEED CONSISTENCY BACKFIRES: THE INVERTED-U RELATIONSHIP BETWEEN CLIMATE ADVOCATES' WORD-DEED CONSISTENCY AND PUBLIC WILLINGNESS TO FOLLOW

Chen G.*, Tam K.

The Hong Kong University of Science and Technology ~ Hong Kong ~ Hong Kong

Climate advocacy serves as an effective strategy for encouraging the public to engage in climate actions. However, the consistency between climate advocates' words and deeds largely determines the effectiveness of climate advocacy. While the facilitating effects of word-deed consistency on public willingness to follow have been extensively examined, the potential diminishing effects of excessive word-deed consistency remain underexplored. Given that lacking understanding of the potential backfire may undermine the effectiveness of climate advocacy, we conducted two preregistered studies (N = 996) to investigate the inverted-U relationship between word-deed consistency and willingness to follow, along with the underlying mechanisms. Both studies revealed that word-deed consistency facilitated willingness to follow by increasing perceived credibility, similarity, moral threat and decreasing perceived hypocrisy when it was below a moderate level. Conversely, word-deed consistency diminished willingness to follow by decreasing perceived similarity when it exceeded a moderate level. Furthermore, Study 2 demonstrated that advocating for easy low-carbon behaviors can eliminate the diminishing effects of excessive word-deed consistency on willingness to follow. The present research contributes to a more comprehensive understanding of the relationship between word-deed consistency and willingness to follow and provides insight into effective climate advocacy.

WEATHERING CONSPIRACIES: CLIMATE CHANGE CONSPIRACY BELIEFS AND EXTREME WEATHER IN THE CARIBBEAN

De Gourville D.*, Douglas K.

University of Kent ~ Canterbury ~ United Kingdom

The existence and severity of climate change are supported by overwhelming scientific consensus and recognized as among the most serious threats facing humanity. Nevertheless, conspiracist narratives continue to flourish globally, attracting multidisciplinary attention. These include denialist narratives which delegitimize the threat of climate change, and warmist narratives which reaffirm or exaggerate it. Despite a research boom in recent years, most studies on the psychology of conspiracy theories remain focused on WEIRD populations, leaving underrepresented regions, disproportionately vulnerable to climate impacts, largely overlooked. The current research addressed that gap by focusing on the Caribbean, an archipelago of small-island developing states along the northern coast of South America. Across three studies, we examined the relationships between climate change conspiracy beliefs, perceptions and behaviours in the aftermath of extreme weather events in Grenada (N = 145) following Hurricane Beryl, and in Trinidad and Tobago (N = 417) and Barbados (N = 206), both facing increasingly volatile rainy and dry seasons. We also assessed whether conspiracy beliefs were linked to migration intentions and attitudes toward climate migrants. Findings indicate that personal experience with extreme weather predicted stronger warmist, but not denialist beliefs. Both forms of conspiracy beliefs were consistently associated with climate-related perceptions and policy attitudes. Specifically, denialist beliefs negatively predicted, and warmist beliefs positively predicted, subjective attribution of weather events to climate change, adaptation policy support, and sustainable investing. No conclusive evidence emerged for links to disaster preparedness intentions. Regarding migration, conspiracy beliefs did not predict migration intentions but were associated with attitudes toward climate migrants. Specifically, denialist beliefs were negatively associated, and warmist beliefs positively associated, with support for climate migration policies and favourable attitudes toward climate migrants. This research is the first to examine climate change conspiracism in the Caribbean, highlighting associations with perceptions, attitudes, and behaviours in extreme weather contexts.

Abstract 961

MORAL PERSPECTIVE-TAKING CAN REDUCE POLARIZATION AROUND CLIMATE POLICY

Hurst K.*, Hurst Z.

Southern Illinois University ~ Carbondale ~ United States of America

Polarization is a barrier to the large-scale collective action urgently needed to address the climate crisis. Moral perspective-taking (MPT) combines counter-attitudinal argument generation with moral framing as a strategy for reducing polarization. Across four online studies, we experimentally tested the efficacy of MPT for depolarization around divisive climate-related topics (transition from fossil fuels, fracking bans). We found consistent evidence that MPT can help moderate views on a divisive environmental topic, thus helping to decrease polarization. All four studies found significant effects of MPT on policy support. Further, Studies 1 and 2 found that the intervention increased empathy for people with opposing views and Studies 3 and 4 found it decreased resistance to opinion change and influenced willingness to take action on the issue. Our findings suggest that MPT can be used as a flexible tool to reduce polarization that is scalable and adaptable across multiple contexts.

Abstract 2201

SEEING SPREAD: HOW STIMULUS NOVELTY & DIVERSITY REPRESENTATION SHAPES NORM PERCEPTIONS AND PROSOCIAL BEHAVIOR

Kirschner J.*, Vock M., Thuerridl C.

University of Amsterdam ~ Amsterdam ~ Netherlands

How do people infer what counts as “normal” behavior? We propose that the diversity of those enacting a behavior serves as a powerful, yet underexplored, signal of societal diffusion. If people observe a wide range of individuals engaging in a practice, they infer that the behavior is more common, accepted, and expected. Across five preregistered vignette studies in pro-environmental and pro-social domains, including charitable donations, green pensions, and food-waste reduction, we test this “diversity-as-diffusion” hypothesis. Our samples (total N > 1,400 across the UK and the Netherlands) consistently show that diverse (vs. homogeneous) representations of actors increase perceived normativity. Mediation analyses reveal that norm perceptions fully account for the positive effect of diversity on behavioral intentions. Importantly, we demonstrate that these effects are not reducible to identification or homophily. A replication study with an explicit identity manipulation confirmed that diversity cues influenced norm perceptions independently of whether participants identified with the actors. This is one of the first empirical demonstrations that diversity can enhance prosocial behavioural through informational rather than identity-based pathways.

We further probe boundary conditions. Effects are strongest in domains with low prior knowledge and weaker in contexts with entrenched priors (e.g. environmental protests). Moderation analyses suggest that diversity signals are effective when they provide novel, independent information and people represent a wider part of the population (representation). While direct effect sizes on observed behavior are small, diversity reliably strengthens perceived norms, which in turn predict behaviours.

Taken together, these studies advance norm psychology by integrating diversity into models of belief updating, and they offer practical insights for campaigns seeking to foster sustainable and prosocial behavior through subtle representational choices.

Abstract 1983

BOOSTING CLIMATE RESILIENCE: THE ROLE OF RISK META-KNOWLEDGE AND INVOLVEMENT IN THE DESIGN OF CLIMATE RISK INFORMATION

Pfeiffer L.*, Reppmann M., Edinger--Schons L.M.

University of Hamburg ~ Hamburg ~ Germany

As climate change increasingly affects daily life, raising climate-risk awareness and motivating individuals to adopt protective behaviors is crucial. Although advances in climate data collection and analysis have yielded a detailed understanding of risks—such as the rising frequency of extreme weather events—among scientists and policymakers, it remains unclear how to communicate this knowledge to the broader public in a way that fosters lasting risk perception and action. Drawing on the theory of boosting, we propose that providing individuals with meta-knowledge about psychological biases in detecting and responding to climate risks strengthens both long-term risk perception and protective behaviors, such as ongoing, digitally enabled climate-risk monitoring. Building on psychological-ownership theory, we further predict that perceived involvement in designing web-based, real-time climate-risk information increases the use of this information for monitoring behavior. To test these propositions, we implemented a 2 × 2 factorial longitudinal field experiment in a medium-sized German city (N = 184). Participants received personalized, web-based, real-time indoor heat-risk information. We manipulated (a) participant involvement in the design of the heat-risk information (high vs. low) before website access and (b) the type of message provided after two weeks of website access (meta-knowledge about cognitive biases vs. a standard heat-risk message). We assessed participants' self-reported heat-risk perceptions and protective behaviors, as well as their actual web-based heat-risk monitoring behavior across the study period. Data collection concludes on September 30, 2025, and results on the main and interaction effects of the interventions on risk perceptions and observed monitoring behavior will be presented at the Congress of Applied Psychology. These findings will advance understanding of how communicating meta-knowledge about cognitive biases and involving citizens in conceptualizing real-time risk information can sustainably enhance climate-risk perception and promote lasting protective action, offering actionable insights for policymakers and practitioners seeking to strengthen climate resilience.

Abstract 1062

ME AND MY SHIRT: PSYCHOLOGICAL RESPONSES TO INDIVIDUALS' SHARES ON FAST FASHION

Lang C.*, Brummernhenrich B., Jucks R.

Universität Münster ~ Münster ~ Germany

Introduction and Purpose. Climate change communication is an effective way to support climate-friendly behavior. However, being directly confronted with one's owns limits and shortcomings regarding climate-friendly behavior can lead to defensive reactions, such as reactance. These reactions can affect attitudes as well as (communicative) behavior. The study aimed to illuminate the relationship between climate change communication, psychological reactance and the willingness to discuss climate change issues.

Method. In an experimental design, we varied whether the climate impact of clothing was framed as an individual (e.g., an individual buying clothes) or a non-individual issue (e.g., shops selling clothes) in a short video on the "journey of a white T-shirt". The study's hypotheses were pre-registered: We expected that the individual framing would lead to more reactance and less willingness to discuss climate issues than the non-individual framing.

Results. Linear regression models showed no direct significant effect of the manipulation on reactance or willingness to discuss climate change. However, exploratory mediation analyses showed a significant positive effect of the individual manipulation on perceived freedom threat, which in turn significantly increased reactance. The direct effect of the individual manipulation on reactance, when controlling for freedom threat, was significant and negative, indicating opposing indirect and direct effects. For the willingness to discuss climate change, perceived freedom threat partially mediated the effects in the direction of the initial hypotheses.

Conclusions. The findings suggest that the framing of climate change communication may influence reactance and the willingness to discuss climate change issues through opposing pathways. These results highlight the complex role of freedom threat as a mediator in how framing impacts both reactance and discussion willingness. Insights from open-ended responses are further examined and integrated within the quantitative findings. Implications for theory and future research are discussed.

RESTORATIVE ENVIRONMENT RESEARCH: METHODOLOGICAL CHALLENGES AND MEASUREMENT ISSUES, WITH THEORETICAL CONSIDERATIONS.

Wednesday 22 July 2026 from 15:30 to 17:00

(F-Spadolini)

Margherita Pasini (University of Verona ~ Verona ~ Italy), Chair and Presenter
Jack Leon Nasar, Discussant

Research on restorative environments has grown rapidly, yet methodological and measurement challenges remain, including assessing nature exposure, inconsistent health outcomes, and limited population-level causality (Hartig et al., 2014). Addressing these requires innovation in assessment, study design, and theory. This symposium highlights methodological and theoretical advances that strengthen understanding of environment–well-being links.

The session opens with Stefano De Dominicis (Green exercise and its physiological and psychological outcomes: insights from subjective and objective measures), who examines how natural settings promote restoration through physical activity. He highlights methodological challenges—heterogeneous measures, small samples, and short-term designs—underscoring the need for multi-method, longitudinal approaches and stronger integration across psychological, physiological, and social domains.

Margherita Pasini (Measuring Restorativeness at Work: Theoretical Refinement and Methodological Insights from the Development of the Restorativeness at Work Scale) focuses on the methodological process of developing and validating a psychometric instrument to assess restorative potential of work environments. She emphasizes item contextualization, dimensional refinement, and validation tailored to indoor contexts.

Next, Sjoerd Ebisch (Restorative Environments and Sense of Self: Linking Green Exposure, Agency, and Mental Well-Being through Innovative Measurement) presents innovations combining psychometric tools, neurophysiological measures, and satellite-based assessments of environmental exposure. His work shows how sense of self and agency mediate restorative processes, offering a multilayered, ecologically valid account of how green spaces support resilience under technostress.

The session concludes with Erin Largo-Wight (Nature Contact, Health, and Well-being: Exploring Dose, Type, and Setting), who examines how forms and doses of nature contact influence restoration. She underscores context-specific measurement, variations in exposure, and integrates the Biophilia Hypothesis with empirical evidence, linking theory to practical health promotion.

Finally, Jak L. Nasar discusses the presentations, drawing methodological and theoretical insights and future directions. The symposium shows how innovation, psychometric rigor, and reflection advance knowledge on restorative environments and well-being.

Abstract 3169

MEASURING RESTORATIVENESS AT WORK: THEORETICAL REFINEMENT AND METHODOLOGICAL INSIGHTS FROM THE DEVELOPMENT OF THE RESTORATIVENESS AT WORK SCALE

Pasini M.*, Menardo E., Brondino M.

Department of Human Sciences, University of Verona ~ Verona ~ Italy

Restorative environments have been extensively examined in environmental psychology, particularly in natural or recreational settings. However, the potential for restorativeness in everyday environments—such as the workplace—remains underexplored. Addressing this gap, we developed and validated the Restorativeness at Work Scale (R@WS), a new instrument designed to assess the perceived restorative quality of physical work environments.

Grounded in Attention Restoration Theory (ART), the R@WS captures four core dimensions: fascination, being-away, coherence, and scope. The dimension of compatibility was intentionally excluded due to its overlap with non-physical and organizational factors. This presentation highlights key theoretical and methodological contributions from a multi-phase, mixed-method validation process.

In the qualitative phase, we conducted interviews with employees across diverse work settings to generate items that reflect ART constructs within workplace contexts. The quantitative phase involved rigorous psychometric testing, including exploratory and confirmatory factor analyses, reliability assessment, and tests for measurement invariance across occupational groups and gender. Results confirmed the scale's validity and robustness.

The findings offer a theoretical extension of ART by demonstrating its applicability beyond natural environments, into cognitively demanding, task-oriented settings. Methodologically, the study emphasizes the importance of item contextualization, dimensional refinement, and validation procedures tailored to complex indoor environments.

The R@WS provides researchers and practitioners with a reliable, theoretically informed tool to evaluate how workspaces contribute to cognitive restoration and well-being. It also supports the design and assessment of environmental interventions in organisational settings where traditional restorativeness measures (e.g., PRS) may not be suitable.

Abstract 3170

RESTORATIVE ENVIRONMENTS AND SENSE OF SELF: LINKING GREEN EXPOSURE, AGENCY, AND MENTAL WELL-BEING THROUGH INNOVATIVE MEASUREMENT

Ebisch S.*, Di Plinio S.

Department of Psychological, Health and Territorial Sciences, University of Chieti-Pescara ~ Chieti ~ Italy

In a series of studies, we investigated how environmental characteristics—especially the presence of green and natural spaces—shape mental well-being and resilience to technostress. We hypothesized that these effects operate primarily through psychological processes associated with sense of self and agency. A further aim was to capture these dynamics using both psychometric instruments and innovative quantitative methods mapping individuals' surrounding environments.

Findings confirm that the sense of self is a key mediator between environment and well-being, integrating identity and agency as fundamental dimensions. A major methodological advance was the development of a Satellite Image Segmentation approach to quantify environmental factors around participants' residences, study, and work locations. Satellite images were segmented using optimized k-means clustering (guided by BIC and Dunn indices) and converted into YIQ color space to enhance chromatic variation analysis. The relative coverage of green versus built spaces was then calculated across multiple neighborhood scales, yielding a multilayered assessment of environmental exposure. In addition to providing novel environmental metrics, this approach enabled a direct integration of objective spatial data with psychometric and neurophysiological findings, enhancing the ecological validity of the findings.

Psychometric results showed that in university contexts, sense of self and agency significantly mediated the link between environmental features and mental well-being, suggesting that exposure to green spaces supports psychological restoration. Neurophysiological experiments using functional infrared imaging (fIRI) and functional magnetic resonance imaging (fMRI) further demonstrated that exposure to green spaces reduced stress perception and physiological activation under conditions of high technostress and low agency, confirming the restorative power of nature.

Overall, the findings demonstrate how environmental features—captured through both psychometric and satellite-based measures—interact with psychological processes to modulate technostress, with concrete benefits for mental and physiological well-being in contexts shaped by digital demands.

Abstract 3171

NATURE CONTACT, HEALTH, AND WELL-BEING: EXPLORING DOSE, TYPE, AND SETTING

Largo--Wight E.*

Institute of Environmental Research & Education, University of North Florida ~ Jacksonville, FL ~ United States of America

Research on nature and health has expanded rapidly in recent decades. Applied scientists have examined how different forms and doses of nature exposure influence well-being, while basic scientists have explored mechanisms underlying psychological restoration. Together, these efforts have advanced our understanding of human-environment interactions and informed evidence-based practices.

This presentation highlights findings from my research and that of others across four central domains, while identifying critical questions that remain:

Nature, Restoration, and Health: Findings consistently show that even brief nature exposure promotes psychological restoration and physiological relaxation. Restoration theories contend that nature either helps replenish fatigued cognitive resources to improve the ability to cope with stressors and or shifts attention from persistent demands, ultimately resulting in decreased stress and improved health. The Biophilia Hypothesis proposes that natural cues - like listening to a bird's song or enjoying a landscape of wildflowers - signal safety and harmony, triggering innate stress-reducing responses rooted in evolutionary survival.
Forms of Nature Contact: The type or form of nature exposure matters. Direct, outdoor experiences yield stronger restorative and health benefits than indirect or indoor contact. Instruments that measure and thus provide the opportunity to compare forms of nature contact are essential for advancing both basic and applied research.
Dose of Nature Contact: As "Nature Rx" and "Nature as Medicine" initiatives grow, understanding dose is increasingly important. I operationalize dose considering duration, frequency, and or quality. Tools that identify minimum effective doses are especially valuable for intervention design and public health guidance.
Settings and Context: Nature-health relationships vary across environments such as workplaces, schools, and hospitals. Context-sensitive measurement is key to tailoring effective, equitable interventions.

I am excited to continue this interdisciplinary work focused on measurement and theoretical mechanisms to ultimately inform and promote healthy communities.

Abstract 3172

THE PRESENT AND FUTURE STATE OF THE FIELD AS PRESENTED AND SOME QUESTIONS. (DISCUSSANT)

Nasar J.L.*

Knowlton School of Architecture, The Ohio State University ~ Columbus, OH ~ United States of America

When I have read and heard the presentations, I will synthesize them and raise questions about methodological, measurement, place-related, and theoretical challenges in research on perceived restorativeness, stress reduction, and other salutary effects of nature. These questions concern both the current state of the field and promising directions, such as more unified approaches to measurement, tools for capturing the dynamic, multi-sensory experience of diverse populations across time and settings, and the role of technologies such as satellite imaging linked with census and health data.

Beyond methodological issues, I ask whether, in focusing on effects, we have overlooked a basic question: What is nature? Natural environments vary widely—forests, deserts, grasslands, tundras, mountains, oceans, farm fields, gardens, invasive and indigenous vegetation, rivers, waterfalls, lakes, skies, and celestial bodies. We encounter them under different seasonal and weather conditions—sun, rain, fog, snow, storms. Which types and conditions are restorative? For example, does seeing a mountain in the distance differ in effect from climbing it, or reaching its summit in sunshine, rain, or snow, alone, with strangers, or with friends? Does meaning matter—for instance, if it is revered as a holy mountain, as Mount Fuji is in Japan?

Given consistent findings of restorative and stress-reducing effects, do we need to identify the specific stimulus properties that produce them, and how to measure these? Should we accept that “nature” is restorative in some mysterious way, or should research aim to isolate and replicate those properties? If so, it may be possible to design virtual environments that do not look like traditional natural settings yet possess the critical features that yield comparable benefits.

Abstract 3168

GREEN EXERCISE AND ITS PHYSIOLOGICAL AND PSYCHOLOGICAL OUTCOMES: INSIGHTS FROM SUBJECTIVE AND OBJECTIVE MEASURES

De Dominicis S., Laezza L.*

Department of Nutrition, Exercise and Sports, University of Copenhagen ~ Copenhagen ~ Denmark

Research on restorative environments has expanded rapidly, with increasing evidence that natural settings promote psychological restoration, physiological recovery, and physical activity adherence compared to urban or indoor contexts. Studies on “green exercise” consistently report benefits for affective states, perceived restorativeness, and stress reduction, alongside favorable physiological responses such as lower cortisol levels and improved autonomic regulation.

Despite these findings, the field faces notable methodological and measurement challenges. Many studies rely on short-term interventions, small convenience samples, and cross-sectional or acute experimental designs, limiting conclusions about causal pathways and long-term effects. Measurement practices are equally heterogeneous: while validated psychological scales such as the Perceived Restorativeness Scale (PRS) and Restoration Outcome Scale (ROS) are frequently applied, their use varies across studies, and physiological indices often lack the sensitivity or statistical power to capture nuanced environmental effects.

Theoretical frameworks such as Attention Restoration Theory and Stress Reduction Theory have guided much of this work but have been critiqued for overlooking the dynamic interplay between individual, environmental, and social processes. Recent perspectives from ecological-dynamics and social identity theory point to the importance of environmental connectedness and social cohesion in shaping restorative outcomes.

To advance the field, greater harmonization of measures, use of multi-method and longitudinal designs, and theoretical integration across psychological, physiological, and social domains are needed to strengthen the Green Exercise’s evidence base and its application in health promotion and urban planning.

EVALUATING AI FOR A JUST ENERGY TRANSITION: A FRAMEWORK FOR SOCIAL, ENVIRONMENTAL, ECONOMIC, AND TECHNICAL IMPACTS

Bringmann E.*, Kacperski C., Kutzner F., Weber B.

Seeburg Castle University ~ Seekirchen ~ Austria

Revolutionising our energy systems is indispensable to achieve climate neutrality. Artificial Intelligence (AI) offers great potential for a successful energy transition and is increasingly deployed to enhance energy efficiency, for example by predicting energy demand in demand-side management. While these technologies offer substantial potential to reduce emissions, concerns are emerging about unintended consequences, e.g., their demand for large amounts of energy and how they will affect job security and energy poverty. From an applied psychology perspective, understanding how people perceive, adopt, and interact with such AI-driven technologies is central to whether these solutions succeed at a just energy transition at scale. Crucially, social implications such as trust in or acceptance of AI are rarely assessed. In a previous study on another innovation in the energy sector – energy communities – we highlighted how claims of social benefit often rest on limited evidence and unclear constructs, which underlines the need for systematic evaluation of social impacts (Bielig et al., 2022). Building on this insight, we argue that a similar lack of systematic impact evaluation currently hampers the responsible deployment of AI and risks undermining its contribution to a just energy transition. This contribution addresses this gap by developing a multidimensional impact evaluation framework designed for AI applications in the energy sector. Based on a systematic literature review and expert interviews (N=20), the framework integrates environmental, social, economic, and technical impact dimensions. It provides a modular structure of indicators that practitioners can select according to their specific use case while ensuring comparability. We discuss how our framework supports evidence-based evaluation of AI-based energy solutions, ensuring their effectiveness, efficiency, and fairness.

Abstract 1389

SAME THEORY, DIFFERENT QUESTIONS: BRIDGING THEORY AND MEASUREMENT IN DISASTER RISK AND ENVIRONMENTAL PSYCHOLOGY

Han S.*[1], Kuhlicke C.[1], De Brito M.[1], Karanci A.N.[2], Hudson P.[3], Santoni V.[4], Rufat S.[4]

[1]Helmholtz Centre for Environmental Research - UFZ ~ Leipzig ~ Germany, [2]TOBB University of Economics and Technology ~ Ankara ~ Turkey, [3]University of York ~ York ~ United Kingdom, [4]Ecole polytechnique ~ Palaiseau ~ France

The field of disaster risk and environmental psychology lacks standardized survey instruments for measuring human adaptive behaviors toward natural hazards and climate risks. Unlike established psychological domains with validated measurement scales, hazard adaptation research suffers from inconsistent operationalization of theoretical constructs, limiting cross-study comparisons, meta-analyses, and theory development. This study addresses this critical methodological gap by developing a comprehensive toolbox that systematically maps theoretical frameworks to their measurement instruments in empirical research.

We employed a novel hybrid approach combining automated extraction with collaborative human validation to analyze theory-measurement relationships across 1000+ peer-reviewed studies. Machine learning and natural language processing techniques identified theoretical frameworks (e.g., Protection Motivation Theory, Theory of Planned Behavior, Cultural Theory of Risk) and extracted survey instruments from disaster risk literature. We then validated these extractions through systematic coding, assessing the quality of theory-measurement connections, psychometric properties, and replicability of identified instruments across different hazard contexts (floods, earthquakes, wildfires, heat waves).

Our analysis reveals significant inconsistencies in how key theoretical constructs are operationalized across studies. For example, "risk perception" - a central construct in multiple theories - is measured through diverse approaches ranging from single-item likelihood assessments to multi-dimensional scales incorporating dread, controllability, and temporal aspects. The toolbox will document these variations while identifying high-quality instruments with demonstrated reliability and validity across cultural contexts.

The resulting toolbox provides researchers with a structured repository of validated survey questions organized by theoretical framework, construct type, and hazard context. Each entry includes original survey items, response scales, psychometric properties, cultural validity information, and replication guidelines. This standardization enables more rigorous theory testing, facilitates international collaborations, and supports the development of evidence-based behavioral interventions for disaster risk reduction.

Abstract 2288

THE SOCIAL DIMENSION OF TRANSFORMATION IN AUSTRIA

Röderer K.[1], Molitor P.[1], Molina C.[1], Seebauer S.*[2]

[1]Environment Agency Austria ~ Vienna ~ Austria, [2]JOANNEUM RESEARCH Forschungsgesellschaft mbh, Graz, Austria

The Transformation Barometer, conducted for the first time by the Environment Agency Austria in 2025, surveys the environmental attitudes, values, needs and behaviors of individuals in society at regular intervals. It aims at developing a social science monitoring system that highlights the social dimension of transformation and makes it possible to gain insights into the attitudes, values, needs and behaviors of different population groups and to track their development over time. The data can thus be used to gain insights into different population groups and developments in society. As a result, environmental policy measures can be formulated in a more targeted and balanced manner, increasing acceptance among the population and supporting social transformation towards a good life for all.

The representative survey was designed to gain a differentiated picture of the social dimension of environmental and climate issues in Austria. It involved 2,022 randomly selected individuals who were interviewed in April/May 2025 using online questionnaires and telephone interviews. The questionnaire was designed to take 30 minutes to complete.

Results show that environmental and climate protection issues are high on the agenda for the Austrian population. Environmental and climate protection are supported by two-thirds of Austrians and rejected by only a minority. Industry and business, as well as the federal and state governments, were identified as not doing enough for climate protection. Negative changes due to climate change are expected especially in the areas of tourism and quality of life. Environmental and climate policy measures are widely supported. This attitude is also reflected in a high level of personal responsibility: most respondents are open to actively using services that promote the circular economy and thus making their own everyday lives more sustainable.

EXPLORING ASSOCIATIONS BETWEEN SOCIAL MEDIA EXPOSURE, CLIMATE BELIEFS, WORRY, SELF-EFFICACY, AND MITIGATION BEHAVIOUR AMONG MALAYSIAN UNIVERSITY STUDENTS

Cheah W.*, Low S.R., Bono S.A.

Universiti Sains Malaysia ~ Penang ~ Malaysia

As climate change becomes an increasingly urgent global issue, social media has emerged as a powerful platform for disseminating climate-related information and shaping public perceptions and responses. Among university students, who are active users of platforms such as TikTok, Instagram, YouTube, and Facebook, social media exposure may facilitate the acquisition of climate-related information, influence environmental beliefs, and elicit emotional reactions such as worry, all of which may ultimately shape mitigation behaviour. However, the psychological associations between social media exposure and climate change engagement have received limited attention, particularly in the Malaysian context. This study explored the relationships between social media exposure, climate change beliefs, self-efficacy, and climate-related worry, and how these variables were associated with three types of mitigation behaviour: accommodating behaviour (e.g., seeking climate information), promotional behaviour (e.g., sharing posts or supporting climate policies), and proactive behaviour (e.g., adopting low-carbon lifestyle practices). A cross-sectional online survey was conducted with 384 Malaysian university students, using self-reported questionnaire items to assess all psychological and behavioural constructs. The strength and direction of associations among all variables were examined. This study provides insights into the cognitive and emotional correlates of climate engagement among the digital generation.

THE IMPACT OF MORAL, FINANCIAL, AND ENVIRONMENTAL NUDGES ON HOUSEHOLD FOOD WASTE BEHAVIOR

Di Napoli F.*[1], Van Herpen E.[2], Aitis D.[1], Mari S.[1]

[1]Università degli Studi di Milano-Bicocca ~ Milano ~ Italy, [2]Wageningen University and Research ~ Wageningen ~ Netherlands

Introduction. Household food waste poses a significant global challenge, with critical environmental, economic, and social implications, contributing to greenhouse gas emissions and exacerbating food insecurity. Although various motivational drivers of food waste behaviors – financial, environmental, and moral – have been identified, few interventions have empirically tested how targeting these motivations through behavioral nudges can reduce food waste. Purpose. This study aims to evaluate the effectiveness of informational nudges based on financial, environmental, and moral motivations in reducing household food waste and enhancing corresponding awareness and attitudes. It also explores whether the impact of the nudges is moderated by participants' pre-existing motivations. Participants. The study will recruit students from the University of Milano-Bicocca and additional adults through snowball sampling, randomly assigning approximately 186 participants into three experimental groups aligned with the motivational framings. Data collection is currently ongoing. Methods. Over nine days, participants will receive tailored nudges via a mobile application highlighting one of the three motivational consequences of food waste. Repeated questionnaires assessing food waste behaviors, motivational scales, attitudes, emotions, and control perceptions will be administered at baseline, mid-point, and study conclusion. Data will be analyzed using repeated measures ANOVAs to detect changes over time and contrasts to assess match or mismatch effects between nudge type and participant motivation. Expected Results. It is anticipated that all groups will exhibit a reduction in food waste behaviors and an increase in awareness related to their assigned motivation. The study expects greater efficacy when nudges align with individuals' existing motivations, potentially revealing interactive effects between motivational drivers. The findings will contribute to the design of more effective, evidence-based behavioral interventions aimed at reducing food waste.

Abstract 680

HOW SOCIAL NORMS SHAPE CITIZEN ACTION FOR SYSTEMIC CHANGE TOWARDS MORE CIRCULARITY

Pacheco I.*[1], Richter I.[2], Van Der Werff E.[1], Steg L.[1]

[1]University of Groningen ~ Groningen ~ Netherlands, [2]Norwegian University of Science and Technology ~ Trondheim ~ Norway

In this talk, I will present our multi-national study with large representative samples examining how norms on the personal, group, and societal level relate to citizens' engagement in actions to promote systemic change.

Addressing today's environmental and social challenges requires more than individual lifestyle changes—it demands systemic transformation. Citizens play a crucial role in advancing such transformations, by urging broader societal actors such as governments, businesses, and fellow citizens to act. Such citizen actions, i.e. circular citizenship behaviours (CCBs), include protesting, attending public assemblies (aimed at governments), boycotting companies, speaking up in one's organisation (aimed at businesses), or motivating people around (aimed at other citizens). When choosing how to behave, people oftentimes look at how others behave (i.e. social norms) to guide their own choices. As citizens' actions are embedded in the societal system at large as well as their closer social circles, we hypothesize that group and societal descriptive norms play a crucial role in promoting CCBs and that this relation is mediated by personal norms.

We conducted an online survey in five European countries (Germany, Italy, Lithuania, the Netherlands, and the UK; N = 5,651) and used path analyses to investigate overall effects and possible country differences.

Our findings reveal that a substantial share of citizens never engage in CCBs, though participation is somewhat higher when actions target fellow citizens. Further, our results confirm our hypotheses. Together, social and personal norms explain a significant portion of variance in engagement (44% for actions directed at governments, 45% for businesses, and 49% for other citizens). Thus, our results underscore the pivotal role of social and personal norms for citizen action for systemic change. Consequently, increasing perceptions of other people's engagement to strengthen descriptive norms or targeting people's feelings of moral obligation might be an effective way of strengthening citizen engagement.

Abstract 2627

EXPERIMENTAL EVIDENCE THAT TIME-SCALE SHIFTS WHEN CONSIDERING THE FUTURE OF THE NATURAL ENVIRONMENT

Milfont T.*, Cuttance--Dunne D., Ellis J.

University of Waikato ~ Tauranga ~ New Zealand

The cognitive ability to mental time travel allows people to project themselves backward and forward in time. Research has shown that anticipating and envisioning possible future events, and imagining ourselves experiencing those events, has many implications for health, finance, and environmental protection. While many public policies in these domains consider events that may occur decades ahead in the future, current evidence suggests we typically consider a much shorter temporal distance when spontaneously thinking about the future. Here we examined whether this typical short temporal distance would vary if individuals were primed to think about the future of the natural environment in a between-subjects experiment with online respondents (212 MTurkers). We compared responses from individuals randomly asked to think about the future in general (control condition) to those asked to think about the future of the natural environment (main experimental condition) or the future of the work environment (contrasting experimental condition). Results confirmed that individuals typically think in very short term into the future, with temporal distance between 1 and 5 years. Supporting our intuition, results showed that individuals asked to think about the future of the natural environment were statistically more likely to think longer term (10 years or more) compared to those in the other conditions. By the time of the conference, we expect to have replicated these findings with a national New Zealand sample, and will discuss their implications of our findings to time-scale mismatches in policy making.

PUBLIC UNDERSTANDING OF THE SIXTH MASS EXTINCTION AND SUPPORT FOR SYSTEMS TRANSFORMATION

Shreedhar G.*

London School of Economics and Political Science ~ London ~ United Kingdom

Humanity risks a sixth mass extinction due to accelerating biodiversity loss. Despite scientific consensus about severity and scale of human-driven species extirpation, and calls for transformative action, public understanding remains largely unstudied across diverse global populations. A representative survey of 2,808 participants across five countries on five continents (Brazil, India, South Africa, United Kingdom, United States) assessed awareness, beliefs, and behavioural responses to biodiversity loss and mass extinction. Findings reveal a striking awareness-acceptance paradox: only 23% had heard the term "sixth mass extinction," yet 86% agreed it may be happening once the concept was explained. Participants correctly identified human activity as the primary driver (85%) and expected severe consequences for climate, health, and food security. Most supported the need for transformative changes (79% for strengthening protections) and expressed willingness to adopt conservation policies and behaviours, especially for low-cost options (75-97%). However, participants perceived widespread scientific disagreement about whether mass extinction was human-caused (92%) and nearly half incorrectly perceived it was reversible (48%). Belief in proximate human causes, perceived impacts and risk, trust in science and personal experiences of nature loss predicted support for transformative change. Participants in Brazil, India, and South Africa expressed higher concern compared to those in the UK and US, challenging assumptions about environmental engagement in developed versus developing countries. These findings have critical implications for science communication and conservation policy, revealing untapped public readiness for action while highlighting the urgent need for targeted awareness campaigns that address the awareness-acceptance gap and leverage existing experiences and concern to drive transformative change

Abstract 1992

THE HEAT & COGNITION MANYLABS PROJECT: UNDERSTANDING HEAT VULNERABILITY ACROSS CONTEXTS AND INDIVIDUALS

Bielig M.*, Kacperski C., Doell K.

University of Konstanz ~ Konstanz ~ Germany

As the climate crisis accelerates, extreme heat events are becoming more frequent, intense, and prolonged. While their impacts on physical health are well established, evidence on how heatwaves affect human cognition, social functioning, and collective well-being remains fragmented and inconsistent. Moreover, the consequences of extreme heat are expected to vary substantially: individuals differ in their exposure to extreme heat, their sensitivity, and their capacity to adapt and protect themselves.

In this talk, we introduce the Heat & Cognition ManyLabs Project, an ongoing global three-wave natural experiment leveraging real-world extreme heat events to examine their impact on cognition and collective well-being. Using a Big Team Science (BTS) approach, we aim to collect data from more than 50,000 participants across 40+ cities worldwide. This unique design allows us to capture contextual variability and to identify which aspects of vulnerability moderates heat's effects on the human mind.

The central focus of this talk is our development of a heat vulnerability index, proposing a multi-dimensional framework including exposure (e.g. temperature, humidity, perceived heat stress), sensitivity (e.g. age, gender, and health status), and adaptive capacity (e.g. access to green spaces, housing conditions, and protective behaviors).

We will present the key indicators of this index, discuss conceptual and methodological challenges in its development, and outline how vulnerability can be systematically integrated as a moderator in analyzing cognitive, social, and well-being outcomes. Finally, we highlight the policy relevance of the expected results, particularly considering the adaptive capacity dimension, which directly translates into actionable protection measures for cities and communities. In doing so, the project exemplifies applied psychology at the intersection of climate science, public health, and social policy.

Abstract 742

ENVIRONMENTAL MOTIVATION'S PRACTICAL RELEVANCE (FOR CO2 EMISSIONS): AN EXAMPLE FROM THE MOBILITY DOMAIN

Neef N.E.*[3], Briem A.[1], Kaiser F.G.[2]

[1]Fraunhofer Institute for Building Physics IBP ~ Stuttgart ~ Germany, [2]University of Magdeburg ~ Magdeburg ~ Germany, [3]University of Hohenheim, Department of Sustainable Development and Change ~ Stuttgart ~ Germany

Recent research questions whether motivation is practically relevant: that is, whether people's environmental motivation can be held accountable for their CO2 emissions. Using the highly emission-relevant mobility domain as our example case, we expound that environmental motivation is relevant for people's emissions. Its relevance can, however, be overlooked easily for three reasons. (A) People differ—irrespective of their environmental motivation—in their travel demands (i.e., the overall distance they travel). (B) Environmental motivation controls people's emissions exclusively indirectly by determining the likelihood of sustainable mode choices. (C) And environmental motivation's emission efficacy will be attenuated by the typical majority of comparatively short trips. Accordingly, only when we account for people's travel demand and only when people persistently choose sustainable modes of transportation for long-distance trips does the relevance of environmental motivations become more recognizable.

GPS mobility data tracked over the course of two weeks from 231 individuals were gathered, and, based on these data, people's emissions were calculated. In total, 18,745 trips were recorded. A linear regression analysis confirmed (A) that environmental motivation was, by and large, unrelated to people's travel demand. A mixed-effect Bayesian logistic regression corroborated (B) that environmental motivation reliably influenced people's sustainable travel mode choices. Finally, mixed-effect Bayesian gamma and linear regression analyses confirmed (C) that environmental motivation's emission-reducing efficacy strongly increased with increasing travel distance at the trip-level and overall travel demand. Essentially, we found environmental motivation to truly matter. This became recognizable when the emission-reduction potential is greatest: with long-distance trips and for people who travel more.

Abstract 1201

ECO-AGENCY:A COGNITIVE CONSTRUCT FOR HUMAN-NATURE RELATIONS AMID UBIQUITOUS TECHNOLOGY

M. Reis C.*

CENSE – Center for Environmental and Sustainability Research, NOVA School of Science and Technology, NOVA University Lisbon ~ Lisbon, Caparica ~ Portugal

Impact perception and visibility are two sides of the same ecological challenge. We propose eco-agency as a cognitive precursor to pro-environmental behaviour, referring to the understanding of one's ability to affect the environment. It is rooted in the reflective dimension of sense of agency and self-efficacy theory, where individuals appraise their potential to act, extending these foundations to ecological contexts.

Eco-agency bridges environmental psychology, where constructs such as nature connectedness and perceived behavioural control are well established, with human–computer interaction research on how feedback, transparency, and system responsiveness shape agency. By foregrounding the pre-intention phase, eco-agency highlights a critical point for intervention: when individuals reflectively evaluate their potential environmental influence before forming intentions.

We are developing measures that assess reflective understanding of environmental impact capacity, complementing existing instruments while distinguishing eco-agency as a pre-intention construct. These draw on adapted indicators such as perceived control and confidence in effectiveness, aligned with methods for evaluating how interactive systems afford or constrain agency, for example, through feedback clarity, action-outcome transparency, or trust in AI-supported decisions.

This perspective offers complementary insights for applied interventions, from extended reality technologies to artificial intelligence interactions, enabling timely approaches that foster ecological connection rather than distraction. Building on this foundation, we propose design pathways that make ecological processes perceptible, embedding ecosystem data into everyday experience to reinforce presence and capacity to act. Such interventions can take the form of privacy-preserving sensing systems, augmented reality place-based initiatives, and educational programmes.

While eco-agency is shaped by cultural, social, and economic conditions, these strategies may help move environmental discourse toward less polarised settings and nurture constructive engagement. Framed as a measurable and actionable construct, eco-agency offers a route to strengthening human–nature relations across education,

technology, and policy, ensuring nature remains salient in both physical and digitally mediated environments.

Abstract 1049

HOW DESCRIPTIVE NORMS CAN AFFECT PEOPLE'S WASTE SEPARATION BEHAVIOR AT LOCAL EVENT VENUE：EVIDENCE FROM JAPAN

Uetake K.*, Ando K.

Nara Women's University ~ Nara ~ Japan

Objective

Waste recycling has attracted growing attention within the circular economy, yet its effectiveness ultimately depends on correct sorting at the point of disposal. Such sorting, in turn, relies on citizens' voluntary compliance. To further promote waste separation behavior, this study aims to estimate the impact of descriptive norms through a field experiment conducted at local public events in Japan. Prior research (Uetake & Ando, under review) has shown that the pre-existing contents of waste receptacles can function as descriptive norms that influence sorting behavior. This study aims to identify the conditions under which descriptive norms are most operative.

Methods

This is a planned study; data collection is scheduled for November 2025. A two-day field intervention is conducted at a community event venue in Tochigi Prefecture, Japan. This municipal lifelong-learning event features student exhibits and presentations by local cultural groups. Daily attendance is projected at approximately 4,000 visitors, with the audience consisting predominantly of local children and their parents. Waste stations are assigned to control and treatment conditions and rotated across time blocks to counterbalance. In the treatment condition, we pre-seed the bins with incorrectly sorted items as descriptive norms. We analyze people's responses using both quantitative and qualitative indicators, including measuring the mis-sorting rate and conducting systematic behavioral observations.

Results & Discussion

We report comparisons of mis-sorting rates between the intervention and control groups, as well as behavioral observation–based comparisons, including the time required to dispose of an item when participants are in front of the bin. We expect that the presence of pre-existing mis-sorted items is expected to increase contamination, because people treat the visible contents as a descriptive normative cue during sorting. The study deepens understanding of the mechanisms through which descriptive norms operate and inform policy applications.

THE RESTORATIVE VALUE OF NATURAL AND BUILT ENVIRONMENTS: PSYCHOLOGICAL MECHANISMS AND EFFECTS ON WELL-BEING

Wednesday 22 July 2026 from 17:00 to 18:30

(F-Spadolini)

Francesca Pazzaglia (University of Padova ~ Padova ~ Italy), Chair and Presenter
Laura Miola (University of Padova ~ Padova ~ Italy), Co-Chair

The growing phenomenon of urbanization has posed significant challenges to human health, driven by rising levels of pollution, noise, urban heat islands, overcrowding, and biodiversity loss. These environmental stressors have a detrimental impact on both psychological and physiological well-being, contributing to chronic stress, cognitive fatigue, and various mental health issues. In this context, restorative environments—places that support psychological and cognitive recovery through specific environmental features—are valuable resources for mitigating these negative effects and promoting mental health in urban settings. A substantial body of research has demonstrated that contact with nature facilitates psychological restoration, reduces stress, enhances attention, and improves both physiological and emotional regulation. More recently, attention has also turned to the restorative potential of built environments, which have shown promising effects on mood and stress reduction. This highlights the importance of expanding our understanding of the restorative value of both natural and built environments. This symposium offers a contribution to explore the restorative qualities of different environments and their connection to wellbeing, with each presentation addressing different yet complementary perspectives. Topics include: The importance of blue space for psychological well-being (M. White); The mental health benefits of urban nature (A. Mechelli); Strategies to improve the restorative potential of workplaces (M. Pasini et al.); and the restorative effects of urban spaces, particularly historic city centers in comparison with modern centers (L. Miola & F. Pazzaglia), with a special focus on activity affordance and social context (A. Bornioli & I. Bray). Understanding the psychological mechanisms that mediate the interaction between individuals and their environments is essential for guiding urban design and promoting well-being in an increasingly urbanized world. This line of research is crucial for building cities that foster not only physical infrastructure, but also mental health and human flourishing.

Abstract 3130

BEYOND GREEN SPACE: THE IMPORTANCE OF WATER AND THE SKY FOR PSYCHOLOGICAL WELL-BEING

White M.*

University of Vienna ~ Vienna ~ Austria

Nature-health research has predominantly focused on (urban) green spaces. However, most urban settings are built on major water sources (rivers/lakes) or the coast meaning blue spaces are an important feature of many people's local environments. Further, in operationalising nature, researchers have spent most of their time looking down at what's below their feet, rather than looking up at what's above their heads. Nevertheless, the sun, the moon, the clouds, and even fleeting rainbows are all part of nature too. The aim of the current talk is to broaden the discussion of what counts as nature in nature-health research, and argue that greater attention should be paid to the role of elements beyond green spaces. The talk will present headline evidence from a 15-year programme of work looking at the contribution various types of blue spaces make to a range of health and well-being outcomes as well as more recent research showing that what's happening in the sky significantly affects psychological reactions to natural elements on the ground. Studying green spaces and health in isolation is only half the picture – it needs to be taken in the context of the larger water cycle as ultimately without rain from the sky and water on and under the ground there are no green spaces. This complex inter-dynamic and its impact on mental health has so far been largely neglected. The talk argues that we need a systematic programme of work that looks at nature in the whole to close this gap. Ultimately, the aim of such a research programme would be to highlight the importance of the interconnected dynamics of various aspects of "nature" for our health and well-being in an attempt to reduce the growing anthropogenic destabilizing of the natural world.

Abstract 3131

THE MENTAL HEALTH BENEFITS OF URBAN NATURE IN THE AGE OF CLIMATE CHANGE

Mechelli A.*

King's College London ~ London ~ United Kingdom

We live on an increasingly hot planet, with more frequent and intense heatwaves affecting populations worldwide. Evidence shows that extreme heat can take a toll on mental health, particularly among people living in dense urban areas, where temperatures tend to be highest. Urban nature, especially trees, but also grass, green roofs, and green walls, can help reduce temperatures in cities. But can urban nature also help mitigate the mental health impacts of extreme heat? To address this question, I will present findings from two datasets. The first is based on large-scale electronic health records collected in the UK over a 15-year period (2008–2022). The second comes from a citizen science project in which participants shared their experiences using a smartphone app (https://www.natureboostproject.com/). Together, these datasets help us understand how urban nature can support mental health in periods of very hot weather. This is especially evident in individuals with existing mental health conditions, who are most vulnerable to the adverse effects of extreme heat. Finally, I will refer to our team's efforts to translate these insights into policy action in the United Kingdom. Notably, the recent 10-Year Health Plan for England does not include a single reference to nature in its 168 pages. By failing to recognise the central role of nature in human health, governments are overlooking one of the simplest and most effective ways to build both human and ecological resilience.

Abstract 3132

RESTORATIVE WORK ENVIRONMENTS, AND NATURE CONTACT AT WORK: PATHWAYS TO PERFORMANCE, HEALTH, AND REDUCED TECHNOSTRESS

Pasini M.*[1], Menardo E.[1], Marossi C.[1], Ebisch S.[2], Di Plinio S.[2], Brondino M.[1]

[1]University of Verona ~ Verona ~ Italy, [2]University "G. D'Annunzio" Chieti-Pescara ~ Chieti.Pescara ~ Italy

The restorative quality of work environments is increasingly recognised as a key resource for supporting employee well-being and performance. In this study, we investigated how perceived restorativeness at work influences technostress, health, and performance, and to what extent different forms of nature contact contribute to strengthening this perception.

A total of 691 Italian employees (59% office workers, 26% teachers, 15% manual workers) completed the Rest@Work Scale (R@WS), the Nature Contact Questionnaire (NCQ; outdoor, indirect, indoor), the Technostress Creators Scale, a single-item performance measure, and the General Health Questionnaire (GHQ).

Path analysis showed that perceived restorativeness at work positively predicted performance and general health, while reducing technostress. In turn, technostress had negative effects on both performance and health. The model demonstrated good fit. Importantly, among the NCQ dimensions, only indirect and indoor nature contact significantly predicted restorativeness, whereas outdoor contact did not.

The R@WS does not directly measure exposure to nature; rather, it captures four psychological dimensions of restorative work environments: Being Away (mental detachment opportunities), Fascination (attention captured effortlessly), Coherence (clarity and organisation), and Scope (spatial richness and openness). Our findings suggest that restorative qualities can exist independently of natural features; however, the presence of indirect and indoor nature elements significantly enhances them. Overall, the results highlight the central role of restorative work environments in buffering technostress and promoting health and performance. Designing workplaces that foster Being Away, Fascination, Coherence, and Scope—potentially strengthened by accessible natural elements—may represent an effective strategy for enhancing employee well-being in contemporary organisations.

Abstract 3133

FROM NATURE TO THE CITY: COMPARING RESTORATIVE QUALITIES OF NATURAL, HISTORICAL, AND MODERN URBAN SPACES

Miola L.*, Pazzaglia F.

University of Padova ~ Padova ~ Italy

Urban built environments have often been studied primarily as a comparison for studying natural spaces. Restorative properties are not exclusive to nature; built environments can also possess such qualities. However, the understanding of the positive effects of built spaces on emotions, cognitive functioning, and psychophysiological responses remains limited. Our project aims to investigate the restorative potential of historical/artistic as well as modern/contemporary environments. In study 1, after a stress induction phase participants were exposed to AI-generated images showing natural environments, historical, historical with nature (mixed) and modern urban environment presented within a Cave Automatic Virtual Environment (CAVE) using a between-subjects design. Before and after the exposure participants assessed emotions and arousal. Moreover, they evaluate affective qualities and perceived restorativeness of the environments. Psychophysiological indices were measured throughout the experimental session using an Empatica bracelet. Similarly, in Study 2 participants were exposed to natural, modern/contemporary, and modern/contemporary with nature (mixed) environments in a within subject design.
Results revealed that natural and mixed environments were perceived as most restorative, while modern urban environments were rated as the least restorative and most negatively valenced. Historical environments, although rated lower in a global score of restorativeness, were perceived as fascinating, coherent, engaging, pleasant and increased positive emotions and reduced arousal levels after stress induction, similarly to natural environments. Historical settings were also considered the least boring. Moreover, natural elements and scenarios improved modern/contemporary environments in terms of restorativeness and affective qualities. Overall, the findings underscore the crucial role of historical environments and mixed environments (both historical/artistic and modern/contemporary), which can offer an important and balanced compromise in urban areas for fostering positive emotions and enhancing residents' well-being.

Abstract 3134

RESTORATIVE EFFECTS OF URBAN AND HISTORIC PLACES

Bornioli A.*[2], Bray I.[1]

[1]UWE Bristol ~ Bristol ~ United Kingdom, [2]ISGGlobal (Barcelona Institute for Global Health) ~ Barcelona ~ Spain

A large body of research confirms the restorative benefits of natural environments. However, a growing number of studies also highlight how urban spaces, particularly historical ones, can equally promote recovery from stress and psychological well-being. According to the evidence, places like churches, museums, and monasteries are particularly effective for psychological restoration. This paper outlines the mechanisms that explain environmental restoration in both urban and historical settings. These include physical characteristics of settings, such as biophilic design and protection from common urban stressors like traffic and noise. Other key factors are more intangible, and include the symbolic value of urban (and historical) places. Such a symbolic value can foster a sense of belonging, identification with place, and a sense of community.

Finally, a study is presented on comparative restorative experiences of favourite urban indoor and outdoor places among adults living in five Western countries (n = 945). We examine self-reported restorative experiences and features of restoration (activity affordance and social context) based on a combination of statistical tests and data mining methods. Results show that, in addition to natural environments, places including the home, eating and drinking places, and study places were also reported as restorative environments by participants. Psychological restoration was mostly characterised by cognitive individual activities, such as reading or thinking, and by socialisation – with variation among places.

Overall, identifying characteristics of built places which can support restoration and wellbeing is crucial towards healthy cities for all.

Abstract 4961

EMOTIONAL IMPACT OF URBAN ENVIRONMENTS: A COMPARATIVE ANALYSIS OF AUDITORY AND VISUAL CHARACTERISTICS OF HIGHWAYS AND PARKS

Erofeeva S.[1], Shepelenko A.*[2]

[1]Faculty of Urban and Regional Development, HSE University ~ Moscow ~ Russia, [2]Institute for Cognitive Neuroscience, HSE University ~ Moscow ~ Russia

As urban populations continue to grow and urban environments undergo rapid transformation,
understanding how specific environmental features affect mental well-being has become increasingly
important, yet the sensory mechanisms underlying these effects remain insufficiently understood. This
study investigates the effects of auditory and visual components of urban environments-highways and
parks—on affective and physiological responses. A pilot experiment included 23 participants. Stimuli
(audio and video recordings of road and park environments) were presented under three conditions:
“Video Only,” “Audio Only,” and “Audiovisual.” Subjective affective responses were assessed using the
PANAS, as well as self-reported valence and arousal. Physiological measures included heart rate and
heart rate variability (RMSSD, SDNN). Comparison of subjective ratings showed that park environments
were associated with more positive valence than road environments (U = 105, p < 0.05). Parks were also
associated with higher self-reported arousal (U = 98.5, p < 0.05) and higher positive affect (U = 87.7, p <
0.05), whereas negative affect was higher for road environments (U = 112, p < 0.05). The effect of
stimulus modality differed depending on the environment. In park environments, the “Audiovisual”
condition was associated with higher positive affect compared to the “Audio Only” condition (W = 34.0,
p = 0.0139). For road environments, the most negative responses were observed in the “Audiovisual”
condition: valence was significantly lower than in the “Video Only” (W = 17.0, p = 0.0069) and “Audio
Only” (W = 16.5, p = 0.01) conditions, while negative affect was higher (W = 4.5, p =

0.0004; W = 9.5, p
= 0.0014). Positive affect in road environments was lower in the “Audio Only” condition compared to
“Video Only” (W = 33.5, p = 0.01). Analysis of physiological measures did not reveal statistically
significant differences, which is likely related to the small sample size. Thus, the results demonstrate an
asymmetric effect of sensory components on affective responses depending on the type of urban
environment. Park environments are associated with more positive emotional responses, primarily due to
visual stimuli, whereas negative affective responses to road environments appear to be driven mainly by
auditory input.

Abstract 2209

EXPLORING THE PROSPECTIVE LINK BETWEEN SELF-TRANSCENDENT EMOTIONS AND PRO-ENVIRONMENTAL BEHAVIOUR: A THREE WAVES LONGITUDINAL STUDY

Unanue W.*

Business School, Universidad Adolfo Ibañez ~ Santiago ~ Chile

Recent research has theorized that three self-transcendent emotions (STEs; i.e., gratitude, compassion, owe) could predict human pro-environmental behaviour (PEB). Unfortunately, up to our knowledge, no previous studies have empirically examined link between STEs PEB neither longitudinally nor simultaneously. Thus, in a three-wave longitudinal study among a representative sample of adults in Chile (n: T1 = 1477, T2 = 820, T3 = 487), we tested the reciprocal relations between gratitude, compassion, owe and PEB, using cross-lagged panel analysis. First, we tested the link between each STE and PEB in three separate models. Our results showed that, taken individually, neither compassion nor owe predicted PEB. We found that only gratitude prospectively predicted PEB. Unexpectedly, we also found that higher PEB predicted longitudinally higher levels of gratitude, compassion and owe. Second, we entered simultaneously into the same models, all four constructs. This more stringent model replicated previous results. In other words, we found that only higher gratitude predicted higher PEB. Unexpectedly again, we also found that PEB predicted higher levels of gratitude, compassion and owe. Our results thus advance research on PEB in two ways. Firstly, we found a novel predictor of PEB (i.e., gratitude). Secondly, we found new positive consequences of PEB. PEBs are not only important for the sustainability of the planet Earth. PEBs may also help to live a better life by increasing key determinants of human flourishing and well-being (i.e., gratitude, compassion and owe) dynamically over time.

Abstract 1849

THE STRUCTURAL RELATIONSHIPS AMONG CLIMATE CHANGE COGNITION, SUSTAINABLE DEVELOPMENT, AND LOW-CARBON LIVING

Zhang H.*, Huang W.

National Cheng Kung University ~ Tainan ~ Taiwan

Global climate change presents unprecedented challenges to human survival, making effective strategies like low-carbon living a pressing international concern for addressing climate change and sustainable development. This study investigated university students in Taiwan, recognized as future social elites, to systematically examine the relationships among their cognition of climate change, sustainable development, attitudes toward low-carbon living, and resulting low-carbon living behavior. The findings are intended to inform the design of effective educational measures, offer valuable references for understanding public cognition in Taiwan, and support future cross-cultural comparisons.

The research utilized Structural Equation Modeling (SEM) to analyze data collected from 432 valid responses from National Cheng Kung University students. SEM was applied to model the complex interrelationships among the four core constructs under investigation: climate change cognition, sustainable development cognition, attitudes toward low-carbon living, and low-carbon living behavior.

A key revelation from the findings is the mechanism through which cognition translates into action. While the analysis confirmed that climate change and sustainable development cognition influence low-carbon living behavior, this influence is indirect. Crucially, the sources state that attitudes toward low-carbon living fully mediate the impact of climate change and sustainable development cognition on behavior. This signifies a critical educational insight: merely enhancing recognition or knowledge alone is insufficient to foster behavioral change effectively. Instead, recognition must first be successfully transformed into favorable attitudes to promote low-carbon practices effectively among this demographic.

These insights highlight the necessity of attitudinal reinforcement. The study emphasizes the importance of integrating robust climate change and sustainability knowledge into environmental education and social movements to cultivate these stronger, necessary attitudes toward low-carbon living. Such attitudinal strength is essential for realizing meaningful behavioral change and ultimately achieving the broader societal goals of sustainability and climate resilience.

Abstract 1223

FROM URBAN ENVIRONMENTS TO COLLECTIVE EXPERIENCES: A SELF-DETERMINATION THEORY APPROACH TO MOBILITY

Balaian A.*[1], Métayer N.[1], Boisadan A.[2], Buisine S.[2]

[1]VEDECOM Institute ~ Versailles ~ France, [2]CESI LINEACT ~ Nanterre ~ France

Tomorrow's cities aim to be safe and inclusive, and mobility is a key component. Self-Determination Theory (SDT; Deci & Ryan, 2000) provides a framework to understand how urban settings support and frustrate psychological needs (autonomy, competence, and relatedness), with potential implications for well-being, perceived risk, and the inclusion of vulnerable and active users.

This study investigates how the perceived quality of urban infrastructure influences the satisfaction and frustration of the three basic psychological needs. The focus is on identifying which environmental elements most strongly affect needs and how this relates to perceived risk and well-being.

A survey was conducted in France between June and August 2025 (N = 1,351), including sighted pedestrians (n = 500), visually impaired pedestrians (n = 105), cyclists (n = 246), and car drivers (n = 500). Constructs were measured on 7-point Likert scales, and analyses rely on Partial Least Squares Structural Equation Modeling (PLS-SEM).

Our preliminary analyses on sighted pedestrians and car drivers show mixed results according to which basic need is considered. Perceived infrastructure quality appears pivotal to feeling autonomous and competent for both user categories, with high-quality infrastructure strongly supporting satisfaction and decreasing frustration of both needs. In contrast, perceived infrastructure quality poorly contributes to the satisfaction or frustration of the need for relatedness, which questions the capacity of current urban design to foster a collective rather than an individual mobility experience and behavior.

Applying SDT to mobility reveals which basic psychological needs are most unsatisfied and frustrated, and how urban design shapes mobility experiences. These findings may lead to actionable insights for designing collective and inclusive urban environments likely to create a mindful atmosphere between road users, to convey social identity or social bound between and within road users' categories, advancing both theory and practice in sustainable and equitable urban mobility.

Abstract 818

TAKING STOCK OF HOW CITIZENS IN URBAN AREAS PERCEIVE RISKS FROM CLIMATE CHANGE: A SYSTEMATIC LITERATURE REVIEW

Holz L.*, Kause A.

Leuphana University Lüneburg ~ Lüneburg ~ Germany

Urban areas are increasingly affected by climate change risks, such as urban heat islands and urban flooding. Those can have serious impacts: Heat stress can be life-threatening, while floods can trigger disease outbreaks. With growing urban populations, an increasing number of citizens will be exposed to such risks. At the same time, citizens play a central role in adaptation to climate change, thereby reducing their exposure to these impacts. Yet, to foster effective adaptation, it is essential to take stock of how citizens perceive such climate risks in cities.

This presentation will introduce findings from a systematic map of empirical research on citizens' perceptions of climate risks in cities worldwide. It will examine how, with whom, when, and where their perceptions of various climate risks have been studied: This includes the composition and location of the samples studied. It will also provide an overview of climate risks examined and thus allow identifying research gaps with respect to climate risks occurring globally in cities.

I will also present findings from a systematic review of an article subset, including samples located within climate zone Cfb (temperate climate, no dry season, warm summer), according to the Köppen-Geiger climate classification map (https://koppen.earth/). I will describe (1) citizens' perceptions of different climate risks in cities within this zone, (2) the individual characteristics that link to their perceptions, and (3) contextual factors associated with these perceptions. The review seeks to highlight patterns of risk perceptions across geographic areas and demographic groups. These insights will be critical for designing strategies that strengthen citizen adaptation in cities that lie within the same climate zone.

This review is part of the CIT work package of the Urban Climate Future Lab (https://urbanclimatefuturelab.de/), which investigates citizens' narratives of climate risks in urban areas.

Abstract 1083

SUBJECTIVE QUALITY OF LIFE AND PLACE ATTACHMENT: INSIGHTS FROM PHNOM PENH, CAMBODIA

Blöbaum A.*[1], Matthies E.[1], Waibel M.[2], Sok S.[3]

[1]Otto-von-Guericke University ~ Magdeburg ~ Germany, [2]University of Hildesheim ~ Hildesheim ~ Germany, [3]Royal University of Phnom Penh ~ Phnom Penh ~ Cambodia

The paper presents results from a transdisciplinary project (Build4People) that aims to enhance quality of life through sustainable urban transformation in Cambodia's capital, Phnom Penh.

The concept of urban quality of life has a long multidisciplinary research tradition, bringing together fields such as human geography, sociology, and environmental psychology. Building on this, the project's conceptual framework integrates sociological, psychological, and geographical perspectives.

Based on a representative standardized household survey (N = 750 face-to-face interviews), subjective quality of life was assessed in relation to psychological factors (people sphere), such as perceived self-efficacy, general stress, coping capability, and locus of control; environmental assessments (environment sphere), including climate, the built environment, and public urban green; and resilience resources, such as social cohesion, satisfaction with social relationships, and neighbourhood-level place attachment.

The findings show that satisfaction with social relationships was the strongest predictor of subjective quality of life, followed by perceived self-efficacy, coping capability, general stress, and place attachment. Interestingly, perceived environmental stressors appear to exert a more indirect impact, moderated by both place attachment and perceived general stress. Place attachment seems to play an integrative role, linking several other factors, such as the evaluation of urban green, social cohesion, environmental stressors, self-efficacy, and coping capabilities.

Results are presented and discussed with respect to theoretical implications and starting points for evidence-based sustainable urban policies and practical interventions aimed at fostering well-being.

Abstract 2141

FAIRNESS AND TRUST SHAPE PUBLIC SUPPORT FOR STREET TRANSFORMATIONS: EVIDENCE FROM BARCELONA

Marquet O.*, Maciejewska M.

Autonomous University of Barcelona ~ Barcelona ~ Spain

Background. Built-environment sustainable travel interventions like superblocks, traffic calming or bike lanes often encounter vocal resistance despite broad latent support. Urban planners have been surprised by the virulence of backlash to seemingly benign measures, as seen in conspiracy-driven debates around the 15-minute city (Marquet et al., 2025) or frequent bike lane conflicts across Europe (Wild et al., 2018). To understand these reactions, we test psychological drivers of policy acceptability in the context of Barcelona's recent street transformations

Methods. A population survey of Barcelona residents (N=2,000) measured four latent constructs: Fairness, Trust in the City Council, Transport Policy Values, and Climate Concern, alongside socioeconomic and political variables (ideology, education, home ownership, car use and need). Support for expanding superblocks served as the primary outcome. We estimated a structural equation model (FIML/MLMV), regressing support on the four constructs and covariates, and regressing each construct on the same covariates. Reliability was acceptable to high (α Fairness≈.80; Trust≈.84–.87; Policy Values≈.62; Climate≈.82)

Results. Trust and Fairness were the strongest attitudinal predictors of support for superblocks (β≈.34 and β≈.24), with Policy Values also contributing (β≈.22). The direct effect of generic Climate Concern was negligible once other attitudes were included. Higher car use did not directly reduce support but was linked to lower Trust and weaker Policy Values, indicating an indirect pathway to opposition. Sociodemographic effects were modest but coherent, such as ideology shaping Trust and Values.

Conclusions. Procedural and distributive fairness, together with institutional trust, are key to acceptance of urban street transformations. Messages relying only on abstract climate benefits may be insufficient unless coupled with references to fair process, equitable outcomes, and transparent governance. Designing processes that build trust can help reduce backlash and sustain progress toward people-centered streets.

PUBLIC ACCEPTANCE OF ALTERNATIVE PROTEINS

Thursday 23 July 2026 from 08:00 to 09:30

(F-Spadolini)

Michael Siegrist (ETH Zurich ~ Zurich ~ Switzerland), Chair and Presenter
Fabienne Michel (ETH Zurich ~ Zurich ~ Switzerland), Co-Chair

Animal-based foods have a higher environmental impact compared with plants. Reducing meat consumption has been suggested as a way of reducing the environmental impact of food production. It is widely assumed that alternative proteins, such as highly processed plant-based meat substitutes, cultivated meat or insects, could substantially reduce the consumption of meat, resulting in a more sustainable food system than the current one. In this symposium, we will outline some of the challenges and barriers that need to be overcome before alternative proteins can play an important role in people's diets. We will discuss the importance of various psychological variables and models for successfully transitioning from animal-based to plant-based protein sources. Furthermore, we will discuss the implications for developing novel meat substitutes.

Abstract 3436

CLASSIFICATION OF MEAT SUBSTITUTES

Fischer A.*

Wageningen University ~ Wageningen ~ Netherlands

Consumers develop rich category associations with food including animal products from an early consumer. Category based associations and inferences guide their judgments about whether products qualify as food, as what kind of food they should be classified, and whether they are acceptable to eat at all. For the past 15 years, the dominant strategy has been to develop meat analogues that mimic the appearance, taste, and functionality of conventional meat. Yet, our research shows that such products and other meat alternatives are not typically categorized as meat by consumers. In focus groups in the Netherlands, consumers did not consider insects a food product making disgust a moot point. Consumers associated duckweed with a green salad like condiment instead of a protein source. Cultured meat was shown to be confusing as it misses the defining attribute of being derived from a professionally slaughtered animal. Beans and legumes were often classified as vegetables due supermarket placement while nuts were considered snacks for the same reason. These entrenched category inferences appear to be a major barrier in positioning meat alternatives as equivalent to meat. Our findings suggest that a more promising pathway lies in developing novel meals and recipes rather than narrowly focusing on replacing meat.

Abstract 3437

WHAT CAN FOOD CHOICE MOTIVES TELL US ABOUT CONSUMERS' INTEREST IN THE SUSTAINABLE FOOD TRANSITION? A CASE STUDY FROM THE UNITED KINGDOM

Jaeger S.*

Aarhus University ~ Aarhus ~ Denmark

A shift away from diets reliant on animal-based foods is underway, but not as quickly as political goals and international guidelines advocate. In Europe, it is estimated that up to ¾ of consumers regularly eat meat, fish, and chicken, while only a minority are vegetarian or vegan. Food choices, which are complex and habitual, are difficult to change. The importance consumers attach to different food choice motives is a good predictor of dietary behaviour and is underused as a source of inspiration for initiatives that can promote a sustainable food transition. In this talk, we present online survey data from >5000 adults living in the United Kingdom who self-identified as one of various dietary styles (incl. omnivore, flexitarian, vegetarian, and vegan) and scored the relative importance they placed on 11 different food choice motives (taste, affordability, health, freshness, naturalness, convenience, animal welfare, environmental sustainability, social sustainability, weight management, familiarity). Among omnivores, food choice decisions were primarily driven by taste, health, freshness, and affordability. Taste was ~10 times more important than environmental sustainability. Flexitarians who reported reducing their meat intake or avoiding red meat had very similar food choice motives to omnivores. For vegans (<5%), animal welfare was the most important food choice motive, followed by health and environmental sustainability. For this group of consumers, the importance placed on taste and affordability was significantly reduced. Vegetarians and pescatarians also placed relatively higher importance on animal welfare and environmental sustainability. The study findings will be presented in detail, while leaving room for a reflection on the minor importance of environmental sustainability, the need to leverage health and freshness as drivers of dietary changes and the value of promoting flexitarianism as a dietary style.

Abstract 3438

EXPLORING EUROPEAN CONSUMERS' ATTRIBUTE PREFERENCES FOR MEAT ANALOGS USING A CONJOINT ANALYSIS

Michel F.*

ETH Zurich ~ Zurich ~ Switzerland

The high share of animal-based protein in our diets has negative effects on the environment and contributes to climate change. Substituting meat with plant-based analogs presents one measure to facilitate the transition to more plant-based diets. But despite increased availability of plant-based meat analogs, the consumption of meat has not decreased substantially.

In the present study, we investigated how important different aspects and attributes of meat analogs are to consumers as the identification of attributes with high importance could be used to increase attractivity of these products.

To achieve a realistic scenario where consumers have to make trade-offs between different attributes such as price, product type, main ingredient, quality-, and nutrition claims, we used a rating based conjoint task. Consumers from four European countries (Finland, Germany, Italy, and Serbia) completed an online questionnaire in which they were shown plant-based burgers and plant-based steaks with different front of package claims and were asked to indicate their willingness to purchase the products.

Results showed that neither nutrition-, nor quality claims influenced consumers' willingness to purchase meat analogs. A large part of participants seemed to be indifferent to any attribute and was not interested in buying meat analogs at all. However, also a substantial part of participants reacted positively to lower prices and products aiming to replace burgers, but not steaks.

We conclude that nutrition- and quality claims do not seem to change existing attitudes towards meat analogs. However, lower prices and products that replace processed meat show greater potential to appeal to consumers.

Abstract 3439

MORE CHOICES AT THE COMMON TABLE: HOW CAN ALTERNATIVES TO ANIMAL-SOURCED FOODS SUPPORT A TRANSITION TOWARD SUSTAINABLE DIETS?

Renner B.*

University of Konstanz ~ Konstanz ~ Germany

Global debates on sustainability, animal welfare, health, and the convenience-oriented food environment are shaping increasingly diverse eating habits across many societies. While animal-based products continue to play a dominant role, a growing plurality of attitudes, motivations, and dietary practices is emerging. Importantly, positive orientations toward animal products do not preclude openness to alternatives. This diversification creates new opportunities for individual dietary choices, but it also raises challenges for social cohesion—particularly with regard to the "common table," understood both as a physical setting for shared meals (commensality) and as a symbolic space of identity, belonging, and mutual acceptance.

In this context, the "Reduce–Remix–Replace" (3R) strategy is proposed as a flexible and practical framework for dietary transitions. Reduce refers to lowering portion sizes of animal-based foods, Remix to combining them with plant-based or alternative ingredients, and Replace to fully substituting them with other protein sources such as plant-based analogues. By offering multiple entry points, the 3R framework accommodates the diversity of contemporary dietary patterns—from omnivores and flexitarians to vegetarians and vegans—while generating potential health and environmental benefits.

For consumers, the success of these strategies hinges on the diversity, accessibility, and everyday usability of alternative products within fair food environments. Beyond their environmental promise, the 3R approach may also foster social acceptance by enabling gradual, context-sensitive changes that respect cultural traditions and shared eating practices. Yet, barriers such as skepticism toward novel technologies, perceptions of naturalness, and concerns about taste and convenience remain significant.

Overall, aligning the development of alternative proteins with the Reduce–Remix–Replace framework offers a promising pathway toward more sustainable diets—reducing ecological burdens while sustaining the integrative role of the common table.

Abstract 3440

WILL ALTERNATIVE PROTEINS SUBSTANTIALLY REDUCE MEAT CONSUMPTION?

Siegrist M.*

ETH Zurich ~ Zurich ~ Switzerland

Animal-based foods tend to have a high environmental impact. A reduction of meat in the diet has been proposed as a strategy to reduce the environmental impact associated with food production. It is widely assumed that alternative proteins, such as highly processed plant-based meat alternatives, cultured meat, or insects, could substantially reduce animal protein consumption, and that this may result in a more sustainable food system compared with the current one. However, we question whether consumption of animal protein will decrease substantially as a result of these alternative proteins. Our research shows that psychological constructs such as food disgust and food neophobia are important barriers to the acceptance of alternative protein sources, such as insects or cultured meat. Furthermore, our survey results from four European countries suggest that plant-based meat alternatives are more widely accepted than insects and cultured meat. Furthermore, imitating processed products (e.g. burgers) is more widely accepted than imitating whole cuts (e.g. steaks). It remains to be seen to what degree alternative proteins will be substitutes for meat. We have some serious doubts that technological food solutions will be sufficient to solve the problems associated with meat consumption. A quick change from animal proteins to alternative protein sources should not be expected.

Abstract 2205

THE SOCIAL AND ENVIRONMENTAL CONSEQUENCES OF VEGAN CONSPIRACY BELIEFS

De Gourville D.*, Douglas K.

University of Kent ~ Canterbury ~ United Kingdom

Reducing meat consumption is a critical component of climate change mitigation, and veganism is often promoted as a high-impact individual climate action. Yet, despite its environmental benefits, resistance persists. Anti-vegan rhetoric frequently draws on conspiratorial claims that depict vegans as deceptive actors who exaggerate the harms of meat and manipulate public opinion. Despite the prominence of such narratives, their psychological consequences have rarely been systematically examined. Across three experimental studies (N = 1,783), we investigated the effects of exposure to vegan conspiracy content. Exposure consistently heightened endorsement of vegan conspiracy beliefs. Compared to a control group, participants exposed to conspiratorial narratives expressed more negative attitudes toward vegans, perceived greater symbolic and realistic vegan threat, attributed more negative traits, and judged vegans and vegan organisations as less moral (Studies 2–3). Exposure also increased support for punitive actions against vegan organisations. At the behavioural level, participants were more likely to sign a punitive petition against vegan organisations, an effect that emerged indirectly via heightened conspiracy beliefs (Study 3). While exposure did not directly reduce intentions to lower meat consumption or support meat-reductive policies, it increased defensive perceptions of meat (endorsement of the “4Ns”: natural, necessary, normal, and nice). No evidence emerged for an effect on food system justification. These findings extend conspiracy theory research in the domain of diet and climate action, showing that anti-vegan conspiratorial narratives heighten perceived threat, foster negative and punitive attitudes, and reinforce meat-defensive ideologies—potentially undermining public support for high-impact climate strategies.

Abstract 1077

INVESTIGATING THE EFFECT OF MESSAGE FRAMING ON PUBLIC OPINIONS AND VALUES TOWARDS SUSTAINABLE FESTIVE GIFTING AT LUNAR NEW YEAR

Lee C.*

Monetary Authority of Singapore ~ Singapore ~ Singapore

Lunar New Year (LNY) gifting of new notes in Singapore involves issuing approximately 90 million new notes annually. Most are used once before being returned to the Monetary Authority of Singapore (MAS) where notes exceeding demand are destroyed through incineration, generating substantial carbon emissions.

Behavioural research suggests effectiveness of loss-framed and social influence messages in promoting environmentally sustainable behaviours, though none have focused on LNY gifting. This study examines attitudes towards sustainable LNY gifting and whether loss-framed or social influence messages affect intentions and values driving such behaviours.

A randomised controlled trial (n = 1,853) assigned participants to three conditions: (i) control group (no message), (ii) loss-framed message highlighting the destruction of excess notes by incineration (iii) social influence message emphasising that new notes are not important to most receivers of hongbaos.

Across groups most receivers had no strong preference for new notes. Older individuals preferred new notes while the digitally savvy were more likely to prefer Fit notes (used currency notes that are generally clean and of suitable quality for recirculation) and digital hongbaos (digitally transferred money gifts). PayNow users were less likely to prefer new notes and more inclined towards digital gifting.

Both intervention messages significantly reduced intent to gift new notes, with social influence messaging proving more effective. It reduced preference for new notes among youth receivers and achieved higher knowledge comprehension. However, messages alone may not overcome fundamental demand as around 2 in 5 still intend to use new notes.

Personal values analyses revealed that givers' preference for Fit notes was linked to "respecting the earth" while those preferring new notes valued "influence". Youth receivers who preferred new and Fit notes prioritised different values like "social power", suggesting targeted messages appealing to givers and receivers based on their values may be more effective than a one-size-fits-all approach.

WHY SUSTAINABLE MOBILITY IS PRESTIGIOUS: AN EXAMINATION OF STUDENTS' NORMS AND VALUES

Joly L.*[1], Li W.[1], Boisadan A.[1], Davies M.[1], Viazzi C.[2], Buisine S.[1]

[1]CESI LINEACT ~ Nanterre ~ France, [2]CESI LINEACT ~ Toulouse ~ France

Introduction – Social influence plays a significant role in promoting sustainable mobility. Research shows that social norms encourage environmentally friendly behaviors. However, most studies focus on norms directly related to sustainable mobility, ignoring the impact of norms rooted in broader societal values such as prestige or innovation. These values often explain mobility choices in other contexts. This gap leads to a key question: Can sustainable mobility be promoted not only through norms tied to specific practices but also through norms anchored in collective values?

Purpose – This study investigates the relative influence of specific mobility norms and broader societal norms on sustainable mobility behaviors. Additionally, we examine the mediating role of personal norms and the contribution of perceived behavioral control to understand broader dynamics.

Method – An online survey was conducted among students at a higher education institution (N = 279) to assess perceptions of descriptive and injunctive norms related to mobility and eight societal values: prestige, health, materialism, hedonism, security, individualism, environment, and technology. Relationships among these variables were analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM), considering personal norms, perceived control, and self-reported behaviors.

Results – As anticipated, specific mobility norms strongly predicted sustainable mobility and perceived control. Among societal values, prestige positively influenced sustainable mobility, while values associated with technology had a negative impact. No other domains showed significant direct effects.

Conclusions – Findings indicate that sustainable mobility is influenced not only by behavioural norms but also by societal values, with prestige serving as a key facilitator. Positioning sustainable mobility as status-enhancing and modern could foster adoption. Incorporating these multi-level normative insights into policy and decision-support systems offers promising opportunities for effective, scalable interventions.

Acknowledgement – This project is part of Mon Trajet Vert, funded through the Energy Savings Certificates and supported by ADEME.

Abstract 813

DISPOSITIONAL DETERMINANTS OF SUSTAINABLE MOBILITY CHOICES AMONG STUDENTS: A COMPARISON OF SELF-DETERMINATION AND VALUE-BELIEF-NORM FRAMEWORKS

Li W.*, Boisadan A., Viazzi C., Buisine S.

CESI_LINEACT ~ Paris ~ France

Introduction : Climate change mitigation requires reducing transport-related emissions, especially in daily student commuting. Understanding dispositional factors that drive ecological mobility is essential to design effective interventions.

Purpose. This study examined how motivational and moral determinants predict students' intentions and behaviors regarding sustainable mobility, by comparing two major theoretical frameworks: Self-Determination Theory (SDT) and Value-Belief-Norm (VBN) theory.

Method : A survey was conducted among 643 engineering students in France. Participants completed validated scales assessing psychological needs satisfaction and frustration, autonomous motivation, personal and social norms, value orientations, ecological beliefs, awareness of consequences, and future orientation. Intention to adopt ecological transport and actual use of polluting transport were measured. Path analyses were used to test and adjust the SDT and VBN models.

Results: Both models showed comparable predictive performance, explaining about 25% of the variance in ecological mobility intention and 11% in polluting transport use. In the SDT model, intention was positively predicted by autonomous motivation and by the satisfaction of competence, autonomy, and relatedness, while competence frustration hindered intention. In the VBN model, intention was positively predicted by biospheric values, awareness of consequences, future orientation, personal norms, and social norms, and negatively by egoistic values. Altruistic values, hedonic values, and ecological worldview showed no significant effect. Both frameworks converged on the finding that higher ecological intention was associated with lower reliance on polluting modes.

Conclusions: Dispositional determinants of ecological mobility can be explained both through motivational processes (SDT) and moral-normative mechanisms (VBN). Their complementary nature suggests that interventions should target both psychological need support and normative influences to foster sustainable transport choices among young adults. Future research should integrate situational factors to better capture the gap between intention and behavior.

Acknowledgments: Part of Mon Trajet Vert (MTV), supported by ADEME, this project fosters sustainable student mobility and engages higher education institutions.

Abstract 1335

L'EFFET DU STRESS ENVIRONNEMENTAL ET PSYCHOSOCIAL SUR LA PLASTICITÉ SYNAPTIQUE : APPROCHE NEUROPSYCHOLOGIQUE CONTEXTUALISÉE AU CONGO-BRAZZAVILLE

Nguiambo Ondze A.P.L.*, Kongo Packa W.A.

Ministère de l'intérieur et de la Décentralisation ~ Brazzaville ~ Congo

Résumé N°2

Le stress environnemental et psychosocial, causé par des facteurs tels que la pauvreté, la migration, les conflits et la dégradation de l'environnement au Congo-Brazzaville, un impact majeur sur la plasticité synaptique du cerveau. La plasticité synaptique est la capacité des synapses, les points de communication entre les neurones, à modificateur leur force et leur efficacité en réponse à des stimulations ou à des expériences. Il est considéré comme comme un mécanisme fondamental sous-jacent aux processus d'apprentissage, de mémoire et d'adaptation cérébrale.

Le stress chronique, surtout lorsqu'il est multiple et contextuel, perturbe les mécanismes biochimiques impliqués dans la plasticité synaptique, notamement par une dérégulation des systèmes neurotransmetteurs et neuromodulateurs (glutamate, dopamine, cortisol). Ces perturbations altèrent la potentialisation à long terme, un processus clé pour le renforcement synaptique, et favorisent des synapses affaiblies, allérant les fonctions cognitives et émotionnelles.

Dans une approche neuropsychologique contextualisée, il est essentiel d'intégrer les expériences locales de stress qui modulent la fonction cérébrale et l'adaptation psychologique de la population congolaise. L'interaction entre le stress psychosocial et la plasticité synaptique rêvèle commentaire des environnements défavorables peuvent affaiblir la santé mentale et le comportement adaptatif en durabilité modifiante les circuits neuronaux.

Comprendre ces mécanismes permet une meilleure orientation des interventions cliniques, éducatives et sociales visant à renforcer les capacités d'adaptation face au stress environnemental. La recherche en neurosciences appliquée à la psychologie contextuelle au Congo-Brazzaville œuvre des perspectives pour des stratégies thérapeutiques et préventives adaptées aux contextes socioculturels et environnementaux spéciaux.

Ce thème illustre ainsi le lien droit entre environnement, cerveau, et psyché, dans un cadre à la fois fondamental et appliqué, essentiel pour comprendre les mécanismes complexes du stress et ses impacts durables.

Abstract 145

THE INFLUENCE OF INDIVIDUAL TEMPORAL AND SPATIAL CONTEXTS ON DECISION-MAKING OF EVACUATION BEHAVIORS DURING TORRENTIAL RAIN DISASTERS

Ohtomo S.*[1], Kimura R.[2]

[1]Kanto Gakuin University ~ Yokohama ~ Japan, [2]University of Hyogo ~ Himeji ~ Japan

Many people do not take evacuation action even if they sense danger during a disaster. This discrepancy between cognition and behavior is a major problem for safety and evacuation behavior. This study aims to investigate the contextual factors that inhibit an individual's decision regarding safety and evacuation behaviors during a disaster. Specifically, this study examines the influences of temporal and spatial contexts of a disaster encounter on safety and evacuation behaviors, by simulating the time course of a torrential rain disaster using ecological momentary assessment (EMA). A total of 130 respondents participated in the EMA over two consecutive days, comprising four measurement sessions. In addition to the contextual variables at the time of measurement, risk perception, crisis feelings toward the disaster, choices related to safety and evacuation behaviors, and behavioral intentions were measured. The measurement sessions were conducted at four different levels of disaster risk over a period of time (up to emergency safety measures). Main results indicated that risk perception and crisis feelings increased with the escalation of disaster risk. The rate of selecting safety and evacuation behaviors was correspondingly higher. However, the selection rate of those behaviors varied depending on the spatial context of the disaster encounter, such as whether the respondents were in transit or at home. Especially, respondents at home were less likely to take the necessary safety and evacuation behaviors. In conclusion, higher levels of risk and crisis feelings were associated with more frequent decisions to undertake safety and evacuation behaviors. However, independent of risk perception and crisis feelings, these decisions may be inhibited by the spatial context in which people encounter a disaster, leading to variations in behavioral choices. This study suggests the importance of designing risk communication that takes into account temporal and spatial contexts to promote safety and evacuation behavior during disasters.

EXPLORING THE USE OF NATURE SOUNDS IN DIGITAL FORM IN DAILY LIFE

Pong V.*, Tam K.

The Hong Kong University of Science and Technology ~ Hong Kong ~ Hong Kong

It has been widely acknowledged in environmental psychology that nature exposure is beneficial to humans' wellbeing, including attention and stress restoration, improved cognitive performance, increased positive affect and reduced negative affect. Based on limited studies, nature sounds were found to have similar effects. However, nature sounds were usually used as an intervention during a restoration phase; in reality, one could be immersed in nature sounds during task performance and as one goes about their daily activities. In other words, nature sounds can be played as background "music". Referring to the literature of background music and given the accessibility of nature sounds (e.g., on platforms like YouTube), we explored how adult office workers utilized nature sounds and other background music and sounds in daily life by conducting a survey study and screening the comments section of some of the most popular nature sounds videos on YouTube. This study analyzed the qualitative and quantitative responses from both data sources. Results revealed diverse habits and practical uses of nature sounds. Future research directions and practical implications were discussed.

Abstract 1216

EFFECT OF FAIR BURDEN DISTRIBUTION ON DISCUSSION AND ITS OUTCOME: GROUP DECISION EXPERIMENT REGARDING THE FINAL DISPOSAL OF REMOVED SOIL OUTSIDE FUKUSHIMA

Souma Y.*[1], Ehkirch Q.[1], Uehara R.[1], Nakazawa T.[2], Tatsumi T.[3], Arima Y.[4], Ohnuma S.[1]

[1]Hokkaido University ~ Sapporo ~ Japan, [2]Toyo University ~ Tokyo ~ Japan, [3]Toyohashi Sozo Junior College ~ Toyohashi ~ Japan, [4]Kyoto University of Advanced Science ~ Kyoto ~ Japan

Fair distribution of burdens mitigates the dissatisfaction of accepting it. Although much of the literature referred to individual decision-making, few studies have focused on the group decisions reached through discussions and their evaluations. This study aims to examine the effects of fair burden distribution on the outcomes of discussions through a group decision experiment. Participants in the experiment were Japanese university students. The discussion subject was the final disposal of removed soil outside of Fukushima, caused by the nuclear power plant accident. The decontamination works were conducted to recover the environment, and they generated a huge volume of the removed soil, which is stored in a facility in Okuma and Futaba towns, Fukushima. By law, the Government must complete the final disposal of the removed soil outside of Fukushima by 2045. To reduce the amount to be disposed of, recycling low-concentration soil as construction material is vital. A key factor influencing the acceptance of the removed soil is burden-sharing. In the experiment, we manipulated the candidate site numbers. In the single-site condition, participants were informed that only their residential area was selected as a candidate site. Conversely, in the multiple-site condition, participants were told that multiple areas, other than their own, were also selected as candidate sites. Participants were asked to decide as a group whether to accept the removed soil. The results revealed no significant difference in the number of groups that decided to accept the removed soil in their residential area. However, contrary to expectations, participants in the single-site condition felt more burden-sharing towards the decisions than in the multiple-site condition. These findings indicated that a fair burden distribution affects the evaluation of the decisions, despite coming from the same outcomes on the surface. This study could contribute to designing the site selection procedure of unwanted facilities.

Abstract 1155

PRACTICE-BASED EVIDENCE FROM THE "PERSUASION GAME" WITH ENVIRONMENTAL POLICYMAKERS AND PRACTITIONERS IN JAPAN: OPPORTUNITIES AND PRACTICAL UTILITY

Uetake K.*[1], Ando K.[1], Sugiura J.[2]

[1]Nara Women's University ~ Nara ~ Japan, [2]Keio University ~ Tokyo ~ Japan

Objective

This study examined the changes elicited in environmental practitioners by the "Persuasion Game," developed by Sugiura (2003). Whereas prior research focused on university students, we implemented the game with practitioners in Japan and assessed both the changes observed and participants' evaluations of the game, including its perceived applicability to their work.

Methods

In July 2025, twenty-three local environmental policy stakeholders took part in an in-person Persuasion Game session in Sapporo, Japan. In the Persuasion Game, participants are divided into two equal groups and, through persuading and being persuaded about ideas related to energy-saving behaviors that they themselves propose. Participants completed pre-post questionnaires to measure the difference. After the game, participants discussed how to improve the game for broader audience in 1-hour workshop.

Results & Discussion

Pre-post comparisons indicated significant increases in (a) subjective norms for energy-saving and (b) intentions to engage in conversations about energy saving. Perceived public concern for energy conservation increased as well.

On a five-point Likert scale, participants evaluated the game favorably: it was enjoyable (M = 4.18), worthwhile (M = 4.18), and deepened their understanding of energy-saving behaviors (M = 4.14); intentions to participate again were also positive (M = 3.82).

Participants identified several strengths of the game: (i) enhanced motivation to engage in energy-saving behaviors; (ii) learning gains through dialogue - having opportunities to refine their ideas; (iii) persuasive effects - feeling a commitment to act because they had themselves endorsed the behaviors; and (iv) broad applicability across contexts, including staff training and community workshops.

Three key areas for improvement were identified: (i) enhancing participants' psychological safety; (ii) establishing multiple criteria to ensure perceived fairness; and (iii) diversifying communication formats.

Results from another implementation scheduled for November 2025 will also be

reported.

Abstract 1093

AN ECOWOMANIST ANALYSIS OF POLITICIZED ENVIRONMENTAL IDENTITY FORMATION AND ENVIRONMENTAL ACTIVISM AMONG BLACK WOMEN IN THE UNITED STATES

Shodiya S.*, Robinson D., Cerezo A.

University of California, Santa Barbara ~ Santa Barbara, CA ~ United States of America

Politicized environmental identity is a central predictor of environmental activism. However, examinations of politicized environmental identity and environmental activist identity have failed to explore nuance embedded in the experiences of individuals with intersecting marginalized identities. Grounded in ecowomanism and Black feminism, this presentation will discuss the results of a phenomenological inquiry that explored the development of politicized environmental identity alongside other social identities through the narratives of six Black women environmental activists. Findings suggested that critical consciousness and exposure to environmental harm may be more facilitative of politicized environmental identity development among Black women, rather than identification with mainstream environmental organizations. This study illuminated Black women's environmental activism through their unique intersectional position as both Black and woman- a position that enables them to readily see connections between social oppression and environmental degradation. As such, this research advances scholarship in environmental psychology and feminist studies by expanding current conceptualizations of both environmental activist identity and politicized environmental identity. Further, this research calls for the development of environmental activism frameworks centered in the intersectional lived experiences of marginalized and politically oppressed individuals.

HEALTH-ENHANCING PHYSICAL ACTIVITY ACROSS NATURAL, BUILT, AND VIRTUAL CONTEXTS: AN INTERDISCIPLINARY PERSPECTIVE ON NEW DIRECTIONS AND APPLICATIONS

Thursday 23 July 2026 from 09:30 to 11:00

(F-Spadolini)

Marino Bonaiuto (Department of Psychology of Developmenta), Discussant

Solid evidence from Environmental Psychology shows that contact with nature can improve affect, restoration, and self-regulation, but turning that knowledge into programs people can use every day is still uneven. This symposium tackles that gap by bringing together results from natural outdoor activity, biophilic retrofits, and virtual nature. The focus is on mechanisms, boundary conditions, and practical levers for health, education, workplaces, and cities.

Three features make the session timely. First, methodological triangulation: randomized cross-over, living-lab, and field studies that combine self-report with objective indicators (HR/HRV, cortisol, presence) and standardized exposure descriptors to support comparability and replication. Second, contextual breadth: green exercise, classroom biophilia, workplace micro-restoration, and multi-city nature-based solutions—so we talk about theory-driven adaptation,. Third, a state-of-the-art reflection on bridging the theory-practice gap and translation to practice and policy: clear design principles, reporting standards, and low-threshold, cost-aware pathways (e.g., modular biophilic upgrades; scheduled micro-restoration; using virtual nature when access is limited).

We also address equity and feasibility discussing topics that includes cost and maintenance, access barriers, and potential risks. We also consider who benefits most from the different applications, and how to avoid widening disparities when scaling up.

The target audience of this symposium includes environmental and health psychologists, behavioral scientists, occupational health professionals, educators, urban planners, and HCI/design researchers. Attendees will leave with: (a) new knowledge on mechanisms linking restoration, affect regulation, and connectedness to nature with specific behavioral outcomes; (b) decision guidelines for when to choose natural, biophilic, or virtual options; and (c) a short checklist for measurement, implementation, and equity safeguards.

Aligned with ICAP’s “New Directions in Applied Psychology” and SDGs on health and wellbeing, quality education and climate action, the session aims for something practical: evidence-based, cost-aware, and ready for use newly developed insights and guidelines, while keeping appropriate scientific caution.

Abstract 3528

VIRTUAL GREEN EXERCISE: A CRITICAL REVIEW OF BENEFITS, LIMITATIONS, AND APPLICATIONS

Calogiuri G.*

Centre for Health and Technology, University of South-Eastern Norway ~ Notodden ~ Norway

Systems that combine physical activity with immersive virtual nature, or Virtual Green Exercise (VGE), hold potential for applications in sport, exercise, and rehabilitation. However, empirical evidence on the benefits of VGE remains limited, and various design and implementation challenges hinder progress in the field. Drawing on two studies involving different state-of-the-art VGE installations, this presentation will: (i) review evidence on the effectiveness and benefits of VGE, and (ii) discuss current limitations and future perspectives for its practical application.

Developed by an interdisciplinary team at the University of Inland Norway, the GreenVR and the GGR Experiential Showcase are highly immersive virtual systems integrated with motion interfaces that enable users to navigate the virtual world through bodily movements. These installations were evaluated through a randomized controlled trial (n = 60) and a field study (n = 139), respectively, assessing user experience, affective responses, and nature connectedness outcomes.

Both installations elicited a strong sense of presence and high levels of perceived environmental restorativeness, as well as psychological benefits such as enjoyment and improved affect. They also led to acute increases in nature connectedness and intention to perform green exercise. However, the capacity of VGE to provide psychophysiological benefits beyond those of physical activity alone appears limited. Some participants reported cybersickness and bodily incoherence, which constrained the type and intensity of activity and detracted from the experience. Moreover, it remains unclear whether short-term increases in nature connectedness and exercise intention translate into sustained behavioural change.

In conclusion, VGE shows promise as a tool in health and sports contexts. While technical constraints currently limit its effective and safe deployment, ongoing advancements in immersive technologies provide grounds for cautious optimism. Continued research is needed to clarify long-term effects, mitigate side effects, and address ethical concerns, including the environmental impact of hardware production and digital infrastructure.

Abstract 3529

BEYOND GREY WALLS: A LIVING LAB UNVEILING THE BENEFITS OF BIOPHILIC DESIGN IN UNIVERSITY CLASSROOMS

Hartmann C.*, Meier R.

School of Applied Psychology, Environmental & Sustainability Psychology, Zurich University of Applied Sciences (ZHAW) ~ Zurich ~ Switzerland

The design of indoor learning and working environments significantly influences users' psychological well-being and performance. Natural elements, such as greenery, have been shown to enhance these outcomes. Biophilic design integrates nature into interior spaces through materials, colors, and forms.

This study investigates whether biophilic design can be effectively implemented in classrooms to improve students' well-being and cognitive performance. It aims to generate scientific evidence and scalable design solutions for sustainable learning environments.

In a participatory process involving students, staff and stakeholders like facility management, a conventional classroom was transformed into a "Green Classroom" using biophilic design principles.

First, a spatial concept was developed through a co-design workshop with students and staff, who created 3D prototypes reflecting their needs and visions for optimal learning environments. These ideas were matched with current research on biophilic design and translated into a set of design elements (natural materials, greenery, acoustic features), which were implemented.

Over two months, one Psychology class (N = 100) is taught in the redesigned room, while a comparable class (N = 100) remains in a standard "Grey Classroom." A pre-post design measures emotional experience (SDQ), affective state (PANAS), performance (d2), and nature connectedness (EINS). Additional user groups evaluate the perceived restorativeness of the Green Classroom. Data collection is taking place in autumn 2025; results are expected in spring 2026.

Preliminary observations suggest that students in the Green Classroom report higher well-being and improved attention compared to those in the Grey Classroom. The space is perceived as more restorative and engaging, with positive feedback from other users supporting broader applicability.

Biophilic design offers a low-threshold, modular approach to enhancing existing educational spaces. This project provides evidence-based insights that can support educational institutions in integrating nature into learning environments, fostering a sustainable and health-promoting campus culture.

Abstract 3530

RESTORATIVE ENVIRONMENTAL INTERVENTIONS AT WORK: THE ROLE OF THE RESTPOD® IN EMOTIONAL RECOVERY

Brondino M.*, Menardo E., Marossi C., Pasini M.

Department of Human Sciences, University of Verona ~ Verona ~ Italy

Emotions at work are central to employee well-being and organizational outcomes such as performance; studying them is crucial to understanding psycho-organizational mechanisms. While prior studies have largely focused on anxiety, anger, boredom, and positive emotions like joy, fewer interventions have targeted relaxation as a key recovery state. The Restpod® project introduces a restorative environmental intervention designed to reduce negative affective states while enhancing joy and relaxation. This dual focus highlights the importance of considering both deleterious and restorative affective processes in workplace settings. Restorative environments have been widely studied in environmental psychology for their ability to enhance well-being. Restpod® represents an innovative application of biophilic design principles to create a micro-environment aimed at providing workers with a restorative experience during daily routines. A total of 106 (56%female, mean(sd) age = 39.1(9.7)) participants took part in the study. We examined the effects of a 15-minute Restpod® pause (week 2) on emotions, life and work satisfaction, and performance (daily measured across three weeks). A series of mixed-design ANOVAs was conducted, with Time (Week 1, Week 2, Week 3) as the within-subjects factor and baseline burnout level (low, medium, high) as the between-subjects factor. Interactions between Time and burnout emerged, suggesting that the benefits of a Restpod® break were stronger among participants with high burnout. Specifically, high-burnout participants showed a significant decrease in stress ($t(92) = 3.27$, $p = .054$), anger ($t(92) = 4.09$, $p = .003$), and boredom ($t(92) = 3.37$, $p = .040$) in week 2. No significant interaction was observed for relaxation, which increased across all groups ($F(4,184) = 3.68$, $p = .027$). No significant differences were found for life and work satisfaction and performance. Thus, this kind of intervention could be a useful tool to support and help restore people at work, and can be particularly effective for people who report high levels of burnout.

Abstract 3531

INTEGRATING CLIMATE, BIODIVERSITY, AND SUSTAINABILITY WITH PHYSICAL ACTIVITY: CONCEPTUALIZATION AND IMPLEMENTATION CONSIDERATIONS

Nigg C.*

Department of Health Science, Institute of Sport Science, University of Bern ~ Bern ~ Switzerland

The EU-funded GO GREEN NEXT (GGN) project aims to deliver evidence-based policies and pilot projects in four European biogeographic regions, addressing the nexus between biodiversity, climate, and planetary health. Specifically, it will use nature-based solutions (NBS) and collaboration with global initiatives to reverse environmental degradation, particularly in urban areas vulnerable to climate change. A total of 19 partners and associated partners from North America, Switzerland, Norway, Spain, Austria, Netherlands, Finland, Germany, Malta, and three partners from Ireland will develop novel approaches to investigate how cities best can realise their climate neutral ambitions. GGN will deliver a comprehensive evidence-based policy-oriented approach model to convey how ecosystem health, physical activity, and human health are connected. NBS, or actions to protect, sustainably manage, and restore natural and modified ecosystems that address societal challenges effectively and adaptively, simultaneously benefiting people and nature, are among the strategies that have emerged to reverse the degradation of nature, notably in urban areas where changes are amplified. In cities, vulnerability to climate change and environmental degradation is high due to dense populations, critical infrastructure, and at-risk communities (e.g. vast differences across social-economic gradient). Cities offer an opportunity to accelerate the implementation of current solutions aligned with emerging strategies and policy initiatives (e.g. New European Bauhaus, 100 Climate Neutral and Smart Cities) combining to form what is termed a just green transition. This refers to a process of far-reaching sociotechnical change leading to a green and climate-neutral economy that preserves biodiversity and ensures social justice. GGN will address the biodiversity-climate-planetary health nexus, delivering positive policy and city/region pilot outcomes in four biogeographic regions across Europe (Cork City [Ireland], Klagenfurt [Austria], Paijat Hame Region [Finland], Malta) and with input from best practice globally.

Abstract 3527

EVALUATING THE BENEFITS OF GREEN EXERCISE: A RANDOMIZED CONTROLLED TRIAL IN NATURAL AND BUILT ENVIRONMENTS ASSESSED FOR THEIR RESTORATIVE PROPERTIES

Laezza L.*[1], Brondino M.[2], De Dominicis S.[1]

[1]Department of Nutrition, Exercise and Sports, University of Copenhagen ~ Copenhagen ~ Denmark, [2]Department of Human Sciences, University of Verona ~ Verona ~ Italy

Exercising in natural environments (green exercise, GE) has been shown to offer significant physiological and psychological health benefits compared to urban or indoor environments. This study evaluated the restorative effects of a 1-h light-to-moderate intensity exercise session across three environments: natural (G), urban (U), and indoor (I).

Using a randomized crossover design, 25 male participants (M = 26.3, SD = 4.3) completed a 1-h walk at 6 km/h in each setting. Psychological outcomes, including perceived restorativeness (PRS), restoration (ROS), emotional states, enjoyment, and behavioral intentions, were assessed with validated questionnaires. Physiological measures (cortisol, heart rate, heart rate variability) were collected pre- and post-intervention.

Results showed that G environment consistently elicited greater relaxation, higher positive emotions, and lower negative emotions compared to U and I. Restoration outcomes (PRS, ROS), enjoyment and intentions to exercise were significantly higher in G, while perceived exertion was lower in G compared to I. Physiologically, cortisol levels, heart rate, and heart rate variability differed by environment, with G promoting a more favorable recovery profile than U and I. No interaction effects were observed for physiological measures, suggesting consistent recovery patterns over time.

These findings highlight the restorative and stress-relieving potential of GE, emphasizing its role in enhancing mental well-being and supporting physical activity adherence. The study underscores the importance of natural environments as a resource for promoting health and well-being, while also identifying the need for further research to clarify the nuanced differences between urban and natural settings.

CLIMATE CHANGE AND ATTENTION: INVESTIGATING THE ATTENTIONAL BIAS TOWARD ENVIRONMENTAL THREATS

Boga M.*[2], Kaça G.[1]

[1]Ege University ~ Izmir ~ Turkey, [2]Bursa Uludag University ~ Bursa ~ Turkey

Climate change is one of the significant challenges facing modern society. Many studies have often examined its psychological effects in the context of anxiety (Ogunbode et al, 2023). More recently, studies have emphasized the influence of climate change on human cognition, especially attention. Climate change–related stimuli are considered emotionally salient and may capture attention (Carlson et al., 2019). However, little is known about how these stimuli compare with other emotional stimuli, particularly those that elicit fear. Most existing studies have contrasted climate change–relevant images with neutral or irrelevant ones (Carlson et al., 2020, 2022); however, the relative attentional priority of these images remains unclear.

To address this gap, the present study investigates attentional biases toward climate change–related stimuli by comparing their attentional priority with modern (e.g., guns, knives) and biological (e.g., snakes, dangerous animals) threats. Using an experimental design based on the dot-probe paradigm, we will investigate whether climate change stimuli capture attention to the same extent as traditional fear-related cues. Furthermore, we will examine the effects of individual differences, such as disposition to connect with nature and state–trait anxiety, on attentional processes. The study is planned to include at least 75 university students, based on power analysis.

This study is expected to provide valuable insights for understanding attentional responses to climate change–related threats.

THE PATHWAYS OF YOUTH GREEN COMMITMENT: PROFILES, PREDICTORS, AND DIFFERENCES BETWEEN UNIVERSITY AND NON-UNIVERSITY YOUTH IN ENVIRONMENTAL CITIZENSHIP

Feo Serrato M.L.*, Dávila M.C., Zlobina A.

Complutense University of Madrid ~ Madrid ~ Spain

In a context marked by the climate emergency, understanding how young people engage in environmental protection is essential to ensure the psychosocial and environmental well-being of society. The aim of this study is to identify differentiated profiles of environmental participation, to analyse the sociodemographic and psychosocial factors that predict them, and to compare participatory dynamics between university and non-university youth.

Two independent samples were analysed: first-year university students (n = 1,510; 56.8% women; M = 18.31, SD = 1.27) and non-university youth with no intention of enrolling in higher education in the short term (n = 562; 51.8% women; M = 18.33, SD = 0.62). Five indicators of pro-environmental participation were assessed (attendance at demonstrations, petition signing, responsible consumption, association membership, and volunteering), along with sociodemographic variables (gender, origin, and parental education) and psychosocial variables (pro-environmental attitudes, the value of universalism–nature, and prior environmental socialisation). Latent class analysis was applied to identify participation profiles in each sample, followed by multinomial logistic regression models to predict class membership.

Three consistent patterns were identified in both samples: low involvement, moderate participation, and high commitment. Multinomial logistic regression showed that gender, origin, universalism–nature, and prior environmental socialisation predicted membership in the more active classes. However, pro-environmental attitudes emerged as a significant predictor only among non-university youth. Furthermore, some practices—such as responsible consumption—were relatively frequent across all groups, whereas others—such as association membership and volunteering—showed lower incidence.

These findings provide insights not only into who participates more, but also into the specific forms through which such commitment is expressed. From an applied perspective, the typology obtained offers guidance for the design of targeted educational and community programmes that strengthen less frequent practices while leveraging the more common ones as gateways to sustained environmental engagement.

Abstract 1397

SHAPING GREEN CITIZENS? LONGITUDINAL EVIDENCE ON PRO-ENVIRONMENTAL BEHAVIOUR IN SPANISH UNIVERSITIES

Feo Serrato M.L.*, Zlobina A., Dávila M.C.

Complutense University of Madrid ~ Madrid ~ España

In the current context of climate emergency, universities face a double challenge: not only to transmit knowledge but also to become spaces of social transformation capable of fostering sustainable attitudes and behaviours. The university stage is a crucial moment in which young people consolidate values and define their civic commitment to the environment. Nevertheless, little is known about how pro-environmental behaviours (PEB) evolve throughout students' academic trajectories and which factors explain such variation.

This study addresses this question through a longitudinal design with two waves of online questionnaires. A total of 286 students were surveyed in their first year and followed up in their third year, allowing for paired analyses of their evolution. The sample included degrees from different fields of knowledge (psychology, computer science, mathematics). The questionnaire covered five types of PEB, ranging from community-oriented actions—such as environmental volunteering—to political consumption practices, such as boycotting products for ecological reasons. Binary logistic regression models were applied to estimate the probability of behavioural change and to examine the role of intrapersonal variables (e.g., moral obligation), psychosocial variables (e.g., perceived social norms), and sociodemographic variables (e.g., gender).

The study proposes two main hypotheses: (H1) the probability of engaging in PEB increases as students progress through their university studies; (H2) this change is not homogeneous across fields of knowledge, but more pronounced in social sciences and humanities than in STEM disciplines.

Preliminary results indicate that each behaviour follows a differentiated dynamic, and that variables such as gender and social class significantly moderate the probability of engagement. Overall, these findings highlight the need for universities to adopt an active role in promoting sustainability, designing specific strategies that support students in building an environmentally committed citizenship.

Abstract 1612

EXPOSURE TO GREEN SPACES ENHANCES INDIVIDUAL AND COMMUNITY SUBJECTIVE WELL-BEING

Kaida N.*[1], Itoi K.[1], Kaida K.[2]

[1]University of Tsukuba ~ Tsukuba ~ Japan, [2]National Institute of Advanced Industrial Science and Technology ~ Tsukuba ~ Japan

Introduction: Green spaces offer recreation, relaxation, and education, improving health, boosting positive emotions, strengthening community bonds, and increasing life satisfaction and subjective well-being. Not only do they benefit individuals, but they can also enhance community well-being. Symbolic green spaces, like Central Park with forest trails, can be especially effective, though these connections are not fully understood. Objective: This study aimed to examine the relationship between citizens' access to green spaces and individual and community well-being.

Method: Data were collected via an online survey of adults in Moriya City, Japan, which has promoted green space development (valid responses: 223, Mage = 53.60, SD = 13.38, male 67.71%). Respondents reported how often they visit symbolic and neighborhood green spaces and their satisfaction with living environment, and subjective well-being at both individual and community levels. Correlation and path analyses examined associations from green area visits to individual and community well-being, directly or through satisfaction with the environment.

Results: Respondents visited symbolic green spaces less often than neighborhood ones, both within a range of a few times a year. Visiting symbolic green areas was positively correlated with both individual ($r = .12$, $p < .1$) and community ($r = .26$, $p < .001$) well-being, while neighborhood green space visits also related to community well-being ($r = .19$, $p < .01$). Path analysis shows that visiting symbolic green spaces contributes to individual and community well-being through satisfaction with the living environment.

Conclusions: Green spaces can enhance residents' well-being at both the individual and community levels through satisfaction with their living environment. This is especially true for symbolic green spaces, even if they are visited less frequently.

Abstract 1553

A CONJOINT-ANALYSIS OF THE ACCEPTANCE OF COMBINED PUSH AND PULL STRATEGIES TO DECREASE CAR TRAFFIC ON A LOCAL LEVEL.

Löfgren E.*, Lindvall D.

Uppsala University ~ Uppsala ~ Sweden

Global climate change calls for wide-ranging policy interventions in different areas and on different levels. One challenging area is transportation, which is responsible for 20 to 25% of global greenhouse gas emissions. To reduce emission, changes in behavior and travel mode choices are necessary.

There are different policy strategies to limit car use and many of these policy interventions can be implemented at local level by municipalities. Some of the most effective approaches to decrease private car use in cities, according to reviews of the existing literature, are congestion charges, mobility service, limited traffic zone and reduced space for cars and increased infrastructure for active travel. However, for these policies to be successfully implemented and complied with, they need to be accepted by the people.

Research on acceptance of climate change policies, such as carbon taxes, suggest that perceived fairness is a strong predictor for acceptance, besides perceived effectiveness, environmental concern and personal values. However, most studies explore acceptance of national level policies, and less research attention are devoted to local urban interventions.

This paper examines acceptance for urban mobility policies, drawing results from a survey in the municipality of Uppsala in Sweden. Acceptance to policy packages (push strategy combined with pull strategies) are explored using a conjoint analysis. Moreover, we explore if fairness and effectiveness influence acceptability.

We also look at how these factors relate to behavior change intentions. Aspects such as frequency of car use, distance travelled and number of cars in the household, besides personal values and sociodemographic factors will be controlled for. The paper thereby addresses questions whether there are combinations of strategies that are perceived more acceptable than others and if perceived fairness and effectiveness increase the acceptability of mobility policies. And at last, are there any correlation between policy acceptance and behavior change intentions?

Abstract 1605

AN EXPLORATORY STUDY OF THE AESTHETIC ENGAGEMENT WITH THE ENVIRONMENT BY COLLEGE STUDENTS

Mansukhani R.*

De La Salle University ~ Manila ~ Philippines

The youth may be encouraged to engage with the environment in their own personal and meaningful way by giving them the opportunity to be aware of their environment using an aesthetic perspective. In the context of training students to view environment—their ordinary surroundings—with fresh eyes, find what they perceive to be beautiful in their surroundings, and sense a connection through an appreciation of beauty in their surroundings. Using the transpersonal psychology perspective of valuing the aesthetic experience to counter the deterioration of urban landscape and mindless destruction of nature (Ferrucci, 1982), this qualitative study explored into the aesthetic experiences of adolescents in appreciating beauty in their ordinary environment in an urban setting and exploring their aesthetic faculty by creating an object from their engagement with the environment. Twenty-two college students participated in this study and the beauty they perceived is mostly rooted in natural world (e.g., plants, the sky, trees), and directed towards scenes of human connection (e.g., two children sharing an ice cream on the street). From their perception of beauty, they produced creative products relating to aesthetic experience focused on nature and using various creative mediums (painting, photography, spoken word poetry, crafts). Their aesthetic engagement with their ordinary urban environment elicited feelings of happiness, peace, and gratitude; and they reported psychological benefits of increased life satisfaction, a deep sense of appreciation, and a change or expansion of their perspective on life. Findings of this study provide a compelling insight into the capacity of the youth for environmental engagement grounded in the aesthetic experience of appreciating beauty, creative expression of the engagement and positive emotions. This paper advocates for a creative pedagogical approach to promoting environmental engagement and stewardship among the youth and offers practical recommendations for designing programs in the school and community settings.

Abstract 1426

ELEMENTS OF INCLUSIVE LEARNING ENVIRONMENTS FOR SCHOOL CHILDREN WITH ADHD AND/OR ASD

Zemp R.[2], Rentsch M.[1], Meier R.*[1], Hartmann C.[1]

[1]Zurich University of Applied Sciences ~ Zurich ~ Switzerland, [2]Swiss Competence Centre for Accessibility in Architecture ~ Zurich ~ Switzerland

Although several countries have adopted inclusive education systems, the inclusion of children and teenagers with neurodivergences such as attention-deficit/hyperactivity disorder (ADHD) or autism spectrum disorders (ASD) remains a complex challenge. The extant literature indicates that specific spatial arrangements and furnishings can positively impact neurodiverse individuals. However, there is a lack of a comprehensive and broader understanding of the role of spatial configurations in school environments that facilitate inclusion. Therefore, this study aims to identify positive spatial configurations of learning environments and their effect on the wellbeing and inclusion of children and teenagers with ADHD and ASD. To achieve this, semi-structured interviews with Swiss children (N = 10) aged 7–13 years with ADHD and ASD, along with their teachers (N = 11), were conducted. The interviews focused on factors in the classroom that support children's well-being, learning outcomes and ability to concentrate. Additionally, parents were surveyed via an online questionnaire. The answers were transcribed and analyzed using qualitative content analysis. The findings indicate that certain aspects of spatial configurations of learning environments, like having an own desk, few visual distractions, natural light or retreat spaces play an important role in the ability to concentrate and for the wellbeing of children and teenagers with ADHD and ASD. The study's findings can help schools and teachers to foster the inclusion of children and teenagers with ADHD and/or ASD and develop design guidelines for officials.

Division 4: Environmental Psychology SDG 13: Climate Action SDG 11: Sustainable cities and communities

Abstract 1858

THE INFLUENCE OF PLACE ATTACHMENT ON ENVIRONMENTAL RISK PERCEPTION AND PREPAREDNESS

Cattelino E., Scacchi L., Monaci M.*

Department of Human and Social Sciences, University of Valle d'Aosta ~ Aosta ~ Italy

Introduction. Climate change continues to increase the frequency and intensity of natural hazards. The Alpine area of Italy is particularly vulnerable due to the interaction between rising temperatures, a changing precipitation regime, and the intensification of extreme events and geomorphological processes (e.g., glacier melting and permafrost thawing). Several studies have highlighted how socio-psychological factors may impact individuals' motivation to protect themselves and adopt mitigation measures. However, findings are contradictory overall, showing positive, negative, or non-significant correlations between risk perception, knowledge, and preparedness.

Purpose. This study is part of broader research on risk communication in the Aosta Valley, financed by the Interreg ALCOTRA 14-20 European Cooperation Program. This research aims to assess the institutional communication system on environmental risks and its effectiveness in terms of citizens' awareness. A specific aim of the present study is to examine the role of place attachment in preparedness with the mediation of risk perception, risk knowledge, and coping strategies.

Method. A total of 457 (58% female) residents of Valle d'Aosta responded to an online questionnaire. In addition to socio-demographic variables, the main variables measured were sources of information, trust in these sources, risk perception and related concern, past exposure to natural hazards firsthand or witnessed, place attachment, coping strategies, and preparedness actions.

Results. Correlations show that previous experiences are positively associated with knowledge and preparedness. However, previous experience is unrelated to place attachment or coping strategies. Place attachment, on the other hand, exhibits moderate positive correlations with risk perception and knowledge. A structural equation model shows that place attachment influences preparedness through perception of hazards probability and problem-focused coping strategies, which are in turn increased by knowledge of possible risks.

Conclusions. Communication strategies should focus on providing credible information about potential risks and detailing appropriate coping strategies that address specific problems.

Division 4: Environmental Psychology SDG 16: Peace, Justice and Strong Istitutions SDG 10: Reduced Inequalities

Abstract 1436

FAIR DISTRIBUTION FOSTERS PUBLIC UNDERSTANDING AND ACCEPTABILITY: A CASE OF THE REUSE AND FINAL DISPOSAL OF REMOVED SOIL FROM FUKUSHIMA

Ohnuma S.*, Ehkirch Q., Souma Y., Uemura M., Konda Y., Uehara R.

Hokkaido University ~ Sapporo ~ Japan

Public understanding and acceptability are vital, particularly when public decisions accompanying burden distribution are at issue. Negative images of unwanted facilities prevent acceptability, which are often labeled from outside the community, such as stigmatization, representing a social reality regardless of scientific facts. Public deliberation is a useful tool to change social representation; however, the processes that make change possible are unclear. This study aims to demonstrate an interactive process that changes social representation. We hypothesized that such changes are more likely to occur when the discourse arena is framed as burden sharing and fair distribution is prioritized than when framed as maximization of the stakeholders' interests. We developed a game to observe social dynamics, simulating the processes of stakeholders' negotiation and public deliberation with a case of reuse and final disposal of the removed soil from Fukushima. Following the Fukushima nuclear accident, decontamination works were conducted to recover the environment, resulting in the generation of a huge volume of removed soil. Approximately 80% of the soil is recyclable material usable by public utilities, of which the radioactive level is below the international safety standard. However, emphasizing safety does not increase the acceptability of the removed soil to the nearby residents. Even though they understand safety, they fear their residential areas will be stigmatized. In the game, participants were asked to offer ideas that prevent the regions, where the removed soil was accepted, from being stigmatized and enhance appreciation by inducing a positive image there, after experiencing the stakeholders' negotiation. The results indicated that the more highlighted the fair distribution in the stakeholders' process, the more constructive ideas emerged, encouraging the regional dignity, mitigating residents' anxiety, and changing the social representation. The hidden function of fair distribution that triggered the emergence of constructive ideas is discussed.

Abstract 1757

IDENTITY AT RISK? SOCIAL CONSEQUENCES OF DIGITAL BEHAVIOR CHANGE INTERVENTIONS

Pfeiffer L.*

University of Hamburg ~ Hamburg ~ Germany

In the face of grand societal challenges, collective action is indispensable. While socially-evaluative interventions—those that provide feedback based on social comparisons—have shown promise in fostering pro-environmental behavior, their long-term effectiveness and psychological mechanisms remain insufficiently understood. Drawing on social identity and social influence theories, I argue that the success of such interventions should not only be measured by their impact on behavior but also by their influence on individuals' social identity. I conducted a longitudinal field experiment with 101 citizens in a medium-sized German city to investigate how social comparison feedback on residential heating behavior affects both energy conservation and group identification over time. Participants were assigned to either a control condition with individual energy-saving tips or one of two treatment conditions receiving real-time feedback comparing their room temperatures to the group average. Group identification and heating energy conservation behavior were assessed at three time points: before, during, and after the intervention. Results reveal that socially-evaluative feedback alone did not directly affect group identification but had an indirect effect via perceived group difference—moderated by behavioral similarity. Importantly, I find that group identification moderates the effect of feedback on behavioral change over time: high identifiers increased their conservation behavior, while low identifiers decreased it. These findings suggest that social identity plays a dynamic role in determining the trajectory and stability of behavioral change. Our study contributes to the debate on the effectiveness of social interventions by highlighting the relevance of identity dynamics in shaping long-term outcomes. It calls for a shift in focus—from merely changing behavior to also understanding and supporting social identity development in interventions designed to tackle grand challenges.

HORTUS LIZORI: ECOBIOLOGY AND RURAL REGENERATION AS A LIVING LABORATORY FOR HUMAN WELLBEING

Thursday 23 July 2026 from 10:00 to 11:30

(I-Spadolini)

Pamela Bernabei (Antonio Meneghetti Scientific and Humani), Chair and Presenter
Gabriella Palumbo (International Ontopsychology Association), Discussant

The physical and cultural environment deeply shapes human perception, behavior, and wellbeing, while people, in turn, transform their surroundings through creativity, culture, and social practices. This symposium explores Hortus Lizori, a unique case of rural regeneration that integrates psychology, architecture, ecology, and education, transforming a medieval village into a living laboratory of human–environment interaction.

The initiative originates from the vision of Antonio Meneghetti, founder of the ontopsychological school, who emphasized the role of ecobiology—the dynamic relation between the person and their environment—as a foundation for psychophysical wellbeing and civic life. Lizori's restoration thus represents not only cultural heritage renewal but also an application of this vision to education, community, and sustainability.

The symposium is novel and relevant for ICAP 2026 because it introduces a transdisciplinary model where ecobiology is applied to real-world contexts of heritage regeneration and higher education. Hortus Lizori has also been officially recognized on the United Nations SDGs Partnerships Platform as an example of concrete implementation of the 2030 Agenda, further underscoring its global value. The project contributes directly to SDG 4 (Quality Education), SDG 11 (Sustainable Cities and Communities), and SDG 17 (Partnerships for the Goals).

Each presentation offers a unique perspective:

1. Intellectual and philosophical foundations of human–environment relations.
2. Architectural restoration and design for wellbeing.
3. Empirical methods for measuring human–environment interactions.
4. Pedagogical models engaging more than 30 universities worldwide.
5. Sustainability, partnerships, and civic ecology for global impact.

Together, these perspectives present Lizori as a model for higher education, interdisciplinary research, and rural regeneration, bridging science, culture, and community to design healthier and more sustainable futures.

Abstract 3419

PHILOSOPHICAL ROOTS AND INTELLECTUAL TRADITIONS

Bianchi P.*

Antonio Meneghetti Scientific and Humanistic Research Foundation ~ Lugano ~ Switzerland

This presentation traces the intellectual foundations of human–environment relations, from Greco-Roman philosophy to contemporary approaches in applied psychology. It explores how ideas of harmony, beauty, and civic life have historically informed the way environments influence human flourishing. Lizori is situated within this intellectual trajectory as a place where cultural heritage and contemporary thought intersect. The contribution emphasizes how philosophical traditions provide conceptual depth to today's challenges of sustainability and wellbeing. By reconnecting classical insights with modern theories, the presentation highlights the enduring value of integrative perspectives for understanding the mutual shaping of people and environments.

Abstract 3420

ARCHITECTURE AND DESIGN FOR WELLBEING

Russo G.*

Sociedade Brasileira De Hipnose ~ Belo Horizonte ~ Brazil

This talk examines the architectural restoration of Lizori as a case study in design for human wellbeing. It explores how spatial form, aesthetics, and adaptive reuse of heritage environments influence perception, social cohesion, and pro-environmental attitudes. The presentation illustrates how design principles can align with psychological insights to create spaces that actively support awareness, community identity, and sustainable living. Lizori demonstrates that architecture is not only about preserving historical form but also about shaping environments that contribute to present and future wellbeing. By bridging architecture and psychology, this contribution shows how design can serve as a catalyst for healthier and more resilient communities.

Abstract 3421

MEASURING HUMAN–ENVIRONMENT INTERACTIONS

Bernabei P.*[1], Ai M.[2]

[1]Antonio Meneghetti Scientific and Humanistic Research Foundation ~ Lugano ~ Switzerland, [2]International Ontopsychology Association ~ Beijing ~ China

This presentation introduces empirical methodologies for assessing how environments affect human perception, awareness, and wellbeing. Drawing on the collaboration with the University of Perugia's Department of Civil and Environmental Engineering, it highlights approaches such as environmental mapping, psychophysical assessment, and participatory evaluation. The Lizori case provides a practical context for applying these tools, enabling measurable insights into the human–environment nexus. The contribution demonstrates the importance of evidence-based strategies in guiding sustainable regeneration projects. By combining scientific rigor with applied contexts, this presentation underlines how empirical research can inform policy, design, and community development aimed at fostering healthier relationships between people and their environments.

Abstract 3422

PEDAGOGY AND TRANSDISCIPLINARY EDUCATION

Linde N.*

Baltic Ontopsychology Association ~ Riga ~ Latvia

This talk presents Lizori as a model for environmental higher education and experiential learning. Through international workshops involving more than 30 universities, students, doctoral candidates, and professionals collaborated on proposals for rural enhancement, later disseminated through exhibitions and a comprehensive academic volume. The presentation emphasizes how immersive, real-world contexts foster environmental awareness, interdisciplinary cooperation, and personal growth. By advancing SDG 4 (Quality Education), Lizori provides an exemplary case of place-based pedagogy that equips new generations with skills and values for sustainability. The contribution highlights the replicability of this educational model, showing how transdisciplinary learning environments can integrate psychology, architecture, and civic engagement.

Abstract 3423

SUSTAINABILITY, PARTNERSHIPS, AND CIVIC ECOLOGY

Palumbo G.*

International Ontopsychology Association ~ Rome ~ Italy

The final presentation situates Hortus Lizori within the broader sustainability agenda. It explores how partnerships among academia, local authorities, and international institutions have enabled rural regeneration while advancing SDG 11 (Sustainable Cities and Communities) and SDG 17 (Partnerships for the Goals). Lizori is discussed as a best-practice model of civic ecology, demonstrating how cultural heritage can be a driver for innovation, education, and cross-sector collaboration. The contribution highlights strategies for cultivating pro-environmental behaviors and fostering resilient communities through shared responsibility. By integrating science, culture, and civic participation, Lizori offers a transferable model for communities worldwide seeking sustainable and human-centered development.

04 - Division 4: Environmental Psychology

EXPERIENCING, REGULATING, AND LEARNING FROM NATURE: MULTIDISCIPLINARY APPROACHES TO HUMAN-NATURE INTERACTIONS IN A CHANGING WORLD

Thursday 23 July 2026 from 11:00 to 12:30

(F-Spadolini)

Valeria Vitale (Urban and Environmental Psychology, Depa), Chair and Presenter

As global challenges such as climate change, urbanization, and biodiversity loss increasingly reshape ecosystems and societies, understanding how people experience, and learn through interactions with nature is both timely and critical. This symposium brings together complementary perspectives on different processes linking nature contact, emotional regulation, education, and urban design.

Maria Johansson (Lund University, Sweden) opens the session by addressing a novel understudied issue: how individuals appraise and emotionally respond to “new” wildlife species emerging from anthropogenic changes, such as wolf–dog hybrids. This contribution highlights the psychological dimensions of biodiversity management and how different perceptions shape responses to environmental change.

Valeria Vitale (University of Vienna, Austria) introduces a newly tool – the Nature Selection Emotion Regulation Questionnaire (NS-ERQ) for understanding how individuals select natural settings to regulate emotions. This work offers theoretical innovation and practical implications for environmental psychology and intervention design.

Valeria Chiozza (Sapienza University of Rome, Italy) presents empirical findings on how specific natural features (e.g., water, floral coverage, biodiversity) shape restorative experiences in urban parks. This study advances applied knowledge by linking environmental indicators with design criteria, for creating healthier, more sustainable cities.

Cecilia Stenfors (Stockholm University, Sweden) presents population-based research on how dimensions of greenspace and nature contact support public health via multiple pathways, including psychological, emotional, social, behavioural processes and ecosystem services, informing urban planning for human and environmental sustainability.

Finally, Paola Perucchini (Roma Tre University, Italy) examines the impact of Environmental Outdoor Education (EOE) in secondary schools through a longitudinal design. By demonstrating how EOE fosters social skills, environmental identity, civic engagement, and sustainable behaviour, this contribution emphasizes the importance of structured nature-based programs in formal education systems.

Together, these contributions highlight the urgent need to integrate psychological insights into biodiversity management, education, and urban design to promote human well-being and environmental sustainability.

Abstract 3639

THE WILD AND THE TAME – HOW PEOPLE APPRAISE “NEW” WILDLIFE SPECIES IN CHANGING ECO-SYSTEMS

Johansson M.*[1], Sjölander--Lindqvist A.[2], Ciucci P.[3]

[1]Environmental Psychology, Department of Architecture and Built Environment, Lund University ~ Lund ~ Sweden, [2]School of Global Studies, University of Gothenburg ~ Gothenburg ~ Sweden, [3]Department of Biology and Biotechnologies “Charles Darwin”, Sapienza University of Rome ~ Rome ~ Italy

Introduction. Global anthropogenic processes such as climate change and urbanization drive changes in biodiversity locally by altering habitat connectivity and influencing gene flows between urban and rural species. Moreover, hybridization between wild and tame species may more easily occur as in the case of wolf-dog hybrids (WDH). The Kunming Montreal Global Biodiversity Framework states that wildlife species should be managed sustainably to provide social, economic and environmental benefits for people. So far the psychological implications of such ”new” species in people’s local nature settings are not yet understood.

Purpose. Theoretically, this study departs from frameworks linking biodiversity exposure and experience through pathways of appraisals of harm, restoring and building capacity, to human health and well-being (Marselle, 2021; Johansson et al., 2021) The objective is to explore European university students’ emotional appraisals of WDHs and their acceptability of available management options. Data is currently collected by an online questionnaire in Sweden and Spain.

Methods. Students are presented with three different scenarios for the presence of WDH. They are asked to assess their emotions towards WDHs and acceptability with regard to how effective and moral they consider management measures (lethal, captivity and sterilization). Additionally participants’ nature experience, connectedness to nature and appraisals of WDH are assessed.

Results. Preliminary analyses based on a first sample of 200 participants suggest that sterilization is considered the most moral measure. Lethal management is assessed as increasingly effective and moral with higher presence. Multiple regression analyses will be used to assess the relative importance of the different pathways in the understanding of emotions and acceptability under different scenarios.

Conclusions. Preliminary the acceptability of WDH-management in Sweden and Spain seems dependent on both the measure chosen and the WDH presence.

Abstract 3642

MANAGING EMOTIONS THROUGH NATURE: INTRODUCING THE NATURE SELECTION EMOTION REGULATION QUESTIONNAIRE (NS-ERQ)

Vitale V.*[1], White M.[1], Bratman G.N.[2], Gross J.J.[3], Preece D.A.[3], Bonaiuto M.[4]

[1]Urban and Environmental Psychology, Department of Cognition, Emotion, and Methods in Psychology, Faculty of Psychology, University of Vienna ~ Vienna ~ Austria, [2]School of Environmental and Forest Sciences, University of Washington, ~ Seattle ~ United States of America, [3]Department of Psychology, Stanford University ~ Stanford ~ United States of America, [4]Department of Psychology of Developmental and Socialization Processes, Sapienza University of Rome ~ Rome ~ Italy

Introduction. Emotion regulation (ER) takes many forms. One of the most intriguing is situation selection, which refers to selecting the situations we're exposed to in order to influence our emotions. Despite its importance, surprisingly little is known about this.
Purpose. This work examines an important type of situation selection, namely location selection – emphasizing the deliberate choice of environmental settings, with a particular focus in selecting nature experiences, in order to influence emotional states. To measure this process, a new self-report scale – the Nature Selection Emotion Regulation Questionnaire (NS-ERQ) – was validated across four studies.
Methods & Results. In the first study (N = 292), the English version of the scale was developed with an initial set of 20 items. Items were generated based on Russell's Circumplex Model of Affect (1980), reflecting the four primary dimensions of affect defined by valence and arousal. Exploratory factor analysis led to a refined 12-item scale, organized into a two-factor structure: restoration and revitalization. The second study (N = 302) tested the 12-item scale's reliability, convergent, and discriminant validity, as well as test-retest reliability and predictive validity through a follow-up survey (N = 125). The third study (N = 308) adapted the scale for Italian speakers, confirming the two-factor structure as well as its reliability and validity. Furthermore, the scale demonstrated measurement invariance across English and Italian versions. The fourth study (N = 200) developed an adapted shortened Italian version of the scale to explore its practical application by evaluating specific environmental stimuli (i.e., images) in an experimental study, demonstrating its versatility in assessing the emotional impact of environments.
Conclusions. Overall, these findings establish the NS-ERQ as a psychometrically sound instrument for assessing how individuals choose to visit nature for ER, providing a new framework for understanding the role of selecting environmental context in ER.

Abstract 3646

DIMENSIONS OF GREEN INFRASTRUCTURE AT THE NEXUS OF HUMAN, SOCIAL AND ENVIRONMENTAL RESILIENCE AND SUSTAINABILITY: INFORMING URBAN DESIGN FOR PUBLIC HEALTH AND WELLBEING

Stenfors C.*

Department of Psychology, Stockholm University & Aging Research Center, Karolinska Institute ~ Stockholm ~ Sweden

Introduction. Human health, social and environmental sustainability are deeply interconnected challenges where urban planning is a key leverage point. Urban nature such as green (vegetation) and blue (water) space provide multiple ecosystem services, and is associated with a range of benefits to health, wellbeing and behaviours supporting health and environment. However, population-based studies using high-resolution, individual-level assessments of residential environment (incl. greenspace dimensions) combined with health and behaviour measures have been sparse.

Purpose & methods. A series of large-scale population-based studies in Sweden were conducted (N≈120,000). High-resolution, individual-level assessments of residential greenspace dimensions and other environmental factors (e.g., ambient noise, air pollution, neighbourhood socioeconomics) were linked with national registers of prescription medication use, dementia outcomes, and survey data multiple aspects of mental health, incl. emotional and social, and health related behaviours. Behaviour-related, self-selected nature interactions including frequency and type of nature visits, and it's role in health and wellbeing dimensions, were also studied in sub-cohorts.

Results. Across studies, greater availability of residential greenspace, especially in the immediate surroundings (50–100 m buffer zones), was consistently associated with lower risk of psychopharmacological medication use, better self-reported psychological health and wellbeing. Greenspace further showed potential buffering effects against negative impacts of traffic noise. Self-selected interactions with nature—where spending time in forests and residential gardens stood out—were associated with better mental health and wellbeing, incl. emotional, social and behavioural aspects, especially during the COVID-19 pandemic.

Conclusions. Green infrastructure supports human, social, and environmental resilience through multiple pathways, including emotional, cognitive, social, other behavioural processes, and additional ecosystem services. Integrating insights regarding salubrious greenspace dimensions into the policy and practice of designing our living environments offers evidence-based strategies to promote public health, foster social and environmental sustainability, and build resilience in the face of global challenges, including climate change and biodiversity loss.

Abstract 3658

OUTDOOR EDUCATION IN SECONDARY SCHOOLS: CROSS-LAGGED INSIGHTS INTO SOCIAL, ECOLOGICAL AND IDENTITY PROCESSES

Perucchini P.*[1], Chiozza V.[2], Xie M.[2], Presaghi F.[2], Alves S.[2], Grilli S.[3], Bonaiuto M.[2]

[1]Department of Education, Roma Tre University ~ Rome ~ Italy, [2]Department of Psychology of Developmental and Socialization Processes, Sapienza University of Rome ~ Rome ~ Italy, [3]Department of Human and Social Sciences, Universitas Mercatorum ~ Rome ~ Italy

Introduction. Environmental Outdoor Education (EOE) is widely recognised as a key driver of sustainable development, fostering individuals' connection to nature, environmental empathy, and social-psychological well-being. While often focused on early childhood, EOE is equally critical during adolescence, a phase in which it can strengthen personal well-being, community engagement, environmental protection, identity, and social skills.

Purpose. This study examined the positive impact of EOE – delivered during regular school hours in secondary schools – on students' individual, social, and ecological engagement and well-being.

Methods. A longitudinal cluster randomised trial was conducted with two conditions (Intervention, n = 113; Non-Intervention, n = 89) across six waves. Intervention and Non-Intervention activities were delivered three times (Activity 1 between T1–T2; Activity 2 between T3–T4; Activity 3between T5–T6). Cross-lagged panel models (CLPM) were applied to test relationships among social skills, pro-environmental behaviour (PEB) and intentions, civic engagement, social identity, and vitality across time points.

Results. CLPM analyses revealed pathways linking EOE participation to sustainable behaviour. Gains in social skills at earlier waves predicted pro-environmental intentions at later waves, which subsequently fostered PEB. A secondary pathway – civic engagement enhancing social identity and, in turn, vitality – was promising but less consistent, with effects emerging more gradually. The first intervention cycle produced the strongest direct effects, while later cycles primarily supported the consolidation and stabilisation of these processes.

Conclusions. These findings deepen understanding of how EOE supports adolescents' development through direct engagement with natural environments. Practically, the results provide evidence for integrating EOE into school curricula as a complementary approach to classroom-based education. By demonstrating measurable benefits across social-psychological domains, this study offers a foundation for evidence-informed decisions by educators, school leaders, and policy-makers. Expanding EOE programmes may therefore serve as a strategic tool to enhance educational quality and advance sustainability goals within formal education systems.

Abstract 3644

DESIGNING HEALTHIER PARKS: PRELIMINARY TESTING OF PSYCHO-ENVIRONMENTAL INDICATORS FROM CERTIFICATION CRITERIA

Chiozza V.[1], Vitale V.[4], Bonaiuto F.[2], Esposito L.[3], Ganucci Cancellieri U.[5], Bonaiuto M.*[1]

[1]Department of Psychology of Developmental and Socialization Processes, Sapienza University of Rome ~ Rome ~ Italy, [2]Faculty of Social and Communication Sciences, Mercatorum University ~ Rome ~ Italy, [3]Department of Earth Sciences, Sapienza University of Rome ~ Rome ~ Italy, [4]Urban and Environmental Psychology, Department of Cognition, Emotion, and Methods in Psychology, Faculty of Psychology, University of Vienna ~ Vienna ~ Austria, [5]University for Foreigners "Dante Alighieri" of Reggio Calabria ~ Reggio Calabria ~ Italy

Introduction. Urban parks provide critical opportunities for psychological restoration, yet little research has systematically examined how specific natural elements shape users' perceptions and experiences across multiple outcomes.

Purpose. The present study investigated the effects of five environmental indicators – blue element, floral coverage (25% and 50%), chromatic floral biodiversity, and faunal biodiversity – on evaluations of urban park images compared to a baseline park.

Methods. A sample of 200 Italian adults participated in a within-subject online survey, rating each image on perceived restorativeness, place perception, liking, desire to visit, uniqueness, aesthetic value, restorative qualities, emotions, and place selection for emotion regulation. The research also examined whether place wellbeing affordances – in terms of naturalness, maintenance, safety, familiarity – mediated the effects of environmental indicators, and explored age and gender differences.

Results. Findings showed that images featuring indicators were evaluated more positively than the baseline across most outcomes, with blue elements and biodiversity features producing the strongest effects. Place wellbeing affordances partially mediated these effects, highlighting the role of perceived environmental quality in promoting positive experiences. Socio-demographic analyses revealed that younger adults generally rated images more positively, while older participants showed higher evaluations of uniqueness, aesthetic value, and desire to visit. Women were more sensitive to specific features, particularly blue elements and biodiversity, in their assessments of restorativeness, pleasantness, and relaxation.

Conclusions. These findings provide robust evidence that specific natural features enhance perceptual, affective, and restorative outcomes in urban parks, and underscore the importance of incorporating blue elements and biodiversity in urban design to support user well-being and guide effective urban planning.

Abstract 2309

SLEEP QUALITY AND SLEEP BEHAVIOR IN STUDENTS: DAYTIME VISUAL EXPERIENCE AND NIGHTLY PATTERNS

Afamefuna K.*, Harmsen J., Schweiker M.

Healthy Living Spaces lab, Institute for Occupational, Social and Environmental Medicine, Medical Faculty, RWTH Aachen University ~ Aachen ~ Germany

Introduction. Sleep is central to students' daily functioning and can be essential to mood, attention, learning, and self-regulation. While psychological models of sleep emphasize arousal regulation and circadian timing, the everyday visual context in which days unfold, both objective light exposure and the momentary, experienced qualities of the visual environment, may shape how well students sleep at night. Evidence that integrates wearable light sensing with in-situ visual appraisals and links both to nightly sleep in naturalistic settings remains limited.

Purpose. Examine how day-to-day variation in objective light and experienced visual qualities aligns with nighttime sleep. Further, outline which aspects of sleep (self-reported sleep timing, duration, quality) show the clearest associations with objective and perceived visual qualities.

Method. In a seven-day field protocol, 43 students wore light sensors. Using Ecological Momentary Assessment, participants completed multiple brief ratings of the visual environment each day, plus a morning and a night sleep diary.

Results. Results will present distributions of sleep and visual context, and correlations between daytime light exposure and visual appraisals with nighttime sleep and sleep behavior. Expected patterns were that higher daytime light and more favorable visual appraisals coincide with longer and/or better-quality sleep, whereas lower light and less favorable appraisals coincide with shorter and/or poorer sleep.

Conclusions. Pairing wearable sensing with in-the-moment appraisals and twice-daily sleep reports yields actionable, real-world estimates of visual conditions linked to sleep in student life. These estimates can guide practical, context-aware adjustments, such as adjusting daytime light exposure or selecting visually supportive study spaces, to support healthier sleep in applied settings and thereby enable the potential to improve overall functioning, health and well-being in students.

Abstract 2143

PREDICTORS OF CLOTHING ACQUISITION: A SYSTEMATIC REVIEW

Bosshard A.*, Rus A., Van Harreveld F., Brick C.

University of Amsterdam ~ Amsterdam ~ Netherlands

Global clothing production transgresses planetary boundaries, including climate change, biodiversity loss, and freshwater pollution. Behavior changes—especially among the richest 10%—are critical for environmental mitigation. Reducing acquisition has the highest mitigation potential, followed by shifts to second-hand clothes and eco-friendly (e.g., recycled) fabrics. Although clothing acquisition is widely studied in the social and behavioral sciences, most research relies on intentions, hypothetical choices, and retrospective self-reports of subjective frequencies. These approaches do not converge well with actual behavior, limiting their utility for understanding and changing acquisition and assessing the scaled mitigation potential of interventions. Here, we systematically review quantitative, empirical studies across psychology, marketing, sociology, and economics to (1) identify observational and precise self-reporting techniques for measuring clothing acquisition and (2) synthesize predictors of different acquisition types. Our search identified 67 peer-reviewed publications published between 2013 and 2025. Outcome measures included individual- and group-level acquisition in naturally occurring situations (by tracking purchases, sales, expenditure, or revenue) as well as arranged, consequential choices. Some studies estimated environmental impacts from purchase counts or expenditure. Preliminary results suggest that environmentalism is more consistently related to acquiring clothes from eco-friendly materials or second-hand than to general or conventional acquisition. In contrast, higher financial resources, advertising exposure, and material aspirations were consistently related to more conventional acquisition. Last, reduction goals and self-regulation were consistently related to less conventional acquisition. Overall, we hope to support theorizing on clothing acquisition and the development and assessment of behavioral interventions.

PROMOTING ENVIRONMENTAL AND UNIVERSAL EUROPEAN VALUES AMONG ADOLESCENTS THROUGH PERFORMATIVE ARTS: PRELIMINARY RESULTS OF THE NEVE ART/ACTION ERASMUS+ PROJECT

Massullo C.[1], Carrus G.*[1], Alessandroni G.[2], Tanda F.[2]

[1]Roma Tre University ~ Rome ~ Italy, [2]Demetra SPV ~ Rome ~ Italy

We present the preliminary results of the Erasmus+ Project "NeVE Art/action", funded by the European Commission. The "NeVE Art/Action" project promoted a shared sustainable vision of Europe among teenage students in six different European countries, based on universal values such as sustainability, empathy, inclusion and participation. This aim was pursued through students' engagement in activities such as classroom readings, text writing and revision, and theatre performance, over three school years. The students performed two theatre texts based on the life and teachings of Saint Francis of Assisi, considered as an archetypal figure and precursor of fundamental European values, as an ecologist and animalist ante litteram, as well as an advocate for social inclusion, pacifism, respect for diversity and equality. In particular, we present here the results of 2 waves of a quantitative and qualitative survey, conducted respectively in the springs of 2024 and 2025, corresponding to the first and second year of the project, that monitored changes in students values and perceptions. A third wave of survey, to be conducted in spring 2026, corresponding to the final year of the project, is also ongoing. The surveys were completed by students of the six countries involved in the NeVE Art/action project: Croatia, Lithuania, North Macedonia, Portugal, Romania, Slovenia. Self-reported quantitative measures of connection to nature, sustainable consumption, empathy, tolerance, sharing, commitment, hope, and civic dedication were collected through a mobile App, at the end of each school year. Open-ended questions on inclusion and sustainability were also administered. Results (N = 356 and 337 for the first and second wave, respectively), indicate a generalized pattern of improvement in students' scores from the first to the second year of the project, in more than 60% of the indicators. The theoretical and practical implications for European and global sustainability and cohesion are discussed.

Abstract 2023

POST-OCCUPANCY EVALUATION FOR LEARNING ENVIRONMENTS (POELE): A FORMATIVE ASSESSMENT TOOL

Laux M.*[1], Schuster K.[2], Beege M.[1]

[1]University of Education Freiburg ~ Freiburg ~ Germany, [2]University of Applied Sciences ~ Darmstadt ~ Germany

Discussion on the subject of how to design an optimal learning environment has always reflected constantly changing educational, social, and technological circumstances, and it continues to do so. Despite being a small field of research, it has attracted attention since its origins in the 19th century (Renz, 2016). However, particularly in the past decade, this state of upheaval in school construction not only intensifies the interest in research but also (re-)vitalize planning processes through participation procedures. Just as users can be involved conceptually at the beginning of a construction project, participation is also possible after a school building has been inhabited. This method of Post-Occupancy Evaluation (POE) was defined by Preiser et al. (1988, p. 3) as "a process of systematically evaluating the performance of buildings after they have been built and occupied for some time". It aims to improve the fit between users and their buildings (Zimmerman & Martin, 2001).

The aim of this work was to develop a empirically tested method for evaluating school buildings (with the aim of improving them). Building on existing Post-Occupancy Evaluation methods (e.g. LEaRN; Cleveland et al., 2016), it is carried out using the data-driven index creation MARI method (Fluck & Lichtenberg, 2021). The benefits of such formative models are still largely unknown in the social sciences and therefore underestimated (Fluck & Lichtenberg, 2021; Jarvis, MacKenzie & Podsakoff, 2003). Testing at six schools with a total of more than 700 students (aged 11 to 19) has shown that the questionnaire could be further developed: Among other things, it is still too complex and should therefore be simplified, especially for younger students. Overall, however, this Post-Occupancy Evaluation for Learning Environments (POELE) proves to be a robust testing tool that provides a sound basis for the comprehensive assessment of school buildings.

Abstract 2630

AMBIVALENT ATTITUDES TOWARD ENVIRONMENTAL AND AI ISSUES: PSYCHOLOGICAL PROCESSES AND INDIVIDUAL DIFFERENCE MODERATORS

Lin H.*

Department of Counseling and Industrial/Organizational Psychology, Ming Chuan University ~ Taoyuan ~ Taiwan

Introduction. Ambivalent attitudes—simultaneously holding positive and negative evaluations toward the same object—are increasingly prevalent in responses to complex societal issues such as environmental sustainability and artificial intelligence. Such attitudinal ambivalence can undermine persuasive effectiveness, reduce behavioral consistency, and intensify emotional conflict. Despite growing research on ambivalence, limited attention has been paid to comparing ambivalence across issue domains and understanding the psychological mechanisms that moderate these responses.

Purpose. This study investigates the cognitive and affective processes underlying attitudinal ambivalence toward environmental and AI-related issues, examining how information valence and issue involvement shape ambivalence intensity, emotional experiences, attitude certainty, and behavioral intentions. We hypothesize that mixed-valence messages will increase both subjective and objective ambivalence, that higher issue involvement will facilitate elaborative processing and reduce negative affect, and that AI issues will elicit greater ambivalence than environmental issues due to differences in psychological distance.

Method. Two pilot studies (N = 60 each, Taiwanese adults) are norming persuasive materials and validating emotional responses. The main experiment employs a 2 (Issue Type) × 3 (Information Valence: pro vs. con vs. mixed) between-subjects design (N = 240). Measures include subjective ambivalence (Priester & Petty, 1996), objective ambivalence (Griffin formula), discrete emotions (Plutchik-based), involvement, attitude certainty, and behavioral intentions. Power analysis ($f = 0.25$, $\alpha = .05$, $1\text{-}\beta \geq .80$) supports the sample size. The study has received ethics approval (National Taiwan University REC No. 202507ES103) and funding (NSTC 114-2410-H-130-042).

Results. Data collection is in progress. Full analyses will be completed by July 2026.

Conclusions. Expected findings will contribute to dual-process persuasion models and ambivalence theory by clarifying how message structure and individual differences

shape responses across issue domains, informing communication strategies for sustainable behaviors.

Abstract 2658

BUILDING RESILIENCE AMONG CHILDREN: INTEGRATING LIFE SKILLS AND STUDENT ENRICHMENT PROGRAMME INTO PSYCHOSOCIAL CARE AND DISASTER RISK REDUCTION

Manikappa S.K.*, Bamney U.

National Institute of Mental Health and Neurosicnes ~ Bengaluru ~ India

Background:

Disasters can be especially stressful for children and teens. Young people are less likely to understand the events affecting them and have fewer opportunities for control and decision-making than adults. As reported by the WHO (2022), the COVID-19 pandemic has had significant indirect effects on multiple areas of child development, including school readiness, educational attainment, socialisation skills, and mental health, in addition to risks associated with social determinants of health. Against this background, the researchers prepared and implemented “Life Skills Education (LSE)” cum “Student Enrichment Programme (SEP) for those children and adolescents who were from low socio-economic status and were severely affected by the pandemic.

Methods & Materials:

Aim: The aim was to assess the effectiveness of integrating life skills education (LSE) and the Student Enrichment Programme (SEP) into Psychosocial Care and Disaster Risk Reduction (DRR) to enhance students' resilience and adaptability. Methods and materials: The study population consisted of 227 children from vulnerable communities who were trained through the LSE-SEP module and a series of sessions on psychosocial skills necessary for addressing their daily life problems and handling challenging situations before, during, and after disasters. A total of 15 sessions, focusing on healthy coping skills, healthy living, study-related issues, effective communication, sleep hygiene, and effective learning and memory, were conducted.

Results:

The study found a significant difference in the participants' knowledge levels about LSE and SEP after the training. The comparison of knowledge on pre- and post-assessment in LSE and SEP shows higher mean scores on the post-assessment (9.39) than on the pre-assessment (1.05), which is a statistically significant difference ($p < 0.001$).

Conclusion:

Children constitute a significant portion of those affected by disasters and are one of the most vulnerable groups, so they must be given more consideration to participate in the DRR programme.

Abstract 4559

5G - GOOD OR BAD? AN 11-COUNTRY STUDY OF PUBLIC PERCEPTIONS OF THE BENEFITS AND RISKS OF 5G TECHNOLOGIES FOR SELF AND SOCIETY

Martin L.*[1], White M.[2], Vaupotic N.[2], Boehmert C.[3], Link S.[4], Kojimahara N.[5], Grellier J.[1]

[1]University of Exeter ~ Penryn ~ United Kingdom, [2]University of Vienna ~ Vienna ~ Austria, [3]Aalen University, ~ Aalen ~ Germany, [4]IU International University of Applied Sciences ~ Erfurt ~ Germany, [5]Tokyo Women's Medical University ~ Shinjuku ~ Japan

Despite widespread public discourse about the potential socio-economic, environmental, and health impacts (positive and negative) of 5G technologies, many questions remain. Using representative (on age, gender and NUTS-1 region) cross-sectional data from 11 countries, we investigated: 1) whether people see the benefits and/or risks of 5G applying more to themselves personally, or to society in general; and 2) key factors explaining positive and negative perceptions—across countries and sociodemographic and health-related characteristics. On average, 5G impact perceptions were close to neutral, with little meaningful differentiation between personal and societal domains; yet consistent with the Impersonal Impact Hypothesis, among those groups exhibiting strong perceptions of impact, differentiation was more evident. Additionally, systematic variations emerged across sub-populations: younger (16–24 vs. 25+), men (vs. women), university-educated (vs. not), higher-income (5th vs. 1st quintile) respondents, and those living with other adults and children (vs. alone) reported significantly more positive perceptions of personal and societal impacts of 5G. Those that reported being particularly sensitive to Radio Frequency Electromagnetic fields (RF-EMF) typically had more negative personal and societal 5G impact perceptions. We found that positive perceptions of impacts were centred on technological advancements (speed, connectivity), while negative perceptions were driven by health concerns relating to 5G. We observed heterogeneity in impact perceptions and motivations at the country-level. Our findings highlight the need for targeted communication addressing health concerns and technological benefits, adapted to key sub-populations and national contexts, to facilitate informed decision-making.

Abstract 2310

THE ROLE OF AUTONOMY IN SUSTAINABLE CONSUMER DECISION MAKING - A MULTIPLE STUDY APPROACH

Schulze M.*[1], Krampe C.[2], Klapper L.[1]

[1]Leuphana University Lüneburg ~ Lüneburg ~ Germany, [2]Wageningen University and Research ~ Wageningen ~ Netherlands

The effectiveness of nudging interventions in sustainability transitions has been widely studied, as they guide consumer choices without restricting freedom of choice. However, in practice, actors such as retailers, event organizers, and policymakers often rely on more restrictive measures. These raise concerns about consumers' perceived autonomy, potentially hindering sustainable behavior. Research on how consumers react to restrictive measures and whether such measures facilitate or obstruct sustainable behavior change remains limited. This study addresses this gap by examining how consumers perceive threats to their autonomy in the context of sustainability-related restrictions. Drawing on self-determination and reactance theory, two online experiments (n=150; n=147) and a virtual reality study (n=53) investigated the effects of autonomy threat on choice satisfaction, compensatory behavior, and the mediating role of psychological reactance. Findings reveal that perceived threats to autonomy significantly reduce choice satisfaction, mediated by psychological reactance. Whether sustainable alternatives were alignable or non-alignable with less sustainable options did not influence this relationship. The results oft he virtual reality study pointed in the same direction, however, showing a significant link only between perceived autonomy threat and compensatory behavior. The results suggest that restrictive measures should be implemented with caution. Although such measures can effectively limit unsustainable behavior by constraining consumers' physical and social opportunities, they may also trigger unintended side effects, such as dissatisfaction or compensatory behaviors. Nevertheless, when restrictions are perceived as appropriate, offering the most sustainable alternatives—regardless of their similarity to less sustainable ones—appears most effective for promoting sustainable choices and satisfaction. Overall, this research provides valuable insights for policymakers and marketers seeking to foster sustainable behavior change. It highlights the importance of balancing effectiveness and autonomy to ensure that sustainability interventions not only drive behavioral change but also maintain consumer satisfaction.

Abstract 2418

EXPLORING PARTICIPATION: AN INTERVENTION STUDY ON INFORMATIONAL AND PSYCHOSOCIAL PREDICTORS OF ENGAGEMENT IN CITIZEN ENERGY COOPERATIVES FOR GREEN H2

Steller R.*[1], Kause A.[1], Fernandez Kurzke C.[2]

[1]*Institute for Sustainability Psychology, Leuphana University of Lüneburg ~ Lüneburg ~ Germany,* [2]*Integrative Institute for Sustainable Development, Department of Electrical Engineering and Computer Science, Bochum University of Applied Sciences ~ Bochum ~ Germany*

Participation in citizen energy cooperatives can strengthen community cohesion, support municipal partnerships, and spill over into other sustainable behaviors. But what needs to change locally, and which information actually motivates people to engage in citizen energy cooperatives? We test (a) how information framing affects intention to participate in citizen energy cooperatives for green hydrogen, (b) who prefers which information, and (c) which psychosocial predictors are associated with participation intention. A representative German sample (N = 1,800) is randomly assigned to one of four brief video conditions or a neutral control: financial risks, environmental benefits, combined risks and benefits, or a free-choice arm in which participants choose either the risk or the benefit video. The primary outcome is participation intention; attitudes are secondary and tested as a mediator. Moderators include environmental consciousness, subjective norm, perceived behavioral control, acceptance of local H_2 production, and income. Analyses rely on ANCOVA to examine main and moderating effects; information choice is modeled with logistic regression; sensitivity analyses apply latent change-score SEM to test mediation via attitude change and moderation by environmental consciousness (benefit framing) and income (risk framing). This study aims to inform evidence-based communication and participatory design for local H_2 projects by indicating which messages may engage which audiences, and under what conditions engagement is more likely. Put simply: if participation is the engine of a just energy transition, we explore what ‘fuel’ (information) it might need, for which ‘drivers’ (citizens), on which ‘roads’ (local contexts).

Abstract 2182

PROJECT "HIPPOCRATES": INTERNATIONAL COOPERATION IS NEEDED FOR THE ANALYSIS OF ENVIRO-NEUROCHEMICAL FACTORS

Sulis W.*, Trofimova I.

McMaster University ~ Hamilton ~ Canada

The presentation describes a possible setup of an international project, "Hippocrates" (H-project), named after the father of systematic medicine who authored the endocrine theory of temperaments. The idea of such a project is already discussed in the academic community 10.1016/j.cobeha.2022.101143. The H-project investigates the interaction of endocrine and neurochemical systems with environmental factors affecting consistent behavioural patterns (CBPs) in health (such as temperament traits) and psychopathology(symptoms of psychiatric disorders). These environmental factors include components of contrasted regions on the rates of mental illness, exposure to common psychostimulants and 12 features of a national character highlighted in the FET framework: diets (for example, tryptophan as a component of serotonin synthesis; soy products as a source of estrogens); climates (for example, exposure to sun light affecting orexin production; cold and heat affecting immune systems), microbiota, exposure to toxins and common psychostimulants (such as alcohol, nicotine, cannabis and opiates). Therefore, the analysis of neurochemical biomarkers of CBP can't limit investigations of the roles of hormones, neurotransmitters and opioid receptor systems in behavioural regulation in isolation from regional differences in named environmental factors. The project's setup suggests structuring measurements and variables in line with the 12 components of the neurochemical framework "Functional Ensemble of Temperament" (FET) (doi: 10.1016/j.neubiorev.2016.03.008; doi: 10.1098/rstb.2017.0167; doi:10.1159/000513688; doi: 10.3389/fpsyt.2021.641286; doi: 10.3389/fpsyg.2021.781631; doi:10.1016/j.cobeha.2022.101109). The experimental design of the project is focused on the functional "relays" between the releasing and receptor sites for each neurochemical system highlighted in the FET and on outlining the dynamics of these relays under the influence of environmental factors (diets, climates, microbiota, exposure to toxins and to common psychostimulants). These investigations could be conducted in culturally and geographically different samples contrasted by the named environmental factors.

Abstract 2115

CENTERING EQUITY IN HOME DECARBONIZATION: EXAMINING SOCIOECONOMIC FACTORS INFLUENCING AGENCY AND ACTION

Trott C.*, Smeyne C.

University of Cincinnati ~ Cincinnati ~ United States of America

Underserved communities, including low-income households and communities of color, are disproportionately affected by the combined challenges of inefficient housing and high energy costs. These residents often live in older, less energy-efficient homes that require more energy to heat and cool, resulting in a higher energy burden—the proportion of household income spent on utilities. Elevated energy burden can force households to make difficult trade-offs, such as foregoing basic necessities to pay utility bills, a dilemma commonly referred to as the “heat or eat” problem. In other cases, residents may engage in restrictive energy behaviors, such as keeping their homes at unsafe or uncomfortable temperatures, which can contribute to respiratory illness, cardiovascular stress, and other adverse health outcomes. As a result, these communities are burdened not only economically, but also physically and socially, by energy inefficiency. Energy efficiency retrofits—such as improved insulation, air sealing, and efficient appliances—offer a powerful solution to reduce energy costs, improve indoor comfort, and mitigate greenhouse gas emissions. These upgrades align with national and international goals to decarbonize the building sector, which is essential for addressing climate change. However, there is growing concern that decarbonization efforts, if not carefully designed, could unintentionally increase housing costs or exacerbate affordability challenges, particularly for renters and low-income homeowners. To better understand these dynamics, this study surveyed 237 residents in Cincinnati, Ohio, to examine how knowledge, attitudes, financial constraints, perceived agency, and household behaviors differ across income levels and influence participation in energy retrofits. In-depth, semi-structured interviews with a sub-sample of homeowners and renters provided richer insights into barriers and opportunities for engagement. Findings reveal the complex interplay between socioeconomic factors and retrofit adoption, offering practical recommendations for equitable, community-centered approaches to home decarbonization.

Abstract 2338

USING ATTRIBUTION SCIENCE TO IMPROVE PEOPLE'S UNDERSTANDING OF CHANGING EXTREME WEATHER EVENTS

Ulrich J.*, Kause A.

Leuphana University Lüneburg ~ Lüneburg ~ Germany

People need to understand changing extreme weather events to effectively protect themselves and to adapt to further climatic changes. Extreme event attribution (EEA) science has been claimed to support this. It studies how climate change affects the likelihood, severity and impacts of specific extreme weather events. Drawing on the 'science of science communication', we study, first, the accuracy of peoples' estimates of the probability that a heatwave in 2019 in Germany had with and without climate change, using a correlational survey. We also assess whether these estimates vary inter-individually by climate change risk perceptions, subjective climate change knowledge, heatwave experience, political orientation and numeracy. Second, EEA results often come with different uncertainty types, such as probability ranges, conflicting outcomes or no robust findings at all. We therefore test in a follow-up survey experiment how different uncertainty types in EEA results affect people's estimates of how the probability of the 2019 heatwave changed due to climate change and their perceptions of such EEA results. We will present initial findings from both studies. These are relevant for climate scientists and climate change communicators who want to support people to better understand change in extreme events, while staying true to the underlying science.

PREVALENCE OF CLIMATE ANXIETY IN PSYCHIATRIC CARE: A GERMAN QUANTITATIVE STUDY OF PATIENTS AND CLINICIANS

Düllberg G.*[1], Rinderhagen M.[1], Rees J.[2], Hennig--Fast K.[3], Hornberg C.[1], Mc Call T.[1]

[1]Medical School OWL, Sustainable Environmental Health Sciences, Bielefeld University ~ Bielefeld ~ Germany, [2]Faculty of Psychology and Sports Science, Department Psychology, Work Unit Political Psychology, and Institute for Interdisciplinary Conflict and Violence Research, Bielefeld University ~ Bielefeld ~ Germany, [3]Psychotherapy and Psychosomatics, Department Psychiatry, Medical School OWL, Bielefeld University ~ Bielefeld ~ Germany

Introduction: Anxiety related to anthropogenic climate change is referred to as climate anxiety. Current research suggests a link between climate anxiety and mental health. In a previous study, we found that adults diagnosed with depression and/or anxiety disorders have significantly higher levels of emotional impairment due to climate anxiety than adults without these diagnoses, making them a potential vulnerable group.

Purpose: This study aims to determine the prevalence of climate-related emotional distress among patients and clinical staff in psychiatric care. Additionally, the study aims to identify potential risk and protective factors for climate-related emotional distress.

Methods: Quantitative online questionnaires will take place from October/November 2025 to June 2026 and will be used to survey psychiatric patients and clinicians. The following information will be collected: climate anxiety and other climate-related emotions, climate-related coping strategies, climate awareness, climate-related media usage, nature-relatedness, personality traits, self-efficacy, perceived stress, and mental health. Patients will also indicate their diagnosis, and clinicians will indicate their profession. Age, gender, social status, and whether they have (grand)children will also be documented. The data analysis will include descriptive statistics and inferential statistical tests.

Expected Results: We expect that psychiatric clinical staff will be impaired by climate anxiety to a similar small extent as the general German population, while we expect patients to be impaired to a greater extent. Additionally, we expect, for example, that climate awareness, nature-relatedness, and having (grand)children will be positively associated with climate-related emotional distress, while climate hope and self-efficacy will be negatively associated with it.

Expected Conclusions: It is to be expected that psychiatric patients represent a potential risk group for climate-related emotional distress. Clinical staff in psychiatric care should therefore be adequately prepared to deal with these emotions. When implementing this, consideration should also be given to how these emotions affect psychiatric clinical staff themselves.

Abstract 221

THE RELATIONSHIP BETWEEN CLIMATE OPTIMISM AND ENVIRONMENTAL CONCERN

Geissinger K.*, Labriola M.

Florida Gulf Coast University ~ Fort Myers ~ United States of America

As climate change continues to escalate, understanding how psychological factors like climate optimism, environmental concern, and pro-environmental behavior interact is essential. Climate optimism—the belief that climate change can be addressed—has been linked to greater motivation to take environmental action, while deep environmental concern may come with increased emotional burden (Morris et al., 2020). Individuals who feel more connected to nature often report heightened anxiety or despair, especially when climate messaging emphasizes threat over hope (MacKinnon et al., 2022). This study examines the relationship between hopefulness about solving climate change and care for the environment.

A total of 400 individuals participated in an online survey where they provided demographic information and information on their hopefulness about climate change being solved and their sense of care towards the environment.

A Spearman's correlation was conducted to evaluate the relationship between optimism about solving climate change and care towards the environment. There was a significant negative relationship between these variables, $r_s(398) = -.13$, $p = .009$. This result indicates that individuals who feel more connected to the environment tend to feel less hopeful about solving climate change.

The negative correlation between climate optimism and environmental care may reflect how increased awareness of environmental decline can reduce hopefulness about climate solutions. Those who care deeply about the environment may be more exposed to pessimistic messaging or overwhelming information, which can heighten distress and lower perceived efficacy (Morris et al., 2020). At the same time, research shows that hopeful framing can boost both optimism and pro-environmental behavior, even in small interventions (MacKinnon et al., 2022). These results suggest that even environmentally engaged individuals may need support to stay hopeful.

Abstract 1116

UNDERSTANDING YOUTH CLIMATE DISTRESS: PROFILING AND CONSEQUENCES

Gordon E.*[1], Bower M.[1], Crandon T.[2], Stapinski L.[1]

[1]The Matilda Centre for Research in Mental Health and Substance Use, University of Sydney ~ Sydney ~ Australia, [2]Queensland Centre for Mental Health Research and the School of Public Health, University of Queensland ~ Brisbane ~ Australia

Background: Young people are particularly vulnerable to climate distress due to limited political and economic power and ongoing neural and cognitive development, making it harder to cope with stress and uncertainty. They will also be the population most exposed to the long-term impacts of climate change, prompting calls for research on the mental health effects of prolonged climate distress.

Methods: We conducted a prospective study of climate distress and its correlates and consequences over one year (2020–2021) in Australian young adults aged 19–21. First, cross-sectional analyses identify characteristics associated with climate distress. Second, longitudinal analyses examine how climate distress predicts mental health and well-being outcomes affected by prolonged stress.

Results: In cross-sectional regression analyses, identifying as female or gender diverse, not being employed nor in education or training (NEET), mental distress, and altruism were all significantly associated with climate distress ($p < .05$). In longitudinal linear mixed-models, climate distress significantly increased depression and generalized anxiety symptoms and reduced drug use over a one-year period ($p < .05$). Climate distress did not significantly impact specific anxiety symptoms, sleep quality or alcohol consumption over time. Estimated marginal means analysis showed that even low levels of climate distress estimated clinically relevant levels of depression over a one-year period.

Conclusion: Our findings demonstrate that climate distress tends to be experienced by those that are already disposed to experiencing poor mental health, demonstrating that the mental health consequences of climate change may be considered one way in which climate change exacerbates pre-existing inequalities. Our findings also contribute to preliminary understanding of the longer-term impacts of climate distress on general and mental health. Our results aid in the development of intervention priorities to address climate distress symptoms and to lessen their impact on vulnerable groups and the wider mental-health crisis as climate change continues to worsen.

Abstract 1557

MITIGATING CLIMATE CHANGE HOPELESSNESS AND SUSTAINING PRO-ENVIRONMENTAL BEHAVIOURS

Han Y.*, Bailis D.

University of Manitoba ~ Winnipeg ~ Canada

Climate change hopelessness is prevalent globally, and it negatively impacts individuals' performance of pro-environmental behaviours (PEB). This research explores factors that may mitigate the effects of climate change hopelessness and sustain PEB, drawing on the life-span theory of control.

This pre-registered study proposes a theoretical model in which climate change hopelessness discourages persistent PEB through diminishing primary control striving. The model also proposes that secondary control strategies (positive reappraisal, lowering aspiration, and social comparison) can buffer the effects of hopelessness by compensating for the loss of primary control.

Canadian residents (N = 290) were recruited via Prolific to complete an online survey of the model variables, using established self-report measures of climate hopelessness, secondary control strategies, and primary control striving. PEB was measured using both self-reports and performance in the Work for Environmental Protection Task (WEPT). Data was analyzed by using the PROCESS macro to test the proposed moderated-mediation model.

Simple correlation analysis of the model variables revealed only a small positive relationship between self-reported PEB and WEPT performance, suggesting that these measures conveyed different information. Climate hopelessness, primary control striving, and two of the secondary control strategies (positive reappraisal and social comparison) correlated in expected ways (according to the theoretical model) with self-reported PEB but not WEPT performance. Initial (ongoing) tests of the moderated-mediation model yielded partial support for the hypotheses. There were significant direct effects of hopelessness and secondary control strategies on primary control striving and self-reported PEB, but no significant interaction between hopelessness and secondary control strategies.

Although not all hypotheses were supported, and some discrepancies emerged between self-reported and performance-based measures, the findings underscore the detrimental effect of climate change hopelessness on PEB. They highlight the potential

offsetting effects of secondary control strategies to counter hopelessness in the context of climate change and support primary control striving and PEB.

Abstract 763

SOLASTALGIA IN THE CHANGING ALPS

Kulcar V.*

University of Innsbruck ~ Innsbruck ~ Austria

Climate change impacts are increasingly evident worldwide, though some regions are more affected than others. The temperate climate of Central Europe has long shielded its inhabitants from disruptive climate change consequences contributing to psychological distance. Still, change progresses and mountain areas are among the first to show clear signs. The negative transformation of individually and collectively valued places can be experienced as loss. The distress caused by place-based loss can be conceptualized as solastalgia. Existing research on solastalgia has predominantly focused on Australian and Indigenous communities with strong place dependence for their livelihoods. Less is known about if and how solastalgia manifests in communities whose connection to the land is primarily recreational.

In this study, we applied the concept to the European context, focusing on winter sport athletes in the Austrian Alps. Winter sport athletes directly witness environmental changes in the mountains yet dependent little on them beyond recreational activities. The study draws on 28 in-depth interviews with long-term winter sport athletes (aged 23–68).

Participants highlighted the lack of snow and melting glaciers as subjectively meaningful changes. But not only climate change impacts elicited emotional responses: The expansion of tourism and commercial infrastructure was a second source of disruption. Tourism expansion was associated with immediate, manifest losses. Climate change impacts additionally signalled ongoing and future environmental degradation, fostering anticipatory solastalgia. Valued places connected to childhood memories were lost and the emotional quality of winter sports inhibited. These manifest and anticipated losses disrupted both individual and collective identities and fuelled intra- and interindividual conflicts.

The findings give insights into the multi-layered psychological consequences of climate change and their interactions with other human-made developments. Environmental losses are experienced by different communities worldwide, with implications for mental health as well as behaviour.

Abstract 408

A QUALITATIVE SCOPING STUDY OF CLIMATE RISK EXPOSURE AND EMOTIONAL WELLBEING IN URBAN WEST AFRICA

Ogunbode C.*[1], Uchendu J.[2], Lekwa H.[2], Jeng F.[3], Singhateh A.[3], Nyanfor E.[4], Mansaray R.I.[5], Dankwa P.[6], Iorfa S.K.[1]

[1]University of Nottingham ~ Nottingham ~ United Kingdom, [2]Sustyvibes ~ Lagos ~ Nigeria, [3]Clean Earth Gambia ~ Banjul ~ Gambia, [4]Liberian Youth for Climate Actions ~ Monrovia ~ Liberia, [5]Fridays for Future Sierra Leone ~ Freetown ~ Sierra Leone, [6]Green Africa Youth Organisation ~ Accra ~ Ghana

The 2021 State of the Climate in Africa report catalogues evidence of how climate change impacts are threatening human health, socio-economic security, and food and water security across Africa. Addressing this threat requires, among other things, current and accurate data to inform climate action and adaptation efforts. To date, climate change research in Africa has largely focused on the physical and socio-economic impacts, whilst neglecting the psychological aspects of climate change. Yet, climate change does not only devastate the landscape and physical infrastructure. It also affects people psychologically through injury, mortality, loss of livelihoods, and other social and economic disruptions. Further, through phenomena like ‘eco-anxiety’, climate change can undermine wellbeing and mental health even before people are directly exposed to physical impacts. In this study we investigated lived experiences of climate risk exposures and emotional responses using interviews with residents in five anglophone West African cities (Banjul, Freetown, Monrovia, Accra, and Lagos; N = 50). The study was co-developed with and led by partner organisations based in the focus countries. Reflexive thematic analysis of participants' responses revealed the sensemaking pathways that link emotional distress with climate risk exposures (particularly flooding and heatwaves), as well as the coping responses enacted to limit the effects of these exposures. This study has implications for climate resilience in West Africa which is one of the fastest urbanising regions of the world.

Abstract 1776

CONDUCTING GLOBAL SCIENCE PROJECTS ON THE IMPACT OF CLIMATE CHANGE HAZARDS ON THE HUMAN MIND: MANYLABS EVIDENCE AND METHODOLOGICAL CHALLENGES

Kacperski C.*, Bielig M., Doell K.

Konstanz University ~ Konstanz ~ Germany

Extreme heat is rising globally and unequally, but evidence of effects on human cognition, social behaviour and collective well-being is still missing, and those studies that exist mostly rely on WEIRD samples and employ laboratory interventions, limiting policy relevance. We present the Heat & Cognition Project as a case study in how applied psychology can use Big Team Science (BTS) to generate scalable, context-sensitive evidence for the impact of climate change hazards. In over 40+ cities across the globe, we are implementing a preregistered three-wave protocol to test the effect of extreme heat on the human mind and collective well-being in a natural experiment, aligned to verified heatwaves and matched temperate periods (>50,000 participants). Outcome measures cover attention and working memory, mood, prosociality and social functioning, well-being, and policy attitudes, alongside real-world vulnerability and adaptation contexts of individuals. In this talk, we present first evidence from pilot data collection cities and discuss key methodological challenges when conducting global science projects related to climate science. These include defining “extreme heat” across climates (absolute vs. relative thresholds), coordinating timing by climate rather than calendar, multilingual instrument validity, and fair resource distribution. We report feasibility metrics from piloting and early waves (recruitment during short heat windows, adherence, missing-data patterns tied to access/adaptation), and preliminary cross-site patterns linking heat exposure to outcomes. We discuss how BTS can enable applied psychology to test theory under dynamic, real-world climate change stressors at policy-relevant scales.

Abstract 1604

RISK PERCEPTION, EXPERIENCE WITH EXTREME EVENTS AND ADAPTATION BEHAVIOURS IN A CONTEXT OF CLIMATE CHANGE AND GLACIAL RETREAT IN HIGHLANDS

Monge--Rodriguez F.*, Huaman--Chulluncuy E.

Universidad Peruana Cayetano Heredia ~ Lima ~ Peru

Climate change is the main cause of glacier retreat and is triggering a series of extreme weather events that are affecting the well-being of populations around the world, especially the most vulnerable. Therefore, studies to understand adaptation behaviors in these scenarios are relevant. The objective of this study was to predict the willingness to adapt in climate change scenarios, based on predictive factors such as experience with extreme events (avalanches, droughts and floods), fear of extreme events and risk perception of climate change. The survey method and computer-assisted personal interviewing (CAPI) technique were used. The sample consisted of 11 communities living near glaciers in the Andean region of Peru, N=2024 participated in the study. Hierarchical multiple regression analysis was used to identify predictors of willingness to adapt in situations of extreme events. The results showed that age, educational level, experience with droughts, experience with floods, fear of droughts, fear of floods, and perception of climate change risk were identified as significant predictors. Experience with droughts, fear of floods, and perception of risk had a greater effect on willingness to adapt than sociodemographic factors. Fear of drought provides additional explanatory power beyond experience, demonstrating that affective responses, particularly towards extreme weather events, play an important role in motivating adaptation. Overall, the model explained 18% of the variance. The implications for communication plans and climate change adaptation policies are discussed.

EXPLORING THE LINKS BETWEEN MENTAL HEALTH, SOCIAL HEALTH, AND PHYSICAL ENVIRONMENT: A PROSPECTIVE NETWORK ANALYSIS IN A NATIONALLY REPRESENTATIVE SAMPLE

Ochnik D.*, Rojczyk E., Budzinski M., Nagel P., Szostak A., Vitkovskyi Y., Wierzbik--Stroinska M.

Academy of Silesia ~ Katowice ~ Poland

The rise in mental health issues, urbanization, and loneliness presents significant societal challenges. It is imperative to comprehend the complex relationships among the various factors influencing mental health.

This prospective study examines the relationships between mental, physical, and social health, as well as the physical environment, considering individual sociodemographic characteristics and objective macro-factors related to the Sustainable Development Goals, using a network approach. Moreover, the Multidimensional Mental Health Model was validated using a nationally representative sample of 1,610 participants (49% women) over a three-month period.

The measurements used for assessing mental health included the PHQ-9, GAD-7, PSS-10, and SWLS; for assessing social health included the neighborhood cohesion scale and R-UCLA3; and for assessing physical health included the SRH.

The network analysis revealed that the model demonstrated robustness and stability over time. Social health (loneliness and neighborhood cohesion) acted as a mediator between mental health and the physical environment. Moreover, urbanicity was positively associated with neighborhood belonging but negatively with social cohesion. Additionally, depression symptoms and CO2 emissions emerged as key risk factors, while forest areas and urbanicity served as influential protective factors. The centrality of neighborhood cohesion and green areas increased over time, highlighting their importance.

The findings underscore the significance of a multifaceted approach to mental health that considers the interplay among social, environmental, individual, and objective macro-factors. This understanding can help develop more effective mental health prevention programs and provide valuable insights for policymakers and urban planners in creating supportive environments.

Abstract 2701

FROM RISK PERCEPTION TO ACTION: THE ROLES OF SELF-EFFICACY AND PSYCHOLOGICAL ADAPTATION IN PRO-ENVIRONMENTAL BEHAVIOR AMONG CLIMATE-AFFECTED PEOPLE IN BANGLADESH

Akter F.*, Haque S., Khan S.

Monash University ~ Sunway City ~ Malaysia

Introduction: Climate change poses an escalating threat to human well-being, particularly in climate-vulnerable countries in the Global South. Bangladesh, a low-lying deltaic nation, is highly exposed to recurrent hazards such as floods, cyclones, and salinity intrusion, which substantially affect everyday life. While existing research has focused largely on the physical, economic, and health consequences of climate change, less is known about the psychological processes through which climate-affected populations perceive risk and translate these experiences into adaptive and pro-environmental behaviour (PEB). Psychological factors such as self-efficacy and psychological adaptation may play a critical role in shaping behavioural responses to environmental threats.

Purpose: This study examined the associations among climate risk perception, self-efficacy, psychological adaptation, and PEB among adults in Bangladesh, with particular attention to the mediating and moderating roles of self-efficacy and psychological adaptation. A cross-sectional online survey was conducted with 652 participants aged 18 years and older using standardised measures. Data were analysed using Pearson correlation, mediation, and moderation analyses.

Results: It revealed four key findings. First, risk perception was strongly associated with self-efficacy and moderately associated with psychological adaptation but only weakly related to PEB at the bivariate level. Second, self-efficacy and psychological adaptation were strong predictors of PEB and fully mediated the relationship between risk perception and behaviour, indicating inconsistent mediation. Third, self-efficacy functioned as both a mediator and a moderator: while it transmitted the effect of risk perception on PEB, higher perceived risk was associated with lower PEB at high levels of self-efficacy, suggesting a shift from threat-driven to capability-driven regulation. Fourth, psychological adaptation operated exclusively as a mediator.

Conclusion: Pro-environmental behaviour among climate-affected populations is shaped less by perceived risk and more by perceived capability and psychological preparedness. Interventions should prioritise strengthening self-efficacy and psychological adaptation and integrate mental health considerations into climate adaptation strategies.

Abstract 2732

CLIMATE CHANGE ANXIETY: AN ANALYSIS OF STUDENT'S EMERGING VIEWPOINTS

Costa K.*

Columbia University, Teachers College ~ New York ~ United States of America

Objectives: The aim of this study was to examine the relationship between current levels of climate change anxiety (CCA) observed by American university students and long-term decision-making processes like where to live, work, or raise a family.

Participants: College and university students (n = 389) across the United States were sampled using an online survey that was disseminated between January and April 2024. Students of undergraduate, graduate, and Ph.D. levels participated in the study. The average age of participants was 21.39 years of age with a standard deviation (SD) of +/- 3.78.

Methods: Participants completed an online cross-sectional five-part survey that consisted of the following sections: (1) Assessment of Understanding, (2) General [Demographic] Information, (3) Climate Change Anxiety Scale (CCAS), (4) Reflection on the CCAS, (5) Long-Term decision-making. The survey featured the Climate Change Anxiety Scale (CCAS), developed by Clayton & Karazsia (2020), to assess student's current levels of CCA and a set of eight questions, developed for use in this study, that focused on long-term decision-making processes.

Results: The average CCAS score for a student participating in this study was 27.95 (M = 27. 95) with a standard deviation of SD = 9. 94. Linear regressions of the relationship between CCAS score and coded answers to the eight long-term decision-making questions revealed a positive linear relationship between CASS score and considerations of CCA in long-term decision-making processes.

Conclusions: The data presented in this study indicates that, of the sample studied, university students within the United States who have higher CCAS scores, marking a greater degree of CCA, had a higher percentage of "Yes" answers to long-term decision scores, indicating CCA or climate change issues are considerations in future life plans, creating social, political, and economic implications for the years to come. This finding is aligned with the findings of similar topical studies.

Abstract 1237

CLIMATE CHANGE ANXIETY AND WORRY IN ADOLESCENTS: THE ROLE OF EMOTIONAL REGULATION

Mirandi M.[1], Lis A.*[2], Garofalo C.[1], Del Vecchio E.[1], Mazzeschi C.[1]

[1]University of Perugia ~ Perugia ~ Italy, [2]University of Padua ~ Padova ~ Italy

Climate change represents an increasing source of psychological stress for adolescents, contributing to the development of climate change anxiety (CCA) and climate change worry (CCW). CCA manifests as a cognitive-emotional (CEI) and functional (FI) response, characterized by rumination, helplessness, guilt, and impairment in daily activities, whereas CCW consists of persistent, difficult-to-control thoughts. Emotional regulation plays a key role in modulating adolescents' responses to CCA and CCW. A sample of 625 Italian adolescents (M=16.21±1.40; 51.68% female) completed the Climate Change Anxiety Scale, the Climate Change Worry Scale, and the Difficulties in Emotion Regulation Scale (DERS), which assesses dimensions of emotion regulation, including non-acceptance of emotional responses, difficulties in goal-directed behavior, impulse control, emotional awareness, access to regulatory strategies, and clarity. Results showed that CCA and CCW were positively correlated with total difficulties in emotion regulation (CCA-CEI: r=.15, p<.001; CCA-FI: r=.19, p<.001; CCW: r=.21, p<.001). Latent profile analysis identified three groups: (1) low levels of climate change anxiety and worry, (2) moderate levels, and (3) higher levels. Adolescents in the second and third groups showed significant difficulties in non-acceptance of emotions (F=16.12, p<.001). However, the second group exhibited greater difficulties in goal-directed behavior (F=5.73, p<.01), while the higher group showed impairments in impulse control (F=7.38, p<.001). Findings suggest that climate change anxiety and worry are associated with perceiving emotions as excessive or unwanted, limiting adaptive regulatory strategies. Adolescents with moderate anxiety and worry struggle to translate worries into action, perceiving climate change as a complex, uncertain challenge, whereas those with higher levels show difficulties in impulse control, likely related to helplessness, frustration, or inadequacy expressed through externalizing behaviors. These results highlight the importance of interventions aimed at fostering emotional awareness, acceptance of emotions, and access to regulatory strategies to support adolescents' emotional well-being facing climate change challenges.

Abstract 410

CLIMATE ANXIETY IN PERSPECTIVE: A COMPARATIVE ASSESSMENT OF DOMINANT FACTORS IN YOUTH MENTAL HEALTH AND SLEEP

Ogunbode C.*[1], Player L.[2], Lu S.[3], Park M.S.[4], Doran R.[5]

[1]University of Nottingham ~ Nottingham ~ United Kingdom, [2]University of Bath ~ Bath ~ United Kingdom, [3]De Montfort University ~ Leicester ~ United Kingdom, [4]Nottingham Trent University ~ Nottingham ~ United Kingdom, [5]University of Bergen ~ Bergen ~ Norway

There is growing evidence that climate anxiety is having a significant impact on the mental health and wellbeing of young people. However, the unique contribution of climate anxiety to young people's mental health burden is unclear, as it has largely been studied in isolation from other common stressors. This study sought to contextualize the significance of climate anxiety for the mental health of UK young adults relative to other concurrent psychological stressors. We surveyed university students (N = 461), and a general population sample aged 18-25 (N = 400). The results showed that while climate anxiety was significantly related to poorer mental health and worse insomnia when examined alone, this relationship became non-significant or greatly diminished when other stressors were taken into account. Specifically, loneliness was found to be the most important predictor of mental health, and financial anxiety the most important predictor of insomnia severity. The findings suggest that climate anxiety, while concerning, may not be the most dominant factor impacting young people's mental health. Our research highlights the need to consider the broader context of young people's lives and the complex interplay of various psychological stressors. Further research is needed to better understand this nuanced relationship.

Abstract 2229

CLIMATE VULNERABILITY AS A THREAT MULTIPLIER FOR SEASONAL DEMOGRAPHIC ASSOCIATIONS IN CHILDHOOD QUALITY OF LIFE

Sprague N.*

Harvard Medical School ~ Boston ~ United States of America

Introduction: Research has documented both seasonal and demographic trends in children's quality of life (QoL). Climate change and human climate vulnerability have been identified as threat multipliers of such disparities, yet no prior study has analyzed how seasonal climate vulnerability modifies demographic associations in childhood QoL and life satisfaction.

Purpose: This study examines whether seasonal climate vulnerability clusters act as threat multipliers for demographic differences in QoL and life satisfaction among students attending Title I schools in St. Louis, MO and Chicago, IL.

Methods: Drawing on four seasonal surveys, we applied k-means multiply imputed cluster analysis to identify climate vulnerability profiles among 528 fourth–eighth grade students, based on three domains: climate exposure, adaptive capacity, and perception. Clusters were thematically labeled using Castleberry and Nolen's approach. Demographic variables included age, sex, race, ethnicity, and child/maternal/paternal nativity. QoL and life satisfaction were measured using the Pediatric Quality of Life Enjoyment and Satisfaction Questionnaire (PQ-LES-Q). We used hierarchical linear regression models with robust standard errors to test demographic associations, and examined effect measure modification by climate vulnerability cluster.

Results: We identified five summer, two fall, four winter, and three spring vulnerability clusters. Cluster assignment was associated with both demographic characteristics and QoL outcomes. Seasonal demographic associations varied substantially: for example, in summer and spring, older children and girls in heat-exposed clusters reported lower QoL, whereas such differences were absent in fall clusters. Patterns consistent with eco-grief emerged, as foreign-born children in climate-concerned clusters reported lower QoL than U.S.-born peers.

Conclusions: Findings suggest that climate vulnerability acts as a seasonal threat multiplier of demographic differences in children's QoL and life satisfaction. Longitudinal, multi-year data are needed to assess temporal stability and to inform targeted, season-specific interventions that support child well-being in the context of climate change.

ENVIRONMENTAL PSYCHOLOGICAL RESEARCH AND THE CHALLENGE OF SUSTAINABLE LIFESTYLES

Thursday 23 July 2026 from 14:00 to 15:00

(F-Spadolini)

GIUSEPPE CARRUS (ROMA TRE UNIVERSITY ~ Rome ~ Italy), Chair and Presenter
Maria Luisa Lima, Discussant

The objective of this symposium is to discuss the contribution of psychological and behavioral sciences for the
promotion of sustainable lifestyles. A series of studies, conducted through different methods and approaches, in a
variety of geographical and cultural contexts, will be presented to discuss the main psychological factors at the basis
of relevant behaviors and perception in the domains of water conservation, energy saving, and perception of climate
change. The presentations included in this symposium will provide a good example of how evidence-based
psychological research could offer a solid base for real-world application of behavioral interventions to address
significant environmental challenges in contemporary society.

Abstract 4262

UNVEILING THE POWER OF SOCIAL NORMS: A PSYCHOLOGICAL INTERVENTION ON ENERGY SAVING BEHAVIOR IN AN ITALIAN ENERGY COOPERATIVE

Carrus G.*, Massullo C., Tiberio L., Caffaro F.

Roma Tre University ~ Rome ~ Italy

Behavioural strategies to reduce energy consumption and promote sustainable habits received increasing attention from economic, psychological, and social sciences. Among these, social norm-based interventions have been proposed as effective tools in psychological research. In this study, we employ a randomized control trial (RCT) to assess the effectiveness of a social norms intervention to encourage energy-saving behaviors among members of an energy cooperative in Italy (N = 442). Participants were randomly assigned to one of three groups. The first group, the descriptive social norm group, received messages showing the average energy consumption of cooperative members to encourage behavioural change. The second group, the injunctive + descriptive social norm group, received messages combining average consumption data with additional messaging emphasising societal expectations for energy conservation. The third, which served as the control group, received no norm-based messaging and acted as a baseline for comparison. Results show a significant 13 % decrease in electricity consumption among participants exposed to the descriptive social norm message, compared to those in the injunctive + descriptive norms and control groups.

Abstract 4263

ENABLERS AND CONSTRAINTS FOR SUSTAINABILITY. THE CASE OF RECLAIMED WATER

Poggio L.*, Sánchez Del Corral G., Aragonés J.I.

Universidad Complutense de Madrid, Spain ~ Madrid ~ Spain

Freshwater resources are under increasing anthropogenic pressure, causing problems of scarcity and water quality, conflicts of use, and risks to natural environments. In this scenario, a paradigm shift in water use is necessary to mitigate the consequences of climate change. To this end, it is not only necessary to implement technological developments that facilitate the reuse of the water, but also for societies to view the use of reclaimed water favorably. The research presented at this symposium is related to the perception and acceptance of the risk of reclaimed water in three countries: Spain, France, and Portugal. To achieve this objective, a qualitative study is first carried out to understand, from the perspective of risk perception, the discourse of experts in this field. Subsequently, a second quantitative study is carried out with the general population of the respective countries to find out in which sectors it is most accepted, as well as the main strengths and weaknesses of using this water.

Abstract 4264

UNDERSTANDING OUR NEW WORLD: PERCEPTIONS OF CLIMATE CHANGE AND POPULIST ATTITUDES

Lima M.L.*

Instituto Universitário de Lisboa – ISCTE, ~ Lisbon ~ Portugal

During the last decades, a huge effort has been made to increase environmental attitudes
and behaviors all over the world. Governmental initiatives and educational programs have promoted more sustainable lifestyles and a higher environmental awareness. However, in the last years, we have witnessed the growth of persons who do not believe climate change to be real (e.g., White, 2018), at the same time that the scientific consensus overwhelmingly supports the reality of climate change. In this paper we explore the relationship between perception of climate change and populism. We wanted to test the resentment hypothesis to populism (Fukuyama, 2018) and understand
the contribution of climate change denial in this process. An online study was conducted (N=414, 50% below 35 years old), including the short version of the perception of climate change scale (van Valkengoed, Steg & Perlaviciute, 2021), a populist attitudes scale (Akkerman et al. 2024), the lack of group recognition scale (Babst et al., 2024), as well as indicators of perceived socioeconomic status. As expected, we found a negative association between socio-economic status and populism, that was mediated by the perception of lack of recognition. However, the denial of climate change increased the explanation of populism, over and above lack of group recognition. The implication of these results for environmental interventions are analyzed.

Abstract 4265

SUSTAINABLE WATER MANAGEMENT: THE ROLE OF FRAMING, IDENTITY, AND METAPERCEPTION

Gómez--Román C.*, Vila Tojo S., Guntín L., Sabucedo J.M.

Universidade de Santiago de Compostela – CRETUS. Spain ~ Santiago de Compostela, ~ Spain

Acceptance of sustainable water management solutions (ranging from decentralized wastewater treatment systems to individual conservation behaviors) remains a challenge, particularly in regions where water scarcity is not perceived as an issue. Drawing on a series of qualitative, experimental, and applied studies conducted in Spain and the Netherlands (focus groups, interventions, and surveys with over 900 participants), our research highlights key psychosocial mechanisms that can either hinder or foster engagement with sustainable water practices. First, we found that without recognizing a need for change, alternatives are unlikely to be considered. A systematic review and a focus group study in Galicia (Spain) (N=18) showed that perceived scarcity and environmental threat are the first step for acceptance. However, making the problem cognitively accessible before presenting the solution significantly improves how these systems are perceived. This was supported by an experimental study with university students (N=287), showing that priming environmental concern increased positive attitudes (even when disadvantages were acknowledged). A threephase
intervention in a business center with an operational decentralized plant combined a focus group (N=6), environmental priming (N=46), and a participatory session with experts (N=25). Results showed that inclusive processes and identity-based framing reduce initial resistance. A follow-up cross-national experiment (Groningen, N=92; Santiago de Compostela, N=208) showed the positive effect of framing these technologies as bottom-up initiatives aligned with pro-environmental identity. Finally, we introduce Metaperception (how individuals believe others evaluate their proenvironmental
behavior) as a promising construct for understanding social image in sustainability. This scale, developed and validated in the context of water conservation (Spain, N=231; N=384), showed strong predictive power for both intention and behavior, and offers new insights for broader applications in environmental engagement.

04 - Division 4: Environmental Psychology

FROM PRODUCING TO CONSUMING ENERGY AND PRODUCTS: THE SOCIO PSYCHOLOGICAL IMPACT OF SUSTAINABILITY.

Thursday 23 July 2026 from 15:00 to 16:00

(F-Spadolini)

Roberto Fasanelli (UNIVERSITY OF NAPLES “FEDERICO II” ~ Nap), Chair and Presenter

This symposium investigates the diverse social and psychological aspects of sustainability, focusing on
how sustainable practices impact and are shaped by the attitudes, behaviors, representations, and values
of both producers and consumers of energy, goods and products. By promoting interdisciplinary dialogue,
the workshop seeks to uncover the connections between societal norms, environmental awareness, policy
making and economic behaviors in fostering a sustainable future.
Sustainability is viewed not only as an environmental or economic issue but also as a significant social,
political, and psychological phenomenon. This symposium unites scholars and practitioners from social
psychology, environmental science, and sustainable energy fields to address key questions: How do
producers incorporate sustainability into their practices while managing social and cultural expectations?
What psychological factors facilitate or hinder consumers' adoption of sustainable products and lifestyles?
What challenges obstruct the implementation of more effective, sustainable, and environmentally friendly
policies in public administration and services? How do shared societal values and norms influence
sustainable behaviors in various cultures and communities?
Through presentations, case studies, and collaborative discussions, participants will delve into the complex
interactions between individual behavior, collective action, and structural change. This will provide insights
to improve the effectiveness of sustainability initiatives on both micro and macro levels.
This topic is both novel and relevant for several reasons:
1. Interdisciplinary Approach: By integrating various scientific perspectives, this topic goes beyond
traditional, isolated research methods to provide a holistic understanding of how human behavior interacts
with sustainable systems.
2. Behavioral Impact: Environmental psychology has long examined individual and group behaviors
regarding sustainability. This topic builds on those insights by exploring the reciprocal influences between
planners/producers and consumers.
3. Practical Applications: The insights gained from this workshop can directly inform interventions,
policymaking, and educational campaigns aimedatpromotingsustainablebehaviors.
4. Transformational Focus: Understanding the feedback loops between

planning/productionpracticesand
consumerchoicesiscrucialforfosteringsystemicchange,whichisakeyemphasisofappliedpsychology.

Abstract 4202

NOVEL FOODS" AND INNOVATIVE ENERGY STRATEGIES: SYNERGIES FOR SUSTAINABILITY AND THE ROLE OF SOCIAL REPRESENTATIONS APPROACH.

Fasanelli R.*

UNIVERSITY OF NAPLES "FEDERICO II" ~ NAPLES ~ Italy

Integrating novel foods, such as insect-based products and cultured meat, with innovative energy strategies like agrivoltaics represents a significant advancement in the transition to sustainable agri-food systems. Novel foods provide high-protein solutions with a reduced environmental impact compared to traditional livestock farming, helping to alleviate the strain on water resources, soil, and greenhouse gas emissions. Meanwhile, agrivoltaics effectively combine agricultural production with solar energy generation, optimizing land use and enhancing climate resilience.

However, the widespread adoption of these innovations requires thorough psychosocial analysis to understand consumers' perceptions, cultural resistance, and behavioral dynamics. Public acceptance of novel foods and new production technologies is crucial for their success. This acceptance hinges on factors such as trust in institutions, effective communication of environmental benefits, and overcoming emotional barriers associated with changing food habits.

The synergy between sustainable technologies and effective management of social change processes can promote circular models, whereby-products from insect agriculture are reused as fertilizer and the excess energy generated by agrivoltaics supports cultivation efforts.

This integrated approach, which combines technological innovation with social awareness, offers a concrete response to global challenges related to food security, sustainability, and energy transition. As part of this symposium, the proponent's research results from 2020 to the present will be presented and discussed, serving the mixed methods approach specific to the social representations paradigm.

Abstract 4204

ARTICULATING THE DIFFERENT LEVELS OF MEANING PRODUCTION: THE CASE OF ENERGY SUFFICIENCY

Gache S.*, Caillaud S.

UNIVERSITE LUMIERE LYON 2, GREPS LABORATORY ~ LYON ~ France

A significant proportion of research in the field of psychology has been dedicated to the promotion of sustainable behaviours among individuals, with the objective of effecting the desired social change. However, these studies often ignore the social meanings of sustainable practices and the relational and identity-related issues that contribute to their construction and transformation. Other studies have focused on the social determinants of sustainable practices, overlooking the potential for social actors to resist the dominant norms. The theory of social representations has been demonstrated to be a valuable framework for understanding how the meanings of sustainable practices are constructed in and within the diverse spheres (scientific, political, media, everyday, etc.) of knowledge production. By exploring how meaning is constructed in and negotiated within these different spheres, the theory can overcome the limitations of approaches that are either psychologising or sociologising in nature. Consequently, it is possible to gain a more profound understanding of the social and identity issues that shape sustainable practices. A research project investigating social representations of sufficiency and energy sufficiency in France will be used as an example. This project explores how the concept of energy sufficiency is re-constructed and negotiated in and within different spheres of meaning construction and by different social actors. To this end, an extensive body of research has been conducted, encompassing a press analysis of 581 articles, a social network analysis of 236,161 tweets, and six focus groups interviews. The findings of this study indicate that the examination of energy sufficiency should be approached from a social and political perspective, rather than merely as a scientific concept.

Abstract 4205

SOCIAL REPRESENTATIONS OF WATER AMONG THE INHABITANTS OF NUEVO LEÓN, MEXICO, AND IN THE IZTAPALAPA DELEGATION OF MEXICO CITY.

Ortega RubÍ M.E.*[1], JuÁrez Romero J.[2], Olivares O.[3]

*[1]*INSTITUTO DE INVESTIGACIONES SOCIALES, FFYL, UNIVERSIDAD AUTÓNOMA DE NUEVO LEÓN ~ NUEVO LEON ~ Mexico, [2]UNIVERSIDAD AUTONÓMA METROPOLITANA, IZTAPALAPA. ~ MEXICO CITY ~ Mexico, [3]EGRESADA DEL POSGRADO EN PSICOLOGÍA SOCIAL DE LA UNIVERSIDAD AUTONÓMA METROPOLITANA, IZTAPALAPA. ~ MEXICO ~ Mexico*

In the context of a water crisis and environmental challenges, two studies addressed the severe drinking water supply issues in Iztapalapa and Nuevo León, Mexico. The first study, conducted in 2022-2023, revealed that Monterrey faced a crisis due to extreme drought and uneven water distribution, leading to drastic measures like reduced household resources and scheduled distribution times. The second study, carried out in 2025, explored persistent water shortages in Iztapalapa, a densely populated area where residents express dissatisfaction through protests. Using the theory of Social Representations, the research aimed to identify how social perceptions of water evolve during crises, integrating the concept of socio-environmental suffering. The findings emphasized eco-anxiety's role in driving shifts toward resource care and new practices. In Nuevo León, data from interviews and online questionnaires were analyzed through various methods, including IRaMuTeQ software and corresponding factor analysis. The results highlighted urgent concerns regarding water use, with participants expressing negative emotions like stress, frustration, and anxiety, illustrating the environmental suffering experienced and its effect on daily habits. In Iztapalapa, press analyses compared social representations from interviews with media narratives. The findings underscored the importance of context and sociability, suggesting the need to consider alternative relationships with water, particularly from indigenous perspectives. Overall, both studies reflect the dynamic relationship between social representations of water and adaptive practices in response to crises.

NAVIGATING FOOD SHARING: ENVIRONMENTALISTS' VIEWS ON ONLINE AND LOCAL NETWORKS

Au A.K.Y.*[1], Szeto S.[2], Yuen E.K.W.[3], Ng J.C.K.[1]

[1]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [2]Saint Francis University ~ Hong Kong ~ Hong Kong, [3]The University of Hong Kong ~ Hong Kong ~ Hong Kong

Introduction: Food sharing is increasingly recognized as a strategy to reduce waste and promote sustainability. Online peer-to-peer (P2P) platforms, such as Facebook groups, have emerged as popular channels for redistributing surplus food. However, the dynamics between these anonymous online systems and established local networks remain underexplored, particularly among environmentally conscious individuals. Purpose: This study aims to understand how environmentalists perceive and navigate food sharing, focusing on their motivations, methods, and concerns when choosing between online P2P platforms and local, personal networks. Method: In-depth qualitative interviews were conducted with five environmentalists (two males, three females) in Hong Kong. Participants were asked about their experiences, attitudes, and decision-making processes regarding food surplus management and sharing practices. Results: Participants demonstrated a strong moral commitment to preventing food waste, actively seeking avenues to redistribute surplus items. They identified several advantages of online P2P platforms, including broad reach, convenience, and the ability to quickly match surplus food with recipients outside their immediate social circles. These platforms were especially valued for efficiently diverting packaged or unopened food from landfill. However, considerable concerns were raised about food safety, accountability, and trust when sharing prepared or partially consumed foods with strangers online. Most participants preferred sharing such items within their immediate social circles or local networks, citing higher levels of trust, easier communication, and logistical convenience. Conclusions: Environmentalists approach food sharing as a pragmatic and ethical exercise, leveraging the strengths of online P2P platforms for low-risk, packaged goods while relying on trusted local networks for high-risk, prepared foods. Their practices reflect a balance between maximizing environmental benefits and minimizing health and liability risks, suggesting that effective food surplus management requires both technological solutions and strong community ties.

Abstract 1122

FROM I BELIEVE TO WE BELIEVE: INVESTIGATING THE RELATIONSHIP BETWEEN CLIMATE CHANGE CONSPIRACY BELIEFS AND IDENTIFICATION WITH CONSPIRACISTS

Chan H.*[1], Kim--Pong T.[2]

[1]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [2]The Hong Kong University of Science and Technology ~ Hong Kong ~ Hong Kong

Climate change conspiracy beliefs may undermine our efforts to tackle climate change. Previous studies have conceptualized the influence of climate change conspiracy beliefs as an individual's behavioral decision-making process, overlooking the possible consequences of such beliefs on social identity. That is, climate change conspiracy beliefs may motivate people to identify with groups sharing similar conspiracy beliefs (i.e., identification with conspiracists). This motive can be particularly salient when the social belonging needs are being thwarted (e.g., being socially excluded). Importantly, ingroup identification can further motivate people to engage in pro-group behaviors (e.g., spreading climate change misinformation). We test this social identity perspective with two studies. In Study 1, with a three-wave longitudinal design, we found a longitudinal association between climate change conspiracy beliefs and identification with conspiracists, even after controlling for conspiracy mentality and national collective narcissism. In Study 2, we found that climate change conspiracy beliefs had a stronger positive association with identification with conspiracists among individuals who reported experiencing more social exclusion. Such ingroup identification was further related to a stronger intention to spread climate change conspiracy narratives. Overall, our results support the need to incorporate the social identity perspective into understanding the consequences of climate change conspiracy beliefs.

Abstract 1768

THE FACTORIAL VALIDITY OF THE NEW ECOLOGICAL PARADIGM REVISITED: EVIDENCE FROM JAPAN FOR CROSS-CULTURAL ENVIRONMENTAL PSYCHOLOGICAL RESEARCH

Itoi K.*, Kaida N.

University of Tsukuba ~ Ibaraki prefecture ~ Japan

The New Ecological Paradigm (NEP; Dunlap et al., 2000) is one of the most widely used scales for measuring environmental attitudes globally. However, previous studies have reported inconsistent findings regarding its dimensional structure, suggesting that it may vary across different cultural settings. Therefore, validating the NEP dimensions across various cultures, especially those from non-Western regions that have been less investigated, is essential for advancing environmental psychology and facilitating cross-cultural comparisons.

This study analyzed the structure of the 15-item NEP in Japan to examine whether its dimensions align with those previously reported. Data were collected from 1,200 Japanese adults via an online questionnaire survey in February 2025. The sample was randomly split into two subsamples of 600 respondents each. Exploratory factor analysis (EFA) using maximum likelihood estimation and Promax rotation was conducted on the first subsample. Confirmatory factor analysis (CFA) was then performed on the second subsample to evaluate alternative models.

EFA identified three factors: Ecological Limits, Anthropocentrism, and Technological Optimism. These factors explained 49.6% of the total variance and showed strong goodness-of-fit indices (TLI = .97, RMSEA = .039). CFA indicated an acceptable fit to the correlated three-factor model (CFI = .92, RMSEA = .074, SRMR = .063), supporting the multidimensional structure suggested by the EFA. However, some estimation issues arose, including a negative variance for Anthropocentrism due to the higher-order factor model.

The current findings indicate that the NEP's dimensional structure in the Japanese context may differ from that of the original and other international results, while sharing common characteristics. In particular, the weak integration of Anthropocentrism into NEP may reflect its unique cultural orientations. The results highlight the importance of considering cultural values to understand human–nature relationships and support future cross-cultural research on the theoretical framework of environmental attitudes.

Abstract 2369

TRAUMA-INFORMED LEADERSHIP FOR SOLAR RENEWABLE ENERGY TRUST IN SOUTH AFRICA: EVIDENCE-BASED FINDINGS

Langa M.*

Wits University ~ Johannesburg ~ South Africa

The study sought to evaluate how trauma-informed training influences leaders' awareness, emotional regulation, and relational capacity across three leadership levels —frontline service providers, advisory committee members, and trustees for Solar Renewable Energy Trust in South Africa.

Method:
A mixed-method design combining pre- and post-test surveys with qualitative reflections was used across three workshops held between July and September 2025. Forty-seven participants completed both pre- and post-assessments examining familiarity with trauma-informed leadership, emotional awareness, and leadership behaviour.

Results:
Pre-test data showed that 63–82% of participants were unfamiliar with trauma-informed leadership concepts. Post-test results revealed major shifts: 100% of frontline and trustee participants and 87.5% of advisory members demonstrated understanding and application of trauma-informed principles. Awareness of the difference between reactive (amygdala-driven) and reflective (cortex-driven) leadership increased from under 20% to over 90%. Participants began to describe themselves as "peace carriers" rather than "trauma carriers," showing deeper self-awareness and empathy. Over 95% recognised their organisations and communities as wounded contexts, identifying collective challenges such as gender-based violence, poverty, and loss of trust in institutions.

Conclusions:
The results confirm that trauma-informed leadership training enhances reflective governance, empathy, and resilience. Leaders who recognise and regulate their own trauma become catalysts for healing within organisations and communities, offering a scalable model for development in wounded contexts.

Abstract 2210

THE LONGITUDINAL LINK BETWEEN GRATITUDE AT WORK AND EMPLOYEE'S ENVIRONMENTAL RESPONSIBLE BEHAVIOUR

Unanue W.*

Business school, Universidad Adolfo Ibañez ~ Santiago ~ Chile

Climate change and environmental degradation are among the most important challenges of the 21st century. Some human behaviours have played a key negative role in the sustainability of the planet. Therefore, studying the psychological mechanisms that may increase environmental responsible behaviour (ERB) is a key issue. Research has consistently shown that gratitude, a "wider life orientation towards noticing and appreciating the positive in the world", is a strong predictor of several pro-social behaviours in general life settings. More recently, a few studies suggest that gratitude at work could also be a predictor of employee's pro-social behaviours, such as ERB. Indeed, ERB is considered a particular case of broader helping/pro-social actions. Further, drawing on gratitude research, environmental psychology and positive organizational scholarship (POS), we theorized that gratitude at work will prospectively predicts higher employee's ERB. Further, we conducted a three-waves longitudinal study (N = 1477), with six months between each wave among a representative sample of workers in Chile. We tested a Cross-lagged Panel Model. In support of our hypothesis, we found that gratitude at work at T1 (T2) prospectively predicts higher employee's ERB at T2 (T3). Unexpectedly, we also found a reverse link: Employee's ERB at T1 (T2) prospectively predicts higher gratitude at work at T2 (T3). The reciprocal link already found not only extend gratitude research in the workplace. It also gives promising insights about understudied psychological mechanisms that may help to protect the future of the Earth. Key implications for gratitude, environmental psychology and POS are discussed.

Abstract 2521

NARCISSISTIC IDENTIFICATION WITH HUMANITY: A PSYCHOLOGICAL BARRIER TO PRO-ANIMAL ACTION

Rabinovitch A.*, Parzuchowski M.

SWPS University ~ Sopot ~ Poland

The concept of the Anthropocene highlights humans as a collective agent whose activities degrade the environment and must be transformed to prevent further ecological harm. However, attributing such failures to humanity as a whole may evoke defensiveness, particularly among individuals high in collective narcissism, a tendency to hold an inflated yet fragile belief in the superiority of one's in-group. Across three studies involving 1,179 participants from Poland and the United Kingdom, we examined whether narcissistic identification with humanity represents a distinct form of social identification that predicts reduced concern for nonhuman animal welfare. Concern for animals was assessed through both attitudinal and behavioral measures, including lower willingness to donate to animal charities and stronger preferences for cheaper food products over costlier options that ensure animal welfare. Results consistently showed that human collective narcissism predicted decreased concern for animals beyond related psychological constructs such as national collective narcissism and human-supremacy beliefs. Mediation analyses further revealed that narcissistic identification with humanity was associated with perceiving pro-animal movements and advocacy as threats to human entitlement, which in turn predicted reduced concern for animal welfare. These findings suggest that a narcissistically inflated identification with humanity may undermine concern for other species. Understanding this defensive dynamic can inform strategies to enhance the effectiveness of pro-animal advocacy and promote a more inclusive moral engagement that extends beyond human boundaries.

JOINING POSITIVE AND ENVIRONMENTAL PSYCHOLOGY: REFLECTIONS, EMPIRICAL EVIDENCE, AND FUTURE DIRECTIONS

Thursday 23 July 2026 from 16:00 to 17:00

(F-Spadolini)

Massimiliano Scopelliti (LUMSA University ~ Rome ~ Italy), Chair and Discussant

Environmental Psychology has widely investigated the processes associated with human functioning and well-being
in relation to the environment, across different contexts, populations, and situations. Yet, much is still to be better
understood, and new directions in the discipline should be identified.
In this regard, this symposium proposes a connection between Positive and Environmental Psychology, starting with
empirical evidences of new potential applications in natural and organizational settings, and then suggesting
reflections and identifying directions for future multidisciplinary work.
Elena Rinallo (presenter) and Massimiliano Scopelliti moved a step forward in the literature on the positive social
effects of contact with nature through a cross-sectional study showing its role in reducing prejudice and discrimination
towards immigrants.
Paula Benevene and Ilaria Buonomo (presenter) developed a qualitative analysis on the role of HR practices in the
simultaneous promotion of both environmental sustainability and employee psychological well-being, giving further
evidence supporting an integrative approach, in which the two goals are not mutually exclusive, but interdependent.

Raquel Redondo proposed a meta-analytic study on nature exposure in the workplace and employee outcomes, in
terms of productivity, organizational attitudes, cognitive functioning and emotional responses, and psychological
well-being.
Finally, Michael Steger offers a comprehensive reflection on the past 25 years of Positive Psychology, and
proposes Regenerative Positive Psychology as a call to reorient this field through the integration with Environmental
Psychology and its attention the environmental crisis, to make a beneficial impact on the systems that sustain life and
well-being.

Abstract 4404

THE POSITIVE EFFECT OF CONTACT WITH NATURE TO REDUCE PREJUDICE AND DISCRIMINATION

Rinallo E.*, Scopelliti M.

LUMSA University ~ Rome ~ Italy

Environmental psychology has widely investigated the positive consequences of contact
with nature on individual functioning, ranging from stress reduction to cognitive improvement, enhanced immune response and mental health. From a relational point of view, positive effects of contact with natural environments in reducing aggressive behavior, promoting pro-social behavior and social cohesion have also been documented.
The present cross-sectional study moved a step forward, testing the role of contact with nature in reducing prejudice and discrimination towards immigrants. Based on the literature on restorative environments, emphasizing the stress reducing and cognitive improving effects of nature, and taking into account both cognitive and emotional aspects of prejudice, a path analysis was used to test our model through the following hypotheses:
H1: contact with nature is positively associated with the perception of the restorative potential of the environment;
H2: the perception of nature as a restorative environment is positively associated with empathy (a) and negatively associated with anxiety (b) towards immigrants;
H3: empathy is negatively associated with prejudice towards immigrants;
H4: anxiety is positively associated with prejudice towards immigrant;
H5: prejudice is positively associated with discrimination towards immigrants.

An online questionnaire measuring contact with nature, perceived restorativeness of natural environments, empathy, anxiety, prejudice and discrimination towards immigrants was administered to 2474 respondents. Results supported the hypotheses. Theoretical advances in the literature on the positive effects of contact with nature and restorative environments will be presented. Practical implications for a positive management of cultural diversity in everyday settings will be also discussed; inter-group contact has been identified as a key mechanism to promote social integration since decades, and natural environments can provide an ideal setting to increase positive relationships among people from different backgrounds.

Abstract 4405

BEYOND COMPLIANCE: HOW HR TRANSFORMS ENVIRONMENTAL SUSTAINABILITY INTO PSYCHOLOGICAL WELL-BEING

Benevene P., Buonomo I.*

LUMSA University ~ Rome ~ Italy

Contemporary organizations increasingly recognize environmental sustainability as crucial for long-term success, yet limited research explores how HR functions can serve as bridges between environmental initiatives and employee psychological well-being. This study examines the intersection between positive psychology and environmental psychology within organizational contexts, specifically investigating how HR practices can simultaneously promote environmental sustainability and enhance employee psychological well-being through Ryff's six-dimensional model of psychological well being.

Purpose

This research aims to explore how HR managers conceptualize and implement practices

that connect environmental sustainability initiatives with employee psychological well being, examining alignment with Ryff's dimensions of autonomy, environmental mastery, personal growth, positive relations with others, purpose in life, and self acceptance.

Method

Semi-structured interviews were conducted with 40 HR managers from diverse organizational contexts (70% profit-sector, 30% non-profit and healthcare organizations). Participants were predominantly male (85%) and held senior HR positions. Interview data were analyzed using thematic analysis guided by Ryff's psychological well-being framework to identify connections between green HR practices and psychological well-being dimensions.

Results

Analysis revealed that HR managers recognize their pivotal role in bridging environmental sustainability and employee well-being. Managers highlighted how sustainability initiatives foster employees' sense of autonomy through flexible working arrangements explicitly linked to environmental goals. Environmental mastery was supported by empowering personal responsibility in daily sustainable behaviors, while sustainability-related training enhanced personal growth and meaning-making. Volunteering and collaborative activities strengthened positive relationships among employees. Significantly, company-wide sustainability values reinforced individuals' sense of purpose and supported authentic self-acceptance through value congruence between personal and organizational environmental commitments.

Conclusions

Findings suggest HR functions can serve as catalysts for integrated positive environmental approaches within organizations. This integration appears particularly relevant for contemporary workforce expectations, where environmental consciousness and personal well-being are increasingly interconnected.Resultshaveimplications for developing HR strategies that simultaneously address organizational sustainability goals andemployeepsychologicalflourishing.

Abstract 4406

META-ANALYSIS ON THE IMPACT OF NATURE EXPOSURE IN THE WORKPLACE ON EMPLOYEE OUTCOMES

Redondo R.*

Comilla University ~ Madrid ~ Spain

This meta-analysis synthesizes published empirical findings to explore how exposure to nature in the workplace affect employee outcomes. Specifically, it examines the influence of nature exposure on three core areas: employee productivity (including task performance and overall output), psychological well-being (encompassing stress levels, burnout, mood states, and mental health), and organizational attitudes (such as job satisfaction, engagement, motivation, organizational commitment, and intent to stay or leave). In addition to these areas, the study also incorporates outcomes related to cognitive functioning—including creativity, adaptability, innovation, and critical thinking—as well as emotional responses.

Drawing on Attention Restoration Theory, the Biophilia Hypothesis, and identity-based motivation theory, we explore the mechanisms and boundary conditions that explain when and for whom nature exposure benefits workplace functioning. Accordingly, we will explore the moderating effects of sociodemographic variables, types of nature exposure, exposure time, immersion degree, type of outcome, measurement approach (self-report vs. other-report), type of work, among others.

In accordance with relevant literature on the matter, we classify nature exposure using the following framework: (a) outdoor breaks during the workday, (b) natural elements incorporated into indoor spaces, (c) exposure through physical barriers (e.g., windows), and (d) symbolic representations of nature (e.g., pictures, artificial plants).

Following PRISMA guidelines, we will include peer-reviewed empirical studies with indoor-working adult samples, covering just experimental. Outcomes are evaluated using a multi-level meta-analytic model to allow introducing several measures coming from the same sample, as well as ensuring g robustness and generalizability, with effect sizes calculated using Hedges's g and moderators explored to identify meaningful patterns.

This study advances prior meta-analyses by integrating restoration, biophilia, and motivational identity perspectives. Findings will offer theoretical contributions on nature's role in workplace well-being and practical guidance for designing healthier, more productive organizational environments contributing to the growing body of evidence on the benefits of integrating natureintothemodernworkplace.

Abstract 1011

WHO'S THE FAIREST OF THEM ALL? HETEROGENOUS VIEWS ON FAIRNESS IN THE ENERGY TRANSITION

Andersson Y.*, Kogler C., Nelissen R.

Tilburg University ~ Tilburg ~ Netherlands

The energy transition requires actors across all parts of society to make the changes necessary to reach net zero targets. In order to ensure public buy in, it is important that policies are perceived as fair by the people affected by them. While the notion of justice or fairness is prevalent in discussions on the energy transition, research on energy justice mostly investigate fairness through analysing policy documents or engaging with relevant stakeholders. Less focus is given to what individuals themselves experience as fair, and importantly, why they do so. In this study, we explore how the public weight different aspects of fairness in the context of the energy transition. Drawing on theoretical and empirical literature, we measure a comprehensive list of fairness principles relevant for energy policy. We also test whether people differ in how they construe fairness depending on individual and context level characteristics. For instance, the role of personal values, system justification beliefs, knowledge and awareness. In doing so we aim to get a more complete understanding of not simply whether people differ in what they deem fair policy, but whether they differ in the processes by which they reach these judgements. Results from this research can help achieve a more nuanced understanding of how people reach fairness judgements, and it can aid practitioners in formulating policies that better respond to these disparate views. Further, by understanding the sources of differences in fairness preferences, it allows for designing interventions to bridge these gaps. It can also serve as a starting point for dialogue about how to design systems for creating fair policies considering these differences. Data collection is currently ongoing, with an expected sample size of 500 Dutch participants.

Abstract 2148

ENHANCING PUBLIC SUPPORT FOR GLOBAL CLIMATE FUNDING

Bosshard A.*[1], Sabherwal A.[2]

[1]University of Amsterdam ~ Amsterdam ~ Netherlands, [2]Princeton University ~ Princeton ~ United States of America

Countries in the Global South have contributed the least to global carbon emissions yet face the most severe consequences of climate change. Despite the critical need for large-scale, grant-based funding from wealthy countries, current institutional funding is insufficient and often comes as loans, exacerbating financial debt. Because citizens are critical agents of change in policy making, this study investigates how to enhance public support for international climate funding. We employ a choice-based conjoint survey experiment among a representative sample of 1030 Dutch residents. This method allows us to systematically assess the impact of three policy attributes on policy support for global climate funding. The attributes were: funding goals (mitigation vs. adaptation vs. loss and damage), funding sources (wealth tax vs. fossil fuel tax vs. existing national budget), and funding recipients (important trade partners vs. former colonies vs. countries most vulnerable to climate impacts). We conducted ordinary least squares regression analyses to assess average component marginal effects (ACMEs) of each policy attribute on support. Mitigation and adaptation payments increased support relative to loss and damage compensation and participants favored funding to the most vulnerable countries. Moreover, wealth and fossil fuel taxation increased support, but only wealth taxation was popular across political ideologies. Understanding these dynamics provides insights for communication and policymaking strategies to increase public support for global climate funding.

Abstract 861

WHEN AND WHY DO PEOPLE ACCEPT CLIMATE POLICIES? TESTING THE INTEGRATIVE PUBLIC POLICY ACCEPTANCE (IPAC) FRAMEWORK

Grelle S.*, Hofmann W.

Ruhr University Bochum ~ Bochum ~ Germany

Individual sustainable behavior is shaped by a broader socio-political context that either constrains or
facilitates available options. Understanding when and why people support climate policies designed to
promote systemic sustainability is crucial for effective climate change mitigation. The Integrative
Public Policy Acceptance (IPAC) Framework synthesizes key psychological determinants of public
policy acceptance into a unified model, highlighting the central role of individuals' Desire for
Governmental Intervention (DGI) (Grelle & Hofmann, 2024). The IPAC proposes that problem
awareness predicts policy acceptance, with this relationship mediated by DGI. Furthermore, support-
seeking characteristics, such as trust in government, control/responsibility attributions, and perceived
changeability are predicted to shape DGI, possibly in interaction with problem awareness. Policy
qualities, such as effectiveness, fairness, and regulatory depth, in turn, are expected to shape policy
acceptance, possibly in interaction with DGI. To test these predictions, we conducted a large online
study (n = 1000, n obs = 25080) across diverse environmental domains, including transportation, meat
consumption, housing, food waste, and fast fashion. Multilevel regression analyses provided strong
empirical support for many of the IPAC's proposed main links affecting DGI and acceptance, as well
as the mediation of the effect of problem awareness on acceptance via DGI. Subsequent moderator
analyses yielded more mixed results. Together, these findings underline the importance of addressing
psychological and contextual factors in designing climate policies. The IPAC offers

valuable insights
for fostering public support for sustainability policies, contributing to climate change mitigation.

Division 4: Environmental Psychology Division 9: Economic Psychology Division 11: Political Psychology SDG 3: Good Health and Well-being SDG 13: Climate Action

Abstract 1255

THE ROLE OF PERSONAL COST EXPECTATIONS FOR PUBLIC POLICY ACCEPTANCE IN A CLIMATE CHANGE CONTEXT

Krumm L.*[1], Grelle S.[2], Bauer J.M.[3], Gwozdz W.[1], Hofmann W.[2]

[1]Justus-Liebig-University ~ Gießen ~ Germany, [2]Ruhr University ~ Bochum ~ Germany, [3]Copenhagen Business School ~ Copenhagen ~ Denmark

Effectively reducing greenhouse gas emissions requires far-reaching public policies and systemic changes, which depend on the acceptance by a critical mass of the public to be politically feasible and achievable. A central factor shaping policy acceptance is the perceived personal cost of implementing the policy. Not surprisingly, prior research shows that policies imposing lower personal costs are more widely accepted. Yet, while many behavior changes essential for significant emission reductions entail substantial costs, the costs differ in type. They may arise as financial expenses, time and effort, or more intangible losses such as reduced comfort, pleasure, or freedom. Understanding how different cost types affect acceptance is crucial for designing impactful policies with minimal adverse effects.

In a pre-registered survey with a German sample (n = 1000), we examine the acceptance of policies across six domains, such as meat consumption and air travel. Each domain includes four policy instruments: a nudge, an incentive, a tax, and a law. Our findings show that both the magnitude and type of expected cost significantly relate to policy acceptance. We identify distinct effects for tangible trade-offs (financial cost, comfort, and convenience), fulfillment costs (joy, personality, and freedom), behavior change costs (effort, time, habits), and social and cultural identity costs (social cost, traditions, nostalgia), at both within- and between-person levels. Interestingly, we find that social and cultural identity costs, contrary to expectations, are associated with higher, rather than lower, acceptance of policies. Moreover, expected changes in well-being partially mediate the link between perceived costs and policy acceptance. We discuss implications of these findings for both theory and the design of effective climate policies in practice.

Abstract 1154

BETWEEN CONCERN AND COLLECTIVE ACTION: THE ROLE OF SYSTEMS THINKING AND TECHNO-OPTIMISM IN MODERATING THE RELATIONSHIP BETWEEN RISK PERCEPTION AND POLICY SUPPORT

Vaupotic N.*, Vitale V., Pahl S.

Environmental Psychology Group, University of Vienna ~ Vienna ~ Austria

Pollution of air, soil, and water is among the most pressing environmental challenges today and a central facet of the triple planetary crisis (UNEP, 2020). Managing this challenge is intricately linked to the human factor, as environmental pollution stems from human activities but can also be mitigated through individual and collective action.

In the present study, we examine the role of two worldviews in predicting risk perception and support for environmental policies: systems thinking and techno-optimism. Systems thinking reflects the perspective that environmental problems cannot be addressed in isolation but must be understood within broader social, economic, and ecological systems (Davis & Stroink, 2016). Since pollutants typically circulate through production, consumption, recycling, and accumulation, they have been described as systemic challenges, suggesting that individuals high in systems thinking may be more concerned and supportive of pro-environmental policies. In contrast, techno-optimism (Gardezi & Arbuckle, 2020) may be associated with less support for pro-environmental policies, as individuals who expect future technological fixes, even when concerned, may be less supportive of collective action.

Within the SOS-ZEROPOL2030 project, we conducted a cross-national survey on risk perceptions of different environmental pollutants (microplastics, PFAS, nutrients, eutrophication, underwater noise) in five European countries (N = 5,206) in 2024. Multilevel regression analyses showed risk perception across different pollutants to be high across European countries and strongly predicted by negative emotions, biospheric values, and pro-environmental norms, while being positively associated with both systems thinking and techno-optimism.

Next, we will use multilevel moderation analysis (pending preregistration) to test how systems thinking and techno-optimism moderate the relationship between pollution risk perception and policy support, accounting for country-level variation. This study provides novel, large-scale evidence advancing our understanding of the interplay between citizens' risk perception, support for collective action (e.g., environmental policies), and different worldviews relevant to the environmental challenges we face.

Abstract 1919

THE ROLE OF ACTIVE HOPE IN VERIFIED COLLECTIVE ACTION ON THE CLIMATE CRISIS

Brouer P.*, Waltzer T., Aron A.

University of California, San Diego ~ San Diego ~ United States of America

Understanding what drives collective climate action has never been more urgent. In the field of collective action research, despite consistent evidence of a gap between people's intentions and actual behaviors, most research continues to rely on self-report scales and intentions instead of measuring real-world behavior. To address this gap, we conducted a 10-week longitudinal classroom-based intervention study with undergraduate students (N = 44). As part of the course, participants learned about the climate crisis and collaborated in small groups with local grassroots organizations on different campaigns. Each week, we assessed their climate-related emotions, what they intended to accomplish with the grassroots organization they were assigned to, and what collective climate action they actually did. We objectively verified the actions participants reported, enabling us to assess the quality of their actions. When analyzing climate emotions, the only variable that significantly related to the quality of collective action was the construct of active hope: the more participants reported a stronger sense of the importance of acting collectively now as preparation for future struggles, the higher the quality of their verified collective climate action. Unlike traditional measures of hope, which often include optimism or wishful thinking, active hope is about agency and commitment regardless of the outcome. Our findings highlight both the promise of active hope as a construct for future research and the value of verified behavioral measures for identifying the psychological factors that matter for real-world collective climate action.

CONTEXT SPECIFIC ENVIRONMENTAL KNOWLEDGE: SCALE DEVELOPMENT AND TESTING

Resanovich S.L.*, Hopthrow T., Randsley De Moura G.

University of Kent ~ Canterbury ~ United Kingdom

Understanding the connection between knowledge and pro-environmental behaviour (PEB) has been studied extensively. Some research has found there to be a connection between knowledge and PEB. Despite this, there is still a clear knowledge-action gap. This is evidenced by critiques of the knowledge deficit model (Cook & Melo Zurita, 2019) and reviews that have demonstrated that information alone is insufficient to create significant adoption of PEBs (Bergquist et al., 2023). Despite the mixed evidence which demonstrated the relationship between environmental knowledge and PEB is not linear, there is still a large focus on environmental knowledge in public advocacy campaigns and government strategies to address climate change. The present research proposes that part of the reason why research and campaigns focusing on increasing environmental knowledge are not sufficient is their conceptualisation and measurement of environmental knowledge. The vast majority of environmental knowledge assessments and scales are designed to evaluate general knowledge about the natural world and its processes. Our research proposes the development of context-specific environmental knowledge scales to better aid in the development of environmental knowledge-centred campaigns and policies. We developed an environmental knowledge scale aimed at measuring environmental knowledge specific to a UK university (e.g. assessing if individuals know how to participate in sustainable programmes, knowledge of biodiversity on campus and how to protect it, etc.). We developed this scale in partnership with key stakeholders, including the university sustainability office, sustainability advocacy groups and general students. The scale was validated through confirmatory factor analysis and item-response theory. Then, the newly developed context-specific scale was compared with an existing measure of general environmental knowledge. This presentation discusses how researchers can adapt the processes we used to develop context-specific scales with communities they work with and how these scales can be better applied to make environmental public knowledge campaigns more successful.

Abstract 2121

ACTION-ORIENTED CLIMATE CHANGE EDUCATION: INSIGHTS FROM EDUCATORS ENGAGING YOUNG PEOPLE AS AGENTS OF CHANGE

Trott C.*[1], Weinberg A.[2]

[1]University of Cincinnati ~ Cincinnati ~ United States of America, [2]Arizona State University ~ Tempe ~ United States of America

In environmental and climate change education, there is an urgent need for approaches that move beyond simply sharing information to actively empowering learners to take action—especially collective and collaborative action. Engaging students in meaningful action not only produces positive ecological outcomes but also helps counter the feelings of fear, anxiety, and hopelessness that often accompany awareness of environmental crises. Action-oriented approaches invite young people to imagine and create alternative futures, supporting their sense of agency and laying the groundwork for lifelong civic and community engagement. Research with young people has consistently shown that what they most want to know about climate change is what they can do about it, underscoring the importance of education that provides opportunities for meaningful action and participation. This chapter explores action-focused environmental education as implemented through the U.S. National Oceanic and Atmospheric Administration (NOAA) Planet Stewards Education Project. Over the past 15 years, Planet Stewards has supported educators across formal and informal learning settings to develop and deliver projects addressing climate change, biodiversity loss, and other ecological challenges through student-led action. Through in-depth interviews with 30 participating educators, this study explored how they have overcome institutional and logistical barriers to create unique, action-centered curricula that position youth as leaders and change-makers in their schools, families, and communities. Drawing on a range of case studies, this presentation further highlights how educators frame and facilitate student action projects, including those situated in historically excluded or marginalized communities. Findings have implications for educators, program designers, and policymakers seeking to expand equitable, action-oriented opportunities for young people to engage with climate challenges in ways that are empowering, collaborative, and transformative.

Abstract 2049

ENVIRONMENTAL ATTITUDES AND BEHAVIORS AMONG UNIVERSITY STUDENTS: THE IMPACT OF CONSCIOUSNESS, AWARENESS, AND ROLE MODELS

Uyanik R.*, Ünal S., Ünel E.[1], GÜl Topuz A.

Mersin University ~ Mersin ~ Turkey

Understanding the factors that influence young people's pro-environmental behaviors is essential for promoting environmental sustainability within higher education contexts. This study examined the extent to which university students' environmental consciousness and sensitivity, their environmental awareness in the context of sustainable development, and their observation of adults' environmental behaviors predicted participation in pro-environmental behaviors. The study sample consisted of 170 university students (127 female, 43 male) from Turkey between the ages of 18 and 29 (M = 22.05, SD = 1.85). Data were collected through an online form, and participants were recruited via snowball sampling. Informed consent was obtained from all participants. The measurement instruments included the University Students' Environmental Consciousness Sensitivity Questionnaire, the Environmental Awareness Scale in the Context of Sustainable Development, and the Adults' Environmental Behavior Observation Scale. To test the hypotheses, a multiple linear regression analysis was conducted. The findings revealed that university students' participation in pro-environmental behaviors was significantly predicted by their environmental consciousness and sensitivity, their environmental awareness regarding sustainable development, and their observation of adults' environmental behaviors ($F(3,166) = 36.12$, $p < .001$). Together, these variables accounted for 38.4% of the variance in pro-environmental behaviors (Adj. $R^2 = .384$). These results indicate that university students' environmental attitudes and behaviors are strongly associated with their observation of adults' environmental practices. In other words, adults appear to play a role-modeling function that reinforces environmentally friendly behaviors among young people. The findings further suggest that enhancing environmental sustainability awareness and supporting positive environmental role models are critical strategies for strengthening pro-environmental attitudes and behaviors among university students. It is also recommended that universities expand their programs to raise environmental consciousness and promote environmental awareness initiatives. Such efforts would constitute important steps toward reinforcing young people's environmentally responsible attitudes and behaviors, thereby contributing to broader sustainability goals.

Abstract 1296

PRO-ENVIRONMENTAL BEHAVIORS FROM THE LIFESTYLE PERSPECTIVES: AN INVESTIGATION INTO INDIVIDUAL CHARACTERISTICS BASED ON DAILY CONSUMPTION PATTERNS

Syakura F.*[1], Oliver Y H.[1], Teragaki H.[1], Itoi K.[2], Kaida N.[2], Ohnuma S.[1]

[1]Hokkaido University ~ Sapporo ~ Japan, [2]University of Tsukuba ~ Tsukuba ~ Japan

Understanding individual lifestyles is essential, as they are the foundation of pro-environmental behaviors (PEBs) and are interwoven with related psychological factors. Particularly, plastic consumption, a globally serious problem, is inseparable from daily lifestyles. However, few studies have investigated the frequency of such behaviors in daily life. This study aims to classify lifestyles based on daily dietary habits, and to examine the demographic profiles, attitudes, values, and relevant pro-environmental behaviors (PEBs) associated with each group. A web-based questionnaire was administered to 2400 individuals in Japan to investigate the interrelations between lifestyle patterns, values, and PEBs. The daily dietary habits were measured on a four-point Likert scale and frequencies, such as the frequency of eating instant meals, ready-made meals, and buying meals at convenience stores. We also measured the value scale (Steg et al., 2014) to identify the characteristics of the classified lifestyles, following plastics-related PEBs, behavioral intentions, social norms, perceived behavioral control, and relevant psychological construal, such as perceived effectiveness and awareness. We obtained four groups from the cluster analysis using lifestyle variables. One was ecological and the rest were not, namely, “selfish”, “rude”, and “passive”, indicating that non-ecological lifestyles were not homogeneous. Value differences revealed that the cluster group named “ecological“ tended to be altruistic and biospheric, and the group named “overconsuming” tended to be selfish. Meanwhile, another group named “passive” tended to be non-altruistic, non-hedonic, and non-selfish, which seemed to do nothing because they had no value orientation. Further group comparison by one-way ANOVA revealed that the “ecological” group showed the highest engagement in the PEBs, intentions, and attitudes, and the “passive” group showed the least for these variables. In contrast, the “overconsuming” group showed an inconsistent pattern. Our results suggest that we need a different approach to the features of lifestyles when considering efficient interventions.

Abstract 2227

INDIVIDUAL- AND SYSTEM-LEVEL EFFECTS OF ECONOMIC AND BEHAVIOURAL CLIMATE POLICY COUPLING

Günther A.*[1], Van Der Kam M.[1], Hadian Rasanan A.H.[1], Gluth S.[2], Hahnel U.[3]

[1]University of Basel ~ Basel ~ Switzerland, [2]University of Hamburg ~ Hamburg ~ Germany, [3]Leuphana University ~ Lüneburg ~ Germany

Policy coupling can accelerate demand-side climate mitigation strategies, such as the shift to electric vehicles. Yet, a holistic understanding of joint policy effects at the individual and system levels remains limited. Here, we combine choice experiments and attention process tracing with system-level modelling to examine how a carbon tax and climate information intervention – individually and combined – influence people's attention and decisions, electric vehicle diffusion, and public policy support. Our findings based on data from four culturally-diverse countries (Mexico, South Africa, USA, UK; N=1,589) show that policies competed for attention but had additive effects on adoption decisions. Integrating the empirical data into an agent-based model showed that combined interventions can, however, have superadditive system-level effects depending on diffusion stage. Finally, support for tax-inclusive policy packages was higher when coupled with climate information policies. Our findings show that policy coupling can enhance impact, depending on diffusion stage, target population, and national context.

Abstract 1265

DOES IMPACT INFORMATION ON UNDERESTIMATED LIFESTYLE DOMAINS INCREASE POLICY SUPPORT? THE ROLE OF POLICY EFFECTIVENESS AS MEDIATOR..

Matthies E.*, Merten M.

Otto von Guericke University ~ Magdeburg ~ Germany

Understanding public acceptance of climate policies is critical for their successful implementation. This study examines how information on carbon impacts of specific lifestyle domains influences support of policies aiming to change behavior in these domains . We focused on heating, mobility, and diet—domains often underestimated in their climate relevance in Germany—and conducted a randomized between-subject online experiment (N = 559) with a representative sample of German adults. Participants received one of four information treatments: no information (Control Group, CG), non-differentiating information emphasizing general importance (Experimental Group 1, EG1), or information highlighting differences in impact either through ranked order (Experimental Group 2, EG2) or absolute tons of CO2eq (Experimental Group 3, EG3).

Differentiating information (EG2 and EG3) influenced impact estimations, evaluations of policy effectiveness, and policy support—but only in the heating domain. The format of differentiation (EG2 ranked vs. EG3 absolute tons) did not produce different outcomes. Mediation analyses using the Greed-Efficacy-Fairness (GEF) model showed that perceived policy effectiveness mediated the effect of impact information on policy support. Across all domains, environmental concern was the strongest predictor of policy support and also explained substantial variance (16–33%) in perceived policy effectiveness. Findings suggest that information about carbon impacts can influence policy support in domains where carbon impacts are underestimated.

Abstract 1838

TOXIC MASCULINITY AS A BARRIER TO ENERGY JUSTICE: A BEHAVIORAL FRAMEWORK

Weber B.*[1], Kacperski C.[1], Loos S.[2], Bringmann E.[1], Vogel M.[1], Bielig M.[1]

[1]Seeburg Castle University ~ Seekirchen am Wallersee ~ Austria, [2]Universität Stuttgart ~ Stuttgart ~ Germany

Introduction. A just energy transition is a global imperative, anchored in the Paris Agreement and central to the Sustainable Development Goals. Beyond technical transformation, it requires fundamental shifts in social relations and power structures that govern energy systems. Without justice, transitions risk exacerbating inequalities, excluding vulnerable groups, and undermining legitimacy. Existing frameworks focus on structural and institutional barriers but insufficiently address how gender norms—particularly toxic masculinity—operate at micro-levels, systematically constraining opportunities, motivations, and capabilities of individuals, and thereby reinforcing inequities. This oversight is critical given growing evidence that hegemonic masculine ideologies correlate with resistance to climate action.

Purpose. This research introduces the Gendered Energy Justice Barriers Framework, a behavioral model for understanding how toxic masculinity creates and reinforces gender-based barriers across distributive, procedural, and recognition justice. Building on the COM-B modell (Michie et al., 2011) our framework systematically identifies opportunities, motivations, and capabilities that are constrained by toxic masculinity, thereby creating barriers to just energy transitions.

Method. The framework is developed in a dual approach: (1) deductively integrating hegemonic masculinity theory (Connell, 2002, 2005) with energy justice scholarship to identify how masculine norms undermine a just energy transition, and (2) inductively analyzing the gEneSys Citizen Survey dataset (N = 30,000) from European and Sub-Saharan African countries using multilevel structural equation modeling.

Results and Conclusion. We report which opportunities (e.g., exclusion from energy access), motivations (e.g., resistance to collective solutions), and capabilities (e.g., energy literacy, care responsibilities) are most constrained by toxic masculinity. We explore country-level differences, comparing differences in key conditions such as gender politics or fossil reliance, to see if barrier patterns differ. Our results contribute to applied psychology by clarifying when and where gender norms impede just energy participation, informing scalable, context-aware behavioral and structural solutions fostering just energy systems.

NO LONGER BLAME THE VICTIM: GOVERNANCE, SHARED RESPONSIBILITY AND ORGANISATIONAL FACTORS IN THE MANAGEMENT OF CLIMATE CHANGE-RELATED NATURAL HAZARDS (PART 1)

Friday 24 July 2026 from 08:00 to 09:30

(I-Spadolini)

Anna Heidenreich (Weizenbaum Institute ~ Berlin ~ Germany), Chair and Presenter
Sebastian Seebauer (Joanneum Research ~ Graz ~ Austria), Co-Chair

In (environmental) psychological risk research, there remains a dominant focus on individual perceptions and behavior, often underplaying or even neglecting the broader social, institutional, and political context. This symposium addresses the need to reframe risk as a shared societal challenge, where responsibility does not rest solely with individuals but is negotiated among citizens, institutions, businesses, and policymakers. We highlight the importance of inclusive and participatory approaches to risk governance, in various natural hazards such as floods, heat, and extreme weather events.

The symposium explores how applied psychology can inform and improve the co-design of risk management, the development of shared understandings of risk and coping strategies, and the acceptance of policies in risk communication and mitigation. The first part of the symposium focuses on shared responsibilities of individuals and stakeholders/governance and their interplay concerning natural hazards. The second part focuses on how individual perceptions and vulnerability concerning natural hazards relate to the organisational and built environments they live in.

The contributions address private households, policy stakeholders and primary care personnel to examine perceptions, behaviors, and social dynamics across different stakeholder groups. A particular focus lies on interdisciplinary approaches that combine psychological frameworks with approaches from neighboring disciplines such as serious gaming or system dynamics. All contributions are grounded in theoretical concepts from applied psychology or related fields, advancing both academic understanding and practical applications in risk and crisis contexts.

Abstract 3208

DYNAMIC INTERPLAY BETWEEN SHORT-TERM HOUSEHOLD FLOOD PREPAREDNESS AND LONG-TERM PUBLIC MEASURES: INSIGHTS FROM A SOCIO-HYDROLOGICAL SYSTEM DYNAMICS MODEL

Seebauer S.*[1], Carr G.[2], Lun D.[2]

[1]Joanneum Research ~ Graz ~ Austria, [2]Institute for Engineering Hydrology and Water Resources Management, TU Wien ~ Vienna ~ Austria

Flood damages result from interacting hydrological and social processes. System dynamics models can describe these interactions numerically, generating insights into possible future impacts. This work analyses the interconnections between floods, community-level public flood risk management, and household-level private flood preparedness. A system dynamics model represents the coupled-interactions between household flood damages, public measures at the community level that reduce exposure to flooding, and private measures at the household level that reduce vulnerability to floods. These interactions are conceptualized based on Protection Motivation Theory and are calibrated to empirical data of 3770 household survey responses on flood risk perceptions and preparedness from various locations in Austria. Model scenarios show that continual and increased proactive investments in public measures minimise future damages. However, because public measures might meet financial, technical or social limitations, private household measures could step in to reduce vulnerability. Flood experience increases household preparedness measures. Modelling shows how these reduce vulnerability shortly after flooding. This is particularly valuable in the time-period before public measures that reduce exposure have been implemented. However, household measures decay rapidly, suggesting the need to promote their implementation (ideally prior to flooding), and ensure their continual functioning through support for their operation and maintenance.

Abstract 3209

POLARIZATION IN FLOOD RISK MANAGEMENT? SENSITIVITY OF NORM PERCEPTION AND RESPONSIBILITY ATTRIBUTION TO FREQUENT FLOOD EXPERIENCE

Köhler L.[1], Masson T.[2], Han S.*[3], Kuhlicke C.[2]

[1]Institute of Environmental Science and Geography, University of Potsdam ~ Potsdam ~ Germany, [2]Institute of Psychology, Leipzig University ~ Leipzig ~ Germany, [3]Helmholtz-Centre for Environmental Research-UFZ ~ Leipzig ~ Germany

In this study, we examine the relationship between frequent flood experience (FFE), norm perception, and responsibility attribution. Given that floods are assumed to occur more often in the future and that perceived norms and responsibility attribution are drivers of individual-level protective behavior against them, understanding these relationships is vital. The data for the current study come from a household survey conducted in flood-prone regions of the Federal State of Saxony (Germany) in 2020. We applied regression analyses to test for nonlinear relationships between FFE, responsibility attribution for flood risk management, and perception of social norms supporting private flood-protective behavior. In addition, we tested for moderating effects of these relationships. We identified three key findings. First, the relationship between experience and responsibility attribution follows a nonlinear path: as individuals experience multiple flood events, the gap between assigned responsibility to the self/the community vs. the city/the state widens. Changes in norm perceptions after frequent flood experience are less dynamic. Second, under consideration of interaction effects, we find increasing discrepancies in responsibility attribution and perception of social versus personal norms after the third flood event, depending on self-efficacy, control beliefs, and ingroup identification. Third, we observe a diverging trend between perceived norms for protective behavior and responsibility attribution to the self/the community. These findings suggest a potential polarization in flood risk management, shaped by the perceived ability to manage floods and the social environment.

Abstract 3210

"WHY DON'T YOU WANT ME?" EXPLORING ACCEPTANCE AND USE OF WARNING APPS IN A GERMAN SAMPLE

Heidenreich A.*, Kox T.

Weizenbaum Institute ~ Berlin ~ Germany

Warning applications for smartphones (short: warning apps) are a tool to inform citizens on imminent dangers. It can save lives and prevent damage when people receive relevant warnings about possible natural hazards (e.g., flooding, heat wave, storm), but also chemical accidents, terrorist attacks or other events that may cause harm.

In Germany most people do not use official warning apps even though they are free of charge. This study aims at analysing factors that explain if people do or do not download and use an official warning app. In order to explore people's behavioural motivations and acceptance, we refer to two theoretical frameworks: the Risk Information Seeking and Processing Model (RISP, Griffin, Dunwoody, & Neuwirth, 1999) and the Unified Theory of Acceptance and Use of Technology (UTAUT, Venkatesh, Thong, & Xu, 2012).

The survey is planned to be carried out in Autumn 2025 with a German online-representative sample of N=1000. The questionnaire was based on different theoretical assumptions, especially the RISP and the UTAUT. With this combined RISP/UTAUT approach we aim at understanding different paths on warning app understanding and use. By applying regression analyses and structural equation modelling we explore how risk perceptions concerning different hazards, information preferences, awareness of warning apps, and technology-related assumptions and motivations influence people's warning app use.

We expect that this study's findings may give implications for improvements in the German warning communication. Official warning policies can differ broadly between countries, but we discuss which findings may be transferable to other national contexts.

Abstract 3211

LOOKING FORWARD, ANCHORED IN THE PAST: HOW BELIEFS OUTWEIGH PERSONAL EXPERIENCE IN POLICY SUPPORT

Skipor S.*, Bergquist M.

University of Gothenburg ~ Gothenburg ~ Sweden

For governments to implement effective adaptation and mitigation policies, they typically require a public mandate, often expressed through voting support. Building on this, we examine how personal experiences with natural hazards translate into voting intentions for politicians who advocate such policies, highlighting the critical interplay between citizen psychology and the political system. First, a 13-week longitudinal study of nearly 2,000 Americans tested whether weekly fluctuations in heatwave experiences drove changes in policy voting intentions. It revealed that while experiences were related to increased climate concern, voting support for both adaptation and mitigation policies remained stable, with support being more strongly related to climate change concern, pre-existing beliefs, and political affiliation. A second cross-sectional study across four countries (N=1,295) and multiple hazards (e.g., floods, storms, droughts) revealed that the relationship between experience and voting intentions was not direct, but mediated by expectations of future severe weather and climate change concern. Together, these findings challenge assumptions that direct experience automatically fuels political demand. Instead, they show that policy support is a function of complex socio-psychological processes, where personal experience is filtered through future expectations, pre-existing concerns, and beliefs. For risk governance, this underscores that simply communicating past events is insufficient. To build the public mandate necessary for societal-level responses, communication must engage with the public's shared vision of the future while taking into account pre-existing beliefs.

Abstract 3212

FACTORS INFLUENCING RESILIENCE OF OLDER PEOPLE TO EXTREME WEATHER EVENTS - WHAT DO STAKEHOLDERS WORKING WITH THIS GROUP NEED TO KNOW?

Setti A.*[1], Stitzel A.[2], Mccarthy N.[1], Lawrance E.[3], Timmons S.[1]

[1]University College Cork ~ Cork ~ Ireland, [2]Carinthia University of Applied Sciences ~ Villach ~ Austria, [3]Imperial College London ~ London ~ United Kingdom

When discussing the effects of climate change-related events and disaster preparedness in vulnerable groups, the emphasis is often put on the risk factors. In this systematic review we adopt a strength-based approach exploring the factors determining a resilient response to climate disasters and chronic climate change in older people. We focus on individual psychological factors, while considering the systems (family, community, health sector, etc.) the individual is part of, and how they can positively impact individual resilience. The findings are evaluated jointly with older climate change activists and Health and Social Care Professionals (HSCP). The aim of this study is to determine the factors promoting resilience in response to climate change-related events in older adults, informing the design and realization of a microcredential for HSCP working with older people. The preliminary findings of the review have been presented and discussed with older climate activists and HSCP in two focus groups.

5249 titles were screened and 17 were included. The results show that the literature focuses on climate disasters instead of slow-paced changes. The most explored enabling factor is social relationships, including emotional support. Behaviours enabling resilience are connecting with nature, establishing routines or reinstating previous habits. Cognitive dimensions explored are learning from past experiences, climate change education and finding meaning in daily activities. An interpretative framework and recommendations for HSCP training were derived from discussing the results with the stakeholder groups. This study identifies enabling factors for climate-change mental resilience to climate disasters that HSCP should consider when working with older people in the community as well as gaps in the field identified jointly with HSCP and older activists. These are discussed in relation to current theories on ageing and the implications for disaster preparedness.

The contributions address private households, policy stakeholders and primary care personnel to examine perceptions, behaviors, and social dynamics across different stakeholder groups. A particular focus lies on interdisciplinary approaches that combine psychological frameworks with approaches from neighboring disciplines such as serious gaming or system dynamics. All contributions are grounded in theoretical concepts from applied psychology or related fields, advancing both academic understanding and practical applications in risk and crisis contexts.

Abstract 3214

IN WHICH CONTEXTS DO WE MELT AWAY? AN EXPERIENCE SAMPLING STUDY OF PSYCHOLOGICAL SENSITIVITY TO EXTREME HEAT

Glunz E.*[1], Nybo L.[2], Kingma B.[2], Flouris A.[3], Lerche C.M.[4], Pihl C.[4], Lund M.[2], Vliora M.[3], Gkkas G.[3], Mantzios K.[3], Lavelle--Hill R.[1]

[1]University of Basel ~ Basel ~ Switzerland, [2]University of Copenhagen ~ Copenhagen ~ Denmark, [3]University of Thessaly ~ Thessaly ~ Greece, [4]Bispebjerg Hospital ~ Copenhagen ~ Denmark

Individual sensitivity to adverse effects from climate hazards such as extreme heat is an essential component of vulnerability. For psychological wellbeing in particular, affective and cognitive sensitivity to environmental stressors is a key mechanism that shapes the extent to which people are affected. In this study, we aim to quantify this psychological sensitivity to heat and explore the situational contexts in which it becomes especially pronounced. To do so, we collect experience sampling survey data across multiple countries with a mobile app for Android and iOS devices. Based on GPS and time stamps, we then combine this intensive longitudinal data with secondary data such as weather (e.g., temperature, humidity) and geospatial (e.g., land cover) parameters. We operationalize psychological heat sensitivity as the within-person effect of heat exposure on affect and attentional control. To better understand when this sensitivity is heightened, we examine the moderating effect of environmental conditions (e.g., greenness), situational work demands (e.g., level of intellect required), and thermoregulating behaviors (e.g., wearing lighter and looser clothing). We present preliminary results showing how responses to heat fluctuate over time while also accounting for differences between individuals using multilevel models. This study contributes to methodological advancements in the quantification of psychological sensitivity to climate hazards as well as valuable insights into how adaptive capacities become relevant in daily life to prevent the negative consequences of extreme heat. In turn, this knowledge can support policy development towards more heat-resilient urban environments and work schedules, as well as offer guidance on the most effective protective actions.

Abstract 3215

HEAT AND EXTREME WEATHER EVENTS IN PRIMARY CARE IN AUSTRIA - PRELIMINARY RESULTS FROM A QUANTITATIVE STUDY AND TOOLKIT DEVELOPMENT

Stitzel A.*[1], Bregulla I.[2], Schauer--Berg J.[2], Flamm M.[2]

[1]Carinthia University of Applied Sciences ~ Villach ~ Austria, [2]Paracelsus Medical University ~ Salzburg ~ Austria

Climate change is intensifying extreme weather events such as heatwaves, floods, and landslides, impacting all Austrian federal states. Among all sectors healthcare faces the most severe societal impacts of climate change due to more frequent heatwaves impacting an aging population. Being the first point of contact to the health system, primary care (PC) is at the forefront of addressing these challenges. Considering that the floods in Lower Austria in 2024 disrupted services in 32 medical practices, including 14 general practices, it becomes clear that PC is also severely affected. The HEX-PV project aims to develop, pilot, and evaluate a disaster preparedness and response toolkit for PC settings, focusing on climate-related extreme weather events. The project is conducted in collaboration with PC facilities in two Austrian federal states. The HEX-PV project uses a multi-phase applied research design: expert surveys, workshops, and an intervention phase piloting the toolkit. The baseline survey will assess knowledge, experiences, preparedness, and needs for extreme weather events. The survey will be tailored to the Austrian PC and will form the basis for the toolkit development. Preliminary findings from a prior research project indicated significant gaps in preparedness and risk communication for extreme weather events in PC, highlighting the need for tailored materials and tools to enhance response capabilities. At the time of ICAP, the results from the HEX-PV baseline survey will be available shedding further light on competence levels, perceived roles and needs of PCPs in disaster preparedness and response. PC plays a critical role in addressing the health impacts of climate change. The HEX-PV project lays the groundwork for practical, context-specific interventions to improve disaster preparedness and resilience in Austrian PC.

Abstract 3216

TALES FROM THE TIMBERLINE: STORYTELLING, SELF-EFFICACY, AND TEMPORAL RISK COMMUNICATION FOR NATURAL HAZARDS. INSIGHTS FROM STAKEHOLDER PARTICIPATION IN MOUNTAIN REGIONS

Graf J.*, Renner R., Mayr--Veselinovic C.

Technical University of Leoben ~ Leoben ~ Austria

Early warning systems play a central role in natural hazard communication, yet they remain largely confined to short-term alerts. While effective in immediate crisis response, they often fail to promote preparedness or to support long-term climate adaptation. This contribution examines how narrative approaches, particularly storytelling, can address these limitations by strengthening self-efficacy and providing a temporal link between urgent warnings and broader adaptive strategies.

Drawing on a participatory stakeholder workshop process in alpine regions, we analyze how storytelling creates cultural resonance, fosters trust, and engages emotions in ways that traditional risk communication rarely achieves. We assume that narratives not only increase awareness of hazards but also empower communities by reinforcing their belief in their own capacity to act. In this sense, storytelling becomes a bridge between institutional responsibility and local agency, enabling communities to move from passive recipients of warnings to active agents of resilience.

Our findings suggest that embedding participatory and narrative methods into hazard communication can generate communication practices that are both psychologically effective and culturally anchored. Such approaches integrate immediate responses with long-term preparedness, ensuring that warnings are not experienced as isolated signals but as part of a broader cultural dialogue about risk, adaptation, and resilience. By situating hazard communication within lived experience and shared cultural frameworks, storytelling can help close the gap between technical expertise and community engagement.

Ultimately, this study highlights the value of narrative-based, participatory approaches for achieving more sustainable forms of temporal risk communication in mountain regions. Storytelling not only enriches early warning systems but also contributes to building resilient, adaptive communities capable of facing the challenges of a changing climate.

Abstract 3217

GAMIFIED DISASTER EDUCATION: A SYSTEMATIC REVIEW OF SERIOUS GAMES ON DEALING WITH NATURAL HAZARDS AND THEIR IMPACTS ON PLAYERS

Heidenreich A.*[1], Wankmüller F.[2], Kox T.[1]

[1]Weizenbaum Institute ~ Berlin ~ Germany, [2]Independent Researcher ~ Zurich ~ Switzerland

Natural hazards pose a threat to human life and health. As a tool of risk communication and disaster education Serious Games (SG) are applied much more frequently. Even though an increase in research on SG is observable, there is not much known on SG's actual impacts on the players. This systematic review gives an overview of existing publications on SG dealing with natural hazards and evaluations of their reported effects on users.

The review consists of 132 papers published between 2007 and 2025. The analysis shows that most publications describe digital SG; analogue (e.g., tabletop or board/card games) or hybrid games (a mix of different modalities) were discussed less frequently. Often, one SG dealing with just one natural hazard is discussed, but also games dealing with multiple natural hazards were observed. Flooding is the hazard addressed most frequently. 23 publications only introduce and describe the serious game(s), while about half of the publications (N=67) report a usability evaluation of the game. This presentation focuses on the 42 publications that also include an evaluation on the SG's impact on the player(s).

Most of these impact evaluation studies do not apply any theoretical frameworks for the game development and/or evaluation processes. Among the few mentions theories by Albert Bandura and Mihaly Csikszentmihalyi appear most frequently. We critically discuss the applied evaluation methods in the background of the explored impacts. We see a peak in findings on mostly positive effects on knowledge and awareness. Behaviour, motivation, and intention, as well as competencies and further psychological impacts are explored only in few publications. We discuss implications on future research in the field and throw a critical view on the use of SG in disaster communication and education.

Abstract 3218

“ALL IN THE SAME BOAT”: PROGRESS AND NEXT STEPS FROM A SERIOUS GAME ABOUT FLOOD RISK PREPAREDNESS AND POLICY MAKING

Raffo R.*, Bracco F.

University of Genoa ~ Genoa ~ Italy

Flood events are among the most frequent and disruptive natural hazards worldwide, with significant social, economic, and environmental consequences. Despite increasing awareness of climate change and extreme weather, effective preparedness at the community level often remains limited. Serious games, tools designed with both educational and engaging purposes, offer an innovative pathway to enhance risk awareness and promote proactive behaviors in crisis scenarios putting the trainee in the center of its own education. This project presents the design and early development of a serious game named “All in the same boat” aimed at improving flood risk preparedness among diverse target audiences, including students, local stakeholders, and emergency response actors. The game integrates realistic flood scenarios and decision-making challenges (e.g negotiating decisions based on limited resources) to foster experiential learning and collective problem-solving. Its design framework draws upon multiple interdisciplinary approaches, combining insights from hydrology, risk communication, environmental psychology and educational sciences. We present a prototype, along with preliminary feedback from pilot testing sessions. Special attention will be given to the balance between scientific accuracy and playability, as well as to the adaptability of the game to different socio-cultural contexts. This contribution highlights the potential of serious games as innovative tools for disaster risk reduction and offers practical reflections on their design process, challenges, and opportunities for broader implementation in flood-prone regions.

04 - Division 4: Environmental Psychology

FROM RESISTANCE TO EMBRACE: SOCIAL-PSYCHOLOGICAL PATHWAYS TO SUSTAINABLE TECHNOLOGIES ACCEPTANCE

Friday 24 July 2026 from 11:00 to 12:30

(I-Spadolini)

Alessandro Milani (Department of Psychology of Developmenta), Chair and Presenter

This symposium explores how psychology can support the social acceptance and individual engagement necessary for
the success of sustainable innovations. Technological solutions to climate and environmental challenges are, indeed,
evolving fastly, but their impact hinges on widespread acceptance (and adoption).
The novelty of this symposium lies in its integration of diverse behavioral and psychological approaches to
understanding public reactions to emerging sustainable technologies and practices. It is particularly pertinent to the
Congress theme of addressing global sustainability challenges by bridging scientific insights with real-world
implementation. The symposium combines five empirical studies, each offering a unique angle on the social
psychological drivers and barriers to sustainable engagement.
Patrizia Catellani will present the first contribution, which investigates how matching mobile app messages to users'
regulatory focus (promotion vs. prevention) can enhance engagement with digital tools that promote sustainable diets.
This study highlights the role of motivational fit in fostering pro-environmental behavior through tailored
communication.
The second presentation, by Sergio Vila-Tojo, examines the free-rider effect in adopting recycled water. It
demonstrates how a strong sense of moral obligation can counteract disengagement when individuals perceive their
contribution as nonessential, particularly in behaviors with high personal costs.
Alessandro Milani will present the third talk, focusing on stakeholder engagement in the bioeconomy transition. By
combining large-scale stakeholder mapping with qualitative interviews, this study offers a framework for identifying
and addressing belief-based barriers and drivers to the acceptance of bio-based materials.
The fourth study by Gonzalo Palomo-Vélez explores public trustinhydrogenenergyinitiatives.Itshowshow
company history andperceivedreputationmanagementinfluencetrustandacceptance,particularlywhenfossilfuel
companiespromotegreeninnovation.
Finally, Nadja Contzen will discuss global perceptions of Solar Radiation Management (SRM), emphasizing
distributive justice concerns and cross-cultural differences in acceptance. The study underscores how perceived
fairness, especially in the Global South, shapes public support for controversial climate interventions.
Together, these presentations offer complementary insights into the social-psychological

dimensionsofsustainable change,showing how motivations,trust,and justiceperceptionsshapeacceptanceandengagementwith environmentalinnovations.

Abstract 4101

HOW REGULATORY FIT AND ANTICIPATED EMOTIONS INFLUENCE THE ENGAGEMENT OF USERS OF A SUSTAINABLE NUTRITION APP

Catellani P.*[1], Festa S.[2], Pompili S.[2], Azzena I.[2], Guidetti M.[3], Scaglioni G.[3], Carraro L.[4], Lenzi M.[4], Scatolon A.[4], Cavazza N.[3], Carfora V.[1]

[1]Department of Psychology, Università Cattolica del Sacro Cuore, Milano, Italy ~ Milano ~ Italy, [2]Department of International Humanistic and Social Sciences, Università degli Studi Internazionali di Roma, Italy ~ Roma ~ Italy, [3]Department of Communication and Economics, Università di Modena e Reggio Emilia, Italy ~ Modena ~ Italy, [4]Department of Developmental and Social Psychology, Università di Padova, Italy ~ Padova ~ Italy

Mobile apps can effectively promote healthy and sustainable diets, but their success depends on initial user engagement. This study aimed to increase initial user engagement by tailoring app descriptions to users' regulatory focus (prevention versus promotion). Four conditions were created by combining two types of messages: regulatory concern (safety versus growth) and anticipated emotion (positive versus negative). The safety message emphasized protecting health and the environment, while the growth message emphasized improving wellbeing and preserving the environment. The message with the positive anticipated emotion described satisfaction with using the app, while the message with the negative anticipated emotion described dissatisfaction with not using the app. Participants' attitudes, desires, and intentions, as well as downloads of the app, were measured to assess the effectiveness of the message. Promotion-focused individuals showed greater desire and were more likely to download the app when the message matched their focus (growth + positive anticipated emotions) than when it did not (safety + negative anticipated emotions). Conversely, prevention-focused individuals did not show increased engagement with regulatory congruent messages. These results suggest that tailoring app descriptions to users' regulatory focus may increase initial engagement among promotion-focused individuals. Further research is needed to investigate methods to increase engagement among prevention-focused individuals.

Abstract 4102

CAN FREE-RIDERS EMERGE AND HINDER THE PUBLIC ACCEPTANCE OF RECYCLED WATER?

Vila Tojo S.*[1], Gómez--Román C.[1], Docampo--López L.[2], Docampo--López L.[2], Sabucedo J.M.[2]

[1]CRETUS. Department of Social Psychology, Basic Psychology and Methodology, University of Santiago de Compostela, Santiago de Compostela, Spain ~ Santiago de Compostela ~ Spain, [2]Institute of Psychology (IPsiUS). Department of Social Psychology, Basic Psychology and Methodology, Universidade de Santiago de Compostela, Spain. ~ Santiago de Compostela ~ Spain

As pro-environmental behaviours become more common, there is a risk that some individuals perceive their personal contribution to the environmental goal as unnecessary. This is known as the free-rider effect—benefiting from collective efforts and results without actively participating. This effect tends to emerge when behaviours involve high perceived costs, such as the use of recycled water. Despite being the result of a strict purification process, recycled water often generates public reluctance, especially for uses involving direct body contact (e.g., drinking).

This study explored the potential development of the free-rider effect in the context of promoting recycled water and examined whether high levels of moral obligation could counteract it, particularly when the behaviour requires greater personal sacrifice. A representative sample of 400 participants from the Galicia (Spain) completed a questionnaire measuring free-rider tendency, moral obligation, acceptance of recycled water, and willingness to pay for both high- and low-body contact uses. Data collection was conducted in person, online, and via telephone.

Results showed that 34.75% of respondents believed their individual effort was unnecessary if others used recycled water—an indicator of the free-rider effect. However, participants who felt morally obligated, even while perceiving their action as nonessential, reported higher acceptance ($F = 8.363$, $p = .004$) and greater willingness to

pay ($F = 5.763$, $p = .017$) for high-contact uses. No significant effects were found for low-contact uses.

These findings suggest that the free-rider phenomenon could threaten the adoption of recycled water. “Benefiting without contributing” may be appealing to many individuals who perceive a high cost in using recycled water. The spread of this belief could trigger a spillover effect, undermining existing social agreements and hindering the implementation of the recycled water. Nevertheless, a strong sense of moral obligation appears to act as a protective factor, encouraging engagement despite cost-related concerns.

Abstract 4103

SHAPING SOCIAL ACCEPTANCE: WHAT STAKEHOLDERS BELIEVE ABOUT BIO-BASED MATERIALS AS BARRIERS OR DRIVERS FOR THEIR ADOPTIO

Milani A.*[1], Nuccio L.[2], Cataldi S.[1], Talamo A.[1], Bonaiuto M.[1]

[1]Department of Psychology of Developmental and Socialization Processes, Sapienza University of Rome, Italy ~ ROME ~ Italy, [2]Department of Engineering "Enzo Ferrari", University of Modena and Reggio Emilia, Italy ~ Modena ~ Italy

The transition toward sustainable bio-based materials is central to addressing Europe's environmental, societal, and economic challenges. The EC Horizon NEXT-STEP project (n. 101157081) aims to develop socially accepted and economically viable bio based chemical platforms and polymers in this context.
The present research adopts a mixed-method approach to identify and engage relevant stakeholders to support this effort. The first study identified and assessed a sample of 431 stakeholders through ex-ante strategies (e.g., desk research, expert workshops) and
ad-hoc assessments provided by 22 internal experts. These stakeholders served as the basis for a web-based snowball sampling procedure, tracking their hyperlink connections to identify further relevant actors. All stakeholders were classified according to the Quintuple Helix model (Academy, Business, Government, Community, and Media) and positioned within a Power-Interest Matrix. The resulting large-scale hyperlink network revealed distinct clusters of highly connected stakeholders, offering strategic insights for targeting engagement efforts.
Building on this foundation, a second qualitative study involved semi-structured interviews with a selection of mapped stakeholders to investigate perceived barriers and facilitators to the social acceptance of NEXT-STEP's final products (e.g., bio-based foams, shoe soles, insulation materials). Adopting the theoretical lens of the i-SETA model, the results highlighted beliefs distributed across three domains: technological features (e.g., technology performance), contextual beliefs (e.g., presence/lack of institutional support), and social-psychological characteristics of the adopters (e.g., biospheric values).
These findings offer actionable insights for designing engagement strategies that address stakeholder-specific concerns and leverage key motivational drivers.
While web-based mapping may overlook offline relationships, combining it with qualitative insights enables a more profound, belief-driven understanding of stakeholder dynamics. Together, the two studies support an inclusive and evidence-based framework for enhancing the social acceptance of sustainable bio-based technologies.

Abstract 4104

GREEN HYDROGEN FUELS ACCEPTABILITY, A PAST IN RENEWABLES FUELS TRUST: PUBLIC PERCEPTIONS OF ENERGY COMPANIES AND THEIR HYDROGEN INITIATIVES

Palomo--Vélez G.*, Pielaviciute G., Contzen N., Steg L.

Faculty of Behavioural and Social Sciences, Rijksuniversiteit Groningen, Groningen, The Netherlands ~ Groningen ~ Netherlands

Hydrogen is gaining interest as a clean energy source from both governments and fossil fuel companies. For hydrogen projects to succeed, securing public acceptability is crucial,
with trust in the implementing actors playing a central role. Drawing from reputation management and attribution theory, we experimentally evaluated whether people's perceptions of energy companies wanting to start producing hydrogen for sustainability reasons differ based on two features of hydrogen production. Specifically, we examined the influence of (1) the type of hydrogen (blue versus green) and (2) the energy company's
history in energy production (fossil fuels versus renewables) on perceptions of how much
companies are engaged in reputation management, as well as on trust –both in general and based on integrity and competence. We further explored whether perceived reputation
management –the belief that companies adopt hydrogen mainly to enhance their image–
explains these effects on trust, and whether the experimental factors also impact public acceptability of hydrogen production itself. Results indicated that people perceived the company with a history of working with fossil fuels as trying to improve its reputation more than one associated with renewables, and trusted it less. Furthermore, perceived reputation management explained the lower (general and integrity-based) trust people had
for companies with a past in fossil fuels. For public acceptability of hydrogen, the company's history was not relevant, with green hydrogen being more acceptable than blue, regardless of which company produced it. We discuss these findings in relation to the literature on public perceptions of hydrogen.

Abstract 4105

JOINT BUT NOT JUST: PUBLIC PERCEPTIONS OF FAIRNESS IN SOLAR RADIATION MANAGEMENT DEPLOYMENT

Contzen N.*[1], Palomo--Vélez G.[2], Perlaviciute G.[3], Steg L.[3]

[1]Department of Environmental Social Sciences, Eawag: Swiss Federal Institute of Aquatic Science and Technology, Dübendorf, Switzerland ~ Dübendorf ~ Switzerland, [2]Faculty of Behavioural and Social Sciences, University of Groningen, Groningen, Netherlands ~ Groningen ~ Netherlands, [3]Institute of Social Sciences, O'Higgins University, Rancagua, Chile ~ Rancagua ~ Chile

Solar Radiation Management (SRM) has been proposed as a last resort to limit global warming to 1.5 °C. However, its use is controversial due to potential risks, such as changes in precipitation. These risks, along with the benefit of cooling, would cross national borders and be unequally distributed across regions, which raises important ethical concerns about distributive and procedural justice. To inform socially responsible decision-making on SRM deployment, it is important to consider public opinion, particularly in the Global South, which is most vulnerable to both global warming and SRM-related risks.

We conducted a cross-cultural study involving students (N = 4,583) and members of the general public (N = 2,248) from 20 countries across all inhabited continents, including the Global South and 'non-WEIRD' (i.e., non-Western, Educated, Industrialized, Rich, and Democratic) countries in the Global North. Because public awareness of SRM is typically low, participants were provided with balanced information on SRM, including scientific arguments for and against its use and on its governance. We assessed perceptions of how SRM's costs and benefits might be distributed across countries, as well as evaluations of the justifiability of different deployment scenarios.

Across countries—and especially in the Global South—participants generally perceived SRM's consequences as unevenly distributed. They viewed unilateral deployment by a single country as the least justifiable and joint deployment by all or most countries as the most justifiable. Moreover, the more uneven participants perceived the distribution of SRM's consequences, the more they judged all deployment scenarios as unjustifiable.

This association was strongest for unilateral deployment and weakest for joint

deployment.

Our findings suggest that while joint deployment is viewed more favorably than unilateral action, it cannot compensate for concerns about the perceived unfair distribution of SRM's consequences.

TOWARDS A JUST ENERGY TRANSITION: PSYCHOLOGICAL PERSPECTIVES, NARRATIVES, AND COMMUNITY

Friday 24 July 2026 from 14:00 to 15:30

(I-Spadolini)

Nicola Rainisio (University of Milan ~ Milan ~ Italy), Chair and Presenter
Marino Bonaiuto (Department of Psychology of Developmenta), Discussant

The transition to more sustainable energy systems is widely recognized as a central challenge in addressing the current ecological crisis. Moving beyond technocratic paradigms, this transformation is increasingly framed as a process of social and community-driven innovation (Steg et al., 2015; Hoppe & De Vries, 2018). Far from being a neutral shift, it raises critical questions concerning social justice, public participation and acceptance, place-based and group identities, and the capacity of communities to envision and shape their own energy futures (Jenkins et al., 2016; Perlaviciute & Steg, 2014; Walker & Devine-Wright, 2008). A just energy transition involves not only the outcomes of change, but also the broader discourses, the processes through which change is enacted, and the ways in which power asymmetries are recognized and addressed.
This symposium brings together psychological contributions that critically examine how individuals and communities interpret, negotiate, and engage with the energy transition. Ricardo Garcia-Mira examines the psychological consequences of decarbonization in carbon-intensive European regions, showing how economic insecurity and weakened place attachment can negatively affect well-being and increase migration intentions. Mauro Sarrica and Sonia Brondi address epistemic injustice in Italian energy debates, showing how technocratic framings sideline community perspectives and limit public engagement. Gonzalo Palomo-Velez, Jelle Loonstra, Goda Perlaviciute, and Linda Steg investigate how the type of hydrogen and the level of development of the exporting country shape perceptions of distributive fairness, trust in government, and public acceptability of hydrogen import policies in the Netherlands. Finally, Nicola Rainisio and Marco Boffi review how the academic community frames gender in domestic energy practices research, revealing a predominant focus on binary categories and individual behaviors, while often neglecting social and intersectional dimensions. Together, these contributions demonstrate how psychological research can illuminate the social, symbolic, and emotional dimensions of energy transitions. By attending to issues of justice, identity, and participation, they call for a more inclusive and reflexive approach to sustainability-one that recognizes communities not just as targets of policy, but as active agents in shaping just and livable energy futures.

Abstract 4149

DOES DECARBONISATION LEAD TO PSYCHOLOGICAL DE-TERRITORIALISATION? AN EMERGING CHALLENGE FOR A JUST TRANSITION IN CARBON-INTENSIVE REGIONS

Garcia Mira R.*

University of A Coruna ~ Coruna ~ Spain

Decarbonisation of economies has become a major policy focus in many European countries to meet carbon emission targets as outlined in the Paris agreement. However, the discontinuation of large-scale carbon intensive industries may cause a local disruption of the economy and reduce the source of income and employment for a large part of the population in coal- and carbon-intensive regions, which in turn will accelerate the process of de-territorialisation as indicated in citizens leaving the regions. The European commission has promised a just transition for these regions, so that nobody feels left behind in this transition, but the actual impact of decarbonisation measures on the psychological level still requires more scrutiny. In this presentation, we will analyse the psychological impact of decarbonisation measures and their relation with place attachment on people's intentions to migrate from these regions and their level of overall life satisfaction, which are important driving factors for the de-territorialisation process. We also explore the impact of gender, age, education, nativity and duration of stay in the region on their decision to migrate and their level of life satisfaction. We use data from a quantitative survey (n =2892) in 13 coal- and carbon-intensive regions in 9 European countries and employ a structural equation modelling approach with subgroup analyses. In the analysis, we find that the place attachment plays an important role in increasing life satisfaction and reducing the intention to relocate, while perceived stress and financial threats have an opposite impact.

Abstract 4150

SILENCED AND LOCKED-IN: EPISTEMIC INJUSTICE AND REPRESENTATIONS OF ENERGY TRANSITION IN ITALY

Sarrica M.*[1], Brondi S.[2]

[1]CIRPA & University of Padova ~ Padova ~ Italy, [2]Ca' Foscari University of Venice ~ Venice ~ Italy

This contribution presents findings from a series of quali-quantitative studies conducted in Italy since 2010 on the social construction of "energy transition", "decarbonisation", and the "just transition". Initially guided by Social Representations Theory (SRT), these studies progressively uncovered the systemic injustices embedded within transition processes, with a specific focus on epistemic injustice. The findings reveal how knowledge that challenges hegemonic, technocentric representations is often marginalised or silenced. Alternative, situated, and community-based discourses struggle to gain legitimacy within public and policy arenas dominated by top-down narratives and decision-making structures. The studies highlight how these dynamics hinder the potential for radical and inclusive transformations. Widespread mutual distrust, denial of environmental and social risks, and a pervasive sense of the impossibility of effective solutions contribute to a collective state of lock-in. Furthermore, the inability to translate between different knowledge systems — from institutional to local, from technical to experiential — exacerbates the marginalisation of vulnerable groups and alternative visions for the future. Models advocating for decentralized and transformative approaches are either suppressed or subordinated to dominant discourses that favor technological substitution and continuity. These processes operate at multiple levels: societal, community, and interpersonal. Overall, the results underscore the crucial role of local communities as discursive arenas where dominant narratives can be appropriated, resisted, or reconfigured. By exposing the mechanisms of epistemic injustice within Italy's energy transition, this contribution advocates for more inclusive, pluralistic, and dialogic approaches to shaping sustainable energy futures.

Abstract 4911

DO DEVELOPMENT ASYMMETRIES SHAPE PUBLIC PERCEPTIONS OF HYDROGEN IMPORT POLICIES?

Palomo--Vélez G.*, Loonstra J., Perlaviciute G., Steg L.

Rijksuniversiteit Groningen (University of Groningen) ~ Groningen ~ The Netherlands

Hydrogen is a key component of European decarbonization strategies. Because projected domestic production is unlikely to meet future demand, several European countries, including the Netherlands, are planning to rely on international hydrogen supply chains. Public evaluations of hydrogen import policies will therefore be shaped not only by technological characteristics but also by how international partnerships are perceived — particularly given that certain trade configurations may be seen as reproducing extractivist patterns. Building on this, here we examined how hydrogen type (blue vs. green) and the development level of the exporting country (comparable to vs. less developed than the Netherlands) shape perceived distributive fairness, trust in the Dutch government, and public acceptability of hydrogen import policies. We conducted a preregistered experiment in which Dutch participants evaluated a set of realistic hydrogen import policy scenarios varying in hydrogen type and trading partner characteristics. Results showed that policies involving green hydrogen and development comparable trading partners were rated as more acceptable, fairer, and elicited higher trust in the Dutch government. Furthermore, the positive effect of green hydrogen on perceived fairness was stronger when paired with a development-comparable trading partner than with a less developed one. Similarly, the positive effects of both manipulations on trust in the Dutch government were stronger for integrity-based than competence-based trust. These findings advance understanding of the social conditions under which international hydrogen trade may gain or lose public legitimacy.

Abstract 4152

CONSTRUCTING GENDER IN ENERGY SCHOLARSHIP: NARRATIVE DIMENSIONS AND JUSTICE IMPLICATIONS

Rainisio N.*, Boffi M.

University of Milan ~ Milan ~ Italy

As energy transitions become central to addressing the ecological crisis, increasing attention is being paid to the social dimensions of change, including questions of equity, recognition, and participation. Within this broader conversation, gender has emerged as a relevant—yet often underexamined—factor in shaping how individuals engage with energy systems. Understanding how gender is framed in academic research can offer valuable insights into the inclusivity of mainstream narratives and the extent to which they reflect diverse lived experiences. Our contribution explores how academic research has framed the relationship between gender and domestic energy practices, with particular attention to the underlying narratives and assumptions that shape this body of knowledge. A systematic review of the studies published between 2010 and 2023 was conducted to identify how gender is conceptualized and operationalized within the context of energy-related behaviors in the home. The findings reveal a growing interest in gendered dimensions of energy use, often emphasizing women's greater propensity for energy-saving behaviors. However, many studies rely on binary categorizations and focus on individual-level factors, offering limited engagement with the social, cultural, and symbolic aspects of gender. Non-binary identities and intersectional dynamics are rarely considered, and qualitative approaches remain underrepresented. Some contributions, particularly from the Global South, introduce more context-sensitive perspectives, though these remain the exception rather than the rule. Those results suggest that broadening conceptual frameworks to include more nuanced and socially grounded understandings of gender could enhance the relevance of psychological research in promoting a just and inclusive energy transition. Greater attention to identity, culture, and power relations in scholarly narratives may help illuminate the diverse ways in which people engage with energy systems, and support more equitable policy and practice.

THE ANIMAL AMBASSADOR EFFECT ON HUMAN PRO-ENVIRONMENTAL KNOWLEDGE, ATTITUDES, AND BEHAVIOURS: A SCOPING REVIEW

Oliva J.*, Imray K., Thomas M.

James Cook University ~ Townsville ~ Australia

Biodiversity loss, a largely anthropogenically driven phenomenon, represents a monumental challenge for both the natural and human world that has serious repercussions. Animal Ambassadors are used by zoological parks and similar institutions to provide close encounter experiences to visitors designed to enhance pro-conservation sentiments. A scoping review was undertaken to assess the animal ambassador effect on human pro-environmental knowledge, attitudes and behaviours, following the PRISMA-ScR guidelines. A search was conducted using the databases Medline, PsycInfo, Scopus and Web of Science, and a grey literature search was undertaken using the ProQuest Dissertation and Theses Global Database, along with the search engine Google (advanced search) and Google Scholar (advanced search). The results demonstrate some acute gains in pro-environmental sentiments; however, longitudinal studies indicate these are largely lost overtime. The importance of the animal in animal ambassador programs is also questioned, with other alternative educational experiences discussed.

Abstract 918

CLIMATE FATIGUE AND YOUTH AGENCY: INTEGRATING QUANTITATIVE PATHWAYS AND QUALITATIVE NARRATIVES IN THE GLOBAL SOUTH

Gayatri R.*, Phogat S.

Gurugram University ~ Gurugram, Haryana ~ India

Introduction:
Climate change is a universal challenge, but its psychological impacts vary across cultural and socio-economic contexts. In rapidly urbanizing India, young people face climate stressors alongside a constant flow of information through digital media. This dual exposure heightens eco-fatigue: a state of exhaustion and disengagement- yet also positions youth as pivotal actors in sustainability transitions. While eco-anxiety has been widely examined in Western contexts, little is known about eco-fatigue in the Global South or how it can be redirected into eco-agency, defined as proactive environmental engagement.
Purpose:
The study investigates whether eco-fatigue can be reframed as eco-agency through the mediating roles of psychological ownership and collective efficacy, while also considering how contextual factors such as collectivist cultural values, and social support may strengthen or weaken this transformation.
Method:
A mixed-method design will be employed. In Phase 1, a cross-sectional survey of 400 university students and early-career professionals in metropolitan India will measure eco-fatigue, ownership, efficacy, and pro-environmental behaviour. Structural equation modelling will test hypothesized pathways. In Phase 2, narrative interviews and focus groups, guided by a phenomenological framework, will explore how youth experience fatigue, make meaning of overload, and identify turning points where concern shifts into action. Thematic analysis will integrate qualitative insights with survey findings, emphasizing cultural dynamics of resilience and agency.
Results:
Eco-fatigue alone is expected to reduce sustainable behaviour, but when mediated by ownership and efficacy and supported by cultural and institutional resources it is anticipated to foster eco-agency.
Conclusions:
By combining quantitative modelling with qualitative meaning-making, the study situates eco-fatigue as a dynamic, culturally contingent condition. Findings will guide youth-focused policies, campus interventions, and community programs that transform climate overload into resilience, responsibility, and collective action.

Abstract 1414

GREEN BUT CHALLENGING? UNIVERSALISM-NATURE AND STIMULATION IN STARTING GRIDS FOR AUTONOMOUS SHUTTLES' ACCEPTANCE.

Thevenet O.*[1], Wilhelm A.[2], Marmoiton F.[3], Bernardin F.[4], Izaute M.[1], Motak L.[1]

[1]Université Clermont Auvergne, CNRS, LAPSCO ~ Clermont-Ferrand ~ France, [2]Université Clermont Auvergne, Clermont Auvergne INP, Institut Pascal ~ Clermont-Ferrand ~ France, [3]Université Clermont Auvergne, CNRS, Clermont Auvergne INP, Institut Pascal ~ Clermont-Ferrand ~ France, [4]CEREMA, Département Laboratoire de Clermont-Ferrand ~ Clermont-Ferrand ~ France

Introduction. Over the last few years, autonomous shuttles (AS) have emerged as a promising form of eco-friendly transportation, offering a variety of environmental benefits. Their integration into urban environments is increasingly being explored and recent meta-analyses and reviews tend to support the diversification of explanatory variables, including psychological factors. While evidence suggests that values – according to Schwartz's model – shape human behavior in several domains, their inclusion is virtually missing within the field of autonomous shuttles' acceptance.
Purpose. We hypothesized that universalism - one's involvement in protecting human kind as well as natural environment and its beauty - would show out as the best predictor of attitudes, but also intentions and behavioral interest in AS.
Method. Almost 200 undergraduate students filled a series of questionnaires including Portrait Value Questionnaire (PVQ-10 in Study 1, n = 100; PVQ-RR in Study 2, n = 97), and met, as if by chance, a real AS in a controlled environment. Within real-life settings, adult and older adult participants who had just experienced an AS (Study 3, n = 50), completed an alternative measure of PVQ, the Portrait Values Dictionnary.
Results. Only the nuanced PVQ-RR value of universalism-nature – but not universalism-concern nor universalism-tolerance – confirmed our hypothesis and predicted the participants' behavior. Stimulation, a value characterized by excitement and challenge-seeking, predicted their behavior on its own. These results were replicated with the alternative value measure, where universalism and stimulation emerged as the main predictors of the participants' intentions to re-use an AS.
Conclusions. This suggest that the acceptance of AS is not only a matter of technological performance but also of motivational orientations. Communication stategies should highlight the novelty, excitement and environmental potential of AS – based on openness-to-change and self-transcendence values – to promote public engagement and support their integration into urban mobility.

Abstract 2698

RISK PERCEPTION, PSYCHOLOGICAL ADAPTATION AND PRO-ENVIRONMENTAL BEHAVIOR: EXAMINING ANTECEDENTS IN ACUTE- AND SLOW-ONSET CLIMATE REGIONS.

Akter F.*, Haque S., Khan S.

Monash University ~ Sunway ~ Malaysia

Introduction: Climate change poses profound existential threats to millions of people, particularly in the Global South, with impacts differing markedly by the nature of climatic events. Slow-onset processes, such as salinization, rising temperatures, and sea-level rise, unfold gradually and disproportionately burden affected communities, while acute events, including floods, cyclones, and droughts, occur suddenly and can trigger severe mental health consequences. Although prior research has extensively documented the mental health impacts of climate adversity, far less is known about how individuals psychologically adapt to these changes, despite the importance of such knowledge for informing psychosocial and behavioral interventions.

Purpose: This study examined the psychological, cognitive, and social determinants of psychological adaptation to climate change and pro-environmental behavior (PEB) among individuals living in slow- and acute-onset climate-affected regions.

Method: Using a large-scale cross-sectional online survey, we recruited 652 adults from Bangladesh, including participants from acute-onset regions (n = 541) and slow-onset regions (n = 111). Standardized measures assessed climate-related knowledge, belief certainty, perceived residential vulnerability, social norms, incentives, authority support, self-efficacy, psychological adaptation, and public and private PEB.

Results: Structural equation modeling revealed that, across both regions, perceived social norms and perceived residential vulnerability were the strongest predictors of climate risk perception. Risk perception robustly predicted self-efficacy, which facilitated psychological adaptation to climate change and subsequently predicted both public and private PEB. Notably, in acute-onset regions, perceived vulnerability and self-efficacy directly predicted private PEB, indicating a more immediate translation of risk appraisal into individual action; by contrast, in slow-onset regions, authority support both directly and indirectly predicted private PEB.

Conclusion: These findings highlight the need for context-sensitive interventions. Community-based, norm-driven programs may be particularly effective in acute-onset regions, whereas interventions that combine institutional support and incentives with adaptive capacity building may yield greater benefits in slow-onset contexts.

UNDER PRESSURE: HUMAN EXPERIENCE AND CARE IN GREEN AND BLUE SPACES IN TIMES OF ENVIRONMENTAL CHANGE

Friday 24 July 2026 from 17:00 to 18:30

(I-Spadolini)

Oriana Mosca (University of Cagliari ~ Cagliari ~ Ital), Chair and Presenter

Across Europe, environmental change is reshaping both landscapes and everyday life. From coastal deltas facing increasing flood and salinization risks to cities experimenting with nature-based urban regeneration, adaptation and co-evolution is not only a technical challenge but also a deeply social, cultural, and psychological process. This symposium brings together interdisciplinary research that explores how people experience, interpret, and engage with green and blue spaces shaped by climate adaptation and urban transformation. Integrating perspectives from social and environmental psychology, geography, sociology and urban planning, the symposium foregrounds people-centered approaches to environmental design and governance. The five contributions share a common focus on identity, emotions, values, and lived experience as key drivers of acceptance, use, and care of adaptive infrastructures and nature-based solutions. Methodologically, the papers showcase innovative tools, from mixed qualitative–quantitative approaches and walk-based digital platforms to psycho-physiological and cartographic mapping, that capture how people relate to changing environments in situ.
Mosca and coll. introduced CitySense, a web app designed to capture users' psycho-social experiences in regenerated urban spaces before and after interventions.
Boffi and coll. assessed the psychological effects of an NBS-based redesign of a Milan public square through pre- and post-occupancy evaluations using emotional, physiological, and georeferenced data.
Ariccio and coll. explore how flood-related identity in Zeeland influences risk perception, trust, and acceptance of traditional and nature-based adaptation measures.
Mishra and coll. examine how participatory arts-based practices and digital tools in the COEVOLVERS Living Labs support transformative, co-evolutionary learning in the co-creation of Nature-Based Solutions across Europe.
Hiedanpää explores metamodern planning theory as a response to persistent urban challenges such as biodiversity loss, climate change, and gentrification, bridging modern and postmodern approaches through multispecies and eco-social principles.

Abstract 4510

ADAPTATION-RELATED PLACE CHANGE IN ZEELAND: APPLIED SOCIAL PSYCHOLOGY AND INTERDISCIPLINARY COLLABORATIONS

Ariccio S.*, Roberts F., Winnubst M.

University of Utrecht ~ Utrecht ~ Netherlands

The history of the Netherlands is marked by its constant life with and against water and the need to constantly adapt to it. If flood adaptation is part of local identity, how does it affect people's acceptance of traditional (e.g., dikes) and innovative (nature-based solutions) adaptation infrastructures and trust in the related responsible actors? What are people's social norms and personal values towards adaptation practices? Moreover, climate change is increasing flood risk, but also bringing new risks, such as salinization. How is people's attitude towards climate change affecting their risk perception and acceptance of adaptation measures? This study in the coastal area of Zeeland, in the delta of the Scheldt, will address these research questions combining applied social psychology, anthropology and history and employing both quantitative and qualitative data.

Abstract 4511

MAPPING RESTORATION AND EMOTION IN URBAN NATURE-BASED INTERVENTIONS: A PRE/POST OCCUPANCY STUDY

Boffi M.*[1], Rainisio N.[1], Piga B.[2], Stancato G.[2], Maninetti C.[2], Laureanti R.[2], Mainardi L.[2], Barbieri R.[2]

[1]University of Milan ~ Milan ~ Italy, [2]Politecnico of Milan ~ Milan ~ Italy

Urban transformations involving Nature-Based Solutions (NBS) are increasingly framed not only in terms of ecological performance, but also for their impact on the human experience of space. While robust literature exists on constructs for evaluating the positive effects of nature in laboratory settings, assessing these effects in complex real-world environments requires methods tailored to applied urban contexts. This study presents the pre- and post-occupancy psychological evaluation of a public square in Milan, redesigned through an NBS intervention. The pre-intervention phase employed a mixed-method protocol collecting both physiological and psychological data along an in-situ exploration path, with a particular focus on emotional states and perceived restoration. Following the redesign, a second round of data collection was carried out along the same path to assess post-occupancy responses. Participants' emotional and restorative experiences at specific points of view (POVs) were measured using physiological sensors and an app grounded in Russell's circumplex model and Attention Restoration Theory, integrated with georeferenced data. The results show a general increase in perceived restoration after the intervention. However, the distribution of restorative responses was spatially heterogeneous: while certain POVs elicited notably higher restoration scores, others showed only marginal improvements. Cartographic visualizations of the data were developed to represent the psychological landscape of the site. These maps function as both diagnostic tools and communication instruments: they highlight areas of subjective place experience and offer valuable feedback to urban designers, local stakeholders, and administrators. This visual feedback can support future decisions regarding spatial interventions, maintenance priorities, and community engagement. Overall, this research underscores the value of evidence-based, people-centered methodologies for urban design, including NBS projects. It demonstrates how psychological mapping can inform adaptive design processes and long-term monitoring of spatial transformation outcomes.

Abstract 4512

DIGITAL WALKS AND URBAN EXPERIENCE: EVALUATING REGENERATED SPACES THROUGH CITYSENSE

Mosca O.*[1], Fornara F.[1], Mura A.L.[2], Pirina D.[1], Marilotti C.[1], Giliberto G.[1], Blecic I.[1]

[1]University of Cagliari ~ Cagliari ~ Italy, [2]Università degli Studi di Enna "Kore" ~ Enna ~ Italy

The TERSICORE project develops innovative models and protocols to investigate the psycho-social dimensions of urban regeneration. Central to the project is CitySense, a web-based application designed to capture users' experiences and interactions within regenerated urban spaces. The tool supports both the design phase, by exploring users' needs, expectations, social practices, and relationships with place, and the evaluation phase, by assessing satisfaction, perceptual changes, and patterns of use after interventions. The project proposes a methodological framework for cultural urban planners and digital designers to create participatory digital tools that enhance regeneration processes. This framework emphasizes key psycho-environmental factors, including place attachment, memory, emotional involvement, and perceived restorativeness, as drivers of meaningful engagement with urban environments. The methodology was tested through guided urban walks involving around 30 participants, combining pre- and post-walk questionnaires with in-situ digital interaction and focus groups after every walk. Results provide insights into how digital tools can foster engagement, support co-creation, and contribute to more walkable, inclusive, and people-centered urban regeneration strategies.

Abstract 4513

FOSTERING TRANSFORMATIVE HUMAN-NATURE RELATIONSHIPS IN NATURE-BASED SOLUTIONS THROUGH ARTS-BASED AND DIGITAL TOOLS AND METHODS

Abstract 4514

METAMODERN URBAN PLANNING FOR ECOSOCIAL RECOVERY

Hiedanpää J.*

Natural Resources Institute Finland (Luke) ~ Turku ~ Finland

While the participatory and discursive planning approaches have been a companion to the rational, science-informed planning approach for decades, the decisions have not adequately addressed the most critical issues in urban development: the loss of urban biodiversity, ecological fragmentation, the impacts of climate change, and the expansion of gentrification. The emergence of metamodern planning theory may offer a potential way forward. It bridges modernism and postmodernism with situated material semiotics, nature cultural niche construction, and organic multispecies design principles. In my presentation, I explicate the theory's requirements for urban land use planning and discuss its implications for pursuing urban eco-social recovery. The metamodern approach aims to overcome many old dichotomies and binaries. I conclude by examining whether the conceptual and empirical aspects of a meta-modernism for planning are robust enough to be considered a theory, and especially a practically relevant urban planning theory.

Abstract 845

OVERHAULING THE INFLUENCER APPROACH TO PERSUASION FOR SUSTAINABLE FASHION CONSUMPTION

Hundgen Q.*

Claremont Graduate University ~ Claremont ~ United States of America

Background. Social media has transformed the fashion industry, helping to popularize cheap and stylish “fast fashion” items. But fast fashion has led to significant environmental harm and social inequity worldwide, which highlights the need for consumers to adopt sustainable fashion brands. Social media influencers helped make fast fashion so dominant, but they also hold underrealized potential to serve as effective messengers for sustainable clothing. This study defines and then applies the contemporary influencer approach to persuasion to shift attitudes towards sustainable clothing and consumption behavior. The study tests the effectiveness of this “messenger-forward” influencer approach against a “message-forward” persuasion approach rooted in extensive social psychological research – the EQUIP model of persuasion (Crano et al., 2018).

Methods. This pre-registered study uses a between-subjects design, with participants recruited from the online platform Prolific*. Participants will view one of three video appeals or a control message, which emphasize either the durability or stylishness of a real sustainable clothing brand. Online “influencers” will deliver the video appeals, and the impact of messenger-based characteristics on attitude and behavior change will be assessed. After receiving the persuasive appeal, general and brand-specific attitudes towards sustainable clothing (in terms of durability and stylishness), purchase intention and actual consumption choice will be assessed.

Results and Implications. The results will demonstrate which type of online influencer persuasion is more effective in encouraging positive attitudes towards sustainable clothing and the associated clothing consumption behaviors. It is expected that the “message-forward” EQUIP persuasion approach will result in greater positive change in attitudes, intentions and behaviors than the “messenger-forward” contemporary influencer approach. However, both are expected to outperform the written appeal condition. The findings will deliver effective online influencer communication strategies for sustainability and social justice causes.

*data will be collected early Winter 2026

Abstract 588

THINKING OUTSIDE THE BOX: PREDICTING THE USE OF REPURPOSED SECONDARY PACKAGING USING AN EXTENDED THEORY OF PLANNED BEHAVIOR MODEL

Del Rosario A.T., Estrada M.A.G., Go R.E., Paladin Q.B., Relucio R.V., Valentin A.P.*

Ateneo de Manila University ~ Quezon City ~ Philippines

The Philippines is one of the leading contributors of plastic waste. Repurposed secondary packaging holds great potential in reducing waste in the country as it extends the life of packaging meant to be thrown out already by giving it another purpose. This study aims to determine the factors that influence the consumption of repurposed secondary packaging among grocery shoppers in Metro Manila. The study utilized regression analyses to determine the effects of attitude, subjective norms, personal norms, and perceived behavior control on predicting intention, and the relationship of intention and habit strength on predicting behavior. Findings revealed that attitude, subjective norms, personal norms, and perceived behavioral control are significant predictors of intention. Additionally, both intention and habit strength both significantly predict behavior. The results provide empirical support for the extended theory of planned behavior model. The findings of this study are significant for governments and the private sector so that the consumption of repurposed secondary packaging among grocery shoppers could be promoted to reduce the environmental footprint of packaging.

Abstract 291

WETSUITS REIMAGINED: EXAMINING CONSUMER READINESS FOR RECYCLED NEOPRENE

Wyles K.*, Kotze S.

University of Plymouth ~ Plymouth ~ United Kingdom

Background: Neoprene, widely used in wetsuits and watersports equipment, presents significant environmental challenges, with over 380 tonnes of waste annually landfilled or incinerated in the UK. Addressing this issue requires a shift towards circular economy practices, particularly through the adoption of recycled neoprene products.

Method: This study explores the social science dimension of consumer perceptions, via an online survey of a representative sample of 1,000 members of the UK general public and semi-structured interviews with 14 consumers of watersports brands. The research assesses consumer awareness of the environmental impacts of fashion and fashion accessories, attitudes towards recycled products, and the factors influencing purchasing decisions, with a specific focus on recycled neoprene.

Results: Whilst analysis in currently underway (to be completed in June 2025), the findings are expected to provide valuable insights into consumer willingness to adopt products made from recycled neoprene, as well as the perceived barriers to uptake, such as concerns about quality, durability, and hygiene.

Conclusions: By identifying key drivers of consumer acceptance and the role of sustainability credentials and industry endorsements, this research will offer evidence-based recommendations to inform brands, policymakers, and manufacturers. These insights can help drive innovation and support a transition towards more sustainable material use in the watersports industry.

CONFLICTING BELIEFS AND FEELINGS: AMBIVALENCE TOWARDS CULTURED MEAT DIFFERS FROM OTHER PROTEIN ALTERNATIVES AND AFFECTS ACCEPTANCE ACROSS CONSUMER GROUPS

Dwyer L.[1], Reinders M.[2], Fischer A.*[1], Onwezen M.[1]

[1]Wageningen University & Research ~ Wageningen ~ Netherlands, [2]Wageningen Social & Economic Research ~ Wageningen ~ Netherlands

In light of the global climate crisis, food systems must transition from animal-based food production to healthier and more sustainable alternatives. Yet, consumer acceptance has remained limited. Cultured meat from cellular agriculture represents a promising pathway, as it replicates conventional meat rather than substituting for it, potentially overcoming the barriers faced by plant-based alternatives. However, consumers express both positive and negative beliefs and feelings about cultured meat, manifesting as ambivalence.

This study examines whether cultured meat elicits distinct ambivalence patterns compared to other protein alternatives and across different consumer groups with varying dietary identities. By doing so, we extend the theory on ambivalence to the acceptance of cultured meat. We hypothesise that cultured meat generates higher levels of ambivalence than other protein alternatives. Additionally, we expected dietary patterns to moderate these effects, with vegetarians/vegans showing greater ambivalence towards cultured meat compared to omnivores.

A between-subjects experimental survey is planned for October 2025 to be conducted with Dutch consumers (N = 2,500), who will be randomly assigned to evaluate one of five product categories: conventional meat, cultured meat, hybrid meat, plant-based analogues, and legumes. Participants will complete measures of subjective ambivalence, objective ambivalence (from ratings of beliefs and feelings), product acceptance, dietary self-identity (meat-eaters, flexitarians, vegetarians/vegans), food neophobia, and familiarity.

We will present key insights into how ambivalence towards cultured meat differs from that towards other protein alternatives and affects acceptance across different consumer groups. This study will also gain insight into the underlying beliefs and feelings that shape ambivalent responses. We expect that cultured meat will elicit the highest levels of ambivalence compared to other protein alternatives, with vegetarians and vegans experiencing stronger conflicting responses.

This research provides insights into the psychological mechanisms underlying consumer responses to cultured meat, informing strategies for more effective communication and market introduction of sustainable protein innovations.

Abstract 2381

DISGUST, NATURALNESS, AND THE BOUNDARIES OF EDIBILITY: UNDERSTANDING RESPONSES TO CULTURED FOODS

Herziger A.*

Technion - Israel Institute of Technology ~ Haifa ~ Israel

Efforts to promote sustainable food systems rely on individuals' willingness to engage with biotechnological innovations. Cultured foods—grown from animal or plant cells without conventional farming—offer a compelling test case for understanding why sustainable technologies can evoke ambivalence. This collection of preregistered studies examines how the biological source of cultured foods uniquely elicits affective and cognitive responses linked to acceptance, focusing on perceived unnaturalness, disgust, and the symbolic meaning of human–animal relations.

Across three empirical investigations (total N = 1,355), cultured foods were consistently evaluated as less natural and more disgusting than conventional counterparts, yet the strength of these reactions depended on biological origin. In one study (N = 601), identical foods described as cultured rather than conventional were judged more unnatural and disgusting, with lower willingness to try—showing that biotechnological production transforms how familiar foods are appraised. Another study (N = 302) used sixteen real cultured products currently in research and development and found that participants categorized them primarily by cell origin—animal versus non-animal. These categories predicted distinct affective profiles, indicating that perceived "animal closeness" organizes the way people think and feel about cultured foods. A third study (N = 452) revealed a consistent gradient: the closer the product's origin was to an animal, the stronger the feelings of disgust and unnaturalness, and the lower the willingness to try.

Together, the findings identify animal closeness as a symbolic boundary that shapes affective and cognitive responses to sustainable food technologies. Cultured foods occupy a unique psychological space, evoking unease precisely because they blur boundaries between what is natural, animal, and human-made—when sustainability itself feels unnatural.

Abstract 2313

SUBSTITUTING MEAT WITH PLANT-BASED ALTERNATIVES: LINKAGE OF BEHAVIORAL BELIEFS AND FOOD CHOICE

Hofmann E.*[1], Nagel M.[2]

[1]University of Vienna, Faculty of Psychology ~ Vienna ~ Austria, [2]NONE ~ Graz ~ Austria

According to existing research, a plant-based diet would reduce CO2 in the atmosphere by 14.5 % (Gerber et al., 2013). Therefore, the current research addresses the question, which behavioral beliefs are related to food choices on meat vs. plant-based alternatives using the theory of planned behavior (Ajzen, 1985) as theoretical basis. The theory of planned behavior (Ajzen, 1985) specifically proposes that different beliefs (e.g., health, environmental protection, animal welfare, sensory perception) trigger specific attitudes, and these again lead to behavioral intention and in the end to a certain behavior. After the preregistered study (https://doi.org/10.17605/OSF.IO/U6CWY) was approved by an university ethics committee, 276 meat-eating participants from German speaking countries (66% female, 33 male, 1% divers; Mage = 36.6 years, SD = 15.4) filled in an online questionnaire in Spring 2023. The questionnaire comprised the scales belief on environmental protection, belief on animal welfare, belief on health, believe on sensory perception, attitudes, subjective norms, perceived behavioral control, intention and choice behavior (selection of a prize of either a meat or plant-based food product). The main question how the beliefs are related to the attitudes towards plant-based alternatives is analysed. Results reveal that beliefs on environmental protection, on animal welfare, on health, and on sensory perception are related to attitudes towards plant-based alternatives. Thus, suggesting that beliefs have an impact on attitudes when consumers decide whether to consume meat or plant-based alternatives. These results show that beliefs such as on environmental protection, on animal welfare, on health, and on sensory perception regarding the choice of plant-based alternatives should have an impact on food choice. From a practical point of view, putting specific beliefs in the focus of the promotion of plant-based alternatives could not only support a diet change but also account for the reduction of CO2.

THE CONNECTION BETWEEN PARENTAL AND CHILD FOOD NEOPHOBIA - CROSS CULTURAL STUDY AMONG EUROPEAN FAMILIES

Bargiel--Matusiewicz K.*[1], Ziolkowska N.[1], Lys A.[1], Baranda A.[2], Katrine E.[1], Da Quinta N.[2], Santa Cruz E.[2], Ríos Y.[2], Rioja P.[2], Erkkola M.[3], Meinilä J.[3], Lee M.[1], Wilkoszewski K.[1]

[1]University of Warsaw ~ Warsaw ~ Poland, [2]AZTI Food Research Division-New Food Department, Basque Research and Technological Alliance (BRTA) ~ Derio ~ Spain, [3]Department of Food and Nutrition, University of Helsinki , Finland ~ Helsinki ~ Finland

The presented study investigates parental and child food neophobia and healthy eating behaviors among European families. The purpose was to analyze the relationship between parental and child neophobia, taking into account the importance of parental gender and family country of origin. The research is a part of the TITAN Project*, which aims to find solutions related to challenges of European families during transition to healthier and more sustainable eating behaviors. The study involved 720 parents from three European countries Spain, Finland and Poland (240 families from each country) with children aged between 6 to 12 years. The average age of adult participants was 41.2 in Spain, 35.9 in Poland and 39.4 years in Finland. The gender distribution was 48.8 % women in Spain, 74.6% in Poland and 62.9% in Finland. Data were collected using questionnaires, including the Food Neophobia Scale, developed by Pliner and Hobden (1992) for adults and a version adapted for children by Proserpio et al. (2020). The moderate positive correlation between parental and child neophobia has been shown. Taking into account parental gender and family country of origin, only parental food neophobia has significantly predicted child food neophobia. There was a significant interaction between the country and food neophobia among parents in the context of the strength of the relationship between parental and children's food neophobia. These results are partly consistent with psychological theoretical perspectives of transgenerational transmission such as attachment theory and social learning theory. A certain limitation of the study is the number of people studied in each country. It is worth continuing this study on a larger population of families.

Abstract 1765

SUSTAINABLE FUEL FOR SHIP-TRAVEL: WHAT PREDICTS THEIR ACCEPTANCE?

Corcoran K.*, Sühs J., Held J.

University of Graz ~ Graz ~ Austria

Establishing a carbon-neutral mobility is a major challenge of our time. Whereas e-mobility is important to substitute cars with combustion engines, this technology is less suitable for heavy duty mobility like trucks and ships. One sustainable alternative would be carbon-neutral liquified gas (GreenLNG) – i.e., liquified gas synthesized from renewable carbon material like waste from wood industry and produced with green energy. In our research, we wanted to predict people's acceptance of such a fuel for ship-travel and explore their willingness to pay more relative to conventional ship-travel. In two surveys in Austria (N = 725 & N = 738), we assessed several psychological variables like problem awareness, perceived outcome efficacy, social norms, and trust to predict acceptance. Even though the data did not fit the preregistered model well, results indicated that acceptance predicts willingness to pay and that the psychological variables (besides knowledge about GreenLNG) are substantially intercorrelate. After revising the hypothesized model, we collected new data in Germany (N = 415) to validate the revised model. Indices confirmed good model fit and this model indicates a central role of perceived outcome efficacy, which together with problem awareness and social norms predict acceptance. Based on these three studies, we conclude that it might be crucial to strengthen people's understanding of the beneficial consequences for the environment of carbon-neutral liquified gas as fuel in the shipping industry to increase acceptance and willingness to pay slightly higher prices for eco-friendly ship-travel.

Abstract 134

MIND THE GAP: ENABLING YOUNG SUSTAINABILITY MINDSETS TO PAVE THE WAY FROM AWARENESS TO ENGAGEMENT WITH FOOD

Eg R.*[1], Saga R.S.[2], Varela P.[1], Berget I.[1]

[1]Nofima ~ Aas ~ Norway, [2]Telemark Research Institute ~ Boe ~ Norway

Food systems affect our diets and health, as well as the planet, yet the inter-connections between food production and consumption and the states of the climate and natural environment are both complex and obscure. While few understand the structure and impact of food systems, some may not even be aware of these connections. Even among those who are aware, there are several barriers to changing how and what we eat.

This research investigates the way adolescents think about food, and what makes certain individuals more engaged in the sustainability of what they consume. We seek knowledge on the constituents of a sustainability mindset, to support the planning of interventions aimed at encouraging sustainable food choices. Young consumers are targeted specifically due to their potential for driving change.

Based on a systematic literature review, we developed a theoretical sustainability mindset model, covering three domains (knowledge, values, competence) and five underlying facets (systems thinking, ecological worldview, contextual values, self-efficacy, growth mindset). This model informed the design of a survey, distributed to high school students (15-19 years) in Norway. Analyses of data from 438 students revealed three segments: One segment (N=179) stood out with low scores on systems thinking, ecological worldview, and self-efficacy, a second segment (N=84) had particularly high scores on self-efficacy, whereas the third segment (N=175) scored high on both systems thinking and ecological worldview, with lower self-efficacy than the second. Growth mindset scores were comparable across segments, and food values mirrored earlier findings on the importance of taste and price, along with food safety. Results highlight that systems thinking and ecological worldview are prominent components in a sustainability mindset, and raising self-efficacy may be key to unlocking young people's potential for driving the shift towards more sustainable food choices.

Abstract 995

FOSTERING COOPERATION IN ONLINE SOCIAL DILEMMA GAME THROUGH COMMUNICATION WITH ARTIFICIAL INTELLIGENCE

Ando K.[1], Himuro A.[2], Goto A.[3], Myojin S.[1], Uetake K.*[1]

[1]Nara Women's University ~ Nara ~ Japan, [2]NEC Solution Innovators, Ltd. ~ Tokyo ~ Japan, [3]Meiji University ~ Tokyo ~ Japan

Amidst the escalating climate crisis and pressing environmental issues, fostering cooperative human behavior is indispensable for the realization of a sustainable society. While findings in environmental psychology have demonstrated that interpersonal communication can promote such cooperation, this study investigates the efficacy of communication with artificial intelligence (AI) as a practical application of this principle. To investigate this, both humans and AIs played the "Online waste management game," which we developed by adapting the iterative public goods game.

An online experiment was conducted with a total of 330 three-person groups under four conditions: three humans, two humans and one AI, one human and two AIs, or three AIs. In the game, participants decided how much of their allocated 20kg of waste to recycle. Recycling incurred point costs, but the total recycled amount was doubled and redistributed. The study included a control condition and a chat condition where participants could communicate anonymously after the fifth round.

Following the communication intervention, the rate of cooperation in all-human groups increased by an average of 10%. In contrast, groups with both humans and AIs saw an average increase of 20%. The analysis of chat showed that the percentage of groups that reached an agreement to cooperate was higher in human-AI mixed groups than in all-human groups.

These findings suggest that communication with AI may have a greater effect on promoting cooperative behavior than communication among humans. Whereas communication between humans is often constrained by logistical challenges such as scheduling, the use of AI can overcome these practical implementation costs. This opens up new possibilities for AI-driven interventions to promote pro-environmental behavior.

Abstract 1275

GAMING GREEN: EXAMINING GLOBAL PLAYER PERSPECTIVES ON VIDEO GAMES FOR CLIMATE ENGAGEMENT AND RESEARCH

Koller K.*

Centre for Social Innovation; University of Vienna ~ Vienna ~ Austria

In response to the global climate crisis, scalable and engaging methods to reach diverse citizens are urgently needed. Game-based approaches have become increasingly popular for promoting climate change engagement across cognitive, affective, and behavioural dimensions. However, they often face implementation challenges related to recruiting participants, long duration, and equipment. An underexplored avenue is the use of existing public or commercial video games with environmental or climate themes – so-called green games – to promote engagement. This study addresses this gap by exploring the prevalence of green gaming and its potential impact on climate change engagement to identify potential applications and avenues for game-based interventions. We conducted an exploratory online survey distributed in video gaming communities across the globe (n = ~15,000), combining quantitative items with an open-ended question analysed using qualitative content analysis. Preliminary results highlight key motivations, emotions, and behaviours linked to playing green games, with variations across geographic regions, sociodemographic groups, and game titles. Furthermore, early qualitative insights provide a deeper understanding of players' experiences with green games and how they relate to topics like climate change and biodiversity. Notably, themes of climate scepticism and distrust toward political and societal actors emerged as influential factors within gaming communities' engagement with these topics. These findings offer novel insights into the expanding gamer population's interaction with environmentally themed games and their potential role in promoting climate change awareness and action. The study also highlights limitations and barriers to using video games as tools for climate engagement. Additionally, this research positions video games as a viable tool for applied psychology, allowing to access diverse populations and opening promising avenues for interdisciplinary research and practical applications.

Abstract 2185

GREENTOUCH: DEVELOPING DIGITAL SOLUTIONS FOR NATURE-BASED SELF-CARE

Ozola A.*, Martinsone K.

Riga Stradins University ~ Riga ~ Latvia

Disconnection from nature is increasingly associated with declining mental health among young people, including elevated stress, anxiety, and emotional imbalance. In contrast, exposure to natural environments has been consistently linked to greater psychological resilience, improved mood regulation, and enhanced cognitive functioning. To achieve lasting effects, however, individuals must integrate nature-based self-care practices into everyday life. Drawing on the Theory of Planned Behaviour, sustained engagement requires positive attitudes, supportive norms, and perceived behavioural control. Digital technologies offer new opportunities to strengthen these conditions, providing accessible and personalized interventions that can help transform intention into long-term self-care routines.

This study reports on the development of GreenTouch, a web-based application designed to promote nature-based self-care. The Intervention Mapping protocol was applied in combination with a participatory co-creation process. An expert panel (N = 12) with backgrounds in health psychology, ecopsychology, and nature-based practices, together with students and academic staff (N = 9), contributed to identifying drivers of nature disconnection and shaping the behavioural outcomes. Following formative and summative evaluations and partial piloting of the intervention, a set of semi-structured interviews was conducted with university students (N = 18).

The prototype consists of seven sessions delivered over 21 days. Each session combines a brief educational component with an experiential nature-based activity, such as mindful walking, sensory exploration, or creative engagement, paired with reflective journaling and progress tracking through a Nature Connectedness Tracker. Students' feedback was collected and will be taken into account in the next stage of development.

The co-creation process enabled the design of an intervention adapted to diverse users. The forthcoming stages will include continued pilot testing, empirical validation of the theoretical framework, and integration of student suggestions into the updated version of the app.

Abstract 292

TECHNO-OPTIMISM: IS TECHNOLOGY THE ANSWER TO MARINE LITTER OR AN EXCUSE FOR INACTION?

Wyles K.*, Cracknell D.

University of Plymouth ~ Plymouth ~ United Kingdom

Background: Common solutions for addressing plastic pollution include legislation, infrastructure improvements, and community- or contractor-led litter removal. One potential area of growth is the development of technologies designed to either prevent plastic entering the natural environment or facilitate its removal. Technologies may include waste collectors (e.g. seabins and 'waste sharks' that collect rubbish from the water that passes through them). While the impact of such technologies on marine environments remains unclear, so too does the potential impact of these technologies on human attitudes and behaviours around the use and disposal of plastic. Emerging research in the broader environmental literature suggest that an overly optimistic view of successful outcomes associated with technology (a term we call "techno-optimism") can lessen people's intentions to undertake pro-environmental behavioural adaptations.

Purpose: This research aims to explore the construct of techno-optimism further by developing and testing a techno-optimism scale focused on plastic pollution. We explored whether techno-optimism exists around the subject of plastic pollution, the extent to which it influences self-reported behaviours, and how it relates to other determinants of behaviour (expanding on the Value Belief Norm Theory)

Method: Using an online survey, we were able to examine techno-optimism in both a UK sample (n = 1006) and a French sample (n = 630).

Findings and conclusion: These findings are crucial, as they will inform practice, particularly with regard to message framing, e.g., in campaigns when introducing new technologies which aim to reduce plastic pollution, so as to not undermine efforts to effect behaviour change.

THOSE REPORTING SENSITIVITY TO RF-EMF FROM 5G TECHNOLOGY OVERESTIMATE THE PREVALENCE OF THEIR CONDITION: EVIDENCE FROM 11 COUNTRIES

Vitale V.*[1], Vaupotic N.[1], Abeln F.[1], Grellier J.[2], Martin L.[2], Bohmert C.[3], Link S.[3], Guxens M.[4], Polanska K.[5], Goszczynska E.[5], Kojimahara N.[6], White M.[1]

[1]Urban and Environmental Psychology, Department of Cognition, Emotion, and Methods in Psychology, Faculty of Psychology, University of Vienna, Vienna, Austria ~ Vienna ~ Austria, [2]European Centre for Environment and Human Health, University of Exeter Medical School, University of Exeter, Penryn, UK ~ Exeter ~ United Kingdom, [3]Department for Social Sciences, IU International University of Applied Sciences, Erfurt, Germany ~ Erfurt ~ Germany, [4]Barcelona Institute of Global Health (ISGlobal) ~ Barcelona ~ Spain, [5]Department of Environmental and Occupational Health Hazards, Nofer Institute of Occupational Medicine, Lodz, Poland ~ Lodz ~ Poland, [6]Department of Epidemiology, Shizuoka Graduate University of Public Health, Shizuoka, Japan ~ Shizuoka ~ Japan

Introduction. Electromagnetic hypersensitivity is characterized by individuals attributing a range of non-specific symptoms, such as headaches or fatigue, to exposure to electromagnetic fields (EMFs) from sources including radio frequency (RF) EMF from 5G technologies. Despite the lack of credible evidence supporting causal relationship between EMF exposure and these symptoms, concerns about technologies can nevertheless result in tangible negative health outcomes.

Purpose. This study examines the self-reported prevalence of sensitivity to EMFs from 5G technology, and general population beliefs about such sensitivity. Specifically, we investigated whether individuals over- or underestimate its prevalence, whether misperceptions differ between those reporting sensitivity and those not, and the role of media and discursive engagement in shaping these perceptions.

Methods. As part of the GOLIAT project (https://projectgoliat.eu/), an online survey (2023) with over 11,000 participants was conducted across 11 countries. Respondents reported whether they considered themselves particularly sensitive to RF-EMFs from 5G technologies and provided estimates of the percentage of the population they believe to be affected. Misperception scores were calculated as the difference between estimated and actual self-reported prevalence within each country.

Results. Overall, 18.9% of participants reported being particularly sensitive to 5G-related EMFs. Average estimated prevalence in the general population by those who did report no such sensitivity was fairly accurate (20.7%), while those who considered themselves sensitive reported a much higher estimated prevalence (52.1%). Multi-level analyses confirmed systematic group differences and additional cross-country variability (e.g. overestimation was most pronounced in Poland, Spain, and Austria, while Slovenia showed underestimation). Both media use and discursive engagement were positively associated with higher prevalence estimates.

Conclusions. Findings provide evidence that individuals reporting sensitivity to EMFs from 5G technology considerably overestimate the prevalence of such condition in the general population, underscoring the role of social and cognitive heuristics in shaping perceptions of emerging technologies.

Abstract 303

THE NEGATIVE EFFECT OF DISCLOSING GENERATIVE ARTIFICIAL INTELLIGENCE USAGE ON PRO-ENVIRONMENTAL BEHAVIOR: THE MEDIATING ROLE OF AWE

Wu T.*, Si J., Hao X.

University of International Business and Economics ~ Beijing ~ China

Artificial intelligence (AI) technology can efficiently produce media content, including highly realistic images of natural scenery, which holds significant implications for advertising and marketing, particularly in the realm of environmental appeals. However, the uncritical use of AI-generated images may also elicit unintended negative consequences. This study aims to examine the psychological mechanisms explaining consumer responses to the disclosure of AI-generated content in environmental marketing. Specifically, we propose that when consumers identify a natural scene as AI-generated, their willingness to engage in pro-environmental behavior diminishes, and this effect is mediated by a diminished sense of awe. Furthermore, this negative impact is moderated by the level of inclusion of nature in the self (INS) and familiarity with generative AI technology of consumers. Three experiments (total N = 670) were conducted to examine proposed hypotheses. The experimental design manipulated AI disclosure by altering whether the natural landscape images were labeled as "generated by AI". Consumers' sense of awe, pro-environmental behavior intentions, INS, and familiarity with generative AI were measured with established psychological scales. The results of ANOVA and bootstrapping analyses support our hypotheses. The findings reveal that disclosing AI usage can decrease consumers' sense of awe, reducing their intention to engage in pro-environmental behavior. However, consumers with higher levels of INS or greater familiarity with generative AI technology are less susceptible to these negative outcomes. For marketing practitioners, these findings underscore the importance of carefully considering consumers' psychological traits, such as their connection to nature and familiarity with AI, to enhance the effectiveness of AI-generated imagery in campaigns.

Abstract 734

ROLE-PLAY GAMES TO ENHANCE PERSPECTIVE-TAKING IN UNDERLYING COMMON GOOD VALUES: CASE OF REMOVED SOIL FROM THE FUKUSHIMA NUCLEAR ACCIDENT

Ehkirch Q.*, Uemura M., Konda Y., Uehara R., Souma Y., Ohnuma S.

Hokkaido University ~ Sapporo ~ Japan

Sharing perspectives to understand the interests, values, and feelings of others is needed in deliberation to reach a compromise, particularly in the case of issues surrounding risks and negative goods burden-sharing. Using role-play games can allow participants to feel a real connection with the people most concerned, encouraging empathic consideration. This study aims to understand how perspective-taking through role-play games can encourage empathy in underlying common good values. Following the 2011 Fukushima nuclear accident, decontamination efforts led to the storage of removed soil around the plant. To reduce the burden of the affected area, final disposal of the soil outside of Fukushima prefecture by 2045 was mandated by law. To share possible narratives surrounding the issue, an experiment using role-play games was created, allowing participants to experience multiple roles and perspectives. It was separated into three stages: a negotiation among prefecture delegates responsible for policy decisions, a debate between residents and administrative staff in a local community, and a deliberation by a citizen panel unrestricted by interests and positions. The first stage created a condition where consensus was difficult to reach due to divergent interests, while the second stage showed the possible implications and local protests from residents. Lastly, having experienced different perspectives and how they created a conflictual situation, participants were asked to propose policies to improve the social acceptability of the removed soil in the third stage. The results of conducting the game indicated that the more a consensus couldn’t be reached in stages 1 and 2, the more proposals reducing the burden were suggested in stage 3. The game facilitated perspective-taking and empathy, encouraging participants to propose more inclusive policies. This study shows an application of role-play games as a mediator for perspective-taking, fostering social acceptability of burden-sharing projects.

Abstract 777

INTEGRATING PUBLIC POLICY PREFERENCES INTO INTEGRATED ASSESSMENT MODELS

Engel L.*[1], Mata R.[1], Nielsen K.S.[2], Peng W.[3], Luo H.[4], Yang H.[3], Hahnel U.[5]

[1]Faculty of Psychology, University of Basel ~ Basel ~ Switzerland, [2]Department of Management, Society and Communication, Copenhagen Business School ~ Copenhagen ~ Denmark, [3]School of Public and International Affairs and Andlinger Center for Energy and the Environment, Princeton University ~ Princeton ~ United States of America, [4]Department of Civil and Environmental Engineering, Penn State University ~ University Park ~ United States of America, [5]Faculty of Sustainability, Leuphana University Lüneburg ~ Lüneburg ~ Germany

Integrated Assessment Models (IAMs) simulate climate change scenarios and substantially contribute to influential reports by supra-governmental institutions (e.g., IPCC). Current models rely on hypothetical policy pathways that largely disregard public preferences, limiting the adequacy of IAM scenarios. Ambitious measures often lack public support and are therefore unlikely to be implemented, resulting in some modeled scenarios being unrealistically optimistic.

We address this shortcoming by linking insights from discrete choice experiments on demand-side policy acceptability with a U.S. focused IAM (GCAM-USA). We assessed acceptability of carbon tax schemes and nine policies across the food, transportation, and household energy domain. Policies were evaluated in isolation and in packages to capture policy bundling effects. Using a large-scale U.S. quota-sample (total N = 5,463 across all U.S. states), we further examined the role of individual- and context-level predictors, applying multilevel regression and poststratification to estimate acceptability at federal and state level.

Results reveal that acceptability declines with more coercive push measures and with less coercive pull measures. Consistent with bundling effects, the effect of policy attributes decreased for policy packages compared to isolated policies. Acceptability was generally low, with few policy packages surpassing 50% (food: 2 of 1,312; transportation: 18 of 1,968; household energy: 8 of 1,312). At the individual level, governmental trust, environmental attitudes, and political liberalism robustly predicted acceptability. At the contextual level, per-capita carbon emissions were negatively and GDP positively associated with acceptability across domains.

Finally, we integrated publicly accepted policy packages into GCAM-USA and demonstrate that realistic scenarios fall short of emission reduction goals and diverge from standard IPCC pathways. While our federal and state-specific scenarios yield similar national emissions, impacts on state-level emissions differ substantially, showing the importance of high-resolution acceptability data. These findings highlight how

incorporating behavioral evidence into IAMs can generate more realistic pathways and inform potential levers for policy-makers.

Abstract 189

"NOT IN MY BACKYARD" OR "NOT IN OUR BACKYARD"? SPATIAL PROXIMITY AND SOCIAL IDENTITY PREDICT PUBLIC OPINION ON NUCLEAR WASTE

Kaiser J.*

Federal Offffice for the Safety of Nuclear Waste Management ~ Berlin ~ Germany

Little is known about public opinion on where to host a long-term repository for high-level radioactive waste. This study tests first whether spatial proximity – i.e., the distance in kilometers of a person's place of residence to the location of a repository – affects three dependent variables: whether proximity a) increases personal relevance of the hosting decision, b) decreases acceptance of this decision, and c) increases the likelihood for opinion expression. Second, it examines whether the effect of proximity weakens when the site selected is located in a region relevant to a person's social identity, so that acceptance for the site selected decreases not only for geographically close but also for geographically distant locations.

Results come from two representative CATI-CAWI survey experiments exposing different participants to different vignettes concerning the hypothetical selection of a site for a nuclear waste repository (n = 3,015).

The first 5x1-experiment only manipulated spatial proximity of the site selected to respondent's place of residence (5/30/50/100/200 km). Results confirm that spatial proximity increases personal relevance of the hosting decision. The second 3x2-experiment tested whether the effect of spatial proximity (5/30/50 km) changes when telling respondents that the site selected is located in their own (vs. another) region. Results reveal a significant interaction between both factors: While spatial distance significantly decreases personal relevance when located in another region, personal relevance does not decrease by spatial distance when still located in respondent's own region (H2). Further mediation analysis shows that personal relevance subsequently influences acceptance and opinion expression about the hosting decision.

This study provides evidence for in-group favoritism for geographically distant communities considered to host a nuclear waste repository. Thus, future research should go beyond the simple idea of "not-in-my-backyard" but should consider public opinion on environmentally relevant infrastructure projects as a result of a "not-in-our-backyard" mentality.

Abstract 541

PUBLIC RESISTANCE IN CRISIS GOVERNANCE: THE ROLE OF ZERO-SUM THINKING IN FUKUSHIMA'S DECOMMISSION PROCESS

Matsunaga L.*[1], Aoki T.[2], Aldrich D.[3], Hayashi Y.[4]

[1]The University of Tokyo, Tokyo College ~ Tokyo ~ Japan, [2]Tohoku University ~ Sendai ~ Japan, [3]Northeastern University ~ Boston ~ United States of America, [4]Keio University ~ Tokyo ~ Japan

Introduction: Despite extensive technical transparency and international oversight, Japan's release of ALPS-treated water from the Fukushima Daiichi nuclear plant continues to face domestic and international opposition. This persistent skepticism highlights the limits of procedural fairness alone in fostering public acceptance of controversial policies, particularly in high-risk and emotionally charged contexts. Trust in scientific evidence and institutional transparency, while essential, may be insufficient when cognitive biases and perceptions of injustice are at play. Objective:bThis study examines the psychological mechanisms underlying public (un)support for crisis policies. Specifically, it investigates the role of Zero-sum Thinking—the belief that government actions disproportionately benefit elites at the expense of ordinary citizens—and procedural justice in shaping policy legitimacy. By integrating these perspectives, the study seeks to illuminate why resistance endures even when procedural safeguards are upheld. Method: A cross-sectional survey was conducted using a stratified sample of Japanese residents, balanced by age and gender. Respondents evaluated procedural dimensions (e.g., transparency, participatory voice), risk perceptions, and cognitive biases in relation to policy acceptance. Conditional process analysis was employed to test mediation and moderation pathways, clarifying how procedural fairness interacts with zero-sum beliefs and risk perception to influence public support. Discussion: The findings aim to advance theoretical models of crisis communication by incorporating cognitive bias into frameworks of legitimacy and trust. This approach extends beyond institutional integrity to explain why policies backed by scientific consensus still encounter resistance. By demonstrating the interplay between fairness perceptions and zero-sum thinking, the study contributes a new lens for understanding public skepticism toward scientifically sound but socially contested policies. Ultimately, these insights may inform more effective strategies for communicating risk and fostering legitimacy in contexts of crisis governance.

Abstract 318

ADDRESSING WATER SCARCITY IN SOUTHWEST EUROPE: BRIDGING MENTAL MODELS ON NON-CONVENTIONAL WATER

Poggio L., Sánchez Del Corral G.*

Universidad Complutense de Madrid ~ Madrid ~ Spain

Southwest Europe (Spain, France, and Portugal) faces increasing human pressure on its freshwater resources, leading to scarcity, quality issues, usage conflicts, and environmental risks. The TARGET project aims to counter this by promoting territorial planning strategies that incorporate Non-Conventional Water (NCW) sources. This research delves into public and expert perceptions of NCW through a series of in-depth interviews. The study conducted 40 semi-structured interviews with experts and 60 with laypeople across the three countries. Each interview lasted approximately 25 minutes. Questions covered various aspects of NCW, including definitions, known types, their "lifecycle" and potential for reuse, typical uses and functions, and perceived differences between NCW sources. A key finding is the significant knowledge gap between experts and laypeople regarding NCW. This disparity highlights a critical need for improved communication strategies. The research suggests several recommendations for developing effective communication plans. These strategies should focus on providing general information about the use and implications of reused water, especially in the context of climate change adaptation. Bridging this knowledge gap is crucial for successful integration of NCW into regional water management, ultimately contributing to more sustainable water resource planning in Southwest Europe.

GROWTH MINDSET IN EDUCATION: LEVERAGING CONTEXTS AND INTERVENTIONS FOR STUDENT SUCCESS

Wednesday 22 July 2026 from 08:00 to 09:30

(H-Spadolini)

Junlin YU (University of Helsinki ~ Helsinki ~ Finl), Chair and Presenter

This symposium presents the latest advances in growth mindset research by integrating classroom-based studies, experimental evidence, and interventions. The first study examines the role of teacher mindset in students' growth orientations across elementary and high schools. The second study delves deeper into the classroom ecology to identify specific instructional practices linked to primary school students' growth mindset. The third study presents experimental evidence on the impact of teacher mindset on student motivation. The fourth study explores the effectiveness of a digital intervention in fostering students' growth mindset in STEM. The last study investigates the effectiveness of a growth mindset intervention in enhancing the efficacy of dyslexia treatment. This symposium will provide valuable insights for educators, researchers, and policymakers on how to cultivate growth mindset in diverse educational contexts.

Abstract 3939

STUDENTS' GROWTH ORIENTATION IN ELEMENTARY SCHOOL AND HIGH SCHOOL: WHAT IS THE ROLE OF TEACHERS' GROWTH MINDSET AND WHAT ARE THE IMPLICATIONS FOR ACADEMIC OUTCOMES?

Martin A.*

University of New South Wales ~ Sydney ~ Australia

Students' growth orientation comprises growth mindset, personal best goal setting, and mastery goal setting. The bulk of prior research has focused on individual differences in students' growth orientation and mostly conducted among high school students. There is a need for research to broaden empirical and conceptual knowledge of growth orientation with particular focus on better understanding the function of growth orientation across classrooms, across diverse developmental stages—and the role of the teacher in student- and classroom-level growth orientation. This presentation shares recent findings from growth orientation data collected among elementary (primary) school students (n = 500) and high school students (n = 800). Employing confirmatory factor analysis (including multilevel CFA where appropriate), it first examines the psychometric properties of the hypothesized growth orientation construct (growth mindset, personal best goal setting, mastery goal setting) among elementary and high school samples. Across these samples, it then conducts structural equation modelling (including multilevel SEM where appropriate) to explore the role of teachers' growth mindset in student-level and classroom-level growth orientation—and the association between student, classroom, and teacher growth-related attributes and student and classroom engagement and achievement. Through these analyses, the presentation identifies approaches to instruction and classroom characteristics that foster elementary and high school students' growth orientation and the academic implications of this. Practical responses relevant to these findings are also discussed, with particular focus on what teachers can do cultivate growth-orientation at both individual and classroom levels.

Abstract 3940

TEACHER MINDSETS AND PRACTICES SHAPING STUDENT PERCEPTIONS AND MINDSETS: EVIDENCE FROM A NATIONAL COHORT STUDY

Yu J.*

University of Helsinki ~ Helsinki ~ Finland

The 2018 PISA results revealed that students with a growth mindset tend to perform better academically in 72 out of 74 participating countries. Given the potential benefits of fostering a growth mindset among learners, interventions have been developed to change students' mindset beliefs from fixed to growth. However, sustained changes in students' mindset necessitate an understanding of the broader classroom ecology in which mindset beliefs are formed.

This study focuses on the role of teachers as key socializers of primary school students' mindset beliefs. Specifically, it examines how teachers' own mindset and three instructional practices—mastery- versus performance-oriented practices, autonomy support, and differential treatment based on ability—relate to students' growth mindset.

Participants were a nationally representative sample of fourth graders (N = 2137, aged 10) and their teachers Ireland. Both students and teachers rated their own mindset and the three dimensions of instructional practices. Multilevel structural equation modeling was used to investigate the relationships between teacher mindset, teaching practices (self-reported and student-perceived), and student mindset.

Findings showed that teachers with a growth mindset were more likely to have students who, on average, also endorsed a growth mindset. These teachers were less inclined to use performance-oriented practices. Importantly, when teachers reported greater use of performance-oriented practices and ability-based grouping, students perceived a stronger emphasis on performance and lower autonomy support. In turn, lower perceived autonomy support was associated with a weaker student growth mindset.These results highlight the significance of teacher beliefs and practices in shaping students' mindset development and suggest promising targets for teacher-focused interventions

Abstract 3941

DO TEACHERS' MINDSETS MATTER? EXPERIMENTAL EVIDENCE FROM SELF-REPORTS, TEXT ANALYSES, AND STUDENT PERCEPTIONS

Heyder A.*

Ruhr University Bochum ~ Bochum ~ Germany

Several correlative findings support the idea that having a growth mindset instructor benefits students' motivation and emotions. However, experimental evidence is rare. Therefore, we tested the effects of teachers' mindsets on students through an experiment involving 306 preservice teachers and 298 seventh graders from Germany. Specifically, we explored how fostering growth mindsets in preservice teachers affects their self-reported instructional practices, their written school career counseling of a low-performing fictitious student, and students' perceptions of the counseling and the preservice teacher.

After participating in a brief teacher-targeted growth mindset intervention (Heyder et al., 2023), preservice teachers anticipated to use more practices that stimulate autonomy and cognitive activation than those in the control group. Qualitative and computer-based quantitative analyses of the counseling texts revealed that the intervention group teachers offered significantly more personal help, wrote longer texts, and used a more diverse vocabulary in their counseling than the control group teachers.

We then randomly assigned the counseling texts to 298 students (average age 12) without providing any information about the preservice teacher who wrote the text. Students rated the quality of the counseling, the teacher's mindset, and the social support expected from the teacher based solely on the counseling text. We found that students' perceptions of teachers' mindsets, the quality of the counseling, and the anticipated social support were significantly correlated with the teachers' self-reported mindset. The more teachers believed in fixed student ability, the more students perceived them to do so, the lower they rated the quality of the counseling, and the less social support they anticipated from the teacher.

Ongoing text analyses aim to explore which text characteristics influenced students' ratings. Overall, the experimental results support the idea that teachers' mindsets matter for students and suggest that (written) school career counseling is a way of transmission

Abstract 3942

DIGITAL MINDSET INTERVENTION TO BOOST STUDENTS' STEM MINDSETS

Karlen Y.*

University of Zurich ~ Zurich ~ Switzerland

Students hold self-beliefs about the malleability or stability of their abilities. Recent work has shown how self-beliefs about intelligence (i.e., whether they believe intelligence is fixed or malleable) support students' development and academic outcomes (Bostwick et al., 2019, Costa & Faria, 2022). Furthermore, intervention studies can shift students' mindsets from a more fixed to a growth mindset (e.g. Yeager et al., 2019). Most studies have focused on domain-general mindsets, such as intelligence. However, it is crucial to examine domain-specific mindsets to understand students' domain-specific development better. Students' science, technology, engineering and mathematics (STEM) mindsets have not yet been the subject of much research.

In the present study, we investigate students' STEM mindsets and the effectiveness of a digital mindset intervention (three 45-minute digital modules). We expect the intervention to support (female) students' positive STEM mindsets and significantly change career prospects towards greater openness toward STEM careers.

The study follows a class-based randomised control group design. N = 866 students from 51 classes (8th grade; n = 29 intervention group classes; n = 22 control group classes) in a Western country participated in the study. The control group received similarly designed but content-neutral digital modules. Data collection occurred immediately before and after the intervention (t1, t5) and during the intervention (t2-t4). Data collection is ongoing at the time of submission (t5).

Data from the first time point can be presented as part of this abstract. Male students rated STEM skills as significantly more helpful for their future careers and enjoyed math and computing significantly more than female students. Finally, they showed a stronger tendency to stereotype STEM fields than female students. However, no significant differences were found between male and female students regarding growth mindset in STEM. The results of the intervention will be presented at the conference

Abstract 3943

FIRST MINDSET, THEN TREATMENT: A GROWTH MINDSET INTERVENTION TO ENHANCE THE EFFECTIVENESS OF DYSLEXIA TREATMENT

Janssen T.*

Vrije Universiteit Amsterdam ~ Amsterdam ~ Netherlands

Reading and writing are skills fundamental to growing up in our current society. However, many children with developmental dyslexia struggle with mastering these skills. This not only has consequences for their academic development, but negative experiences (i.e., falling behind compared to peers) also impact their motivation, self-beliefs, and well-being. In the Netherlands, these children can receive treatment aimed to increase phonemic processing and awareness, as well as spelling skills. However, much less time is dedicated to stimulating psycho-social factors that might indirectly promote treatment efficacy. Recent studies in educational and clinical contexts have highlighted the beneficial role of fostering a growth mindset in increasing motivation and mental well-being. In a pilot study conducted by our research group, we found a tentative link between mindset and dyslexia treatment success. Children with stronger negative effort beliefs - which are associated with a fixed mindset - improved less during dyslexia treatment. This was also evident at a behavioral level, where the percentage of completed homework was correlated with negative effort beliefs and fixed reading mindset. Furthermore, parents' spelling mindset about their children was a predictor of their child's spelling improvement during treatment, emphasizing the importance of contextual factors. In our current study, we hypothesize that by offering a growth mindset intervention adapted to children with dyslexia, their motivation for and efficacy of the dyslexia treatment will increase. We aim to investigate this by conducting a randomized controlled trial, following 240 children, 8 to 11 years old, throughout their dyslexia treatment. Prior to this dyslexia treatment, children will receive either the growth mindset intervention or an active control intervention. In this symposium presentation, the pilot results, development process of the tailored growth mindset intervention, and preliminary results will be further discussed.

PLANTS IN THE CLASSROM TO PROMOTE WELL-BEING

Crepaldi M.*[1], Caivano G.[1], Donadoni F.[2], Campori M.[2], Micheli E.[3], Persico L.[4], Alberti F.[4], Piccoli E.[4], Cortinovis S.[4], Greco A.[1]

[1]Dipartimento di Scienze Umane e Sociali, Università degli Studi di Bergamo ~ Bergamo ~ Italy, [2]Hydro Ware S.r.l.SB. ~ Alzano Lombardo (Bergamo) ~ Italy, [3]Rapsoidea Società Cooperativa Sociale ~ Berzo San Fermo (Bergamo) ~ Italy, [4]Istituto Comprensivo E. Talpino ~ Nembro (Bergamo) ~ Italy

Introduction: The place where we live must meet the practical needs of the individual and promote well-being, particularly in a classroom. The presence of plants promotes better air quality, creativity, curiosity, and social interaction and supports attention to others. Plant care has historically been used in the rehabilitation of people who have mental illnesses. Little has yet been investigated about the impact on self-efficacy and well-being at school. Purpose: This project aimed to investigate whether the presence and care of plants in classrooms promote emotional and psychological well-being in students. Method: 92 students (45 W; Mage= 12.18; DSage= 0.39) from the second grade of the secondary school IC Talpino di Nembro (BG) participated in the study. The students completed a battery of pre- and post-intervention self-report questionnaires: 'Questionnaire for the evaluation of School Well-being' (Questionario per la valutazione del benessere scolastico e identificazione dei fattori di rischio-QBS 8-13); 'Perceived empathic self-efficacy'; Ad hoc questionnaire to evaluate the physical space's quality and for a qualitative evaluation of the intervention. Results: Quantitative analyses (repeated-measures ANOVA) were conducted, showing a significant improvement in the post-intervention subscales of school well-being (emotional attitude). Qualitative analysis reveals 14 themes (e.g., collaboration, interest, discovery) to describe the project with a significant difference between males and females (i.e., in the theme of collaboration and take care). Conclusion: In the post-intervention evaluation questionnaire, the students reported feeling better and that the classroom was organised to facilitate attention and concentration. The perception of the physical space in which we live improves with the presence of plants, even unconsciously. Caring for the plants fostered social relationships and self-efficacy, even under challenging conditions, promoting well-being and learning.

Abstract 1442

ARE SOCIAL SUPPORT, MATTERING TO THE INSTITUTION AND TIME PRESSURE REALLY CONNECTED TO STUDENTS' WELL-BEING AT UNIVERSITY? A QUALITATIVE CONTENT ANALYSIS

Micheletto V.*, Fici A., Jacomuzzi A.C.

Università Ca' Foscari di Venezia ~ Venice ~ Italy

Introduction - During their university years, students experience a decisive phase in their personal and professional development. The academic environment, interactions with peers and faculty, individual skills and abilities, previous experiences, and relationships define a foundational framework for well-being and create the basis for well-being in adulthood (Figueira et al. 2017; Morales et al. 2020; Soto et al. 2023).

Purpose – The qualitative study, promoted by the University of Venice, emerged from the need to shed light on students' experiences and contextualize their well-being with the aim of identifying key areas for intervention and implementing evidence-based strategies to enhance overall well-being.

Method – The research design was based on semi-structured interviews with 17 key observers from the student community (59% female, age μ = 24.58), including undergraduate, master, and doctoral students holding representative or tutoring roles. The interview guide addressed themes including perceptions of society, time perception, relationships, university, life purpose, and soft-skills. The data were subjected to content analysis within a constructivist perspective utilizing Nvivo 15.2.

Results – Based on the interviews, participants were categorized into three main groups ('good', neutral', 'bad') according to their evaluation of overall student wellbeing. The analysis yielded four overarching categories: University, Relationships, Individual, and Time. The findings reveal differences between the groups in terms of perceived social support, mattering to the institution, experiences of time pressure, and levels of anxiety. A sort of specularity is noticed between the 'good' and the 'bad' group.

Conclusions - Students appear to have a general need to be in a community that, through a continuous dialogue with them, both at an institutional level and relational level with peers and faculty, actively fosters well-being. The findings should provide policy makers and university institutions with concrete tools to develop and implement targeted interventions to strengthen student wellbeing within the academic community.

UNDERSTANDING COLLEGE STUDENT WELL-BEING: THE INTERPLAY OF PSYCHOLOGICAL CAPITAL AND LONELINESS

Kaur S.A.*[1], Choubisa R.[1], Debata B.[1], Sharma M.[2]

[1]Birla Institute of Technology and Science, Pilani, Pilani Campus ~ Pilani ~ India, [2]Panjabi University ~ Pstiala ~ India

Psychological capital and its sub-components—hope, efficacy, resilience, and optimism (Luthans et al., 2004)—have been proven to enhance student well-being and decrease their sense of loneliness. The World Health Organization identifies social well-being as a fundamental health aspect because it measures how well people connect with their social communities and perform their social roles. Students commonly experience loneliness, which researchers consider equivalent to social isolation (Caciopo & Hawkley, 2010). Research has investigated PsyCap and social well-being separately, but no studies have examined whether loneliness mediates between psychological capital and social well-being. Our research investigates how loneliness functions as a mediator between psychological capital and social well-being among undergraduate students at a residential institution in northern India. We approached about N≥245 sophomores schematically in a stratified manner and distributed the Psychological Capital Scale–Student Version (PsyCap-S), the UCLA Loneliness Scale, and five social well-being items (items 4–8) from the Mental Health Continuum-Short Form (MHC-SF) to acquire data. We used a structural equation modeling (SEM) approach to evaluate the connections between our study variables. We predicted that psychological capital would have a negative relationship with loneliness but a positive one with social well-being. College students who have higher levels of positive psychological capital tend to feel less lonely, thereby enhancing their social well-being. We ultimately propose interventions that focus on alleviating loneliness through PsyCap-based programs that may presumably impact their campus life in a positive manner.

Abstract 1582

THE RECIPROCAL RELATIONSHIP BETWEEN CREATIVITY AND SCHOOL WELL-BEING IN COLLEGE STUDENTS: THE MEDIATING ROLE OF ACADEMIC ENGAGEMENT

Wang Q.*

East China Normal University ~ Shanghai ~ China

Introduction:
Fostering creativity and promoting school well-being are essential for the holistic development of students. However, the relationship between these two factors and the underlying mechanisms remains insufficiently explored, particularly within the context of higher education.
Purpose:
The present study aims to investigate the bidirectional influence of creativity and well-being among college students, focusing on the mediating role of academic engagement.
Method:
This study consists of two phases: a cross-sectional study (Study 1) and a longitudinal study (Study 2). In Study 1, 665 college students participated in an online survey. Structural equation modeling was employed to examine the bidirectional relationship between self-reported creativity and school well-being, with academic engagement as a mediator. Study 2 involved 302 college students who completed weekly surveys over seven weeks. A cross-lagged model was used to investigate the predictive relationship between weekly creative behaviors and school well-being, again considering academic engagement as a mediating variable.
Results:
Study 1 found a significant reciprocal relationship between creativity and school well-being, with academic engagement fully mediating this relationship. Study 2 further supported these findings, showing that weekly creative behaviors and school well-being were mutually predictive, with academic engagement playing a significant role in this dynamic over time.
Conclusions:
This study provides new empirical evidence that creativity and school well-being are reciprocally linked, with academic engagement serving as a critical mediator in this relationship. The findings underscore the importance of fostering creativity and engagement in college settings to enhance students' overall well-being, offering valuable insights for interventions aimed at improving student development in higher education.

Abstract 577

WHY DOES SCHOOL MATTER?: THE LINK BETWEEN ECONOMIC FACTORS AND CHILDREN'S SELF-ESTEEM IN JAPAN

Yoshizumi T.*

Chukyo University ~ Nagoya ~ Japan

Introduction

With the widening economic divide in the Japanese society, child poverty has drawn increasing public and academic attention. Economic hardship influences not only children's access to material necessities, but also their psychological well-being, including self-esteem. Although the link between economic factors and children's self-esteem has been widely discussed, the mechanisms underlying this relationship remain poorly understood.

Purpose

This study examined whether school life mediates the relationship between economic factors and self-esteem in Japanese children. In particular, the roles of school adjustment and parent–child relationships were compared across developmental stages.

Method

Data were obtained from the 2018 Survey of Children, Youth, and Parenting Families' Awareness and Living Conditions conducted in Nagoya. The analysis focused on 1,210 households with children in elementary, junior high, and high school. The children completed questionnaires to assess their perceptions of economic hardship, academic achievement, learning motivation, school adjustment, and self-esteem. Parents provided information on household income, shortage of essential goods, perceptions of economic hardship, and their relationship with their children. Path analysis was conducted to test the mediating effects of school adjustment and parent–child relationships.

Results

The findings showed that children's perceptions of economic hardship were negatively associated with school adjustment across all age groups, which in turn lowered their self-esteem. For elementary school children, perceptions of hardship were strongly influenced by shortage of essential goods, whereas junior high and high school students were more strongly affected by their parents' perceptions of hardship. The indirect effect of economic factors on self-esteem through parent–child relationships was observed only among elementary school children.

Conclusions

These results highlight the central role of school adjustment as a mediator between economic hardship and self-esteem among Japanese children. Therefore, interventions

to support children living in poverty should prioritize fostering positive school experiences as a means of protecting and enhancing self-esteem.

Abstract 4772

Predicting Non-Suicidal Self-Injury Risk in Junior High School Students: A Machine Learning Approach Integrating Psychological and Familial Factors

Gongxiang C.*, Zibei G.

School of Education and Psychology, University of Jinan ~ Jinan ~ China

Non-suicidal self-injury (NSSI) is becoming increasingly prevalent and harmful among adolescents, yet its intrinsic mechanism and early identification remain to be further explored. To investigate the influencing factors of NSSI in junior high school students and develop an early identification tool, a questionnaire survey was conducted on 1160 junior high school students in Shandong Province (49.9% female; mean age = 14.05 years, SD = 0.833). This study examined the mechanism of action of parental psychological control, future self-continuity and cognitive reappraisal on NSSI, and based on the above analysis, a machine learning-based NSSI risk prediction model (NSSI-XGBoost) was constructed using eXtreme Gradient Boosting (XGBoost). The results showed that the Prevalence of NSSI was 52.50%; future self-continuity played a partial mediation effect between paternal guilt induction, maternal love withdrawal and NSSI; cognitive reappraisal moderated the direct path of paternal love withdrawal, paternal authoritarianism, maternal love withdrawal to NSSI, as well as the indirect path of paternal guilt induction, maternal love withdrawal to NSSI via future self-continuity. The NSSI-XGBoost model exhibited good discriminative performance (AUC = 0.816 in the test set), with the main predictive variables being cognitive reappraisal, maternal love withdrawal and paternal guilt induction. This study revealed the key roles of future self-continuity and cognitive reappraisal in the relationship between parental psychological control and NSSI, and constructed a prediction model with high accuracy, providing a practical tool for the early identification of NSSI in junior high school students.

INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP): FOUNDATIONAL COMPETENCE MODEL DEVELOPMENT AND IMPACT

Wednesday 22 July 2026 from 09:30 to 11:00

(H-Spadolini)

Jacquelyn Cranney (University of New South Wales ~ Sydney), Chair and Presenter

As the number and diversity of undergraduate psychology programs increase globally, there is growing recognition of the need for a shared yet adaptable framework of foundational psychology competences. While an international competence model exists for professional psychology, previously there has been no such global model for foundational competences at the undergraduate level, despite the critical role undergraduate programs play in preparing students for diverse pathways including further education, employment, and societal impact. This symposium introduces the International Competences for Undergraduate Psychology (ICUP), developed through the International Collaboration on Undergraduate Psychology Outcomes (ICUPO) project, comprising 120 psychology educators from 47 countries. The ICUPO project comprises a core committee and an International Reference Group for Undergraduate Psychology Outcomes (IRGUPO). The symposium will include five presentations. The first outlines the aims, rationale, and background of the ICUPO project. The second presentation details the relevance of psychological literacy, global citizenship, inclusive leadership and especially cultural responsiveness to the project processes and outcomes. The third presentation outlines the inclusive and iterative processes and methods used to develop the ICUP Model. The fourth presentation details the ICUP Model, which includes 24 competences organized into seven categories: two core categories (Psychological Knowledge and Research Methods), and five Psychology-relevant categories (Values & Ethics; Cultural Responsiveness & Diversity; Critical Thinking & Problem Solving; Communication & Interpersonal Interaction; and Personal & Professional Development). The fifth presentation outlines the processes and outcomes of engagement, dissemination and educational resource sharing strategies, whereby the aims include increased global input to and adoption of the ICUP Model, leading to discernable impact on the quality of foundational psychology education and outcomes. “ICAP Relevance Statement: The ICUP competences constitute a unique international Model designed to guide foundational undergraduate psychology curricula globally, while remaining adaptable across diverse national and institutional environments. The competences include emphasis on application of psychological knowledge, skills and values/attitudes to personal, work and community/societal contexts.”

Abstract 4072

BACKGROUND TO THE DEVELOPMENT OF THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL

De Souza L.K.*[1], Hulme J.A.[2], Machin T.[3]

[1]Universidade Federal do Rio Grande do Sul, Brazil ~ Porto Alegre ~ Brazil, [2]Nottingham Trent University, UK ~ Nottingham ~ United Kingdom, [3]University of Southern Queensland, Australia ~ Southern Queensland ~ Australia

The aims of the International Collaboration on Undergraduate Psychology Outcomes (ICUPO) project are to: (1) produce the International Competences for Undergraduate Psychology (ICUP) Model to guide curriculum development and renewal; (2) encourage and support adaptation of the Model to different local, national, and regional contexts; and (3) seek support for the Model by international and national psychology organizations and education leaders. The reasons for developing the Model include: (a) the growing numbers of psychology programs worldwide; (b) international professional, but not foundational, psychology competences exist; and (c) the high potential for graduates (regardless of career destination) with these competences to contribute to meeting challenges in personal, work, and community/societal contexts. The presenters then provide an overview of several competence models that guided the work of the ICUPO, including international education qualifications frameworks and other relevant frameworks (e.g., OECD's Future of Education and Skills 2030). The presenters outline how these and other resources led both to the germination of this project and to the ongoing processes of the development of foundational competences.

Abstract 4073

CULTURAL RESPONSIVENESS AND OTHER CONCEPTUAL FRAMEWORKS UNDERLYING THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL

Cranney J.*[1], Waitoki M.[2], Harris R.[3]

[1]University of NSW ~ Sydney ~ Australia, [2]University of Waikato ~ Aotearoa ~ New Zealand, [3]Leeds University, UK ~ Leeds ~ United Kingdom

In this presentation, the centrality of psychological literacy, global citizenship, inclusive leadership and especially cultural responsiveness to the development and content of the
ICUP Model are described. Psychological literacy is the intentional application of psychology knowledge, skills and values to achieve personal, work and community (local to global) goals; the integration and application of foundational psychology competences within an undergraduate program should lead to psychologically literate graduates. Cultural responsiveness involves adopting an ongoing reflexive approach to understanding and addressing the psychological needs and well-being of diverse peoples, including by actively seeking knowledge about a cultural group's histories, traditions, customs, belief systems, languages, connection to land and geographies, determinants of health, systemic influences, and unique lived experiences, strengths and
challenges. Global citizenship involves the understanding of global interrelatedness, and
the capacity to live, work and contribute positively as a member of global communities. Inclusive leadership is a "set of positive leader behaviors that facilitate group members perceiving belongingness in the work group while maintaining their uniqueness within the group as they fully contribute to group processes and outcomes" (Randel et al., 2018). By way of illustration, we detail how cultural responsiveness: (a) was integrated into the processes of the ICUPO project, (b) became a critical focus of development for the ICUPO Committee members, and (c) became a core part of the ICUP Model itself. We give recommendations for educational leaders contemplating similar projects.

Abstract 4074

METHODS IN THE DEVELOPMENT OF THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL

Job R.*[1], Machin M.A.[2]

[1]University of Trento ~ Rovereto ~ Italy, [2]University of Southern Queensland ~ Australia

We provide an overview of the processes and methods of the International Collaboration on Undergraduate Psychology Outcomes (ICUPO) project. Planning was initiated in approximately August 2022, with a core principle being stakeholder diversity. The ICUPO Committee and the larger advisory group, the Reference Group for Undergraduate Psychology Outcomes (IRGUPO), consist of 120 psychology educators from 47 countries, granting representation from all continents.The ICUPO project was launched in October 2022 with the first ICUPO Committee virtual meeting. ICUPO meetings are approximately monthly, and there are several additional monthly meetings of working groups (WGs), for example, the Process WG, Terminology WG, Outcomes WG, and Integration WG. The inclusive methods for developing the Model are briefly described, including: monthly online committee meetings with pre-tasks, procedures to give voice to all participants; rapid post-meeting communication; regular consideration of the literature and of national and regional developments; working groups with expanded leadership and inclusive membership; frequent consultations with the advisory group (IRGUPO) and with psychology organisations. Over 40 educational frameworks, including 27 national psychology frameworks were analysed. Committee members engaged in bottom-up processes, for example, deriving themes from 27 national undergraduate psychology sets of outcomes. Members also engaged in top down processes that gleaned commonalities from several existing international education and qualifications frameworks (e.g., OECD's Future of Education and Skills 2030). We purposefully engaged in 'forward-thinking', for example, considering what is 'missing' in terms of the current and future needs of all stakeholders: students, educators, graduates, employers, society. We describe the contributions of the IRGUPO
members, who continue to provide crucial input. We then outline the iterative feedback seeking and consensus-seeking among the ICUPO Committee, IRGUPO, and colleagues
at conferences and from international and national psychology organizations and education leaders, regarding the developing draft ICUP Model versions. The planned processes for progressing the project are then outlined.

Abstract 4075

THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL

Gullifer J.*[1], Gauer G.[2]

[1]Monash University ~ Melbourne ~ Australia, [2]Universidade Federal do Rio Grande do Sul ~ Porto Alegre ~Brazil

We present a detailed overview of the Gamma.R3 Version of the ICUP Model developed by the International Collaboration on Undergraduate Psychology Outcomes (ICUPO). It consists of 24 competence statements grouped into seven competence categories: two core, (1) Psychological Knowledge and (2) Psychological Research Methodologies and Methods, and five Psychology-relevant: (3) Values and Ethics; (4) Cultural Responsiveness and Diversity; (5) Critical Thinking and Problem Solving; (6) Communication and Interpersonal Skills; and (7) Personal and Professional Development. We describe the principles that guided the drafting of these competences,
and we present the competences for each category. Examples of competence-aligned teaching and assessment strategies and related educational resources are provided. Finally, the presenters will elicit feedback from the attendees, particularly regarding the competence model, the potential adaptation to local context, and processes to share resources to support such adaptation.

Abstract 4076

THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL: ENGAGEMENT, DISSEMINATION, AND IMPLEMENTATION.

Nolan S.*[1], Boeta Madera V.[2], Clinton A.[3], Muazzam A.[4], Petrovic I.[5]

[1]Seton Hall University ~ South Orange ~ United States of America, [2](Marist University of Mérida, Mexico ~ Merida ~ Mexico, [3]American Psychological Association ~ United States of America, [4]Lahore College for Women University, Pakistan) ~ Lahore ~ Pakistan, [5]University of Belgrade, Serbia ~ Belgrade ~ Serbia

In this presentation, we describe the processes and outcomes relevant to the International Collaboration on Undergraduate Psychology Outcomes (ICUPO) project's ongoing stakeholder engagement and dissemination activities. These include conference
presentations, meetings with psychology organizations and education leaders, social media outreach, a dedicated website, and scholarly publications. These multifaceted strategies are critical for promoting widespread awareness and informed adoption of the ICUP Model across diverse educational settings. We also preview findings from ongoing international survey research exploring students' and educators' perceptions of the ICUP Model and the extent to which undergraduate psychology currently address the ICUP competences. Further, we provide an overview of educational resources developed to support curriculum renewal in both local and national contexts. These resources should assist institutions to develop ICUP competences in a practical and contextually relevant manner. We illustrate how the model has been adapted and applied
across various national and institutional settings, highlighting its flexibility and relevance. Finally, we outline the next steps in the ICUPO project, focusing on expanding adoption of the ICUP Model, enhancing the quality and consistency of foundational psychology education, and building global capacity through competence based teaching. Our goal is to develop globally informed, culturally responsive and psychologically literate graduates who are well equipped to meet contemporary challenges.

Abstract 1964

EMOTION REGULATION AND PERCEIVED STRESS AS PREDICTORS OF FLOURISHING IN ACADEMIC STUDENTS: IMPLICATIONS FOR AI-DRIVEN MENTAL HEALTH SYSTEMS

Ahmad A.*, Pradhan R.K.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Mental health assessment in academic environments has become increasingly critical as institutions worldwide face rising student stress levels. This study examines the predictive role of emotion regulation strategies and perceived stress on academic flourishing among students, with implications for future AI-driven mental health monitoring systems. Our cross-sectional study of 200 academic students (aged 18-30) demonstrates that cognitive reappraisal strategies show a strong positive correlation with flourishing ($r=.643$, $p<.01$), while perceived stress exhibits significant negative associations ($r=-.435$, $p<.01$). Regression analysis revealed that cognitive reappraisal serves as the strongest predictor of flourishing ($\beta=.591$, $p<.001$), followed by perceived helplessness ($\beta=-.189$, $p=.001$). These findings provide a foundation for developing intelligent educational systems that can automatically assess student mental health indicators and predict academic outcomes. The identified psychological predictors offer valuable features for machine learning algorithms in future educational technology applications, contributing to the emerging field of AI in education and student wellbeing analytics.

Abstract 678

LINKING SOCIO-ECONOMIC STATUS TO SUBJECTIVE WELL-BEING: INSIGHTS FROM PARENT-CHILD RELATIONSHIP AND ADAPTIVE COGNITIVE EMOTION REGULATION

Chen L.L.*[1], Liang Q.[2], Pan Q.[3], Tao S.[4], Lan M.[5], Tan C.Y.[1], Law N.[1]

[1]University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]Jinan University ~ Guangzhou ~ China, [3]Nanyang Technological University ~ Singapore ~ Singapore, [4]Education University of Hong Kong ~ Hong Kong ~ Hong Kong, [5]Zhejiang Normal University ~ Jinhua ~ China

Prior research has consistently demonstrated that socio-economic status (SES) predicts subjective well-being (SWB), and that adaptive cognitive emotion regulation (ACER) is known to serve a protective role in maintaining SWB. However, the mechanism through which SES influences SWB remain underexplored among children, particularly regarding the role of family processes and their interaction with individual regulation capacities across developmental stages. Emerging evidence suggests that the parent-child relationship (PCR) may serve as a critical intermediary, shaping children's emotional development and their ability to engage in ACER strategies. Building on this framework, the present study investigated whether SES indirectly affects children's SWB through PCR and ACER, and whether these pathways differ between primary and secondary school students. Data were collected from a regional sample of 2,315 parent-child dyads (78.3% mothers and 56.1% girls), with parents reporting on PCR and students self-rating their family SES, ACER, and SWB. Path analysis revealed a significant chain effect: SES shaped SWB indirectly through PCR and ACER. Notably, developmental differences were observed in the indirect pathway, with the link from SES to PCR varying between primary and secondary school cohorts. These findings suggest that as children grow older, their SWB becomes increasingly sensitive to the social environment, highlighting the importance of age-specific approaches in family-based interventions.

Abstract 417

A SERIAL MULTIPLE MEDIATOR MODEL OF GRIT, EMOTION REGULATION, OPTIMISM, AND DEPRESSIVE SYMPTOMS AMONG A SAMPLE OF CHINESE UNIVERSITY STUDENTS

Lam K.K.L.*

University of Macau ~ Macao ~ Macao

This cross-sectional study explores the role of grit and positive psychological resources (emotion regulation and optimism) and the processes between them that explain depressive symptoms. Understanding how grit and positive psychological resources can work independently and through each other to influence depressive symptoms can prove beneficial for higher education institutions in understanding why gritty students are less depressed, and the supported paths can be used to design mental health programs that enhance the appropriate psychological resources, which may assist with preventing students from the risk of depression. A sample of 165 participants (67.7% females and 88.4% undergraduates), with a mean age of 20.52 years (range 18–39), completed a structured self-reporting questionnaire. A serial multiple mediator model was analyzed to explain sequential relations among emotion regulation and optimism and to investigate the direct and indirect effects in SPSS 30, Amos 30, and PROCESS macro program (Model 6; bootstrapping with 5,000 resamplings and 95% confidence interval). Results supported that grit, two types of emotion regulation (cognitive appraisal and expressive suppression), and optimism were significantly associated with depressive symptoms. Moreover, a serial mediation (β = –0.02, 95% CI [–0.059, –0.002]) was found among the variables: gritty students tended to report higher cognitive appraisal, which further increased their positive outlook towards life and the future, and subsequently weakened perceived depressive symptoms. The total effect of grit on depressive symptoms was significant, and the proposed model accounted for 35.4% of the explained variance in depressive symptoms. Practically, in order to reduce the risk of depression, researchers and educators can help students identify their achievable life goals and/or academic goals, incorporate strategies to primarily foster cognitive appraisal of the stressors or stressful events and of their emotional reactions to these stressors and events, and prompt positive expectations and hope for goal attainment and the future.

Abstract 364

IDENTIFYING GRIT PROFILES IN A CHINESE UNIVERSITY STUDENT SAMPLE USING LATENT PROFILE ANALYSIS: RELATIONS TO DEPRESSIVE SYMPTOMS THROUGH GRATITUDE

Lam K.K.L.*, Liang K., Chi P.

University of Macau ~ Macau ~ Macao

Although a burgeoning body of research has illustrated the association of students' grit with psychosocial functioning, little is known about how different grit profiles may diverge in this association. We took a person-centered approach to identify distinctive students' profiles based on two grit facets (passion and perseverance) and evaluate the mediating effect of gratitude in the grit–depressive symptoms link across the estimated profiles. A total of 326 students (aged from 18–25 years; 68.1% female) completed self-report questionnaires. A latent profile analysis revealed four grit profiles (entropy = .86 ≥ 0.80; smallest group% = 10% ≥ 5%; BLRT = 0.01 < 0.05) based on grit items: Low Grit (9.8%; low passion–low perseverance), High Grit (17.8%; high passion–high perseverance), Insufficient Perseverance (33.1%; high passion–low perseverance), and Insufficient Passion (39.3%; low passion–high perseverance). The path model analysis —controlling for gender and age—showed that a significant mediation model was only observed in Insufficient Passion group, but not in the other three grit profiles. We found that the effect of grit on depressive symptoms is only completely explained by gratitude in those students with insufficient passion for long-term goal striving. Our results also highlight the importance of person-centered grit intervention development. Gratitude, as a positive emotion, is not effective in alleviating depression symptoms for those students with insufficient perseverance for long-term goal striving.

Division 5: Education and School Psychology Division 6: Clinical and Community Psychology Division 16: Counseling Psychology SDG 8: Decent work and economic Growth SDG 4: Quality Education SDG 3: Good Health and Well-being

Abstract 1286

THE EARLIER TITLE WAS "ROLE OF SELF-COMPASSION IN MITIGATING ACADEMIC BURNOUT AND ENHANCING RESILIENCE AMONG COLLEGE STUDENTS."; THE UPDATED TITLE IS "SELF-COMPASSION, RESILIENCE, AND ACADEMIC BURNOUT AMONG COLLEGE STUDENTS: A COMPARATIVE STUDY."

Kaur H.[1], Sharma M.*[1], Kaur S.A.[2]

[1]Punjabi University ~ Patiala ~ India, [2]Birla Institute of Technology & Science ~ Pilani ~ India

Academic burnout has become a widespread issue among college students, stemming from excessive workload and performance pressure. High levels of burnout have significant consequences in learning engagement, well-being, and academic performance among students. Self-compassion and resilience are key attributes, as they contribute to positive adaptation and overall well-being by adopting a constructive self-attitude. The purpose of this research is to identify the role of self-compassion in burnout and fostering resilience among the college population, as a more comprehensive understanding is needed at work with self-compassion to support students in bouncing back more effectively in the face of adversity and burnout.

A cross-sectional survey design was used, collecting data from 100 university students using the standardized self-report scales Self-Compassion Scale Short Form (Raes et al., 2011), Brief Resilience Scale (Smith et al., 2008), and Burnout Assessment Tool for Students (Popescu et al., 2023). Statistical analysis was performed employing a regression model and utilizing inferential statistics (t-test, correlation). The results will be discussed in the presentation.The current study hypothesizes that higher self-compassion translates to lower academic burnout and greater resilience. It is expected that self-compassion will alleviate burnout and emotional disengagement and simultaneously promote adaptive resilience by buffering the negative effect of academic stress and burnout. The study's anticipated outcomes have practical implications where interventions and self-compassion trainings can be provided to protect students against academic burnout and enhance mental well-being, academic persistence, achievement, and resilience.

Division 5: Education and School Psychology Division 15: Students and Early Career Psychologists SDG 4: Quality Education SDG 3: Good Health and Well-being SDG 11: Sustainable cities and communities

Abstract 151

HARMONIOUS AND OBSESSIVE PASSION AS MEDIATORS BETWEEN PERFECTIONISM AND ACADEMIC BURNOUT: A CROSS-CULTURAL COMPARISON OF CHINESE AND SINO-FOREIGN UNIVERSITIES

Wang T.*, Li Q., Liu X., Feng Y.

Wenzhou-Kean University ~ Wenzhou ~ China

Academic burnout among university students has become a growing concern, due to its high prevalence and negative effects on students' academic performance and overall well-being. Previous studies have revealed a complex association between perfectionism and burnout, as perfectionism could both contribute to and buffer against academic burnout. Given the inconsistent findings, the study aims to explore the underlying psychological mechanisms and cultural settings that influence the perfectionism-burnout link. Specifically, the present study collected 333 university students' responses and examined (1) the direct association between perfectionism and academic burnout, (2) the mediating role of harmonious and obsessive passion, and (3) the moderating effect of cultural contexts (i.e., traditional Chinese and Sino-foreign joint universities).

Mediation analysis indicated that perfectionism had a significant positive effect on burnout ($\beta = 0.48$, $p < .001$), but also an indirect negative effect through harmonious passion ($\beta = -0.16$, 95% CI [-0.25, -0.09]), accounting for 51.7% of the total effect. Similarly, obsessive passion partially mediated the relationship (indirect $\beta = -0.04$; total mediated effect = 13.7%), reflecting a suppression effect whereby both forms of passion attenuated the impact of perfectionism on burnout.

Moderated mediation analysis revealed that the indirect effect of perfectionism on academic burnout through obsessive passion was significantly moderated by cultural context: obsessive passion had a significant protective effect in Sino-foreign universities (effect = -0.06), but not in traditional Chinese universities (effect = 0.02).

These findings indicate a stable protective effect of harmonious passion across different cultural settings, while challenging the previous view that obsessive passion is consistently maladaptive. Instead, within autonomy-supportive environments such as Sino-foreign universities, obsessive passion may function as a motivational resource promoting persistence under academic pressures. These findings highlight the crucial role of cultural and educational context in shaping students' psychological outcomes.

FINANCIAL EDUCATION IN A LIFE-SPAN PERSPECTIVE: PROGRAMS, TOOLS, AND BEHAVIORAL OUTCOMES

Wednesday 22 July 2026 from 11:00 to 12:30

(H-Spadolini)

Antonella Marchetti (Research Center on Theory of Mind and So), Chair
Annalisa Valle (Research Center on Theory of Mind and So), Co-Chair
Antonio Iannaccone (Institut de Psychologie et éducation, Un), Discussant

Financial literacy is increasingly recognized as a cornerstone of citizenship education, equipping individuals with the competences needed to navigate the growing complexity of economic life. From the dematerialization of payments to the digitization of financial transactions, young generations face unprecedented challenges in understanding value, planning resources, and making responsible decisions. Schools are therefore called to play a pivotal role in fostering financial literacy from the earliest years of education through adolescence and into adulthood. This symposium brings together international contributions that examine financial education across the life span, with a particular focus on the school context.

The symposium opens with presenting how financial education has become a national policy priority in Italy, following international assessments such as PISA. This contribution highlights the integration of financial education into curricula, the monitoring of student outcomes, and the training of teachers as critical levers for long-term impact. The second presentation shifts to practice-oriented innovation, illustrating how experiential programs—such as peer education and interdisciplinary teaching units—can effectively bring financial topics into everyday school life and strengthen autonomy, empowerment, and decision-making among students.

The third contribution discusses how financial education can be introduced in primary school through teacher-oriented tools (Learning Unit) and child-centered training (financial education training), highlighting both opportunities and challenges for everyday teaching practice. Complementing this developmental focus, the fourth presentation introduces the design and evaluation of serious games for adolescents and young adults. By combining behavioral finance insights with digital learning environments, this work shows how motivation and conceptual understanding can be enhanced through gameplay, with direct applicability in secondary and vocational schools.

The symposium concludes with a discussant's reflection on the cultural and psychological transformations associated with financial education and digitization. This perspective emphasizes the need for new models capable of addressing how children and adolescents perceive financial value in rapidly changing contexts.

Abstract 3414

PROMOTING FINANCIAL EDUCATION IN ITALY: POLICIES, STRATEGIES, AND MONITORING BETWEEN PISA AND NATIONAL GUIDELINES

Di Chiaccio C.*

Istituto Nazionale per la Valutazione del Sistema d'Istruzione – INVALSI ~ Roma ~ Italy

Financial education has become a policy priority in Italy, following the disappointing results of the 2012 PISA assessment, which revealed low levels of financial literacy among 15-year-old students. This paper traces the evolution of financial education initiatives in Italy, critically examining institutional responses, regulatory frameworks, and the monitoring strategies developed over the past fifteen years.

Initially marked by fragmented approaches and local projects, Italy gradually established a national strategy, formalized in 2016 through the coordination of the Ministry of Education and with the involvement of institutional actors such as the Bank of Italy, CONSOB, and the Committee for the Planning and Coordination of Financial Education Activities. The current strategic framework is inspired by OECD principles and aims to provide citizens of all ages with the knowledge and skills needed to make informed financial decisions.

The presentation highlights the crucial role of monitoring and impact evaluation in ensuring the effectiveness of financial education programs. In this regard, ONEEF—the National Observatory on Economic and Financial Education—promotes the use of standardized indicators to improve program design and ensure transparency. Particular attention is paid to the integration of financial education into school curricula, especially with the 2024 update of the Civic Education Guidelines, which include specific learning objectives across all educational levels, following a vertical and cross-curricular approach.

Finally, the main ongoing challenges are discussed: teacher training, systematic assessment of student learning outcomes, coordination among stakeholders, and the complexity of financial literacy in a rapidly evolving socio-economic context.

Abstract 3415

GROWING AWARE: THE VALUE OF FINANCIAL EDUCATION

Rivelli M.*, Boggio Robutti G.

Fondazione per l'Educazione Finanziaria e al Risparmio ~ Roma ~ Italy

The Financial Education Foundation, established in 2014 by the Italian Banking Association, has been playing a fundamental role for 10 years in informing and raising awareness among young generations about the management of financial resources, with the aim of promoting a more responsible and conscious financial culture. This activity is not limited to the mere transmission of economic knowledge but intertwines with the citizenship skills that are now indispensable, as well as psychological principles concerning learning and the cognitive and behavioral development of individuals. Among these, we can highlight:

• The transmission of information "close" to students' daily experiences, such as the concepts of saving, managing expenses, and financial planning, according to a progressive approach based on the students' age.

• The connection between money management and the perspectives of autonomy and empowerment.

• The ability to solve practical problems and make well-considered decisions in economic contexts, which are essential skills in everyday life.

• The development of emotional awareness regarding one's inclinations and reactions towards money.

• The use of active learning techniques such as practical simulations, role-playing, or real-life stories.

The Foundation, which played a pioneering role prior to the introduction of financial education in civic education, which became law in Italy in 2024, also continually innovates its methods of dissemination in schools. Among the most recent initiatives, we recall the development of interdisciplinary teaching units linked to traditional curriculum subjects and the establishment of a network of young peer educators who bring the topic of financial education closer to thousands of children, boys, and girls in many Italian schools

Abstract 3416

ECONOMIC EDUCATION IN PRIMARY SCHOOL. TEACHERS' TOOLS AND PUPILS' TRAINING FOR FINANCIAL LITERACY

Valle A.*[1], Lombardi E.[2], Rinaldi T.[2], Marchetti A.[1]

[1]Research Center on Theory of Mind and Social Competences in the Lifespan, Department of Psychology, Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Department of Theoretical and Applied Sciences, eCampus University ~ Novedrate ~ Italy

Early financial education plays a crucial role in shaping children's understanding of economic concepts and decision-making. Research has shown that even at a young age, children develop naïve economic conceptions, which can serve as a starting point for structured educational interventions. Addressing these early representations in primary school offers an opportunity to foster financial awareness and decision-making skills that may have long-lasting benefits for personal and social development.

In recent years, the Italian school system has increasingly recognized the importance of integrating financial education into the curriculum. However, there is still a need for specific and structured pathways that can be effectively embedded within daily teaching practices. This contribution will explore possible ways to implement financial education in primary schools, focusing on two main approaches: (1) the design of Unità di Apprendimento (Learning Units), used by teachers; and (2) the creation of targeted training programs for pupils.

The first study analyzes Learning Units constructed in collaboration with 13 primary school teachers, highlighting both the potential and the challenges encountered when integrating economic and financial education into everyday didactic planning. This process underlines the importance of providing teachers with accessible, context-sensitive tools that can be adapted to different classroom realities.

The second study presents a financial education training tested with 78 children aged 8 to 10 years, aimed at strengthening specific competencies, such as decision-making, with a direct application to economic contexts. These training are conceived to be developmentally appropriate, engaging, and effective in promoting critical thinking and financial awareness.

Overall, the contribution will provide reflections supported by empirical evidence on how financial education can be meaningfully introduced in primary school by combining teacher-oriented tools with child-centered training, thus advancing both the theoretical and practical discussion on financial literacy at school.

Abstract 3417

INTEGRATIVE DESIGN, DEVELOPMENT AND EVALUATION OF A DIGITAL GAME AND GAME-BASED LEARNING SETTING IN FINANCIAL EDUCATION

Aprea C.*

University of Mannheim & Mannheim Institute for Financial Education (MIFE) ~ Mannheim ~ Germany

In light of ongoing societal and economic changes—such as demographic change, digitalization, and the retrenchment of public welfare—financial literacy has become a vital competence, particularly for adolescents and young adults. Despite the implementation of numerous financial education programs worldwide, research suggests that traditional approaches have limited success in influencing long-term financial behaviour. These programs often emphasize declarative knowledge while neglecting decision-making processes and learners' motivational and emotional needs. Serious games offer an innovative alternative, capable of fostering engagement and simulating real-life financial decisions. However, their effectiveness depends on the integration of several key dimensions.

This paper presents a research project aimed at developing and evaluating an educational serious game for financial literacy. The project addressed three integrative aspects: (1) aligning game design with learners' cognitive and motivational processes; (2) adapting the game to diverse educational contexts and stakeholder needs; and (3) bridging procedural knowledge gained through gameplay with formal conceptual understanding. These aspects were investigated through three interconnected studies: a developmental study, a series of case studies, and an experimental study.

The developmental study led to the creation of FinanceMission Heroes, digital serious game rooted in behavioural finance and learning psychology. The case studies, conducted in general and vocational schools and colleges in Switzerland and Germany, provided practical guidelines for implementation, emphasizing teacher training and stakeholder communication. The experimental study demonstrated that conceptual scaffolds significantly enhance students' understanding of budgeting and support the transfer of knowledge.

Collectively, the findings suggest that serious games, when thoughtfully designed and implemented, can enhance both motivation and learning in financial education. Moreover, providing scaffolds that connect gameplay to abstract concepts appears to amplify these effects. This research contributes to the growing body of evidence supporting serious games as effective tools for addressing complex educational challenges.

WORKING WHILE STUDYING: A REVIEW OF THE PSYCHOLOGICAL LITERATURE

Giusino D.*, Di Biase G.

University of Foggia ~ Foggia ~ Italy

Introduction: The increasing number of university students engaged in paid employment while studying represents a major social and psychological trend. Working students embody the convergence of educational, occupational, and personal demands, an intersection that remains underexplored in applied psychology. This group faces unique challenges and opportunities that directly relate to mental health, well-being, and academic success.

Purpose: This scoping review aimed to map and synthesize the existing psychological literature on working students, identifying dominant theoretical perspectives, methodological patterns, and key gaps in current knowledge.

Method: A systematic search was conducted across EBSCOhost, Scopus, and Web of Science using combinations of terms such as “working students”, “employed students”, and “working undergraduates”. Out of 147 initial records, 27 empirical studies met inclusion criteria. Studies were thematically analyzed to identify recurrent constructs, theoretical models, methodological trends, and psychological outcomes.

Results: The literature reveals the dual nature of the working student experience. While employment can enhance self-efficacy, identity development, and career optimism, it is also associated with stress, burnout, and work-study conflict. Theoretical approaches draw primarily on the Job Demands-Resources and role conflict models. Most research originates from the Global North and relies on quantitative, cross-sectional designs, limiting understanding of dynamic and contextual influences.

Conclusions: Working students constitute a growing yet under-researched population in occupational health psychology. The findings highlight the need for more qualitative, longitudinal, and cross-cultural research to capture the complexity of their experiences. Advancing this field will contribute to promoting well-being, sustainable work-study integration, and educational equity, which are key priorities for applied psychology in addressing global challenges.

Abstract 21

COLLEGE STUDENTS' LANGUAGE MINDSETS AND ENGLISH ABILITY HAVE INFLUENCES ON THE EYE MOVEMENTS OF L2 ACADEMIC TEXT READING

Jian Y., Li M.*, Su J.

Department of Educational Psychology and Counseling, National Taiwan Normal University, Taiwan ~ Taipei ~ Taiwan

Recent research has confirmed that growth mindsets (GMs) have a positive effect on reading performance and attitudes towards engagement. However, due to the scarce use of second language (L2) texts as reading materials, if mindsets are relevant to L2 reading processes remain unclear. This study used an eye tracker, questionnaires, and a reading comprehension test to explore the relationship between readers' language mindsets and levels of concentration and willingness to read L2 academic texts, reading processes, and comprehension performance. Data were collected from 107 college students with English as a second language. Participants filled out the Language Mindsets Inventory, read an academic English text with their eye movements recorded, and completed comprehension post-tests. Pearson's correlation analysis revealed that students who considered language intelligence malleable also thought their English learning ability was changeable, had higher levels of concentration and willingness to read academic articles, and had better general English reading ability than those whose language intelligence level was fixed. Moreover, multiple regression analysis revealed that students approaching the growth mindset end had a shorter single-mean fixation duration (i.e., faster decoding) when reading the academic text, and this eye-movement measure could further predict their academic English reading comprehension outcomes, with general English ability providing mediating effects. Overall, the findings suggest that students' language mindsets are directly relevant to L2 academic text reading processes, concentration, and willingness levels and indirectly relevant to reading comprehension performance.

Abstract 941

WHEN FEELING GOOD FUELS LEARNING: LIFE SATISFACTION AMPLIFIES THE WELL-BEING–ENGAGEMENT NEXUS IN HEI STUDENTS

Kamboj K.P.*, Surana P.

O. P. Jindal Global University ~ Sonipat ~ India

Purpose: This study endeavours to investigate the reciprocal association between HEI student's psychological wellbeing and their academic engagement, informed by an amalgamation of Self-Determination Theory (SDT), Study Demands–Resources (SD-R) model, and elements of the Broaden-and-Build Theory of Positive Emotions. It also examines the extent to which life satisfaction of HEI students contributes to the association between their wellbeing and engagement in academics.

Methods: A cross-sectional study of 350 HEI students in India conducted using validated scales for psychological well-being, academic engagement, and life satisfaction uses hierarchical linear regression to access the reciprocal associations and PROCESS macro moderation analysis.

Findings: Results revealed a bidirectional association in the HEI students' psychological wellbeing and academic engagement. Also, life satisfaction significantly moderated the impact of HEI students' wellbeing on their academic engagement, while it was not applicable to the reverse path.

Implications: These findings suggest that students with greater life satisfaction experience enhanced intrinsic motivation and amplify the effect of wellbeing on engagement. It further explains how well-being broadens thought–action repertoires, facilitating sustained academic engagement and life satisfaction acts as an additional resource that buffers or amplifies this effect.

Originality: The novelty of this work lies in the demonstration of the reciprocal association between HEI students' wellbeing and academic engagement, having major implications for the educational administrators, policy makers, and educational leaders, providing a nuanced understanding of student success mechanisms in HEIs.

UNIVERSITY FOR WELL-BEING: THE PRISMA 2.0 PROJECT - PROMOTING INDIVIDUAL AND SOCIAL RESOURCES IN THE ACADEMIC WORLD

Perrella L.*, Lepri G.L., Scarpa M.L., Patrizi P., Lodi E.

University of Sassari ~ Sassari ~ Italy

The PRISMA 2.0 project aims to promote and encourage psychological, emotional, and relational well-being throughout the academic community (students, professors and non-teaching staff), including through measures to prevent and combat risky behaviors (e.g., addictions). The project aims to promote a culture of prevention and support, strengthening psychosocial skills and enhancing the resources available in different contexts of life. To this end, the objectives are: 1) a qualitative and quantitative survey of students' well-being and lifestyles. In the first year, 778 students aged between 19 and 69 (M=27.9; SD=9.9), of whom 71.7% were women and 28.3% were men, mainly of Italian nationality (97.2%). Some of the preliminary results showed that, in terms of psychological well-being, 47.2% of students are in a state of flourishing and show high levels of perceived academic satisfaction (M=72.23; SD=13.88); 2) psychological support from university counselling service, as well as training and supervision for the professionals involved. During the first year, out of 165 requests, 143 students were taken on. Of these, 124 are women and 41 are men, with an average age of 25. The main reasons for accessing the service were difficulties in studying, managing emotions (e.g., combating anxiety, panic, etc.), and increasing psychosocial resources, for example, by improving self-esteem or the quality of relationships; 3) Focus groups and circles among students to discuss university life and how to improve its quality, as well as to promote a sense of academic community; 4) Sports activities to promote physical and mental well-being through physical activity.
The results of the first year of activities and the project actions that have emerged for the second year of the project will be presented.

A TWO-WAVE STUDY OF COLLEGE ADJUSTMENT AND WELL-BEING: ROLES OF SELF-EFFICACY, FAMILY/FRIEND SUPPORT, AND PERSONALITY TRAITS

Uyanik R.*, Aras I., Gök B., Ulasli R., Almas H.

Mersin University ~ Mersin ~ Turkey

The transition to university is a critical young-adult milestone that demands academic, social, and personal adaptation. Challenges in this process may undermine both academic performance and psychological well-being. This study examines associations between first-year students' adjustment and well-being with self-efficacy, perceived social support from family and friends, and personality traits of extraversion and openness to experience. The study is approved by Mersin University Social Sciences Ethics Committee. The study's hypotheses are as follows: H1. T1 self-efficacy will positively predict T2 university adjustment and life satisfaction, controlling for T1. H2a. T1 perceived family support will positively predict T2 adjustment and life satisfaction, controlling for T1. H2b. T1 perceived friend support will positively predict T2 adjustment and life satisfaction, controlling for T1. H3a. Extraversion will positively predict T2 adjustment and life satisfaction, controlling for T1. H3b. Openness to experience will positively predict T2 adjustment and life satisfaction, controlling for T1. The sample will consist of first-year students at a public university in Mersin. Based on comparable studies, analyses will target about 200 participants, with at least 300 recruited at T1 to allow for attrition. Participation will be voluntary; data will be collected via paper-pencil surveys. Instruments include the Self-Efficacy Scale, Multidimensional Scale of Perceived Social Support, extraversion and openness subscales of the Big Five Inventory, the University Life Adjustment Scale, and the Satisfaction with Life Scale. Data will be gathered in two waves: (T1) the first week of the academic year (September 2025) and (T2) about two months later (November 2025). Analyses will begin with repeated-measures ANOVAs to assess changes in adjustment and well-being from T1 to T2. Correlational analyses at both waves will further explore associations among variables. Findings are expected to provide longitudinal evidence on early adaptation processes and inform development of orientation and psychosocial support programs for first-year students.

Abstract 966

STUDENTS' SAFETY NET: ACADEMIC SELF-HANDICAPPING

Uyar P.*, Barutçu Yildirim F.

Middle East Technical University ~ Ankara ~ Turkey

Individuals sometimes purposefully engage in strategies that reduces their chances of success, and they attribute the reason for their failure to these. For instance, students procrastinate until the final hours before an exam, and sometimes do not put the complete effort even though they are able to do so. In other words, they self-handicapp. Often strategies like these are employed when people want to avoid the pain of failure, or don't want their abilities to be questioned by others. Even though excuses are made and pain is avoided through these, negative outcomes including anxiety, low self-esteem, and perfectionism can happen as a result of self-handicapping as well.

As a period filled with assignments and exams, it is college years that these strategies, academic self-handicapping in this context, come to the fore. However, there is a lack of body of knowledge on why and how these manifest during this period remains less investigated compared to academic self-handicapping during k-12 education. Thus, to fill this gap, this ongoing study aims to investigate academic self-handicapping strategies of university students. It employs a qualitative phenomenological design. Data will be collected through semi-structured interviews from 20 university students. The results will shed light on students' behaviors, thoughts and emotions regarding their academic life, as well as when and how they do academic self-handicapping. It is expected that conclusions of this research will also help college counselors in designing interventions to help students overcome these destructive strategies, improving their academic well-being.

HOW DO PARENTAL EXPECTATION AND INVOLVEMENT PREDICT CHILDREN'S ACADEMIC PERFORMANCE? – A PROPENSITY MATCHING SCORE APPROACH

Wei S.*

State University of New York at Farmingdale ~ New York ~ United States of America

Previous studies have reported mixed results on the relationships between parental beliefs, parental involvement, and student academic achievement. Yet less is known of the heterogeneity factors in these connections based on the propensity for a parent to hold certain expectations and to provide support in various contexts. By using a propensity score matching method, this study investigates the relationship between parents' beliefs, behaviors, and child's academic performance with a nationally representative dataset from the National Household Education Survey in 2019. Results indicate that advanced family socioeconomic status such as parents' high education level and high household income are associated with a high propensity for parents to aspire for a graduate level education for their children. In contrary, advanced socioeconomic status leads to a low propensity to provide homework help and to have family dinner together. Evidence shows that Asian parents and immigrant parents have both high expectations and high involvement. Male parents are more likely to hold high expectations, but female parents are more likely to give direct help in homework. Children higher in school year tend to have parents with lower education expectations and engagement. Overall, parents' expectations for graduate school education are positively associated with children's academic performance between age 5-20. However, parents' direct involvement with homework help is negatively associated with child's performance. Indirect involvement with family dinner is not significantly associated with academic performance. These patterns suggest that 1) both child-level and family-level characteristics induce parents' beliefs and behaviors, 2) it is important to further understand how parents can better communicate their expectations to children and interact with them outside of school hours.

Abstract 1273

THE EFFECTS OF PROFICIENCY-BASED PEER REVIEW GROUPS ON EFL WRITING DEVELOPMENT

Cui Y.*, Gai X.

Northeast Normal University ~ Changchun ~ China

This study examined how writing proficiency and grouping methods influence the effectiveness of trained peer feedback. Employing a 2×2 between-groups design, 80 EFL learners from a Chinese university were systematically categorized into four groups (20 per group) based on writing proficiency (high/low) and grouping method (homogeneous/heterogeneous). During the initial semester, students received training in implementing peer feedback within their writing classes. In the second semester, each experimental group received peer feedback across multiple assignments. Standardized assessments of writing proficiency, writing self-efficacy, and writing self-regulated learning were conducted at the beginning and end of the second semester, while classroom experience was evaluated only post-intervention. For students with high writing proficiency, peer feedback proved most effective in homogeneous groups, resulting in significantly enhanced writing development, self-efficacy, and autonomous motivation. Conversely, students with low writing proficiency benefited most from peer feedback in heterogeneous groups, leading to notable improvements in writing development and self-efficacy. The study advises against using groups of two and suggests using AI assistance for lower-ability students in peer reviews, although further clarification on these recommendations may be warranted.

Abstract 4899

FROM FEEDBACK TO RUMINATION: COGNITIVE MECHANISM UNDERLYING FEEDBACK EFFECTS ON PERFORMANCE

Mendiratta H.*, Singh R.M.

Indian Institute of Technology Roorkee ~ Roorkee ~ India

Grounded in Feedback Intervention Theory (Kluger & DeNisi, 1996), the present study explored the circumstances under which feedback shifts attention away from task execution toward self-referential processing, and the implications of such shifts for performance. The study focused on three key characteristics of feedback: its consistency with prior expectations (consistent vs. inconsistent), its type (comparative vs. absolute), and its valence, examining their influence on rumination and subsequent task performance. A sample of 239 students first completed an initial set of ten Raven's Progressive Matrices items. Participants then received experimentally manipulated feedback aligned with their assigned condition, followed by a second performance task. The results indicated that neither feedback valence nor feedback type significantly shaped ruminative responses. Instead, expectancy-discrepant feedback emerged as the primary predictor, leading to heightened rumination and a decline in subsequent performance. Further analysis revealed that rumination served as a key explanatory mechanism, mediating the relationship between discrepant feedback and reduced performance. These findings highlight the critical role of expectancy violation in shaping cognitive responses to feedback and demonstrate how such responses can undermine performance.

Abstract 1326

WHAT DO CHILDREN UNDERSTAND ABOUT SKEPTICISM? CHILDREN'S DETECTION OF DISBELIEF AND EVALUATION OF OTHERS' CREDIBILITY

Rho K.*, Birch S.

University of British Columbia ~ Vancouver ~ Canada

Introduction. People often rely on subtle prosodic cues (e.g., changes in vocal pitch or tone) to infer a speaker's mental state. While much research has examined children's ability to identify emotions via prosody (e.g., anger, sadness), disbelief states have received little attention. Disbelief is especially important for development because, when justified, it can serve as a credibility cue to guide learning (e.g., disbelieving implausible information makes you a wise skeptic). Purpose. To determine what children understand about these mental state concepts and whether they can use vocal cues alone to detect them.

Methods & Results. Across two experiments, English-speaking children ages 6-8 years (Experiment 1 N = 56; Experiment 2 N = 60) were introduced to characters who differed in their disbelief toward implausible information (gullible believer vs. justified disbeliever). We tested whether (1) children can detect disbelief through prosodic cues, and (2) use a speaker's justified disbelief to guide their learning decisions and impressions of that speaker's credibility. Participants were randomly assigned to Control (explicit statements, e.g. "I believe that") versus Experimental conditions (prosodic cues only). We then asked questions examining children's ability to a) detect disbelief from prosody versus explicit statements and b) use that information to guide their impressions of the speaker's credibility (e.g., "Who's smarter?" "Who would be the most help with your homework?"). Results suggest that children this age understand that justified disbelief can signal credibility. However, their ability to detect justified disbelief using prosodic cues alone may be tenuous, especially earlier in development.

Conclusions. Children are remarkably savvy learners and use even subtle cues to determine the credibility of others. These results are discussed in terms of their implications for social cognition, the development of critical thinking, and the practical applications for information consumption and education.

Abstract 707

PERCEIVED STRESS IN EARLY CHILDHOOD: THE PROTECTIVE ROLE OF EXECUTIVE FUNCTIONS ACROSS SOCIO-ECONOMIC CONTEXTS

Veraksa A.[1], Plotnikova V.*[2]

[1]Lomonosov Moscow State University ~ Moscow ~ Russian Federation, [2]Federal Scientific Center of Psychological and Multidisciplinary Research ~ Moscow ~ Russian Federation

Previous studies show that stress negatively affects executive functions (He & Yin, 2016; Finegood et al., 2017). Nonetheless, most existing research relies on reports from parents or caregivers neglecting vital subjective component and the potential of executive functions as a protective factor.

This study investigates the association between subjectively perceived stress and executive functions in preschool children from different sicio-economic environments. The sample comprised 1,241 children aged 6–7 years (50.5% – boys, M = 80.6 months, SD = 4.75 months) across four regions of the Russian Federation. Executive functions were assessed using NEPSY-II subtests. Perceived stress was measured with a self-report test for children PSS-C. The socio-economic environment was defined by the family's place of residence: a large city, a town, or a rural area.

Analyses revealed significant negative associations between perceived stress and all core executive functions components, including working memory, inhibitory control, cognitive flexibility, and processing speed. Notably, children with high executive functions level reported lower perceived stress in low socio-economic settings (rural areas), suggesting a protective role of executive functions. However, in urban environments, children with high executive functions still reported elevated stress, highlighting that socio-environmental factors may override cognitive resources. This indicates that executive functions should not be considered as distinct cognitive processes. Instead, it can be seen as a system indicator of the voluntary nature of higher mental functions in the line with the cultural-historical approach (Vygotsky, 2004).

These findings underscore the reciprocal relationship between executive functions and perceived stress in early childhood. The current study suggests that a high level of executive functions could counteract the negative effect of a low socio-economic environment on a child's stress and enhance resilience. The results highlight the importance of fostering executive functions as part of educational and preventive practices, while also addressing contextual stressors in children's everyday environments.

Abstract 2323

PSYCHOLOGICAL MISCONCEPTIONS AMONG PSYCHOLOGY STUDENTS: THE ROLES OF EDUCATION, UNSUBSTANTIATED BELIEFS, AND PERCEIVING PSYCHOLOGY AS A SCIENCE

Yalcindag B.*[1], Aktan T.[2], Cambaz H.Z.[3]

[1]Social Sciences University of Ankara ~ Ankara ~ Turkey, [2]Afyon Kocatepe University ~ Afyonkarahisar ~ Turkey, [3]Ankara Yildirim Beyazit University ~ Ankara ~ Turkey

Psychological misconceptions are unsubstantiated yet persistent beliefs that hinder the education and practice of psychology. Understanding their prevalence and relation to psychological knowledge is essential. We expected that as students' class level increased, endorsement of misconceptions and other unsubstantiated beliefs (i.e., paranormal and conspiracy beliefs) would decrease, whereas perceiving psychology as a science would increase.

A total of 1,584 Turkish psychology undergraduates (1,343 women, 233 men, 8 unidentified; M = 21.85, SD = 6.51) from various universities completed measures of psychological misconceptions, paranormal beliefs, conspiracy beliefs (generic and wellbeing–related), and perception of psychology as a science. Correlations showed that class level was negatively, albeit weakly, related to psychological misconceptions, paranormal beliefs, and wellbeing–related conspiracies. ANOVAs revealed that freshmen endorsed misconceptions and wellbeing–related conspiracies more strongly than higher-grade students, whereas seniors endorsed paranormal beliefs less strongly ($Fs > 7.81$, $ps < .001$, $\eta^2 > .015$). However, class level was unrelated to the three most strongly endorsed misconceptions: that the tongue has distinct taste regions, that matching instruction to learning styles improves achievement, and that subliminal messages drive product purchases.

In hierarchical regression, religiosity and interest in astrology explained 9% of the variance in misconceptions. Adding paranormal and conspiracy beliefs increased the explained variance to 28%, and adding psychology as a science in the last step raised it to 29%. All predictors except religiosity were significant, with perception of psychology as a science being the only negative predictor.

Overall, psychology education in Türkiye made only a modest contribution to reducing unsubstantiated beliefs. Viewing psychology as a science emerged as the key factor in reducing misconceptions beyond the influence of paranormal and conspiracy beliefs. The implications for education and the application of psychology were discussed.

PERSONAL AND CONTEXTUAL VARIABLES THAT INFLUENCE THE WELL-BEING OF TEACHERS AND PUPILS IN THE SCHOOL CONTEXT

Wednesday 22 July 2026 from 14:00 to 15:30

(H-Spadolini)

Enrica Ciucci (Department of Education, Languages, Inte), Chair
Antonella Marchetti (Dipartimento di Psicologia, Università C), Discussant

Teachers' and students' well-being in the school context have received growing attention, particularly in the aftermath of the COVID-19 pandemic. Studies have identified many individual, relational, and organizational level factors that influence teachers' and students' well-being.

The goal of the present symposium is to explore factors that influence teachers' and students' wellbeing and how to enhance it. Specifically, two contributions are presented as part of the same large international research project on teachers' well-being and mental health following the COVID-19 Pandemic: using a qualitative approach, Matteucci et al., highlighted the crucial role of socio-relational factors in supporting teachers' well-being in the Italian context. The quantitative study by Palikara et al., involving teachers across a broad age range, showed that subjective well-being and job satisfaction mutually influence each other, and that both were negatively affected by dissatisfaction with school workplace conditions. Using a mixed-methods approach, Crescentini et al. reported the results of interventions aimed at promoting teachers' Psychological Capital (PsyCap) that is demonstrably linked to enhanced personal well-being and improved work performance. Two contributions directly concern student well-being. The one by Baroncelli and colleagues evidenced that students who enjoy higher levels of personal well-being benefit more from a positive and supportive school atmosphere in the development of their social-emotional competences. The contribution by Colomeischi et al. underscores the predictive role of grit, hope, and resilience in promoting students' well-being and proposes individual and environmental strategies that can be effectively employed to foster these psychological resources.

The present symposium permits a deeper understanding of how supporting teachers' and students' well-being means not only strengthening healthy psychological states in both groups but also enhancing school environments in terms of relational climate.

Abstract 3890

FACTORS AFFECTING TEACHERS' WELLBEING IN ENGLAND FOLLOWING COVID-19 PANDEMIC: THE ROLE OF JOB SATIFACTION AND WORKPLACE CONDITIONS

Palikara O.*[1], Jones C.[1], Katsapi E.[2], Nastasi B.K.[4], Varjas K.[3]

[1]Department of Education Studies, University of Warwick ~ Coventry ~ United Kingdom, [2]Department of Psychology and Human Development, University College London ~ London ~ United Kingdom, [3]Department of Counseling and Psychological Services, Georgia State University ~ Atlanta, GA ~ United States of America, [4]Department of Psychology, Tulane University ~ New Orleans, LA ~ United States of America

Rationale: This study, conducted in England as part of the Global Perspectives on Teachers' Well-being and Mental Health Following the COVID-19 Pandemic project, aimed to develop a comprehensive understanding of teachers' subjective well-being and job satisfaction in the context of the post-COVID period.

Methodology: All 1819 responders who completed the survey were qualified school teachers currently working in England. Participants' ranged from 21-70 years old (M = 42.5, SD = 10.4) and they had between 0-42 years' teaching experience (M = 16.6, SD = 9.56). All participants completed a teacher self-report online survey administered through Qualtrics, which included demographic questions, the School Workplace Conditions Survey (Ansley, 2019), the Teacher Subjective Wellbeing Questionnaire (Renshaw et al., 2015) and the Job satisfaction survey (Spector, 1994).

Key findings: The findings indicated a bidirectional relationship between subjective well-being and job satisfaction, both of which were negatively influenced by dissatisfaction with school workplace conditions. Teaching experience emerged as a significant predictor of well-being, but not of job satisfaction.

Implications: These results will be discussed in relation to the implications paused for enhancing school environments, school communities and supporting teachers' wellbeing and mental health following the COVID-19 pandemic and in the light of any future global future emergency.

Abstract 3891

THE IMPACT OF INDIVIDUAL VERSUS GROUP WORK IN TEACHER PSYCHOLOGICAL CAPITAL TRAINING

Crescentini A.*[1], Pettignano M.[1], D'amato A.[2]

[1]Dipartimento formazione e apprendimento / Alta scuola pedagogica, Scuola universitaria professionale della Svizzera italiana (SUPSI) ~ Locarno, Ticino ~ Switzerland, [2]Scuola europea di Varese ~ Varese ~ Italy

In the field of education, it is widely recognised that positive psychology interventions have significant positive effects on both educators and students (Allen et al., 2022). Specifically for teachers, these interventions target the development of key psychological resources, including hope (Snyder, 2000), optimism (Seligman, 2011), self-efficacy (Bandura, 1997), and resilience (Masten, 2001). These four constructs were conceptually integrated by Luthans (2007) under the framework of Psychological Capital (PsyCap), a higher-order core construct characterised as being state-like. This means PsyCap is not a fixed personality trait but is instead measurable, open to development within a limited time, and demonstrably linked to enhanced personal well-being and improved work performance. For teachers, investing in this personal potential has been directly correlated with higher teaching quality and a greater capacity to motivate students (Vink et al., 2011).

Building on this evidence, a series of PsyCap training interventions have been implemented within initial and continuing teacher training programs in the Canton of Ticino, Switzerland. This particular contribution will present a study focused on comparing the efficacy of different training formats. The primary variable distinguishing the courses is the deliberate balance between individual reflection time and collaborative group work. To evaluate the impact, a standardized questionnaire assessing the four PsyCap constructs will be administered in a pre-test/post-test design. The subsequent quantitative analysis of these results will be systematically supplemented by qualitative data gathered from participant feedback. This mixed-methods approach aims to provide a comprehensive understanding of both the outcomes and the experiential process of the training, offering valuable insights for optimizing future professional development initiatives for educators.

Abstract 3892

THE UNIQUE AND INTERACTIVE ASSOCIATIONS OF SCHOOL CLIMATE AND INDIVIDUAL WELL-BEING IN STUDENTS' AND TEACHERS' SOCIAL AND EMOTIONAL COMPETENCES

Introduction

Social and emotional competences (SECs) manifested by students and teachers within school contexts are fundamental for an adaptive development (Cavioni et al., 2023; Grazzani et al., 2024).

Research objectives

The study examined the role of the school climate (in the two dimensions of classroom practices – factors related to everyday choices and behaviors during classroom activities - and school atmosphere - the quality of the general experience in school internalized over time; Grazia & Molinari, 2021; Molinari & Grazia, 2022) in the SECs of students and teachers, also testing the moderation of individual well-being.

Methodology

3685 students (49.63% females; mean age = 11.95 years, SD = .92) and 569 teachers (82.95% females; mean professional seniority = 13.49 years, SD = 9.85), from lower secondary schools in Italy completed self-report questionnaires within the PRIN PNRR 2022 project "Mapping social emotional learning and school climate in Italian lower secondary schools: Advancing understanding and participation to inform intervention" (CUP J53D23016840001). A linear regression approach was adopted.

Results

In both groups, the association of the school atmosphere with the SECs was positive, and it was strengthened at higher levels of good classroom practices; a conditioned effect occurs in teachers: the effect became statistically significant only from average levels of good classroom practices. In both groups, the individual well-being added unique variance, and, in students, it interacted with the school atmosphere: the positive association between school atmosphere and SECs was stronger in students who reported greater individual well-being.

Conclusions

The results highlight the importance of school climate in the association with the SECs of students and teachers, although with differences between these two groups - also with reference to the role played by their individual well-being.

Abstract 3893

FOSTERING A SENSE OF GRIT, HOPE AND RESILIENCE IN STUDENTS: STRATEGIES TO PROMOTE WELL-BEING IN SCHOOLS. IMPLICATIONS FROM EMPIRICAL RESEARCH

Colomeischi A.A.*, Rusu P.P.

Stefan cel Mare University of Suceava ~ SUCEAVA ~ Romania

In the educational landscape, promoting student well-being extends beyond academic achievement to encompass holistic development, including the cultivation of grit, hope and resilience. We intend to explore strategies aimed at nurturing these vital psychological assets in students and, consequently, promoting their overall well-being in school settings. This research highlights the role of grit, hope and resilience in promoting well-being and their interrelationship with student well-being.

This research underscores the predictive role of grit, hope and resilience for well-being and highlights the significant implications of cultivating grit, hope and resilience for students' well-being and academic outcomes. The sample consists of 501 students aged 9 to 18 years (mean age 12.3 years, SD=1.51), 251 from urban areas, 249 from rural areas, 215 boys, 285 girls). The instruments used were Grit Scale (Duckworth), (Cronbach's Alpha = 0.949), CYRM-R (Ungar) (Cronbach's Alpha = 0.956), Sterling Childrens Wellbeing Scale (Cronbach's Alpha =0.951), Childrens Hope Scale (Snyder, 1997) (Cronbach's Alpha = 0.930). Analyses were carried out using SPSS 27.

The findings indicate high correlations between variables and a strong explanation of wellbeing in terms of students' grit, hope and resilience. Based on the findings of the empirical study, we try to identify a number of evidence-based strategies for promoting grit, hope and resilience in students. These strategies include both individual-level interventions, such as goal-setting exercises, growth mindset interventions, and mindfulness practices, and environmental factors, such as supportive teacher-student relationships, a culture of high expectations, and opportunities for meaningful engagement and autonomy.

In conclusion, the empirical evidence presented highlights the importance of intentional efforts to foster grit, hope, and resilience in students within the school context. By implementing evidence-based strategies aimed at cultivating these psychological assets, educators can play a pivotal role in promoting student well-being and creating supportive learning environments conducive to academic and personal growth.

Abstract 2207

IMPACT OF A KINDERGARTEN MULTICOMPONENT INTERVENTION ON GRADE 1 SPELLING

Ramirez G.*

Thompson Rivers University ~ Kamloops ~ Canada

This study examined the effects of two kindergarten literacy interventions on Grade 1 spelling outcomes among monolingual Spanish-speaking kindergarteners in low socioeconomic schools in Argentina. One intervention targeted phonological awareness (PA) and basic phonics, while the other was a multicomponent intervention integrating PA, morphological awareness (MA), and vocabulary instruction. A control group followed the standard kindergarten curriculum without explicit literacy instruction. The interventions were delivered over three months by classroom teachers. Repeated measures ANOVAs showed that both intervention groups outperformed the control group on spelling at posttest, with large effect sizes. Vocabulary outcomes were significantly higher in the multicomponent group compared to both the control and PA-only groups. No between-group differences were observed in phonological awareness gains, although all groups improved over time. The results suggest that both PA-focused and multicomponent instruction can enhance early spelling skills in transparent orthographies such as Spanish, with the multicomponent approach offering additional benefits for vocabulary development. These findings support the integration of MA and vocabulary into early literacy curricula and underscore the potential of teacher-delivered interventions to promote foundational literacy skills in under-resourced settings.

Abstract 635

ECONEUROBIOLOGY IN EDUCATION: LEVERAGING ENVIRONMENTAL AND NEUROLOGICAL INSIGHTS TO ENHANCE CHILD DEVELOPMENT AND LEARNING OUTCOMES

Mualem R.*[2], Hussein Farraj R.[1]

[1]Dr Rania Hussein Farraj ~ Econeurobiology Research Group, Research Authority, Oranim Academic College ~ Israel, [2]Dr raed Mualem ~ Econeurobiology Research Group, Research Authority, Oranim Academic College ~ Israel

Introduction:
Econeurobiology explains how environmental factors shape brain development and learning. It highlights love and positive emotions, movement, sleep, nutrition, music, and STEAM-based learning in attention, memory, and executive function.
Purpose:
This project examined how modifiable inputs affect children's cognitive, emotional, and academic outcomes, aiming to identify strategies that build resilience, equity, and critical thinking.

Method:
Studies with children aged 5–12 used within-subjects and quasi-experimental designs. Standardized tasks measured attention, memory, and problem-solving; observations and QEEG recordings provided behavioral and neural data.
Results:
• Love and positive emotions: Stress-inducing games (e.g., Fortnite) impaired memory (–41.8%), concentration (–30.3%), and math efficiency (–41.5%). Calming tasks (e.g., Solitaire) enhanced these functions, showing love and safety act as neurocognitive enhancers.
• Movement: Ten minutes of effortless walking improved concentration by 255%, recall by 54.3%, understanding by 42%, application by 33%, and analysis by 66%, alongside increased alpha and gamma activity.
• Sleep: Children sleeping 8–10 hours outperformed those with 4–6 hours, with restriction causing declines of 20.4% in memory, 22.7% in concentration, and 35.9% in academic performance.
• Nutrition: A Mediterranean-style diet improved memory by 35.9%, concentration by 35.4%, and social behavior by 46.1%, while reducing negative behaviors by 48%. QEEG confirmed higher alpha and gamma activity.
• Music: Listening to music raised exam performance by 31.5%, with 29–34% gains across Bloom's taxonomy; CEEG showed increased alpha and gamma activity.
• STEAM: Projects boosted motivation, collaboration, and reasoning, emphasizing brain

connectivity and shifting learning from memorization to inquiry.
Conclusions:
Econeurobiology shows that targeted environmental interventions can enhance learning, well-being, and equity. Above all, findings highlight the role of positive emotions and love in strengthening prefrontal regulation and growth. Embedding movement, sleep, nutrition, music, supportive contexts, and STEAM pedagogy can foster critical thinking and teach children not what to think, but how to think.

Abstract 709

EFFECTIVE PRACTICES FOR EARLY CHILDHOOD DEVELOPMENT: WHY SUPPORTING CHILDREN'S AGENCY MATTERS

Plotnikova V.*, Veraksa A.

Lomonosov Moscow State University ~ Moscow ~ Russian Federation

Designing effective educational practices that can support children's development is a pressing challenge for educators and policymakers. Within the cultural-historical approach, the social environment serves as a source of development for the child, but it becomes truly developmental only when the child actively engages with it (Vygotsky, 2004). This process is mediated by perezhivanie, understood as an emotional, lived-through experience that integrates cognitive, emotional, and cultural aspects of a child's activity, thereby linking external social conditions with internal development. In this regard, the present study examines how the support of children's agency in educational practices as an external social condition influences their development.

The study investigates play- and project-based practices that vary in the degree of children's agency. The sample included 215 children aged 5–6 years (50.2% boys). A pre-test/post-test design assessed self-regulation (NEPSY-II subtests), narrative competence (MAIN), and social outcomes (SCBE-30, TEC). Children were randomly assigned to five groups: (1) control group, (2) research project, (3) free play, (4) child–adult play, (5) creative projects. Each group participated in 22 sessions.

The results showed that the higher the degree of children's agency in an activity, the stronger its developmental effect. Free play supported gains in verbal working memory and narrative macrostructure. Child–adult play significantly enhanced working memory, inhibitory control, and narrative development. Creative project activity promoted narrative development and children initiative, reduced anxiety and aggression. In contrast, children in the control group showed an increase in aggressive behavior.

The findings suggest that supporting children's development requires organizing activities where they can act as active subjects, express their own ideas, and receive support for initiative. This study underlines the applied value of differentiating between play and project approaches in preschool education and offers evidence for balancing creativity, play, and guided interaction to foster holistic child development.

Abstract 1075

CHILDREN'S VISUAL ATTENTION TO HUMOROUS IMAGES: AN EYE-TRACKING STUDY

Tsuji H.*

Osaka Shoin Women's University ~ Osaka ~ Japan

Humour is a powerful tool for social interaction and learning, however, how young children visually engage with humorous stimuli remains poorly understood. Developmental theories suggest that humour appreciation emerges in early childhood and may be reflected in distinct attention patterns. This study used eye-tracking to examine whether humour captures children's visual attention beyond mere novelty effects.

We tested whether 3- to 6-year-olds fixate longer on humorous images compared to perceptually matched non-humorous controls. Participants viewed five paired stimulus sets, each depicting a standard action, a colour-variant control, and a humorous incongruity that violated functional expectations. Children saw the standard image followed by either the humorous or control version in randomised order. Eye-tracking recorded dwell time to target objects, and the children also provided explicit humour judgements.

Children fixated significantly longer on humorous images ($M = 1.53$ s, $SD = 0.76$) than colour-variant controls ($M = 1.26$ s, $SD = 0.76$), $t(128) = 6.07$, $p < .001$, Cohen's $dz = 0.53$. Linear mixed-effects modelling confirmed this effect after controlling for individual and stimulus variability ($\beta = –0.29$, 95% CI [–0.37, –0.21], $p < .001$). However, effects varied by stimulus: clear differences were not observed for two of the five sets. Children's explicit judgements validated the humour manipulation, with 82% of choices favouring humorous images. Sets showing the strongest gaze differences were also rated as the funniest, demonstrating convergence between implicit attention and explicit judgement.

These findings demonstrate that humour captures early visual attention through incongruity processing. Stimulus-specific effects suggest that successful humour detection depends on children's conceptual knowledge and expectation violations. This work advances understanding of how incongruity, novelty, and meaning interact to guide children's perception and learning.

Abstract 381

DIVIDED BY AI: CHATGPT USERS AND NON-USERS IN HIGHER EDUCATION

Blahopoulou J.*, Ortiz--Bonnin S.

University of the Balearic Islands ~ Palma ~ Spain

Introduction

As artificial intelligence (AI) tools like ChatGPT become more prominent in academic settings, student attitudes toward their integration in higher education vary significantly.

Purpose

This study explores how prior experience with ChatGPT influences students' perspectives on the role of AI in teaching and learning.

Method

A quantitative study was conducted using an online survey completed by 737 undergraduate students at a Spanish university. Data were analyzed using descriptive statistics and non-parametric tests (Wilcoxon and Mann-Whitney U).

Results

Students who regularly use the tool generally support its integration into university, particularly in teaching methods, while non-users often oppose its integration, advocating for measures such as banning AI use within academic institutions.

Conclusions

These contrasting views highlight the complex psychological and pedagogical implications of AI in education. Understanding these differences is crucial for developing inclusive policies and interventions that reflect the diverse needs and values of the student population. Educational psychologists and institutions must address this divide by promoting informed, ethical, and equitable approaches to AI adoption that support both student development and educational quality.

Abstract 2538

THE USE OF GENERATIVE ARTIFICIAL INTELLIGENCE IN MODULATING ANXIETY RELATED TO LEARNING AND PERFORMANCE IN UNIVERSITY STUDENTS: EVIDENCE FROM A SYSTEMATIC META-ANALYSIS

Di Segni F.*, Di Pomponio I.

University Uninettuno ~ roma ~ Italy

Introduction.
Academic anxiety is a widespread concern among university students, negatively affecting motivation, academic performance, and psychological well-being. Recent advances in Artificial Intelligence (AI) — including generative models such as ChatGPT, adaptive tutoring systems, and predictive algorithms — have opened new opportunities for emotional regulation and cognitive support in higher education. However, despite the growing number of empirical studies, no previous meta-analysis has quantitatively assessed the effectiveness of AI-based interventions in reducing academic anxiety and enhancing self-efficacy.
Purpose.
This meta-analysis aimed to evaluate the overall efficacy of AI-based interventions in improving emotional and cognitive outcomes among university students, with particular attention to the reduction of academic anxiety, the enhancement of motivation, and perceived self-efficacy.
Method.
Following PRISMA guidelines, 20 quantitative studies published between 2022 and 2025 were systematically identified and analyzed (total N ≈). A random-effects model (DerSimonian–Laird method) was applied, using Hedges' g as the standardized effect size. Heterogeneity was assessed through Cochran's Q and the I^2 index, and meta-regressions explored the moderating roles of AI type, study design, and intervention duration.
Results.
The overall effect size was g = 0.64 (95% CI [0.55, 0.74], p < .001), indicating a moderate-to-high positive effect of AI interventions on learning-related and emotional outcomes. Heterogeneity was moderate (I^2 = 61%), and publication bias appeared limited. Predictive machine learning models and integrated AI platforms yielded the strongest effects, while conversational AI tools showed smaller but consistent improvements.
Conclusions.
AI-based tools demonstrate significant potential to reduce academic anxiety and enhance students' motivation, engagement, and self-efficacy. These findings highlight the relevance of AI as a complementary instrument for promoting psychological well-

being and adaptive learning in higher education settings. Future research should investigate longitudinal effects, differential impacts across disciplines, and ethical dimensions of AI use in psychological and educational interventions.

Abstract 2403

INTERACTIVE ROBOT-ASSISTED JOB INTERVIEW TRAINING: AN AI-DRIVEN INTERVENTION FOR YOUTH WITH SPECIAL EDUCATIONAL NEEDS

Fung K.Y.*, Sin K.F.

The Education University of Hong Kong ~ Hong Kong ~ Hong Kong

Youth with Special Educational Needs (SEN) face challenges in the employment market. Job interview skills represent a barrier due to anxiety and communication difficulties. Traditional human-led training programs suffer from scalability limitations, inconsistent delivery, and anxiety induction. This study presents JoBot, a cat-shaped social robot designed to provide engaging, adaptive job interview training in a low-stakes environment. We conduct an empirical study with 28 youth with SEN (ages 19-26) randomly assigned to robot-led (n=14) or human-led (n=14) training sessions. This study employs a mixed-methods approach that incorporates performance assessments, questionnaires, and qualitative interviews. Training efficacy in four interview competence domains is evaluated. We also examine psychological outcomes using Self-determination Theory. In general, the experimental group shows greater improvement (mean: +17.06%) than the control group (mean: +8.23%). For performance assessment, participants' verbal competence exhibits statistically significant enhancement (robot-led: +30.19%, $p<.01$; human-led: +16.96%, $p=.13$). For psychological outcomes, robot-led training manifests a statistically significant improvement in intrinsic motivation (robot-led: +7.69%, $p<.05$, $d=.58$; human-led: +2.86%, $d=.33$). Qualitative analysis reveals that most participants demonstrate motivational readiness. Some participants report that they increase confidence but reduce stress through repeated robot-led practice. These findings suggest that robot-led training creates a stress-free environment and fosters a non-judgmental mastery-learning experience for youth with SEN. This work provides empirical evidence that social robots are effective and scalable alternatives for job interview training among SEN populations. The result implies the importance of inclusive and assistive technology development in the future.

Abstract 633

GUIDING ETHICAL DECISION-MAKING AMONG UNIVERSITY STUDENTS IN THE DIGITAL ERA: A SCENARIO-BASED APPROACH

Keung C.*[2], Zou T.[1]

[1]The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]The Education University of Hong Kong ~ Hong Kong ~ Hong Kong

The advancement of digital technology has transformed teaching and learning, offering unprecedented opportunities. When effectively utilised, digital transformation can enhance connectivity, efficiency, productivity, and creativity. However, it has also significantly impacted our approaches to education and work, leading to emerging ethical issues. Key concerns include digital privacy, the use of personal information, intellectual property rights in digital media, misinformation dissemination on social media, ownership of AI-generated content, and cyberbullying. There is a lack of research that guides decision-making in digital contexts based on ethical theories and moral principles. This study employs a scenario-based approach to explore how simulated scenarios can facilitate ethical decision-making among university students through a virtual learning platform. We developed 20 scenarios, each reflecting real-life situations involving critical incidents related to the digitalisation of teaching and learning. Each scenario is paired with response options designed to encourage exploration of major ethical theories and moral reasoning—such as Deontology, Egoism, Ethics of Care, Social Contract Theory, Virtue Ethics, and Utilitarianism. Student responses were collected and stored in database, which, allows them to view aggregated decisions for each scenario through an online platform, fostering a deeper understanding of diverse perspectives. This database also serves as a useful resource for teachers to track student responses and gather formative assessment data. This presentation will showcase how this platform enhances university students' abilities to discern incidents, consider multiple perspectives, and make judgments based on moral reasoning in various digital contexts. By integrating these scenarios into courses, teachers empower university students to apply, reflect on, and discuss moral principles that lead to ethical decisions in complex dilemmas. This approach not only fosters critical thinking but also enables students to evaluate the relative importance of different considerations in determining the appropriateness of various response options.

Abstract 749

THE ROLE OF EXPLANATION TYPE FROM DIGITAL VOICE ASSISTANT IN YOUNG CHILDREN'S EPISTEMIC TRUST AND BELIEF REVISION

Li T.*[1], Zhu L.[2], Zhou K.[1], Wang X.[1]

[1]Zhejiang Normal University, College of Child Development and Education ~ Hangzhou ~ China, [2]Faculty of Psychology, Shandong Normal University ~ Jinan ~ China

In the digital era, Digital Voice Assistants (DVAs) have become a significant channel for children to acquire knowledge. However, little is known about how the type of explanatory testimony influences children's epistemic trust in DVAs. This study employed a conflicting sources paradigm, manipulating both the type of explanatory testimony provided by DVAs (teleological explanations vs. mechanical explanations) and the conflict situations (non-conflict vs. low-conflict vs. high-conflict), to examine the epistemic trust and its developmental characteristics of 90 children aged 4-6 years in DVAs. Data were analyzed using Generalized Linear Mixed Models (GLMM). The results showed: (1) Children exhibited higher epistemic trust in DVAs providing teleological explanations. This trust preference showed significant age differences, compared to the 5-year-old and 6-year-old groups, the 4-year-olds demonstrated a stronger trust tendency towards teleological explanations. (2) In conflict situations, children's trust in the DVAs providing teleological explanations significantly decreased across all ages. Furthermore, the degree of conflict influenced children's epistemic trust, compared to high-conflict situations, in low-conflict situations, children were not only more willing to trust DVAs providing teleological explanations but also more inclined to revise their pre-existing beliefs. (3) Belief revision also exhibited significant age differences, 4-year-olds were more prone to revise their pre-existing beliefs, whereas 5- and 6-year-olds showed a stronger tendency to maintain their original beliefs. This study is the first to investigate the mechanisms and developmental patterns of children's epistemic trust in DVAs. It provides empirical evidence for evaluating the educational suitability of DVAs as informants for children and offers valuable insights for optimizing the effectiveness of children's interactive learning with DVAs.

Abstract 1632

AI IN MENTAL HEALTH PROMOTION IN EDUCATIONAL SETTINGS: A SYSTEMATIC REVIEW AND META-SYNTHESIS OF USES, OUTCOMES, BENEFITS AND CHALLENGES

Simon P.*[1], Nalipay M.J.[2], Yema D.P.[3], Dela Cruz I.[4], Liu T.[5]

[1]Hong Kong Baptist University ~ Hong Kong ~ Hong Kong, [2]The Education University of Hong Kong ~ Hong Kong ~ Hong Kong, [3]The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong, [4]Massachusetts Institute of Technology ~ Cambridge ~ United States of America, [5]University of Macau ~ Macao ~ Macao

Artificial intelligence (AI) integration into educational settings has opened new avenues for mental health promotion. Despite reviews and meta-analysis conducted on AI's effectiveness in addressing mental health issues, a comprehensive understanding of the uses, outcomes, benefits, and challenges of AI-driven mental health initiatives across all educational levels remains limited. This systematic review and meta-synthesis aim to critically examine the current landscape of AI applications in mental health promotion within educational environments, synthesizing evidence from qualitative studies on their uses, outcomes, benefits and barriers to implementation. We systematically searched six databases (WoS, Scopus, MEDLINE, Embase, PsycINFO, and Google Scholar) for peer-reviewed articles published between 2020-2025. Studies were included if they reported on AI-based interventions or tools aimed at promoting mental health among students across educational levels. Data were extracted and synthesized using thematic analysis and meta-synthesis techniques. Thirty-nine studies met inclusion criteria, encompassing a range of AI approaches such as chatbots, wearables, social robot, mobile agents, etc. We found that AI were used for assessment/diagnosis, adoption of therapist's role, enhancement of socio-emotional skills, facilitation of the therapeutic process, improvement of well-being and functioning, and management of mental health symptoms. Mental health outcomes addressed by AI were grouped into positive mental health, negative mental health, and physiological functioning. Reported benefits include positive user experience and engagement, adoption of therapist's positive characteristics, enhanced mental health and well-being of users, enhanced socio-emotional skills, enhanced therapeutic process, and privacy and confidentiality. Challenges identified were related to client factors, technology and design issues, negative attitude towards AI, lack of counsellor characteristics, and resource intensiveness. AI holds promise for mental health promotion, yet its implementation in educational settings is accompanied by notable practical and methodological challenges. Future research should prioritize transparent reporting, stakeholder involvement, and robust evaluation frameworks to maximize AI's potential while safeguarding student well-being.

ARGUMENTATION AND LEARNING WITHIN A DIALOGICAL AND INTERACTIONAL PERSPECTIVE

Wednesday 22 July 2026 from 15:30 to 17:00

(H-Spadolini)

Antonio Iannaccone (Università Mercatorum ~ Rome ~ Italy), Chair and Presenter
Francesco Arcidiacono (University of Teacher Education BEJUNE ~), Co-Chair
Nathalie Muller Mirza, Discussant

By adopting a life-span development framework, this symposium addresses questions related to the role of argumentation in education, through the presentation of studies that examine the impact of argumentative activities in different learning contexts.
Contributors present qualitative data collected through systematic observations of various educational contexts (from preschool to secondary school). The presentations are characterized by a common dialogic and interactional perspective to illuminate how argumentation is built upon different characteristics depending not only from the explicit role assigned to it by the teacher, but also established by the socio-cognitive characteristics that define different modes of action and interaction in the human development. The adoption of an interactive and dialogical perspective (Arcidiacono & Bova, 2017; Muller Mirza & Buty, 2015; Muller Mirza & Perret-Clermont, 2009; Perret-Clermont et al., 2019; Schwarz & Baker, 2017) allows to define situations in which argumentation is developed through interpersonal dynamics characterizing learning activities.
In this sense, the five studies refer to argumentative situations as dialectical and intersubjective exchanges among people: it is the social and intersubjective matrix that makes argumentation suitable in various educational contexts, such as preschool settings (first contribution) or primary school (second paper) in which different semiotic resources contribute in promoting children's cognitive argumentation. Third and fourth studies consider argumentation, education and technology at secondary school level, to reflect on cultural dimensions necessary to build a genuinely cross-cultural theory of argumentative interaction in education. A final presentation presents a constructivist and dialogical approach to study argumentation, by highlighting insights of a lifelong learning perspective into how argumentation takes forms with social and cognitive skills that gradually emerge during ontogenesis.
All contributions support the idea of argumentation as an effective linguistic tool (in a Vygotskian sense) during social interactions, which can be then internalized to support individual cognitive activities (Iannaccone et al., 2019).

Abstract 3599

ARGUMENTATION AS EXPLORATORY DIALOGUE IN PRESCHOOL CHILDREN: AN EMPIRICAL AND THEORETICAL CHALLENGE

Iannaccone A.*[1], Perret--Clermont A.[2]

[1]*Mercatorum Universitas ~ Roma ~ Italy,* [2]*Université de Neuchâtel ~ Neuchâtel ~ Switzerland*

This contribution reports on a series of studies on reasoning in preschool children with an interactive-dialogic approach, which has empirically demonstrated the impact of interpersonal relationships on cognitive development (Perret-Clermont, 1976, 2022). This raised theoretical questions when trying to explain the processes of shifts in the logical levels (in Piagetian terms) of participants interacting around a common task (Perret-Clermont & Schubauer-Leoni,1981; Light & Perret-Clermont, 1989; Schubauer-Leoni & Grossen, 1993; Grossen, 1994; Iannaccone, 2010). This has led to a reliance on theoretical elements drawn from interlocutory, intersubjective, cultural, and narrative psychology, to conduct micro-genetic qualitative analyses of the meaning making and conceptual activity of children's dialogues (Perret-Clermont & Grossen 1994; Liengme et al.,1994; Schwarz et al., 2008; Arcidiacono & Perret-Clermont, 2010; Tartas et al., 2016). This highlighted the fundamental role played by children's contextualized and dynamic interpretation of situation, task and adults 'questions within the interaction.

Rather than individual socio-cognitive resources, arguments appear as the fruit of interpersonal processes in conversational moves: why do children indulge in argumentative activities? In our research, we faced the striking evidence that children often use argumentation not to defend a standpoint, but as a mean to explore the situation and its meaning, to examine their place and agentivity within the setting, and to discover the interlocutor's point of view (Iannaccone et al., 2019; Convertini et al., 2021). In such cases, their argumentation, if accepted by the interlocutor in spite of the fact that it might seem out of frame (Greco et al., 2017), gives rise to conversational adjustments that seem to be important in the process of understanding reality. It also reveals the agentivity of the child who explores the world of questions, standpoints and reasoning, just as s/he explores the material world of objects and usages (Iannaccone et al., 2024).

Abstract 3600

THE ROLE OF SEMIOTIC RESOURCES IN PROMOTING COGNITIVE ARGUMENTATION DURING PRACTICE-BASED SCIENCE EDUCATION IN CLASSROOM

Arcidiacono F.*

University of Teacher Education BEJUNE ~ Bienne ~ Switzerland

Science education is often presented at school by setting up practical-based activities to stimulate children's reasoning and learning, as research clearly recognizes the role of argumentation as an inquiry-based approach common to various learning experiences for the children's achievement of high-quality results (Erduran & Jiménez-Aleixandre, 2008). However, how teachers work on semiotic aspects of argumentation is still less explored (Convertini, Arcidiacono & Miserez-Caperos, 2024). For this reason, we decided to focus on teachers' interventions in science education and on the role of different semiotic resources that are mobilized during argumentative interactions with pupils. A collaboration between teachers and researchers has been set up, with the aim of designing a device enabling teachers to work with children so that the latter can learn to think argumentatively during problem-solving situations. The following questions were addressed: How practice-based science experiences settled up by teachers shape children's argumentation in classroom? How teachers' interventions mobilizing different semiotic resources support argumentation in science? Which are the main features of children's argumentation during these practices in science education?

In our investigation, we have involved 39 children (6-7 years old, grades 3-4) and 3 teachers, coming from two different classrooms recruited on a voluntary basis in the French speaking-part of Switzerland. Different practice-based tasks inviting children to discuss around science phenomena were video-recorded and then transcribed.

Through the lenses of the pragma-dialectical approach, we selected the argumentative discussions emerging during the observed experiences and we analyzed different semiotic resources (speech, gaze direction, deictic gestures, and position of physical objects) mobilized by the participants during their argumentative exchanges.

The findings show the crucial role of teachers in sustaining children's argumentation by the integration of different semiotic resources during the activities. This reveals the importance of mobilizing various communicative tools to favor children's learning in science education at primary school.

Abstract 3605

ARGUMENTATION, LEARNING AND CRISIS. A SOCIOCULTURAL AND DIALOGICAL APPROACH FOR THE ANALYSIS OF PERSONAL DIARIES

Muller Mirza N.*

University of Geneva ~ Geneva ~ Switzerland

While numerous studies on the relationship between argumentation and learning have been conducted in educational contexts with children, the sociocultural and dialogical perspective at the core of this symposium provides valuable theoretical and epistemological tools for examining argumentation and learning in everyday life across the lifespan with adults.

Drawing on a research project that investigates how societal crises are experienced in people's daily lives and narrated in diaries written over more than twenty years (Zittoun, Muller Mirza & Gillespie, 2022), our contribution offers a detailed analysis of two personal diaries. We adopt a dialogical approach to argumentation (Arcidiacono & Baucal, 2021; Grossen, 2015; Muller Mirza, 2024; Muller Mirza & Perret-Clermont, 2008) to highlight how two individuals, a man and a woman, through their writing, engage in argumentative dialogues with themselves (in a form of auto-dialogue) and with various other « voices » - including significant others in their family, friendship, or professional circles, political figures, the media of their time, and broader social "doxa".

For this analysis, we focus on the global societal crisis of COVID-19 in 2020, as well as on more personal crises that these individuals faced in their lives. We show that argumentative dynamics unfold across the life course in distinct ways, becoming intertwined with situations that carry particular meaning for the individuals, leading to decision-making, heightened awareness, and, in certain respects, forms of "learning".

This talk thus contributes to reflections on the role of argumentation in everyday life throughout the lifespan, within a sociocultural and dialogical perspective.

A STUDY OF ENHANCING STUDENT ENGAGEMENT IN ACCOUNTING EDUCATION THROUGH THE APPLICATION OF PADLET: A PEDAGOGICAL PERSPECTIVE

Chen Y.*, Mao C.

Chihlee University of Technology ~ New Taipei City ~ Taiwan

This study explores the application of Padlet, a digital collaborative platform, in accounting education to enhance student engagement. Accounting, often perceived as dry or difficult, presents unique challenges in sustaining student interest and motivation. The integration of interactive technologies like Padlet is increasingly relevant in today's digital learning environments. This paper examines the theoretical underpinnings of student engagement, the functionalities of Padlet, and how it can be effectively integrated into accounting curricula. Through a review of recent studies (2020–2025), a case study, and survey analysis, the research highlights the potential of Padlet to foster collaboration, active participation, and deeper learning in accounting classrooms.

SMARTPHONE USAGE AND MIND WANDERING AMONG STUDENTS: MODERATING ROLE OF MINDFULNESS

Jain A.*, Sarkar S., Yadav A.

Banaras Hindu University ~ Varanasi ~ India

Excessive smartphone usage has been a cause of concern lately. It is linked with adverse health effects and cognitive impairments. In this view, the present study investigated the effect of smartphone usage on mind wandering with focus on moderating role of mindfulness. The sample consisted of 112 university students whose age ranged from 18 to 26 years. The responses of participants were obtained using Mindful Attention Awareness Scale (Brown & Ryan, 2003), Mind-Wandering Questionnaire (Mrazek et al., 2013) and Smartphone Use Scale (Mukherjee & Dasgupta, 2020). Finally obtained data (of 100 participants) was subjected to regression and moderation analyses that indicated significant positive association between smartphone usage and mind wandering and moderating role of mindfulness. The findings revealed that higher smartphone use was associated with increased occurrences of mind wandering and students with elevated mindfulness reported higher linkage between mind wandering and smartphone usage. These results showed that individuals high in mindfulness have either enhanced awareness or higher sensitivity to attentional disruptions caused by smartphone engagement. The results of this study suggested that intervention programs for smartphone addiction should focus on the mindfulness perspective to curb excessive usage of smartphone. In future, empirical researches may be conducted to further explore the smartphone addiction in the mindfulness aspect.

Abstract 154

EXAMINING THE EFFECT OF INSTRUCTOR VISIBILITY IN MULTIMEDIA INSTRUCTIONAL VIDEOS FOR LANGUAGE LEARNING

Lan Y.*, Manalo E.

Graduate School of Education, Kyoto University ~ Kyoto ~ Japan

Introduction:
In recent years, multimedia instructional videos have been widely used in both in-person and online education. However, there is debate about whether to incorporate instructor visuals in the instructional materials. This study examines the mechanisms of instructor videos, focusing on social presence and the additional information instructors can provide, using a Mandarin language learning context.
Purpose:
The present study aimed to examine the mechanisms of the instructor video, focusing on the social presence and additional information by examining different levels of the instructor's visibility (or invisibility).
Method:
91 Japanese university students with no prior experience learning Mandarin (the language setting used) were recruited and randomly assigned to one of three conditions: no instructor video (NT) condition, only mouth video (OM) condition, and whole instructor video (WT) condition. Learning performance was assessed with pre- and post-tests based on a beginner-level Mandarin speaking and listening lesson. Gaze allocation was measured during the lesson and a survey about their subjective perceptions of the instructional video was conducted afterward.
Results:
Findings revealed that instructor visibility significantly impacted performance, with participants in the WT condition outperforming those in the OM condition on the listen-and-choose task. The presence of the whole instructor provided additional visual cues, such as gestures and facial expressions, which enhanced learning outcomes. However, participants in the NT condition also outperformed those in the OM condition, suggesting that partial instructor visuals may negatively impact learning due to unfamiliarity and increased split attention. Gaze allocation data supported these findings, showing significant differences in fixation patterns across conditions.
Conclusions:
This study contributes to theoretical frameworks by clarifying how instructor visuals interact with learning processes. Practical implications include insights on the strategic use of teacher videos, avoiding partial and unfamiliar visuals, and integrating training to enhance learners' ability to process multimedia instruction effectively.

Abstract 4947

TAMING TABLETS, LEARNING LIMITS: A COMPARATIVE STUDY OF PARENTAL MEDIATION INFLUENCE ON RECREATIONAL SCREENTIME AMONG FILIPINO PRESCHOOL AND SCHOOL-AGE CHILDREN

Capulong A.*

University of the Phiippines ~ Quezon City ~ Philippines

With the ubiquity of digital technology in the daily lives of children, issues have been raised regarding its potential perils on children's development. Parental mediation may mitigate these potential negative effects. However, parental mediation and its impact on children's screentime have been hardly explored in the Philippine setting, highlighting the need to examine the said topic. Thus, this study aimed to investigate the impact of parental mediation strategies on the children's recreational screentime according to three age groups: preschoolers (4-6 years), younger (7-9 years) and older (10-12 years) elementary graders. 172 parents, with children ages 4-12 years, answered an online survey on their children's media practices and the mediation strategies they use. Results revealed that the mean screentime for preschoolers and younger elementary graders were significantly lower compared to older elementary graders but there was no significant difference between mean screentime of preschoolers and younger elementary graders. Regression analysis indicated that diversionary mediation was a statistically significant predictor of screentime (i.e., children whose parents use this strategy have significantly lower screentime compared to parents who do not use it). Results also showed that there was a statistically significant interaction between age group (older elementary graders versus preschoolers) and absence of co-use mediation, indicating that the decrease in screentime associated with non-practice of co-use was less pronounced for older elementary graders than for preschoolers, which in turn, may suggest that co-use mediation is more likely used with younger than older children. This study highlights the crucial role of parents and caregivers in regulating children's screen media use and the value of employing more than one parental mediation strategies, especially more contemporary ones such as diversionary mediation.

LITERACY ACQUISITION IN THE THIRD MILLENNIUM: CHALLENGES AND OPPORTUNITIES

Wednesday 22 July 2026 from 17:00 to 18:30

(H-Spadolini)

Chiara Pecini (University of Florence ~ Florence ~ Ital), Chair and Discussant

In an increasingly interconnected and digitally mediated world, the development of literacy skills
remains a cornerstone of educational success and social inclusion.However, the pathways to
literacy are shaped by a complex interplay of cognitive, cultural, linguistic,and technological
factors that vary widely across individuals and regions.This symposium brings together diverse
contributions that illuminate these pathways from multiple, complementary perspectives,
highlighting the urgent need to adopt both a comparative cultural lens and digitally enriched
methodologies.
A key theme emerging across the presentations is the recognition that literacy development is not a
uniform process. For example, one contribution investigates the early cognitive and environmental
predictors of writing ability using longitudinal twin data. This research distinguishes between
general developmental abilities and domain-specific precursors and leverages genetically sensitive
designs to unravel the intricate influences on writing outcomes and Specific Learning Disorders.
Such work underscores the necessity of early,individualized intervention informed by both
biological and contextual data.
This need for contextualization is further echoed in a systematic review focused on Sub-Saharan
Africa, a region marked by profound linguistic and cultural diversity. Despite global literacy
initiatives, regional outcomes remain below average, emphasizing the importance of culturally and
linguistically responsive approaches to literacy instruction and teacher training.
Simultaneously, the growing centrality of digital media in education introduces new opportunities
and challenges.Some contributions explore how core executive abilities—particularly in students
with ADHD—affect engagement and comprehension with digital vs print texts. Meanwhile,
interventions like Legends of Hoa’manu and CRAB show how well-designed digital tools can
strengthen foundational reading and cognitive skills, even across different languages.Other
contributions explore how students can be equipped to critically engage with online content
through gamified and scenario-based digital interventions such as VITO and EMILE.
Together, these studies argue for a paradigm shift: one that embraces comparative,culturally

grounded frameworks and harnesses the potential of digital innovation to foster literacy for all
learners—regardless of geography, background, or cognitive profile.This symposium aims to
ignite dialogue and collaboration toward more inclusive,adaptive, and effective literacy research
and practice.

Abstract 4458

EARLY CHILDHOOD PREDICTIVE INDICES OF WRITING SKILLS AT SCHOOL AGE: A PHENOTYPIC AND GENETIC ANALYSIS USING A TWIN DIFFERENCE DESIGN

Malanchini M.*[1], Mercugliano A.[2]

[1]Queen Mary University of London, United Kingdom King's College London, United Kingdom ~ London ~ United Kingdom, [2]University of Florence, Italy ~ Florence ~ Italy

Writing ability is a fundamental educational skill that significantly influences academic achievement and broader life outcomes. Despite its crucial role, research investigating early predictors of writing development remains limited compared to other literacy domains, particularly regarding genetic and environmental contributions. Using the dataset from the Twins Early Development Study (TEDS), this study aims to investigate the longitudinal relationships between early predictors, including cognitive and non-cognitive abilities (e.g. language skills, motor skills, behavioural indices) assessed at ages 2, 3, 4, 4.5, and writing outcomes, and a diagnoses of Specific Learning Disorders (SLD), assessed at age 7, 9, 12. Specifically, we distinguish between developmentally distal predictors, such as broad cognitive and language skills assessed in infancy, and proximal predictors, more domain-specific skills such as phonological awareness or early numeracy, assessed closer to the time of formal literacy instruction. Using a twin-difference design, accounting the genetic similarity of monozygotic and dizygotic twins, we estimate the relative contribution of genetic, shared, and non-shared environmental influences on writing development and SLD. Our findings would contribute to understanding the developmental pathways leading to writing difficulties and SLD, offering insights into early identification and tailored intervention, informed by genetically sensitive methods.

Abstract 4459

DECODING DIVERSITY: LITERACY THROUGH A LINGUISTIC AND CULTURAK LENS IN SUB- SAHARAN AFRICA

Otieno--Leppänen S.*[1], Mekdes A.[2], Wafula W.C.[2], Samuel J.[3], Leppänen P.[3]

[1]University of Jyväskylä, Finland Great Lakes University, Kisumu ~ Jyväskylä, ~ Finland, [2]Great Lakes University, Kisumu ~ Kisumu ~ Kenya, [3]University of Jyväskylä Finland ~ Jyväskylä ~ Finland

Sub-Saharan Africa possess a remarkable linguistic and cultural diversity of more than 2000 spoken languages (excluding Arabic, Malagasy, Afrikaans, English, French, Spanish and Portuguese (Heine & Nurse 2000). Despite various interventions, research and related reports, literacy levels in the region remain below global averages with an average literacy rate of only 65% (Macrotrends, 2023; World Population Review, 2025). In this systematic review we explore empirical evidence on how linguistic and cultural contexts influence literacy outcomes across the region. In our analysis we also explore teacher preparedness in language of instruction

Abstract 4461

LEVERAGING GAME-BASED TECHNOLOGIES TO FACILITATE READING ACQUISITION

Pasqualotto A.*[1], Bochud M.[1], Damas J.[1], Menestrina Z.[1], Zesiger P.[1], Brem S.[2], Ziegler J.[3], Bavelier D.[1]

[1]University of Geneva, Geneva, Switzerland ~ Geneva ~ Switzerland, [2]University of Zurich, Switzerland), ~ Zurich ~ Switzerland, [3]Marseille University, Aix-en-Provence ~ Aix-en-Provence, ~ France

Learning to read is a complex and multifaceted process, involving both language-specific abilities, such as phonological awareness, and domaingeneral cognitive skills, such as attentional control and working memory. Although the contribution of domain-general skills to reading development is increasingly recognized, few interventions have directly targeted these foundations. In this presentation, I will introduce Legends of Hoa'manu (LoH), a video game-based intervention designed to strengthen executive functions through action-based mechanics, adaptive difficulty, and an engaging narrative structure. I will present findings from the Edugame randomized controlled trial, in which 311 secondgrade children (Italian and French speakers) were assigned to either the LoH intervention or an active control condition. Reading and cognitive skills were assessed at pre-test, post-test, and six-month follow-up using our novel Computerized Reading-Related Assessment Battery (CRAB), a parallel-form, cross-linguistic tool developed to capture key linguistic (e.g., phonological awareness) and cognitive precursors of reading. Results showed that LoH significantly enhanced text reading fluency, with improvements sustained over time. Gains were observed consistently across languages with different orthographic transparency. These findings highlight the potential of game-based cognitive training to strengthen the foundations of reading acquisition and offer a scalable complement to traditional literacy education

Abstract 4462

VITO AND EMILE: DIGITAL INTERVENTIONS TO SUPPORT CRITICAL ONLINE READING

Tarchi C.*[1], Pecini C.[1], Incognito O.[2], Vettori G.[1], Fallaci A.P.[3], Della Rocca S.[1], Scrocco A.[1]

[1]University of Florence ~ Florence ~ Italy, [2]IUL University, Italy ~ Firenze ~ Italy, [3]University of Reggio Emilia and Modena, Italy ~ Reggio Emilia e Modena ~ Italy

In the present knowledge society, reading comprehension represents a key competence for lifelong learning and active citizenship. People need to critically identify, select, comprehend, evaluate and integrate information from multiple, often conflicting, sources. As our students are accessing the Internet at young ages, it is important for schools to empower them in becoming critical users of digital information. Critical online reading consists in evaluating source credibility, selecting relevant sources, and integrating content across sources. In this contribution we present two digital interventions validated through experimental studies in secondary school students: VITO, a scenario-based digital intervention to enhance sourcing and intertextual integration skills; and EMILE a project validating a gamified intervention to teach students to identify and process relevant sources

PRELIMINARY RESULTS OF ASP-BELONG IN PORTUGAL: A NOVEL INTERVENTION TO REDUCED SOCIAL ANXIETY AND PROMOTE SCHOOL BELONGING THROUGH AUGMENTED SOCIAL PLAY

Coelho V.A.*, Brás P., Marchante M., Primor A.C.

Académico de Torres Vedras ~ Torres Vedras ~ Portugal

The goal of the ASP-Belong project is to develop a digital mental health intervention format, Augmented Social Play (ASP). ASP is a serious game for smartphones based on augmented reality. It is meant to be Used for group psychotherapeutic interventions in educational settings, with the aim of creating supportive communities for adolescents. Additionally, the ASP app can be used as a digital high quality solution for prevention and promotion in the field of Mental Health.

The current presentation will detail the rationale that supports the evolution from the previous version of LINA into the current version, as well as the model of change employed. It will also reflect upon the rationale employed to assemble the current consortium. Furthermore, an additional focus of the presentation is the prevention of undesirable cognitive or emotional effect, because immersive Mental Health experiences can be associated with stress and stigma for vulnerable youth if not adequately managed. Therefore, the presentation will reflect upon the creative process employed to create the new intervention and focus upon identifying risks, and developing strategies to mitigate risks.

Finally, the presentation will feature the first results of the implementation of LINA in Portugal which will be collected from October to February and reflect upon the lessions that these preliminary results will bring to the development of the project.

Abstract 591

THE DIGITAL DIVIDE REVISITED: COMPETENCE, NOT USAGE, DRIVES LEARNING

Guo L.*

the university of macau ~ macao ~ Macao

Despite decades of investment in educational technology, much research on the digital divide has focused on the first level of inequality—physical access to devices and the frequency of use—while giving insufficient attention to the second and third levels, namely digital competence and learning outcomes. Using data from the Programme for International Student Assessment 2022, this study applied Multilevel Latent Profile Analyses to examine how patterns of ICT usage, competence, and academic achievement combine to shape learning outcomes across economies. Four ICT–achievement profiles were identified. The most successful group combined balanced ICT use with high competence and attained the strongest academic achievement. By contrast, students who reported heavy ICT use primarily for leisure performed below average, and students with poor competence and limited ICT engagement remained the most disadvantaged. Another group with high ICT engagement for both study and leisure achieved only average performance, suggesting that greater access and intensity of use do not automatically translate into better learning outcomes.

At the country level, economies differed systematically in the distribution of these profiles. High-performing systems such as Singapore, Japan, and Finland were characterized by a larger proportion of students in the balanced, high-competence group. In contrast, countries including Brazil and Indonesia showed higher proportions of students in low-competence or leisure-focused profiles, corresponding with weaker overall performance. Wealthy but uneven cases, such as Brunei, demonstrated that economic development does not guarantee strong educational digital capital, as high levels of access were not matched with high competence.

Anchored in Digital Capital Theory, the findings demonstrate that the decisive factor in bridging the digital divide lies not in expanding infrastructure or increasing usage, but in cultivating students' digital competence and ensuring its productive application to learning. Efforts to narrow educational inequalities in the digital era must therefore prioritize competence-building and meaningful engagement, particularly for disadvantaged groups.

Abstract 1346

THE RELATIONSHIP BETWEEN INQUIRY- CONSTRUCTIVISM BASED TEACHING METHODS, AND DIGITAL LITERACY

Osnaya--Moreno M.*[1], Llanes--Medina A.[2], Sánchez--Zamudio I.[1]

[1]Universidad Autónoma del Estado de Morelos ~ Cuernavaca, Morelos, Mexico ~ Mexico, [2]Universidad Autónoma de Occidente ~ Guasave, Sinaloa, México ~ Mexico

Since the COVID-19 pandemic, educational institutions have emphasized the employ of information technologies in academic processes. It is increasingly important to integrate these technologies into teaching strategies and practices, as well as in the digital literacy of students and teachers. The importance lies not only in having digital skills but in how to apply them in the teaching and learning process. This research explores the relationship between constructivism based teaching methods, and digital literacy from the perception of Mexican students. Two scales were applied online using Google Forms. The classroom was visited to seek the support of the students, with prior authorization from school authorities. 263 participants with an average age of 17 years. Informed consent was required from each subject. The voluntary participation of the students was appreciated. Confidentiality in their responses was guaranteed. One scale explores the constructivism based teaching method, composed of 46 items on a Likert-type scale with five response options ranging from never to always. A second scale explores digital literacy, composed of nine items with response options on a Likert scale, from no literacy to familiar. Both scales underwent exploratory factor analysis with orthogonal rotation, as well as a reliability analysis using Cronbach's alpha. Subsequently, a correlation analysis between both scales was conducted using SPSS v. 19. The constructivism based teaching scale, a second-order factor analysis with orthogonal rotation was performed, resulting in a factor composed of 44 items. The total variance explained is 76.1% with a Cronbach's Alpha coefficient of .971. The digital maturity scale consisted of two factors with 53.32% of explained variance, a Cronbach's alpha coefficient of .814. The correlations between both scales were statistically significant. The discussion will address the analysis of the relationship between constructivism based teaching methods and the digital literacy perceived by students.

Abstract 2400

EXAMINING THE EFFECTS OF FEEDBACK ON ONLINE CREATIVITY TRAINING FOR UNIVERSITY STUDENTS：EVIDENCE FROM A LONGITUDINAL STUDY

Shi J.*[2], Gao T.[1], Tong D.[1], Liu H.[2], Gu X.[3], Qi W.[4], Zhou Y.[5]

[1]School of Psychology, Northwest Normal University ~ Lanzhou ~ China, [2]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [3]Center for Educational Science and Technology, Institute of Advanced Studies in Humanities and Social Sciences, Beijing Normal University ~ Zhuhai ~ China, [4]Gansu Normal University For Nationalities ~ GanNan ~ China, [5]Zhuhai College of Science and Technology ~ Zhuhai ~ China

Creativity, which is a critical skill for college students to meet the complex challenges of the technology-driven world, can be enhanced through online training. Feedback provides learners with assistance in improving their self-regulation, especially for online learning. However, few empirical studies have examined the impact of feedback on online creativity training. Therefore, the present study evaluated the longitudinal effectiveness of an online creativity training and examined the moderating role of feedback. A 12-day intervention (40 minutes per day) online training was delivered to college students via either the feedback training group or the non-feedback training group. College students' creativity was measured in terms of divergent thinking, convergent thinking, and creative self-efficacy. After exposure to the online creativity training, participants showed significant long-lasting improvements in divergent thinking compared to the control group. Notably, the feedback training group retained more training improvement benefits even after the training period and demonstrated significant short-term and long-lasting effects in creative self-efficacy than the non-feedback training group. Besides, regarding convergent thinking, the changes were not significantly different between groups. Overall, the results find evidence for the importance of feedback in such online training, with important implications for the promotion of creativity in higher education.

Abstract 2355

MINDFULNESS IN THE DIGITAL AGE: IMPACT OF A CLASSROOM INTEGRATED ONLINE INTERVENTION ON STUDENT MINDFULNESS AND STRESS

St Martin M.*, Vidic Z., Boatman A., Oxhandler R.

Western Michigan University ~ Kalamazoo ~ United States of America

Introduction: Since the COVID-19 pandemic, online teaching has reshaped how students engage and connect in academic settings. While offering flexibility and accessibility, it also presents challenges and opportunities related to stress and well-being. Mindfulness-based interventions show promise in addressing these issues, yet their effectiveness in virtual classrooms remains underexplored. This study examined whether participation in an online mindfulness intervention could enhance resilience, reduce stress, and increase mindfulness among college students compared to a control group.

Method: Participants (N= 234) in this multi-year study included undergraduate and graduate students ages 19-63 (M= 28.6, SD=8.58). The experimental group consisted of N=102 participants, and the control group consisted of N= 132 participants. The experimental group consisted of students enrolled in an asynchronous online holistic health course, whereas the control group comprised students from three asynchronous online sports studies courses that did not include a mindfulness component.

Results: An Independent-Samples t-test indicated statistically significant decreases in stress (Perceived Stress Scale, $t232 = -6.084$, $p < .001$) and increases in mindfulness (Mindful Attention Awareness Scale, $t231 = 7.720$, $p < .001$; Freiburg Mindfulness Inventory, $t231 = 7.673$, $p < .001$) for the experimental group compared to the control group. Resilience measures revealed non-statistically significant changes (The Brief Resiliency Scale, $t231 = 4.623$, $p = .193$).

Conclusion: This study suggests that online mindfulness interventions embedded in a higher education course may offer significant benefits for students. Findings showed that a classroom-based online mindfulness intervention reduced stress and increased resilience and mindfulness when compared to the control group. Given students' high stress levels, limited access to mental health resources, and the impact of stress on academic and health outcomes, these results could help guide future campus interventions. Integrating mindfulness into course curricula may provide a convenient, accessible method for stress relief. Implications and limitations will be discussed.

Abstract 2463

PSYCHOLOGY OF ADVANCED USERS OF INFORMATION TECHNOLOGIES AS A NEW AVENUE OF APPLIED RESEARCH

Kononets M., Vynoslavska O.*

National Technical University of Ukraine "Igor Sikorsky Kyiv Polytechnic Institute" ~ Kyiv ~ Ukraine

Introduction. The unprecedented spread of information technologies (IT) into various spheres of human life has led to the emergence of many specialists who work online. Therefore, the current task of applied psychology is to study the impact of IT on the development of cognitive processes and behavior of advanced IT-users.
Purpose. To highlight the dynamics of Ukrainian IT-users' attitudes towards the advantages and disadvantages of working online.
Methods. The questionnaire "Advantages and disadvantages of using IT in the educational process" developed by author was used.
Results. The dynamics of the attitudes of technical university teachers and graduate students as advanced IT-users to advantages and disadvantages of working online are presented. It is shown that during period from 2013 to 2017 the users' euphoria of owning computers or having unlimited access to IT began to gradually decline due to understanding that not all desired tasks can be quickly solved with their help. Many users have experienced the harmful effects of online work on human health. Over the next four years (2018-2021), a large number of people with moderate or no experience using IT began working online due to COVID-19. Thanks to the opportunity to work and study remotely, the number of advantages mentioned by respondents has increased significantly. Under war conditions in Ukraine (2022-2025), the number of advantages of working online mentioned by respondents remains at the same high level, but the number of disadvantages has increased significantly: in addition to the harmful effects on human health, technical factors such as lack of or limited access to the network, lack of equipment, and power outages have been added.
Conclusions. Despite constant improvement of IT, the number of problems regarding its negative impact on human physical and mental health will not decrease, and the psychology of IT-users should study these problems.

SCHOOL AS EMOTIONAL SYSTEM: BETWEEN BURNOUT AND POSITIVE ACCOMPLISHMENT

Thursday 23 July 2026 from 08:00 to 09:30

(H-Spadolini)

Maria Beatrice Ligorio (University of Bari ~ Bari ~ Italy), Chair and Presenter

With this symposium we want to look at school in an innovative way; not exclusively as a learning
place but as an emotional system. Learning, indeed, is not just a cognitive act but implies feelings
and ways to cope with them. The set of papers composing the symposium is considering different
perspectives. First of all, the contributions come from four different countries: Italy, Spain,
Switzerland, and Türkiye. These are countries that share some similarities – being in the same
continent – but also many differences. This makes us caution in drawing generalization but it
helps us in increasing our capacity to discuss the results also from a cultural point of view.
Secondly, both students' (four papers) and teachers' perspective (Paper 5) has been considered.
Students are recruited from high school (Paper 1), adult and professional training (Paper 4), and
university (Paper 2 and 3).
Attention is also devoted to the role technology can play in terms of emotions. This is due not only
to the centrality technology gained lately but also to its impact on educational contexts.
Theattempt is to understand how technology interrelates with students' study strategies (Paper 2), how
can be used to foster positive attitude toward sustainability (Paper 3) and how to create effective
digital environments where to train professionals (Paper 4).
Different methods are adopted across the papers: from standardized questionnaires (Paper 1, 2,
and 3), to focus group discussions (Paper 3, 4, and 5), and self-report (Paper 3 and 5). This is
because all the authors involved believe that a multi-method approach in the educational field can
offer an in-depth understanding of the phenomena studied. We trust that as a whole this
symposium can offer useful inputs so to consider schools as cultural institutions able to take care
also of the emotional side of theirparticipants.

Abstract 4398

"I HAVE TO PERFORM AT MY BEST!" SELF-ESTEEM, BURNOUT, AND COPING STRATEGIES IN HIGH SCHOOL STUDENTS ATTENDING TOP RANKED SCHOOLS

Ventrella A.*[1], Crescenzo P.[2], Ritella G.[3], Torre S.[1], Ligorio M.B.[1]

*[1]*University of Bari ~ Bari ~ Italy, [2]University Ecampus; ~ Bari ~ Italy, [3]Unicampania ~ Bari ~ Italy*

In this paper we consider students' attending top ranked schools. Their level of burnout is examined in relation to self-efficacy and coping strategies. Our sample is composed by 572 final-year high school students that filled a set of questionnaires, composed by the Burnout Assessment Tool Student Version, the Rosemberg Self Esteem Scale, the Coping Orientation to the Problems Experienced Brief Version and a short socio-bio questionnaire. Preliminary findings indicate that these students are at a high risk of burnout and this negatively impacts their self-esteem. Avoidance emerged as the main dysfunctional coping strategy, while social support surprisingly increased emotional exhaustion. Problem-oriented coping, however, showed to be correlated to students' emotional and cognitive control suggesting a practical indication for teachers and educators in general. The study highlights the importance of addressing students' burnout by promoting effective coping strategies to enhance students' well-being in high-demand school environments

Abstract 4399

TECHNOLOGY USAGE, EMOTIONAL STYLES, AND BURNOUT AMONG UNIVERSITY STUDENTS

Subasi M.*, Bulut S.

Ibn Haldun University ~ Istanbul ~ Turkey

Technology has been widely used and incorporated into teaching curriculum in every level of education. This includes computer technology, smartphone usage, flip-class, distance education, e-learning, and much more. The COVID-19 pandemic has furthered the role of technology in educational institutions. However, technology usage may not be suitable for students if not tailored to their needs and preferences as part of teaching. In particular, emotional styles and burnout levels of students are likely to play significant roles in technology usage in education. This study aims to investigate technology usage, emotional styles, and burnout levels of students in undergraduate level of education. 810 undergraduate students, from all of the departments and both private and public universities. This study has the potential to shed light on students' certain characteristics and preferences as learners in the context of technology usage. This study plans to enhance our understanding of technology usage in teaching among undergraduate students by addressing the roles of emotional styles and burnout and offering new avenues to improve them. Furthermore, demographic variables and differences in chosen majors and universities will be explored.

Abstract 4401

EMOTION REGULATION IN HEALTHCARE ASSISTANTS: A QUALITATIVE ANALYSIS OF CHALLENGING PROFESSIONAL SITUATIONS

Amenduni F.*, Cattaneo A.

Swiss Federal University for Vocational Education and Training (SFUVET) ~ Lugano ~ Switzerland

Healthcare assistants (HCA) are highly susceptible to burnout, particularly during their early career. Despite this, limited research has focused on identifying the situations that trigger negative emotional responses in novice HCAs or the strategies they and their more experienced colleagues use to regulate these emotions.
We will conduct eight focus group discussions involving 50 participants collapsed into four target groups: apprentice HCAs attending their internship, HCAs in their first five years of job after the diploma, intercompany trainers involved with HCA vocational courses, and expert HCAs with at least 10 years of experience (including people occupying the role of “company tutors”).
The contribution presents findings from a qualitative exploration of these triggering scenarios and the emotion regulation strategies adopted by both novice and experienced HCAs. The results present critical situations that will inform the design of learning scenarios including 360° immersive video (360°VR). 360°VR aims to recreate realistic professional contexts, evoke authentic emotional responses, and enhance emotion regulation skills.

Abstract 1063

KNOWING, NOT KNOWING YOU KNOW, AND THINKING YOU KNOW WHEN YOU DON'T: CONFIDENCE, ACCURACY, AND CUE-BASED MONITORING

Florence A.*

University of North Carolina at Chapel Hill ~ Chapel Hill ~ United States of America

Students often misjudge their knowledge by relying on cues such as familiarity or ease, which can lead to misplaced confidence in wrong answers and unnecessary doubt in correct ones. These mismatches between confidence and accuracy, called calibration errors, disrupt effective learning by skewing how students manage study time, choose strategies, and seek help. Because these errors persist even when knowledge increases, interventions must focus instead on strengthening metacognitive monitoring, the ability to evaluate the reliability of one's own thinking, independent of content knowledge.

This study tests two psychoeducational modules designed to improve monitoring accuracy. Undergraduate participants complete pre- and post-tests of general knowledge questions with confidence ratings. In the post-test, students can revise their confidence after reflecting on cues such as effort or answer accessibility. Participants are randomly assigned to one of three conditions: (1) an experiential-information module, which trains students to evaluate the meaning of cues such as ease or doubt; (2) a combined module, which adds a motivational framing that treats errors as useful information; or (3) a control condition.

Effectiveness will be evaluated through improvements in calibration (the alignment of confidence with accuracy) and resolution (the ability to distinguish correct from incorrect answers). If successful, these modules offer a scalable way to embed metacognitive scaffolds into classroom practice, equipping students with transferable strategies for monitoring their own learning. In doing so, the project translates metacognition research into practical tools that help students recognize and act on what they do not know, an ability essential for learning across both familiar and novel contexts.

PROFESSIONAL AGILITY AS A PSYCHOCOGNITIVE CONSTRUCT: INSIGHTS FROM CLT AND COR

Buttan D.*, Shukla T., Nirban V., Nadig R., Singh M.

BITS Pilani (Pilani campus) ~ Pilani, Rajasthan ~ India

The emerging demands of present-day industries require STEAM (Science, Technology, Engineering, Arts, and Mathematics) students to cultivate professional agility, emphasising resilience, adaptation, and flourishing across dynamic workspaces. This paper argues that agility can be re-theorised through Cognitive Load Theory (CLT) and Conservation of Resources (COR) theory, which together highlight how cognitive and psychological resource management determine career preparedness. CLT stresses that working memory is finite, and effective learning requires balancing intrinsic, extraneous, and germane cognitive load. In STEAM careers, complex tasks, digital demands, and interdisciplinary integration often cause cognitive overload. If education does not address these challenges, students face fatigue and impaired application of skills in professional settings. Thus, cognitive capacity is critical, and so COR theory extends this by treating cognition and cognitive capacity as part of a broader “resource caravan” (skills, motivation, social support, identity). Individuals strive to acquire and protect resources, with loss outweighing gain. For STEAM students, resources include not only time or technological tools, but also psychological aspects such as self-efficacy, adaptability, and identity. From a COR lens, professional agility is an integrated set of cognitive and psychological assets that buffer against loss spirals and sustain employability.

By synthesising CLT and COR, this paper proposes a model where optimising cognitive resources (reducing extraneous load, managing intrinsic load, fostering germane load) supports conserving psychological resources (resilience, motivation, adaptability), thereby equipping students to navigate career transitions with agility. This synthesis links cognitive and organisational psychology, showing how education sustains human potential and prepares students for uncertain careers. The argument repositions STEAM education towards resource sustainability and advances the idea that fostering agility is not about endlessly acquiring new resources, but about strategically conserving and reallocating cognitive and psychological ones. This resource-sensitive framework contributes to applied psychology by reimagining career readiness in a complex world.

Abstract 177

EXPLORING MINDSETS AND NEUROCOGNITIVE PROCESSES IN ELEMENTARY SCHOOL CHILDREN

Weißmann M.[1], Stern M.[1], Köllbichler L.[1], Wüstenberg T.[1], Adam M.[3], Karlen Y.[2], Hertel S.*[1]

[1]Heidelberg University ~ Heidelberg ~ Germany, [2]University of Zurich ~ Zurich ~ Switzerland, [3]Stanford Medicine ~ Palo Alto ~ United States of America

Prior research has shown that growth mindsets go along with higher resilience to failure experiences (e.g., Moser et al., 2011; Schroder et al., 2017). Neurophysiological findings advanced the understanding of failure processing, showing that endorsing a growth mindset is associated with a higher event-related potential (ERP) in response to errors (Schroder et al., 2017). While the original understanding of mindsets mainly referred to intelligence (e.g., Blackwell et al., 2007; Dweck & Leggett, 1988), the latest research applies the concept of growth mindsets to domain-specific abilities such as self-regulation (e.g., Hertel & Karlen, 2021; Hertel et al., 2024). Domain-specific mindsets have been shown to better predict specific behavior (e.g., Bråten & Strømsø, 2005; Hertel & Karlen, 2021).

Expanding the neurophysiological findings by Schroder et al. (2017) by including the domain-specific self-regulation mindset, our study examines correlations between self-reported mindsets and ERPs during a go-nogo-task (Grammer et al., 2014). We conducted analyses on data from 107 children (mean age 6.66 years, 42.9% females), who reported growth mindsets on a scale from 1 to 5 regarding both self-regulation (M = 4.24, SD = 1.02) and intelligence (M = 4.27, SD = 0.93).

Preliminary analyses show a mean accuracy during the go-nogo-task of about 88.8%, ensuring enough error trials for the ERP-analyses. For stimulus locked responses, we found a positive correlation between the self-regulation mindset and P300 amplitudes (tau = 0.241, p = 0.035). This association suggests that individuals with a growth mindset about self-regulation exhibit an increasing attentional focus on upcoming stimuli following an initial error. In contrast, a negative correlation between the intelligence mindset and ERN amplitude (tau = -0.283, p = 0.007) indicates stronger immediate error monitoring in children with a growth mindset about intelligence.

The findings emphasize the relevance of mindsets for neurophysiological processes, offering valuable insights for educational practices.

Abstract 2733

"IT'S MY FAULT": HOW SECONDARY SCHOOL STUDENTS EXPLAIN ACADEMIC FAILURE

Wider W.*[1], Chua B.S.[2], Mutang J.A.[2], Hon K.Y.[2], Tan J.Y.[2], Wu H.[1], Wu C.[1]

[1]INTI International University ~ Nilai ~ Malaysia, [2]Universiti Malaysia Sabah ~ Kota Kinabalu ~ Malaysia

Experiences of academic failure are a routine part of secondary schooling, yet the ways in which students interpret these setbacks are pivotal in shaping their motivation, emotional adjustment, and capacity for resilience. Drawing on Seligman's attribution theory and explanatory style framework, this qualitative study explored how secondary school students explain academic failure, with a specific focus on the personalization dimension of attribution. Data were obtained from written responses to a single open-ended question embedded within a larger paper-based survey administered to 629 secondary school students in Sabah, Malaysia. A multilevel thematic analysis revealed five distinct patterns of personalization. The results showed a clear predominance of internal forms of personalization, particularly those emphasizing moralized effort failure and difficulties in self-regulation, suggesting that many students view academic outcomes as personally controllable and closely tied to individual responsibility. At the same time, a notable subset of students attributed failure to enduring self-deficits and diminished self-worth, indicating potential susceptibility to maladaptive self-blame and psychological vulnerability. Smaller groups of respondents demonstrated conditional personalization shaped by contextual considerations or adopted a largely neutral attributional stance. Overall, the findings suggest that personalization operates as a multidimensional construct, with divergent implications for resilience depending on whether responsibility is interpreted as changeable behavior or fixed personal inadequacy. By examining attributional processes within an underrepresented East Malaysian educational context, this study contributes to the attribution literature and offers practical implications for attribution-informed teaching practices, school-based counselling, and educational policy aimed at fostering adaptive coping and student well-being in secondary education.

EXECUTIVE FUNCTION DEVELOPMENT: EXPLORING NEW DIRECTIONS

Thursday 23 July 2026 from 09:30 to 11:00

(H-Spadolini)

Laura Traverso (University of Genoa ~ Genoa ~ Italy), Chair and Presenter
Sabrina Panesi, Discussant

In last decades, numerous studies on executive functions (EF) in children have examined their
development, influencing factors, and connections with other domains, particularly academic achievement.
Research has also explored strategies to enhance EF and the relationship between these cognitive abilities
and variables that support self-regulation. This symposium brings together diverse contributions that
address less-explored aspects of EF literature, presenting new challenges and opportunities to better
support children's EF development. It is well-established that EF undergo significant growth during the
preschool years, and many studies have focused on this critical stage, leveraging various assessment
tools. However, fewer resources are available for assessing EF in early childhood. Chiara Pecini's
contribution addresses this gap by exploring EF assessment methods for children aged 12 to 36 months
and examining the role of variables that influence EF development in this age group. Sarah Bardack's research shifts the focus to the role of EF in a school competency training program in Malawi. This study
introduces novel elements, including conducting EF research in under-explored cultural contexts and
investigating how EF impacts the results of learning interventions. Ebru Gear's contribution examines
individual differences in EF task performance. While most studiesemphasizetheeffectsoftraining
programs to promote EF, Gear investigates how children's ability to recognize their mistakes influences
their EF task performance. This approach highlights the importance of monitoring processes, which is an
under-studied factor in EF development. Lastly,Laura Traverso's study explores the impact of manipulating
specific variables, such as mental state, during EF tasks on children's performance. Although context
related variables have been extensively studied in other psychological domains, their role in EF research
remains less investigated. In summary, this symposium presents four distinct research contributions, each
addressing unconventional and under-examined aspects of EF literature. The discussant, Sabrina Panesi,
will provide an integrative commentary, highlighting these innovative approachesandfosteringadiscussion

on thechallengesandpotentialbenefitsthey bring tothefield.

Abstract 4012

EXECUTIVE FUNCTIONS IN EARLY INFANCY ACROSS TYPICAL AND ATYPICAL NEURODEVELOPMENTAL CONDITIONS. CAN BE MEASURED? DO THEY MATTER?

Pecini C., Berni M.*

University of Florence ~ FLORENCE ~ Italy

A broad body of literature supports the role of early Executive Functions (EF) in neurodevelopment, learning, and quality of life, and documents widespread and transdiagnostic alterations in cases of social or neurodevelopmental risk. However, it remains unclear what and how to measure EF during early childhood, between 12 and 36 months of age, when the neurofunctional foundations of EF have already begun to mature and, importantly, to connect with other cerebral networks. To contribute to this critical area, we have recently developed longitudinal studies of children at risk for neurodevelopmental disorders based on the analysis of EF profiles using the Bayley Scales of Infant and Toddler Development and new tools for the direct observation of emerging EF. The methods and results of such studies will be presented. The correct identification of EF and self-regulation profiles in early childhood can provide important insights for early interventions aimed at reducing hindering factors (e.g., parental stress, socioeconomic status) and promoting those that support EF development.

Abstract 4015

EXECUTIVE FUNCTION PERFORMANCE: INVESTIGATING THE SOURCE OF VARIATION

Traverso L.*

University of Genoa ~ Genoa ~ Italy

One of the main issues in studying executive function (EF) is the impurity problem. Performance on an EF task is only partially attributable to the executive function processes involved in the task. Typically, correlations among EF tasks are low, especially between direct and indirect measures. Another way to address this issue is by considering that exploring variations due to task specificity or contextual factors can provide valuable insights into executive functioning. In this regard, Doebel (2018) argues that EF may be better understood as the emergence of skills in applying control to achieve specific objectives, and that performance can be influenced by children's mental states while performing the task. This research explores this idea with a sample of preschool children. Their performance on various inhibitory tasks conducted under different conditions will be studied. The findings may provide valuable insights for educational practices aimed at supporting children's executive function development.

Abstract 1388

STUDENT–ENVIRONMENT FIT, PERSISTENCE AND PERFORMANCE: COMPARING THE VALIDITY OF THREE CONGRUENCE MEASURES

Bailey L.*[1], De Bruin D.[1], Morgan B.[2]

[1]Stellenbosch University ~ Stellenbosch ~ South Africa, [2]JVR ~ Johannesburg ~ South Africa

Introduction:
According to Holland's RIASEC model, greater congruence between an individual's vocational interest profile and an environment's profile should promote persistence and performance. However, empirical support for this congruence hypothesis has been inconsistent, often due to limitations in how congruence is measured.
Purpose:
This study compared the predictive validity of three approaches in relation to students' persistence and performance: (a) Euclidean distance (ED) between student and environment profiles, (b) profile correlation analysis (PC), the correlation between a student's profile and that of their faculty, and (c) criterion profile analysis (CPA), the similarity of a student's profile with a criterion profile, such as high performers.
Method:
Participants were 2,946 undergraduate and postgraduate students from eight faculties at a South African university who completed the South African Career Interest Inventory (SACII) and a measure of persistence. Academic performance was assessed by aggregating subject marks.
Results:
Across faculties, CPA consistently outperformed ED and PC in predicting both persistence and performance. The mean disattenuated correlation of CPA with persistence was .28. For academic performance, the corresponding mean observed correlations were .19 for undergraduates and .23 for postgraduates.
Conclusion:
CPA appears particularly promising for aligning students with academic and occupational environments. Unlike ED and PC, CPA compares individuals with the profiles of those who persist or perform well, rather than with an average student profile. This enables more precise alignment of interests with successful outcomes. Matching prospective students to high-performing peer profiles may therefore enhance persistence, retention, and achievement. These insights have practical implications for career counselling, educational guidance, and recruitment, supporting evidence-based decision-making that enables individuals to thrive in environments aligned with their interests and strengths.

Abstract 640

HOMEWORK AS A SELF-REGULATED LEARNING CONTEXT: LOAD, PARENTAL SOCIALIZATION, AND WITHIN-SCHOOL VARIABILITY IN HONG KONG

Hau K.*, Chang F.F.

The Chinese University of Hong Kong ~ Shatin ~ Hong Kong

Introduction. Homework is a core context for self-regulated learning (SRL), motivational regulation, and parent–child socialization. Cross-cultural work shows Chinese students devote more time and report fewer negative attitudes than Western peers. Yet developmental patterns, within-school variability, and the coupling of school-assigned and self-arranged study in Hong Kong remain under-specified.

Purpose. We examined (a) time distributions for school-assigned homework/revision and non-school (parent/self-arranged) study across stages; (b) between- versus within-school variability; and (c) coupling among study domains/activities and links with achievement, socioeconomic status (SES) and other attitude/motivational constructs to identify intervention targets grounded in educational psychology.

Method. Multiwave, representative samples totaling ~30,000 Hong Kong students in Grades 3–9 completed attitude/motivation questionnaires adapted from PISA. Parents reported daily time on school-assigned and non-school study and activity type (Chinese, English, Mathematics, interest classes, sports, arts). Analyses used weighted descriptives, variance partitioning, and stage-stratified correlations; earlier waves triangulated a 2017 module with more detailed homework items.

Results. Results showed ≤2 hours/day of school-assigned study was reported by 83%–86% of students; 48%–59% had ≤1 hour. For non-school study, 69%–74% reported <30 minutes/day and 26%–31% reported ≥1 hour/day. Between-school differences in study time were small, whereas within-school heterogeneity was large. At least 70% of study time focused on Chinese, English, and Mathematics; English time decreased and Mathematics increased from Grade 3 to Grade 9. Students with more school-assigned homework also did more parent/tutor-assigned work (r≈.50–.60). Heavy study time in primary occurred across SES and achievement; by Secondary 3 it aligned more with higher achievement.

Conclusions. From middle childhood to adolescence, learning time shows increasing coherence consistent with SRL consolidation. Psychologically informed supports should target within-school outliers, calibrate parental expectations, and differentiate homework to sustain motivation and mitigate SES-linked risks, rather than impose school-level quotas.

Abstract 2348

THE MODERATING ROLES OF CHINESE LANGUAGE CLASSROOM ANXIETY AND LEARNING ANXIETY IN THE RELATIONSHIP BETWEEN PERSONALITY TRAITS AND STUDENT ACADEMIC ENGAGEMENT IN CHINESE LANGUAGE LEARNING

Jiang L.*, Stanculescu E.

University of Bucharest ~ Bucharest ~ Romania

This study investigates how personality traits influence academic engagement in Chinese language learning and examines the moderating effects of two types of anxiety: Chinese language classroom anxiety (Horwitz, Horwitz, & Cope, 1986) and Chinese language learning anxiety (Luo, 2015). Using structural equation modeling with a sample of 361 Romanian students in learning Chinese, the study finds that conscientiousness, agreeableness, and extraversion significantly predict academic engagement, with conscientiousness having the strongest effect. Chinese learning anxiety negatively affects engagement and significantly moderates the relationship between openness and engagement. Neither of Classroom anxiety affect on engagement and the moderation relationships between personality traits and engagement are significant. These findings contribute to theoretical models of affective variables in second language acquisition and offer practical insights for culturally responsive language teaching.

Abstract 1354

PREDICTING READING ENJOYMENT AMONG 10979 CHINESE CHILDREN IN SUMMER E-READING PROGRAM: A MACHINE LEARNING APPROACH

Lin J.*

Beijing Normal University ~ Beijing ~ China

Reading enjoyment is crucial to students' reading performance and reading behaviors. A key concern for educators is identifying the factors that predict children's reading enjoyment. However, previous research has predominantly employed traditional regression methods, which may oversimplify the complex associations between predictors and reading enjoyment. In this large-scale study, we investigated the impact of demographic variables, reading motivation, and the family reading environment on reading enjoyment among 10,979 Chinese children participating in a summer reading program. We utilized five machine learning algorithms (Linear Regression, Random Forest, Gradient Boosting, XGBoost, and Support Vector Regression) to assess the contribution of 18 predictors to reading enjoyment. The XGBoost model was selected as the optimal model, demonstrating strong predictive performance (R^2 = 0.6795, MSE = 0.3944, RMSE = 0.6280, MAE = 0.4434). Subsequent SHapley Additive exPlanations analysis (SHAP) revealed that the five most important predictors of reading enjoyment were intrinsic motivation, reading persistence, social motivation, mastery goals, and self-efficacy, all of which positively predicted children's reading enjoyment. In contrast, performance-avoidance goals and performance-approach goals were found to be negative predictors. Further stratified SHAP analysis indicated that the SHAP value for parental education expectation was the only feature to show a significant difference between boys and girls (difference = 0.001, p = 0.003). Beyond grade level and age, the SHAP values for nine features differed significantly between lower-grade (Grades 1-3) and upper-grade (Grades 4-6) students. Specifically, personal book collection, intrinsic motivation, self-efficacy, and performance-approach goals were more influential predictors for upper-grade students (ps < 0.05). Conversely, parental reading support, social motivation, mother's educational level, parent-child reading activities, and personal education expectation had a greater predictive contribution for lower-grade students (ps < 0.05). These findings provide robust empirical evidence to inform targeted interventions designed to enhance children's reading enjoyment.

Abstract 1883

EMPOWERING STUDENTS AND TEACHERS THROUGH LIFE DESIGN INTERVENTIONS

Paludo G.*

University of Trento ~ Trento ~ Italy

The 21st century has posed significant challenges to adolescents in defining their aspirations and career trajectories, with higher uncertainty and many socio-cultural factors limiting motivation and future hopefulness. In this context, the educational system is called to take action in supporting the upcoming generations with apt career orientation interventions. With this purpose, Life Design was acknowledged as a successful approach for supporting students in developing key psychological constructs such as self-efficacy, resilience, and career adaptability, central elemtents for them to successfully navigate career transition. This presentation provides evidence from 2 complementary Life Design interventions, an classroom intervention with students and a teacher training, highlighting the value of actions oriented to both the actors involved.

With students, a short intervention of 10 hours grounded in Career Construction Theory and Self-Efficacy Theory was developed, carried out and assessed in a between and within subject experimental design. Results indicated significant improvement in self-efficacy, clarity of future goals, and conceptual associations, supporting how even brief Life Design practices can expand perceived opportunities and strengthen adaptability.

In parallel, a short-intensive teacher training of 4 hours aimed at providing instructors tools for guiding students in more inclusive and generative ways was conducted. The analysis of the artifacts produced during the sessions and the discussions suggest that teachers' shift from prescriptive to facilitative approaches is critical in creating sustainable ecosystems where agency and career resilience can flourish.

The combination of insights from these two experiences underscore Life Design as both a psychological intervention and a pedagogical framework. With joint actions toward students and teachers, the Life Design approach fosters environments that integrate self-determination, inclusive practices, and long-term planning, empowering individuals and educational systems in shaping meaningful futures.

Abstract 87

PSYCHOLOGICAL DRIVERS OF INCLUSIVE TEACHING: CULTURAL HUMILITY, RELIGIOSITY, AND AGENCY AMONG EDUCATORS IN DIVERSE AND DISPLACED CONTEXTS

Amer M.*

Sultan Qaboos University ~ Muscat ~ Oman

In the context of forced displacement and growing cultural diversity across Arab school systems, the question of how teachers foster inclusion for refugee students is of pressing importance. This study investigates the psychological pathways through which cultural humility informs multicultural teaching practices in Egypt, Kuwait, and Qatar. Drawing on Value-Belief-Action theory and situated within a culturally grounded socio-educational framework, we propose and test a structural equation model linking cultural humility to multicultural teaching, mediated by teacher religiosity and teacher agency.

Data were collected from 688 in-service teachers across the three countries, all working in schools that enroll displaced learners. Standardized instruments were used to measure cultural humility, religiosity, agency, and multicultural teaching practices. Results from structural equation modeling confirmed that cultural humility strongly predicts inclusive pedagogy both directly and indirectly. Specifically, teachers who scored high in humility reported stronger religious motivation and higher professional agency—both of which independently contributed to inclusive, culturally responsive teaching practices. Multi-group analyses indicated that the model held consistently across national contexts, affirming its generalizability.

This research advances a dual mediation model whereby internal values (religiosity) and professional capacities (agency) bridge the gap between personal dispositions and inclusive classroom behavior. It challenges Western-centric models of teacher inclusivity by highlighting how ethical and spiritual frameworks unique to the Arab world shape pedagogical action. The findings carry significant implications for teacher training, school psychology, and educational policy, especially in refugee-hosting nations. They underscore the importance of cultivating humility and supporting agency as key drivers of inclusive education.

05 - Division 5: Education and School Psychology

SOCIAL COMPETENCE AT SCHOOL: THE INTERPLAY BETWEEN COGNITIVE AND EMOTIONAL ASPECTS OF THEORY OF MIND.

Thursday 23 July 2026 from 11:00 to 12:30

(H-Spadolini)

Ilaria Castelli (Department of Human and Social Sciences,), Chair
Antonella Marchetti (Catholic University of the Sacred Heart), Discussant

Social competence plays a major role in human development, allowing children and adolescents to become active social partners. Theory of Mind (ToM), the ability to understand, explain and foresee the behavior based on mental states meta-representations, is a key component of social competence. ToM undergoes significant changes across developmental ages, and it is supported by the educational relationships within family and school settings. This Symposium addresses a relevant topic for applied psychology in the domain of human development and education, as it aims to focus on the cognitive and on the emotional components of ToM and to highlight how important school is for ToM development.

The first contribution shows how school learning is able to foster specific ToM skills, namely recursive and interpretive reasoning, which in turn are foundational to the development of scientific reasoning, with cross-cultural differences.

The second contribution deepens our knowledge about the relations among children's advanced ToM, emotional closeness with teachers, and social functioning at school (loneliness and social skills), with a longitudinal study.

The third contribution enriches our understanding of the acquisitional steps of II-order-recursive thinking, combining the mastering of true and false beliefs with positive and negative desires, through the employment of a novel scaling-ToM-task.

The last contribution moves attentions towards adolescence, studying how the way young people think of themselves as humble may play a critical role in their ability of mindreading and in social anxiety.

Overall, the novelty of this Symposium is set in the recent insights about ToM implications for social competence, in order to help those psychologists who work in schools and in socio-educational settings to address the profound challenges of social life, and to promote the wellbeing of children and adolescents.

Abstract 3272

THEORY OF MIND IN THE CLASSROOM: BRIDGING SOCIAL COGNITION AND SCIENTIFIC REASONING

Osterhaus C.*[1], Koerber S.[2], Uchinokura S.[3]

[1]University of Vechta ~ Vechta ~ Germany, [2]Freiburg University of Education ~ Freiburg ~ Germany, [3]University of Kagoshima ~ Kagoshima ~ Japan

Advanced Theory of Mind (ToM) skills—particularly recursive and interpretive reasoning—are foundational to the development of scientific reasoning (Kyriakopoulou & Vosniadou, 2020; Osterhaus & Koerber, 2023; Osterhaus et al., 2017). However, most evidence comes from Western contexts. Japan offers a compelling test case, as previous studies suggest delays in recursive ToM development among Japanese children compared to their Western peers (Osterhaus & Uchinokura, 2024), potentially reflecting cultural influences such as Japan's collectivist orientation and emphasis on group harmony. Comparing Japan and Germany thus provides a unique opportunity to test the universality of the ToM–scientific reasoning link.

This study examined (1) whether the relation between advanced ToM and scientific reasoning generalizes to a non-Western context, and (2) whether cross-cultural differences in recursive ToM explain potential disparities in scientific reasoning.

Study 1 included 401 children (grades 2–6) from Kagoshima, Japan. Children completed an advanced ToM battery (Osterhaus et al., 2016), the Science Primary Reasoning Inventory (SPR-I; Osterhaus et al., 2020), and control measures of vocabulary and inhibition (Seifert et al., 2017; Stroop, 1934). The findings replicated previous results from Western samples, with recursive and interpretive ToM predicting scientific reasoning, even after controlling for cognitive covariates.

Study 2 compared a propensity-score-matched sample of third graders from Japan (n = 102) and Germany (n = 102). No significant overall difference in scientific reasoning emerged between groups. However, subcomponent analysis revealed that German children outperformed their Japanese peers in the Control-of-Variables Strategy. This performance gap disappeared when limiting the analysis to Japanese children with demonstrated mastery of recursive ToM.

Overall, our findings show that recursive ToM appears to be a universal foundation for scientific reasoning, especially experimentation. Cultural differences in ToM development may underlie group differences in scientific reasoning, underscoring the importance of integrating social-cognitive development into cross-cultural science education research.

Abstract 3275

DOES EMOTIONAL CLOSENESS WITH THE TEACHER MEDIATE THE LINKS BETWEEN CHILDREN'S ADVANCED THEORY OF MIND AND SOCIAL FUNCTIONING AT SCHOOL?

Smogorzewska J.*[1], Szumski G.[4], Grygiel P.[2], Bosacki S.[3]

[1]Faculty of Education, University of Warsaw ~ Warsaw ~ Poland, [2]Faculty of Philosophy, Jagiellonian University ~ Cracow ~ Poland, [3]Brock University ~ St. Catherines ~ Canada, [4]University of Warsaw

The present study tested the longitudinal (3 waves) relations among children's advanced theory of mind (AToM), emotional closeness with the teacher, and social functioning at school (loneliness and social skills). Seven hundred and fifty-one typically developing Polish children (344 boys and 416 girls, M age = 7.45 years (SD = 0.50 years) at T1) took part in the study. To measure AToM we used 17 tasks capturing children's understanding of second-, third- and fourth-order false belief, emotions and contradictory emotions, irony, pretence, diverse perspectives, faux pas, metaphors and persuasion; these tasks originated in a variety of publications. To measure closeness with the teachers we used the short form of the Student-Teacher Relationship Scale (Pianta, 2001). Social skills were measured by teachers with the social skills subscale from the Social Skills Improvement System Rating Scale (Gresham & Elliott, 2008). To assess children's sense of loneliness, we asked children to fill in the Loneliness and Social Dissatisfaction questionnaire (Cassidy & Asher, 1992). It has been demonstrated that (1) children who had AToM at T1 were able to establish closer, more positive relations with their teacher later on (T2) that were beneficial for children's functioning; (2) closeness with the teacher (T2) was found to mediate the relations between previous levels of AToM (T1) and later social functioning of children (T3); (3) AToM abilities (T1) reduced children's levels of dissatisfaction with peer relationships (T3). Overall, the study emphasises the importance of positive contact between children and their teachers for children's social functioning at school.

Abstract 3276

DEEPENING SECOND-ORDER RECURSIVE THINKING IN PRIMARY SCHOOL CHILDREN: THE DESIRE X BELIEF MODEL

Varutti L.*[1], Bianco F.[1], Cornaggia A.[1], Marchetti A.[2], Massaro D.[2], Prodan N.[3], Visu--Petra L.[3], Castelli I.[1]

[1]University of Bergamo ~ Bergamo ~ Italy, [2]Catholic University of the Sacred Heart of Milan ~ Milan ~ Italy, [3]Babe?-Bolyai University ~ Cluj-Napoca ~ Romania

Theory of Mind (ToM) is crucial for social competence. Although the acquisitional steps of the I-order reasoning has been widely investigated in literature (Apperly et al., 2011; Wellman & Liu, 2004), II-order reasoning remains less explored. This research addresses this gap combining true and false beliefs (B+, B-) with positive and negative desires (D+, D-).

53 children (M age = 8.13, DS = 1.09, Grades 2 and 4 of primary school) were tested on verbal abilities, executive functions, II-order traditional tasks, Yoni task, and the computerized Belief x Desire II-Order task.

Results suggest that B+D+ condition was the best managed (M = 1.60, DS = .599). In all the other conditions, Grade 4 children performed significantly better than Grade 2 children (B+D-, p <.001; B-D+, p <.001; B-D-, p <.001). There were significant effects of belief, F (1,51) = 29.24, p < .001, ηp2 = .364, favoring true belief, .47 95% CI [.29, .64], of Desire, F (1,51) = 8.02, p = .007, ηp2 = .136, favoring positive desire, .24 95% CI [.07, .41], and also of the interaction Belief x Desire, F (1,51) = 15.30, p < .001, ηp2 = .231. Positive correlations were found for B+D+ with vocabulary (r = .28, p = .042) and reading comprehension (r = .34, p = .014). For B-D- with working memory (r = .27, p = .049) and The ice-cream seller (r = .13, p = .023). For all conditions, despite B+D-, with The Chocolate Bar. For B-D+ with Yoni Task affective (r = .28, p = .005) and cognitive (r = .38, p = .045) ToM.

These results contribute to understanding the acquisitional path of II-order recursive thinking in school-aged children, laying the groundwork for the development of a II-order ToM scale.

Abstract 3277

INTERCONNECTIONS BETWEEN ADOLESCENTS' MINDREADING AND PROSOCIALITY WITHIN THE CONTEXT OF SECONDARY SCHOOL

Bosacki S.*[1], Talwar V.[2], Yasiniyan S.[2]

[1]Brock University ~ St. Catharines ~ Canada, [2]McGill University ~ Montréal ~ Canada

How young people think of themselves as humble plays a critical role in their ability to read the minds and emotions of others and engage in social interactions. This study explored the interconnections among mindreading, humility, and social anxiety in adolescence. Adolescents 11-18 years (N=326; 167 female, 145 male, Mage= 14.57, SD = 2.37) completed on-line tasks to measure mindreading or Theory of Mind, and self-report questionnaires on humility and social anxiety. Results showed that one's ability to read the minds of others increased throughout adolescence, although feelings of anxiety and fear around others remained consistent throughout the teenage years. Proficient mindreaders were more likely to hold high perceptions of humility, and experience different feelings of social anxiety around others depending on their gender. Separate gender mediation analysis showed that high levels of mindreading related to high levels of humility and social anxiety for girls, but low social anxiety for boys. The present findings contribute to research on mindreading, humility, and social anxiety, and hold implications for positive youth development and gender-sensitive social-emotional learning programs. Results extend theoretical models of adolescent development by clarifying the dual role of humility, and suggest new directions for intervention strategies that promote healthy social self-concepts in youth.

ENHANCING PERSONAL GROWTH INITIATIVE AND MENTAL HEALTH: EVIDENCE FROM A SCHOOL-BASED INTERVENTION AMONG VOCATIONAL STUDENTS

Cui Y.*, Zhang C., Wang Y., Chen F.

Beijing Normal University ~ Beijing ~ China

Adolescents in vocational education often experience elevated risks of depression and anxiety, alongside lower wellbeing and weaker developmental support compared to their academic-track peers. Personal Growth Initiative (PGI)—defined as proactive and intentional efforts toward self-improvement—has emerged as a promising protective factor, yet intervention studies targeting PGI in vocational contexts are rare. This study presents a quasi-experimental school-based intervention designed to enhance PGI and promote mental health among secondary vocational students.

Two vocational schools with distinct campus climates participated in the program. A total of 412 students were assigned to intervention and control groups, with PGI, depression, anxiety, and subjective well-being assessed at pre- and post-test. The intervention combined workshops, group reflection, and teacher-facilitated practice to cultivate self-awareness, goal setting, and adaptive coping.

Results demonstrated significant improvements in PGI in the intervention group compared to controls ($p < .01$), accompanied by reductions in depression and anxiety symptoms and increases in subjective well-being. Multilevel analyses further showed that intervention effects were stronger in schools with a more positive climate, suggesting a synergistic role of contextual resources. These findings provide empirical evidence that PGI can be effectively cultivated in applied settings and that enhancing growth-oriented mindsets may yield broad psychological benefits.

This research advances new directions in applied psychology by integrating intervention science, positive psychology, and educational practice. It highlights how cultivating personal growth initiative empowers vocational students to recognize their strengths, pursue meaningful goals, and build resilience. The findings demonstrate psychology's societal applications in promoting well-being, flourishing, and adaptive coping among youth, while emphasizing the role of supportive school environments in fostering trust, responsibility, and collective growth. By addressing the developmental potential of vocational students, this study illustrates how applied psychology can contribute to sustainable well-being and inspire hope for the future of education.

Abstract 572

ACADEMIC SELF-EFFICACY AND PASSION AMONG UNIVERSITY STUDENTS: THE MEDIATING ROLE OF EMOTION REGULATION

Dhiman S.*, Bhatia N., Kaur S.A., Choubisa R.

Birla Institute of Technology and Science ~ Pilani ~ India

Academic self-efficacy defined as the judgement of the learner about their capability to attain educational goals is a central concept that has been extensively studied within the academic context. Academic self-efficacy has manifested strong correlations with academic performance, academic motivation, academic procrastination, and self-esteem (Zheng, 2024). However, academic self-efficacy, despite its importance for university students, remains an under-explored theme in the Indian context. We investigate the mediating role of emotional regulation in the relationship between academic passion and academic self-efficacy among university students. We used Academic Passion Scale (Vallerand et al., 2003), Emotion Regulation Questionnaire (Gross & John, 2003), and General Academic Self-efficacy Scale (Nielsen et al., 2018) to collect data from university sophomores. Following the cross-sectional paradigm, a total of 164 student participants filled the google forms circulated in exchange for course credits. We used structural equation modeling on the data set for interpreting the results. Our findings indicated that passion has a significant influence on academic self-efficacy with emotion regulation acting as a mediator. The current research tested a new pathway to understand development of academic self-efficacy of university students. The findings provide practical guidance for teaching strategies and support service, including suggestions and useful directions for university policies, student counseling, and curriculum planning.

Abstract 2033

REFLECTIVE JOURNALING AS A PEDAGOGICAL STRATEGY FOR DEVELOPING EMOTIONAL INTELLIGENCE IN UNDERGRADUATE PSYCHOLOGY EDUCATION

Goenka R.*

Rishihood University ~ Sonipat ~ India

Emotional Intelligence (EI) is celebrated as essential for well-being, leadership, and relationships,yet in higher education it is often taught through abstract theories that leave students disconnected from its lived practice. To bridge this gap, a reflective journaling strategy was developed as the core pedagogy for an undergraduate Emotional Intelligence course. Over the semester, students completed 28 structured exercises grounded in the RULER framework of EI—Recognizing, Understanding, Labeling, Expressing, and Regulating emotions. Activities were intentionally diverse, including emotion body maps to connect feelings with somatic cues, cultural message reflections to examine societal rules about emotions, daily use of the emotion wheel to expand vocabulary, the Inside–Out mask activity to explore authentic versus performed selves, film-based reflections on shame and vulnerability (Masaan, Meet Cute), and the creation of personal emotional toolboxes for regulation.

Exercises were assigned gradually in weekly clusters, typically two at a time, and journals submitted weekly. Detailed formative feedback was provided throughout, enabling students to refine their reflections and deepen awareness. The first implementation involved seven psychology honors students who collectively produced over 200 journal entries. Quantitative evaluation employed the Schutte Self-Report Emotional Intelligence Test administered pre- and post-course, while qualitative data drew from journals, reflections, and feedback on impactful activities. Five of the seven students demonstrated measurable increases in EI scores. One student maintained an already high baseline score, while another reported that her apparent decline reflected a more honest awareness of emotions previously suppressed. Thematic analysis revealed growth in emotional vocabulary, recognition of bodily and contextual cues, openness to vulnerability, and improved regulation strategies.

Now being replicated with new cohorts, this reflective journaling approach is emerging as a standard pedagogical strategy for teaching EI. By combining structured reflection, gradual scaffolding, and continuous feedback, it offers a replicable model for embedding emotional intelligence into lived practice and higher education pedagogy.

Abstract 2721

LOVE AND HATE: EMOTIONAL ASSOSIATIVE VOCABULARY IN TURKIC LANGUAGES

Kyuchuk H.*[1], Yilmaz R.[2], Fazylzhan A.[3], Abaeva M.[4], Nazarova A.[3], Amonov S.[5], Ikramova B.[6]

[1]University of Silesia, ~ Katowice ~ Poland, [2]Selcuk University ~ Konya ~ Turkey, [3]Institute of Linguistics ~ Almaty ~ Kazakhstan, [4]Institute of Linguistics ~ Almaty ~ Kazakhstan, [5]Bukhara State Pedagogical Institute ~ Bukhara ~ Uzbekistan, [6]Bukhara State Pedagogical Institute ~ Bukhara ~ Uzbekistan

Introduction

The paper presents one of the first cross-linguistic study of Turkic languages of emotional vocabulary associations among preschool children.

Purpose

An associative experiment with approximately 300 children (4 grade primary school pupil 9-10 years old) speakers of Turkish, Kazakh and Uzbek languages from Bulgaria, Turkey, Kazakhstan and Uzbekistan are investigated for associations of 20 emotional stimuli words.

Method

The emotional stimuli words are mixed with other words, but only the words expressing emotions are studied. The experiment is organized in a written form. For this purpose the stimuli words are read to the children and they have 10 sec. to write down the first word that comes to their mind when they hear the words. The present study focuses on 8 emotional stimuli words.

Results

The results of the 8 emotional stimuli words are compared among different Turkic languages. The associative nest of words are compared and analyzed. The similarities and differences to the stimuli words are discussed and connected with the country of residence of the children.

Conclusions

The result from the experiment shows what is the mental lexicon structure of the emotional words of Muslim children speakers of Turkic languages. They map out how words are stored and linked in our brains, revealing the organization of our internal dictionary. The semantic networks and the relationship among the words are found. It shows the linguistic consciousness. Associative fields are built that reflect common cultural and linguistic understandings of words.

Abstract 619

SOCIO-EMOTIONAL COMPETENCIES AS CATALYST OF WELL-BEING AMONG TRIBAL STUDENTS IN INDIA

Kumar V.*, Goyal P., Choubisa R.

Birla Institute of Technology And Science, Pilani (BITS Pilani) ~ Pilani, Jhunjhunu, Rajasthan ~ India

Tribal communities throughout the world face disproportionately high impediments to educational and psychosocial development which is also a significant hindrance to Fourth Sustainable Development Goal (SDG 4). Socio-Emotional Competencies (SECs) in recent times have shown promise as an essential tool for cultivating resilience and enhancing well-being in developed countries. This study inquires whether SECs hold potential as a catalyst of Subjective Well-Being (SWB) in a tribal sample using Self-Determination Theory and CASEL framework of SEC, i.e. self-awareness, self-management, social-awareness, responsible decision-making, and relationship skills. This study targets the tribal community adolescents and school students in day schools and residential schools and aims to operationalize Socio-Emotional Learning (SEL) in a contextualized manner among the most vulnerable tribal groups in the state of Rajasthan, India. We test it through a cross-sectional mixed methods approach where we use scales such as Social and Emotional Competence Questionnaire (SECQ) as well as validated measures of subjective well-being, such as the Satisfaction with Life Scale (SWLS) and the Scale of Positive and Negative Experience (SPANE). Whereas, for the qualitative part data will be collected through focus group discussions and interviewing with students, teachers and parents. Predictive and interactive effects of the socio-emotional competencies on well-being outcomes will be explored through subsequent statistical analyses based on the correlations, regression and mediation models. This study is expected to highlight the utility of SEL frameworks in promoting educational equity and psychosocial health among a small sample of subaltern youth.

Abstract 889

PRESCHOOL PLAY EXPERIENCE AND ITS ASSOCIATION WITH SUBJECTIVE WELL-BEING AND ACADEMIC MOTIVATION IN ADOLESCENCE: A RETROSPECTIVE STUDY

Zmieva E.*, Veraksa A.

Lomonosov Moscow State University ~ Moscow ~ Russian Federation

Play in preschool childhood is the leading activity through which the main developmental formations of preschool age occurs. However, the role of play in further ages is not studied enough. The aim of this study was to investigate the relationship between play experience in preschool age and subjective well-being and academic motivation in adolescents, using a retrospective method. The study involved 348 adolescents aged 15-18 years. To assess the level of subjective well-being, we employed the "Satisfaction with Life Scale" by E. Diener. To assess academic motivation, the "Scales of Academic Motivation in School-Age Children" was used. For the retrospective assessment of play experience in preschool age, a questionnaire was developed for the adolescents. This questionnaire included items regarding the types of play they preferred in preschool age, the presence of a favorite toy, and the social context of play. According to the results, construction play in early childhood is associated with a higher level of subjective well-being in adolescence, as well as with both intrinsic and extrinsic academic motivation. Adolescents who played with their parents more frequently during preschool age and who had a favorite toy demonstrated a higher level of subjective well-being, lower levels of extrinsic academic motivation, and lower amotivation. Digital games in early childhood is associated with higher indicators of extrinsic academic motivation in adolescents. The results of the study underscore the importance of play in preschool age and the essential role of parental involvement in play activities with children.

Abstract 276

ASSOCIATIONS BETWEEN LONG DAY CARE ATTENDANCE AND CHILD DEVELOPMENT

Gregory T.*, Gross M., Harvey E., Harman--Smith Y.

The Kids Research Institute Australia ~ Adelaide ~ Australia

There is mixed international evidence about the impacts of long day care (LDC) on child development, with research suggesting benefits for some aspects of development but not others. Moreover, many of these studies have limitations including measuring a narrow range of developmental outcomes, utilizing parent reports of child development, and relying on small and/or non-representative samples. The aim of the current study was to explore the relationship between LDC and child development across five domains using teacher reported data from the 2021 Australian Early Development Census (AEDC). The sample were 166,467 children with available data on the key exposure (teacher-reported long day care attendance in the year before full-time school), confounders and child development outcomes. A series of Poisson regression analyses were conducted to explore the association between LDC and child development at school entry, after adjusting for child and family level confounders. Just over half of the sample (n = 92,611, 55.6%) attended long day care in the year before full-time school. In adjusted models, children who attended long day care had a lower relative risk (RR) of developmental vulnerability in fine and gross motor skills (RR=0.94, 95% CI 0.90-0.98), language and cognitive skills (RR = 0.79, 95% CI 0.76-0.82) and communication skills and general knowledge (RR = 0.81, 95% CI 0.78-0.84) than children who did not attend long day care. However, children who attended long day care had an increased risk of developmental vulnerability in social competence (RR = 1.23, 95% CI 1.19-1.28) and emotional maturity (RR = 1.38, 95% CI 1.33-1.43) than their peers who did not attend long day care. Findings highlight opportunities for the sector to grow supports for children's social and emotional development within LDC settings.

Abstract 2638

CULTURALLY GROUNDED GRATITUDE PROCESSES IN KOREAN ADOLESCENTS: NEW DIRECTIONS FOR APPLIED PSYCHOLOGY IN EDUCATION

Kim B.*

University of Cambridge ~ Cambridge ~ United Kingdom

Intensifying academic pressure in East Asian education systems has generated sustained concern about adolescent stress, socio-emotional vulnerability, and the need for evidence-based wellbeing approaches. Although gratitude interventions are widely promoted in psychology for enhancing positive emotion, relationships, and health, their cross-cultural variability highlights a pressing need for culturally sensitive models. This study synthesises two qualitative investigations that examine how Korean adolescents experience gratitude in their everyday lives, offering insights relevant to global applied psychology, positive education, and sustainable youth wellbeing.

Across five weeks of gratitude journalling in urban and rural middle schools, adolescents provided diary reflections analysed using Interpretative Phenomenological Analysis. The urban study developed the STARR model, comprising Sense, Transition, Affect, Recognise, and Respond. The rural study identified six superordinate themes: recognising meaning and value; cognitive reflection; emotional complexity; inhibitions in expression; prosocial motivation; and transformational self-understanding. Despite contextual variations, such as competitive academic environments in urban schools and relationally interdependent dynamics in rural communities, core processes converged.

Adolescents described gratitude not as a simple positive feeling but as a culturally shaped relational appraisal involving mixed affect, attention to effort and sacrifice, and motivation toward moral or prosocial action. Journalling acted as a practical, low-cost wellbeing tool that enabled adolescents to slow down, reinterpret everyday care, regulate emotional ambivalence, and strengthen relational awareness. Expression was often inhibited due to norms around modesty and emotional restraint, yet gratitude consistently supported empathy, responsibility, and relational repair.

Findings offer a new direction for applied psychology by demonstrating how socio-emotional interventions must be culturally attuned, contextually embedded, and developmentally sensitive. This work highlights pathways for integrating reflective practices into educational systems to promote adolescent wellbeing, relational competence, and sustainable positive development.

Abstract 2008

ABILITY AND TRAIT EMOTIONAL INTELLIGENCE IN PRIMARY SCHOOL CHILDREN: A SYSTEMATIC REVIEW AND META-ANALYSIS

Piombo A.M.*[1], Yang J.[2], Trombini E.[3], La Grutta S.[1], Epifanio M.S.[1], Novara C.[1], Petrides K.[2], Andrei F.[3]

[1]University of Palermo ~ Palermo, Italy ~ Italy, [2]University College London ~ London,UK ~ United Kingdom, [3]University of Bologna ~ Bologna, Italy ~ Italy

Emotional intelligence (EI) has been identified as a key factor in children's socio-emotional and academic development. However, studies in primary school often target different kinds of outcomes but in isolation, using different EI models and measures, which limits comparability and integration. The present study aimed to provide an integrated synthesis of the associations between EI and developmental outcomes in primary school children, with a focus on trait EI, the most widely used model at this age.

A systematic review was conducted across ERIC, PsycINFO, Web of Science, and Scopus, yielding 7,298 records. After screening and eligibility assessment in line with PRISMA 2020 guidelines, 53 studies were included in the review, of which a subset contributed to quantitative synthesis. Narrative results indicated that EI in childhood has been studied in relation to cognitive functioning, academic performance, adaptive and maladaptive behaviors, affective well-being, and intervention outcomes.

Meta-analytic results showed that primary school girls scored significantly higher than boys on trait EI (Hedges' g = 0.23, p < .001). Trait EI was positively associated with academic performance (r = .14, p = .027) and adaptive behavior (r = .25, p = .020), while negatively associated with behavioral problems (r = –.24, p = .028) and bullying victimization (r = –.18, p = .025). By contrast, no significant association was found between trait EI and cognitive functioning (r = .05, p = .260).

These findings suggest that EI, particularly trait EI, plays a crucial role in supporting children's socio-emotional adjustment and learning during the primary school years. The small-to-moderate effect sizes highlight the potential value of implementing evidence-based EI interventions in school settings to promote both academic achievement and psychological well-being. Future studies should expand longitudinal and cross-cultural research, clarify distinctions between EI models, and evaluate the effectiveness of tailored intervention programs for primary school populations.

Abstract 2192

DOES AN SEL PROGRAM HAVE SIMILAR IMPACTS ON STUDENTS INVOLVED IN DIFFERENT BULLY-ROLES?

Coelho V.A.*[1], Sousa M.[2], Marchante M.[1]

[1]Académico de Torres Vedras ~ Torres Vedras ~ Portugal, [2]Psychology for Development Research Center ~ Porto ~ Portugal

This study aimed to analyze if a middle school universal social and emotional learning program had different or similar impacts upon students involved in different bullying roles (victim, bully, bully-victim or non-involved.

The participants in this study were 992 middle school students (Mage = 13.12; 51% girls), of which 337 composed the control group. The Positive Attitude middle school SEL program is composed by 13 weekly sessions and it was applied during two consecutive school years. Assessment by students and their teachers (n = 54) was implemented in the beginning and end of the program and in a follow-up six months later.

Multilevel analysis were performed and both self and teacher-reports showed more gains in self-control and self-esteem from the intervention for students who were victimized when compared with all other groups. Additionally, according to self-reports students who reported to be bully-victims also reported more gains in relationship skills than non-involved students. However, most of the differential gains had dissipated in the follow-up assessment.

Given the results it is possible to concluded that the SEL program had a differential impact upon students involved in different bullying roles.

EMOTION, EMPATHY, AND EQUITY: DEVELOPING PSYCHOLOGICAL COMPETENCIES FOR INCLUSIVE TEACHING IN INDIA

Harleen K.*

O.P. JINDAL GLOBAL UNIVERSITY ~ HARYANA ~ India

As India embraces the vision of inclusive and equitable education outlined in the National Education Policy (NEP) 2020, the psychological preparedness of educators emerges as a critical factor in transforming this vision into reality. This study explores the emotional and cognitive competencies Indian teachers require to support Inclusive and Diversified Students (IDS) across intersections of caste, gender identity, disability, language, religion, and socio-economic background. Grounded in the understanding that inclusive teaching is not solely a pedagogical challenge but a deeply psychological one, the research investigates how educators manage emotional labor, cultivate empathy, and navigate internal conflicts when their personal beliefs encounter institutional expectations. Drawing from teachers' lived experiences, the study highlights the mental health stressors, communicative sensitivities, and identity negotiations involved in managing diverse classrooms. It further examines how emotional intelligence, self-awareness, and affective communication function as essential tools for inclusive practice. The findings emphasize the need for systemic investment in teacher well-being and psychological skill-building through context-sensitive professional development. By centering the affective dimensions of inclusion, the study contributes to reimagining teacher education in India—one that prioritizes empathy, emotional resilience, and psychological safety as foundational to inclusive teaching. Ultimately, it proposes a culturally responsive framework that equips educators not just to teach all learners, but to understand and connect with them at a human level.

Abstract 1906

FROM COMPLIANCE TO CONNECTION: SCHOOL-COMMUNITY WELLBEING APPROACHES TO STUDENT ATTENDANCE

Carroll A.*[1], Lynn S.[2]

[1]University of Queensland ~ Brisbane ~ Australia, [2]Queensland University of Technology ~ Brisbane ~ Australia

Student absenteeism is a pressing concern in schools worldwide, especially within equity-impacted communities where systemic disadvantage and wellbeing challenges intersect. Too often, policy and practice frame absenteeism as an issue of student compliance or parental responsibility. Yet this approach fails to capture the broader relational, emotional, and material contexts shaping whether young people can, and want to, attend school.

This study draws on qualitative interviews with school leaders, staff, students, and community organisations across marginalised Australian school communities. Using reflexive thematic analysis, we explored the importance of wellbeing in school attendance, and the impact of community in connecting students with school.

Findings reveal that absenteeism cannot be disentangled from adolescents' experiences of wellbeing across multiple domains. Emotional wellbeing emerged as critical: students attended when they felt seen, safe, and supported, rather than when threatened with consequences. Social wellbeing was equally influential, with peer belonging, cultural inclusion, and stigma reduction shaping engagement. Material wellbeing, including access to food, uniforms, transport, and stable housing, was an integral but often overlooked determinant of attendance. Finally, community wellbeing was central, as staff capacity, educator wellbeing, and partnerships with families and local organisations created the conditions for sustained connection.

Across sites, participants consistently emphasised the role of connection over compliance. Leadership that prioritised care, roles dedicated to student wellbeing, flexibility to adapt to individual needs, and authentic partnerships with families and community services were identified as enabling factors.

By repositioning absenteeism as a reflection of relational disconnection and unmet wellbeing needs, this research reframes attendance not as an individual problem but as a community responsibility. The findings highlight practical, place-based strategies within schools and communities to help young people attend, connect, and thrive. The implications are clear: sustainable improvements in attendance will depend on

resourcing educator wellbeing, and embedding school–community partnerships as core to educational systems.

Abstract 2508

AUSTRALIAN CHILDREN WHO FEEL SAFER AND MORE SUPPORTED REPORT FEWER DIFFICULTIES AND MORE PROSOCIAL BEHAVIOUR

Russell D.*

Australian Catholic University ~ Melbourne ~ Australia

Understanding how children and adolescents perceive safety within school environments is critical for preventing abuse and promoting wellbeing. This study draws on data from the Children and Young People's Safety Survey (n = 4,407), focusing on students' perceptions of safety across five domains: child-informed perceptions of school safety climate, confidence in adults to respond to safety concerns in adult and peer-based situations which might make them feel unsafe, and interpersonal barriers to seeking help in such a situation. Associations between these perceptions of safety and psychological wellbeing were examined alongside regression models investigating which aspects of safety predicted which aspects of wellbeing or difficulties.

Multivariate analyses revealed that child-informed perception of school safety climate was consistently and significantly associated with lower emotional symptoms, conduct problems, hyperactivity, peer difficulties, and total SDQ difficulties, as well as higher prosocial behaviour and wellbeing scores. In contrast, confidence in adults to respond to safety concerns in peer or adult-based situations showed weaker or non-significant associations with wellbeing outcomes. Fewer barriers to seeking help when feeling unsafe was significantly associated with lower psychological difficulties and higher wellbeing, underscoring the importance of teachers and other school staff being available, caring, and willing to listen.

These findings highlight the centrality of school-based safety in shaping young people's emotional and behavioural wellbeing. For psychologists working in educational settings, the results underscore the need to assess and address students' subjective safety experiences—not only through individual support but also via systemic interventions that enhance protective school climates. The study supports the integration of safeguarding frameworks into psychological practice and school policy, with implications for training, prevention, and early intervention.

Abstract 225

SCHOOL CLIMATE AND ADOLESCENT ANXIETY IN VOCATIONAL EDUCATION: A SEQUENTIAL MEDIATION OF SELF-COMPASSION AND HOSTILITY WITH GROWTH MINDSET AS A MODERATOR

Zhang X.*, Hao S.

Peking University ~ Beijing ~ China

Anxiety poses a significant challenge to the well-being and academic success of adolescents, particularly those in vocational schools facing unique pressures. While school climate is known to influence student anxiety, the underlying psychological mechanisms and potential boundary conditions remain underexplored in this population. This study investigated the mediating roles of self-compassion and hostility in the relationship between school climate and anxiety, proposing a sequential pathway. Furthermore, it examined whether students' growth mindset moderates these relationships. Data were collected from secondary vocational students in Beijing using both cross-sectional (N=797, Mage=15.89, 71.4% female) and three-wave longitudinal (N=333, Mage=15.84, 66.7% female, one-month intervals) designs. Cross-sectional analyses and longitudinal structural equation modeling were employed, controlling for age and gender. Results from both designs consistently showed that positive school climate was associated with lower anxiety. This relationship was partially mediated by self-compassion and hostility, both individually and sequentially. Furthermore, growth mindset significantly moderated specific pathways: the positive association between school climate and subsequent self-compassion was stronger for students with higher growth mindset, and the positive association between hostility and subsequent anxiety was weaker for those with higher growth mindset. These findings highlight a moderated chain mediation process, suggesting that supportive school climate foster self-compassion, which in turn reduces hostility and subsequently anxiety, with growth mindset amplifying the benefits of school climate and buffering the risks of hostility. Interventions targeting school climate, self-compassion, hostility, and growth mindset may be beneficial for vocational students' mental health.

DOES PSU NECESSARILY IMPAIR FUNCTION? EVIDENCE OF A HIGH - PSU, WELL - FUNCTIONING ADOLESCENT SUBGROUP

Xiang K.*[1], Lei H.[2], Zhang Y.[1], Wang H.[1], Yang Z.[1], Tian F.[1], Zhang C.[2], Ke L.[1], Wang Y.[1]

[1]State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University, Beijing ~ Beijing ~ China, [2]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China

As smartphones become increasingly prevalent in adolescents' learning and social lives, the question of whether problematic smartphone use (PSU) itself leads to measurable psychological or behavioral dysfunction remains inconclusive. A multi-model cluster analysis was conducted based on cross-sectional data from 5th–9th graders (N=16,052; Mage=13.24, SD=1.14) in a district of Beijing. The analysis used four PSU dimensions (life interference, virtual life orientation, withdrawal and tolerance) and six psychological indicators (subjective well-being, resilience, prosocial behavior, depression, anxiety and impulsivity). After identifying distinct subgroups, SHAP attribution analysis was applied to 24 variables encompassing academic performance, individual psychology, smartphone use, and contexts relating to family and school, to identify key differentiating features. Cluster analysis based on multidimensional indicators categorized adolescents into the following five groups: Well Functioning–High PSU, Stable–Moderate, Flourishing–Low PSU, Distressed–Low PSU, and Severely Distressed–High PSU. Feature attribution analyses, with the Well Functioning–High PSU group as the reference category, revealed the features that most clearly distinguished the Severely Distressed–High PSU group in terms of psychological functioning (emotion regulation, school belonging, study interest, and growth initiative). Compared to the Flourishing–Low PSU group, key differentiating features were observed in behavioral/time management variables (study habits and weekend screen time). These findings suggest that dysfunction is more closely linked to self-regulation and social connectedness, while PSU levels are more strongly correlated with habitual behavioral and rhythmic patterns. This provides empirical evidence to support the precise identification of individuals and the development of targeted interventions.

Abstract 133

THE CASE FOR MORE PSYCHOLOGISTS IN AUSTRALIAN SCHOOLS

Godinho V., Diggins J.*

Charles Sturt University ~ Melbourne ~ Australia

Almost 20% of pre-school children in Australia show symptoms of psychosocial distress, and almost 670,000 school-aged children experience mental, behavioural, or neurodevelopmental disorders each year (Australian Psychological Society [APS], 2022) . Anxiety, depression and conduct disorder are amongst the leading causes of disease burden for Australian children aged 5–14 years. Children who are not supported while still in the early stages of psychological distress, can face significant challenges later in their lives, including their academic performance as they can struggle with poor engagement at school, and face learning difficulties; and other areas of daily life including managing emotions, maintaining strong social relationships, engaging in productive work etc.

The COVID-19 pandemic - which resulted in school shutdowns, social isolation, loneliness, and tremendous economic strain for many families and communities across Australia, particularly those living in regional areas and/or from marginalised, culturally and linguistically diverse backgrounds - further exacerbated the mental health and wellbeing of Australian school-aged children, with research demonstrating these impacts are persisting.

I am currently studying a Masters in Professional Psychology at Charles Sturt University while also serving as the part-time General Manager of Policy and Social Impact at the Australian Psychological Society, thus am aware that the Society has consistently advocated for 1 psychologist to be allocated for every 500 students in schools. Yet in reality, the number of psychologists supporting children in schools is far lower for a number of reasons, including a chronic shortage in the psychology workforce, which meets only 35% of projected demand, the cost of hiring school psychologists unless supported by government grants, and the cost of studying psychology unless supported by scholarships.

I want to provide an oral presentation on the case for more psychologists in Australian schools, practical recommendations to address the current challenges, and opportunities to learn from international experience.

Abstract 1210

NEURALIS: AN INTERDISCIPLINARY FRAMEWORK FOR YOUTH GROWTH BASED ON THE POWER OF THE MOMENT

Minoiu M.[1], Coconea L.D.*[2]

[1]Unaffiliated ~ Brasov ~ Romania, [2]Unaffiliated ~ Rome ~ Italy

Traditional didactic systems rarely cultivate the life skills that psychological and organizational research consistently identify as predictors of success. Furthermore, declining attention spans and shifting engagement patterns render purely instructional approaches increasingly ineffective.

NEURALIS is an applied youth development framework that integrates evidence-based psychology (e.g. elements from positive psychology, CBT, ACT, neuroscience) with innovation design and leadership principles. It introduces 28 core life skills and strengths - such as perseverance, empathy, inspiration, and gratitude - organized into five developmental paths: DREAM, ACT, COPE, TRANSMIT and ENJOY. In contrast to traditional curricula, NEURALIS emphasizes in vivo practice: adolescents are supported in cultivating these capacities in real time by using everyday challenges, conflicts, and small successes as direct opportunities for growth. Its defining feature, the “power of the moment” model, makes skill development immediate, authentic, and sustainable.

Developed through collaboration between a clinical psychologist and a corporate innovation specialist, NEURALIS is a result-oriented approach that combines scientific rigor with experiential, design-thinking methodologies. Initial piloting in a summer camp format yielded promising feedback, with participants reporting improvements in resilience, empathy, and self-confidence.

The program ultimately seeks not only to enhance well-being and fulfillment in adolescence, but also to equip young people with enduring strengths—enabling them to become adults who are more resilient, less prone to burnout, and better able to achieve meaning, balance, and long-term well-being. An assessment tool is currently under development to systematically measure the stage of cultivation across the 28 gifts.

This presentation will introduce the NEURALIS framework, outline its theoretical underpinnings and moment-driven methodology, and share preliminary observations of its impact on youth development. It will further demonstrate how interdisciplinary approaches can enrich applied psychology by transforming everyday life into a living laboratory for growth, resilience, and connection.

Abstract 1474

NATURAL POTENCIAL TO AUTONOMIES: THE PROJECTS OF THE ANTONIO MENEGHETTI FOUNDATION AND ANTONIO MENEGHETTI UNIVERSITY IN THE FORMATION OF YOUTH

Caraffa V.N.*, Rothmann A.R., Schaefer R., Wazlawick P., Fleck Da Silva B.

Faculdade Antonio Meneghetti ~ São João do Polêsine ~ Brazil

The education of university students increasingly requires pedagogical practices and proposals capable of providing a comprehensive humanistic formation, developing technical competencies (hard skills), behavioral competencies (soft skills), and also the competencies of the self, the FOIL skills, which seek to identify and foster the natural potential of each student (Schaefer; Silva; Wazlawick, 2022). In this regard, ontopsychological pedagogy (Meneghetti, 2019), applied in the projects of the Antonio Meneghetti Foundation (FAM) and the Antonio Meneghetti University (AMF), aims to promote the development of the four autonomies — psychological, legal, economic, and social (Meneghetti, 2020) — among students, favoring the formation of autonomous, responsible, and fulfilled individuals. The present study aims to investigate how the projects of FAM and AMF stimulate the development of natural potential and the four autonomies of university students. This is a qualitative research, structured as a multiple case study, involving students entering higher education and benefiting from the aforementioned institutional projects. Data collection employed specific questionnaires and documentary analysis of reports. As expected results, participation in the projects of FAM and AMF is shown to strengthen student's understanding of their natural project. It is also understood that students demonstrate greater awareness of who they are and how they can develop these four autonomies, thereby achieving greater protagonism in personal, academic, and professional domains. It is concluded that the projects of the Antonio Meneghetti Foundation and the Antonio Meneghetti University, grounded in ontopsychological pedagogy, constitute a model of humanistic formation by fostering the education of young protagonists capable of acting responsibly, consciously, and constructively in their personal, professional, and social spheres.

SCHOOL-TO-WORK TRANSITION AND EMPLOYABILITY: EVIDENCE FROM TURKISH UNIVERSITY STUDENTS

Buyukgoze--Kavas A.*, Kirazci F., Yazan Z.Ö.

Ondokuz Mayis University ~ Samsun ~ Turkey

Transitioning from school to work is a critical developmental stage during which young people clarify their career goals and prepare for labor market entry. Broadly defined, the School-to-Work Transition (STWT) refers to the shift from the student role to the worker role through full-time employment. This period represents a pivotal phase in which young individuals make key decisions regarding education, employment, and career trajectories; although some experience a smooth transition, others face uncertainties and challenges.

The current study examined the applicability of the STWT model proposed by Masdonati and colleagues (2022) in the Turkish context and investigated factors influencing university students' perceived employability. The sample consisted of 389 students (203 female, 181 male, 6 unspecified; M age = 22.12) enrolled in eight faculties at a large public university in Türkiye. Participants completed the Turkish versions of the Economic Constraints Scale, Lifetime Experiences of Marginalization Scale, Career Adapt-Abilities Scale–Short Form, Vocational Identity Measure, and Perceived Employability Scale.

Path analysis conducted in AMOS 24 showed that vocational identity and career adaptability directly and strongly predicted perceived employability. Economic constraints significantly predicted both career adaptability and vocational identity, whereas marginalization predicted only career adaptability. Overall, the model explained 58% of the variance in perceived employability.

These findings support the applicability of the STWT model for Turkish university students and highlight the central role of vocational identity and career adaptability in managing labor market uncertainties. The results contribute to the growing STWT literature and offer practical implications for career counseling interventions in higher education settings.

Abstract 1322

BEST PRACTICES IN CLINICAL SUPERVISION WITH RACIAL/ETHNIC MINORITY SUPERVISEES: INSIGHTS FROM STUDENT FEEDBACK AND PRACTICE IN CANADA

Zamudio G.*

University of Calgary ~ Calgary ~ Canada

Clinical supervision plays a critical role in the development of competent, culturally responsive counselors and therapists. For racial and ethnic minority supervisees, supervision that affirms their identities and acknowledges systemic inequities is essential for fostering professional growth and confidence. Supervisors who are culturally attuned can create supportive environments that strengthen both learning and clinical practice. Established frameworks such as Developmental and Competency-Based Models highlight the need to tailor supervision to trainees' developmental levels, while Multicultural and Social Justice–Oriented approaches underscore the importance of supervisor cultural competence for supervisee outcomes and client care. To this end, this presentation examines whether existing supervision approaches adequately reflect the voices and needs of racial/ethnic minority supervisees and illustrates how their perspectives can inform culturally responsive and socially just supervisory practices.

This presentation draws on supervisory experiences across four consecutive years within a social justice–oriented, accredited counseling psychology program in Canada. During this period, over 35+ racial/ethnic minority trainees engaged in supervision that intentionally addressed racial, ethnic, and other identity-based considerations. Insights were informed by supervisee feedback shared during training, supervision, and survey feedback, with attention to supervisory structure, feedback, skill development, professional identity formation, and culturally responsive practice.

Emerging themes suggest that racial and ethnic minority supervisees value supervision that is strength-based, identity-affirming, and structured to support practical skill development. Trainees highlighted the importance of explicit discussions of systemic barriers, opportunities for reflection on positionality, and guidance in applying theory to practice as critical to their professional growth and confidence.

This presentation will connect these insights to established supervision models and multicultural frameworks while offering practical recommendations for supervisors. Implications for training and the continued development of culturally responsive and socially just supervision practices will also be discussed.

DIGITAL CITIZENSHIP

Thursday 23 July 2026 from 14:00 to 15:30

(H-Spadolini)

Angela Costabile (University of Calabria ~ Rende (CS) ~ It), Chair and Discussant

All people around the world use digital devices for work or relaxation daily, and more than all youth are constantly involved in the digital environment and cyberspace through the use of devices for all their activities. Although we live and interact in the digital world in a similar way to the offline world, we're not always as mindful of our actions online.
Digital media provide unique opportunities for everyone to get involved, to speak out and to make change through our actions. So, if on one hand digital environment can contribute to accomplish some behavioral achievement, cognitive development, identity formation, through the access to information and educational resources (Geith & Vignare, 2008), on the other also might expose to risks such as cyberbullying, excessive screen time, privacy concerns etc..
To promote and support a responsible and ethical digital citizenship (Jones & Mitchell, 2016; Kim & Choi, 2018), encouraging a balanced technology use (Rapanta et al., 2021) some educational approaches are essential, starting from school-based educational programs, moving to the development of digital educational platforms, pass through fostering digital literacy.

Abstract 3671

MORAL PROCESSES INVOLVED IN CYBERBULLYING DECISION-MAKING

Romera E.M.*

Universidad de Córdoba ~ Córdoba ~ Spain

Cyberbullying represents a complex relational and moral dynamic that influences well-being and development. Automatic and emotional moral processes impact decision-making in cyberbullying. Moral sensitivity is an automatic process that involves recognizing that the situation is immoral (cognitive dimension) and triggering an affective reaction to the situation (affective dimension). Schadenfreude is a moral emotion consisting of enjoyment when seeing other people suffer, and whose activation has been related to transgressive behaviour in adulthood. Despite this, the study of this automatic and emotion processes among schoolchildren online relationships has received little scientific attention, possibly due to a lack of instruments. The sample consisted of more than 2,000 Spanish early and middle adolescents.

The affective response in moral sensibility was associated with lower cyberbullying perpetration. Thorough multiple linear regression models, schadenfreude due to aversion directly and significantly predicted involvement in cyberbullying aggression. Schadenfreude due to justice inversely predicted cyberbullying Aggression. This work highlights the main role of moral sensibility and schadenfreude in decision-making when facing peer cyberbullying. It is discussed how schadenfreude due to aversion can increase the risk of participating in cyberbullying. However, when this moral emotion arises from evaluations of justice, the probability of engaging in cyberbullying was seen to decrease, which could indicate that, although schoolchildren can experience schadenfreude at the misfortunes of others, the dimension of justice associated with this emotion could be mediated by the existence of a certain moral criterion or judgment which prevents them from participating in cyberbullying. These findings may be useful for guiding psycho-educational interventions aimed at improving moral emotion regulation and preventing cyberbullying. These results are analysed in the context of the educational program “CuidaMe”, that promotes sociomoral and emotional competence.

Abstract 3672

A PERSON-CENTERED APPROACH OF SELF-REGULATION AGAINST MISINFORMATION IN ADOLESCENCE

Corbelli G.*[1], Cicirelli P.G.[2], Sportelli C.[3], D"Errico F.[2], Paciello M.[4]

[1]Faculty of Psychology, Uninettuno Telematic International University, Rome, Italy. Department of Psychology, Sapienza University of Rome, Rome, Italy ~ Rome ~ Italy, [2]For.Psi.Com, Università degli Studi di Bari 'Aldo Moro', Bari, Italy ~ Bari ~ Italy, [3]Faculty of Psychology, Uninettuno Telematic International University, Rome, Italy. For.Psi.Com, Università degli Studi di Bari 'Aldo Moro', Bari, Italy. ~ Rome ~ Italy, [4]Faculty of Psychology, Uninettuno Telematic International University, Rome, Italy. ~ Rome ~ Italy

Online misinformation has become a pervasive and growing social concern. Adolescents may be especially vulnerable because they are still developing regulatory capabilities and place a heightened value on peer approval, including among social networks. Understanding how protective factors could buffer youth against online misleading content is becoming therefore an increasing priority for educators,psychologists, and those supporting adolescents' development. Adopting a person-centered approach, this study aim to: identify groups of adolescents characterized by different configurations of individual dimensions related to self-regulation; examine whether and how these configurations are associated to different profiles in their cognitive, behavioral, and emotional responses in dealing with specifically created manipulated news. Participants were 156 adolescents(17.9%Female;age 13-16 years,M=14.19,SD=0.55). Cluster analysis identified three clearly distinct profiles. C1:reflective adolescents highly activated by the piece of news, with high cognitive reflection and high perceived importance of the news,but low regulatory emotional self-efficacy toward anger and average inhibitory self-efficacy against misinformation sharing; C2:adolescents with regulation difficulties, low cognitive reflection, average perceived importance and regulatory emotional self-efficacy toward anger, and low inhibitory self-efficacy against misinformation sharing; C3:self-efficacious adolescents, with high cognitive reflection, high regulatory emotional self-efficacy toward anger, high inhibitory self-efficacy against misinformation sharing, and low perceived importance of the news content. Regarding responses to the misleading news item, C1showed the highest perceived credibility,empathy, and anger; C2demonstrated high sharing intentions(equal to those inC1)and moderate levels of perceived credibility; C3showed the lowest sharing intentions, perceived credibility, empathy, and anger. These meaningful differences in sharing intentions,credibility judgements,and emotional activation in response to the same news item suggest different adolescents' vulnerability or resistance to online manipulation.

The variety of the non-trivial interplay of such aspects of self-regulation could be useful for designing tailored interventions in preventive and educational programs focusing on reflective and self-regulatory capabilities to mitigate the spread and impact of online

misinformation among youth.

Abstract 3674

PROMOTE CO-DESIGN SKILLS IN PRE-SERVICE TEACHERS WITH THE USE OF A DIGITAL SERIOUS GAME. RESULTS OF A DESIGN BASED RESEARCH STUDY IN THE UNIVERSITY CONTEXT.

Giacchi I., Saija E., Vecchio G.M., Perucchini P.*

Università degli Studi Roma Tre ~ Rome ~ Italy

Digital Serious Games (DSGs) have attracted growing attention in education for their potential to foster learning, promote soft skills and digital citizenship, such as the conscious and responsible use of technology. A key challenge in teacher education is to strengthen pre-service teachers' competences in co-designing learning experiences that integrate digital tools, while supporting digital citizenship development. This study investigates the effectiveness of a DSG intervention aimed at enhancing co-design skills among pre-service teachers. Cooperative learning and peer feedback are explored as strategies to design innovative learning environments that promote both learning. The intervention was developed to entail a three-month collaborative work aimed at designing prosocial education activities. Participants were 435 pre-service teachers (mean age = 26.97, SD = 6.30; 94.2% female) enrolled in the Course Degree in Primary Teacher Education, comprising two cohorts of students across two academic years.

Following a design-based research (DBR) model, based on the results obtained in the first year, in the second year we introduced more structured peer feedback.

A quasi-experimental design with control groups was applied. The intervention groups used DSG at the beginning of the program, while the control groups only at the end.

The learning outcomes were assessed by two independent evaluators who analyzed the group reports based on criteria of originality, consistency, and theoretical soundness.

Results showed that intervention groups outperformed control groups in both academic years. The cohort A control group obtained lower scores than the cohort B control group, probable due to the absence of peer feedback. However, no significant differences emerged between intervention groups, suggesting that DSGs may reduce the necessity of structured peer feedback phase.

Overall, the findings underscore the potential of DSGs to support collaborative learning and highlight the relevance of engaging pre-service teachers in digital practices to prepare them for the challenges of digital society.

"HOW'S YOUR SEMESTER GOING?": MODELLING WEEK-TO-WEEK STUDENT ENGAGEMENT AND BELONGING IN HIGHER EDUCATION

Chu O.*, Badcock N., Wee S.

The University of Western Australia ~ Perth ~ Australia

Student engagement and university belonging are central to student success, yet little is known about how they relate to one another in the ebb and flow of everyday university life. Most research treats engagement and belonging as relatively stable or examines them at a single point in time, leaving unanswered the question of whether short-term changes in one drive changes in the other. Although some longitudinal work has captured week-to-week variability, no study has tested whether fluctuations in engagement predict corresponding shifts in belonging. This study directly addresses that gap by modelling the dynamic relationship between engagement and belonging across the semester. First- and second-year psychology undergraduates at the University of Western Australia will complete surveys at four time points between Weeks 2 and 8 of semester via a staggered rolling design, with data collected across two semesters. Engagement will be assessed across academic and social domains, and belonging measured through perceptions of inclusion, acceptance, and being valued. Students will also provide brief qualitative reflections on contextual factors shaping their experiences. Analyses will include multilevel within-person models to test whether week-to-week changes in engagement predict changes in belonging, and structural tests to examine whether both constructs are multidimensional and stable in structure but variable in intensity over time. By modelling engagement and belonging dynamically, this study will be the first to test a predictive week-to-week model of engagement on belonging, identifying when, where, and how these processes shift during semester. Findings are expected to add to evidence that engagement and belonging are fluctuating states rather than stable traits, while uniquely demonstrating the predictive influence of engagement fluctuations on belonging fluctuations. In doing so, the study will provide practical insights by identifying critical periods when targeted engagement strategies are most likely to strengthen belonging and support student adjustment in higher education.

EXPLORING THE TALENT ASSESSMENT AND DEVELOPMENT MODELS OF CORE LEADERSHIP COMPETENCIES FOR NEW-GENERATION COLLEGE STUDENTS

Hsu Y.*, Wu C., Wu Z.

National Tsing Hua University ~ Hsinchu City ~ Taiwan

In an era defined by super-intelligence and rapid societal transformation, the development of college students' competencies has become a crucial issue for higher education. This study investigates the evaluation and developmental pathways of core leadership among new-generation college students, with the aim of addressing emerging challenges and fostering adaptive leadership capacities. Over the past several years, a series of interrelated research projects have been conducted in Taiwan. First, the Scale of Youth Core Leadership Competency was developed to provide a reliable and valid assessment framework tailored to college students. Building on this foundation, individualized psychological coaching interventions were introduced, focusing on enhancing self-awareness, decision-making, and changing with personal goal. Furthermore, group psychological coaching models were designed and implemented, emphasizing collaborative problem-solving, interpersonal influence, and the support the cultivation of personal transformation. To extend the impact of these initiatives, cross-institutional camp activity which group relation conference (GRC) base on the approach of Bionian and A. K. Rice were organized and conducted, for enabling students to engage in shared learning, peer dialogue, and reflected on leadership practice within diverse group contexts.

Findings from the series studies highlight the dynamic nature of leadership as a developmental competency rather than a fixed trait. The integrated model proposed in this research suggests that effective leadership development for college students requires a multi-layered approach—combining systematic assessment, personalized coaching, and experiential group learning. This model not only enhances students' leadership readiness but also strengthens their adaptability to future societal and professional demands. The series explorations contributes both theoretical and practical insights into higher education reform, offering a framework for cultivating the next generation of leaders equipped to navigate complexity and drive their core leadership competencies change.

SOFT SKILLS TRAINING FOR YOUNG ADULTS: AN EXPERIENTIAL AND SELF-REFLECTIVE COLLEGE COURSE

Özbek P.*

Koç University ~ Istanbul ~ Turkey

Mental health crisis among young adults is a global issue that psychologists as well as educational institutions have been trying to address effectively, especially after the pandemic. Within this context, preventive work, such as soft (life) skills training, is essential in supporting young adults' wellbeing and resilience. Soft skills are pivotal in making a difference in young adults' personal and social life as well as their academic and professional journey. Research shows that university students with improved life skills have better outcomes in terms of psychological wellbeing as well as academic success. Universities are in a unique position to help flourish "the whole student" by offering programs to help students build these skills in addition to forming them as professionals in their respective fields. This presentation will focus on Academic and Life Skills (ALIS) Program, a well-established applied psychology program that aims to foster soft skills development in university students. The skills that are the focus of this program are self-awareness, goal setting, time management, stress management, psychological resilience, communication, relationship management, multicultural competence, team membership, project management, conflict resolution, decision making, motivation, self-competence and adaptation to change. The program offers required and elective courses for credit for students at different stages of undergraduate career, namely Academic and Life Skills (ALIS 100), Applied Life Skills (ALIS 200) and Transition to Professional Life (ALIS 350). The course sessions are composed of experiential workshops, and student learning is assessed via self-awareness and skill practice assignments. The effectiveness of the courses is evaluated via standard forms and verbal feedback, and the course content and methods are regularly updated with the ever-changing growth needs of incoming generations of students.

Abstract 1550

TALENT OR EFFORT? EFFECTS OF PARENTAL ACHIEVEMENT ATTRIBUTIONS ON EDUCATION PRACTICES AND LATER ADOLESCENT DEVELOPMENT IN A 12-YEAR STUDY

He Y.*[1], Pu Q.[1], Zhang Y.[2], Chen F.[1]

[1]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University ~ Beijing ~ China

In Chinese educational context, academic performance is viewed as a key form of adolescent achievement and a pathway to future social success. Parents' attributions of achievement during this stage may thus shape their educational practices and lay the foundation for children's long-term social development.

Using panel data from the China Family Panel Studies (CFPS) collected in 2010 (T1) and 2022 (T7), this study examined 1,069 adolescents（Mage at T1 = 12.70，SD) and their parents (. Latent Profile Analysis (LPA) at T1 identified parental attribution patterns, and the manual three-step approach tested their effects on parental educational practices (educational involvement, investment), adolescents' academic outcomes (engagement, pressure, effort), and later social development (income, occupational prestige, educational attainment, growth mindset) at T7.

Results showed that: (1) Three latent profiles of parental achievement attributions were identified: high talent-effort attribution (54.54%), moderate talent attribution (6.36%), and low talent attribution (39.10%). Across all three profiles, parents consistently showed high levels of effort attribution. (2) After adjusting for demographics (child gender, age, household income, etc.), parents in high talent-effort attribution group reported significantly more educational investment than those in the low talent attribution group, but there was no difference in educational involvement. (3) Adolescents with parents in high talent-effort attribution group demonstrated higher academic engagement and learning effort, along with greater academic pressure. (4) In terms of long-term social development outcomes, only growth mindset was significantly higher among children of high talent-effort attribution parents compared to those of low talent attribution parents.

This study identified distinct types of parental achievement attributions and revealed that parents with high talent-effort attributions of personal achievement may promotes both external educational investment and internal motivation, fostering adolescents' growth-oriented cognition. Findings underscore the central role of parental achievement attributions in shaping adolescents' academic adjustment and long-term development.

Abstract 1056

TRAINING IN COACHING AS A WAY TO BUILD TRUST

Dryjanska L., Stolarski M.*

Uniwersytet Kardynala Stefana Wyszynskiego ~ Warsaw ~ United States Minor Outlying Islands

Based on the assessment of training in coaching provided to graduate students of work and organizational psychology for over two years, this presentation will demonstrate how such training can be used to build trust. Three instructors have been working with two cohorts of students enrolled in a graduate program at a public university in Poland. In the era of artificial intelligence, offering workshops on coaching where students were directly involved as coaches and clients, has provided a way for them to rely on interpersonal skills and cultural competence rather than electronic resources. From a non-clinical perspective, participants had an opportunity to learn how to build trust and listen attentively to each other, gaining a transferable skill useful at workplaces and institutions. However, before the students began working with clients, they were introduced to evidence-based approach in coaching practice. The structure of the coaching session was based on the GROW model. The preparation of students for working with clients was based on Gasiul's personalistic concept of personality development and Hermans' concept of the dialogical self. These two concepts allowed for an explanation of the mechanisms occurring between the client and the coach and clarified possible directions for development (Gasiul's three principles of personality development). Throughout a semester, each student took the role of a coach and of a client at least twice. Feedback after the sessions was provided by those actively involved, as well as fellow students who watched the session, besides the instructor. In line with principles of coaching, instructors encouraged coaches to refrain from giving advice and instead to assist the client in delineating a solution an practical steps to achieve it. As a result, students were trained in an ability to take the perspective of the other person, essential for their future careers.

RECANTO MAESTRO ECOSYSTEM AND POSITIVE YOUTH DEVELOPMENT: THE SPACE FOR CREATIVITY AND INNOVATION

Wazlawick P.*[1], Rothmann A.R.[2], Fleck Da Silva B.[2], Caraffa V.N.[2]

[1]Faculdade Antonio Meneghetti ~ Restinga Seca ~ Brazil, [2]~ Restinga Seca ~ Brazil

In contemporary times, with the advent of Artificial Intelligence and the exponential development of Information Technology, numerous new challenges have emerged in the education of young professionals at the university level. The focus falls on the development of soft skills (life, emotional, and behavioral competencies), hard skills (technical competencies), and this study introduces self skills (intrapersonal competencies) as the foundation for the development of the first two. The objective of this research is to investigate how the development of self skills can occur in the Undergraduate Programs of the Antonio Meneghetti College, primarily in the Bachelor's Degree in Ontopsychology, in Information Systems, and in the educational, cultural, and social projects of the Antonio Meneghetti Foundation for the positive development of youth. This investigation is set within the ecosystem of the Recanto Maestro International Center of Humanist Art and Culture and is grounded in Ontopsychological Science. This is a qualitative, exploratory research study that also incorporates insights from the Design Thinking method. The results point to an original educational approach that fundamentally integrates the application of creative and innovative activities to develop the innate nature project of young students. Furthermore, they highlight the interrelationship between the development of hard skills, soft skills, and self skills for integrated human, professional, technical, social, and scientific growth, alongside innovative learning methodologies used both in educational projects and in university higher education, skills and competencies required by life and by the emerging social contexts of this historical period.

THE EFFECTIVENESS OF PREVENTIVE SOCIAL SKILLS INTERVENTIONS IN PRESCHOOL-AGED CHILDREN: A SYSTEMATIC REVIEW

Orgilés M., Ruiz--Soria L., Serrano--Ortiz M., Amorós--Reche V.*, Espada J.P.

Miguel Hernández University of Elche, Child and Adolescent Research Center ~ Elche ~ Spain

The preschool stage represents a critical period for the development of skills that support successful adjustment in later stages of life. In particular, strong social competence serves as a protective factor against the emergence of childhood problems. As a result, increasing attention has been given to the development and implementation of preventive programs. In recent years, there has been a notable rise in emotional and behavioral difficulties among young children, which has led to the creation of various national and international prevention initiatives. To consolidate the existing evidence, this study conducted a systematic review of group-based social skills prevention programs targeting preschool-aged children (0–7 years). Searches were carried out across several databases, including APA PsycINFO, Web of Science, MEDLINE (PubMed), SCOPUS, PSICODOC, and ERIC. From an initial pool of 10,600 records, 33 articles met all inclusion criteria. The selected programs varied in terms of methodology, study design, duration, and number of sessions. Overall, findings indicated that most children showed improvements in social skills as well as reductions in emotional and behavioral problems. These results support the effectiveness of school-based social skills training as a preventive strategy during early childhood. Practically, the findings underscore the relevance of incorporating evidence-based social skills programs into preschool curricula to support children's socio-emotional development and prevent future psychological difficulties.

ACHIEVEMENT EMOTIONS AS MEDIATORS AND MODERATORS BETWEEN MOTIVATIONAL BELIEFS AND ACADEMIC PERFORMANCE IN SCIENCE

Casas A.J.*[1], Ceballos--Munuera C.[2], Fernández--Theoduloz G.[1]

[1]Universidad de la República ~ Montevideo ~ Uruguay, [2]Universidad de Sevilla ~ Sevilla ~ Spain

Grounded in expectancy-value theory, this study examined whether specific academic emotions mediate and moderate the relationship between motivational beliefs (X) and academic performance (Y) in science during adolescence. The sample comprised 340 Uruguayan secondary school students (M = 16.5 years, SD = 0.96; 42.6% female) from five public and private institutions. After removing seven outliers and twelve cases with missing data on the outcome variable, analyses were conducted with 321 cases. A cross-sectional correlational design was used. Analyses were conducted using the PROCESS macro for SPSS (Model 5, version 4.2), which allows estimation of an indirect effect (via a mediator, M) and a moderation of the direct effect by a moderator (W). Motivational beliefs (X) were assessed through the interaction of adapted items assessing expectancy of success and task value. Achievement emotions were measured using a shortened version of the Achievement Emotions Questionnaire, grouped into two dimensions: academic disengagement emotions (M, e.g., hopelessness, boredom) and learning-facilitating emotions (W, e.g., enjoyment, pride). Academic performance (Y) was indexed by one of the final evaluation grades in a Physics course. Motivational beliefs and learning-facilitating emotions were mean-centered prior to analysis. Heteroscedasticity-consistent standard errors were used (HC3 estimator; Davidson & MacKinnon, 1993) to account for observed violations of normality and heteroscedasticity. Results showed a significant indirect effect of motivational beliefs on academic performance through disengagement emotions (ab = 0.015, 95% CI [0.002, 0.029]), suggesting that lower academic disengagement partially explains the positive association between motivational beliefs and performance. The direct effect of motivational beliefs on performance remained significant (B = 0.065, p = .013) and was moderated by learning-facilitating emotions (interaction term: B = –0.038, p = .047). Conditional effects analysis showed that motivational beliefs significantly predicted performance at low and medium levels of learning-facilitating emotions, but not at high levels.

Abstract 386

AGRICULTURAL INTENSIFICATION AND ITS EFFECTS ON GROUNDWATER RESOURCES: INSIGHTS FROM THE SURABAYA-LAMONGAN GROUNDWATER BASIN AND OPPORTUNITIES OF PSYCHOEDUCATION TOWARDS GROUNDWATER CONSERVATION

Gunawan A.*

Faculty of Earth Sciences and Technology, Institut Teknologi Bandung, Indonesia & Muhammadiyah University of East Kalimantan, Indonesia ~ Bandung ~ Indonesia

The Surabaya-Lamongan Groundwater Basin (SLGB) is one of the important water resources that support raw water needs for urban and agricultural areas in East Java. Based on the analysis of 1091 groundwater samples in the basin, it was found that the concentrations of manganese (Mn), phosphate (PO_4^{3-}), and Total Dissolved Solids (TDS) exceeded the threshold set for drinking water. This finding indicates the presence of pollution that could potentially jeopardize groundwater quality in the area. Land use analysis between 2000 and 2021 shows a fourfold increase in land use change from forest to agricultural areas. The expansion of agricultural activities, including the use of chemical fertilizers and intensive irrigation practices, is thought to be one of the main factors for the increased pollution load on groundwater. This research confirms the need for more sustainable land use management and regulation of groundwater utilization to preserve the Surabaya-Lamongan groundwater basin as a strategic resource. One-way Anova analysis based on land cover classification showed different levels of compounds, and is discussed in this study. Education with a psychological approach to groundwater conservation and environmentally friendly agriculture can be a planned program to overcome the threat of damage to groundwater resources. This is a psychological and practical mitigation effort that can be done for the people living around the study area.

Abstract 131

WHY SO SERIOUS? HOW VISIT PURPOSE SHAPES PARENT–CHILD TALK AT THE AQUARIUM

Kelly K.*, Chhor L., Ortiz J., Delgado J., Panameno H., Barillas X., Serrano E.

California State University Long Beach ~ Long Beach ~ United States of America

Introduction. Families' visits to museums, aquariums, or other informal science institutions (ISIs) are shaped by their goals, expectations, and values. The purpose of ISI visits (i.e., entry agenda) can influence the activities families engage in and the ways they interact. Research shows that entry agendas affect conversation structure, visitor attention, and how knowledge is shared, ultimately shaping family learning outcomes (Ellenbogen, 2002; Falk & Dierking, 2000). Therefore, the current study examined the relationship between the purpose of family visits to an aquarium and the content and style of parent-child conversations.

Methods. The sample included 50 parent-child dyads (27 girls; age: M = 5.75 years, SD = 1.7) recruited at a Southern California aquarium. Families represented diverse racial/ethnic and socioeconomic backgrounds. Researchers invited families to participate as they explored an aquarium exhibit and recorded consenting dyads' conversations using Bluetooth microphones. Subsequently, parents completed an electronic survey reporting family demographics and rating the purpose of their visit (educational/learning, recreational/fun, or relational/family time) on a 4-point Likert scale (1 = disagree to 4 = agree). Conversations were transcribed verbatim and coded for content (parent and child science talk) and parent conversational style (autonomy support vs. controlling) using pre-established coding systems (Author et al., 2020; Author, 2018).

Results and Conclusions. Preliminary findings showed that 96.6% of parents agreed their visit was recreational, 93.1% relational, and 72.4% educational. Parents' average autonomy support score was 0.30 (range: -12 to 36), and children averaged 12.56 utterances of science talk. Parents who agreed (vs. somewhat agreed/disagreed) their visit was educational were more controlling (M = 4.71 vs. –.05), had shorter conversations (M = 234.71 vs. 258.14 utterances), and their children used less science talk (M = 8.05 vs. 11.00 utterances). These findings suggest rigid educational agendas may reduce opportunities for meaningful, child-driven informal learning. Full analyses will be presented.

Abstract 215

TEACHER AND CLASSROOM INFLUENCES ON MATHEMATICS ANXIETY: A SYSTEMATIC LITERATURE REVIEW OF INSTRUCTION, TEACHER SUPPORT, AND CLASSROOM STRUCTURE

Li Q., Huang K.*, Yipeng H., Ying S., Chen N., Palaroan R.

Wenzhou-Kean University ~ Wenzhou ~ China

Mathematics anxiety is a prevalent concern among K-12 students, with well-documented negative impacts on their academic performance, motivation, and psychological well-being. While prior research has revealed that teacher- and classroom-related factors can significantly contribute to students' mathematics anxiety, the evidence remains fragmented and inconsistent. Given the mixed findings, a systematic literature review is necessary to clarify how teacher- and classroom-level variables influence students' mathematics anxiety. Following PRISMA guidelines, the review employed a structured literature search process and predefined inclusion criteria and identified 56 relevant empirical studies. Through thematic analysis of the selected studies, four domains that captured the primary pathways through which teacher- and classroom-level factors influence K-12 students' mathematics anxiety emerged: (1) instructional strategies (e.g., gamification, cognitive activation, dialog-based activities), (2) teacher support (e.g., autonomy support, motivational style, teacher-student rapport), (3) classroom structure (e.g., clarity of classroom routine, task difficulty, and workload management), and (4) teacher characteristics (e.g., mathematics anxiety, self-efficacy, professional knowledge). Evidence indicates that cognitively engaging instruction (e.g., gamification, cognitive activation) and emotionally supportive teacher-student interactions can reduce mathematics anxiety. Further comparative studies suggest that instructional strategies enhancing students' mathematical understanding are more effective than interventions focused solely on emotional regulation. Moreover, the impact of these interventions varies across student groups, with stronger effects documented among female students, those from lower socioeconomic backgrounds, and students in rural areas. Teachers' own mathematics anxiety and low self-efficacy are consistently associated with higher levels of student mathematics anxiety. Several longitudinal studies further reveal that these effects intensify as students progress through grade levels, influencing not only their anxiety but also their mathematics performance over time. Drawing on Control-Value Theory and Social Cognitive Theory, this review highlights the mechanisms through which teacher- and classroom-related variables shape students' emotional experiences in mathematics learning and outlines implications for theory-driven, school-based intervention design.

Abstract 149

ENHANCING SECOND LANGUAGE MOTIVATION THROUGH SELF-APPRAISAL: IMPLICATIONS FOR EDUCATIONAL PSYCHOLOGY

Murakami H.*, Manalo E.

Graduate School of Education, Kyoto University ~ Kyoto ~ Japan

Introduction:
Motivation is a critical factor in second language acquisition, and it is a concern that many Japanese university learners struggle to sustain it. The L2 Motivational Self System (Dörnyei, 2005, 2009) posits that motivation is driven by the discrepancy between learners' Ideal L2 Self and their Current L2 Self. However, the psychological processes that shape this self-discrepancy, particularly the role of self-appraisal, remain underexplored. Self-appraisal, which pertains to a learner's confidence in their performance, is believed to influence how they construct their self-images, yet empirical validation is scarce. This study aims to clarify the mechanism by which self-appraisal affects self-images, self-discrepancy, and motivation.
Purpose: To investigate how self-appraisal predicts (1) self-images (Ideal and Current L2 Selves), (2) self-discrepancy, and (3) the motivational effectiveness of self-discrepancy.

Method:
A total of 253 Japanese university EFL learners completed an English proficiency test and a questionnaire measuring self-appraisal (confidence towards the test), self-images (Ideal and Current L2 Selves), self-discrepancy, and Intended Learning Effort. Multigroup structural equation modeling (SEM) and polynomial regression were employed to explore the relationships across different levels of self-appraisal.

Results:
Self-appraisal significantly predicted both Ideal and Current L2 Selves, with higher confidence associated with more positive self-images. It also significantly predicted self-discrepancy: learners with higher confidence reported smaller self-discrepancies. Crucially, the explanatory power of self-discrepancy on motivation was significant only among learners with moderate confidence who demonstrated moderate level of self-discrepancy. Moreover, a curvilinear relationship emerged, suggesting that motivation is maximized when the discrepancy between Ideal and Current L2 Selves is neither too large nor too small.

Conclusion:
This study demonstrates that learners' confidence meaningfully shapes the construction

and motivational function of L2 self-images. The findings offer practical implications for applied psychology and language education, particularly in designing interventions that foster accurate and motivating self-perceptions.

Abstract 120

DEFENDING OR REMAINING PASSIVE AS A BYSTANDER OF SCHOOL BULLYING: THE ROLE OF MORAL DISTRESS, CONFORMITY, AND COLLECTIVE EFFICACY

Nishino Y.*

Hiroshima Shudo University ~ Hiroshima ~ Japan

When bullying occurs in school, most students are not only aware of it, but are also present and witness bullying. In the case of witnessing bullying, a bystander may recognize bullying as wrong, and feel responsible and motivated to intervene, but they may occasionally fail to actively intervene and defend a bullied peer for any reasons. The purpose of this study was to investigate how moral distress, conformity, collective efficacy and psychological safety in the class were related to bystander behaviors (assertive defender, comforting defender, sympathetic outsider, and indifferent outsider) in bullying. In addition to examining the pathways to bystander behaviors, we also tested the hypothesis that middle school students have different pathways from those of primary school students. One thousand one hundred and six Japanese primary school students (49.1% girls) and nine hundred and twenty middle school students (46.8% girls) participated in our questionnaire survey. T-test showed that compared with middle school students, primary school students significantly expressed more defending and remaining passively aside, higher moral distress, collective efficacy and psychological safety and less conformity. In order to examine how each variable is related to the occurrence of bystander behaviors, we converted the experience of bystander behaviors into a binary value, with “never” set to “0” and all other responses set to “1”, and conducted a binomial logistic regression analysis by using experience of bystander behaviors as the criterion variable. Results showed that defender behaviors only among middle school students and outsider behaviors were positively predicted by conformity, and that indifferent outsider behavior was negatively predicted by collective efficacy. Moreover, the results of simple slope analysis for the significant effect of two-way interaction suggested that collective efficacy might regulate the effect of moral distress on defending behaviors among only middle school students. Implications of these findings are discussed.

Abstract 382

ETHICS AND RISKS IN THE USE OF AI IN HIGHER EDUCATION

Ortiz--Bonnin S.*, Blahopoulou J.

Universitat de les Illes Balears ~ Palma ~ Spain

Introduction: The integration of Artificial Intelligence (AI) tools like ChatGPT into higher education presents both opportunities and challenges, especially in terms of ethics, trust, and educational equity.
Purpose: This study explores how undergraduate students' perceptions of academic dishonesty (PAD) influences their intention to use ChatGPT, and whether this relationship is mediated by perceived risk.
Method: A quantitative study was conducted using an online survey completed by 468 undergraduate students at a Spanish university. Data was analyzed through mediation models using the PROCESS macro (Model 4).
Results: The findings show that greater awareness of ethical risks is significantly associated with lower intention to use such technologies in the future. Additionally, perceived risk significantly mediates the relationship between PAD and intention to use, suggesting that ethical concerns reduce AI adoption by increasing perceived risks.
Conclusions: The study provides valuable insight into why some students are more aware and sensitive to the potential risks of ChatGPT than others. Further, these findings highlight the need for universities to foster critical discussions around academic integrity and the responsible use of emerging technologies like ChatGPT.

Abstract 125

EXPLORING INDICATORS OF INTERNAL QUALITY ASSURANCE IN JAPANESE UNIVERSITIES THROUGH EVALUATION REPORT ANALYSIS

Shibui S.*, Noda A., Kaneko A.

National Institution for Academic Degrees and Quality Enhancement of Higher Education ~ Tokyo ~ Japan

The establishment of robust internal quality assurance (IQA) systems is increasingly recognized as a cornerstone of sustainable quality enhancement in higher education. While international frameworks emphasize the importance of IQA, specific practices that constitute effective systems remain diverse and context-dependent. In Japan, accreditation agencies regularly publish peer-reviewed evaluation reports, offering valuable insights into how IQA efforts are judged in practice. This study explores indicators that reflect the development and maturity of IQA systems by analyzing the linguistic features of evaluative comments in such reports.

We focused on the psychological underpinnings of evaluators' judgments, particularly the language used to describe good practices. Text data were extracted from accreditation reports issued by multiple certified agencies between FY2015 and FY2023, covering 240 accredited universities. Using morphological and frequency analysis, we identified commonly used terms and thematic clusters associated with positive evaluations. The analysis allowed us to derive a set of potential indicators reflecting effective IQA implementation.

Key findings include the repeated emphasis on (1) the use of third-party verification and external feedback, (2) systematic and continuous data collection for quality improvement, and (3) structured faculty development initiatives. Notably, variations in evaluative focus across agencies suggest that different institutional logics influence how IQA is interpreted and assessed.

These results contribute to understanding the cognitive criteria used by evaluators and highlight the implicit standards that guide judgment. By clarifying these indicators, the study offers practical tools for institutions seeking to enhance their IQA frameworks and align with external evaluation expectations. It also informs efforts to improve the consistency and transparency of accreditation practices, bridging applied psychological insights with policy and institutional development in higher education.

EXPLORING THE DEVELOPMENT OF CLINICAL EMPATHY AMONG CHINESE MEDICAL STUDENTS: A TRANSITION FROM SIMULATION-BASED LEARNING TO CLERKSHIP

Zhou H.*, Shen Z., Wu H.

Peking University ~ Beijing ~ China

Background: Little is known about how simulation-based learning and clinical clerkship —two key learning contexts—shape medical students' interaction with simulated and actual patients and influence students' clinical empathy. This study investigated the development of clinical empathy among medical students from simulation-based learning to clerkship in China. Methods: In a constructivist paradigm, this study employed an exploratory qualitative approach, adhering to the COREQ. Data were collected through semi-structured interviews with eight fifth-year medical students and observations of 26 instances among 16 fourth-year students in a six-station objective structured clinical examination. Thematic analysis was used to analyse the qualitative data. Results: In simulation-based learning, medical students focused on improving their clinical skills, seldom perceiving simulators as patients they might encounter in clinical settings, and pretended to show empathetic concern as needed. Furthermore, due to the lack of timely simulator feedback, medical students easily overlooked critical steps in clinical procedures. During clerkship, medical students experienced stronger emotional responses. Concern about potentially harming patients made students more cautious in procedural steps. Medical students gradually recognized patients' uniqueness, becoming attuned to emotional cues and alleviating patient suffering by improving their clinical skills. Moreover, their perspective on patients shifted, enabling them to see patients as a whole to carry out medical procedures with empathetic concern. Conclusions: While simulation provides skill training, its procedural nature limits empathy development. Clerkship, in contrast, fosters medical students' emotional engagement, individualized thinking, and flexible views of patients.

EDUCATING FOR RESILIENCE: STRATEGIES FOR NAVIGATING GLOBAL CHALLENGES

Thursday 23 July 2026 from 15:30 to 17:00

(H-Spadolini)

FRANCESCA GIORDANO (UNIVERSITA' CATTOLICA DEL SACRO CUORE ~), Chair and Presenter

This symposium examines the role of resilience education as a scientifically grounded strategy to promote adaptation and psychological functioning in the face of contemporary global challenges, including war, displacement, climate change, and socio-political instability. While resilience has traditionally been studied as an individual trait, emerging evidence emphasizes its dynamic and context-sensitive nature, which can be cultivated through structured educational and training programs. The symposium brings together five empirical contributions that explore how resilience can be taught, practiced, and operationalized at different levels: within national education systems, among university students, and in humanitarian professional contexts.

Each presenter offers a unique contribution to this theme: Carmel Cefai reports results from a nationwide assessment of social-emotional skills and academic functioning in Maltese students from kindergarten to secondary school. The study provides large-scale empirical data to inform targeted educational policies and interventions promoting resilience in school systems.

• Shannon Lipscomb presents a pilot study evaluating the adaptation of a resilience-building intervention for undergraduates involved in internships and community work. The study highlights qualitative shifts in students' conceptualization of resilience and quantitative trends toward reduced stress and enhanced adaptability and empathic listening.

• Lana Batinić presents an educational program on resilience implemented with undergraduate psychology students at a Croatian university. The study investigates how structured, scaffolded learning can foster core resilience and interpersonal functioning. It offers a higher education perspective on resilience-building interventions.

Abstract 4143

YOUTH AS AGENTS OF CHANGE TO BUILD RESILIENCE TO GLOBAL THREATS IN THEIR OWN LOCAL COMMUNITIES

Lipscomb S.*

Oregon State University ~ Oregon ~ United States of America

Equipping youth and young professionals to build resilience in their own communities is essential. This study pilot tested the adaptation of a resilience intervention designed for professionals in crisis zones for use with undergraduate students (N=8) in the United States engaged in internships, work, or volunteering.

In a follow-up focus group, all students affirmed that resilience can be taught. A theme emerged about learning processes with two codes: all people are capable of resilience, and resilience is brought out from within. A second theme involved teaching methods: authentic modeling, and using tools and guidance (activities, creativity, encouragement). Example quotes included: “It's like a power that you're unlocking in people. You're giving them the tools to find the key to unlock [resilience] in themselves,” “do exercises or activities that remind them and bring [resilience] out in them,” and “Modeling resilience … doesn't mean like only having this perfect like exterior, but being vulnerable with the people that you're working with as well.” In their own learning, students’ open-ended survey responses revealed impacts for self (n=8) and improved skills and ability for working with others (n=4). Outcomes for self included personal growth (“I gained a new perspective of myself”), own resilience (“we can apply [intervention] to our own lives), and improved knowledge or understanding (“I gained a strong understanding of the importance of community in building resilience.”). Four described outcomes for both self and other, such as, “I feel like I have tools, not only for myself, but for clients … to help them find resilience in their lives.”

Pre- to post-intervention survey responses showed a qualitative shift in students’ conceptualizations of resilience that involved more active practice, adaptation, and external resources, and less passive endurance. Quantitative survey data showed trends toward decreased stress and increased adaptability and empathic listening.

Abstract 4144

EVALUATING A RESILIENCE EDUCATION PROGRAM FOR PSYCHOLOGY UNDERGRADUATES

Batinic L.*

Catholic University of Croatia ~ Zagreb, ~ Croatia

In a context marked by global threats and rapid socio-ecological transformations—including natural disasters, climate change, and armed conflicts—developing adaptive capacity has become essential for individual and collective wellbeing. Key competencies such as flexibility, critical thinking, and the ability to form supportive social networks have been identified as foundational for navigating uncertainty (Chapin et al., 2009). Research suggests that structured and scaffolded learning experiences can effectively foster these competencies (Spellman et al., 2016).

This study examines the implementation and impact of a university-based resilience education program delivered to undergraduate psychology students at the Catholic University of Croatia. The program aimed to promote the acquisition and internalization of resilience-related competencies through experiential and reflective learning. A mixed-methods design was employed, including both open-ended questions and standardized quantitative measures administered pre- and post-intervention. Variables assessed included general knowledge of resilience, perceived stress, wellbeing, self-care, self-compassion, and interpersonal functioning.

Preliminary results indicate meaningful improvements in both self-reported practices and conceptual understanding, suggesting that resilience can be effectively cultivated through targeted educational interventions. These findings contribute to the growing evidence base supporting the integration of resilience education in higher education settings, and offer implications for the design of curricula that aim to equip youth with the skills needed to face contemporary challenges.

Abstract 4145

RESILIENCE AND MEANING-MAKING AMONG HUMANITARIAN WORKERS IN WAR-AFFECTED UKRAINE: A MULTILEVEL NETWORK PSYCHOMETRICS TO UNCOVERING MECHANISMS AND PROCESSES

Giordano F.*, Zambelli M., Tagliabue S.

Resilience Research Unit, Università Cattolica del Sacro Cuore ~ Milan ~ Italy

Helping professionals operating in war-affected areas are at high risk of developing adverse psychological outcomes. Nonetheless, increasing evidence shows their capacity to sustain resilient functioning even under extreme conditions. Recent literature has shifted toward a dynamic, process-oriented understanding of resilience. Within this framework, identifying mechanisms that promote positive adaptation becomes crucial. Key factors highlighted in war contexts include positive reframing, empowerment, agency, and supportive relationships. Additionally, meaning making—through both the presence and search for meaning—has emerged as a central psychological resource for coping with adversity. However, limited knowledge exists on how these mechanisms interact in sustaining daily resilience among frontline workers. This study explores the dynamic relationships between resilience and meaning-making in a group of Ukrainian professionals operating in conflict-affected areas. Over a 30-day period, 66 Ukrainian humanitarian providers involved in child protection, education, and community support in eastern Ukraine completed twice-daily questionnaires assessing various aspects of resilience and meaning-making. A Multilevel Network Psychometrics approach (Epskamp, 2021) was applied to investigate reciprocal associations among these dimensions over time. The network analysis revealed a positive pattern of associations between resilience and meaning-making at the daily level. Search for meaning predicted both empowerment and search for positive reframing, while presence of meaning predicted increased agency. Additionally, search for positive reframing was found to predict agency the following day. The findings suggest that meaning-making plays a pivotal role in supporting the development of resilience in war-related contexts. Activating meaning-making processes fosters empowerment, agency, and search for positive reframing, contributing to daily psychological adjustment. These insights can inform the design of targeted support interventions for professionals operating in high-stress humanitarian environments

PARENTAL PERSONALITY AND PRO-SOCIAL BEHAVIORS OF HIGH SCHOOLER IN A SINGLE PARENTING DYNAMIC

Bada B.*, Okubadejo K.

University of Lagos ~ Lagos ~ Nigeria

The family is often regarded as the primary and most basic unit of socialization and a very important determinant to the development of children's behavior and personality. The main aim of this study is to investigate the relationship between Personality Traits in Single Parenting Dynamic and Pro-social behaviors in highs choolers in Lagos State, Nigeria. 255 participants were used for this study and were administered test instruments, using Prosocial Self-Regulation Questionnaire, Self-Report Altruism Scale, and Big Five Inventory-10. The result of the study revealed that that there was a significant negative relationship between extraversion (r = -.178, P<.001) and Altruism Development. While an insignificant relationship was observed between altruism development and other dimensions of Personality Traits of Single Parents. Secondly, result of the study revealed that there was a significant positive relationship between Self-Regulation of respondents (r = .335, P<.001) and conscientiousness personality trait.. The study therefore concludes by positing that specific personality traits exhibited by single parents such as openness, conscientiousness, and emotional stability significantly influence the development of pro-social behaviors in their children. High schoolers raised in supportive and nurturing single-parent environments tend to demonstrate higher levels of altruism and self-regulation, suggesting that the emotional and psychological climate established by single parents plays a crucial role in shaping their children's social behaviors

MUTUAL PERCEPTIONS OF SELF-EFFICACY IN CHILD–PARENT–COUNSELOR TRIADS: A LONGITUDINAL STUDY

Yariv A.*[1], Ben Uri I.[2], Madjar N.[1]

[1]Bar Ilan University ~ Ramat Gan ~ Israel, [2]Hebrew University ~ Jerusalem ~ Israel

Mutual Perceptions of Self-Efficacy in Child–Parent–Counselor Triads: A Longitudinal Study

The transition to middle school entails substantial emotional, social, and cognitive changes, which can be particularly challenging for children with special needs. For these students, placement in a supportive educational environment is crucial for promoting successful adjustment. According to Bandura's social-cognitive theory, self-efficacy—defined as one's belief in the ability to organize and execute actions required to achieve desired goals—plays a central role in managing new tasks and challenges. Prior research has shown that students' self-efficacy predicts school adjustment following the transition to middle school. Parents and school staff serve as major sources of support during this process, with the quality of collaboration influenced by their mutual perceptions.

The present study aims to extend the theoretical framework linking self-efficacy and adjustment among children with special needs by examining the triadic relationship between the child, parents, and school counselor. It highlights the importance of collaborative processes within this triad for promoting adaptive adjustment to middle school.

A mixed-method, longitudinal design was employed, combining quantitative and qualitative approaches. The quantitative sample included 210 child–parent dyads and 88 school counselors, all of whom completed validated self-efficacy scales. In addition, nine child–parent–counselor triads were recruited for semi-structured interviews at two timepoints: at the end of elementary school and again midway through the first year of middle school (an interval of 8–10 months).

Although data collection is ongoing, preliminary findings indicate a strong correlation between parental self-efficacy and children's social self-efficacy and mental well-being. Interaction analyses revealed that higher social self-efficacy attenuates the impact of lower academic self-efficacy, suggesting a protective role of social self-efficacy. Thematic analysis of interviews further illuminated parents' contributions to supporting an adaptive transition, particularly through proactive and collaborative strategies with schools, which children perceived as leading to positive outcomes.

Abstract 1419

PARENTAL ADVERSE CHILDHOOD EXPERIENCES (ACES) AND PARENTING PRACTICE FROM A CHINESE PERSPECTIVE

Zhao Y.*, Murphy D., Adkins M.

University of Nottingham ~ Nottingham ~ United Kingdom

Introduction: Adverse childhood experiences (ACEs) has attracted increasing attention due to its profound impact. Currently, the concept of ACEs remains largely dominated by the findings of Felitti et al. (1998), which is grounded in a Western theoretical framework and normative experiences. There is still a limited understanding of ACEs from Eastern cultural perspectives.

Purpose: This study aims to advance knowledge of ACEs by studying how parents from Chinese cultural contexts perceive and interpret their own adverse childhood experiences; thus, shedding light on the process of intergenerational transmission of ACEs in parenting practices.

Method: In-depth semi-structured, open-ended interviews were conducted with 31 parents (aged 32 to 53 years) of children in primary schools in China. Narrative research combined with thematic analysis was employed to construct individual experiences and conduct cross-case comparisons.

Results: Ten major themes emerged, including negative parenting, poverty, exposure to hazards or diseases, inharmonious family environment, educational challenges, bullying, premature romantic relationships, separation from parents, involvement in violence and child labour experiences. Narrative analysis of typical cases detailed how Chinese parents perceive ACEs, and how they view their childhood adversities as well as their impacts, particularly the linkage to current parenting practice.

Conclusion: Given growing up in a specific historical context and stage of social development, Chinese parents have different adverse experiences and hold unique perceptions of these experiences. Eastern traditional values and social norms further influence how Chinese parents interpret and assign meaning to their personal childhood experiences. This study enriches the conceptual framework of ACEs by incorporating insights from an Eastern perspective and qualitatively illustrates the influence of parental ACEs on their parenting. Findings provide a reference for practitioners working in parenting counselling and skills training.

RELATIONSHIPS BETWEEN TURKISH PRESCHOOL CHILDREN'S PROBLEM BEHAVIOR, TEMPERAMENT, AND PARENTAL SELF-EFFICACY

Özdogru Z.[2], Özdoğru A.*[1]

[1]Marmara University ~ Istanbul ~ Turkey, [2]Biruni University ~ Istanbul ~ Turkey

Early childhood years are foundational in children's social, emotional, and behavioral development. Problem behaviors among preschool children can present a great challenge for parents at home and teachers in early learning environments. In order to provide effective support strategies for children, parents, and teachers, factors associated with behavioral problems should be explored in different cultures. This study aimed to investigate the relationships between problem behaviors, temperamental traits, and parental self-efficacy among Turkish preschool children. Sample of the study consisted of 79 children (47 girls and 32 boys) between the ages of 52 and 81 months (M=67.21, SD=7.34) attending two public preschools in İstanbul. For each child, their parents completed Temperament Scale for Children and their teachers completed Problem Behavior scale of the Preschool and Kindergarten Behavior Scales. Parents also completed Berkeley Parenting Self-Efficacy Scale-Revised. Correlation analyses showed that while there was no significant relationship between children's problem behavior and parental self-efficacy, there were significant relationships between children's problem behavior and temperament as well as parental self-efficacy and temperament. Out of the seven temperamental traits, the two were correlated with problem behaviors and five were correlated with parental self-efficacy. Findings of the study shows that young children's temperamental characteristics play an important role in the development of their behavioral problems as well as their parents' self-efficacy. Parents and early childhood professionals can learn more about temperamental traits and self-efficacy in their management of child problem behavior.

Abstract 4766

Predicting Non-Suicidal Self-Injury Risk in Junior High School Students: A Machine Learning Approach Integrating Psychological and Familial Factors

Gongxiang C.*, Zibei G.

School of Education and Psychology, University of Jinan ~ Jinan ~ China

Non-suicidal self-injury (NSSI) is becoming increasingly prevalent and harmful among adolescents, yet its intrinsic mechanism and early identification remain to be further explored. To investigate the influencing factors of NSSI in junior high school students and develop an early identification tool, a questionnaire survey was conducted on 1160 junior high school students in Shandong Province (49.9% female; mean age = 14.05 years, SD = 0.833). This study examined the mechanism of action of parental psychological control, future self-continuity and cognitive reappraisal on NSSI, and based on the above analysis, a machine learning-based NSSI risk prediction model (NSSI-XGBoost) was constructed using eXtreme Gradient Boosting (XGBoost). The results showed that the Prevalence of NSSI was 52.50%; future self-continuity played a partial mediation effect between paternal guilt induction, maternal love withdrawal and NSSI; cognitive reappraisal moderated the direct path of paternal love withdrawal, paternal authoritarianism, maternal love withdrawal to NSSI, as well as the indirect path of paternal guilt induction, maternal love withdrawal to NSSI via future self-continuity. The NSSI-XGBoost model exhibited good discriminative performance (AUC = 0.816 in the test set), with the main predictive variables being cognitive reappraisal, maternal love withdrawal and paternal guilt induction. This study revealed the key roles of future self-continuity and cognitive reappraisal in the relationship between parental psychological control and NSSI, and constructed a prediction model with high accuracy, providing a practical tool for the early identification of NSSI in junior high school students.

Abstract 613

MAKE ROOM FOR DADDY: ENHANCING PATERNAL SELF-EFFICACY FOLLOWING PRETERM BIRTH THROUGH KANGAROO CARE

Varela N.*, Gingras V., Pierce T., Tessier R.

Université Laval ~ Quebec ~ Canada

Background: The premature birth of a child is often experienced as a stressful and destabilizing event for fathers. In addition to the medical fragility of the infant, the intensive care environment can challenge men's confidence in their ability to assume an active caregiving role. This situation represent a significant threat to paternal self-efficacy, a psychological resource closely linked to parental adjustment, sensitivity, and involvement. Identifying factors that foster fathers' confidence in caring for their preterm infants is therefore essential for supporting both child development and family well-being.

Aim: This longitudinal study examined whether fathers' participation in Kangaroo Care (KC), a skin-to-skin caregiving practice widely recognized for its benefits to premature infants, contributes to strengthening paternal self-efficacy across time.

Methods: A total of 42 fathers of infants born at or before 33 weeks of gestation were recruited from a neonatal intensive care unit (NICU) in Quebec. Paternal self-efficacy was assessed using the Parenting Sense of Competence Scale at three time points: before the first KC session, at NICU discharge, and three months after discharge. The frequency of KC performed by fathers relative to mothers during hospitalization was calculated. Path analyses were conducted to examine longitudinal associations between KC and self-efficacy trajectories.

Results: Analyses revealed that a higher father-to-mother KC frequency ratio during the NICU stay significantly predicted greater paternal self-efficacy at discharge, even after controlling for baseline levels. Moreover, this positive effect persisted three months following the infant's return home, suggesting enduring benefits of early father involvement in KC.

Conclusion: Findings underscore the importance of promoting fathers' active engagement in KC with their preterm infants. Healthcare providers and mothers can play a key role by encouraging and facilitating paternal participation in caregiving activities in the NICU. Strengthening fathers' self-efficacy during this sensitive period may enhance both paternal adjustment and family functioning over the longer term.

Abstract 426

LONGITUDINAL INTERVIEWS WITH PARENTS-SELECTED COCHLEAR IMPLANT RECIPIENTS

Araki Y.*

Kanazawa University ~ Kanazawa ~ Japan

Introduction: Self-advocacy skills are not something that can be acquired suddenly in adolescence. They involve various psychological factors, such as self-understanding, acceptance of disability, establishing one's identity, trust in others, and self-esteem. These psychological factors overlap with the non-cognitive skills that OECD (2021) points out as important. What specific parenting and therapeutic experiences can lead to children with disabilities acquiring self-advocacy skills?

Purpose: The purpose of this study was to explore what childhood experiences influenced self-advocacy in adolescence by conducting a total of five semi-structured interviews with a hearing-impaired child who underwent cochlear implant surgery as an infant, from the age of 9 to 24, and conducting longitudinal analysis.

Method: The interviewee was born with severe congenital hearing impairment. He underwent cochlear implant surgery in his right ear at the age of 3 years and 6 months. Semi-structured interviews using the same questions were conducted five times in total: in the fourth and sixth grades of elementary school, the second and third grades of junior high school, and the fourth year of university.

Results: An example of an interview is shown below: Q: What do you think about being deaf? A (4th year university): I think I like it. I'm glad I'm not deaf. I have friends that I've been able to meet because I'm deaf. I've never hated myself for not being deaf. A big part of that is because I went to the kindergarten department of a school for the deaf. I remember the teachers at the kindergarten teaching me sign language carefully and loving me.

Conclusions: It was suggested that the therapeutic experience at the kindergarten, in which the teacher warmly accepted the child through sign language despite her hearing impairment, led to a positive view of himself and trust in others.

Abstract 616

BEYOND ONE-SIZE-FITS-ALL: SUPPORTING CULTURALLY AND LINGUISTICALLY DIVERSE STUDENTS WHEN TRADITIONAL SYSTEMS FALL SHORT

Blier H.*[1], Demichaelis O.[2], Wisniewski K.[1]

[1]Dirigo Consulting ~ Portland ~ United States of America, [2]Massachusetts General Hospital ~ Lexington ~ United States of America

Globally, educational systems increasingly serve culturally and linguistically diverse (CLD) students. The overrepresentation of culturally and linguistically diverse children in special education is a significant issue, with factors including inaccurate screenings, grade retention, and parental lack of awareness of available services (Mohamed, 2023). Research demonstrates persistent barriers, including inadequate professional preparation, insufficient culturally sensitive assessment tools, and systemic challenges in differentiating between language acquisition difficulties, adjustment, and learning disabilities (Khawaja & Wotherspoon, 2022). Despite calls for evidence-based practice that integrates research evidence with clinical expertise, client values, and circumstances (Kazdin, 2008), school systems are lagging in the development of targeted solutions to improve educational equity for CLD students worldwide.

This mixed-methods study systematically identifies barriers to appropriate assessment and intervention for CLD students across multiple levels: literature-documented challenges, educator-reported systems-level needs, and individual case-level implementation obstacles. Understanding these barriers is essential for developing evidence-based practices that effectively integrate research findings with clinical expertise and family values in a culturally responsive educational community.

First, a systematic literature review identified documented challenges in CLD student assessment globally. Second, a multidisciplinary educator survey, comprising school psychologists, special education teachers, ESL coordinators, and administrators, assessed perceived barriers in public school settings. Third, three in-depth case studies of CLD students referred for comprehensive evaluations provided a qualitative analysis of assessment process obstacles and systemic challenges encountered during real-world implementation.

Together, these analyses revealed four key themes: inadequacies and cultural misalignment in assessment tools, complexities in family engagement, gaps in professional development, and an interplay of ethical and legal dilemmas related to identification and service delivery. Results inform targeted interventions, professional preparation reforms, and policy frameworks for advancing culturally responsive

educational practices when working with CLD students.

Abstract 421

NETWORK ANALYSIS OF STRESS AND WELL-BEING AMONG COLLEGE STUDENTS: A LONGITUDINAL STUDY

Chen S.*, Lin S.S.J.

National Yang Ming Chiao Tung University/ Institute of Education ~ Hsinchu City ~ Taiwan

Extensive research has examined the impact of academic, financial, and relationship-related stress on college students, highlighting their significant influence on mental health and overall well-being. However, aspects of students' lives, such as self-perceived health and happiness, also warrant investigation due to their links to stress. Network analysis offers a unique advantage by visualizing complex relationships, identifying central variables, and uncovering patterns or clusters within interconnected systems. Despite its potential, few studies have employed network analysis to explore connections between stress across multiple dimensions and students' self-perceived well-being indicators.

This study used network analysis to examine these associations among 430 Taiwanese university students (61% male) who completed surveys in their freshman and junior years. The surveys assessed stress related to parent-adolescent, intimate, and peer relationships; academic and financial stress; and ratings of academic performance, relationships, health, future outlook, and life satisfaction.

The results revealed that social stress was the most central node among the variables in both freshman and junior years. In the freshman year, stronger associations were observed between friendships and school grades, friendships and academic stress, grades and family stress, and friendships and future outlook. These patterns suggest that during the early college years, students with strong friendships tended to report better academic performance, lower academic stress, and a clearer sense of future direction. By junior year, financial stress showed a stronger negative association with life satisfaction, indicating that students experiencing higher financial stress were more likely to report lower life satisfaction. This association was weaker during the freshman year.

The findings underscore the evolving impact of stress on life domains as students progress through college, with peer relationships alleviating early stress and financial stress diminishing life satisfaction later. These results highlight the importance of support systems and strong relationships to help students manage stress and enhance well-being.

ASSOCIATION BETWEEN PATTERNING, EXECUTIVE FUNCTIONS, MATHEMATICAL LANGUAGE, AND NUMERACY SKILLS IN KINDERGARTEN CHILDREN: A 2-YEAR LONGITUDINAL STUDY

Chung K.K.H.*, Lam C.B.

The Education University of Hong Kong ~ Hong Kong ~ China

This study investigated the relationships between patterning skills, executive function skills, vocabulary knowledge, and mathematical language with children's numeracy development. A total of 140 first-year Hong Kong kindergarten children in K1 who followed up on to K2 participated in this study. Chinese children were assessed on their patterning skills, mathematical language, oral vocabulary at K1, number counting, and number word comparison at K1 and K2. Mothers were asked to rate their children's executive function skills at K1. With the child's age, mothers' education and arithmetic competence in K1 were controlled; patterning skills, executive function skills, oral vocabulary, and mathematical language at K1 uniquely contributed to arithmetic competence at K2. These findings highlight the need to consider the impacts of these cognitive and language knowledge and skills in future research, shedding light on the multifaceted nature of mathematics achievement determining factors. Findings also suggest that the instructions and interventions integrating patterning, executive function, and language skills may be an essential avenue for enhancing children's numeracy development in the early years and future mathematics achievement.

Abstract 535

A SYSTEMATIC REVIEW OF LGBTQ+ STUDENTS' EXPERIENCES OF HARM IN HIGHER EDUCATION

Wilson--Lemoine E.[2], Corlett S.*[1], Harleen K.[3], Ojiaku M.C.[4], Wilson--Lemoine J.[5]

[1]Universidad de Valladolid ~ Segovia ~ Spain, [2]University of Virginia ~ Charlottesville ~ United States of America, [3]O.P. Jindal Global University ~ Sonipat ~ India, [4]University of Nigeria ~ Nsukka, Enugu ~ Nigeria, [5]Texas State University ~ San Marcos ~ United States of America

Lesbian, gay, bisexual, trans, queer (LGBTQ+) students face elevated risks of stigma, prejudice, and discrimination within college and university environments. This systematic review examines the prevalence of these kinds of harm experienced by LGBTQ+ students. Five databases were searched, from which we found 60 studies that met our inclusion criteria. Only quantitative results were included, with results grouped into 12 forms of harm (e.g., discrimination, harassment, physical harm and threat). Adverse experiences were commonly reported among LGBTQ+ students, and multiple correlates of harm were identified. Most studies focused on experiences among LGBTQ+ students overall, with few investigating experiences of harm specific to gender minority students. Intersectionality was also rarely considered. Findings suggest that on-campus prejudice, stigma, and discrimination are issues faced by LGBTQ+ students. These harms are heightened by various individual and structural factors. However, findings should be interpreted with caution as all included studies used a cross-sectional design. Future research should prioritize longitudinal designs, intersectional approaches, and considerations about the role of structural stigma.

Abstract 615

SOCIO-EMOTIONAL COMPETENCIES AS PROTECTIVE RESOURCES IN DIGITAL ERA: SMARTPHONE ADDICTION, DIGITAL SELF-CONTROL AND SUBJECTIVE WELL-BEING AMONG COACHING STUDENTS

Kumar V.*, Choubisa R., Goyal P.

Birla Institute of Technology And Science, Pilani (BITS Pilani) ~ Pilani, Jhunjhunu, Rajasthan ~ India

Youth who study at high-pressure coaching institutes need socio-emotional competencies as protective resources to handle the digital world. The research investigates how socio-emotional competencies function as both mediators and moderators between smartphone addiction and digital self-control and subjective well-being using Self-Determination Theory, Ecological Systems Theory and resilience frameworks. Whereas the existing research confirms a correlation between smartphone addiction and lower life satisfaction and increased level of psychological distress, the dynamics of these constructs have not been thoroughly studied, specifically in competitive coaching settings. The current research investigates whether Socio-Emotional Competencies (SECs) play the role of a mediator or moderator in the relationships among Smartphone Addiction (SA), Digital Self-Control (DSC), and Subjective Well-Being (SWB) in group of coaching students. The research design includes a cross-sectional study which will recruit 325 participants who are 16 to 20 years old from different coaching institutes from a mid-level city of the state of Rajasthan, India. The research will use the Socio-Emotional Competence Questionnaire (SECQ), Smartphone Addiction Scale-Short Version (SAS-SV), Digital Self-Control Scale (adapted from Brief Self-Control Scale), Satisfaction with Life Scale (SWLS) and Scale of Positive and Negative Experience (SPANE) to collect data from participants. The research will use Structural Equation Modeling (SEM) to analyze how SECs function as mediators and moderators. The research predicts to verify that students having stronger socio-emotional competencies will experience better mental health protection against smartphone addiction's negative effects on their subjective well-being.

Abstract 630

INSPIRING STUDENTS IN HIGHER EDUCATION

Mitchell V.*[1], Brown J.[2], Cahilap D.[3]

[1]University of Sydney ~ Sydney ~ Australia, [2]Jac Brown ~ Australia ~ Australia, [3]SYSTRA ANZ ~ Sydney ~ Australia

Inspiration is arguably the holy grail in higher education and can become a key driver of student educational actions inside the classroom and activities outside the classroom. However, there is increasing anecdotal evidence that students are less inspired but rather disengage with the university in general and specific aspects of the educational experience during COVID, such as lectures and online content. Despite recent interest in the role of inspiration in education (DeCoito, 2022), theory about the nature, dimensions, origins and effects of educational inspiration is underdeveloped. We therefore explore the notion of inspiration within Higher Education.

Using a data triangulation approach, we first assess how often the word 'inspiration' is used on three top-tiered university websites in Australia, the United States, and the United Kingdom. Next, we conducted a content analysis of sample university articles that mention inspirational themes and educators. Third, we analyze student posts on Reddit (Stage 3) and student responses through an informal open-ended questionnaire (Stage 4) to identify factors that students associate with the term inspiration and inspirational student experiences versus the term motivation.

As illustration, one top University used inspired nearly 69,000 times on its website. Stories on inspiration mainly contained themes of influence of university research work while content of Reddit posts revealed key themes of hope, doing what they enjoy and realizing potentials, curiosity, helping others and changing the world. Finally, student survey responses highlighted the external sources of influence, including people, experiences, and stimuli that spark creativity and passion. The findings indicate differences in inspiration's meaning and how it is created which provide important implications for communication, education, and support for university students as well as in lecturer training and alumni engagement and fundraising.

Abstract 584

UNDERSTANDING HOW JAPANESE GRADE 9 STUDENTS MONITOR THEIR LEARNING: THE ROLE OF SELF-MONITORING INFORMATION IN COMPREHENSION ACCURACY

Uchihashi M.*

Japan Women's University ~ Tokyo ~ Japan

Accurate self-monitoring of comprehension is a key metacognitive skill that supports effective learning, yet little is known about how middle school students engage in this process during independent study. This study is the first to empirically examine the relationship between the quality of self-monitoring information and the accuracy of comprehension self-evaluations in Japanese grade 9 students in the context of learning English verb tenses. Self-monitoring information was defined as the cognitive criteria and justifications related to learning tasks and experiences that learners use when evaluating their own comprehension.

A preliminary interview with expert learners identified four types of high-quality self-monitoring information: (1) distinguishing differences among verb tenses, (2) providing explanations, (3) applying knowledge to everyday contexts, and (4) solving abstract or integrative tasks, such as conceptual understanding problems or translation tasks between Japanese and English. Based on these categories, 232 grade 9 students completed self-study tasks and, after completing comprehension self-evaluations, reported the self-monitoring information they had used, and then completed a comprehension test. Their open-ended reflections from participants with complete data were analyzed, and the self-monitoring information was classified into three types: comprehension-based (n = 66), memory/recall-based (n = 139), and not based on learning experience (n = 17).

Contrary to expectations, no significant differences in evaluation accuracy were found across groups. These results suggest that while students may appear to use high-quality self-monitoring information, the information often lacks sufficient depth or relevance to support accurate comprehension self-evaluation.

These findings highlight the need to provide instructional support that helps grade 9 students develop and apply high-quality self-monitoring strategies. Enhancing metacognitive awareness may improve the accuracy of comprehension self-evaluations and foster greater autonomy in learning, emphasizing the importance of targeted educational support for adolescent learners.

Abstract 3758

ONLINE SAFETY EDUCATION: CHALLENGES OF 'ONE-SIZE-FITS-ALL' APPROACH”

El Asam A.*

Kingston University London ~ London ~ United Kingdom

With the emergence of new technology and widespread internet access, it has become normal for young people (ages 11–18) to have an ‘online life.’ Social connections, leisure, education, shopping, and relaxation are now increasingly taking place online. While digital access offers many opportunities, the constant evolution of technology has also amplified online risks and harms. Yet, online safety education has not kept pace. Schools, parents, carers, and even professionals working with young people often adopt limited or resistant approaches. This paper draws on three large-scale surveys conducted over the past five years (combined sample of approximately 20,000 young people) exploring online risks, harms, and the provision of online safety education in schools in England. The findings reveal that online risks are on the rise and that vulnerable young people (e.g., those with special educational needs) are also more vulnerable online. Such vulnerabilities tend to override existing safety measures, while parental monitoring and school-based interventions remain inconsistent and rarely inclusive of individual differences. In schools, online safety education is not embedded within the curriculum. Instead, it is delivered through isolated sessions that young people often describe as “boring” or overly rule-focused, offering little opportunity for dialogue. Parents also tend to reduce involvement after age 12, just as risks evolve and autonomy over technology use increases. By contrast, continuous parental dialogue and positive mental health support appear to play a more influential role in promoting online safety. In conclusion, while most young people regularly encounter online risks, resilience varies. Online safety education should therefore be grounded in scientific research, designed to accommodate individual differences, and focused on building digital resilience. It should move beyond one-off sessions and be fully embedded within school curricula—and reinforced at home by parents—to meet the realities of young people’s digital lives.

Abstract 3765

HOW DO PERSONAL AND PROXIMAL FACTORS MODERATE THE CONSEQUENCES OF (CYBER)BULLYING VICTIMIZATION?

Ozbek E.*[1], Caravita S.C.S.[2], Salmivalli C.[3]

[1]Norwegian Centre for Learning Environment and Behavioral Research in Education, University of Stavanger ~ Stavanger ~ Norway, [2]Universitas Mercatorum ~ Rome ~ Italy, [3]INVEST Flagship, University of Turku ~ Turku ~ Finland

Peer victimization affects the well-being and mental health of young people, even for a long period of life (Kelly et al., 2015). Buffering or preventing the adverse effects of bullying victimization contributes to the well-being and life quality of individuals. Although the literature on moderators of the impact of cyberbullying is limited, evidence suggests that psychological stress following cyberbullying victimization is higher for boys with negative parent-child relationships (Sampasa-Kanyinga et al., 2018). Considering the dynamic and interpersonal characteristics of bullying, it is essential to understand both personal and contextual protective and risk factors to effectively intervene in bullying (Rapee et al., 2020). This study aims to investigate how personal, environmental sensitivity, and contextual factors, parent-child relationship and preventive actions of schools, moderate the relation of cyberbullying and offline bullying victimization with internalizing problems and self-esteem. Using three-wave, multi-informant longitudinal data from 3,696 Finnish students (grades 4–9; Mage=13.06, SD=1.70; 46.7% male) and 1,625 parents, we applied cross-lagged panel models with moderation analyses. Students reported depression and anxiety symptoms, self-esteem, offline and cyberbullying victimization three times, and environmental sensitivity at time 1. Parents reported on parenting behaviors and school preventive action on bullying at time 1. The preliminary results of the main effect models showed that self-esteem is negatively affected by each type of bullying victimization, while only cyberbullying victimization increased depression. Although parenting stress and affective parenting are directly associated with self-efficacy and depression, no significant interaction with cyberbullying and offline bullying victimization was found. Surprisingly, we could not find any preliminary main effect or interaction effect of the preventive action of schools. Only environmental sensitivity provided a significant interaction, and students with higher environmental sensitivity exhibited greater anxiety following cyberbullying victimization. The findings are discussed to provide insights for policy implementation and future research.

Abstract 3766

THE MODERATOR ROLE OF TEACHER SUPPORT FOR THE ASSOCIATION BETWEEN UNSUPPORTIVE PARENTING STYLE AND CYBERBULLYING

Marinoni C., Zanetti A., Caravita S.C.S.*

University of Pavia ~ Pavia ~ Italy

Longitudinal studies showed that parenting styles can increase the risk of perpetrating Cyberbullying (Marinoni, 2025) and that high levels of teacher support can reduce the influence of deviant peer groups on adolescent problem behavior (Wang and Dishion, 2012). The aim of the study is to investigate whether the vulnerabilities of unsupportive parenting styles on Cyberbullying can be moderated by teacher support.

A sample of 1605 Italian adolescents (43.2% females; age: M=15.63, SD=1.251) participated to a three waves data collection, answering self-report questionnaires to assess cyberbullying (Palladino et al., 2015), support of adult (teachers) at school and parenting styles (Tagliabue et al., 2014).

As preliminary analysis, a series of moderation models was run with Cyberbullying perpetration (at time 2) as criterion variable, types of parenting style (time 1) -for mothers and fathers separately- as predictors, and teachers' support (at time 1) as moderator. Cyberbullying perpetration at time 1 was also included as covariate. Teachers' support was negatively associated with Cyberbullying, but it moderated only the association between mothers' authoritarian parenting styles and Cyberbullying (b=.116, p=0.001), with mothers' authoritarian style predicting, positively and significantly, Cyberbullying for medium (b= .122, p=0.000) and high levels of teacher support (b=.209, p=0.000).

Results suggest that teacher support at school can be a direct protective factor against Cyberbullying but it can moderate vulnerabilities related to parenting styles only to a very limited extent. This finding can depend on the type of teacher support experienced at school, more focused on generic emotional and academic support, and calls for the implementation of specific online education at school to prevent Cyberbullying.

Abstract 2498

BULLYING VICTIMIZATION AND DEPRESSIVE SYMPTOMS AMONG ADOLESCENTS: THE ROLES OF MEANING IN LIFE AND STRESS MINDSET

Lyu M.*[1], Xiong Y.[2], Ren P.[1]

[1]Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]Department of Psychology, School of Social and Behavioral Sciences, Nanjing University ~ Nanjing ~ China

Background: Bullying victimization is a serious stressful event in schools and is widespread among adolescents. The experience of bullying victimization has long-lasting deleterious effects on adolescents' mental health, including depressive symptoms and other internalizing problems. Previous literature has shown that bullying victimization is an important risk factor for depressive symptoms among adolescents. However, not all adolescents will experience depressive symptoms. Explaining how and when bullying victimization leads to depressive symptoms is pivotal to developing effective preventive measures and interventions. Stress mindset refers to the belief that stress can have enhancing consequences (a "stress-is-enhancing mindset") or debilitating consequences (a "stress-is-debilitating mindset"). Stress-is-enhancing mindset is considered a buffer factor in the face of stressors. Guided by the shattered assumptions theory and the implicit theory, this study examined the mediating effect of meaning in life on the relation between bullying victimization and depressive symptoms, as well as the moderating effect of a stress mindset among adolescents. Methods: Using a short-term longitudinal design, two-wave data were obtained from 3,547 Chinese adolescents (52.4% boys; Mage = 12.36; SD = 0.50) from 76 classes over six months. Results: (1) T1 meaning in life played a partial mediating role in the relation between T1 bullying victimization and T2 depressive symptoms. (2) T1 stress mindset moderated the effect of T1 bullying victimization on T1 meaning in life. Specifically, for adolescents with a stress-is-enhancing mindset, the negative association between bullying victimization and meaning in life was weaker than for adolescents with a stress-is-debilitating mindset. Conclusions: These findings clarify how and when bullying victimization can lead to depressive symptoms among adolescents. Given the considerable malleability of the stress mindset, it is highly beneficial to devise strategies and curricula that foster a stress-is-enhancing mindset in prevention and intervention programs targeting bullying and internalizing problems among adolescents.

Abstract 2294

SUICIDAL BEHAVIOUR AMONG UNIVERSITY STUDENTS: A SYSTEMATIC REVIEW

Pillay J.*

University of Johannesburg ~ Johannesburg ~ South Africa

Introduction: Suicidal behaviour among university students is an escalating concern in universities across the globe.
Purpose: A systematic literature review was conducted to explore worldwide prevalence studies on student suicide, the risks and protective factors related to student suicide, and university-based
interventions to combat it.
Method: The search of four major databases (EbscoHost, Scopus, Proquest and Google Scholar) identified 60 studies published in peer-reviewed academic journals between 2015 and 2020. Majority of these publications were from the United States, followed by China and the United Kingdom. Studies in South Africa and the African Continent as a whole were limited in terms of meeting the selection criteria of the review.
Results: The findings indicate that most of the publications ranged from describing suicide risk factors innate to students, such as their demographic and mental health features, to social and
university stressors. Although the studies on protective factors were limited, several psychological, social, and behavioural elements to prevent student suicide were identified.
Conclusion: The Three-Step Theory of suicide was used to discuss the implications of the findings and several several campus- based strategies are provided to combat student suicides.

Abstract 1824

THE DEVELOPMENT AND VALIDATION OF A SCHOOL MENTAL HEALTH CLIMATE SCALE AMONG HONG KONG ADOLESCENTS

Mo P.*[1], Mak W.W.S.[1], Xie L.[1], Lau C.Y.K.[1], Tsang S.[2], Ng M.[3], Tin R.[1]

[1]The Chinese University of Hong Kong ~ Shatin ~ Hong Kong, [2]University of Bath ~ Bath ~ United Kingdom, [3]University of Edinburgh ~ Edinburgh ~ United Kingdom

Introduction:
Adolescence is an important period for psychological development. Most studies on adolescent mental health focused on individual risk factors, overlooking the influence of the broader social environment. School is a central arena not only for academic, but also for social and emotional learning for adolescents. Understanding school mental health climate is fundamental to cultivating mental health of adolescents. However, no specific scale on school mental health climate is available in the literature.

Purpose:
To develop and validate a school mental health climate scale among adolescents in Hong Kong.

Method:
A total of 16 items were developed, tapping into dimensions of school, teachers and peers. A cross-sectional survey was conducted among 1,512 secondary school students in Hong Kong. Data was randomly split into two halves: exploratory factor analysis using parallel analysis (EFA, N = 756) in the first half and confirmatory factor analysis (CFA, N = 756) in another half. Internal consistency, convergent validity and concurrent validity were also tested among the overall sample.

Results:
EFA supported a three-factor structure corresponding to school, teachers, and peers, explaining 35.5%, 26.6%, and 20.7% of variance. After removal of items with cross-loadings, a 13-item scale was obtained. Standardized factor loadings ranged from 0.786 to 1.007. A bi-factor CFA, including a general factor and three specific factors (school, teachers, peers), demonstrated a satisfactory fit: χ^2 (52) = 209.138, p<.001, RMSEA=0.063, CFI=0.999, TLI=0.999. Standardized factor loadings ranged from 0.712 to 0.887. The scale demonstrated excellent internal consistency (ω = 0.96), significant positive correlation with sense of community (r = 0.68), mental well-being (r = 0.48), and significant negative correlation with depression (r = -0.25) and anxiety (r = -0.22).

Conclusions:

The 13-item school mental health climate scale demonstrates satisfactory reliability and validity. It can be used to predict and promote mental health of adolescents.

Introduction: Gaining and maintaining social popularity is a central concern during early adolescence. Those who feel insecure about their social standing may attempt to enhance their popularity by engaging in bullying behaviors. However, whether such strategies truly achieve their intended social rewards—or perhaps even undermine it—remains unclear. Few studies have tested this process longitudinally or examined how it may differ across classrooms with varying bullying popularity norms.

Purpose: The present study examined whether bullying mediates the longitudinal link between social status insecurity and popularity and whether bullying popularity norms moderate these associations.

Method: A total of 2,310 adolescents (51.6% boys at T1; Mage = 12.36, SD = 0.69) participated in the study across five waves over a two-year period (six-month intervals).

Results: Mediation analyses using random-intercept cross-lagged panel models showed that bullying did not significantly mediate the link between social status insecurity and popularity, regardless of whether popularity was assessed via peer nominations or self-reports. Multi-group analyses revealed that bullying popularity norms moderated within-person associations differently for the two popularity indicators. For peer-nominated popularity, associations were non-significant in low-norm classrooms, while in high-norm classrooms, social status insecurity and bullying were positively associated, but bullying did not affect peer-nominated popularity. For self-reported popularity, in low-norm classrooms, only social status insecurity negatively predicted popularity, whereas in high-norm classrooms, social status insecurity was positively and reciprocally associated with bullying and negatively predicted self-reported popularity; the indirect effect remained non-significant.

Conclusions: The findings suggest that although adolescents may bully when feeling socially insecure, such behavior does not effectively enhance their popularity, whether measured by peer nominations or self-reports. Moreover, the classroom social context, in terms of bullying popularity norms, shapes the associations among social status insecurity, bullying, and popularity, but does not render bullying an effective strategy for gaining social standing.

Abstract 1560

CONSTRUCTION OF AN AUTOMATIC EVALUATION SYSTEM FOR STUDENT GUIDANCE CASES USING ANTISOCIAL COGNITIVE EMOTIONAL BEHAVIOR RISK AND INTERPERSONAL ENVIRONMENTAL FACTORS

Yoshizawa H.*[1], Sakai K.[1], Sasatake Y.[1], Yoshida T.[2], Asano R.[3], Osumi T.[4], Matsushita K.[1]

[1]Gifu University ~ Gifu ~ Japan, [2]Gifu Shotoku Gakuen University ~ Gifu ~ Japan, [3]Kurume University ~ Kurume ~ Japan, [4]Chiba University ~ Chiba ~ Japan

In this study, first, we constructed an automated machine learning evaluation system using data from an online questionnaire survey conducted on all elementary and junior high school students in multiple municipalities to measure cognitive emotional behavior risk (moral disengagement, self-serving cognitive distortion, normative beliefs about aggression, CU traits, low self-control, and sensation seeking) and interpersonal environmental factors (parenting and domestic violence, friendship, teacher's leadership, and neighbors' collective efficacy). We then attempted to verify the prediction of student guidance cases involving problem behaviors, school absenteeism, and bullying. Second, we examined whether the predictive power of machine learning could be improved by adding indicators of social information processing using VR and game-version neuropsychological tests (Iowa gambling task, facial recognition task, Go/No Go task) to the measurement of cognitive emotional behavior risk factors. In Study 1, we attempted to construct a machine learning system using data from two surveys of approximately 20,000 students collected in 2020. Four types of machine learning algorithms (random forest, LightGBM, SVM, and logistic regression) were applied, and precision, recall, and the evaluation index F-measure were compared. Focusing on recall, we confirmed that logistic regression had a recall rate of approximately 70%, and that it had a higher precision rate and F-measure than other algorithms. In Study 2, we attempted to build a machine learning system using data from approximately 9,000 children and students collected in 2022, which added VR social information processing measurements and neuropsychological tests to the indicators from Study 1. We confirmed that logistic regression had a recall rate of approximately 90%, dramatically improving predictive power. Based on these findings, we demonstrated that it is possible to build an automatic evaluation system using the machine learning method "logistic regression" and to predict and evaluate the occurrence of student guidance incidents probabilistically.

Abstract 986

SELF-REGULATED LEARNING IN CORRESPONDENCE HIGH SCHOOL STUDENTS: I. A COMPARISON OF LEARNING PROCESSES WITH FULL-TIME STUDENTS

Hanita K.*, Kobayashi H., Iso Y.

Tokyo Future University ~ Tokyo ~ Japan

Self-regulated learning (SRL), in which students monitor and adjust their learning, has been widely emphasized in education and school psychology. SRL is expected to be particularly crucial for students in correspondence high schools, where independent study constitutes the main part of learning. However, research on correspondence high school students' learning remains limited. This study examined how learning strategies, including SRL, relate to students' beliefs about learning and friendships and how these factors affect school adjustment and academic achievement. We also compared correspondence and full-time high school students. In total, 1,469 correspondence and 471 full-time high school students from the Tokyo metropolitan area participated in an online survey. They completed questionnaires on beliefs about learning and friendships, use of various learning strategies, and adjustment to school and peers. They also self-reported their academic achievement. Structural equation modeling revealed that learning beliefs influenced strategy use, which in turn affected academic achievement and school adjustment. Among correspondence students, autonomous learning beliefs strongly promoted strategies for self-reflection and improvement, behavioral regulation, and rehearsal. It was also found that beliefs favoring emotional and instrumental friendships enhanced peer adjustment directly and indirectly through the use of collaborative learning strategies. This indirect effect was particularly evident for instrumental friendship beliefs among correspondence students. These findings highlight the importance of self-regulated and collaborative learning for academic achievement and school adjustment. In correspondence high schools in particular, fostering autonomous learning beliefs, developing instrumental peer relationships, and providing opportunities for collaborative learning appear to be especially important for promoting effective learning and a fulfilling school experience.

Abstract 796

GUILT AND MORAL JUDGMENT OF BYSTANDING IN ANTISOCIAL CONTEXTS AMONG PRESCHOOLERS AND SCHOOL-AGED CHILDREN

Hasegawa M.*

Tohoku University ~ Sendai ~ Japan

Whether children attribute guilt to bystanders or evaluate their inaction as wrong when witnessing antisocial behavior is unclear. Therefore, this study examined guilt and moral evaluation related to bystanding in situations involving antisocial behavior among preschoolers (kindergarteners, 5–6 years old) and school-aged children (students in the third and sixth grade). Eighty Japanese participants evaluated the extent of guilt and moral wrongness attributed to classmates who passively observed a moral or conventional transgression in a classroom setting. For comparison, additional scenarios depicted the classmate as being outside the classroom and, therefore, unaware of the transgression. The results indicated that the participants attributed a greater level of guilt to the classmate in the classroom-bystander condition than to the one in the outside-the-classroom condition. However, the guilt ratings did not differ significantly across age groups or types of transgression (moral vs. conventional). Regarding moral evaluation, the classmate in the classroom-bystander condition was judged more negatively than the one in the outside-the-classroom condition, and moral transgressions received harsher evaluations than conventional ones. Moreover, although no age-related differences emerged in the outside-the-classroom condition, students in the third and sixth grade judged the bystander more negatively than preschoolers in the classroom-bystander condition. Based on the observed correlation between guilt and moral judgment, these findings suggested that the two constructs become increasingly interconnected with age. Furthermore, while young children often make judgments without considering contextual factors, such as the type of act and the presence of bystanders, older children increasingly incorporate these factors into their evaluations.

Abstract 897

ENHANCING TEACHERS' WELL-BEING AND SELF-EFFICACY THROUGH LIFE SKILLS TRAINING

Iannotti D.*

Libera Universita´ di Bolzano ~ Bolzano ~ Italy

Teacher well-being and resilience are critical factors influencing the effectiveness of education and students´ holistic development. Educators face increasing stress due to evolving pedagogical demands, classroom management challenges, and emotional burdens.

Despite the recognized importance of Life Skills in addressing these challenges, professional development programmes often overlook their role in enhancing teacher well-being and sense of self-efficacy. Addressing these gaps is essential to nurture a resilient and emotionally competent teaching workforce.

This project aims to implement and evaluate a teacher training programme on Life Skills. The programme is anticipated to improve teachers' well-being and provide strategies to incorporate Life Skills into teaching practices. This approach could positively influence teaching methods, curriculum and a school environment that promotes students´ highest potential in intellectual, emotional, physical, and social growth.

The study will adopt a mixed-methods approach, incorporating both quantitative and qualitative research methods. A cohort of teachers will participate in a training programme featuring workshops and peer discussions. The study will employ pre and post training surveys, interviews, and focus groups, enabling a comprehensive understanding of the programme's impact.

Preliminary expectations suggest that teachers will report increased well-being and enhanced emotional competence post-training. Improvements in classroom interactions and student engagement are also anticipated, highlighting the transferability of Life Skills to students, thereby fostering their holistic development.

This study underscores the necessity of embedding Life Skills training within teacher education frameworks. While the findings will offer valuable insights for educational policymakers, potential limitations include variability in individual teacher receptiveness and contextual factors influencing programme effectiveness. Future research should explore long-term impacts and scalability across diverse educational settings. Extending the program duration is recommended to better understand its long-term benefits and sustainability.

Abstract 992

SELF-REGULATED LEARNING IN CORRESPONDENCE HIGH SCHOOL STUDENTS: III. VARIATIONS IN LEARNING AND FRIENDSHIP BELIEFS AND LEARNING STRATEGIES ACROSS ATTENDANCE TYPES

Iso Y.*, Hanita K., Kobayashi H.

Tokyo Future University ~ Tokyo ~ Japan

Self-regulated learning (SRL), in which students monitor and adjust their learning, is considered particularly important for correspondence high school students who study independently. To accommodate diverse reasons for enrolling, such as employment or school refusal, correspondence high schools in Japan have introduced various attendance types. However, the effect of attendance types on learning strategies and outcomes remains under-examined. This study examined whether learning strategies, including SRL, varied across attendance types, using data from a survey of correspondence and full-time high school students, with a focus on correspondence students (n = 1,459). We also compared beliefs about learning and friendships, school adjustment, and academic achievement across attendance types. Students were enrolled in one of four attendance types: Online Learning (OL), home-based study with online instruction; Once-a-Month (1M), home-based study with monthly on-campus instruction; Once-a-Week (1W), weekly on-campus instruction; and Three- or Five-Day course (3–5D), face-to-face classes three or five days per week. One-way ANOVA revealed significant differences in instrumental friendship beliefs, cooperative learning strategies, peer adjustment, and academic achievement across attendance types. Instrumental friendship beliefs were higher among 1W students than among OL or 1M students. Collaborative learning strategies were highest among 3–5D students, and were higher among 1W than among 1M or OL students. Peer adjustment increased steadily from OL to 3–5D. Academic achievement was highest among 1M students, followed by 1W and 3–5D students; 3–5D students outperformed OL students. These findings suggest that frequent school attendance is associated with stronger peer relationships and higher academic achievement. Future research should investigate how beliefs and learning strategies affect school adjustment and achievement across attendance types, and how to provide opportunities for peer interaction effectively.

Abstract 993

SELF-REGULATED LEARNING IN CORRESPONDENCE HIGH SCHOOL STUDENTS: II. DIFFERENCES IN LEARNING PROCESSES ACROSS ATTENDANCE TYPES

Kobayashi H.*, Hanita K., Iso Y.

Tokyo Future University ~ Tokyo ~ Japan

In recent years, correspondence high schools in Japan have enrolled students facing diverse challenges, including employed youth, those with experiences of school nonattendance or dropping out, and students with special needs. To address individual students' needs, correspondence high schools have established some courses that encourage regular on-campus instruction, in addition to the course offering only online instruction. In any course, students spend more time on independent study and require self-regulated learning (SRL) skills. This study examined whether the effects of SRL strategies on academic performance and school adjustment may differ across attendance types. We also investigated factors that influence these strategies. We analyzed survey data drawn from correspondence and full-time high school students, focusing specifically on correspondence high school students (n = 1459). Participants were enrolled in one of four attendance types: (1) once-a-month attendance, (2) once-a-week attendance, (3) three- or five-days-a-week attendance, or (4) minimal attendance (online learning course). Multigroup structural equation modeling revealed course-specific differences in how behavioral regulation strategies affected achievement and school adjustment. In the once-a-month and the once-a-week attendance courses, behavioral regulation strategies were positively associated with both academic performance and school adjustment. However, this effect was not observed in the three- or five-days-a-week attendance courses or in the online learning course. Furthermore, autonomous learning beliefs promoted rehearsal strategies particularly in the online learning course. These findings suggest that the role of SRL strategies varies by attendance types. To understand these differences, future research should examine the specific tasks required in each course and the characteristics of enrolled students.

Abstract 896

EDUCATIONAL AND LEARNING CAPITAL IN CHILDREN WITH AND WITHOUT HIGH INTELLECTUAL ABILITY

Valadez Sierra M.D.L.D.*, Grecia Emilia O.C.

Institute of Psychology and Special Education, Department of Applied Psychology, University Center for Health Sciences, University of Guadalajara ~ Guadalajara ~ Mexico

This study examines the relevance of the Actiotope Model in the Latin American educational context, especially in the Mexican population, with a focus on educational equity for gifted and talented children. The Actiotope Model, which addresses various socio-cultural factors that influence student development, goes beyond traditional approaches that focus solely on the cognitive aspect.

Educational and Learning Capital in children with and without high intellectual ability is analyzed, seeking to identify and comprehensively assess the needs of these students. The results reveal significant differences between the two groups studied: students with high ability obtain higher scores on various subscales of Educational Capital, excelling in areas such as economic, cultural, social, infrastructural, and didactic aspects. They also show higher scores on the subscales of Learning Capital, including organic, actional, episodic, and attentional aspects.

These findings highlight the importance of considering factors beyond cognitive ability in the educational care of gifted and talented children, and have significant implications for the promotion of equitable educational contexts and the comprehensive development of students. In addition, they demonstrate the viability of ecological models such as the Actiotope in different populations, providing a basis for more comprehensive and up to date educational policies at the international level

Abstract 920

DYSLEXSCAN: A HYBRID DIGITAL-LINGUISTIC FRAMEWORK FOR EARLY DYSLEXIA SCREENING

Nguyen T.P.T.*, Feijoo S.

University of Barcelona ~ Barcelona ~ Spain

Dyslexia is prevalent yet under-identified, with many learners not accessing timely assessment; school-based tools often trade diagnostic rigor for reach. Current screening methods are either costly, language-specific, or fail to integrate both cognitive and linguistic dimensions. This paper introduces DyslexScan, a hybrid digital-linguistic framework designed to enable early screening of dyslexia through structured tasks grounded in psycholinguistic theory and applied linguistics. DyslexScan combines five interactive modules delivered via a digital interface: (1) Sound Identification & Manipulation, assessing phonological awareness in Vietnamese through minimal pair distinction and phoneme deletion; (2) Word and Phrase Reading, targeting decoding accuracy and fluency; (3) Reading Comprehension, requiring participants to read short passages and answer comprehension questions; (4) Rapid Automatized Naming (RAN), measuring lexical retrieval speed with timed picture/number naming; and (5) Working Memory, evaluating auditory-verbal memory through digit span repetition. All sessions are administered in controlled classroom settings, with tasks displayed on slides, audio recorded for later analysis, and behaviors noted on structured score sheets. Pilot testing is currently underway with 30 participants across different age groups. Initial observations suggest that the multi-task structure captures diverse aspects of reading-related processing, with younger participants showing greater variability in phonological tasks and older participants displaying marked differences in fluency and comprehension. Quantitative scoring and qualitative feedback are being analyzed to refine item difficulty and optimize usability. DyslexScan provides an accessible and theoretically grounded screening tool that integrates digital delivery with linguistic and cognitive assessment. By bridging technology and applied linguistics, it aims to improve early detection of dyslexia, reduce educational inequalities, and support interventions aligned with global goals for inclusive and quality education.

Abstract 1101

PRE- AND POST-INTERVENTION STUDY ON THE EFFECTS OF AN ANTIBULLYING PSYCHOEDUCATIONAL PROGRAM WITH BRAZILIAN TEACHERS

Oliveira W.*[1], Esteca A.M.[1], Siddiqui S.[2], Schultze--Krumbholz A.[3]

[1]Pontifical Catholic University of Campinas ~ Campinas ~ Brazil, [2]University of Wuppertal ~ Wuppertal ~ Germany, [3]Technische Universität Berlin ~ Berlin ~ Germany

Bullying and cyberbullying are issues that affect the health and development of school-aged children and adolescents. Within the context in which these phenomena occur (i.e., schools), teachers are recognized as essential agents in both the prevention and intervention of reported cases. They are also key figures in antibullying initiatives implemented across various countries. However, there is limited scientific literature in Brazil documenting antibullying actions or interventions led by teachers. Our aim was to develop a brief, culturally adapted, and validated Brazilian version of the Sohanjana Antibullying Intervention Program. This intervention was originally developed at a university in Germany and experimentally applied in Pakistan. An integrative literature review preceded the empirical study to inform decisions and support the discussion. This is a quasi-experimental study that followed the phases of the Integrative Cultural Adaptation Model: information gathering; preliminary adaptation design; feasibility study; adaptation refinement; randomized controlled trial. Two schools served as the empirical sites for data collection—one designated as the experimental school, and the other as the control. In total, 57 teachers (65% women) from both schools participated in the study. Teachers' knowledge and attitudes regarding the study's core phenomena were collected qualitatively. Their responses were analyzed using thematic content analysis through the Requalify.ai platform. The evidence revealed high acceptability of the intervention among participating teachers, as well as their engagement throughout the various stages of the program. Post-intervention comparisons between groups showed that teachers in the intervention group demonstrated greater conceptual clarity and alignment with the scientific literature when describing bullying and cyberbullying. We conclude that the brief Portuguese-language version of the Sohanjana Antibullying Intervention Program, implemented in Brazil, is a useful tool with potential to support schools in preventing bullying and cyberbullying. The results may be useful to support other studies in other contexts of the same nature.

Abstract 1085

DEVELOPING A TOOL TO ASSESS LGBTQ+-INCLUSIVE TEACHING PRACTICES IN SECONDARY SCHOOLS

Randolph Chun Ho C.*

The Chinese University of Hong Kong ~ Shatin ~ Hong Kong

Lesbian, gay, bisexual, transgender, queer, and other gender and sexually diverse (LGBTQ+) students in schools often face hostile environments marked by discrimination, exclusion, and victimization. Teachers play a critical role in shaping inclusive school climates, yet few validated tools exist to assess their engagement in LGBTQ+-inclusive teaching practices. This study aimed to develop and validate the LGBTQ+-Inclusive Teaching Scale (LITS). A total of 305 secondary school teachers in China were recruited to participate in the study. An initial pool of items was evaluated through exploratory and confirmatory factor analyses, resulting in an 8-item scale with two factors. Instructional and environmental inclusion captures structured and visible efforts to support LGBTQ+ students, while interpersonal affirmation reflects responsive and relational practices within classroom interactions. The two factors demonstrated strong internal consistency. Construct validity was supported by significant negative correlations with attitudes toward gay men. The results also showed that teachers with greater contact with sexual and gender minority individuals, more exposure to LGBTQ+ media, and more positive perceptions of student attitudes toward sexual and gender minority individuals reported higher levels of inclusive teaching practices. The LITS is a reliable and valid instrument for assessing LGBTQ+-inclusive teaching in China. It offers a comprehensive framework for evaluating and promoting inclusive practices in schools, with implications for research, professional development, and educational policy.

Abstract 884

FOUNDATIONS OF EDUCATIONAL OPTIMIZATION: OPTIMIZATION OF PROFESSIONAL DEVELOPMENT IN INTERCULTURAL AND INTERDISCIPLINARY CONTEXTS AND COMPETENCIES FOR THE THERAPEUTIC RELATIONSHIP (A1_INTER_25_03)

Robles--Bello M.A.*

University of Jaén ~ Jaén ~ Spain

Introduction: Intercultural competence and therapeutic skills are increasingly essential in higher education training. The COIL (Collaborative Online International Learning) project between the University of Jaén (Spain) and the Pedagogical and Technological University of Tunja-Boyacá (Colombia) aimed to strengthen students' intercultural sensitivity, therapeutic abilities, and critical reflection through collaborative online activities. Objectives: To compare professional realities in Social Education (Spain) and Clinical Psychology (Colombia); To improve knowledge of therapeutic skills in multicultural contexts; To assess the satisfaction and learning outcomes of students from both institutions. Methodology: A qualitative design with pre–post evaluation was used. A total of 39 students participated (11 from Spain, 28 from Colombia).

Activities included debates, role-plays, intercultural clinical simulations, and guided reflection circles. Knowledge assessment: pre- and post-questionnaire on therapeutic skills. Satisfaction assessment: Likert scale (1–5) measuring motivation, relevance, and perceived usefulness. Qualitative data: reflective journals, SWOT analysis, and group discussions. Results: Spain (n=11): Knowledge improved from a mean of pre 6.4 and post 8.7, satisfaction rose from 3.0 to 4.8. Spanish students highlighted intercultural sensitivity and awareness of professional prejudices. Colombia (n=28): Knowledge improved from 6.1 to 8.3, satisfaction rose from 3.2 to 4.5. Colombian students emphasized teamwork, empathy, and applicability to clinical practice. Qualitative analysis: Emerging categories included interdisciplinary collaboration, empathy, cultural awareness, professional identity reflection, and practical utility. Conclusions:

The COIL experience was effective in enhancing therapeutic skills and intercultural sensitivity, with notable increases in knowledge and satisfaction across both groups. Spanish students showed stronger gains in cultural reflexivity, while Colombian students emphasized applied clinical learning. The project demonstrates the potential of COIL to foster meaningful, situated, and collaborative learning, aligned with Sustainable Development Goals on inclusive education and international cooperation.

TRAINING PSYCHOLOGISTS TO HELP CLIENTS SEEK EMPLOYMENT

Schiro--Geist C.*

University of Memphis Institute on Disability ~ Memphis, Tennessee ~ United States of America

This poster will review the evidence-based research completed over the last 6 years on a client base of over 25,000 clients. The researchers compared the vocational outcomes of practitioners from 4 states in the USA to the employment results of their clients. They then regressed the specific training of those practitioners in the area of work and special needs assessment. The outcomes revealed the 4 most critical areas for training practitioners whose client's, especially those with disabilities, sought competitive integrated employment, and especially those seeking quality jobs. The results will be provided in the poster, along with several other findings in the study involving caseload management, subminimum wage, diversity of clients, credentials of practitioners and the length of time needed to learn these methods without pre-service training. A review of the 8 peer-reviewed papers which resulted from the study will be included, as well as a summary of feedback from participants and those who took specialized training, as a result of this body of work. The 5 free training modules, which resulted from the study will be presented and how to access the training modules at no cost. All of this data will be shared, especially how practitioners may want to self-train on the free modules and how they may want to offer such employment-focused services to their clients. Special emphasis will be given to clients with special needs and to youth ,from a psycho-educational perspective.

Abstract 717

COGNITIVE-AFFECTIVE FACTORS IN TEACHER RESILIENCE

Wang Y.*[1], Duncun M.[2], Young K.[2], Hirsch C.[2]

[1]The Unviersity of Hong Kong ~ Hong Kong, [2]King's College London ~ London ~ United Kingdom

Dealing with excessive workload and managing student misbehaviours are common stressors associated with teaching. Resilience has been found to be positively associated with teacher mental well-being and work performance. Previous research proposed that a range of cognitive-affective factors could be associated with resilience. However, resilience factors are dependent on context and time, and it remains unclear which factors promote teacher resilience over time. This study explored which cognitive-affective factors (i.e., positive interpretation bias, positive reappraisal, cognitive control, cognitive flexibility, positive affect, anticipatory pleasure, responses to positive affect, and positive meaning finding) are related to resilience among trainee teachers cross-sectionally and longitudinally across a one-year teacher training. Trainee teachers (N = 148) completed a task and a battery of questionnaires online at the start of teacher training (baseline). Resilience and stress were assessed during 8-month (final placement) and 13-month follow-ups (at the start of newly qualified teacher year). Results suggest that a range of cognitive-affective factors was significantly associated with trainee teachers' resilience cross-sectionally and predicted resilience up to 8 months later. Although cognitive-affective factors contributed 36-53% of the total variance in trainee teachers' resilience across teacher training, different factors inconsistently mapped onto resilience across time. This study provides implications for understanding which factors could be intervention targets to promote resilience in early-career teachers.

Abstract 4125

THE IMPORTANCE OF STARTING SMALL WITH BABY ROBOTS: DEVELOPMENTAL ROBOTICS FOR LANGUAGE GROUNDING

Cangelosi A.*

University of Manchester ~ Manchester ~ United Kingdom

Cognitive developmental robotics aims to develop robots capable of human-like learning, interaction, and behavior by grounding concrete and abstract concepts in sensorimotor experiences and social interactions. This talk introduced examples on language grounding in cognitive developmental robotics, and explores how principles like “starting small”, “embodied intelligence” and “super-embodiment” can address the limitations of AI tools, such as large language models (LLMs), which rely heavily on large datasets and lack sensorimotor grounding. By integrating incremental, multimodal learning and redefining embodiment to encompass physical, mental, and social processes, we can enable robots to better understand and utilize abstract concepts. The talk will also reflect on the pros and cons of using foundation models in cognitive robotics.

Abstract 4127

OPEN-ENDED INTERACTION IN EDUCATIONAL ROBOTS USING GENERATIVE AI

Belpaeme T.*[1], Verhelst E.[2], Janssens R.[3]

[1]IDLab ~ Ghent, ~ Belgium, [2]AIRO ~ Ghent ~ Belgium, [3]Universiteit Gent ~ Ghent ~ Belgium

Revolutions in AI have recently enabled open-ended conversational interactions with social robots. In educational contexts, interactions with robots were until recently heavily structured and limited, which restricted the scope of engagement and made the integration of educational content labour-intensive. The emergence of data-driven AI, particularly Large Language Models (LLMs) and Diffusion Models, now opens up new possibilities, while also introducing challenges inherent to the probabilistic nature of these systems. This shift compels us to rethink how we design, deploy, and evaluate social robots in education.

One particularly promising application for LLM-powered social robots is second language learning. These robots can engage in open-ended spoken dialogue with learners, adapting both language level and conversational content to suit the learner's interests and progress. We present a prototype robot that leverages speech recognition, LLMs, and generative AI to support open-ended learning for students of French. Our results show that while state-of-the-art Transformerbased speech recognition systems typically achieve superhuman performance for native speech (Word Error Rate < 5%), they produce a WER of 32.8% for French learners. Despite this relatively high error rate, the output remains sufficient for the LLM to generate coherent and contextually appropriate responses, enabling effective spoken interaction.

We further enhance the experience with images generated by Diffusion Models, which illustrate the conversation and provide visual grounding to support shared understanding. This paper explores the educational potential of AI-driven dialogue and, in particular, investigates the application of Ellis' usage-based approach to second language acquisition—emphasising exposure over corrective feedback in robot-assisted learning.

Abstract 1671

RETHINKING WELL-BEING STRUCTURE IN POSITIVE EDUCATION: ITEM-LEVEL EFA/CFA AND BASELINE CRITERION VALIDITY

Chen W.*, Ng T.Y., Siu O.L.

Lingnan University ~ Hongkong ~ Hong Kong

Background. Positive-education research often validates single instruments rather than an integrated structure spanning multiple strengths. We examined whether a coherent, multi-factor well-being structure is evident at baseline and how it relates to psychological well-being in a university sample (N = 255) from the Asia-Pacific region.

Purpose. The study aimed to identify a defensible latent structure of well-being at baseline and establish its criterion-related validity with psychological well-being.

Methods. Students completed item-level measures of gratitude, resilience, positive emotion, prosocial behavior, and psychological well-being. Internal-consistency checks and an item-level EFA guided screening; a small set of items with factor loadings below .50 were removed from the gratitude, resilience, and prosocial behavior scales. We then contrasted a four-factor CFA with a one-factor alternative and tested criterion validity with SEM, linking the well-being domains to psychological well-being.

Results. The four-factor model showed good fit (CFI = .90, RMSEA = .06) and clearly outperformed a one-factor alternative (CFI = .58, RMSEA = .13). Structural relations were directionally consistent with theory. The composite well-being predictor was positively associated with psychological well-being ($\beta = 0.61$, $P < .001$).

Conclusions. Identifying a single, integrated four-factor baseline structure—linking gratitude, resilience, positive emotion, and prosocial behavior to psychological well-being—advances positive-education measurement beyond siloed scales and yields a psychometrically defensible core for assessment and program targeting. This integrated frame has immediate applied value and sets the stage for future work to test measurement stability and structural change over time, as well as sensitivity to positive-education interventions.

Abstract 1191

EARLY EXECUTIVE FUNCTION IMPAIRMENTS AND ATYPICAL BRAIN-BEHAVIOR COUPLING IN PRESCHOOL CHILDREN WITH DEVELOPMENTAL COORDINATION DISORDER: IMPLICATIONS FOR EARLY INTERVENTION

Chi Y.*, Cheng T., Zhang C., Chen F., Wang Y., Ke L.

Beijing Normal University ~ Beijing ~ China

Executive function (EF) deficits are widely documented in children with developmental coordination disorder (DCD), yet little is known about their emergence during the preschool years and their underlying neural mechanisms. This study investigated EF performance and cortical development in 125 children aged 3–6 years, including those with and without DCD. Behavioral tasks assessed inhibitory control, cognitive flexibility, and working memory, while structural MRI was used to evaluate cortical thickness across five large-scale brain networks: frontoparietal, dorsal attention, ventral attention, default mode, and limbic networks. Results showed that children with DCD performed significantly worse on all EF tasks compared to typically developing peers. Across the full sample, EF performance was negatively correlated with cortical thickness, consistent with typical developmental patterns of synaptic pruning and neural efficiency. However, this relationship was absent in the DCD group, suggesting atypical structure–function coupling. These findings highlight that EF deficits are already present in preschool-aged children with DCD and that atypical neural pathways may underlie their early cognitive difficulties. From an applied perspective, identifying such early biomarkers offers critical insights for timely interventions, emphasizing the importance of integrating neuroscientific evidence into educational and clinical practices to support children at risk.

Abstract 1428

THE CONTRIBUTION OF ORAL LANGUAGE AND COGNITIVE SKILLS TO DIFFERENT ASPECTS OF READING COMPREHENSION AMONG CHILDREN WITH READING COMPREHENSION DIFFICULTIES

Grigorakis I.*

University of Crete ~ Rethymno, Crete ~ Greece

Meaning-oriented oral language skills, including morphological awareness and vocabulary, have been identified as key predictors of reading comprehension. In addition, empirical evidence highlights the important role of cognitive functions like planning and attention in reading comprehension processes. However, the combined influence of these linguistic and cognitive factors on reading comprehension difficulties remains underexplored. This cross-sectional study investigated the unique contributions of vocabulary, morphological awareness, planning, and attention to different aspects of reading comprehension in third- and fourth-grade students who experience difficulties in reading comprehension but demonstrate adequate reading fluency. The sample included 33 children with reading comprehension difficulties and 41 typically developing children, selected from a pool of 143 Greek-speaking students with typical non-verbal ability. Group classification was based on a cut-off approach using performance on reading comprehension measures, excluding children with reading fluency difficulties. Participants completed two standardized reading comprehension tasks, each engaging distinct cognitive processes, along with a word reading fluency task. They were subsequently assessed on oral receptive vocabulary, morphological awareness, planning, and attention. Children with reading comprehension difficulties scored lower than typically developing children in vocabulary, morphological awareness, and attention. Hierarchical regression analyses revealed that vocabulary was the only significant predictor of reading comprehension in both groups, after controlling for age and reading fluency. Among children with reading comprehension difficulties, morphological awareness significantly contributed to their performance on the more cognitively demanding reading comprehension task, even after controlling for vocabulary. Despite certain limitations, these findings underscore the prominent role of meaning-oriented oral language skills—rather than cognitive skills—in reading comprehension difficulties during the middle grades of primary education in an alphabetic language with a shallow orthographic system and rich morphological structure.

Abstract 1620

THE RELATIONSHIP BETWEEN SOCIAL ACHIEVEMENT GOALS AND IMPLICIT THEORIES OF PEER RELATIONSHIPS

Kohyama T.*[3], Kobayashi T.[1], Yukura M.[2]

[1]Kwansei Gakuin University ~ Nishinomiya ~ Japan, [2]Kagoshima University ~ Kagoshima ~ Japan, [3]Doshisha University ~ Kyoto ~ Japan

Previous research examining the relationship between implicit theories of peer relationships and social achievement goals (Rudolf, 2010) has revealed that implicit theories are positively correlated with performance goals and negatively correlated with mastery goals. While these individual associations are well-established, the question of how implicit theories vary based on patterns derived from combinations of multiple social achievement goals remains unexplored. Therefore, this study examines social achievement goals from four perspectives—mastery-approach, mastery-avoidance, performance-approach, and performance-avoidance (Kainuma & Sakurai, 2018)—to identify emergent patterns. We then examine how these patterns influence implicit theories of peer relationships. Additionally, we investigate whether these pattern differences affect friendship satisfaction and the number of close friends.

An online survey was conducted with 843 first-year university students in Japan. After data screening, 275 valid responses were retained for analysis. The measured variables included social achievement goals (Kainuma & Sakurai, 2018), implicit theories of peer relationships (Rudolf, 2010), friendship satisfaction (Takasaka, 2010), and the number of close friends.

A cluster analysis using Ward's method, based on scores from the four subscales of social achievement goals, identified six distinct groups: C1: All Average; C2: Mastery Low / Performance-Approach High; C3: Mastery-Approach High & Mastery-Avoidance Very High / Performance-Avoidance High; C4: Mastery High / Performance Very High; C5: Mastery High / Performance Low; C6: Performance Low. Based on these results, an ANOVA was conducted with social achievement goals as the independent variable and implicit theories as the dependent variable. The analysis revealed that C4 held the strongest entity beliefs, followed by C3. Both groups showed high mastery and performance-avoidance goals. In contrast, C5, with high mastery but low performance goals, showed weaker entity beliefs and stronger incremental beliefs. These findings suggest that entity beliefs about peer relationships are closely tied to social performance goals, particularly performance-avoidance.

Abstract 1412

ECOLOGICAL VALIDITY EVIDENCE IN THE CROSS-CULTURAL ADAPTATION OF AN ITALIAN ANTIBULLYING INTERVENTION FOR USE IN BRAZILIAN SCHOOLS

Oliveira W.*[1], Lembo V.M.[1], Menesini E.[2]

[1]Pontifical Catholic University of Campinas ~ Campinas ~ Brazil, [2]University of Florence ~ Florence ~ Italy

The cross-cultural adaptation of interventions – defined as the deliberate modification of the design or implementation of interventions for a new context – is more resource-efficient than developing new intervention proposals from scratch. However, such adaptation must be approached methodically and evidence-based, as certain modifications, particularly those involving core components, can compromise the original intervention's effectiveness. Based on this premise, we aim to present the process of cross-cultural adaptation and validation of an antibullying intervention program developed in Italy (Notrap!) for use in Brazilian schools. This is a qualitative study encompassing the stages of translation/back-translation, adaptation, and validation of the program. The adaptation process incorporated a cultural sensitivity framework, an ecological validity framework, and principles of cross-cultural evaluation research. To assess aspects such as structure, layout, scope, and appropriateness of the intervention's activities/materials, a two-round Delphi Method was applied. This stage included the participation of four judges (aged 22 to 27), all of whom were enrolled in a Master's program and had research experience on violence. For dialogic assessment of the material by the target audience, four focus group sessions were conducted in a school setting with seven adolescents (aged 15 to 17) who were students at the school. Applying the cultural sensitivity framework revealed the need to incorporate Brazilian cultural expressions into certain sections of the original intervention materials. Both expert judges and the target audience assessed the ecological validity framework, demonstrating a high level of reliability. The qualitative analysis supported the culturally sensitive modifications or additions made to the original program – such as cultural elements and textual translations from Italian – which were considered ecologically valid and representative. This research provides supporting evidence for future quasi-experimental studies aimed at confirming the effectiveness of the Notrap! intervention in Brazilian settings, as has already been observed in Italian schools.

Abstract 1112

INSIDE-OUT PRISON EDUCATION: PSYCHOLOGY THROUGH CONNECTION

Richmond K.*, Denke J.

Muhlenberg College ~ Allentown ~ United States of America

The Muhlenberg College Inside-Out Prison Exchange Program is a joint collaboration between Muhlenberg College and the Lehigh County Department of Corrections. The program closely aligns with the APA Guidelines for the Undergraduate Psychology Major, Version 3.0, and is driven by the idea that access to education and sustained community connection across difference creates belonging and care within communities that are otherwise separated by privilege and dispossession.

The poster will feature details of the Inside-Out Prison Exchange course, which is a unique educational experience that brings together traditionally-enrolled Muhlenberg College undergraduate students with incarcerated adults as classmates in a semester-long college-level academic course. We will highlight course content that addresses incarceration in the United States through a psychological lens and utilizes many types of knowledge - that developed through scholarly study, personal experience, and societal position. We explore basic psychological concepts that describe and explain behavior, while allowing for individual differences in evaluating plans to reduce the harms of incarceration in our community. While the work of this college-level course includes reading a variety of scholarly texts, writing papers, and engaging in independent inquiry, a hallmark of it is the meaningful small and large group class discussions. The Higher Education Research Institute assessed that sustained intensive dialogues increase civic learning and democratic engagement, and longitudinal studies also show that incarcerated individuals who participate in a college course during their incarceration are least likely to recidivate and more likely to find and sustain employment after incarceration. This poster will outline the multi-year development of our program and present several years of assessment of our relational learning goals. These goals have been central to creating a collaborative learning community that meets multiple outcomes identified in the APA Guidelines for the Undergraduate Psychology Major, Version 3.0.

Abstract 1479

NEURODIVERGENT BIPOC STUDENT EXPERIENCES & NEEDS STUDY

Sadiq A.*, Hicks S., Mccabe R.

Cornell University ~ Ithaca, New York ~ United States of America

Neurodivergent students consistently report greater marginalization than peers (McDowall and Kiseleva, 2024), with BIPOC individuals experiencing compounded vulnerabilities shaped by race, disability, and institutional culture. Although evidence is limited, students with ADHD display lower GPAs and higher attrition rates (Henning et al., 2021), and only 34% of students with disabilities graduate compared to 51% of nondisabled peers (Newman et al., 2011). Yet, intersections of race and neurodivergence remain underexplored. This knowledge gap hinders a systemic understanding of the issue, thereby ongoing campus organizing and administrative efforts to solve them. To address this gap, the Student Neurodiversity Alliance at Cornell (SNAC) and the Black Graduate and Professional Student Association (BGPSA) co-developed the BIPOC and Neurodivergent Student Experiences & Needs Survey. This community-based participatory mixed-methods study investigates how neurodivergent BIPOC (ND BIPOC) students navigate structural and cultural barriers in a predominantly white neurotypical academic environment. Over 500 students participated in Fall 2024. Quantitative measures included the Everyday Discrimination Scale (Williams, 1997) and the Sense of Belonging Scale (Hurtado & Carter, 2002). Qualitative data from 17 open-ended items were analyzed through inductive coding (Patton, 1990; Miles, Huberman, & Saldaña, 2013), examining barriers and facilitators to accommodation use and environmental accessibility. Emerging findings reveal: (i) ND BIPOC students report higher discrimination scores and lower belonging scores relative to white and neurotypical peers; (ii) Only 8.3% of respondents are formally registered with Student Disability Services, despite strong evidence of unmet need; (iii) Graduate and professional students accounted for 44% of respondents, underscoring that challenges extend beyond the undergraduate level. This project represents one of the largest studies to date documenting intersections of race and neurodivergence in higher education. Our study demonstrates that there are disparities in belonging, access, and institutional support, potentially indicating a need for additional and improved supports for neurodivergent students.

Abstract 1217

PROMOTING MULTICULTURAL MENTAL HEALTH EDUCATION FOR PRESCHOOL CHILDREN THROUGH PICTURE BOOK READING

Wu Y.*, Wang H.

National Tsing Hua University ~ Taipei ~ Taiwan

In an era of globalization and borderless societies, people are more likely than ever to encounter others with different values, beliefs, languages, and traditions in everyday life. Possessing intercultural competence not only promotes mutual respect and understanding but also enhances communication, reduces conflict, and fosters inclusive environments. This ability of multicultural awareness, acceptance, and inclusivity is a critical component of emotional intelligence, collaboration, and global citizenship in the 21st century. However, it is crucial to foster this ability during the formative years of childhood personality development. Picture books play a significant role in early childhood education, serving not only as a literacy tool but also as a medium for cognitive, emotional, and social development. Moreover, picture books offer a safe and accessible space for children to explore complex themes such as cultural identity, diversity, empathy, and emotional regulation. Therefore, this study aims to develop a picture book and test its effect in promoting multicultural mental health education among preschool children.

This study used action study as research method. The development of the picture book was based on 3CAPs model (Culturally, Contextually, and Child-Individually Appropriate Practices) proposed by Li and Chen (2023). In this book, five characters represented different cultural background in the society. The theme was similar to daily activities experienced by preschoolers but focused on different perspectives and reactions from characters. Because shared reading experiences, especially in parent-child or teacher-child contexts, promote bonding, conversational turn-taking, and socio-emotional learning. A parent guidebook was designed. After this picture book was developed, it was reviewed by 2 well-known experts in children's book. We also invited two pairs of parent and child. During reading session, their interactions were observed and documented. Additionally, parents were interviewed afterwards to collect feedback for further improvement of the book. This presentation will include study results and suggestions.

Abstract 1266

THE DYNAMIC RELATIONSHIP BETWEEN PATERNAL AND MATERNAL REJECTION AND ADOLESCENT RISK-TAKING: THE LONGITUDINAL MEDIATION EFFECT OF SELF-DISCLOSURE

Zhang L.*, Zhang A., Duan G.

School of Psychology, Shaanxi Normal University ~ Xi'an ~ China

The relationship between paternal/maternal rejection and adolescent risk-taking involves a bidirectional interaction, yet few studies have examined the adolescent-driven and parent-driven effects within parent-child interactions from a dynamic developmental perspective. Moreover, existing research has focused solely on one parent (particularly mothers), neglecting the role of fathers or failing to distinguish differences between mothers and fathers in their interactions with children. The present study used cross-lagged panel model and latent growth mixture model to examine the dynamic relationship and mechanism between paternal/maternal rejection and adolescent risk-taking behaviors. A total of 2024 adolescents (47.5% girls; Mage at Wave 1 = 13.07 years) were followed for three times with six-month intervals. The results showed that: (1) Parental roles exhibited significant differences in the bidirectional relationship between parental rejection and adolescent risk-taking behavior. Specifically, the paternal-driven effect was significantly stronger than the maternal-driven effect; Compared to paternal rejection, the adolescent-driven effect on maternal rejection was stronger, which was also significantly stronger than the maternal-driven effect. (2) Parental rejection and adolescent risk-taking exhibited distinct heterogeneous developmental trajectories. Parental rejection: paternal increase and maternal stable rejection group (5.14%), the parental rejection growth group (8.60%), the parental rejection low stability group (81.18%) and the maternal increase parental stable rejection group (5.09%). Adolescent risk-taking behavior: the low risk-taking growth group (13.19%), the low risk-taking stability group (83.60%), and the high risk-taking volatility group (3.21%). (3) Adolescents' self-disclosure to fathers mediated the effect of paternal rejection on adolescent risk-taking behavior, while adolescents' self-disclosure to mothers mediated the relationship between maternal rejection and adolescent risk-taking behavior in a bidirectional manner. There were gender differences in the mediation models. The findings have practical implications for fostering effective parenting practices and nurturing healthy behavioral patterns among adolescents.

INTERNATIONAL COUNCIL OF PSYCHOLOGY EDUCATORS (ICOPE): NATIONAL DEVELOPMENT AND INNOVATION IN PSYCHOLOGY EDUCATION.

Friday 24 July 2026 from 09:30 to 11:00

(H-Spadolini)

Remo Job (University of Trento ~ Rovereto ~ Italy), Chair and Presenter
Michael Anthony Machin (University of Southern Queensland ~ Toow), Co-Chair

Psychology education varies widely across Nations in terms of the length of the specific psychology programs offered (typically 4-to-6 years), the university level available (BA, MA, PhD), the space devoted to different subject matters, and the professional outcome (professional psychologist vs. liberal art professionals). Also, psychology is often offered as a subject matter in other programs, such as teacher training, behavioral economics, health professions, to name just a few. These different patterns may index the effort of a given Country's administrative norms and Universities to accord training programs to their differing cultural and contextual situations or they may result from markedly differing assumptions about the function of psychology education. In this Symposium, we would analyze and discuss some of these issues and try to draw implications by the differing patterns. The first presentation will provide an overview of the activities of ICOPE regarding psychology education, will then briefly discuss recent legislative and academic development of psychology training in Italy, and will present a short comparison among three Countries that pattern differently about the graduate careers psychology undergraduates may pursue. The second presentation will provide insights on the nature of and recent developments in psychology education programs in Australia. The third presentation will focus on Brazil, a Country where psychology is flourishing and where professional training is delivered at undergraduate level following the acquisition of foundational competences. The fourth presentation will address the structure of psychology education in Japan and will discuss the co-existence of several qualifications and certifications for professional psychologists. The fifth presentation will discuss some trends in teaching ethics, considered a foundational aspect of psychological literacy, to undergraduate and graduate students of psychology in the USA, and the recommended pedagogical and assessment standard.

Abstract 3156

THE INTERNATIONAL COUNCIL OF PSYCHOLOGY EDUCATORS (ICOPE) AND A COMPARISON AMONG AUSTRALIA, ITALY, AND USA ON PSYCHOLOGY UNDERGRADUATE PROGRAMMES.

Job R.*[1], Nolan S.[2], Tasso A.[3], Cerni T.[3], Cranney J.[4]

[1]University of Trento ~ Rovereto ~ Italy, [2]Seton Hall University ~ South Orange, NJ ~ United States of America, [3]University of Ferrara ~ Ferrara ~ Italy, [4]University of New South Wales ~ Sydney ~ Australia

In this presentation the main activities put into place to reach the ICOPE aim of advancing psychology education (including psychological literacy) around the world will be outlined. In particular, we will review recent and planned Conferences and Symposia, including the ICOPE Satellite Meeting at ICAP 2026, Firenze (Italy), July 20th, 2026, “Psychology Curricular Innovation for Wellbeing and Sustainability”; the Book series, whose last volume is “Teaching psychology globally”; activities directly related to teaching, such as the ICOPE Scholarship of Teaching and Learning in Psychology Community of Practice (SoTL-P CoP), whose aim is to share and discuss best practices and emerging issues, and the planned Webinars on teaching of psychology aimed at reaching a wider audience and favouring multiple perspectives in teaching of psychology. The second part of the presentation will address some of the legislative and academic changes in the Italian university training programs of the health professions and their implication for psychology education. We will then briefly compare three Countries where undergraduate psychology students are encouraged (and possibly constrained) to choose psychology at the graduate level (Italy) or are, instead, encouraged to choose training and careers other than psychology at the graduate level (Australia and USA). Peculiarities and implications of the three systems will be discussed.

Abstract 3157

KEEPING PSYCHOLOGY ON TRACK IN AUSTRALIA: GOVERNANCE AS THE BACKBONE OF QUALITY LEARNING AND TEACHING

Machin M.A.*[2], Machin T.[2], Gullifer J.[1]

[1]Monash University ~ Melbourne ~ Australia, [2]University of Southern Queensland ~ Toowoomba ~ Australia

Governance is the backbone of quality assurance in higher education, providing the structures, policies, and processes that align institutional missions with teaching and learning goals. In psychology, strong governance is especially critical: accreditation, registration, and workforce needs demand systems that are rigorous, transparent, and responsive.

This presentation explores how governance safeguards standards while enabling innovation in psychology education, with a particular focus on the Australian context. External frameworks such as the Australian Psychology Accreditation Council (APAC) and the Higher Education Standards Framework (HESF) ensure consistent graduate competencies and national compliance. Internally, teaching and learning committees and structured review cycles provide feedback loops that connect student, staff, and industry perspectives. Case studies from Monash University and the University of Southern Queensland demonstrate how governance processes drive curriculum improvement and enhance graduate employability outcomes.

Governance also plays a vital role in navigating new opportunities and risks. Examples include emerging policies that guide the ethical integration of generative AI into teaching and assessment, as well as initiatives such as the Australian Indigenous Psychology Education Project (AIPEP), which embed cultural responsiveness into curricula.

Key lessons highlight the value of transparency, evidence-informed decision-making, and collaborative leadership in building stakeholder trust and ensuring educational quality. Attendees will gain practical recommendations to strengthen their own contexts: auditing governance structures, linking governance to institutional strategy, and embedding continuous quality enhancement through data-driven approaches and benchmarking.

By grounding governance in both external standards and internal practice, psychology education can remain accountable, innovative, and aligned with the evolving needs of students, employers, and society.

Abstract 3164

QUANTITIES AND QUALITIES IN BRAZIL´S PSYCHOLOGY EDUCATION

Gauer G.*, De Souza L.K.

Universidade Federal do Rio Grande do Sul ~ Porto Alegre ~ Brazil

The authors have been examining the growth of Psychology education in Brazil for more than two decades. The period has witnessed accelerated expansion of graduate and postgraduate courses, and consequently a steep growth in numbers of degree-holding professionals and students of psychology. That has led Brazil to become the country with the most psychologists in the world, both in absolute and per capita figures by the 2020s. We are more than 500,000 as of august 2025, but is that an adequate quantity? Although considered as a middle-income country, Brazil still faces alarming social and economic vulnerabilities as well as high levels of inequality. Those have posed complex challenges to health policy and health education. Psychology´s sheer numbers do not seem to have been enough to overcome such challenges, as seen in mental health indices. We here discuss a number of conditions that have led to that situation, as well as its consequences, both actual and expected. For instance, to what point the largest national body of professionals have been able to respond and contribute to the serious demands of mental health prevention and promotion. Moreover, we ponder the sustainability of the continuing expansion of Brazil´s psychology education for the future. The effectiveness of national policies in balancing general foundational knowledge and professional competences in psychology education warrant evaluation. We argue for a systematic reflection on the interplay between quantity and quality, generality and specialization. That seems like a priority for Brazilian psychology to better serve the country´s sustainable development goals. Furthermore, such an analysis of the Brazilian case may inform other nations and their institutions toward decisions and policies on psychology education and its role in professional expansion.

Abstract 3165

TODAY'S PSYCHOLOGY EDUCATION IN JAPANESE UNIVERSITIES: AN OVERVIEW

Kojima H.*

Kanazawa University ~ Kanazawa ~ Japan

In this presentation, an overview of modern psychology education in Japan will be provided. The presentation will briefly describe the structure of the standard psychology education in Japan and will then address issues that are debated among Japanese psychology educators. The presentation will include 1) a history of psychology education, 2) today's typical curriculum of undergraduate psychology education, 3) psychology-related professions and qualifications in Japan focusing on the three main certifications for professional psychologists, Mental Health Social Worker, operated by the Japanese Association of Mental Health Social Workers, Clinical Psychologist by Foundation of the Japanese Certification Board for Clinical Psychologists, and Authorized Psychologist, operated mainly by the Japanese Psychological Association.

Abstract 3166

MORAL PHILOSOPHY AS A FOUNDATION FOR ETHICS IN PSYCHOLOGY: AN OVERLOOKED DIMENSION OF PSYCHOLOGICAL LITERACY

Searight R.*

Lake Superior State University ~ Sault Ste. Marie ~ United States of America

Ethics is a foundational element of psychological literacy, yet undergraduate psychology programs often address it narrowly, focusing primarily on research ethics and approval processes through Human Subjects Review Boards. At the graduate level, ethics courses are more common but typically center on applied issues in clinical or organizational psychology. Professional codes of conduct, such as those from the APA, BPS, or EFPA, offer essential behavioral guidelines; however, they emphasize procedural compliance rather than the philosophical foundations of ethical decision-making. Davidson and Morrissey (2011) have argued that ethics education should include more than just adherence to rules—it should engage students in moral theory in order to develop deeper ethical reasoning. While research ethics protect participants and codes of conduct set professional standards, they do not fully prepare students to navigate complex or emerging ethical dilemmas that lie outside established guidelines, as was evident during the COVID-19 pandemic. Integrating moral theory into undergraduate education equips students to critically evaluate ethical issues and articulate the rationale behind their decisions. For instance, Kantian deontology focuses on absolute duties and categorical imperatives, prohibiting actions like harming research participants or engaging in dual relationships, regardless of consequences. Utilitarianism, in contrast, evaluates actions by their outcomes for the greater good, sometimes justifying controversial practices like deception in research. Virtue ethics highlights the development of moral character traits such as humility, honesty, and prudence, which are also central to positive psychology. Principlism, developed by Beauchamp and Childress (2019), advances four core principles—autonomy, beneficence, nonmaleficence, and justice—yet offers limited guidance when these principles conflict. By expanding ethics education to include these moral frameworks, psychology programs can foster stronger critical thinking, promote a richer understanding of ethical standards, and better prepare students to address complex challenges in research, practice, and public engagement.

Abstract 1950

RELATIONSHIP AMONG TEACHERS' LEARNING AGILITY, AI LEARNING ACCEPTANCE INTENTION, AND INSTRUCTIONAL BEHAVIOR:THE MODERATED MEDIATION EFFECT OF AI TRAINING

Au Y.*

Kongju national university ~ Gongju city ~ Korea, Republic of

This study investigates factors that enhance teachers' intention to accept AI learning in order to effectively apply AI technology in instruction and prepare students for future-oriented education. A total of 148 secondary school teachers from Seoul, the metropolitan area, and the Chungcheong region participated, and analyses were conducted using the Process Macro model.

The findings revealed several key points. First, teaching experience did not significantly influence teachers' AI learning acceptance intention or actual instructional behavior. In contrast, both learning agility and the frequency of AI training significantly increased acceptance intention, though learning agility alone did not directly predict instructional behavior. Second, when teachers were categorized into developmental stages—novice, growth, maturity, and mastery—based on years of teaching experience, no significant differences emerged in training frequency. However, notable differences appeared in developmental characteristics, such as tendencies toward survival and frustration. Third, AI learning acceptance intention was found to mediate the relationship between learning agility and instructional behavior, demonstrating its central role. Fourth, among teachers who reported frequent AI training, the indirect effect on instructional behavior through acceptance intention was particularly strong, highlighting the importance of training as a facilitator of AI-related practice.

These findings underscore that enhancing AI-integrated instructional competence requires more than simply increasing the number of training sessions. Instead, training programs should be designed to reflect teachers' developmental characteristics and professional contexts. Furthermore, cultivating learning agility is essential, as it strengthens the intention to engage with AI and thereby fosters the transition from intention to practice. This study provides meaningful insights for designing teacher professional development and for shaping educational policies that promote instructional expertise in the era of AI-based educational innovation

Abstract 1921

TRANSLATION AND CULTURAL ADAPTATION OF QUESTIONNAIRES RELATED TO DEATH EDUCATION IN ELEMENTARY SCHOOL TEACHERS RESIDING IN PUERTO RICO

Cartagena Torres D.*, Pérez--Colón J., Pérez--Pedrogo C., Matos--Moreno A.

Albizu University ~ San Juan ~ Puerto Rico

The aim of this study is to translate and culturally adapt into Spanish the Death Education Attitudes Scale-Teachers (DEAS-T) and the Death Education Questionnaire-Teachers (DEQ-T). These instruments assess teachers' attitudes and knowledge regarding death education in the classroom, a topic of growing importance in the educational field.

The Back-Translation method by Brislin (1970) was employed for translation and cultural adaptation. This procedure consisted of an initial translation from English into Spanish independently performed by two bilingual translators, followed by a back-translation into English by other translators with no access to the original version. This process ensured the semantic and conceptual equivalence of the questionnaires in the Puerto Rican context.

The adapted questionnaires were administered to a sample of 122 elementary school teachers actively working in public and private schools in Puerto Rico. The sample was selected through convenience sampling, including participants over the age of 18 with diverse educational backgrounds and teaching experience.

For data analysis, a psychometric study will be conducted, including factor analyses to evaluate the structure of the instruments, as well as reliability and correlational validity tests. The expected results will provide evidence of the psychometric adequacy of the scales for the Puerto Rican population, allowing their application in future research on death education in school contexts. This will contribute to the development of effective tools to prepare teachers to address death as part of children's educational experience.

Abstract 1743

UNDERGRADUATE STUDENTS' EPISTEMIC BELIEFS ABOUT ENGLISH LEARNING AND LEARNING STRATEGIES FOR VOCABULARY LEARNING

Fujiwara T.*[2], Akamatsu D.[1]

[1]Kyoto University of Education ~ Kyoto ~ Japan, [2]Mahidol University International College ~ Nakhonpathom ~ Thailand

Introduction: Individuals' beliefs regarding knowledge and knowing have been extensively examined over the past three decades as epistemic beliefs, both at domain-general and domain-specific levels. However, epistemic beliefs related to language learning have rarely been empirically investigated. This study focuses on domain-specific epistemic beliefs concerning the learning of English as a foreign language (EFL).

Purpose: The objective of this study was to identify the nature of EFL learners' epistemic beliefs about learning English and to examine differences among the learners in terms of their epistemic beliefs. It also investigated the relationship between these beliefs and the use of learning strategies in vocabulary learning.

Method: Undergraduate students enrolled in an EFL course at universities in Japan were invited to participate in an online survey developed for this study (N = 448). The survey included items from three measurement instruments developed by Greene et al. (2010), Bong (2001), and Habók and Magyar (2018).

Results: Although confirmatory factor analysis failed to support Greene et al.'s (2010) model, exploratory factor analysis (EFA) of the 13-item epistemic belief measurement yielded a three-factor structure. The identified factors were labelled in accordance with Greene et al. (2010) as "Justification by Authority," "Simple and Certain Knowledge," and "Personal Justification." From cluster analysis, five clusters of EFL learners were identified, with two clusters comprising students with strong or weak beliefs across all three factors identified in the EFA. In terms of strategy use in vocabulary learning, differences were uncovered only among certain clusters.

Conclusions: This study empirically supports the dimensional structure of epistemic beliefs regarding EFL learning, as well as the groups of EFL learners exhibiting varying strengths of epistemic beliefs. The findings may suggest the unique nature of language learning and vocabulary learning, which can differ from knowledge and knowing in most other disciplines in numerous aspects.

Abstract 1960

CONSTRUCTION AND VALIDATION OF A MEASUREMENT SCALE FOR PRESCHOOLERS' ATTITUDES TOWARDS COMPANION ANIMALS (SPACA)

Markodimitraki M.[1], Kypriotaki M.*[1], Linardakis M.[1], Kalesiou M.[1], Spanaki E.[1], Zymonopoulou M.[1], Kalogiannakis M.[2]

[1]University of Crete ~ Rethymno ~ Greece, [2]University Of Thessaly ~ Volos ~ Greece

Recent research findings have consistently highlighted significant developmental benefits of early animal-child interactions such as promotion of empathy and social skills and the need for effectively informing and sensitizing different age groups towards animals. Despite these well-documented advantages, there is a lack of validated instruments specifically designed to assess preschoolers' attitudes toward animals, a gap that hinders the development of evidence-based and age-appropriate educational interventions. The present study addressed this gap by constructing and validating the Scale of Preschoolers' Attitudes toward Companion Animals (SPACA). The participants were 1,081 preschool children (age range 3.92–5.83 years) from public and private schools who participated in the educational program EY ZOON: Learning to live with animals - Actions to raise awareness of children, parents and teachers towards companion animals. The final version of the SPACA comprised 19 categorical items and revealed a coherent three-factor structure: (a) caring for and from animals, (b) cruelty and stereotypes against animals, and (c) adults' involvement. The factor analysis demonstrated acceptable psychometric properties, supporting the scale's reliability and validity. Findings underscore the importance of employing standardized and psychometrically sound tools to capture young children's awareness and sensitivity toward companion animals from the earliest years of life. Such tools not only enable the systematic assessment of preschoolers' perceptions but also provide a crucial foundation for the design, implementation, and evaluation of targeted educational programs that foster empathy, responsibility, and animal welfare values at a formative stage of development. This work represents an original contribution to the field, offering the first validated scale specifically tailored to preschoolers' attitudes toward animals.

Abstract 1954

MODELING NONLINEAR DYNAMICS IN PROBLEM SOLVING: A CUSP CATASTROPHE APPROACH TO COGNITIVE AND CONTEXTUAL PREDICTORS OF ARITHMETICAL ATTAINMENTS IN EARLY CHILDHOOD PRESCHOOLERS WITH DEVELOPMENTAL DISABILITIES

Charitaki G.[1], Kypriotaki M.*[2], Alevriadou A.[3]

[1]University of Thessaly ~ Volos ~ Greece, [2]University of Crete ~ Rethymno ~ Greece, [3]Aristotle University of Thessaloniki ~ Thessaloniki ~ Greece

Problem-solving in early childhood has been receiving increasing research attention and recognition for its crucial role in the teaching and learning of arithmetic skills (e.g. Vessonen et al., 2025). When preschoolers engage in problem solving, they can develop key mathematical processes such as reasoning and proof, communication, and the ability to make connections and representations (Chen, 2024; Nafiqoh, 2025). For preschoolers with intellectual disabilities, these key mathematical processes are even more important, as they are closely linked to the acquisition of skills essential for independent living (Charitaki et al., 2024). The present study aimed to investigate the way that individual and contextual factors interact in producing nonlinear transitions in children's problem-solving competencies, to capture discontinuities in children's learning processes with the use of cusp catastrophe modeling (as an optimal model), and to reveal the specific factors that serve as control (asymmetry) and bifurcation (splitting) parameters within early problem-solving dynamics. A total number of 64 preschoolers with intellectual disabilities (min=4, max=8, m=5.16, sd=.73 years) enrolled in this study. We administered children's problem solving based on different domains of early numeracy [Parents' Questionnaire (LeFevre et al., 2009), The Academic Attainment Checklist (Sloper et al., 1990) and Parents' Attitudes Toward Mathematics and Literacy scale (LeFevre et al., 2009). The findings suggest that problem-solving in early childhood unfolds nonlinearly, with the potential for sudden shifts in competence when specific cognitive thresholds are reached. In particular, self-regulated problem-solving acts as a bifurcation variable, potentially pushing children over a developmental "cusp". This aligns with developmental systems theories and contributes to educational psychology by empirically validating a dynamic model for early learning. Moreover, it opens a new methodological pathway for capturing discontinuous changes in behavior and cognition, especially valuable in early education, where such shifts are standard yet hard to model with traditional regression.

Abstract 1957

YOUNG ADULT AGGRESSION. DIFFERENCES BY PERCEIVED PARENTING STYLE AND LEVELS OF BULLYING AND CYBERBULLYING, EMPATHY AND VULNERABILITY.

Predescu R.M.*[1], Panisoara G.[2]

[1]*University of Bucharest, Doctoral School of Psychology and Educational Sciences ~ Bucharest ~ Romania,*
[2]*University of Bucharest, Faculty of Psychology and Educational Sciences ~ Bucharest ~ Romania*

Objective: This study aims to explore and develop a research model that investigates the dynamic between perceived parenting style, bullying, cyberbullying, empathy and vulnerability of young adults.
Participants: A total of 135 young adults (age between 18-21 years – 37,8%, age between 22-25 years – 22,2%, age between 26-29 years – 11,9%, age between 30-33 years - 11,9%, age between 34-37 years – 16,3%) participated in this study.
Methods: Data were collected at a single point in time, by completing the self-report questionnaires regarding bullying, cyberbullying, perceived parental styles, aggression, empathy and vulnerability.
Results: Responsiveness (of mother, father, parental) and control (of mother, father, parental) when high levels correlate negatively with certain facets of bullying, cyberbullying, aggression (physical, verbal, anger, hostility) and vulnerability. On the other hand, empathy is the variable that correlated positively with responsiveness and control, which means that as the level of responsiveness and control increases, empathy also follows an upward slope.
Conclusions: Aggression, in any form, is a complex behavior. Starting from bullying and up to forms adapted to changes in society such as cyberbullying, it is necessary to see the connection with other elements related to the individual, in order to better understand this phenomenon. Parenting styles, especially parental responsiveness and control, empathy and vulnerability can have an impact on the frequency of bullying and cyberbullying.

Abstract 2000

DEFENDING OR NOT ? THE ROLE OF MORAL DISTRESS, PEER NORMS AND COLLECTIVE MORAL DISENGAGEMENT

Nishino Y.*

Hiroshima Shudo University ~ Hiroshima ~ Japan

When bullying occurs in school, most students are not only aware of it, but are also present and witness bullying. A bystander may recognize bullying as wrong, and feel responsible and motivated to intervene, but others may occasionally fail to actively intervene and defend a bullied peer for any number of reasons. The purpose of this study was to investigate how moral distress, peer norms and collective moral disengagement were related to bystander behaviors (assertive defender, comforting defender, sympathetic outsider, and indifferent outsider) in bullying. In addition to examining the pathways to bystander behaviors, we also tested the hypothesis that middle school students have different pathways from those of primary school students. One thousand one hundred Japanese primary school students (M=10.6 years, 48.5% girls) and one thousand four hundred and fifty-five middle school students (M=13.6 years, 49.9% girls) participated in our questionnaire survey. T-test showed that compared with middle school students, primary school students significantly expressed more defending, higher peer norms, and lower collective moral disengagement. In order to examine how each variable is related to the occurrence of bystander behaviors, we converted the experience of bystander behaviors into a binary value, with “never” set to “0” and all other responses set to “1”, and conducted a binomial logistic regression analysis by using experience of bystander behaviors as the criterion variable. Results showed that bystander behaviors were positively predicted by collective moral disengagement and that outsider behaviors were negatively predicted by peer norms. Moreover, the results of simple slope analysis for the significant effect of two-way interaction suggested that peer norms might regulate the effect of moral distress on defending behaviors among primary school students, and that collective moral disengagement might regulate the effect of moral distress on outsider behaviors among middle school students. Implications of these findings are discussed.

Abstract 2103

WORKING MEMORY IN CHILDREN WITH INTELLECTUAL GIFTEDNESS AND CHILDREN WITH TWICE-EXCEPTIONALITY

Rodriguez Cervantes C.J.*, Valadez Sierra M.D.L.D.

DEPARTAMENTO DE PSICOLOGIA APLICADA, CENTRO UNIVERSITARIO DE CIENCIAS DE LA SALUD, UNIVERSIDAD DE GUADALAJARA ~ GUADALAJARA, JALISCO ~ Mexico

Working memory (WM) is a core executive function that allows temporary storage and manipulation of information, enabling performance in complex cognitive tasks such as reading comprehension, problem-solving, and mathematical reasoning (Baddeley, 2000). Children with High Intellectual Ability (HIA) typically demonstrate above-average performance on WM tasks, especially in visuospatial and complex information processing domains (Rinn & Reynolds, 2012; Calero et al., 2007). However, when HIA coexists with Attention Deficit Hyperactivity Disorder (ADHD), forming a twice-exceptional (2e) profile, research findings are inconsistent. Some studies report impairments in WM (Alloway et al., 2009; Mahone & Slomine, 2007), while others suggest a compensatory effect of HIA. Objective: To analyze working memory performance in children with HIA and those with twice-exceptionality (HIA-ADHD). Method: A cross-sectional, descriptive ex post facto study. Participants were 54 children aged 7 to 10 years, evaluated using the WISC-IV and the BANFE-2 neuropsychological battery. Descriptive analyses and independent sample mean comparisons were conducted using SPSS. Results: No statistically significant differences were found between groups in visuospatial, verbal, visual, or numerical working memory tasks. Conclusion: High intellectual ability may have a protective effect on working memory in children with twice exceptionality, mitigating the typical negative effects associated with ADHD.

PRAGMATICS OF CHILDREN'S SINCERE AND DECEPTIVE SOCIAL COMMUNICATION

Friday 24 July 2026 from 11:00 to 12:30

(N-Lorenese)

Laura Visu-Petra (Research in Individual Differences and L), Chair

Children grow up in a highly variable world and progressively learn to interact and communicate with their social environment. Effective communication goes beyond the simple, literal meaning of words and involves the pragmatic inferences they have to make about the internal states, e.g., needs or intentions, of their interaction partners. Our symposium aims to provide insight into how this individual and environmental variability influences these pragmatic aspects of their communication. Language skills provide the basic tools for both articulating and disguising communicative intent. The first study from the University of Zurich uses communicative tasks to reveal that bilingual children (4-5 years), endowed with a greater repertoire of communicative means, are better at adapting to the communicative needs of their interaction partner than monolingual children. The second study involves slightly older Polish children (6-10 years) in a task eliciting truthful or deceptive communication by manipulating payoff rates for the child (the sender) and a fictional partner (the receiver). The third contribution takes us even further down the developmental pathway (8-13 year-olds) and investigates how pragmatic communication (sincere or deceptive) is modulated by parental influences in a sample of Dutch children. Finally, the last two contributions move the spotlight to the parents themselves in two cultural contexts (France and Romania), relating their parenting by lying practices (use of deception to elicit children's conformity or protect their feelings) to their socialization of honesty in children and their general parenting practices. To summarize, our symposium brings together five distinct cultural contexts in which children’s pragmatic communicative skills develop in interaction with contextual (parental, language) factors that affect their competence and motivation to rely on sincere and deceptive statements in their expanding repertoire of social exchanges.

Abstract 3473

PRAGMATIC BEHAVIOUR: HOW MONOLINGUAL AND BILINGUAL CHILDREN DIFFER

Wermelinger S., Rutkowska J.*, Moser N., Zoebeli V., Daum M.

University of Zurich, Jacobs Center for Productive Youth Development ~ Zurich ~ Switzerland

Communication is a complex process as it can easily go wrong. To avoid misunderstandings and failed interactions, communicators must monitor the communication process and flexibly choose communicative means that are familiar and accessible to their interaction partner. Children differ in how well they can do this. Bilingual children are suggested to be able to navigate challenging communicative situations better than their monolingual peers. We will present two studies exploring this proposal with 4- to 5-year-old children.

In Study 1, we investigated N = 86 children's communicative behaviour in a task where the experimenter asked them to communicate which target objects they should pick up from a shelf with a set of ambiguous objects. We assessed how often children used information about the entity, appearance, or location of those objects in their verbal and non-verbal communication. Compared to monolingual children, bilinguals focused more on the location of the objects in both their gestures and verbal statements. Given the goal of the task, they were more informative and thus more sensitive to their interaction partner's communicative needs.

In study 2, we disentangled whether these differences in children's communicative behaviour are due to bilinguals having a greater repertoire of communicative means at their disposal or a greater flexibility in using these means. We achieved this by first equating N = 120 children's repertoire through the introduction of study-exclusive communicative means and then assessing children's flexibility in using this repertoire. Bilingual children were less flexible in using the newly learnt repertoire to communicate compared to monolingual children.

Together, these studies suggest that bilingual children better adapt to the communicative needs of their interaction partner than monolingual children, and that this is probably based on their greater repertoire of communicative means. Bilingualism is an important source of individual differences in children's communicative development.

Abstract 3479

NURTURING HONESTY OR LYING: PARENTAL SOCIALIZATION OF CHILDREN'S LIE-TELLING

Kok R.*[1], Schröer L.[1], Talwar V.[2]

[1]Erasmus School of Social and Behavioural Sciences, Erasmus University ~ Rotterdam ~ Netherlands, [2]Department of Educational and Counseling Psychology, McGill University ~ Montreal ~ Canada

Introduction. Many parents across the world lie to their children, for example, to influence children's behavior and emotions (parenting-by-lying; lifetime prevalence rates 67-100%; Roza et al., 2024; Setoh et al., 2024). However, most parents also explicitly teach their children that lying is not acceptable (Heyman et al., 2009; Lavoie et al., 2016). Although socialization theories propose that parental teaching, modeling, and inconsistencies between them affect children's tendency to lie, it remains underexplored.

Purpose. In this study, we explore these socialization pathways to advance understanding of how children learn to be honest or lie through parental influence.

Method. We conducted a hypothetical vignette study in 150 Dutch children aged 8-13. Parent figures gave consistent moral messages (It is not OK to lie + modeling honesty) or inconsistent moral messages (It is not OK to lie + modeling lying) to a child figure. Subsequently, children were asked if they think the child in the story would lie or tell the truth after receiving these socialization messages. We vary the type of lie (instrumental, prosocial, or antisocial) and the recipient of the child's lie, to explore generalization of socialization.

Results. Currently, data of 139 Dutch children (68 females, Mage = 10.29 years, SD = 1.31) have been collected. The following research questions will be preregistered and analyzed: (1) How do parental modeling, teaching, and inconsistent moral messages regarding lie-telling influence children's lie-telling? (2) Are these effects person-specific (e.g., only towards parents, but not teachers)? (3) Do these socialization effects vary by lie type?

Conclusions. These data provide an understanding of how moral socialization and potential discrepant moral messages affect children's lie-telling. As parents are primary socialization agents for children, this study will provide unique insights to advance not only science, but also to provide better parenting advice about the socialization of honesty.

Abstract 3481

INDIVIDUAL AND CONTEXTUAL PREDICTORS OF PARENTING BY LYING IN A FRENCH SAMPLE

Caillault E.*, Lancelot C.

Angers University, Laboratoire de Psychologie des Pays de la Loire ~ Angers ~ France

One of the most important aspects of children's social development is their understanding of the role of honesty in relationships, which is primarily influenced by their parents (Lavoie et al., 2017; Setoh et al., 2020). A specific parenting practice that may shape children's honesty is parenting by lying, which refers to parents' use of deception typically to elicit children's conformity (Heyman et al., 2009).

This study aims to examine the relationship between parenting by lying and several individual and contextual factors, such as lie acceptability, parents' socialization of lying, parents' practices and socialization goals for their children, and religiosity in a French population. It also explores the frequency and types of lies more commonly used among French parents.

Participants are parents of children aged 5 to 12. Data are being collected through an online questionnaire comprising six scales. Parenting by lying is assessed using a modified version of Jackson's (2021) scale. Socialization of honesty is measured using the Revised Socialization of Lying scale (Talwar et al., 2022), whereas lie acceptability is evaluated with the Lie Acceptability scale (Oliveira & Levine, 2008). Parental socialization goals are assessed with the Goals and Values in Adulthood Scale (Suizzo, 2007). We also evaluate parental practices using the short parental EMBU questionnaire (Castro et al., 1997), cultural values with the Singelis (1994) scale, and religious practices with the DUREL (Duke University Religion Index; Koening & Bussing, 2010). Participants are being recruited via social media, posters in public settings (schools, sports establishments, etc.), and snowball sampling. The target sample size is at least 150 parents.

Data collection is ongoing, and preliminary analyses will be available by the time of the conference. This study will provide the first empirical evidence on parenting by lying in France, highlighting how cultural and individual factors relate to this parenting practice.

Abstract 3483

INDIVIDUAL AND CONTEXTUAL PREDICTORS OF PARENTING BY LYING IN A ROMANIAN SAMPLE

Prodan N.*, Magyarossy N., Visu--Petra L.

Research in Individual Differences and Legal Psychology Lab (RIDDLE), Department of Psychology, Babes-Bolyai University ~ Cluj-Napoca ~ Romania

A particular form of parental rearing practices that could model children's honesty is parenting by lying, which refers to parents' lie-telling behavior for children's compliance. Previous literature shows that 78% of American and 98% of Chinese parents used such lies (Setoh et al., 2023). Nevertheless, most studies were conducted in WEIRD nations, which differ from middle- to low-income countries, such as Romania.

The current study aimed to evaluate the prevalence of parenting by lying and explore the relationship between parenting by lying and parental socialization goals, parental practices, socialization of lies towards children, lie acceptability, and cultural values.

Participants were 260 parents of 5-to-12-year-olds. Parenting by lying was assessed using a modified version of Jackson's (2021) scale. Socialization of honesty was measured using the Revised Socialization of Lying scale (Talwar et al., 2022), whereas lie acceptability was evaluated with the Lie Acceptability scale (Oliveira & Levine, 2008). The Goals and Values in Adulthood Scale assessed parental socialization goals for their children (Suizzo, 2007). We also evaluated parental practices using the short parental EMBU questionnaire (Castro et al., 1997) and cultural values with the Singelis (1994) scale.

Results showed a high prevalence of parenting by lying (over 60%). Parental instrumental lies (e.g., fake promises/threats) were predicted by parental involvement ($\beta = 0.11$, $p = .044$), parental control ($\beta = 0.30$, $p = .000$), and lie acceptability ($\beta = 0.16$, $p = .011$). In contrast, comparison lies (e.g., praising lies) were associated with parental warmth ($\beta = 0.13$, $p = .033$), interdependent cultural values ($\beta = 0.13$, $p = .038$), and parental education ($\beta = -0.17$, $p = .008$).

Summarizing, highly involved yet more controlling parents used more instrumental lies, whereas less educated yet emotionally supportive ones reported using more comparison lies. Implications for the parental socialization of children's behavior are discussed.

Abstract 3477

TO LIE OR NOT TO LIE: THE ROLE OF COSTS AND BENEFITS IN CHILDREN'S DECISION-MAKING

Plotnikowska J.*[1], Filip A.[2]

[1]Department of Cognitive and Comparative Psychology, Nicolaus Copernicus University ~ Torun ~ Poland, [2]Institute of Psychology, Ignatianum University in Kracow ~ Kraków ~ Poland

Introduction

Lies can be placed on a continuum ranging from purely self-serving lies, which benefit the liar at others' expense, to altruistic lies, which benefit others at the liar's cost. Adults, adolescents, and preadolescents decide whether to lie or tell the truth by weighing costs and benefits for themselves and the message receiver. In sender–receiver games, they are most likely to lie for mutual benefit. Additionally, unlike adults, adolescents and preadolescents are more likely to lie when lying incurs a personal cost than when it negatively affects another player. Moreover, preadolescents are more self-oriented than older groups: they lie as readily for mutual benefit as for their own benefit.

Purpose

Although prior studies with adults, adolescents, and preadolescents show clear cost–benefit tradeoffs, it remains unclear how cost–benefit ratios influence primary school–age children's decisions to lie or tell the truth.

Method

We examined 52 children aged 6 to 10 using a modified sender–receiver game. In a within-subjects design, we manipulated payoff rates for the child (the sender) and a fictional partner (the receiver).

Results

The material cost–benefit ratio influenced children's decisions to lie or tell the truth, $\chi^2(2, 52) = 9.45$, $p = .009$. Children were more likely to lie for their own benefit ($z = 2.75$, $p = .003$) or for mutual benefit ($z = -3.33$, $p < .001$) than solely for the other player. However, there was no difference in lying rates when both parties benefited compared to when only the liar benefited ($z = -1.31$, $p = .096$).

Conclusion

Our findings confirm that 6- to 10-year-olds engage in a quasi-rational evaluation of cost–benefit ratios when making decisions. Similar to preadolescents, children's choices to lie or be truthful rely more on costs and benefits for themselves than on outcomes for the recipient.

Abstract 1072

DIGITAL GAME-BASED ANTI-BULLYING TRAINING WITH PROCESS AND EXPERIENCE ANALYSIS: A PILOT STUDY

Chang C.*, Liu Y.

National Yang Ming Chiao Tung University ~ Hsinchu ~ Taiwan

Introduction: Bystanders play an important role in shaping the dynamics of bullying situations. Although digital games have been applied in anti-bullying programs, most prior efforts have emphasized knowledge transmission or behavioral strategies, with limited attention to cultivating individuals' socio-emotional skills such as empathy and resistance to peer pressure, which critically determine real-life bystander intervention.
Purpose: This study conducted a pilot test of a digital game designed to train bystanders' skills in responding to bullying, focusing on socio-emotional skills. In addition, we analyzed in-game data to understand the participants' learning process.
Method: Twenty-five eighth-grade students in Taiwan participated in the study. The game consisted of three chapters focusing on empathy, resistance to peer pressure, and pro-social skills. After gameplay, participants completed a game experience questionnaire to evaluate engagement and learning, and answered open-ended questions about their experiences. In-game logs were used to summarize time and response patterns on tasks across chapters.
Results: Participants demonstrated good knowledge and responses in simulated bullying scenarios, suggesting gains in cognitive and behavioral skills. However, affective aspects such as empathy and resistance to peer pressure remained more challenging, and students spent longer on these parts. Most participants evaluated the game positively, reporting strong engagement and focus.
Conclusions: This preliminary study suggests that digital game is a promising tool for anti-bullying education, particularly for enhancing knowledge and intervention strategies. At the same time, it highlights the challenges of cultivating socio-emotional competencies, which may require more intensive or sustained interventions. Future research should involve larger and more diverse samples, longitudinal evaluations, and integration into school curricula to maximize educational impact.

Abstract 1879

SAFE-PHOTO-SHARE APP: IMPORTANCE OF INDIVIDUAL AND FAMILY RELATED FACTORS FOR THE LONG-TERM EFFECTIVENESS OF A PERSONALIZED FEEDBACK INTERVENTION TO REDUCE PROBLEMATIC ONLINE PHOTO SELF-DISCLOSURE AMONG ADOLESCENTS

Cepukiene V., Paluckaite U., Žardeckaite -- Matulaitiene K.*

Dr. ~ Kaunas ~ Lithuania

Introduction. There is a lack of evidence-based interventions targeting adolescents problematic photo self-disclosure on social networking sites (SNS). Given the success of the Prototype Willingness Model (PWM) in reducing adolescent risk behaviors, a mobile app, Safe-Photo-Share (SPS), was developed. The aim of this presentation is to present the importance of individual and family level factors related to the long-term effectiveness of the SPS app.

Methods. A randomized experimental study design was used, with pre-, post-, and follow-up evaluations integrated into the app. Study participants had to be aged 15-16 years and had to be sharing at least one problematic photo online in the past week. All elements of PWM as well as number and frequency of sharing problematic photos were measured three times (at the initial survey, in one and in three months). Two individual (narcissism and self-control) and two family level (perceived interparental conflicts and perceived parental mediation (active and restrictive) factors were measured in the initial survey. 154 adolescents (51.1%) in the experimental group started using SPS. At post-intervention, dropout rates were 64.3% in the experimental group (n = 54) and 70.6% (n = 88) in the control group. Follow-up retention was 12% in the experimental group (n = 36) and 16% in the control group (n = 48).

Results. Controlling for baseline scores, the experimental group showed statistically significant improvements in the number of problematic photo shares, subjective norms, attitudes, and willingness. Effect sizes indicated medium impacts across these outcomes. Different individual and family level factors were related to higher positive change of different PWM elements and number of shared photos.

Conclusion. The SPS app demonstrated medium, long-term effects on key PWM constructs, supporting its potential as a digital intervention to reduce problematic photo self-disclosure among adolescents on SNS, including various individual and family level factors contributing to this change.

Abstract 859

CROSS-LAGGED ANALYSIS OF CYBERBULLYING VICTIMIZATION, SCHOOL CONNECTION, AND DEPRESSION AMONG HIGH SCHOOL STUDENTS

Zhu F.*[1], Xiao W.[2], Liu L.[3]

[1]Vrije Universiteit Brussel ~ Brussels ~ Belgium, [2]Zhejiang Normal University ~ Jinhua ~ China, [3]South China University ~ Guang Zhou ~ China

Cyberbullying is a prevalent social problem that significantly influences adolescents' psychological and emotional health. Victims often experience isolation and weakened school connection, reducing opportunities for social support and increasing vulnerability to depression. To clarify these relationships, this study employed a longitudinal design with two waves of data collection six months apart, involving 622 high school students. Participants completed the Cyberbullying Victimization Scale, the School Connection Scale, and the Depression Scale. Using cross-lagged analysis, we examined the longitudinal associations among cyberbullying victimization, school connection, and depression.

Findings showed that cyberbullying victimization at T1 negatively predicted school connection and positively predicted depression. Moreover, depression at T1 significantly predicted higher levels of cyberbullying victimization at T2, suggesting a bidirectional cycle between victimization and depressive symptoms. School connection and depression also demonstrated reciprocal predictive effects, indicating that weakened school connection may increase depressive symptoms, while heightened depression may further erode students' sense of belonging. Importantly, school connection at both T1 and T2 mediated the relationship between cyberbullying victimization and depression, underscoring its protective role.

Overall, these results suggest that cyberbullying victimization not only directly increases the risk of depression but also indirectly exacerbates it through reduced school connection. Prevention and intervention efforts should therefore focus on reducing cyberbullying incidents and enhancing students' sense of connection with the school community. Strengthening school connection may serve as a buffer against the negative psychological consequences of cyberbullying and help break the vicious cycle between victimization and depression.

FUNCTIONING WELL BUT FEELING BURNED OUT: EXECUTIVE FUNCTIONS AND EDUCATIONAL BURNOUT AMONG UNIVERSITY STUDENTS

Bochniarz K.*, Buzniak A., Skoczko M.

University of Gdansk ~ Gdansk ~ Poland

Burnout is a well-documented phenomenon in the occupational context. However, an increasing body of research suggests that the burnout process may begin already during the educational stage. Experiencing educational burnout may have serious negative consequences for students' mental health.

Moreover, persistent academic demands and elevated expectations from educational institutions and/or parents contribute to chronic stress in young adults, which may undermine cognitive functioning and self-regulatory processes, ultimately increasing vulnerability to educational burnout. Previous research has primarily focused on the associations between occupational burnout and cognitive functioning, while comprehensive investigations in student populations remain relatively limited. Therefore, the aim of the present study was to examine the relationships between executive functions—assessed using both self-report and performance-based measures—and educational burnout. Additionally, the study investigated the role of rumination as a potential mediating mechanism in the relationship between self-reported executive dysfunctions and exhaustion.

The questionnaire-based phase of the study included 738 university students, while 120 students participated in the second phase involving performance-based executive function tasks. Valid and reliable instruments were used to assess educational burnout (School Burnout Inventory), executive dysfunctions (Cognitive Failure Questionnaire, WCST, Digit Span Task), and rumination (Ruminative Response Scale). The results indicate that self-reported difficulties in executive functioning are significantly associated with higher levels of educational burnout, whereas no relationships were found for performance-based measures of executive functions. Furthermore, rumination significantly mediated the relationship between self-reported executive dysfunctions and exhaustion.

The findings will be discussed in light of self-regulation models, with particular emphasis on the role of rumination. Implications for sustainable education and students' long-term well-being will be outlined.

Abstract 2460

PROMOTING TEACHERS' SELF-EFFICACY IN PERSONAL AND PROFESSIONAL DOMAIN: EVIDENCE OF THE "ME4YOU LEVEL 2" TRAINING PROGRAM

Ciucci E.*[1], Facci C.[1], Carpenzano D.[2], Sanesi M.[2], Taddei M.[2], Tomberli L.[1], Baroncelli A.[3]

[1]Department of Education, Languages, Interculture, Literatures and Psychology, University of Florence ~ Florence ~ Italy, [2]Independent researcher ~ Firenze ~ Italy, [3]Department of Philosophy, Social Sciences and Education, University of Perugia ~ Perugia ~ Italy

The promotion of teachers' wellbeing and the improvement of their social-emotional competence are key aspects in enhancing healthy classroom climate. The training program "ME4YOU [ME for YOU]" fosters teachers' self-reflective competences to deal with emotional and relational dimensions of teaching. Two levels of the ME4YOU program were realized. Level 1 encompasses experiential activities that encourage participants to reflect on their professional practices and their general functioning as individuals. Level 2, the focus of this contribution, is proposed to teachers who have completed level 1 and uses a narrative technique that leads participants to explore their life stories and professional careers, highlighting the interconnection between personal characteristics and professional role. Each training group included teachers from kindergarten, primary, and middle school.

56 teachers took part in the training group (52 females; M professional experiences = 22.27 years, SD = 9.64 years), and 67 teachers constituted the control group (62 females; M professional experiences = 15.25 years, SD = 8.84 years).

The effectiveness of the ME4YOU was evaluated with reference to three variables, that were assessed before (pre-test) and after (post-test) the training activities: professional self-efficacy (PSE), self-efficacy as emotional socializers toward students (SEES), and emotional self-efficacy (ESE). Analyses of variance (ANOVA) for repeated measures were implemented. Results evidenced a significant effect Time x Group both for PSE (Wilks' λ = .92, F (1,113) = 10.294, p = .002, $\eta p2$ = .08), SEES (Wilks' λ = .97, F (1,120) = 4.045, p = .047, $\eta p2$ = .03) and ESE (Wilks' λ = .92, F (1,119) = 10.037, p = .002, $\eta p2$ = .08). In all cases, the training group demonstrated higher self-efficacy in both personal and professional domains compared to the control group.

The results highlight the importance of strengthening teacher agency to promote both individual and classroom well-being.

Abstract 2412

THE ROLE OF CRÈCHE EDUCATORS' META-EMOTIONS ON THEIR STYLES TOWARD CHILDREN'S EMOTIONS

Ciucci E.*[1], Baroncelli A.[2]

[1]Department of Education, Languages, Interculture, Literatures and Psychology, University of Florence ~ Florence ~ Italy, [2]Department of Philosophy, Social Sciences and Education, University of Perugia ~ Perugia ~ Italy

Introduction: Crèche educators work as socializers of children's emotions. Consistently with the literature about parents, they can adopt two emotional styles toward children's emotions (Ciucci et al., 2015, 2018): the coaching style that involves the awareness, acceptance, and regulation of children's emotions, and the dismissing style that is characterized by the tendency to minimize, ignore, or reject children's emotions, above all the negative ones. According to the Meta-emotion philosophy conceptual framework (Gottman et al., 1996, 1997), these styles encompass an organized set of feelings and thoughts concerning one's own emotions as well as the child's emotions. So, meta-emotions - emotional reactions about one's emotions - can illuminate processes in (non-)acceptance of emotions.

Purpose: This study aims to investigate educators' personal meta-emotions that underpin coaching and dismissing styles.

Methods: 233 crèche educators from Center of Italy (average age = 40.38 years, SD = 10.68) were requested to fill out the MES (Mitmansgruber et al., 2009) and the CEESQ (Ciucci et al., 2015) questionnaires that provided, respectively, a measure of meta-emotions (i.e., interest, suppression, compassionate care) and two styles used to deal with children's emotions (i.e., Coaching and Dismissing).

Results: Regression analyses showed that higher levels of interest and compassionate care uniquely and independently contribute to coaching style toward children's emotions; higher levels of interest and lower levels of suppression uniquely account for dismissing toward children's emotions; moreover, compassion - if associated with high levels of suppression - also accounts for greater dismissing.

Conclusion: Results evidenced that crèche educators' emotional experience (i.e., meta-emotions) may play an important role in the way they socialize children's emotions. We discuss the role of meta-emotions on personal and professional life.

Abstract 4546

BUILDING BELONGING IN ASYNCHRONOUS PSYCHOLOGY COURSES: AN APPLIED MODEL FROM A COMMUNITY COLLEGE CONTEXT

Gearhart A.*

Leeward Community College ~ Pearl City ~ United States of America

Fully asynchronous courses often limit opportunities for social connection, placing community college students at increased risk of isolation, disengagement, and attrition. These challenges are especially pronounced among first-generation, working, veteran, and Native Hawaiian and Pacific Islander students who frequently balance academic responsibilities with significant family and employment demands. This study presents an applied model for fostering belonging in online psychology courses developed and implemented across multiple semesters at a community college in Hawai‘i.

The model integrates structured peer interaction, culturally responsive curriculum design, and instructor practices that can be scaffolded for various courses. Key components include facilitated peer mentorship, weekly reflective discussion prompts connecting psychological concepts to local community experiences, micro-check-in surveys, and short personalized instructor feedback. Open educational resources and locally relevant examples were also incorporated to reduce financial barriers and increase cultural relevance.

Data sources include learning management system analytics, course completion records, student self-report surveys, and qualitative reflections collected from introductory and upper-division psychology courses. Findings indicate consistent improvements in perceived social belonging, academic self-efficacy, help-seeking behavior, and course persistence. Students reported increased confidence in navigating online learning environments and greater willingness to engage with peers and instructors.

Results suggest that intentional, relationship-centered course design can help manage the social limitations of asynchronous instruction without overly increasing faculty workload. This applied model offers a potential strategy for promoting equity, psychological well-being, and academic success among diverse community college learners. Implications are discussed for faculty development, institutional policy, and cross-functional collaboration in distance education.

Abstract 2314

EXPLORING THE RELATIONSHIP BETWEEN SOCIAL MEDIA USE AND LONELINESS IN ADOLESCENTS: A SYSTEMATIC REVIEW AND META-ANALYSIS

Lien Y.*[1], Feng H.[2]

[1]National Taiwan Normal University ~ Taipei ~ Taiwan, [2]National Defense Medical University ~ Taipei ~ Taiwan

Introduction: Social media is embedded in adolescents' daily routines, and concerns have grown about its links with loneliness, a common social-emotional challenge in this period. Clarifying whether general exposure or dysregulated engagement is more relevant may explain when and how social media relates to loneliness.

Purpose: This meta-analysis estimates the association between social media use and loneliness, contrasts engagement patterns (problematic use, time spent, active use, and passive use), and tests moderation by geographic region, gender, and study year.

Method: We searched six databases from January 2000 to May 2025 for studies reporting associations between social media use and loneliness among adolescents or emerging adults. The dataset included 59 studies, 67 independent samples, and 81,344 participants (59.5% female; mean age = 17.6 years; range = 12.5–24.9). Random-effects models synthesized effects, and meta-regression tested the moderators. Engagement patterns were modeled separately to reduce construct confounding.

Results: Problematic social media use showed a moderate and consistent association with greater loneliness ($r = 0.29$, 95% CI [0.22, 0.35], $p < .001$). Time spent on social media was positively but more weakly related to loneliness ($r = 0.07$, 95% CI [0.01, 0.12], $p = .014$). No reliable differences emerged between active and passive use in their associations with loneliness. Meta-regression indicated no significant moderation by geographic region, gender, or study year, which implies broad generalizability across the contexts and cohorts sampled to date.

Conclusion: Differentiating normative time-based exposure from problematic engagement is essential when evaluating psychological correlates of social media use. The results point to mechanisms such as social comparison, displaced offline connection, and difficulties with emotion regulation as promising explanatory targets. Future longitudinal and experimental studies should clarify causal pathways and guide developmentally appropriate interventions to reduce loneliness in adolescence.

Abstract 2495

CAUSE, CONSEQUENCE, OR RECIPROCAL RELATION? LONGITUDINAL ASSOCIATION BETWEEN BULLYING VICTIMIZATION AND EXECUTIVE FUNCTIONS AMONG EARLY ADOLESCENTS

Lyu M.*[1], Xiong Y.[2], Ren P.[1]

[1]Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]Department of Psychology, School of Social and Behavioral Sciences, Nanjing University ~ Nanjing ~ China

Background: Bullying victimization is a long-standing global issue that leads to range of cognitive, psychological, and social adjustment problems among adolescents. Executive functions, involving top-down cognitive processes, are crucial for regulating adolescents' social interactions and behavior. However, the directionality of the relation between bullying victimization and executive functions remains unclear, with debates surrounding cause, consequence, and reciprocal relations. Guided by the developmental cascades model, this study investigated the longitudinal association between bullying victimization and executive functions among early adolescents.

Methods: A four-wave longitudinal design was employed, with data collected at six-month intervals from 2,045 Chinese adolescents (51.0% boys; Mage = 12.92; SD = 0.62) across eight secondary schools. Students completed a self-report measure of bullying victimization, and their parents completed a parent-report measure of executive functions at each wave. A random intercept cross-lagged panel model was used to analyze the within- and between-person associations.

Results: At the between-person level, there were positive relations between bullying victimization and the two main dimensions of executive functions (behavioral regulation and metacognition). At the within-person level, significant autoregressive paths from T1 to T4 were observed for bullying victimization, behavioral regulation, and metacognition. This suggests that adolescents who reported higher-than-expected levels of bullying victimization, behavioral regulation difficulties, or metacognitive deficits tended to maintain these elevated levels at subsequent time points. The bidirectional, time-lagged paths consistently emerged across the waves from T1 to T4, indicating that increased bullying victimization was associated with worsening behavioral regulation over time, and vice versa. Additionally, the model revealed a significant within-person time-lagged path from behavioral regulation to subsequent metacognition.

Conclusions: The findings support the developmental cascades model, demonstrating the reciprocal relation between bullying victimization and behavioral regulation during adolescent development. These results highlight the importance of developing targeted prevention and intervention strategies to disrupt the negative interaction between bullying victimization and executive functions.

Abstract 4568

ADVANCING ADOLESCENT PREVENTION: DEVELOPING THE 2026 AUSTRALIAN PRINCIPLES FOR DRUG EDUCATION IN SCHOOLS THROUGH APPLIED PSYCHOLOGY AND CO-DESIGN

Matar J.*[1], Rowland B.[1], Leahy D.[1], Cheetham A.[1], Davison N.[1], Grove C.[2], Diener T.[2], Craig M.[3], West R.[4], Lubman D.[1]

[1]Monash University ~ Melbourne ~ Australia, [2]RMIT ~ Melbourne ~ Australia, [3]NSW Ministry of Health ~ Sydney ~ Australia, [4]NSW Department of Education ~ Sydney ~ Australia

Objective

Adolescent substance use and related mental health harms remain a significant public health challenge, underscoring the need for developmentally appropriate, evidence-informed prevention in schools. This presentation introduces the revised Australian Principles of Drug Education in Schools, a national framework to strengthen early intervention and public mental health approaches through education systems. In 2024, the New South Wales Ministry of Health and the Department of Education initiated a collaborative review of the 2004 Principles to align them with contemporary prevention science, applied psychology, and future-focused teaching practice. The revision integrated advances in adolescent development, wellbeing promotion, and school-based intervention research, while improving accessibility and practical relevance for educators. The updated Principles are scheduled for release in 2026.

Methods

Turning Point and Monash University led a national mixed-methods review with education, health, and research stakeholders. The review examined relevance, evidence alignment, and redesign opportunities to address emerging adolescent health and educational needs. Methods included an international systematic review of reviews, an implementation-focused scoping review, a national educator survey, co-design workshops with teachers and students, and consultations with national experts and policymakers. Findings were synthesised using an applied implementation science lens to prioritise feasibility and translation into classroom practice.

Results

The review identified limited awareness and uptake of the existing Principles revealed a substantial implementation gap. Evidence synthesis identified effective prevention components, including whole-school approaches, developmental tailoring, skills-based

learning, and alignment with mental health and wellbeing curricula. Co-design and stakeholder consultation highlighted the need for clarity, flexibility, culturally responsive resources, and explicit implementation guidance. These findings informed redevelopment of the Principles alongside an implementation guide to support consistent, psychologically informed delivery across schools.

Discussion

The 2026 Principles shift from static guidance to an implementation-oriented framework grounded in applied psychology and prevention science. The presentation will discuss implications for public mental health, workforce capability, and cross-sector collaboration.

Abstract 2344

PREVENTION OF GENDER-BASED VIOLENCE: THE ROLE OF APPLIED PSYCHOLOGY IN DECONSTRUCTING MASCULINITY AND STRENGTHENING RESILIENCE IN EDUCATIONAL AND CARE CONTEXTS

Sabrina B., Pistacchi P.*, Bicocchi L.

Istituto degli Innocenti ~ Firenze ~ Italy

This work focuses on masculinity and gender representations within educational and care settings for children aged 0–6, with particular attention to the psycho-emotional wellbeing of boys and girls.

From an applied psychology perspective, the study analyses how educational practices influence the early development of identity and relationships, affecting inclusion processes and the prevention of violence.

The poster will present concrete data and field experiences, offering models of intervention and good practices aimed at promoting gender equality, nurturing relationships, and counteracting stereotypes.

These models derive from consolidated experience in the management of educational and care services, from monitoring and research activities for national and international bodies, and from training programmes for educational, social and psychological professionals.

Participation in the congress represents an opportunity to highlight the contribution of our Institution in preventing violence and building inclusive educational environments that foster harmonious early childhood development.

The contents presented are further explored in the Infanzia e Adolescenza (Childhood and Adolescence) series — a scientific and editorial tool accompanying fieldwork, offering theoretical and operational insights on protection, early identity, listening, and respect for differences.

Abstract 2524

HOW 7-YEAR-OLDS GRASP IRONY: THE IMPACT OF COMMUNICATIVE CONTEXT

Szmytke M.*, Plotnikowska J., Bialecka M.

Institute of Psychology, Faculty of Philosophy and Social Sciences, Nicolaus Copernicus University in Torun ~ Torun ~ Poland

Recognizing that what someone says is not always what they truly think or feel is a key social skill, and understanding irony reflects this ability. Around age seven, children begin to interpret ironic messages similarly to adults. Irony comprehension is not uniform: ironic criticism tends to be easier to grasp than ironic praise. Ironic statements might also differ in the way they are delivered to a child, e.g., via indirect speech in stories or in a natural communicative context. However, it remains unknown whether a child's context-based, natural engagement with an ironic message might enhance their understanding of irony; thus, the aim of this study was to examine that.

We analyzed the performance of 182 children (girls, n = 88) aged seven years, who responded to questions about standardly used illustrated stories (two depicting praise and two depicting criticism), presented in a counterbalanced order. At the end of each session, children participated in quasi-natural interactions in which the experimenters acted out a scene in which one experimenter ironically criticized or praised the behavior of the other. The tone of the message was manipulated: half of the children heard a neutral tone, and the others an ironic tone.

Consistent with previous research, children were better at recognizing ironic criticism than praise in both tasks. They also performed slightly better at understanding irony in the interactive than in the story-based tasks. Moreover, while the tone of speaking did not improve comprehension of ironic criticism, it facilitated understanding of ironic praise.

To conclude, 7-year-olds find ironic praise more difficult to detect than criticism. A context-based task is likely to enhance understanding of ironic messages, and the ironic tone facilitates comprehension of ironic praise. Our results suggest that children's social skills, such as interpreting irony, may be fostered through natural context experiences.

Abstract 2505

FROM COGNITIVE SCAFFOLDING TO ENDURING SKILL: A LONGITUDINAL STUDY OF KNOWLEDGE CONSTRUCTION IN STUDENT-AI CREATIVE COLLABORATION

Xie Y.*, Yue H., Wu X.

Beihang University ~ Beijing ~ China

The integration of generative artificial intelligence (GenAI) into education presents a critical paradox: does it act as a temporary "cognitive crutch" that enhances immediate performance at the cost of long-term skill, or can it serve as a "cognitive gymnasium" for enduring learning? Cross-sectional studies have been unable to resolve this tension. Adopting a social constructivist perspective, this longitudinal study investigates the dynamic process through which students' skill in querying AI fosters creative capacity over time. We conducted a two-wave study with university students, measuring their creative performance immediately after a GenAI-supported task (Time 1) and again one week later (Time 2). Results from a moderated mediation model revealed a distinct temporal shift. At Time 1, AI inquiry quality influenced immediate creativity through two parallel paths: a strong direct effect and an indirect effect via critical thinking. However, at Time 2, the mechanism transformed entirely: the direct effect vanished, and AI inquiry quality influenced delayed creativity solely through the enduring indirect pathway of critical thinking. Crucially, this pathway of internalization was exclusively available to students with a high learning-goal orientation. This finding demonstrates that the cognitive benefits of the engagement were not automatic but were sustained over time through a motivated process of knowledge construction. This study contributes a dynamic model of AI-supported skill acquisition, highlighting that lasting creative gains are not a function of AI use alone, but of a motivated, constructivist engagement. We provide clear evidence that pedagogies must shift from teaching how to get answers from AI to fostering the inquiry skills and learning mindsets that drive internalization.

INTERCULTURAL EDUCATION AND TEACHING ROMA HISTORY IN ROMANIA: EDUCATORS' PERSPECTIVES, CHALLENGES, AND PEDAGOGICAL PRACTICES

Stefan I.N.[1], Zamfir A.*[1], Negoi I.V.[2]

[1]Roma Education Fund Romania; University of Bucharest ~ Bucharest ~ Romania, [2]Roma Education Fund Romania ~ Bucharest ~ Romania

Introduction

The Roma community represents Romania's largest ethnic minority, facing systemic discrimination and educational marginalization. Although intercultural education has potential to combat stereotypes and promote inclusion, Roma-focused curricula remain poorly represented, a deficit amplified by teachers' lack of preparation. Anti-Roma prejudices are frequent in schools, while topics such as five centuries of slavery, the Holocaust, and deportations are rarely discussed.

Purpose

This study explores how Romanian teachers understand and practice intercultural education focusing on Roma culture and history. The research evaluates how teachers define and implement these practices, perceive racism manifestations in schools, use pedagogical strategies for teaching Roma history, and encounter personal, professional, and institutional barriers when managing inclusive education.

Method

We analyzed responses from 25 female teachers (age: 23-54, experience: 1-34 years) from urban and rural settings with varying percentages of Roma students (0-100%). Participants completed an open-ended questionnaire following training on intercultural education and Roma history in September 2025. Thematic analysis was used.

Results

Five main themes emerged: (1) educators conceptualize intercultural education through empathy, respect, diversity, and equality; (2) essential competencies include socio-emotional skills, reflective thinking, cultural knowledge, and conflict management; (3) racism manifests through labeling, social exclusion, spatial segregation, low expectations, and cultural invisibility; (4) intervention strategies emphasize immediate action, educational opportunities, and empathy promotion; (5) barriers exist at personal (prejudices, fear), professional (inadequate training, lack of resources), and institutional (rigid curriculum, segregation, insufficient support) levels.

Conclusions

Although teachers demonstrate empathy, creativity, and theoretical understanding of inclusion, significant gaps persist between problem awareness and practical strategy implementation. Participants' good intentions are insufficient without comprehensive training, quality resources, clear policies, and institutional support. Findings indicate the

need for continuous professional development programs, culturally adapted teaching materials, and systemic reforms to support the inclusion and cultural identity affirmation of Roma students.

Abstract 2073

DYSLEXIA IN DIVERSE LANGUAGES: IMPLICATIONS FOR INTERVENTION

Padakannaya P.*

Christ University ~ Bangalore ~ India

Dyslexia is a neurodevelopmental disorder affecting reading acquisition. It is different from reading difficulties children may exhibit due to disadvantages related to general intelligence, sociocultural background, or school-teaching conditions. However, the manifestation of dyslexia across languages varies significantly, despite its neurobiological origin, due to variations in language structure, phonological structure, script features such as grain size, orthographic depth, visual complexity, and cultural practices. While English has dominated dyslexia research, cross-linguistic studies reveal that interventions must be tailored to the linguistic and cultural context of each learner. This presentation explores dyslexia across diverse languages—Kannada, Hindi, Japanese, Urdu, Persian, and Chinese—highlighting both universal cognitive markers and language-specific challenges, with implications for assessment and intervention. Each of the above languages is very different from English in many linguistic and orthographic features. I juxtapose the critical features of these languages with each other and with English, and draw evidence-based implications for diagnosis and intervention of dyslexia in individuals as well as bilingual/multilingual settings. Though phonological deficit is a universal marker of dyslexia, its effect is modulated by specific orthographic features of many languages. Language-specific challenges and their consequences will be highlighted. More importantly, the presentation will highlight the importance of cultural embeddedness of interventions for specific situations, focusing more on an asset-based approach than a deficit-based approach in planning effective intervention models for dyslexia.

Abstract 2316

THE POLICY–PRACTICE GAP IN INCLUSIVE SCHOOLING: INSIGHTS FROM REFLEXIVE THEMATIC ANALYSIS

Basu S.*

Azim Premji University ~ Bengaluru ~ India

Inclusive education in India, though advancing in policy, continues to stay uneven in practice, particularly in urban-rural contexts. The present qualitative study aims to explore how teachers and schools understand, enable, and drive inclusion across socioeconomic contexts. Five themes emerged using reflexive thematic analysis of semi-structured interviews and school observations. The first theme explored teachers' awareness of inclusive education from a systemic lens, wherein teachers' awareness was frequently policy-centric but fragmented, with limited translation into classroom decision-making. The second theme explored teacher functioning in an inclusive setup. Topics such as teachers' responsibilities, associated strain, improvisational adaptations, and emotional labour amidst limited mentorship and high caseloads were discussed. The third theme explored the provisions and infrastructure of inclusive education. It consisted of challenges in assistive technologies, accessible spaces, and specialist supports with pronounced rural shortfalls. The fourth theme explored topics on the essence of inclusion according to the schools, while the final theme explored the functioning of the school through collaborative routines, accommodations, and a strong psychosocial environment. Across these themes, teacher self-efficacy, attitudes towards disability, emotional demands of care, and stigma management emerged as key drivers of inclusive education. Findings highlight a policy-practice gap sustained by limited professional development, a lack of contextualized tools (such as universal design strategies and behavioural supports), and weak professional linkages. This study contributes to a grounded map of where and how inclusion falters and how psychologically informed supports can strengthen teachers and systems. Implications of this study include redesigning teacher education to promote reflective practice, embedding psychosocial supports in school routines and targeting rural capacity gaps through mobile expertise and shared services.

Abstract 2247

SUBGROUPS OF GIFTED CHILDREN: A LATENT PROFILE ANALYSIS OF COGNITIVE, AFFECTIVE, AND CONTEXTUAL PATTERNS

Niederlechner J.*

Ludwig Maximilian University of Munich (LMU) ~ Munich ~ Germany

Introduction:

Intellectual giftedness is traditionally defined by high cognitive ability, but it also involves diverse cognitive, affective, and contextual characteristics. Understanding intra-group variability is essential to provide effective educational and clinical support.

Purpose:

This study aimed to identify empirically based subgroups of gifted children by integrating cognitive, affective, and contextual variables, and to describe their distinct profiles. The goal was to provide a foundation for differentiated interventions and to inform educational and clinical practices that address both intellectual potential and psychosocial well-being.

Method:

The sample included N = 200 children (IQ ≥ 125; mean age = 8.3, SD = 2.51), including 72 girls (36%) and 128 boys (64%). Cognitive abilities were assessed using WISC-V and WPPSI subscales. Affective and contextual variables, including emotional difficulties, peer problems, hyperactivity, prosocial behavior, family and school stress, motivation, and social integration, were measured using the Strengths and Difficulties Questionnaire (SDQ) and supplementary questionnaires. Latent profile analysis (LPA) was used to identify subgroups.

Results:

LPA revealed three distinct subgroups. Profile 1 (n = 69) included children with average cognitive abilities but elevated emotional and behavioral difficulties, often associated with familial stress. Profile 2 (n = 86) comprised emotionally sensitive, socially reserved children with average cognitive abilities and unstable peer relationships. Profile 3 (n = 45) consisted of highly gifted, socially competent, and emotionally stable children with strong prosocial skills. These findings underscore substantial intra-group variability, demonstrating that cognitive talent alone does not capture the full spectrum of needs.

Conclusions:

Implications include the necessity for targeted interventions addressing emotional regulation, social confidence, and intellectual stimulation, tailored to each subgroup's characteristics. The study extends existing models of giftedness by integrating cognitive, affective, and contextual dimensions and illustrates the utility of person-centered methods such as LPA in elucidating heterogeneity within gifted populations.

Abstract 724

BRIDGING LANGUAGE, COMMUNICATIVE, COGNITIVE AND SOCIO-EMOTIONAL DEVELOPMENT: INSIGHTS INTO PREDICTORS OF SOCIO-EMOTIONAL DEVELOPMENT IN DEAF AND HARD-OF-HEARING CHILDREN

Siebert L.*, Steiner K., Avemarie L.

Ludwig-Maximilians-Universität München ~ Munich ~ Germany

Introduction: Compared to children with typical hearing (TH), deaf and hard-of-hearing (DHH) children often experience greater challenges in developing language skills, communicative competence, executive functioning (EF), and socio-emotional competence. Previous research has suggested associations among these developmental domains.

Purpose: This study investigates the relationships among language skills in sign and spoken languages, communicative competence, EF, and socio-emotional competence in DHH children.

Method: In this cross-sectional study, data were collected from N = 77 DHH first graders aged 5 to 10 years (M = 6.95, SD = 0.63). Standardized assessments and validated teacher-rated questionnaires were administered. Data analysis included Pearson correlations, simple bivariate regression analyses conducted with SPSS as well as path analysis conducted with AMOS.

Results: Significant associations were found across the developmental domains, with moderate to strong positive correlations ($r = .24–.85$, all $p < .05$). Communicative competence significantly predicted both EF ($\beta = .24$, $p = .034$, $R^2 = .06$) and socio-emotional competence ($\beta = .24$, $p = .034$, $R^2 = .06$), whereas language skills did not. Furthermore, EF significantly predicted socio-emotional competence ($\beta = .85$, $p < .001$, $R^2 = .72$). Path analysis revealed that language skills predicted communicative competence ($\beta = .36$ and $\beta = .46$), which in turn predicted EF ($\beta = .28$). EF strongly predicted socio-emotional competence ($\beta = .83$), while the direct effect of communicative competence on socio-emotional competence was negligible ($\beta = .02$). These results indicate that the link between language skills an socio-emotional competence is mediated through communicative competence and EF.

Conclusions: The findings of this study highlight the complex interplay among language, communicative, cognitive, and socio-emotional development in DHH children. Ensuring that DHH children have access to language systems, for example through early bimodal-bilingual intervention, may foster communicative competence, which in turn promotes EF development and, ultimately, socio-emotional competence.

Abstract 2474

INTEGRATING POSITIVE YOUTH DEVELOPMENT AND HUMAN RIGHTS EDUCATION TO FOSTER INCLUSION AND RESPECT FOR RIGHTS IN KINDERGARTEN

Valbusa I.*[1], Ginevra M.C.[2], Rossier J.[1]

[1]University of Lausanne ~ Lausanne ~ Switzerland, [2]University of Padova ~ Padova ~ Italy

Introduction: Contemporary school environments are highly diverse, posing challenges to social inclusion and peer relationships. This diversity can lead to bullying, discrimination, and social exclusion, violating participation rights associated with inclusion and sustainability. Such violations particularly affect students with stigmatized attributes (e.g., disabilities, overweight) or identities (e.g., ethnic minorities, immigrants). This study explores a transdisciplinary approach integrating Positive Youth Development (PYD), which fosters inclusive social skills, with Human Rights Education (HRE), which promotes knowledge and respect for participation rights. This integration may recover collective responsibility for constructing inclusive and peaceful societies, starting with rights-respectful school contexts among kindergarten children.

Purpose: This pilot study evaluates the efficacy of "A Puzzle of Rights" in promoting knowledge and respect for participation rights, enhancing recognition of rights violations, and developing assertive responses among kindergarten children.

Method: Sixty children (aged 4-6) attending their final kindergarten year were randomly assigned to intervention or control groups. The intervention comprised ten 40-minute sessions addressing human rights from the Convention on the Rights of the Child (UN, 1989) and animal rights from the Universal Declaration of Animal Rights (UNESCO, 1978). Sessions included discussions of rights-violating situations, identification of positive social behaviours and assertive reactions, and simulated role-playing exercises. Pre- and post-intervention assessments measured peer acceptance/rejection (sociometric nominations), recognition of rights violations, and assertive responses.

Results: Repeated-measures analyses revealed that intervention group participants demonstrated significantly higher positive sociometric nominations, and enhanced recognition of and assertive responses to rights violations compared to the control group.

Conclusions: Integrating PYD and HRE effectively promotes rights-respectful, inclusive and sustainable school contexts. This transdisciplinary approach demonstrates psychology's role in fostering inclusive social skills such as the ability to assertively react to rights violations, and collective responsibility for respecting participation rights, aligning with SDG 16 for building inclusive and peaceful societies.

Abstract 1363

THE ROLE OF ETHNICITY AND TYPE OF NARRATIVE FEEDBACK IN STUDENT FEEDBACK PERCEPTION OF ACADEMIC ASSIGNMENTS

Van Buel S.*[1], Born M.[1], Stegers--Jager K.[3], Oostrom J.[2]

[1]Erasmus University Rotterdam ~ Rotterdam ~ Netherlands, [2]Tilburg University ~ Tilburg ~ Netherlands, [3]Radboudumc Health Academy ~ Nijmegen ~ Netherlands

Feedback is considered fundamental for student learning and academic achievement. Rojek et al. (2019) found that language use in feedback differed depending on a student's ethnicity, with minority students receiving significantly less feedback on their competencies than majority students. While the effect of feedback on various aspects of students' lives has been studied extensively, fewer studies have focused on how feedback is perceived by students, let alone to what extent a student's ethnicity affects these perceptions. This study aims to understand how students in higher education perceive feedback on their assignments. The main objective is to establish whether students' ethnicity influences the extent to which feedback is perceived as (1) reflecting what needs to be assessed, (2) facilitates equal treatment, and (3) aligns with students' self-concept, and whether that relationship is mediated by the extent to which they identify with their ethnicity. Furthermore, we want to explore whether this relationship exists depending on the language used in feedback. We aim to collect data on 550 students via an online survey. Using a cross-sectional mixed design, participants will be presented with several types of narrative feedback, inspired by Rojek et al. (2019): Social-oriented feedback (i.e., individual disposition), agency-oriented feedback (i.e., task behaviour), and cognitive-oriented feedback (i.e., intellectual ability). An example item for social-oriented feedback would be "You are a lovely person to work with!". For each type of narrative feedback, we measure participants' perceptions of feedback fairness, feedback usefulness, and self-concept. Data will be analyzed using a multi-group structural equation model. While data collection is currently still ongoing, with 223 of the 550 participants having participated, preliminary results suggest that ethnic identification might mediate the relationship between ethnic background and perceived usefulness as well as perceived fairness when feedback targets an individual's disposition or task behaviour, rather than their intellectual ability.

Abstract 279

SUPPORTING CHILDREN IMPACTED BY TRAUMA IN EDUCATION SETTINGS: LEARNINGS FROM THE EVALUATION OF IMPLEMENTING TRAUMA-INFORMED PRACTICES IN SOUTH AUSTRALIAN SCHOOLS

Harman--Smith Y.*, Button E., Plueckhahn T., Ankers M., Gross M.

The Kids Research Institute Australia ~ Adelaide ~ Australia

There has been increasing recognition of the impact of trauma on children and young people's development and the implications this has for engagement in learning and wellbeing within education settings. The South Australian (SA) Department for Education implemented Trauma-informed practices in education (TIPiE) with a view to support teachers and school leaders to develop a deeper understanding of trauma, increase knowledge of impact on children's development, and inform their practices in order to create safe and inclusive environments for children and young people impacted by trauma. Participants included school leadership, educators and corporate staff. A mixed-methods evaluation measured changes in self-reported confidence, skill and knowledge of trauma-informed practices; the extent to which trauma-informed practices were present; and perceptions of working with children who have experienced trauma. Participants felt that TIPiE training had increased their knowledge, skills and confidence, but the extent to which they felt the training translated into their work with students varied. Findings demonstrate the need to support educators beyond initial training as they begin to apply and reflect on the effectiveness of their practices. The evaluation findings add to a growing literature about what supports schools to create inclusive learning and social environments to for children who have been impacted by trauma.

Abstract 2719

THEORY OF MIND DEVELOPMENT IN ROMANI AMONG ROMA CHILDREN AND ADULTS WITH AND WITHOUT DISORDERS (CASE STUDIES)

Kyuchuk H.*

University of Silesia ~ Katowice ~ Germany

Introduction: In most of the European countries if the Roma children do not speak well the official language of the country they live in, they are considered to have “psychological disorders”.
Purpose. The study aims to investigate the knowledge of wh- complements and the Theory of Mind in Romani of Roma children and adults with and without disabilities.
Method. The method used is individual testing of Roma children and adults with wh-complements and The two classical Theory of Mind Tasks: unexpected content and misdisplacement. If the children and adults pass the Theory of Mind tests, they are tested also with the language test. The number of the tested children are as follows: 41 normally developing Roma children: 21 children from Turkey (3-6 years old), 12 Roma children from Serbia (6-8 years old) , 8 Roma children form Lithuania, (6-12 years old), 1 Roma child (9 years old with Autism) and 8 adult Roma from Bulgaria, with disabilities.
Results. The children from Turkey, Lithuania and from Serbia are also normally developing. The Turkish and Serbian Roma children are balanced bilinguals. The Lithuanian children are bilinguals, but their dominant language is Russian. The Bulgarian Roma child and the Bulgarian adults are balanced bilinguals. Result show that the Roma children from Turkey and Serbia understand the Theory of Mind tasks because, they are good in wh-complements. The Roma children from Lithuania who do not know Romani well, they can not solve the Theory of Mind tasks. Their results are similar to the results of the Roma child with Autism and Roma adults with disabilities.
Conclusions. The study shows that knowledge of Romani grammatical category – wh-question facilitates the Theory of Mind development and that helps the children to be educated better in their second language.

Abstract 2385

NAVIGATING TWO WORLDS: ACCULTURATION PROCESSES AND SCHOOL INTEGRATION EXPERIENCES OF MIGRANT AND REFUGEE CHILDREN IN IRISH EDUCATIONAL SETTINGS

Zheng B.*

Trinity College Dublin ~ Dublin ~ Ireland

This study examines the acculturation experiences of migrant and refugee children within Irish primary and post-primary schools through Bronfenbrenner's Ecological Systems Theory. As Ireland's student population becomes increasingly diverse, understanding how children navigate cultural adaptation within educational environments has become critical for psychological wellbeing and academic integration.

Using a mixed-methods approach, we conducted semi-structured interviews with educators and school management teams alongside quantitative surveys examining school climate, inclusion practices, and educator preparedness across DEIS and non-DEIS schools in urban and rural settings. The bioecological framework enabled analysis of microsystem interactions, mesosystem connections, exosystem influences, and macrosystem values affecting children's acculturation trajectories.

Findings reveal that migrant and refugee children navigate complex bicultural identity formation processes, balancing heritage culture maintenance with host culture adoption. However, significant disconnections between ecological system levels create psychological stress and impede healthy acculturation. While educators demonstrated strong commitment to fostering belonging, they operate within inadequately supported structures. Children's sense of belonging and psychological adjustment varied significantly based on culturally responsive practices, multilingual support, peer relationships, and teacher understanding of acculturation challenges.

Critical barriers included linguistic isolation, cultural misunderstandings affecting self-concept, social exclusion experiences, and limited institutional capacity for supporting bicultural identity development. Many children experience acculturative stress from conflicting cultural expectations across home and school environments.

This research demonstrates how ecological systems interact to shape adaptation outcomes for migrant and refugee children in educational contexts, with implications for developing trauma-informed, culturally responsive educational practices that support healthy bicultural identity formation, reduce acculturative stress, and promote psychological wellbeing alongside academic integration.

MEDIATING ROLE OF GRIT AND OPTIMISM IN ASSOCIATION BETWEEN SELF-ESTEEM AND PSYCHOLOGICAL WELL-BEING AMONG STUDENTS WITH MOBILITY DISABILITY: A SERIAL MEDIATION MODEL

Lata S.*, Kumar S.

Banaras Hindu University ~ Varanasi ~ India

This study investigates the relationship between self-esteem and psychological well-being among students with mobility disabilities, focusing on the mediating roles of grit and optimism. Grounded in positive psychology, the research adopts a cross-sectional quantitative design involving a sample of university students with disabilities. The present study employed the serial mediation model to examine the serial mediation effects of grit and optimism in the relationship between self-esteem and psychological well-being. 203 participants with mobility disability were selected using a purposive sampling technique from various institutions of Uttar Pradesh. Standardized measures were used to assess self-esteem, grit, optimism, and psychological well-being. The findings indicate a significant positive association between self-esteem and psychological well-being. Moreover, grit and optimism were found to partially mediate this relationship, suggesting that higher self-esteem contributes to greater psychological well-being through enhanced grit and a more hopeful outlook. These results underscore the importance of fostering self-esteem and cultivating personal strengths like grit and optimism to promote mental health and well-being in students with physical disabilities. Implications for educational policies and support programs aimed at inclusive psychological development are discussed.

Abstract 346

AWARENESS OF STAKEHOLDERS ABOUT INCLUSIVE EDUCATION

Berwal S.*

Chaudhary Ranbir Singh University ~ Jind, Haryana ~ India

Inclusive education in India involves educating children with disabilities alongside non-disabled children in the same physical, social, and emotional environment with necessary support services. Despite two decades of its implementation, the educational status of children with disabilities remains disheartening, primarily due to the lack of awareness among stakeholders about inclusive education. This study aims to assess the level of awareness among stakeholders in Haryana State, providing recommendations to improve the educational standards of children with disabilities. The sample includes 30 school heads, 108 class teachers, 44 parents, and 28 School Management Committee members, with data collected through a self-constructed thirty-item awareness questionnaire and analysed using descriptive statistics. The findings indicate that stakeholders are generally well-informed about inclusive education, with parents being the most aware. Female stakeholders and those with higher educational qualifications demonstrated greater awareness. However, the study reveals that awareness alone is not a significant factor contributing to the poor educational standards of children with disabilities in Haryana. This study is justified by the need to identify the actual barriers to effective inclusive education and to provide actionable insights for policymakers. It recommends that authorities allocate more funds to determine the root causes of poor academic performance and organize continuous capacity-building programs, such as workshops, seminars, and conferences, to enhance stakeholder awareness further.

THE RELATIONSHIP BETWEEN PARENT–CHILD COMMUNICATION FREQUENCY AND MATHEMATICS LEARNING BEHAVIOR: THE MEDIATING ROLE OF LEARNING ANXIETY WITH GENDER DIFFERENCES

Chang Y.C.*, Tang Y.

National Cheng Kung University ~ Tainan City ~ Taiwan

Parent–child interactions play a vital role in students' learning and development. In today's families, these interactions occur in diverse ways—sometimes squeezed into busy routines, sometimes through digital tools—and tend to be brief and fragmented. As a result, the frequency of interaction has become a meaningful reflection of consistent parental involvement. Gender differences also warrant attention. Prior research has indicated that girls tend to interact more frequently with parents than boys, yet boys' achievement is not necessarily weaker, suggesting different psychological pathways. Most studies focus on achievement, with less attention to underlying psychological mechanisms.

This study conducted a secondary analysis using PISA 2022 data from 17,304 students in Taiwan, Japan, and Korea. Missing data were addressed with multiple imputation. The analysis was carried out in R using multi-group SEM to examine the mediating role of learning anxiety, and Wald tests were applied to assess gender differences.

The results revealed three key findings.
(1) Communication frequency and learning behaviors:
More frequent parent–child discussions about schoolwork and daily life were linked to stronger mathematics learning behaviors, such as more active class participation and attentiveness.
(2) Partial positive mediation of learning anxiety:
Frequent communication was associated with higher anxiety, which in turn fostered more active learning behaviors.
(3) No significant gender difference:
Boys and girls showed a similar pattern with frequent communication, experiencing higher anxiety alongside stronger learning behaviors. This suggests that all students benefit from regular parental interaction.

Parent–child communication frequency is related not only to students' emotions but also to their concrete behaviors. For parents, this may help ease concerns, as simply keeping regular conversations can support positive mathematics learning behaviors for

both boys and girls. At the same time, the findings suggest that moderate levels of anxiety may sometimes motivate greater effort, reflecting its complex role in learning.

Abstract 7

INTERTWINING IDENTITIES: THE DEVELOPMENT OF GENDER IDENTITY AND LEADERSHIP AMONG LGBTQ+ STUDENT LEADERS IN TAIWANESE UNIVERSITIES

Chang T.*[1], Wong G.[1], Chung D.[2], Wang C.[1]

[1]National Dong Hwa University ~ Hualien ~ Taiwan, [2]Soochow University ~ Taipei ~ Taiwan

This study explores the interconnected development of gender identity and leadership among LGBTQ+ student leaders in Taiwanese universities. Motivated by Taiwan's gender movement—from the Peng, Wan-Ru case and the Yeh, Yung-Chih incident to marriage equality—this research examines the significant role LGBTQ+ student organizations play in shaping campus activism and gender discourse. Unlike general student organizations, LGBTQ+ groups exhibit distinct recruitment, community-building, leadership, and mobilization dynamics, shaped by their members' diverse gender experiences.

Despite the legalization of same-sex marriage, negative stereotypes about LGBTQ+ individuals persist in Taiwan. University student organizations, including LGBTQ+ groups, face increasing operational challenges, compounded by the absence of leadership training programs tailored for LGBTQ+ students. This study seeks to document and preserve the leadership experiences of past LGBTQ+ student leaders.

Using qualitative narrative interviews and data simplification analysis, this research investigates the leadership journeys of 10 LGBTQ+ students who came out during university and held leadership roles in LGBTQ+ student organizations. Semi-structured interviews reveal that five cisgender male participants experienced gender-based oppression during their formative years. LGBTQ+ identity development, from personal recognition of sexual orientation to a broader affirmation of "I am LGBTQ+," was significantly reinforced through participation in LGBTQ+ student groups. While leadership identity varied, all interviewees expressed a strong sense of purpose, encapsulated in the idea of "doing something meaningful for one's life and identity."

This study addresses the gap in research on LGBTQ+ leadership identity development in Taiwanese higher education and beyond. Its findings offer insights for future gender education, university administration, student affairs curriculum development, and policy-making, contributing to more inclusive leadership training and support structures for LGBTQ+ students.

Abstract 1182

PERCEPTIONS AND CONTESTATIONS OF HETERONORMATIVITY AMONG ASPIRING HUMAN RESOURCES PROFESSIONALS IN SPAIN

Corlett S.*[1], Di Marco D.[2], Arenas A.[2]

[1]Universidad de Valladolid ~ Segovia ~ Spain, [2]Universidad de Sevilla ~ Sevilla ~ Spain

Heteronormativity in workplace settings can adversely affect LGBTQ+ individuals as well as cisgender heterosexual people who do not fully align with its norms. This qualitative study examines how aspiring Human Resources professionals in Spain perceive, reproduce, and challenge heteronormativity within organizational contexts. Through four focus groups involving 24 university students, participants engaged with a fictional scenario to explore manifestations of heteronormativity. Their discussions revealed its presence in gendered role assignments, leadership structures, aesthetic expectations, and interpersonal dynamics. A recurring theme was the power imbalance that privileges hegemonic masculinity, with men facing stricter penalties than women when deviating from normative standards. Although participants acknowledged evolving societal attitudes in Spain, they observed that men often resist change due to the advantages conferred by heteronormative norms. Furthermore, despite a general climate of acceptance toward LGBTQ+ identities, traditional family expectations continue to generate tension. Participants expressed a range of attitudes, from reinforcing heteronormativity to critically reflecting on it, sometimes recognizing their own complicity or using humor to expose normative pressures. The study underscores the pivotal role of educational institutions in shaping the values and perspectives of future organizational leaders.

MULTIDISCIPLINARY COLLABORATION WITHIN TRANSITION SERVICES FOR STUDENTS WITH NEURODEVELOPMENTAL DISORDERS

Sekula M.*[1], Sekula A.[2], Hajovsky D.[1]

[1]Texas A&M University ~ College Station ~ United States of America, [2]John Peter Smith Hospital ~ Fort Worth ~ United States of America

Research suggests that 8.5% of children in the United States, and 15% worldwide have a neurodevelopmental disorder (NDD) (Gidziela et al., 2023; Yang et al., 2022). NDDs include autism spectrum disorder (ASD), attention-deficit/hyperactivity disorder (ADHD), intellectual disorder (ID), communication disorders, learning disabilities (LD), and motor disorders (APA, 2015). These disorders persist across the lifespan yet, there is limited research on the developmental trajectory after children leave K-12 education. Transition services are aimed at assisting the student and family to continue to reach goals in post-secondary education. The goals of this presentation will be to illustrate a multidisciplinary perspective on transition services, highlight current literature and recommendations on collaboration, and inform the audience on techniques for successful transition.

SEXUAL EDUCATION IN SCHOOL

Bones Rocha K.*[1], Affonso Gomes G.[1], Perinetto Pontel V.[1], Sanchez--Garcia R.[2]

[1]Pontifícia Universidade Católica do Rio Grande do Sil ~ Porto Alegre ~ Brazil, [2]Universidad Autónoma de Madrid ~ Madrid ~ Spain

The term sexual education encompasses a whole set of information, skills and values to allow young people to exercise their sexual and reproductive rights and make decisions about their health and sexuality (UNESCO, 2010). The objective of this study is to present the results of the pilot study of the cross-culturally adapted version of the SATZ intervention for middle school students in Porto Alegre (Brazil). This is a quantitative study with a quasi-experimental design with pre and post intervention evaluation. Participants were 30 adolescents with an average age of 15.2 years (DE=0.92). The variables evaluated were the intention to use the condition, assertive communication, knowledge and stigma related to HIV. Preliminary results indicate that 36.4% of adolescents declare that they have had sexual relations. Comparing the responses to pre and post intervention, there is a greater intention to always use the condition in the coming months (68.6% pre and 87.1% post). Respect for knowledge and stigma about HIV: “Healthy profit even with HIV?” (68.6% responded that it was before and 93.5%). In the question “whether young people with HIV should be allowed to attend school” they argued that 62.9% pre and 87.1% post. In the same direction, to the statement “I would visit a friend who was infected with HIV”, 62.9% responded “accordingly” (previously) and 80% in the post. It is observed that a greater proportion of adolescents reported feeling comfortable talking about using the conditioner with their couple (pre 70.6% and post 90.3%) and convincing their couple to use the conditioner (pre 74.3% and post 93.1%). The data presented are preliminary, but they show that students have adhered to the intervention, and the initial results indicate that the intervention has positive effects, which must be confirmed with the expansion of the sample.

Abstract 1342

EXPLORING IMPLEMENTATION STRATEGIES IN A NATIONWIDE SCHOOL MENTAL HEALTH PROGRAM: A MIXED-METHODS APPROACH

Leiva L.*, Sanchez F., Carreño C.

University of Chile ~ Santiago ~ Chile

Introduction: School-based mental health interventions constitute one of the most effective responses to the increasing prevalence of mental health problems among children and adolescents, demonstrating a positive impact globally. However, their implementation faces significant challenges related to the need to identify and adapt strategies to the school context in order to achieve the intended objectives.
Objective: This study aimed to explore the implementation strategies of a preventive school mental health intervention at the national level, incorporating the perspectives of the involved educational communities.
Methodology: A sequential exploratory mixed-methods design was employed. In the qualitative phase, a multiple-case study was conducted, with implementation teams as the units of analysis. Four cases were included, in which the following were carried out: (a) structured observations of school-based mental health prevention sessions (10 sessions per case; N = 40), and (b) semi-structured interviews with members of the implementation teams (n = 16). Data were analyzed using content analysis, which allowed for the identification and systematization of implementation strategies. Subsequently, in the quantitative phase, hierarchical cluster analysis was applied based on a consensus clustering matrix that integrated the qualitative findings.
Results: Fifteen implementation strategies were identified and organized into four clusters: (1) Diagnosis and Planning, (2) Training and Technical Support, (3) Collaboration and Networking, and (4) Implementation and Sustainability.
Discussion and Conclusions: The findings highlight that effective implementation requires not only technical training but also the consolidation of collaborative networks, the promotion of the well-being of school actors, and the development of sustainability mechanisms. In this regard, the proposed model—based on initial diagnosis, capacity building, alliance formation, and adaptive monitoring—constitutes a comprehensive framework that enhances the feasibility and impact of school mental health practices.

FIVE YEARS AFTER THE PANDEMIC: ENHANCING PREADOLESCENTS' SOCIAL SKILLS, SOFT SKILLS, AND SELF-EFFICACY THROUGH A SCHOOL-BASED INTERVENTION IN THE BERGAMO AREA

Pelizzari S.[1], Zambetti E.[1], Crepaldi M.[1], Regonesi M.[2], Barbato L.[2], Pontoglio F.[2], Greco A.*[1]

[1]University of Bergamo ~ Bergamo ~ Italy, [2]ASST Bergamo Ovest ~ Bergamo ~ Italy

Introduction: The pandemic has led to greater reflection on the well-being of pre-adolescent students, who have experienced a period of isolation. The literature highlights the emergence of problems such as social withdrawal, risk of school dropout, and difficulties in social communication.

Purpose: Organize psychoeducational groups, led by local psychologists, using strategies to improve self-efficacy and promote soft skills to help students cope with possible isolation and loneliness.

Method: A total of 395 preadolescents participated in the intervention, with an average age of 10.7 years (M = 207, 52.4%; F = 188, 47.6%). Six psychoeducational sessions were conducted across five middle schools in the province of Bergamo, focusing on emotion regulation, assertive communication, self-efficacy and group dynamics. A battery of pre- and post-intervention assessments was administered, including the Soft Skills Self-Evaluation Questionnaire (3SQ), the Perceived Social Self-Efficacy Scale (ASP/G), the Perceived Self-Efficacy Scale for Negative Emotions (APEN/G), and the Perceived Self-Efficacy Scale for Positive Emotions (APEP/G). Paired-sample t-tests were performed to analyze the data.

Results: The results show an improvement in self-efficacy beliefs post-intervention related to negative emotions ($t(369)=-2,17$, $p<0.05$) and in beliefs of social self-efficacy ($t(369)=-3.11$, $p<0.05$). Furthermore, the results of the Soft Skills show a slight decrease in the autonomy scores ($t(369)=-1,77$, $p<0.05$) and collaboration ($t(369)=-2,22$, $p<0.05$). Finally, a trend towards significance in self-confidence is highlighted with an improvement in the score ($t(369)=-1,51$, $p=0,065$).

Conclusions: The results highlight the value of projects focused on the development of soft skills. Improvements in self-efficacy related to the management of negative emotions and social interactions suggest a positive impact on social difficulties and the risk of school dropout.

Abstract 457

A MIXED-METHODS EXPLORATION OF TEACHER SOCIAL-EMOTIONAL COMPETENCE: PROFILES AND PSYCHOLOGICAL ADJUSTMENT

Chang C.*, Lan Y.C.

Tamkang University ~ New Taipei City ~ Taiwan

Teachers serve as pivotal change agents, and robust social-emotional competencies (SEC) are essential for promoting student development and managing classroom complexities. This multi-site, mixed-methods study investigated distinct teacher SEC profiles and their associations with psychological adjustment across two cultural contexts using person-centered analytical approaches. Quantitative and qualitative data were collected from K–12 teachers in Canada (N = 100), primarily in Quebec and Saskatchewan, and from elementary teachers in the Greater Taipei area, Taiwan (N = 238). Both studies were guided by the Collaborative for Academic, Social, and Emotional Learning (CASEL) framework, with outcome measures including work engagement and general well-being. Five core SEC domains were assessed: relational self-efficacy (teachers' confidence in building supportive relationships with diverse students), multicultural attitude (beliefs in the value of culturally inclusive education), warmth provision (emotional support and caring behaviors), emotional regulation (cognitive reappraisal and expressive suppression), and decision-making skills (option generation and consequence evaluation). Cluster and latent profile analyses identified four SEC profiles among Canadian teachers— "Socially Engaged," "Rational," "Emotionally Suppressed," and "Emotionally Uncontrolled"—and three profiles among Taiwanese teachers— "Socially Engaged," "Open Expression," and "Decision-Making Deficient." Across both sites, teachers with more adaptive SEC profiles consistently reported significantly higher levels of work engagement and well-being, while less adaptive profiles were associated with lower psychological adjustment. Qualitative findings further illuminated culturally embedded coping strategies, including distinctive patterns of emotional suppression observed in the Taiwanese context. The present study highlights the universal relevance of SEC in supporting teacher well-being and professional functioning. The identification of culturally nuanced profiles underscores the importance of differentiated professional development and institutional support tailored to educators' socio-emotional needs. Strengthening SEC across diverse educational systems may cultivate a more resilient, emotionally competent, and engaged global teaching workforce, ultimately enhancing classroom climate and advancing student social-emotional learning.

Abstract 671

HOW TO REDUCE TEACHER BURNOUT? THE EFFECTS OF TEACHER PROFESSIONAL IDENTITY, COMPETENCE AND GROWTH, WORK ENGAGEMENT, AND PERCEIVED ORGANIZATIONAL SUPPORT

Li X.*[1], Gong M.[2], Zhang Y.[1]

[1]Zhejiang Normal University ~ Jinhua ~ China, [2]Lanxi Shuguang School ~ Lanxi ~ China

Introduction. Teacher burnout is the exhaustion of emotions, attitudes, and behaviors caused by teachers' long-term stress experience. Long-term job burnout affects not only teachers' physical and mental health but also students' academic achievement, learning motivation, and happiness. To alleviate the negative effects of teacher burnout, exploring the protective and moderating factors is necessary. Purpose. This study explored the mediating mechanism underlying the relationship between professional identity and teacher burnout and the moderating roles of competence and growth values (i.e., personal resource), and perceived organizational support (i.e., organizational resource). Method. 2,710 teachers from kindergarten, primary schools, middle schools, and high schools completed a survey. SPSS 23.0 (PROCESS macro) was used to conduct the mediation analysis, moderation analysis, and moderated mediation analysis. Results. Results showed that work engagement partially mediated the relationship between professional identity and teacher burnout. Moreover, when the scores of competences and growth as well as perceived organizational support, are high, the predictive effect of teacher professional identity on burnout through work engagement was the biggest. Conclusions. This study indicated that different resources may play different roles in the process of reducing teacher burnout. Some implications were provided for alleviating teacher burnout.

Abstract 677

TEACHERS' AI LITERACY: LINKING DIGITAL READINESS TO SUBJECTIVE WELL-BEING

Liang Q.[1], Wang Y.[1], Chen L.L.*[2], Zhuo J.[3], Li W.[4], Li M.[5]

[1]Jinan University ~ Guangzhou ~ China, [2]University of Hong Kong ~ Hong Kong SAR ~ Hong Kong, [3]Beijing Normal University at Zhuhai ~ Zhuhai ~ China, [4]Lingnan University ~ Hong Kong SAR ~ Hong Kong, [5]Nanjing Normal University ~ Nanjing ~ China

Given the evolving digitalization in education, teachers' artificial intelligence (AI) literacy has become increasingly important for professional development. On the basis of the data collected from 189 primary and secondary school teachers, this study aims to (1) assess teachers' AI literacy in four dimensions (i.e., affective, behavioral, cognitive, and ethical learning), (2) investigate how teachers' background characteristics (e.g., gender, teaching experience, and educational background) and technological knowledge (e.g., digital readiness) are related to their AI literacy, and (3) examine whether AI literacy mediates the relationship between digital readiness and subjective well-being. Results show that the participating teachers generally demonstrated a high level of overall AI literacy, with outstanding performance in the ethical and behavioral dimensions, yet room for improvement in the cognitive dimension. Gender, teaching experience, and educational background did not significantly link to AI literacy, whereas digital readiness was positively related to AI literacy. Furthermore, AI literacy played a significant positive mediating role between digital readiness and subjective well-being. This study reveals AI literacy's contribution to teachers' holistic development, underscoring its importance in promoting teachers' subjective well-being in the digital education context.

Abstract 508

CLUSTER ANALYSIS OF RISK–PROTECTION PROFILES BASED ON TEACHER WORK STRESS AND SAVORING STRATEGIES: ASSOCIATIONS WITH PSYCHOLOGICAL WELL-BEING

Lu C.*[1], Ma Y.[2], Chen H.[1]

[1]Department of Educational Psychology and Counseling, National Taiwan Normal University ~ Taipei ~ Taiwan, [2]New Taipei Municipal Zhongshan Junior High School ~ New Taipei ~ Taiwan

Teachers' psychological well-being is closely linked to the effectiveness of teaching, making its promotion a critical priority for fostering high-quality education. However, teaching is widely recognized as a highly stressful profession, and work-related stressors can pose substantial risks to well-being. While previous research has suggested that savoring strategies may buffer the negative effects of work stress on psychological well-being, these variable-centered studies often assumed homogeneity in teachers' work stress levels, thereby limiting the ecological validity of their findings. To address this gap, the present study adopted a person-centered approach, using cluster analysis to identify distinct risk–protection profiles based on teacher work stress and savoring strategies. Participants were 328 secondary school teachers who completed the Teacher Work Stress Scale, the Psychological Well-Being Scale, and the Savoring Strategies Scale for Teachers developed for this study. Descriptive statistics, cluster analysis, chi-square tests, and analysis of covariance (ANCOVA) were conducted using SPSS, revealing four distinct clusters: Moderate Stress–High Savoring, Low Stress–High Savoring, Moderate Stress–Moderate Savoring, and Low Stress–Moderate Savoring. Gender and teaching position (teaching-only, teaching with homeroom duties, teaching with administrative duties) were not significantly associated with cluster membership. Teachers in the Moderate Stress–High Savoring and Low Stress–High Savoring clusters reported the highest levels of psychological well-being, whereas those in the Moderate Stress–Moderate Savoring cluster reported the lowest; the Low Stress–Moderate Savoring group demonstrated significantly higher well-being than the Moderate Stress–Moderate Savoring group, but lower than both high-savoring clusters. These findings provide strong evidence that promoting savoring strategies can protect teachers from the detrimental effects of work stress across different stress levels. The study offers actionable implications for school psychology research and practical applications aimed at enhancing teacher well-being.

Abstract 46

WILL STUDENTS' INCIVILITY AFFECT TEACHERS' THRIVING AT WORK?

Luo Y., Xu A.*, Chen C.

Beijing Normal University ~ Zhuhai ~ China

Thriving at work, i.e., the sense of learning and vitality, is an important indicator of individual psychological well-being. Understanding what promotes teachers' thriving is critical for effective school functioning. While accumulated studies have revealed the impact of work resources and contexts on teachers' thriving, we know little about whether students' behaviors will affect teachers' thriving. This is important to know because students' behaviors stand as an important work context facing teachers. And revealing how and when this happens will help scholars and practitioners further gain a better knowledge to foster teachers' thriving.

By integrating the interpersonal sensemaking theory into the socially embedded model of thriving at work, this study investigates whether, how, and when students' incivility, an increasingly common behavior in school, impacts teachers' thriving. We propose that students' incivility undermines teachers' work meaningfulness, thereby negatively affecting their thriving. Nevertheless, a high-quality leader-member exchange relationships with immediate supervisors are hypothesized to mitigate the detrimental effects of students' incivility on teachers' work meaningfulness and subsequent thriving. Results from a two-wave survey study involving 180 primary and secondary school teachers in the Guangdong Province of China support our hypotheses.

Our study contributes to extant literature in multiple ways. First, this study adds new knowledge to the antecedents of teachers' thriving at work from a teacher-student interaction perspective. The integration of the interpersonal sensemaking theory into the socially embedded model of thriving further enriches the theoretical foundations of existing thriving studies. Second, while existing studies have employed job characteristics model to reveal the impact of different job characteristics on teachers' work meaningfulness, our focus on the interpersonal sensemaking process preceding work meaningfulness extends this line of research. Third, on a practical level, the moderating role of LMX further enlightens practitioners regarding how to promote teachers' thriving by helping them cope with students' incivility.

Abstract 692

IDENTIFYING WELL-BEING-RELATED FACTORS IN TEACHERS: AN APPLICATION OF MACHINE LEARNING AND NETWORK ANALYSIS

Xue D.*[1], Xiao W.[2]

[1]KU Leuven ~ Leuven ~ Belgium, [2]Zhejiang normal university ~ Jinhua ~ China

As the primary implementers of educational activities, teachers' sense of well-being directly shapes their career sustainability and quality of life, while also exerting an indirect influence on students. In recent academic research, a shift has occurred toward adopting more robust methodological approaches, such as machine learning, to identify critical predictors of teachers' workplace well-being (WWB). The present study evaluated four distinct machine learning algorithms and ultimately selected the optimal model (random forests) to identify factors associated with educators' WWB. Complementarily, network analysis was employed to examine the associations between these predictive factors and WWB, aiming to inform targeted intervention strategies for future application. A total of 4,081 Chinese teachers participated in this study. Through latent profile analysis, these participants were categorized into three distinct subgroups: the "low WWB" profile, the "medium WWB" profile, and the "high WWB" profile. The random forest model, which demonstrated satisfactory performance, identified the top 10 predictive features from 19 variables linked to WWB. Results from the network analysis revealed notable differences in core predictive nodes across the three WWB subgroups. Specifically, increasing structural job resources emerged as the core node in the low WWB subgroup; role values functioned as the central variable in the medium WWB subgroup; and increasing challenging job demands stood out as the primary central node in the high WWB subgroup. Additionally, a directed acyclic graph was constructed to model the potential causal relations among the items under investigation. Furthermore, these key identifying factors provide valuable insights for designing future intervention programs tailored to teacher groups with medium and low levels of WWB.

CRACKS IN THE CHALKBOARD: THE INTERPLAY OF ORGANIZATIONAL DEMANDS, RESOURCES, AND PRACTICES AND TEACHERS' (UN)WELL-BEING AND PERFORMANCE

Oliveira S.[1], Marques--Pinto A.*[2]

[1]ISCTE - Instituto Universitário de Lisboa, Business Research Unit (BRU-Iscte) ~ Lisbon ~ Portugal, [2]Universidade de Lisboa, Faculdade de Psicologia, CICPSI ~ Lisbon ~ Portugal

Teacher burnout is a critical issue worldwide, leading to teacher shortages and high turnover rates. Although theoretical perspectives often highlight the influence of contextual factors on burnout, the role of (positive) organizational characteristics is frequently overlooked, with most focus placed on individual factors. The HEalthy and Resilient Organization (HERO) Model suggests that healthy organizational resources and practices contribute to developing healthy employees and achieving organizational success. Our study aimed to adapt and evaluate the Portuguese version of the HERO Check diagnosis tool. We also explored the relationship between organizational demands, resources, and practices and teachers' (un)well-being and performance in a subsample of education professionals. Our sample consisted of 1,295 Portuguese workers (74.7% female, M = 49.17 years, SD = 10.22), comprising 924 teachers and 371 general workers. The HERO check tool consists of three questionnaires: Healthy Organizational Practices and Resources (job demands, job resources, and practices); Healthy Employees (personal resources and (un)well-being); and Healthy Organizational Outcomes. Factor analysis confirmed the structural validity and reliability of the questionnaires. Structural equation modeling revealed an acceptable fit of the theoretical HERO model for applied settings. Multi-group invariance was attained across gender, work context, and instructional level. Comparative analyses indicated that teachers perceived higher job demands than non-educational workers, but perceived similar levels of job and personal resources, (un)well-being, and organizational outcomes. This suggests that while support structures were perceived as similarly accessible, the specific pressures of education appear to be more salient. Additionally, healthy organizational practices were perceived as underdeveloped across Portuguese workplaces. Regression analyses supported the predictive role of organizational demands, resources, and practices on teachers' personal resources, (un)well-being, and performance. These findings underscore the importance of context-sensitive tools in assessing and promoting healthy workplaces. Addressing teaching demands while strengthening organizational resources is key to retaining and engaging teachers effectively.

Abstract 2555

DEVELOPMENT AND PRELIMINARY VALIDATION OF THE "TEACHERS' BOUNDARIES BETWEEN PERSONAL LIFE AND PROFESSIONAL ROLE QUESTIONNAIRE

Baroncelli A.*[1], Facci C.[2], Iacopino M.[3], Paoli M.[1], Tomberli L.[2], Capurso M.[1], Mazzeschi C.[1], Del Vecchio E.[1], Ciucci E.[2]

[1]University of Perugia ~ Perugia ~ Italy, [2]University of Florence ~ Florence ~ Italy, [3]Independent Scholar ~ Independent Scholar ~ Italy

Introduction

By applying some principles of Salvador Minuchin's Structural Family Therapy, it is possible to describe teachers as systems including two interconnected subsystems: one referring to personal characteristics and skills, and the other to characteristics and skills related to their professional role (Baroncelli et al., 2024). In line with this, three types of boundaries between personal and professional life have been described: rigid, which indicate a clear separation between personal and professional dimensions; diffuse, reflecting overlapping or confusion between roles; and clear, which represent an adaptive exchange between the characteristics of the two subsystems.

Research objectives

This study presents the development and preliminary validation of the "Teachers' Boundaries between Personal Life and Professional Role Questionnaire - TBQ", a self-report tool based on the theoretical framework proposed by Baroncelli and colleagues (2024).

Methodology

738 teachers (95.00% females; mean professional seniority = 19.00 years, SD =11.30), from kindergartens, primary schools, and lower secondary schools located in north-central Italy completed self-report questionnaires, including the TBQ and other measures concerning personal well-being and professional burnout.

Results

A CFA showed satisfactory fit indices ($\chi 2$ = 276, df = 87, $p < .001$; CFI = .918, TLI = .901, SRMR = .056, RMSEA = .059) for a three-factor structure: rigid boundaries (5 items, Mc Donald's ω = .77), diffuse boundaries (5 items, Mc Donald's ω = .74), and clear boundaries (5 items, Mc Donald's ω = .74). Multi-group invariance was demonstrated across levels of professional seniority, role category (subject vs. special education teachers), and school level. Associations with measures of personal well-being and professional burnout emerged, moderated by professional seniority and

school level.

Conclusions
The results highlight the importance of considering teachers both as professionals and as individuals, two facets that need to interact through well-defined boundaries to foster well-being and adequate role adaptation.

Abstract 847

WHEN FLOW MEETS EMOTION REGULATION: MULTILEVEL EVIDENCE FROM STUDENTS' CARDIAC RESPONSES IN EDUCATIONAL SETTINGS

Huang E.*, Chang Y., Lo M.

National Yang Ming Chiao Tung University ~ Hsinchu ~ Taiwan

Learning involves both psychological and physiological processes, yet few empirical studies have examined these dimensions concurrently in educational contexts. Prior research has separately linked motivation- and engagement-related factors (e.g., perceived challenge, competence beliefs, flow) and emotion regulation (ER) to cardiac responses such as heart rate (HR) and heart rate variability (HRV). However, little is known about how these factors jointly shape students' cardiac activity during the learning process. Therefore, this study aimed to investigate these associations and to examine whether ER interacts with motivation- and engagement-related factors in predicting HR and HRV.

Thirty-three university students participated in a computer-based programming learning task aimed at developing proficiency in the R programming language. The task consisted of seven phases with specific activities. ER was assessed at the training session. Throughout learning, participants were equipped with Biosignalplux wireless monitoring patches on their hands and body to record cardiac activity and reported perceived challenge, competence beliefs, and flow immediately after each phase. Physiological and self-report data from 231 learning events were analyzed with multilevel modeling.

Students with strong competence beliefs and better ER showed lower HR, whereas higher flow was linked to elevated HR. For HRV, greater levels of competence beliefs and ER corresponded to increased HRV, while higher levels of flow were associated with reduced HRV. Perceived challenge showed no significant effect on either HR or HRV. Furthermore, ER moderated the effect of flow on physiological responses, with greater ER attenuating HR and promoting HRV.

This study provides new insights into the relationships between perceived challenge, competence beliefs, flow, ER, and cardiac responses during learning. Importantly, ER moderated the impact of flow, buffering the increase in HR and supporting HRV. In particular, students with greater emotional regulatory capacity were better able to maintain optimal cardiac responses during higher flow states.

Abstract 289

"IT'S NOT ABOUT PASSION NOW-IT'S RESPONSIBILITIES": CHINESE TEACHERS' EXPANDING ROLES AND BURNOUT UNDER THE DOUBLE REDUCTION POLICY

Lin P.[1], Ma J.[1], Zhou Q.[2], Zhang J.[1], Zou W.[3], Li Q.*[1]

[1]Wenzhou-Kean University ~ Wenzhou ~ China, [2]University of Illinois Urbana-Champaign ~ Champaign ~ United States of America, [3]University of Pennsylvania ~ Philadelphia ~ United States of America

The "Double Reduction" policy (DRP), enacted by the Chinese government in 2021, was primarily designed to reduce students' academic burdens by limiting homework assignments and off-campus tutoring activities. Nevertheless, the policy essentially reshaped the professional responsibilities and roles of teachers, emphasizing a notable increase in non-instructional tasks such as after-school services and psychological counseling. Employing a mixed-method research design, this study explored the relationship among teachers' perceived changes in workload following the DRP implementation, their experiences of role ambiguity and overload, and resultant burnout. Quantitative analysis based on responses from 325 teachers indicated significant increases in non-instructional workloads, which were (in)directly associated with elevated levels of burnout, mediated primarily through increased role ambiguity and overload. Complementing these findings, qualitative insights from semi-structured interviews with 13 teachers provided a deeper understanding. Interviewees highlighted a pervasive role ambiguity arising from unclear standards and expectations surrounding their expanded non-instructional responsibilities, compounded by inadequate institutional training and support. Teachers frequently expressed feeling overwhelmed by diverse new duties, resulting in role overload. They described the necessity of becoming multi-functional professionals to fulfill expectations in areas previously beyond their scope. Furthermore, teachers reported substantial role conflict as these non-instructional duties encroached upon their core instructional responsibilities, causing increased stress, reduced efficiency, and diminished teaching effectiveness. Collectively, these pressures contributed to a pronounced shift in professional identity—from traditional educators toward service-oriented public providers—required to balance multifaceted demands from students, parents, and broader societal expectations. Despite the challenges faced by teachers, the DRP positively impacted students by alleviating academic stress and increasing their engagement in extracurricular physical activities. Yet, the policy's effectiveness displayed notable variability, influenced significantly by regional disparities, economic contexts, and specific professional roles held by teachers (e.g., class supervisors versus non-supervisors, subject-specific teachers with administrative duties), resulting in sharply polarized outcomes.

Abstract 4579

POSITIVITY RESONANCE IN EDUCATION: A RELATIONAL INTERVENTION TARGETING TEACHER AND STUDENT WELL-BEING

Wang J.*

The University of Hong Kong ~ Hong Kong ~ Hong Kong

Educational systems face interconnected challenges: declining student mental health and rising teacher burnout, particularly in high-pressure academic contexts. While positive teacher-student relationships are foundational to student academic and emotional outcomes and teacher well-being, existing interventions adopt individual-focused approaches that fail to leverage relational dynamics through which well-being naturally emerges in social interactions.

This research aims to investigate positivity resonance—moments of shared positive emotions, mutual care, and behavioral synchrony—as a relational mechanism uniquely suited to address these challenges. As teacher burnout compromises the capacity to provide one-way emotional support, this approach builds upon the reciprocal nature of teacher-student relationships, where positivity resonance operates bidirectionally, benefiting both simultaneously. The study examines whether structured practices cultivating these micro-moments accumulate over time to promote sustainable outcomes across individual, relational, and classroom levels.

A longitudinal mixed-method study will involve approximately 200 Chinese high school students (ages 15-18) and 20 teachers assigned to intervention and comparison conditions. The 8-week intervention integrates shared positive emotions (positivity journals, appreciation circles), mutual care (focused acknowledgment), and synchronous practices (loving-kindness meditation). Analyses will employ pre-post comparisons, multilevel modeling to capture nested data structures, and mediation analyses to test relationship quality as a mechanism linking intervention to outcomes.

The study is expected to demonstrate intervention effects at multiple levels: enhanced individual well-being and personal resources for both students and teachers, strengthened teacher-student relationship quality, and improved classroom climate and collective resilience. Findings are anticipated to show that relationship quality mediates intervention effects on individual outcomes, while repeated micro-moments of positivity resonance accumulate to generate emergent collective benefits.

This research extends positivity resonance theory to hierarchical educational relationships, advancing understanding of how interdependent well-being processes

address individual and systemic challenges. Findings may inform relationship-focused approaches that promote sustainable well-being within educational systems and generate mutually beneficial outcomes for teachers and students.

INTEGRATING SOCIAL EMOTIONAL LEARNING ACROSS EDUCATIONAL CONTEXTS: STAKEHOLDER EXPERIENCES AND IMPLEMENTATION CHALLENGES

Saturday 25 July 2026 from 09:30 to 11:00

(H-Spadolini)

Chinu Agrawal (SAM Global University ~ Bhopal ~ India), Chair and Discussant
Tushar Singh (Banaras Hindu University ~ Varanasi ~ In), Co-Chair

It is well established that fostering well-rounded individuals requires the integration of Social Emotional Learning (SEL) with academic learning from early childhood. A purposeful emphasis on SEL leads to improved coping mechanisms, enhanced academic performance, and the development of crucial life skills. In this context, the National Education Policy (NEP,2020) of India emphasized experiential and project-based learning in schools. Following this, various SEL curricula entered the mainstream, receiving mixed responses from stakeholders such as teachers, students, parents, and school counsellors.
This symposium brings together five complementary perspectives that explore SEL integration across diverse educational contexts, ranging from primary schools in India and Malaysia to higher education institutions and multicultural schools in Dubai. They highlight stakeholder experiences, including insights from students, school counsellors, and school leaders, and emphasize the importance of culturally and contextually responsive program design.
Evidence from various studies that have explored the impacts of India's HEMA Foundation SEL program across various stakeholders demonstrates the benefits of project-based SEL in enhancing teamwork, creativity, and real-world application. Thes studies also report barriers such as time constraints, limited faculty and counsellor capacity, and alignment with existing curricula which present the need for future research/ policy implications to completely harness the potential of such programs in educational settings. Comparative analyses of findings from Malaysia and Dubai further underscore the need for cultural adaptation, aligning core SEL competencies with local values, traditions, and educational philosophies.
Conclusively, this symposium present evidence-based insights, practical strategies, and cross-cultural lessons to underscores the multifaceted contributions of educators, counsellors, and institutional leaders as agents of change in cultivating socially and emotionally competent learners. The symposium is an effort to equip the participants/ audience with understanding of the ways in which SEL can be effectively implemented, scaled, and adapted across diverse educational settings for ensuring both student well-being and holistic development.

Abstract 3730

SOCIAL-EMOTIONAL LEARNING IN MALAYSIA: CULTURAL CONTEXTUALIZATION WITH REFERENCE TO ITS APPLICATION IN INDIA BY HEMA FOUNDATION

Ng A.L.O.*

Sunway University ~ Jaya ~ Malaysia

This paper presents review of research that have studied the outcomes of the application of Social Emotional Learning (SEL) in the Malaysian educational system and highlights some of the issues that warrants further exploration. The paper also makes an effort to compares the applications of Malaysian SEL initiatives with existing SEL initiatives in India, particularly those by the Hema Foundation.

SEL is widely recognized in Malaysia as a key component of holistic education, especially at the preschool and special education levels, and is integrated into subjects such as Health Education for primary school students. Malaysia's national education philosophy emphasizes values-based education and holistic development, integrating spirituality, morality, and ethics. SEL interventions in Malaysia, often based on the Collaborative for Academic, Social, and Emotional Learning (CASEL) framework, have generally shown positive outcomes, including enhanced emotional resilience, improved academic performance, and reduced emotional issues such as anxiety and school refusal. A significant finding from the literature is the need for cultural adaptation of SEL constructs. While the core SEL themes align with the CASEL model, underlying subskills—such as maintaining interpersonal relationships and using experiential and expressive strategies for emotion regulation—reflect unique Malaysian, collectivist cultural values.

Despite its recognition, SEL implementation in Malaysia remains inconsistent. Integration in higher education is minimal, and at the primary level, teachers often report moderate knowledge of SEL but low application in practice. These challenges are discussed in relation to best practices by the Hema Foundation in India, which integrates SEL approaches with traditional cultural values to promote holistic education within the community.

Abstract 3731

UNDERSTANDING STUDENTS' PERSPECTIVES ON SOCIAL EMOTIONAL LEARNING: A QUALITATIVE STUDY

Jindal S.K.*[1], Mukherjee C.M.[2]

[1]Amity University ~ Gurgaon ~ India, [2]Artemis Hospital ~ Gurgaon ~ India

Social Emotional Learning (SEL) is increasingly recognized as a vital element of holistic education. However, the research and program designs for the implication of SEL in education often ignore students' perspectives. This study was designed to explore how students belonging to classes 3 to12 perceive and experience SEL program being implemented through the HEMA Foundation's program. Using focus group discussions and reflective responses, we examined students' insights on the program's relevance, its influence on relationships, self-awareness, and decision-making, as well as the challenges they encountered during project-based activities.

The findings indicate that, in general, students appreciate SEL as meaningful, practical, and closely connected to real-world situations, which suggest that such programs can foster essential life skills beyond the classroom. However, participants also highlighted constraints such as limited time availability and academic pressures, which occasionally hinders their full engagement into these programs. These insights underline the importance of acknowledging students' voices in the development and refinement of SEL initiatives.

By centring student experiences, educators and program designers can create interventions that are both developmentally appropriate and contextually sensitive, enhancing the effectiveness and relevance of SEL. This study demonstrates that listening to learners not only improves program design but also supports their overall well-being and readiness to navigate social and emotional challenges.

Abstract 3732

EXPLORING SCHOOL COUNSELLORS' PERSPECTIVES ON INTEGRATING SOCIAL EMOTIONAL LEARNING INTO THE CURRICULUM

Neogy P.*

IILM University ~ Gurgaon ~ India

Social Emotional Learning (SEL) has been recognized as a critical component of holistic education by researchers, educators, and policy makers. Integration of SEL in school curriculum not only fosters academic success but also promotes emotional well-being, resilience, and positive interpersonal relationships among students. Although these benefits are repeatedly reported by research, the successful integration of SEL into school systems often depends on the active engagement and expertise of school counsellors. They play a very pivotal role in guiding both students and teachers throughout the implementation period of the program.

The present study was an attempt to explore the perspectives and attitudes of school counsellors who have been actively involved in implementing the HEMA Foundation's SEL program across diverse schools in India. In-depth interviews and reflective discussions were carried out with the school counsellors, and the data was analysed using reflexive content analysis.

Findings of the analysis revealed that school counsellors studied in this study strongly value SEL as essential for students' academic growth, emotional regulation, and overall well-being. However, they also reported several challenges which includes limited time, insufficient resources, and varying levels of administrative support, which can hinder consistent program delivery. To address these challenges, counsellors often employed Project-Based Learning (PBL) strategies enabling students to engage actively with SEL concepts. These efforts simultaneously allowed counsellors to reflect upon and enhance their own professional skills.

These findings highlight the critical role of school counsellors as catalysts for sustainable SEL integration, suggesting that their capacity-building and ongoing professional development are essential for long-term success. Furthermore, the study emphasizes that systematic support from school leadership and the provision of adequate resources are key to overcoming implementation barriers.

Abstract 3734

INTEGRATING SOCIAL EMOTIONAL LEARNING (SEL) IN HIGHER EDUCATION

Singh T.*

Banaras Hindu University ~ Varanasi ~ India

Although researchers and educational administrators worldwide have considered Social Emotional Learning (SEL) as a critical component of holistic education, its application in higher education setting is few and far behind. Building on the emphasis of the National Education Policy (NEP, 2020) in India, which encourages the integration of experiential and project-based learning, the present paper tried to examine the potential benefits, challenges, and contextual considerations of embedding SEL into university curricula. Drawing inferences from existing literature and comparative analyses of SEL bases programs in various Asian countries, this paper highlights the ways in which SEL initiatives can foster emotional intelligence, resilience, and interpersonal skills among college going students.

An amalgamation of the findings from existing studies resulted in various key factors that influence successful integration of SEL into university curriculum. These include the need for culturally and contextually relevant program content, flexible alignment with existing academic structures, and targeted capacity-building for faculty and counsellors.

Insights from focused-group interviews of students conducted at a national university in northern India reveals both opportunities and obstacles that are relevant to be considered for ensuring the success of such programs in developing emotionally competent, resilient and socially responsible graduates. It indicates that students at higher education levels show enthusiasm for SEL adoption but also highlight challenges such as limited teacher-taught ratio, faculty preparedness, time constraints, and diverse student populations that must be addressed for ensuring success of such programs.

Conclusively, the findings of the study are important as they suggest that higher education can benefit significantly from incorporating SEL principles not only in terms of academic outcomes but also in forms of students' social and emotional development. These insights provide a foundation for policy recommendations, curriculum development, and contextual adaptation of SEL integration into higher education settings.

Abstract 1839

HOW MAY SCHOOL SOCIOECONOMIC AND ACADEMIC STATUS BIAS ITS WEBSITE CONTENTS? AN APPLICATION OF STRUCTURAL TOPIC MODELLING IN SINGAPORE

Chan H.S.*[1], Chiu C.Y.[2]

[1]The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]City University of Hong Kong (Dongguan) ~ Dongguan ~ China

Schools have specific expectations to the students according to their socioeconomic status (SES) and academic standing. The school webpage content can reflect these expectations. If students browse their school webpages frequently, school websites may communicate these expectations to the students and unintentionally become an accessory for reproducing social class differences in learning behaviours and academic performance. Nonetheless, few past studies of the function of school websites have examined the use of websites to signal schools' expectations. The present study applied structural topic modelling (STM) to analyse the webpage contents of secondary schools in Singapore and to examine how the SES and academic ability of the students are related to the contents of the school webpages. Webpages of about 90% of secondary schools in Singapore (10089 webpages from 133 schools) have been collected and analyzed. Results show that schools' socioeconomic and academic statuses are related to the relative prevalence of different topics on the school websites. Among the schools that admitted high-ability students, those located in more affluent districts had a greater tendency to mention co-curricular activities that are associated with high society (e.g., art). Moreover, schools in more affluent neighborhoods and those that admitted higher-ability students more frequently showcased their students' achievements in national competitions. In contrast, schools that admitted lower-ability students or those located in less privileged neighborhoods more frequently mentioned outdoor activities and special events, and non-specifically mentioned competitions and prizes. These results indicate that schools admitting students with higher ability and in more affluent neighborhoods have higher expectations on their students. These specific expectations may shape students' behaviors and may infleunce students' academic outcomes. These findings deepen our understanding of how schools signal their expectations according to students' socioeconomic and academic status and provide a policy reference for ameliorating educational inequality.

Abstract 2069

TEACHING PSYCHOLOGY IN ITALY: A STATE-OF-THE-ART ANALYSIS OF MASTER'S DEGREE PROGRAMS

Delbosq S.*[1], Branda M.[1], Bertolini H.[1], Velati E.[1], Picco E.[2], Vecchio L.[1]

[1]Università degli Studi di Milano-Bicocca, Dipartimento di Psicologia ~ Milano ~ Italy, [2]Aalto University ~ Espoo ~ Finland

Introduction

Universities constitute the main providers of education for psychologists. However, recent data indicates that Italian psychologists complain about a low value of university education. It is therefore crucial to investigate the implementation of degree programs, to understand what is taught and how.

Furthermore, as psychology is a rather varied and segmented science, its teaching could be operationalized in different ways. An overview of university education in Italy could provide insights about different ways of teaching psychology, tailoring programs to the needs of professionals, and activate reflective processes.

Purpose

The purpose of the study is providing an overview of all Master degree programs in Psychology taught in Italy, describing their characteristics (public or private, on-site or online, language of the programs, number of curricula, number of ECTS, etc.) and their didactical activities (courses, workshops, and other activities and their contents).

Method

The list of programs was retrieved from the website "Universitaly", managed by the Ministry of University and Research. Specifically, we selected the programs starting in the academic year 2023-2024, which was also the first cohort to introduce the "qualifying degree" in Italy. For each program, the list of didactical activities was retrieved by consulting the "teaching plan" and/or the "course regulation document".

Results

Information was retrieved with respect to 91 Master degree programs in 42 Universities. A total of 2570 didactical activities were retrieved; 63% of which included courses related to the 8 psychological "scientific sectors" recognized in Italy. More information, on a quantitative and qualitative level, will be provided and discussed.

Conclusion

This is the first comprehensive overview of all master's degree courses in psychology in Italy, providing a factual picture of the entire range of courses that is on offer and

allowing readers to understand their content in terms of prevalence, variability, and emerging themes.

Abstract 1750

CHILDREN'S REACTIONS TO HOLISTIC SEXUALITY EDUCATION IN PRIMARY SCHOOLS: AN OBSERVATIONAL STUDY IN CZECHIA

Macháčková M.*, Smetáčková I.

Charles University, Faculty of Education, Department of Psychology ~ Prague ~ Czech Republic

Sexuality education in primary schools remains controversial in many countries, often framed narrowly and delayed out of concern for children's innocence. However, research shows that children actively engage with topics related to their bodies, emotions, and relationships. Presented study examined how Czech children aged 8–10 react during lessons of a holistic sexuality education program.

An observational mixed-methods design was applied during the pilot implementation of My Body, My Feelings – My Superpower!, an eight-lesson program developed in line with WHO Standards for Sexuality Education in Europe. The curriculum covers topics such as emotions, intimate body parts, personal boundaries, gender identity, friendship and love, media and body image, sexual behavior, and children's rights. Data were collected in six classes across different Czech primary schools (n = 120) as part of evaluation analysis of pilot run of the program. Each lesson was observed in person and through video recordings. The analysis focused on the frequency, content, and meaning of children's emotional expressions, levels of engagement, and questions raised during and after lessons. Written pupil feedback and demographic characteristics of pupils and teachers were also included. Data are being analyzed using thematic analysis to identify patterns of reactions across lessons and contexts.

Preliminary analyses suggest that children express a wide range of emotions—including embarrassment, curiosity, and humor—depending on lesson topics and classroom dynamics. Early findings indicate that teacher approach, demographics of children, and the sequencing of lessons influence type and stregth of expressed emotions.

This study contributes evidence on how primary school children experience sexuality education. By documenting children's spontaneous reactions, it highlights both opportunities and challenges in creating safe, supportive learning environments in diverse school collectives. The results can inform teacher preparation, curriculum development, and policy debates on the timing and framing of sex education in primary schools.

Abstract 582

PROFILES OF TEACHERS' WORK ENGAGEMENT IN CHINA: EVOLUTION AND RELATIONS WITH PERCEIVED ORGANIZATIONAL SUPPORT, PROFESSIONAL IDENTITY, AND BURNOUT

Xiao W.*, Xu L., Sun B.

Zhejiang Normal University ~ Jinhua ~ China

Teacher work engagement is central to sustaining educational quality and teacher well-being, yet prior studies have largely overlooked individual heterogeneity and developmental change. This study applied a person-centered, longitudinal design to identify engagement profiles, examine transitions, and explore predictors and outcomes among Chinese teachers. Drawing on the Job Demands–Resources (JD-R) model, we focused on perceived organizational support (POS) as a contextual resource, teacher professional identity (TPI) as a personal resource, and job burnout as an outcome. Data were collected from 1,018 teachers across kindergarten, primary, junior high, and senior high schools at two waves over 39 months. Work engagement was measured via vigor, dedication, and absorption; POS and TPI at Time 1; and burnout at Time 2. Latent Profile Analysis and Latent Transition Analysis were conducted. Three profiles emerged consistently at both time points: Low Dedication Engagement, Moderate Engagement, and High Engagement. Dedication was the most discriminative dimension, underscoring its cultural salience in the Chinese teaching context. While profiles showed structural stability, many teachers transitioned upward: nearly one-third of the Low Dedication group moved to higher engagement, and 30% of the Moderate group advanced to High Engagement. Regression analyses indicated that POS predicted upward shifts from Low Dedication to High Engagement, whereas TPI predicted transitions from Moderate to High Engagement. Both resources reduced risks of downward movement. Engagement profiles were strongly linked to burnout: highly engaged teachers reported the lowest levels, while those in the Low Dedication group reported the highest. These results demonstrate that engagement protects against stress and resource depletion. Overall, this study highlights the dynamic and culturally embedded nature of teacher engagement and suggests differentiated strategies, enhancing organizational support for disengaged teachers and strengthening professional identity for moderately engaged teachers, to sustain well-being and educational quality.

Abstract 34

ONLINE SEXUAL HARASSMENT AMONG ELEMENTARY SCHOOL STUDENTS IN INDIGENOUS COMMUNITIES: EXPERIENCE, PERCEPTION, HELP-SEEKING DELAY, AND HELP-SEEKING BEHAVIOR

Ho Y.[1], Chang T.*[2]

[1]Baosang Elementary School, Taitung, Taiwan ~ Taitung ~ Taiwan, [2]Department of Education and Human Potential Development, National Dong Hwa University ~ Hualien ~ Taiwan

The increasing exposure of children to digital devices and online platforms has led to a rise in online-related risks, including online sexual harassment (OSH). While most existing studies focus on adolescents or adults, research on OSH among younger children, particularly in Asian or indigenous contexts, remains scarce. This study aims to fill that gap by investigating the experiences, perceptions, delay factors, and help-seeking behaviors of elementary school students in Taitung County, Taiwan, many of whom come from indigenous communities.

The Attitude Scale Toward Online Sexual Harassment for Elementary School Students was developed and applied to the study. This quantitative survey was administered to 926 students.

Results showed that approximately 10% of students had encountered online sexual harassment, such as receiving inappropriate messages or being asked to send personal images. A high percentage (90%) reported feeling discomfort when imagining OSH scenarios. Gender differences were significant: girls were more likely to report discomfort, while boys were more likely to delay or avoid seeking help. Notably, younger students and boys expressed a stronger belief that they could handle such incidents independently.

Regression analyses revealed that students' perception of discomfort, experience with OSH, and grade level were significant predictors of their delay in help-seeking. Key delay factors included fear of being blamed, fear of not being believed, and a lack of trust in adult responses. Despite high levels of reported discomfort, around 10% of students said they would not seek help even if they experienced OSH, highlighting a critical gap between awareness and action.

This study contributes to applied psychology by developing and validating an age-appropriate OSH attitude scale, Identifying cognitive and emotional predictors of help-seeking behavior, uncovering the gendered and cultural nuances in young students' responses to OSH, and proposing a predictive model that educators and school counselors can use to identify at-risk students.

THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL: CHALLENGES, IMPLEMENTATIONS, NATIONAL PERSPECTIVES, AND STUDENT/EDUCATOR PERCEPTIONS

Saturday 25 July 2026 from 11:00 to 12:30

(H-Spadolini)

Susan Nolan (Seton Hall University ~ Orange ~ United), Chair and Presenter

We present the International Competences for Undergraduate Psychology (ICUP) Model, developed through the International Collaboration on Undergraduate Psychology Outcomes (ICUPO) project. Created through extensive collaboration among over 120 psychology educators from over 47 countries, the Model comprises 24 competence statements across seven categories: two core competences (Psychological Knowledge; Research Methodologies) and five Psychology-relevant competences (Values and Ethics; Cultural Responsiveness and Diversity; Critical Thinking and Problem Solving; Communication and Interpersonal Interaction; Personal and Professional Development). The ICUP Model is intended to be used alongside existing local and national competence models as appropriate to the specific context. The first presentation of this symposium will provide a brief overview of the 'why, how and what' of the ICUP Model. The second presentation highlights the value of the ICUP Model from stakeholder (student, educator, employer, community/society) perspectives. The third presentation will provide examples of (a) implementation of the Model in national and local contexts, and (b) national perspectives on the ICUP Model. The fourth presentation will provide a specific example of how the ICUP competences have been integrated into an undergraduate program through a curriculum renewal process. The fifth presentation will introduce international research on student and educator perceptions of (a) the value of the ICUP Model, and (b) the extent to which the ICUP competences are covered in their current foundational psychology curriculum. ICAP Relevance Statement: The ICUP competences constitute a unique international Model designed to guide foundational undergraduate psychology curricula globally, while remaining adaptable across diverse national and institutional environments. The competences include emphasis on application of psychological knowledge, skills and values/attitudes to personal, work and community/societal contexts.

Abstract 4178

OVERVIEW OF THE INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY (ICUP) MODEL: "WHY, HOW, AND WHAT"

Gauer G.*[1], Job R.[2], Machin M.A.[3]

[1]Universidade Federal do Rio Grande do Sul ~ Porto Alegre ~ Brazil, [2]University of Trento ~ Rovereto ~ Italy, [3]University of Southern Queensland ~ Toowoomba ~ Australia

We introduce the ICUP Model, developed through the International Collaboration on Undergraduate Psychology Outcomes (ICUPO) project. Created through extensive collaboration among 120 psychology educators from 47 countries, the Model comprises 24 competence statements across seven categories: two core competences (Psychological Knowledge; Research Methodologies and Methods) and five Psychology-relevant competences (Values and Ethics; Cultural Responsiveness and Diversity; Critical Thinking and Problem Solving; Communication and Interpersonal Interaction; Personal and Professional Development). We give a brief overview of the background to the ICUPO project, and of its inclusive methods. The Model aims to guide curriculum development while remaining adaptable to diverse national and institutional contexts.

Abstract 4179

INTERNATIONAL COMPETENCES FOR UNDERGRADUATE PSYCHOLOGY: HIGHLIGHTING THE VALUE OF UNDERGRADUATE PSYCHOLOGY EDUCATION FROM DIVERSE STAKEHOLDER PERSPECTIVES

Cranney J.*[1], Nolan S.[2], Hulme J.[3]

[1]University of New South Wales ~ Sydney ~ Australia, [2]Seton Hall University ~ Orange ~ United States of America, [3]Nottingham Trent University ~ Nottingham ~ United Kingdom

The value of undergraduate foundational psychology education has been questioned, particularly in nations where the majority of graduates do not obtain further education/training to acquire the professional psychology competences necessary for registration/licensure as a psychologist. We developed the International Competences for Undergraduate Psychology (ICUP) Model partly to address this issue, in that the Model focuses on how graduates can contribute meaningfully in the workplace, but also in personal and community contexts. Specifically, we address the value of foundational psychology undergraduate education from the perspectives of the major stakeholders: students, educators, employers, communities/society. We answer common questions from each of these groups, with reference to the ICUP competences, and the broader literature. For example: Students may ask: How can I use the ICUP competences to achieve goals in my personal, work, and community life? Educators may ask: How can I use the ICUP Model to better prepare my students for diverse careers? They may also raise specific queries regarding the Model, for example: Aren't some of the ICUP competences at a professional rather than foundational level? Employers may ask: What do psychology graduates with ICUP competences bring to the workplace that distinguishes them from other graduates? Community/societal groups may ask: How do the ICUP competences better prepare students to be good local and global citizens? In answering these questions, we make reference to specific competences, and provide examples of educational resources that demonstrate integration/implementation of the Model. Such guidance should facilitate educators supporting students to (a) be aware of the competences that they have acquired, (b) apply such competences to their personal and community lives, and (c) communicate such competences to potential employers. In essence, we assert that the integration/implementation of the ICUP Model should increase the perceived and actual value of undergraduate psychology education.

Abstract 4180

PERSPECTIVES AND IMPLEMENTATIONS REGARDING THE ICUP MODEL - CHALLENGES AND OPPORTUNITIES

Nolan S.*[1], Boeta Madera V.[2], Muazzam A.[3], Petrovic I.[4]

[1]Seton Hall University ~ Orange ~ United States of America, [2]Marist University of Mérida ~ Mérida ~ Mexico, [3]Lahore College for Women University ~ Lahore ~ Pakistan, [4]University of Belgrade ~ Belgrade ~ Serbia

We describe existing examples of the implementation, impact and challenges regarding the International Competences for Undergraduate Psychology (ICUP) at a range of levels and with broad geographic diversity. First, we will share a variety of cases in which educators used the ICUP to further develop their courses/units. These include cases from across the subdisciplines of psychology and from several continents, and we will share detail on some of these, including from the USA, whereby the psychology department used the ICUP along with the national guidelines to overhaul the curriculum for the psychology major. We consider the case of Mexico, and how the ICUP was considered by the National Council for Teaching and Research in Psychology (CNEIP), Mexico's regulatory body for psychology education, as an input for the analysis of potential changes in the graduation profiles of psychology programs in Mexico. We also consider national contexts in which the adoption of the ICUP Model is particularly challenging, but where educators can still integrate the ICUP Model into their pedagogical approach. We highlight the existence of a 'living' summary 'ICUP Educational Resources' document at the ICUPO OSF website, as well as published examples of teaching strategies focusing on Competence 7.5 (which highlights the United Nations Sustainable Development Goals). Finally, we will provide an opportunity for conference attendees to share their own perspectives and/or experiences in using the ICUP in their own contexts, as well as suggestions for how the ICUP might be used going forward.

Abstract 4181

INTEGRATING THE ICUP MODEL TO FOSTER WORK READINESS AND PSYCHOLOGICAL LITERACY IN MONASH UNIVERSITY'S PSYCHOLOGY PROGRAM

Gullifer J.*

Monash University ~ Melbourne ~ Australia

At Monash University, the psychology program is designed to equip students with the foundational knowledge and skills necessary for careers in psychology, which typically require postgraduate training in Australia. Recognizing the need to better prepare undergraduates for diverse career opportunities, Monash has restructured its psychology curriculum to produce job-ready graduates with a broad skill set. The redesigned program integrates an accredited psychology major with a concurrent stream of applied psychology units, leveraging a flipped curriculum approach that emphasizes psychological literacy. This innovative structure aligns with the International Competences for Undergraduate Psychology (ICUP) Model, which highlights the development of psychological literacy and global citizenship. The ICUP Model outlines seven competence categories, including Psychological Knowledge, Research Methodologies & Methods, and core areas such as Critical Thinking & Problem-Solving, Communication & Interpersonal Skills, Cultural Responsiveness & Diversity, Values & Ethics, and Personal & Professional Development. By adopting the ICUP Model, the program ensures that students not only acquire essential psychological knowledge but also learn how to apply this knowledge in real-world contexts. A key feature of the program is the work-integrated learning unit, offering students the chance to participate in industry, clinical, community, or research-based capstone projects. These opportunities help students develop critical competences from the ICUP Model while also fostering personal and professional growth. Emphasis is placed on reflection, self-awareness, self-care, and addressing global challenges, such as sustainability and social justice. This approach ensures that graduates are well-prepared for diverse careers and equipped to make a meaningful impact in both local and global contexts. Integrating the ICUP Model enhances employability, adaptability, and the ability to contribute effectively to global communities.

Abstract 4182

HOW TO SAMBA WITH THE ICUP MODEL: PERSPECTIVES FROM BRAZILIAN AND OTHER INTERNATIONAL EDUCATORS AND STUDENTS

De Souza L.K.*[1], Gauer G.[1], Nolan S.[2], Bevilaqua Trevisan S.[1], Alves Marques F.[1]

[1]Universidade Federal do Rio Grande do Sul ~ Porto Allegre ~ Brazil, [2]Seton Hall University ~ Orange ~ United States of America

The goal of the current study is to elicit input from psychology students and educators with regard to whether each of the competence categories and statements of the International Competences for Undergraduate Psychology (ICUP) Model are important to their (or to their students') future educational and career goals, as well as whether they believe their undergraduate psychology program – in which they are a student or faculty member – is currently addressing the categories and statements. From April 2025, an online English-language version of surveys for students and educators is being distributed by ICUPO Committee and advisory group (IRGUPO) members. We will report on the findings, including any national differences and differences between students and educators. In Brazil, we are not only contributing to recruiting for the original English-Language version of the survey, but we also providing the translation and cultural adaptation of the ICUP Model into Brazilian-Portuguese. Brazil has more than 550 thousand registered/licensed psychologists, more than 700 undergraduate psychology courses, 70% from the private sector. This study will allow Brazilian stakeholders to assess the ICUP Model and provide valuable feedback that will contribute to the cultural responsiveness that drives the ongoing development and implementation of the Model. We will conduct the study through eight steps, using professional translators and experts in psychology education in Brazil. Moreover, ten educators and 30 students intensely involved with undergraduate psychology programs will interact with the ICUP Model and have the opportunity to present their perceptions, understanding, and suggestions for the Model. Finally, the future of this research project will be outlined.

Abstract 2645

UNDERSTANDING MYSTERIOUS RESOLUTIONS TO REAL ISSUES THROUGH ANALYTICAL PSYCHOLOGY

Mishra S.*

Manav Rachna International Institute of Research and Studies ~ Gurgaon ~ India

In the world of globalization, young individuals are competing for survival not just within community that they reside in but with youngsters across the globe. Their struggles are real and magnitude high. In this paper we explore how dreams support these young adults as they transition into higher education and negotiate the complex terrain of early adulthood. It focuses on dreams as a coping mechanism within the context of major life-stage changes. This is understood through Carl Gustav Jung's analytical psychology.

The study is anchored in the psychological challenges that accompany significant developmental shifts. This then often disrupts both the conscious and unconscious mind of the individual, influencing emotional regulation, behaviour, and inner conflict. By observing how young adults dream during these periods, the paper investigates how symbolic imagery and recurring patterns provide insight into their internal struggles and their evolving coping strategies. It also examines how these dream experiences, in turn, shape waking behaviour, emotional processing, and decision-making.

The research adopts an Interpretative Phenomenological Approach (IPA), incorporating both primary and secondary data. Primary data includes detailed dream diaries maintained by first-year graduation students, complemented by reflective notes, symbolic drawings, and expert interpretations. Depth interviews and self-reflective accounts help uncover the subjective meanings embedded in dream patterns. Secondary sources consist of scholarly works on dream analysis, trauma, and analytical psychology. The Gioia method is employed to systematically code and organize data, allowing for the emergence of coherent themes and theoretical insights.

Preliminary findings indicate that dreams offer a subconscious space for processing emotional overload and unresolved issues, especially when conscious coping mechanisms are insufficient. Ultimately, the study positions dream analysis as a valuable therapeutic and introspective tool, offering practitioners and scholars a nuanced framework for understanding trauma, emotional conflict, and psychological growth through the symbolic language of the unconscious mind.

Abstract 951

HOW CAN WE INTEGRATE THE SUSTAINABLE DEVELOPMENT GOALS INTO MENTAL HEALTH TRAINING? A SCOPING REVIEW OF PEDAGOGICAL STRATEGIES

Pownall M.*[1], Harris R.[1], Ejova A.[2], Turnbull D.[2], Van Antwerpen N.[2]

[1]University of Leeds ~ Leeds ~ United Kingdom, [2]University of Adelaide ~ Adelaide ~ Australia

The Sustainable Development Goals (SDGs), adopted by the United Nations in 2015, set 17 global objectives addressing interconnected social, economic, and environmental challenges to be achieved by 2030. Achieving these goals requires a workforce equipped with the skills, knowledge, and competencies to contribute effectively to sustainable development. This is particularly critical for the interdisciplinary mental health workforce, given the escalating global mental health crisis and its direct and indirect impacts on progress across multiple SDGs. Despite this, limited evidence exists on how pedagogical approaches and practices in higher education and professional training embed SDG-related content for mental health professionals.

This scoping review examined the extent to which SDGs have been incorporated into degree programs and professional training relevant to frontline mental healthcare delivery. Specifically, we sought to identify pedagogical approaches, educational frameworks, and practices used to integrate SDG content, as well as to track instances of global mental health literacy within curricula. A total of 48 papers were included for full-text review. Analysis revealed three broad pedagogical approaches underpinning integration: (1) active and critical learning, (2) collaborative learning, and (3) experiential and service learning. These approaches reflect efforts to foster critical engagement, interdisciplinarity, and practical application of knowledge in diverse contexts.

Key challenges emerged in embedding SDGs within mental health education, including limited curricular space, variability in institutional priorities, and the need for ongoing professional development. Findings highlight the importance of coordinated, interdisciplinary strategies to ensure that mental health education equips graduates to engage with and advance the SDGs.

This review contributes to understanding how sustainable development principles are being translated into education for the global mental health workforce. Implications for future psychology curriculum design, policy, and professional training are discussed, with emphasis on strengthening global mental health literacy as a driver of sustainable development.

Abstract 2452

TRANSLATING THE MIND: OTTO JÖRGENS' OUTLINE OF PSYCHOLOGY (1925) AND THE CROSS-CULTURAL FOUNDATIONS OF APPLIED PSYCHOLOGY IN CHINA

Zhang J.*

Zhejiang Agricultural and Forest University ~ Hangzhou ~ China

Introduction:
The global history of applied psychology has largely been written from a Euro-American viewpoint, often neglecting early intercultural exchanges that shaped the discipline's applied dimension. In 1925, the German missionary Otto Jörgens (SVD) published Xinlixue Gangling (Outline of Psychology) in Chinese, introducing scholastic and experimental psychology to China's teacher-training context and initiating one of the earliest encounters between Western psychological science and Chinese educational reform.

Purpose:
This paper explores Outline of Psychology as an early case of cross-cultural application of psychological knowledge. It asks how psychological concepts were linguistically transformed, pedagogically localized, and ethically adapted to Chinese educational modernization, emphasizing translation as an active site of knowledge creation rather than transmission.

Method:
Archival materials from the SVD Generalate Archives (Steyl) and the United Evangelical Mission Archives (Wuppertal) were examined. A trilingual corpus (German–English–Chinese) was built to compare terminology and translation patterns. Corpus-linguistic tools (AntConc, Sketch Engine) traced semantic migration of key terms such as sensation, apperception, and will. Genealogical mapping situated these conceptual shifts within the broader circulation between European scholastic psychology and Chinese normal-school pedagogy of the 1920s.

Results:
Findings indicate that Jörgens's textbook was not a literal translation but a conceptual mediation between theology and emerging empirical psychology. Its Chinese terminology re-semanticized Seele ("soul/mind") into culturally resonant categories of xin (心 heart-mind) and li (理 principle). By redefining mental functions through moral and educational behavior, the work operationalized psychological knowledge for classroom use, prefiguring the institutionalization of applied psychology in modern

China and offering a historical lens on how global psychology first took root in a non-Western intellectual setting.

Conclusions:
This study highlights translation as a formative process of application in early global psychology. It reframes “application” not only as practical use but as cultural negotiation through which psychological knowledge became pedagogically meaningful across civilizations, revealing how linguistic adaptation fostered the global plurality of psychological thought.

STORIES OF STRUGGLE AND HOPE: TRAUMA-INFORMED MULTI-LEVEL SUPPORT FOR PEOPLE SEEKING ASYLUM ACROSS BORDERS IN THREE GEOGRAPHIC AREAS

Wednesday 22 July 2026 from 08:00 to 09:30

(G-Spadolini)

Donna San Antonio (Lesley University ~ Cambridge, MA ~ Unit), Chair and Presenter

This panel will discuss applied psychology at the intersections of ethics, cross-cultural collaboration, and social justice to support mental health and wellbeing among migrant youth and families. Each presenter will draw from their own experience in holding space for the voices of migrant people and in offering support at multiple levels—immediate (at the border), intermediate (upon relocation), and long-term (on-going support for social, emotional, economic, and vocational well-being). Using academic research and practice-based knowledge, presenters will address the experiences of people seeking protection across borders in Sub-Sahara Africa, the Mediterranean, and North America. Specifically, this symposium will explore these questions: What are the mental health concerns for people seeking asylum and migrant people?
What are the current conditions, policies, and practices in our regions? What are effective interventions that support youth and families to sustain hope across time during this transition? What are the benefits and challenges for receiving communities? Through group dialogue we will share ideas and clarify promising responses that strengthen possibility development and connection, while alleviating the long-term impact of physical and emotional suffering

Abstract 3105

THE EXPERIENCE OF ASYLUM SEEKERS AND REFUGEES IN AFRICA

Doe P.*

Médecins Sans Frontières ~ Juba ~ South Sudan

Africa hosts over 30 million forcibly displaced people, including 7.8 million refugees and asylum seekers, mainly due to conflicts and instability. Top hosting countries are Uganda (1.5 million), Sudan (1.1 million), Ethiopia (880,000), Kenya (610,000), and Chad (580,000). Despite resource challenges, countries like Uganda are praised for progressive policies supporting refugee integration (Kalyegira, 2023). In the context of the refugee crisis in Africa, addressing the mental health of asylum seekers and migrants is critical. Refugees face multiple challenges, including pre-migration trauma, migration-related stress, and post-migration struggles such as legal uncertainty, discrimination, and poor living conditions. These challenges often undermine the satisfaction of basic psychological needs, which is essential for psychological well-being (Kalyegira, 2022). Additionally, the perceptions and attitudes of host communities significantly impact refugees' integration and mental health (Hellmann et al., 2021). Kalyegira, Kühnen, and Boehnke (2025) found that satisfying basic psychological needs, especially autonomy and relatedness, is key to refugees' well-being, and that refugees develop diverse coping mechanisms. Community-based interventions, task-shifting approaches, and culturally sensitive psychosocial programs have shown promise in bridging this gap. Advocacy for faster asylum processes and inclusive healthcare policies is essential to reduce stress and improve well-being. Receiving communities play a pivotal role in supporting or hindering integration. Positive actions such as inclusive services, employment opportunities, and awareness campaigns can foster belonging, while hostility and exclusion worsen isolation and mental health challenges. Strengthening community-based coping mechanisms and fostering dialogue between refugees and host populations is vital. Recommendations for effective practices include integrating MHPSS services into humanitarian responses, training local mental health workers, and ensuring sustainable referral pathways. Collaborative research and evidence-based policies, as highlighted in Kalyegira (2022) and Hellmann et al., are critical to improving mental health support and promoting integration.

Abstract 3107

REPORT ON MOVEMENT OF MIGRANTS AND REFUGEES IN CASERTA, ITALY: MENTAL HEALTH CONCERNS, CAUSES, AND REMEDIES

Doe P.*

Centro Sociale Ex-Canapificio ~ Caserta ~ Italy

The City of Castelvolturno of Caserta in the Southern part of Italy is populated with mixed immigrants and refugees from different parts of the world and most especially of those from Africa. This population faces diverse challenges and problems in everyday living, including mental health and physical health concerns, sometimes facing serious psychological and psychiatric issues. This presentation will touch on the mental health challenges, their causes and the remedies. Our interactions and interviews with people that come to Centro Sociale Ex-Canapificio, help us to discern and understand the major factors that contribute to their mental health challenges, specifically due to events that happened to them in life.

First and foremost, most were traumatized due to the experiences they had while on their way to Italy. Another factor to this mental health crisis is denial of regular permits to stay in Italy. Mental health is negatively impacted when people are denied permits to stay in Italy, after going through various applications and requests. Many try to alleviate their suffering through the use of alcohol or taking hard substances, which can further harm mental health.

This presentation will also address traditions and beliefs, the impact of stigma and the rejection of society and loved ones, and the draw toward detrimental associations. Centro Sociale has a long history of implementing effective approaches and practices to respond to psychological and physical trauma. I will outline our practices that support mental health and well-being, including, intake and follow-up procedures, welcoming projects, regular appointments in our office to talk with others, reintegration activities, courses, and referrals to health centers, psychologists, and psychiatrists.

Abstract 3108

BEYOND BARRIERS: STRATEGIES OF RESISTANCE AND EMPOWERMENT IN MIGRATORY CONTEXTS

Santilli S.*

University of Padova ~ Padova ~ Italy

This study investigates the transformative potential of critical participatory action research as a psychosocial intervention with African unaccompanied minors hosted in a reception center (CAS) in Padua, Italy. Employing an exploratory, process-oriented approach, the project aimed to foster critical consciousness through artistic and dialogical activities involving 18 participants and 5 researchers. Utilizing methods such as photovoice, discussions, and abductive thematic analysis, the research uncovered strategies of resistance within the "liminal hotspots" of migratory contexts, highlighting their emancipatory dimensions. The findings emphasize the importance of collaborative practices, empowering narratives, and acts of solidarity, proposing a redefinition of psychosocial support toward less hierarchical, experiential, and participatory frameworks.

Abstract 3109

OVERVIEW OF CURRENT POLITICAL CONTEXTS AND COMMUNITY RESPONSES SUPPORTING THE WELL-BEING AND SOCIAL INTEGRATION OF MIGRANT AND REFUGEE CHILDREN AND FAMILIES

San Antonio D.*

Lesley University ~ Cambridge, MA ~ United States of America

Globally, policies are being enacted that have devastating consequences for migrant people fleeing violence, poverty, and climate change. In many countries, there is an increased possibility of deportation and people seeking asylum who have already suffered traumatic experiences fear what will happen to them and their family members. The way communities and schools respond to migrant and refugee children depends on community, social, economic, political and historical contexts. Some schools and communities have responded with increased support and possibilities for social integration and healing for children and families. This presentation will overview the ways that psychologists and counselors are collaborating with educators, faith-based communities, and agencies to help migrant children and families with multiple mental health challenges. The stories of tragedy are in the news daily, but the stories that are less widely known are the stories of collaboration, compassion, integration, cultural awareness, and intercultural identity development. This presentation will provide brief case studies on cross-role collaboration and activism to support social integration and well-being of migrant children and families.

Abstract 549

A MODERATED MEDIATION MODEL OF INFIDELITY AND SEPARATION ANXIETY: THE ROLE OF OPENNESS AND OBSESSIVE-COMPULSIVE SYMPTOMS

Genc E.*[2], Isik R.[1]

[1]Bartin Üniversitesi ~ Bartin ~ Turkey, [2]Bartin University ~ Bartin ~ Turkey

Introduction: Infidelity is a salient relational stressor linked to anxiety, yet the mechanisms and boundary conditions of this link are not fully understood. Prior research indicates that individual differences shape psychological responses to relational threats, underscoring the need to examine personality-related moderators.
Purpose: This study tested whether obsessive-compulsive symptoms (OCB) mediate the association between infidelity and separation anxiety, and whether openness in romantic relationships moderates this indirect pathway.
Method: Participants (N = 297) completed measures of infidelity, OCB, separation anxiety, and openness. A moderated mediation model (PROCESS Model-7) tested infidelity as X, obsessive-compulsive thoughts as M, separation anxiety as Y, and openness as W.
Result: The direct effect of infidelity on separation anxiety was not significant, b = −0.00, SE = 0.06, t(295) = −0.05, p = .96, 90% CI [−0.11, 0.10]. Higher obsessive-compulsive thoughts predicted greater separation anxiety, b = 0.29, SE = 0.04, t(295) = 6.77, p < .001, 90% CI [0.22, 0.36]. The a-path showed a marginal interaction with openness, b = 0.26, SE = 0.15, t(295) = 1.76, p = .08. Conditional indirect effects were significant at high openness (+1 SD), b = 0.07, BootSE = 0.03, 90% CI [0.02, 0.13], but not at mean or low openness. The index of moderated mediation was significant, b = 0.07, BootSE = 0.04, 90% CI [0.01, 0.15].
Conclusion: Openness amplifies the indirect effect of infidelity on separation anxiety through obsessive-compulsive thoughts. Individuals higher in openness appear more susceptible to obsessive-compulsive responses following infidelity, which, in turn, elevates separation anxiety. This suggests that openness not only shapes emotional reactivity to relational stressors but may also influence the cognitive patterns that maintain anxiety.

Abstract 2056

THE END OF ANALYSIS AS LIMIT: A LACANIAN-MATHEMATICAL MODEL AND A SINGLE-CASE STUDY

Kartal F.*

Middle East Technical University, Department of Psychology ~ ANKARA ~ Turkey

Within Lacanian psychoanalytic theory, the "end of analysis" resists closure. Lacan outlined several endpoints—revelation of subjective truth, traversal of fantasy, identification with the symptom, and identification with the sinthome—while stressing that analysis promises neither cure nor happiness. This study reframes these endpoints through a mathematical analogy, treating the analytic process as a function over signifiers and its ending as a matter of limits rather than final values.

The subject's discourse is modeled as a function F mapping signifiers to meanings. Traumatic points appear where F is undefined, yet limits may still exist nearby. An analytic "end" is thus conceptualized as convergence: the limit of F(x) as x approaches a, where the process circles around objet a without reaching a final value. The sinthome, in this view, names a re-knotting that stabilizes this orbit of jouissance, permitting consistency without closure.

To explore this model clinically, the study draws on a single-case design (Ms. S., 20 sessions). Clinical material, anonymized for confidentiality, showed her repetitive positioning as the object of the Other's demand—"serving"—and her occupational shift from engineering to flight attendant work ("hosting"). Findings indicate a shift from symptomatic repetition toward a reconfiguration consistent with Lacan's later teaching: rather than abolishing the symptom, Ms. S. moved toward an identification that stabilized jouissance. In functional terms, the signifier "hostess/host" rewrote the mapping so that trajectories once divergent circulate within a bounded neighborhood; the limit exists even if the value is not taken.

These results clarify why analytic endings are not cures or definitive closures but convergences toward a workable regime of desire and jouissance, often through identification with the sinthome. Thus, the end of analysis is best conceived not as a last word but as a limit.

Abstract 2218

DYNAMIC CHANGES IN EXTENDED NETWORKS OF DEPRESSIVE SYMPTOMS AND COGNITIVE FUNCTIONS IN RESILIENT VS. PROGRESSIVELY DEPRESSED OLDER ADULTS FOLLOWING BEREAVEMENT

Semkovska M.*, Zhang D.

University of Southern Denmark ~ Odense ~ Denmark

Introduction
Late-life depression affects nearly one-fifth of older adults, while approximately 16% experience mild cognitive impairment. These conditions are reciprocally related: depression may signal prodromal dementia, while cognitive deficits can increase vulnerability to depression. Stressful life events, such as bereavement, represent additional risk factors for both outcomes. Network theory posits that depressive symptoms and related risk factors form interdependent systems, where their dynamic interactions may reveal pathways toward resilience or depression onset, highlighting potential prevention targets.

Purpose
This study investigated how interactions between depressive symptoms and cognitive functions evolve over time in older adults following bereavement. We compared individuals who developed depression with those who remained resilient, aiming to identify temporal patterns that distinguish flexible versus rigid symptom networks.

Method
Participants were 1,992 Danish adults aged >70 who met the following eligibility criteria: (1) recent bereavement, (2) no prior depression, (3) complete depressive symptoms and cognitive function data at baseline and two-year follow-up. At follow-up, 1,770 participants remained non-depressed, while 222 developed depression. Contemporaneous and cross-lagged panel networks (CLPNs) were estimated to examine cross-sectional and longitudinal associations between 15 depressive symptoms and five cognitive functions.

Results
Both groups showed an increase in depressive symptom severity over time, though the difference widened at follow-up. Resilient networks displayed significant structural change, indicating flexibility, while depression-onset networks remained rigid. In CLPN analyses, the resilient group exhibited few repeated temporal predictions, whereas the depression-onset group showed consistent bidirectional influences between cognition and depression. Depressive symptoms predicted later verbal fluency decline, while

poorer baseline attention, working memory, and memory functions predicted greater depressive symptoms.

Conclusions
Following bereavement, resilient elders demonstrated flexible network restructuring, whereas those who developed depression showed rigid, self-perpetuating interactions. Lower baseline cognitive function within an inflexible network increased depression risk by activating later anhedonia and worthlessness. Preventive strategies should target sustaining attention and memory functions in older adults.

NEUROSCIENCE-BASED TEMPERAMENT FRAMEWORK AND ITS APPLICATIONS

Trofimova I.*

McMaster University ~ Hamilton ~ Canada

Temperament traits are linked to specific patterns in the relationships between neurotransmitters, and similar links were found between neurotransmitters and mental disorders. Temperament and mental illness are considered therefore to be variations along the same continuum of imbalance in neurochemical systems regulation of behaviour. This talk will discuss contributions of neurophysiological systems regulating consistent aspects of behaviour that emerge both as temperament traits and/or symptoms of mental disorders. Several results in clinical psychology will be discussed, with possible applications in both, clinical and forensic psychology.

Abstract 112

THE WINDING ROAD TOWARDS PTSD SYMPTOMATOLOGY. THE ROLE OF PERSONALITY, UNCERTAINTY AND ANXIETY SENSITIVITY. A TWO-WAVE PROSPECTIVE STUDY

Altungy P.*[1], Liébana S.[1], Navarro--Mccarthy A.[1], Garcìa Vera M.P.[2], Sanz J.[2]

[1]Universidad Europea de Madrid ~ Madrid ~ Spain, [2]Universidad Complutense de Madrid ~ Madrid ~ Spain

There is significant amount of scientific literature regarding psychological variables that account as vulnerability/protective variables for the onset and maintenance of PTSD symptomatology. Among them, Big Five personality traits (openness, conscientiousness, extraversion, agreeableness and neuroticism). However, there is still little evidence regarding the underlying mechanisms that may explain that relationship. Transdiagnostic variables, such as intolerance of uncertainty or anxiety sensitivity, arise as potential candidates for being (at least partially) part of these mechanisms. Method. A sample of 300 participants from Spanish general population (Mage = 38.72; 54.7% women) completed an on-line survey in two separated moments: personality traits (NEO-FFI), intolerance of uncertainty (IUS-27) and anxiety sensitivity (ASI-3) at T1, and PTSD symptomatology (PCL-5) at T2, three months later. Results. Neuroticism (βstandarised = .144), intolerance of uncertainty (βstandarised = .195) and anxiety sensitivity (βstandarised = .269) at T1 predicted 25.5% of PTSD symptomatology at T2. Moreover, intolerance of uncertainty (a1a2 = .129) and anxiety sensitivity (b1b2 = .119) partially and complementary mediated the relationship between neuroticism at T1 and PTSD symptomatology at T2 (c' = .144). Discussion. This study is the first to analyse together, in a two-wave prospective study, the predictive capacity of personality traits, intolerance of uncertainty and anxiety sensitivity, over PTSD symptoms, and to test a mediation model that may help understanding the underlying mechanisms in the proved relationship between neuroticism and PTSD symptomatology. These results have significant implications for future development of targeted prevention and intervention programs aimed to traumatic events survivors.

Abstract 274

A SCHEMA-BASED INVESTIGATION INTO DESIRE INTOLERANCE: THE MEDIATING ROLE OF EMOTION REGULATION STRATEGIES AND THE MODERATING ROLE OF EMOTION MYTHS

Gunduz I.D., Can S.*, Meral Y.

Izmir University of Economics ~ Izmir ~ Turkey

Emotion regulation is a fundamental psychological process that encompasses both intrapersonal and interpersonal strategies to manage affective experiences. However, the effectiveness of these strategies may be shaped by underlying cognitive-emotional structures developed during early life, such as maladaptive schemas, as well as by meta-emotional belief systems, often referred to as emotion myths. Meanwhile, difficulty in coping with intense internal urges—conceptualized as desire intolerance—has emerged as a transdiagnostic self-regulatory vulnerability. Desire intolerance refers to an individual's perceived inability to endure the internal tension associated with strong desires (e.g., for food, alcohol, or social approval), and is increasingly recognized as a significant component of emotional dysfunction. This study investigates whether emotion regulation strategies mediate the relationship between early maladaptive schemas and desire intolerance, and whether this mediating effect is moderated by the endorsement of rigid emotion-related beliefs. Participants completed a set of validated measures including the Young Schema Questionnaire–Short Form 3 (YSQ-S3), the Emotion Regulation Strategy Scale (ERSS), the Desire Intolerance Questionnaire (DIQ), and the Emotion Beliefs Scale. Although data collection is still ongoing, preliminary findings indicate a significant positive association between early maladaptive schemas and desire intolerance. Initial analyses suggest that emotion regulation strategies may partially mediate this relationship, highlighting their potential role. Moreover, the strength of this indirect effect appears to vary depending on individuals' levels of endorsement of emotion myths; participants with more rigid beliefs about emotions seem to benefit less from adaptive regulation strategies. These findings point to a complex interaction between schema-driven vulnerabilities and regulatory mechanisms, underscoring the value of integrated interventions targeting both early cognitive structures and emotion-related beliefs.

Abstract 262

WHEN SELF-KINDNESS MEETS RUMINATION: THE MODERATING ROLE OF SELF-COMPASSION IN REPETITIVE NEGATIVE THINKING AND PSYCHOLOGICAL SYMPTOMS

Meral Y.*[1], Gökdag C.[2], Dumlu Gündogan S.[1]

[1]Izmir University of Economics ~ Balcova ~ Turkey, [2]Manisa Celal Bayar University ~ Manisa ~ Turkey

Introduction: Repetitive negative thinking (RNT), characterized by persistent and intrusive thought patterns, is recognized as a transdiagnostic cognitive process contributing to a wide range of psychological disorders. On the other hand, self-compassion - encompassing self-kindness, a sense of common humanity, and mindfulness - has been associated with improved emotional resilience and reduced psychological distress. Drawing on the transdiagnostic perspective and contemporary therapeutic approaches that emphasize how individuals relate to their thoughts rather than the content itself, this study investigated how self-compassion might buffer the negative effects of RNT.

Purpose: The present study aimed to investigate the moderating role of self-compassion in the relationship between RNT and general psychological symptoms in a non-clinical adult sample.

Method: A large sample of 776 non-clinical individuals (M_age=28.27, SD=6.55) participated in the study. Participants completed the Repetitive Thinking Questionnaire-10, the Self-Compassion Scale-Short Form, and the Brief Symptom Measure-25.

Results: Findings revealed that higher levels of RNT were significantly associated with elevated psychological symptoms, confirming its detrimental impact on mental health. Moreover, moderation analysis revealed a significant interaction effect, indicating that self-compassion moderated the relationship between RNT and general symptoms. Specifically, higher levels of self-compassion weakened the association between RNT and symptoms.

Conclusion: These results reveal that self-compassion can serve as a protective factor, weakening the intensity and impact of RNT on overall psychological well-being. These findings suggest that enhancing self-compassion could be a valuable component of interventions aimed at addressing the pervasive and transdiagnostic nature of RNT.

VALIDITY AND RELIABILITY EVIDENCE FOR NEO PI-R PSYCHOPATHY SCORES IN COMMUNITY SAMPLES OF ADULTS

Sanz--García A.*, Garcìa Vera M.P., Sanz J.

Universidad Complutense de Madrid ~ Madrid ~ Spain

A growing body of scientific literature conceives psychopathy as a maladaptive variant of normal personality, reflecting the more general interest in understanding personality disorders from the five-factor model (FFM) or Big Five. Sanz-García et al. (2022) developed a psychopathy scale (known as EP-NEO for its name in Spanish) based on Costa and McCrae's (1992) NEO Personality Inventory Revised (NEO PI-R), the standard instrument for assessing the FFM. The aim of this presentation is to summarize the results of several studies conducted to examine the reliability and validity of EP-NEO scores in samples of adult volunteers from the general Spanish population (N = 682, 239, and 525). The EP-NEO presented a structure of three correlated factors (Interpersonal, Affective, and Lifestyle) similar to those of Hare's model of psychopathy underlying the PCL-R. Internal consistency coefficients were excellent for the total score (alpha/omega = 0.85-0.89) and between adequate and excellent for the scale scores (alpha/omega = 0.76-0.89). The convergent correlations with measures of antisocial personality disorder from the NEO PI-R (r = 0.88–0.96) and with the psychopathy measure from the SRP-4 (r = 0.76) were excellent and greater than the discriminant correlations with measures of other personality disorders from the NEO PI-R. These results suggest that the EP-NEO provides reliable and valid measures of psychopathy in Spanish adults assessed in situations where there is no direct interest in distorting responses.

RISKS TO ADDRESS IN INDIVIDUAL AND COMMUNITY PSYCHOLOGY: CLIMATE CHANGE, TERRORISM, PANDEMICS, AND COMMUNITY INTERVENTIONS

Wednesday 22 July 2026 from 09:30 to 11:00

(G-Spadolini)

Jesús Sanz (Complutense University of Madrid ~ Madri), Chair and Presenter

Countries around the world are facing various challenges that impact society (WHO, 2020). The world is exposed to health challenges, such as health pandemics like COVID-19 and mental health pandemics, such as depression. In addition, for years, violent activities such as terrorism have caused environmental, health, and mental health problems for thousands of affected people. Furthermore, we are exposed to climate change, and people around the world are suffering the consequences of floods, droughts, and other weather conditions. In this symposium contributions of psychology to the biggest challenges worldwide will be discussed. Dr. María Paz García-Vera will examine the results of a national psychological care program in Spain for people affected by the COVID-19 pandemic and lessons that can be learned for future pandemics and disasters. For his part, Dr. Jonhrev Guilaran will explore the role of social and community support in the promotion of positive psychological outcomes during the COVID-19 pandemic. Dr. Jesús Sanz will speak about depression as a global challenge for mental health and the problems facing its adequate prevention and treatment. Terrorism remains one of the most serious global issues, affecting a significant number of individuals. Even during the same year as the pandemic, and despite the restrictions imposed by COVID-19, terrorist attacks continued. Dr. Rocío Fausor will focus on the contributions of psychology in the field of terrorism. Last, but not least, Dr. Daniel Dodgen will focus on how climate change is impacting in terms of individual and community mental health and social impacts and also how these effects differ across people and nations.

Abstract 3220

IF YOU FAIL TO PREPARE, PREPARE TO FAIL: RESULTS AND LESSONS LEARNED FROM A NATIONAL PSYCHOLOGICAL CARE PROGRAM FOR PEOPLE AFFECTED BY COVID-19 IN SPAIN

Garcìa Vera M.P.*[1], Navarro--Mccarthy A.[1], Fausor R.[2], Sanz--García A.[1], Sanz J.[1]

[1]Complutense University of Madrid ~ Madrid ~ Spain, [2]Valencian International University ~ Valencia ~ Spain

The severity and extension of the COVID-19 pandemic and the social and economic consequences of the measures taken to control it impacted the mental health of many people. Between March and May 2020, the Ministry of Health and the General Council of Psychology of Spain launched the Psychological First Aid Service (Servicio de Primera Ayuda Psicológica or SPAP), a national helpline designed to provide early psychological care to people affected by COVID-19. This service attended more than 15,000 calls and carried out more than 11,000 interventions and 9,500 follow-ups with the general population, healthcare and other essential professionals and the patients and relatives of the sick or deceased. This oral communication presents the results of the SPAP regarding the sociodemographic characteristics and psychological problems of the people served and the follow-up of these problems one and a half years after the end of the SPAP. It also discusses the lessons learned from the analysis of the SPAP's activities and results, which should be taken into account when planning the necessary measures to prepare countries for the psychological impact of future pandemics and other large-scale disasters.

Abstract 3221

THE PSYCHOLOGICAL IMPACTS OF CLIMATE CHANGE AND EXTREME WEATHER

Dodgen D.*

IAAP Division of Clinical & Community Psychology ~ Washington, DC ~ United States of America

Climate change represents a significant global threat. Extreme weather events are increasing in frequency and intensity, varying from heat waves to wildfires, floods, and hurricanes. One thing these events have in common is that they all have significant health and mental health consequences. This presentation will describe the individual and community mental health and social impacts of climate change. It will also describe how these effects differ across people and nations. Finally, we will consider what psychologists can do to participate in preparing for, responding to, and mitigating the needs emerging from climate change.

Abstract 3222

CONTRIBUTIONS OF PSYCHOLOGY IN THE CHALLENGE OF TERRORISM

Fausor R.*[1], Navarro--Mccarthy A.[3], Altungy P.[3], Garcìa Vera M.P.[2], Sanz J.[2]

[1]Valencian International University ~ Valencia ~ Spain, [2]Universidad Complutense de Madrid ~ Madrid ~ Spain, [3]Universidad Europea de Madrid ~ Madrid ~ Spain

Terrorism remains one of the biggest challenges for societies and states across the globe. 156,025 incident fatalities took place since 2018 around the world (counter terrorism report, 2024). This phenomenon has been widely studied from a psychological perspective, with hundreds of scientific papers currently available on the topic. No study to date has gathered the qualitative experiences accumulated by those experts who have led the study of terrorism. Therefore, the aim of the present study is to: (1) gain insights from international experts on terrorism regarding their experiences and perspectives for the future through a qualitative approach and (2) provide a scoping review of the most relevant scientific literature recommended by these experts in the areas of terrorism. To this end, 740 international expert psychologists were contacted, 76 of whom completed an online survey and provided more than 100 bibliographic references to articles considered especially relevant in this field. Most relevant contributions will be discussed as so future lines of research and policy recommendations will be proposed.

Abstract 3223

THE PANDEMIC OF THE FUTURE: DEPRESSION AND THE RIGHT TO HEALTH CARE

Sanz J.*[1], Fausor R.[2], Sanz--García A.[1]

[1]Complutense University of Madrid ~ Madrid ~ Spain, [2]Valencian International University ~ Valencia ~ Spain

Depression is a common mental disorder that may affect more than 380 million people worldwide, with an estimated 5.5% of the adult population in high-income countries and 5.9% of the adult population in middle- or low-income countries having experienced a major depressive episode in the past year. Moreover, in many countries, depression is one of the ten leading causes of mortality and disability in terms of disability-adjusted life years lost. Although effective prevention and treatment programs for depression exist, many people affected by or at risk for depression do not receive such programs or do not receive the most appropriate prevention and treatment programs. This paper analyzes some of the causes that may explain this lack of prevention and treatment, especially in high-income countries, ranging from misinformation, overprescription of psychotropic drugs, lack of psychologists at the different levels of mental health care, or the rise of pseudosciences. Likewise, some of the measures that can be implemented to address these causes and their difficulties will be analyzed, taking as an example the situation of these causes and measures in Spain.

Abstract 3224

PRELIMINARY FINDINGS OF A SYSTEMATIC REVIEW OF SOCIAL SUPPORT INTERVENTIONS AND PSYCHOLOGICAL OUTCOMES IN THE GENERAL POPULATION DURING THE COVID-19 PANDEMIC: IMPLICATIONS ON COMMUNITY MENTAL HEALTH

Guilaran J.*, Adenix K., Navarro J.J.

University of the Philippines Visayas ~ Miagao ~ Philippines

Social support refers to behaviors and social interactions that provide actual assistance and embed people in a web of social relationships that are perceived to be loving, caring, and readily available (Hobfoll & Stokes, 1988). It is one of the most reliable predictors of mental health outcomes after disasters. However, disasters, like the pandemic, disrupt community dynamics, including social support mobilization, provision, and utilization. This paper aims to systematically review the evidence on mental health outcomes and social support dynamics in the general population during the COVID-19 pandemic. Published social support studies on social in community settings during the pandemic will be searched in various academic databases (i.e., Scopus, PubMed, Web of Science). Reference lists and articles cited will also be searched. This paper will present the mental health outcomes associated with the pandemic. This paper aims to highlight the differential effects of the various facets and types of social support, as well as their psychological and social correlates. Implications on community mental health will be discussed, particularly in harnessing the salutary effects of social support to promote positive psychological outcomes.

Abstract 901

UNCOVERING THE LIVED EXPERIENCES OF SKIN PICKING: A QUALITATIVE INQUIRY

Çakir M.*[1], Ünal E.[2], Gençöz T.[1]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Ondokuz Mayis University ~ Samsun ~ Turkey

Pathological skin picking, or dermatillomania, is a body-focused repetitive behavior that remains underexplored in psychological research, particularly with respect to subjective lived experience. Existing studies predominantly emphasize neurobiological and behavioral accounts, while the affective meanings and personal narratives surrounding the symptom have been insufficiently addressed.

From a psychoanalytic perspective, self-inflicting behaviors such as skin picking may be understood as unconscious attempts to regulate overwhelming affect. When symbolization fails, unrepresented pain is enacted on the body. In this sense, skin picking may function both as an expression of unmet psychic needs and as a somatic means of regulation in the absence of symbolic mediation.

The present preliminary study aimed to capture how individuals themselves describe skin picking, using secondary data from publicly available YouTube videos in which people shared their experiences in search of community. A qualitative approach was chosen to allow access to authentic, unfiltered accounts that may be difficult to elicit in clinical settings, thereby offering unique insight into the lived experience of the symptom. Thematic analysis was selected for its flexibility in identifying and interpreting recurring patterns across narratives while remaining grounded in participants' language. Six videos were selected for relevance, featuring women aged 25–50.

Three overarching themes were identified: (1) Affective and Experiential Cycle: Including trance-like states, numbness, craving, satisfaction, guilt, and shame; (2) Social Perceptions and Stigma: Including secrecy, misunderstanding, bullying, and the search for recognition; and (3) Impact on Life and Coping Strategies: Including sensory triggers, avoidance, functional disruption, and paradoxical relief.

By foregrounding subjective experience and situating it within a psychoanalytic frame, this study addresses a gap in the literature and provides a foundation for subsequent qualitative inquiry. These findings may inform the design of semi-structured interview questions, thereby contributing to a deeper clinical understanding of skin picking.

Abstract 1028

RAISING VOICES IN RESEARCH: A COMMUNITY-LED MODEL FOR BUILDING INCLUSIVE RESEARCH ECOSYSTEMS

Gray D.*[1], Husted M.[2]

[1]Kingston University ~ London ~ United Kingdom, [2]University of Winchester ~ Winchester ~ United Kingdom

Despite growing recognition of the need for inclusive inquiry, traditional research systems continue to privilege academic and institutional voices, resulting in evidence bases that fail to reflect the lived experiences, needs, and priorities of some communities, which remain under-represented in research. This exclusion not only undermines the relevance and equity of health research but also perpetuates disparities in access, outcomes, and policy influence across local, national, and global contexts. In this paper, we provide insight into Raising Voices in Research (RViR), a programme grounded in community and health psychology principles that seeks to engage underrepresented communities in research, including as participants. Across several phases, RViR has worked with 20 VCSE organisations representing a wide spectrum of communities, including young people, carers, neurodivergent individuals, LGBTQ+ groups, those seeking sanctuary, and people experiencing homelessness. In this paper, we will detail how, through a range of participatory and co-production activities, we sought to foster trust, build research capacity, and create systemic pathways for community-led research influence among communities who are traditionally excluded from health research: moving from research-led to community-led. We also reflect on the challenges we faced in attempting to bring about systemic change in research culture and systems, ethical evolution toward community-led inquiry, and more relevant and inclusive research. Finally, we examine risks such as institutional resistance, capacity, and funding, whilst also showcasing how community empowerment and participatory methods can fundamentally reshape research institutions and practices.

FACTORS INFLUENCING SUSTAINABLE IMPLEMENTATION AND SCALE-UP OF COGNITIVE BEHAVIOURAL THERAPY FOR INSOMNIA (CBT-I) IN THE PERINATAL COMMUNITY

Atzmon O.*[1], Crowther M.E.[1], Bennett C.[2], Davey M.[3], Drummond S.P.A.[1], Manber R.[4], Mol B.W.[5], Mortimer D.[6], Rolnik D.L.[5], Ryan J.[7], Wiley J.F.[1], Bei B.[1], Connor D.A.[8]

[1]Turner Institute for Brain and Mental Health, School of Psychological Sciences, Faculty of Medicine, Nursing and Health Sciences, Monash University ~ Melbourne ~ Australia, [2]Department of Nutrition, Dietetics and Food, School of Clinical Sciences, Monash University ~ Melbourne ~ Australia, [3]Melbourne Children's Sleep Centre, Monash Children's Hospital, Monash Health ~ Melbourne ~ Australia, [4]Department of Psychiatry and Behavioral Sciences, School of Medicine, Stanford University ~ Stanford ~ United States of America, [5]Department of Obstetrics and Gynaecology, Monash University ~ Melbourne ~ Australia, [6]Centre for Health Economics, Monash University ~ Melbourne ~ Australia, [7]Royal Women's Hospital ~ Melbourne ~ Australia, [8]School of Public Health and Preventive Medicine, Monash University ~ Melbourne ~ Australia

Introduction:Perinatal insomnia is a prevalent sleep concern that affects maternal and infant health. Although CBT-I is the recommended first-line treatment for insomnia, it is not routinely implemented in perinatal care in Australia. This study explored factors (barriers and facilitators) influencing sustainable implementation and scale-up of CBT-I in perinatal care, as investigated in the SHINE (Sleep-Health-in-Perinatal-Care) hybrid effectiveness-implementation type 1 randomised controlled trial.

Methods:507 pregnant females were randomised to either CBT-I or active control. CBT-I was delivered online through psychologist-led sessions and digital materials. Of the 252 randomised to CBT-I, 26 completed a semi-structured interview at six months postpartum to explore implementation. Seventeen key stakeholders (including obstetricians/gynaecologists, general practitioners, psychiatrists and psychologists), and four clinicians who delivered the program were interviewed. Interview guides were developed using implementation science theory. Interviews were analysed thematically to identify implementation barriers and facilitators.

Results:Preliminary results show that most participants found CBT-I beneficial, reporting improved sleep, wellbeing and strong understanding of CBT-I strategies. This was supported by clinicians, with majority observing sleep improvement during delivery. Most participants valued the flexible access to materials, which supported continued engagement postpartum. Some participants expressed insufficient support during postpartum, a concern echoed by clinicians who noted the need for additional structured follow-up/check-ins. Social support was identified by participants and clinicians as a key facilitator of CBT-I adherence. Lastly, stakeholders highlighted the need for clear referral and screening pathways, including easy-to-use tools and a streamlined pathway,

alongside ongoing communication about program outcomes to maintain engagement.

Discussion:Participants and clinicians found CBT-I useful, with its flexible digital delivery promoting sustained strategy engagement. Clear referral pathways and ongoing communication with stakeholders are likely essential for scalability. Key barriers and facilitators, including maintenance treatment postpartum and social support, can inform design of a tailored implementation strategy to accelerate sustainable implementation and scale-up of CBT-I into routine care.

Abstract 1051

BARRIERS AND FACILITATORS TO HELP-SEEKING BEHAVIOUR FOR DEPRESSIVE SYMPTOMS IN THE DUTCH ADULT POPULATION: A GENERAL PUBLIC PERSPECTIVE.

Zandbergen M.*[1], Jansen E.[1], De Kok I.[1], Jabbarian L.[2]

[1]Erasmus MC, University Medical Center Rotterdam, Department of Public Health ~ Rotterdam ~ Netherlands, [2]Erasmus MC, University Medical Center Rotterdam, Department of Psychiatry ~ Rotterdam ~ Netherlands

Introduction

Depression is a major public health problem worldwide, with a 9% prevalence among Dutch adults. Around 70% of individuals experiencing depressive symptoms do not seek timely help, increasing the risk of major depressive disorder (MDD) and long-term problems. Identifying barriers and facilitators may support earlier intervention and improve public mental health.

Method

We conducted semi-structured interviews with 18 participants from Rotterdam area (the Netherlands). Transcripts were thematically analysed by two independent researchers using inductive coding, with overarching themes for barriers and facilitators derived from the data and stratified by demographics (age, gender, education, and cultural background) and by frequencies of mentions at the individual level.

Results

Among the 18 participants (11 woman, ages 18-86, 61.1% Western European), all reported barriers and facilitators, and six overacting themes of barriers and facilitators were identified. Stigma and self-stigma were the most common barriers (88.9% of 18 participants), followed by systemic issues (88.3%), knowledge and literacy (77.8%), accessibility/affordability (77.8%), psychological/illness-related barriers (66.7%), and cultural barriers (61.1%). Demographic differences showed that men more often cited knowledge gaps and cultural norms as barriers for help-seeking while woman emphasised accessibility and systemic issues (e.g. waiting lists or trust in Dutch healthcare). Younger adults highlighted stigma, while psychological barriers were most frequently mentioned by older adults. The most frequently proposed facilitators were improving knowledge/awareness (88.9% of 18 participants), systemic improvements (66.7%), stigma reduction (61.1%), professional training and communication (44.4%), peer/community support (22.2%), and better screening(16.7%).

Conclusion

Although primary care in the Netherlands is freely accessible, stigma, systemic barriers, and knowledge gaps still delay timely help-seeking for depressive symptoms. Targeted strategies, such as addressing knowledge gaps particularly among men and systemic improvements for women, may promotor earlier intervention. Increasing awareness and building more trust in healthcare providers are key areas for future prevention efforts and improve mental health outcomes.

Abstract 295

COGNITIVE EMOTION REGULATION AND NEGATIVE EMOTIONS: THE MODERATING ROLE OF TRAUMATIC NEWS EXPOSURE

Büsra Nur D.T., Gözde I.*

TOBB University of Economics and Technology ~ Ankara ~ Turkey

Introduction and purpose of the study: In the era of constant media exposure, increased exposure to traumatic news has raised concerns about its psychological impact, particularly in terms of emotional distress. This study aimed to examine the relationship between cognitive emotion regulation strategies and negative emotions, with a focus on how traumatic news exposure might moderate this relationship.

Method: The research was conducted in two stages. In Study 1 (n = 72), participants rated a pool of news stories, and items identified as highly traumatic were selected for use in the experimental phase. Study 2 (n = 120) utilized a between-subjects experimental design. Participants were randomly assigned to view either traumatic or neutral news content. The Cognitive Emotion Regulation Questionnaire and the Positive and Negative Affect Schedule were used to assess cognitive emotion regulation strategies and emotions.

Results: Findings indicated that individuals exposed to traumatic news experienced significantly more intense negative emotions than those who viewed neutral content. Moderation analysis revealed that the relationship between rumination as an emotion regulation strategy and negative emotions was moderated by the news types that the participants viewed, suggesting that rumination may function as a vulnerability factor in the context of trauma exposure.

Discussion: In conclusion, the study provides evidence for the critical role of cognitive emotion regulation strategies in shaping emotional responses in the context of traumatic news exposure. The findings highlight rumination as a key target for intervention and contribute to a growing body of literature that emphasizes the psychological consequences of indirect trauma exposure through media and underscore the role of individual differences in coping strategies and emotional processes. The findings also underscore the importance of addressing cognitive emotion regulation strategies in both therapeutic and preventive mental health interventions, especially in the context of widespread media exposure.

Abstract 244

FROM DISCOMFORT TO GROWTH: TRAINEE THERAPISTS' CHALLENGES IN FEEDBACK-INFORMED CBT

Meral Y.*[1], Özge Y.[1], Yorulmaz H.[2]

[1]Izmir University of Economics ~ Balcova ~ Turkey, [2]Koç University ~ Istanbul ~ Turkey

Introduction: Feedback-Informed Treatment (FIT) involves systematically tracking patients' progress during psychological treatment using two four-item self-report measures: the Outcome Rating Scale (ORS) and the Session Rating Scale (SRS) (Miller, 2016). he ORS assesses client well-being, while the SRS evaluates the therapeutic alliance. Research shows that incorporating FIT into sessions can lead to shorter treatment durations and improved retention. Moreover, immediate feedback and self-reflection enhance clinicians' ability to respond empathically and collaboratively. However, implementing FIT can be challenging due to therapists' concerns about time constraints, discomfort in receiving feedback, and potential disruptions to therapeutic flow.

Purpose: Understanding how trainee therapists experience these challenges is essential for developing effective training models. This study explores the experiences and challenges faced by trainee therapists in integrating FIT into their practice.

Method: Participants currently include 14 trainee therapists who apply FIT while practicing Cognitive Behavioral Therapy (CBT) under supervision at Izmir University of Economics' public mental health center. The study is ongoing and will continue until December 2025; thus, the sample size may increase as additional therapists join. A longitudinal qualitative design is used, with open-ended surveys administered at the beginning and end of the psychotherapy process. The survey explores their expectations, the challenges they encounter, and the impact of receiving client feedback on the therapy process

Results: Although data collection is ongoing, emerging themes suggest that trainee therapists initially experience discomfort when confronted with direct client feedback and struggle with integrating FIT tools into time-limited sessions. However, preliminary data suggest that over time, trainee therapists begin to feel more comfortable using the scales and become increasingly capable of handling negative feedback effectively.

Conclusions: Based on the potential findings, this study aims to propose practical recommendations for training therapists to engage effectively with client feedback and implement routine monitoring as an integral part of CBT practice.

Abstract 880

DIGITAL EXPRESSIONS OF TRAUMA AND HEALING: RESILIENCE AND HOPE IN THE VOICES OF ACID ATTACK SURVIVORS

Mittal S.*[1], Singh T.[2]

[1]Bennett University ~ Greater Noida ~ India, [2]Banaras Hindu University ~ Varanasi ~ India

Acid attack survivors experience profound physical and psychological trauma. This study addresses a significant gap in understanding how survivors grapple with trauma, healing and identity in contemporary digital spaces. The present study aims to explore how acid attack survivors express trauma, resilience, and identity on social media; to analyse how digital storytelling and activism challenge stigma and promote advocacy, and to assess how survivors' online narratives can inform psychological support and awareness programs. By adopting a netnographic approach, the research analyses publicly available content from survivor-led accounts, campaigns, and hashtags across platforms such as Instagram, Facebook, and X (formerly Twitter). Thematic analysis (Braun & Clarke, 2006) was done to identify the recurring patterns in the digital narratives of the survivors pertaining to trauma, identity and resilience. To complement this, visual framing analysis by both Entman (1993) and Goffman (1974) was implemented. Thematic analysis revealed themes including scars as strength, digital advocacy, humanizing narratives, psychosocial resilience, community solidarity, social media healing, body image experiences, and joyful expressions. Analysis through Entman's approach showcases a balance between two main frames: highlighting their suffering and trauma and portraying their resilience and strength. From Goffman's framing approach, the key finding is that acid attack survivors actively manage their online self-presentation by carefully selecting and shaping how they share their stories and images. The research has relevance for practitioners as the findings highlight the value of incorporating survivors' online communication in psychosocial interventions. The research emphasizes the significance of digital stories in informing inclusive awareness campaigns and in spreading survivor agency. Finally, the research contends that resilience and healing in the modern world are not limited to transcending trauma but also in expressions of joy, creativity, and everyday engagement in cultural life.

Abstract 300

THE IMPACT OF THE 2023 EARTHQUAKES ON PSYCHOLOGISTS: VICARIOUS TRAUMA, COPING STRATEGIES, AND PROFESSIONAL FACTORS ASSOCIATED WITH GROWTH AND DEPRECIATION

Munevver Rana K.*, Gözde I.

TOBB University of Economics and Technology, Department of Psychology ~ Ankara ~ Turkey

Introduction and Purpose:
Large-scale disasters not only affect individuals directly impacted but also pose psychological risks for mental health professionals providing support. One such risk is vicarious trauma (VT), which may lead to either positive psychological change—vicarious posttraumatic growth (VPTG)—or negative outcomes—vicarious posttraumatic depreciation (VPTD). This study aimed to examine the relationships between VT and both VPTG and VPTD in psychologists who provided psychosocial support after the 2023 Kahramanmaraş earthquakes in Türkiye. It also investigated the mediating role of coping strategies and the moderating roles of supervision and trauma training.
Method:
The sample consisted of 122 psychologists who worked in clinical settings and were involved in post-earthquake psychosocial support. Participants were reached via purposive and snowball sampling on social media. Data were collected using the Demographic Information Form, Vicarious Trauma Scale, Ways of Coping Questionnaire, and the Posttraumatic Growth and Depreciation Inventory – Expanded Version. Analyses were conducted using multiple regression and mediation analysis.
Results:
Coping strategies such as seeking refuge in fate and supernatural forces were found to significantly mediate the link between VT and VPTG. In contrast, no coping mechanism was found to predict VPTD or mediated the relationship between VT and VPTD. Among the professional variables, only supervision showed a positive association with VPTG, while neither supervision nor trauma-related training moderated the relationships between VT and either VPTG or VPTD.
Discussion and Conclusion:
The findings highlight the importance of addressing spiritual coping strategies in post-disaster support programs designed for psychologists. Additionally, the positive association between supervision and VPTG underscores the value of ongoing professional support. Future studies should further explore the mechanisms behind VPTD by incorporating additional psychosocial variables.*

Abstract 412

A NETWORK ANALYSIS OF GENDER DIFFERENCES IN UNRESOLVED ATTACHMENT, POSTTRAUMATIC STRESS FOLLOWING COVID-19, PSYCHIATRIC COMORBIDITY, AND CONTAMINATION FEAR IN ADOLESCENTS: IMPLICATIONS FOR PSYCHOTHERAPY

Wang N.*[1], Chung M.C.[2], Liu F.[3]

[1]Huazhong University of Science and Technology ~ Wuhan ~ China, [2]Zayed University ~ Dubai ~ United Arab Emirates, [3]Jiangxi Normal University ~ Nanchang ~ China

This study used a network approach to examine gender differences in adolescents regarding unresolved attachment styles, COVID-19 PTSD symptoms, comorbid psychiatric symptoms, and contamination fear. The rationale for the study stems from the suggestion that parents' relationships with adolescents (i.e., attachment) can influence how adolescents cope with distress during COVID-19. Since attachment is linked to gender differences, these differences should also be considered. Furthermore, while much has been documented on secure or insecure attachment, little is known about whether the impact of unresolved attachment can influence psychological distress in adolescents. Adolescents (n = 1,715; 803 females, 912 males) from five Hong Kong secondary schools completed measures assessing unresolved attachment, contamination-related fears, PTSD symptoms, and general psychological disorders. Results showed no significant gender differences in network density or global strength. However, network structure analysis revealed weaker connections among males compared to females. For males, all unresolved attachment aspects were linked to COVID-19 PTSD and comorbid psychiatric symptoms, while for females, only perceived failed protection correlated with depression. Both genders showed associations between PTSD, comorbid symptoms, and contamination fear.

In conclusion, while trauma and psychological reactions were shared, gender differences emerged in how unresolved attachment influenced distress. Males exhibited broader attachment-related distress links, whereas females showed more specific associations. These findings enhance understanding of adolescent psychotherapy needs during crises.

INNOVATIVE APPLICATIONS OF QUALITATIVE METHODS FOR CHANGE

Wednesday 22 July 2026 from 14:00 to 15:30

(G-Spadolini)

Elisa Guidi (eCampus University ~ Novedrate (CO) ~ It), Chair and Presenter
Patrizia Meringolo (Laboratory “Multisetting Community Actio), Discussant

In recent years, qualitative research has gained increasing attention in psychology. This symposium examines how innovative uses of qualitative approaches can promote positive change across different groups and contexts, including organizational, local community, clinical, and academic-educational settings.

Guidi et al. illustrate the first step toward second-order change in mothers' working conditions in Italy, using qualitative research to capture their voices regarding unmet needs. This work highlights how gender stereotypes constrain well-being and shows the potential of community psychologists to foster support networks and transformative change.

Gavrilovici and Dronic adapt positioning theory/analysis in a narrative qualitative inquiry in search for identity migration and development of participants in bottom-up community running in Romania. The positioning lens describes the identity development process in terms of agency (being positioned/positioning oneself), movement (constancy and change), and difference.

Covelli focuses on the critical application of qualitative narrative research methods in narrative medicine to deepen the understanding of patient experiences, promoting person-centered care and fostering clinical and policy advancements in response to evolving healthcare challenges.

Lateef et al. offer a unique perspective by applying intersectionality theory within an interpretative phenomenological analysis to sexual violence research, presenting how intersecting systems of oppression shape survivors' counseling experiences. This work demonstrates psychology's potential to promote equity in services for survivors from marginalized groups by incorporating intersectionality considerations into practice and research.

Novara et al. present photovoice as a qualitative method fostering reflection, empowerment, and proposals for university governance among university students. The project emphasized informal spaces as sites of belonging and generated actionable suggestions for improving campus life, illustrating photovoice's capacity to drive institutional and cultural change.

This symposium shows how the innovative use of qualitative methods not only brings participants' perspectives to the forefront but also enables researchers to understand how to foster transformative and inclusive change processes across multiple levels and contexts.

Abstract 3461

QUALITATIVE RESEARCH FOR SECOND-ORDER CHANGE PROCESSES AND POWER SHIFTS: HEARING THE VOICES OF WORKING MOTHERS

Guidi E.*[1], Cecchini C.[2], Di Loreto C.[3], Chiodini M.[1]

[1]1 eCampus University; 2 LabCom Research and Action for psychosocial well-being ~ 1 Noverate (CO), Italy; 2 Firenze, Italy ~ Italy, [2]LabCom Research and Action for psychosocial well-being ~ Firenze ~ Italy, [3]Me First® ~ Firenze ~ Italy

In Italy, the working conditions of mothers reveal a structural gender gap: parenthood reduces women's participation in the workforce while often enhancing men's. Work-family balance remains a central challenge and a primary reason for women's resignations. Achieving a second-order change requires modifying the rules that define the working context, challenging entrenched stereotypes, and fostering a new culture. The first step in this process is to listen attentively to and foreground women's voices through qualitative research.

This study is part of a national project on the well-being, challenges, and needs of working mothers in Italy. Results are based on 1,130 participants who completed an online questionnaire, which included an open-ended question about their perceived needs in their roles as women, mothers, and workers. Six women also participated in in-depth interviews to explore social support, workplace recognition, and fulfillment of needs. Data were analyzed using reflexive thematic analysis.

We identified three main themes from the open-ended responses: Desire for Time and Burden of Judgment, reflecting the need for personal and family time, often accompanied by guilt and social judgment; Professional Recognition and Structural Changes, highlighting calls for equality, fair pay, flexible work arrangements, and parental leave supported by workplace policies fostering work–family balance; and Building Family Support Networks, emphasizing the need for accessible services, psychological support, and collaboration from partners and the community to reduce isolation and inequalities. Interview analysis identified three additional themes: persistence of gender stereotypes and the maternal wall, the need for cultural change, and the strengthening of both service networks and connections among mothers.

In conclusion, as community psychologists, we can work to challenge gender stereotypes affecting working mothers and support local communities in creating stronger resource networks. Addressing these issues requires coordinated action at multiple levels—individual, organizational, and societal—to foster truly transformative change.

Abstract 3462

ARRIVING AT MENTORING FROM COUCH TO ULTRAMARATHON: A POSITIONING ANALYSIS STUDY

Gavrilovici O.*[1], Dronic A.[2]

[1]Alexandru Ioan Cuza University of Iasi; and Psiterra Association ~ Iasi ~ Romania, [2]Psiterra Association ~ Iasi ~ Romania

The positioning theory and analysis developed rather recently in qualitative inquiry in psychology, mainly in the past 20 years. Taking Michael Bamberg's narrative inquiry perspective within positioning analysis the study taps into the narratively-led conversation within the framework of a series of interviews with participants in community running activities. Community running is a rather new bottom-up practice in Iasi, Romania, the first individual and small group initiatives of this kind started in 2015 and developed fast in the past 10 years. The idea of this research was inspired by the passion we share regarding running or "life into movement". Participating and contributing to a lively and growing running community in our hometown, Iasi, Romania, and inviting people to contribute to a collection of stories, sharing their experiences, stirred our curiosity about what inspires people to start running and the effects of their identity migration.

Particularly, we explore how "runner" identity becomes one of the preferred identities, and how a "migration of identity" may be described and understood, for life trajectories in relation to running "from couch to ultramarathoning". With a focus on narrative identity development, this study focuses on one conversation with a participant who describes a migration of identity from solo runner to becoming a mentor of ultra-marathonists.

The positioning analysis describes the co-construction of meaning about the runner identity in successive steps of the storyteller and the facilitator, alternating self-descriptions with narrative-knitting initiatives. The study renders visible the gradual enrichment of a runner's identity descriptions defined by agency, change, and difference. Running experiences in relation to identity migration and development can be viewed, in conclusion, as a gradual knowledge development process engaging the main protagonist (the storyteller) and the facilitator (the researcher).

Abstract 3463

NARRATIVE RESEARCH IN NARRATIVE MEDICINE: QUALITATIVE METHODS FOR ENHANCING PERSON-CENTERED CARE AND PROMOTING INNOVATION

Covelli V.*

eCampus University ~ Noverate (CO) ~ Italy

Significant changes in the Italian healthcare system pose important challenges for health professionals in managing patient care and treatment pathways. The aging population and rising prevalence of chronic diseases require complex and personalized care approaches. Moreover, the implementation of digital technologies, while enhancing management efficiency, may limit the time available for doctor-patient interactions. In this context, narrative medicine plays a crucial role in integrating various clinical perspectives and refocusing on the patient's subjective experience, helping to overcome fragmentation in care pathways.

Qualitative research has played a key role in narrative medicine, providing methods to explore healthcare professionals' and patients' experiences. In particular, narrative research examines life stories, illness journeys, and patient-provider relationships, uncovering the symbolic, cultural, and emotional aspects of care, which helps foster more empathetic clinical practices.

This presentation discusses a qualitative narrative research study conducted in the field of narrative medicine, focusing on exploring the subjective experiences of 23 paediatric patients with headaches aged 11 to 17, recruited at a specialized neurology center. Data were collected through in-depth narrative interviews and analysed using narrative and thematic approaches. Results revealed different ways of describing illness experiences, with emerging themes related to pain description, social impact, coping strategies, and future perceptions. Based on these narratives, a prototypical first-person narrative was created to serve as a clinical tool that supports dialogue and reflection in care processes.

The presentation will further explore the role and impact of qualitative methodologies in narrative medicine, comparing tools and approaches used in research on illness experiences and care pathways. Special focus will be on how these methods help understand the complexity of individual and social factors affecting healthcare, emphasizing their importance for clinical practice and health policy.

Abstract 3464

APPLYING INTERSECTIONALITY IN QUALITATIVE RESEARCH: INSIGHTS FROM A SURVIVOR-CENTERED SEXUAL VIOLENCE STUDY

Lateef R.*[1], Collin--Vézina D.[2], Alaggia R.[3], Macintosh H.[2]

[1]Université de Sherbrooke ~ Sherbrooke, Québec ~ Canada, [2]McGill University ~ Montreal, Quebec ~ Canada, [3]University of Toronto ~ Toronto ~ Canada

Intersectionality theory proposes that multiple social identities form qualitatively different life experiences and challenges for individuals in society, as a reflection of multiple and interwoven systems of privilege and oppression. Although intersectionality has long been recognized as essential for understanding sexual violence, psychological research often overlooks how intersecting oppressions shape survivors' experiences, psychological outcomes, and systemic responses. This presentation will demonstrate the clinical and scholarly value of adopting an intersectional lens in psychological research by sharing the findings from a study that qualitatively explored, utilizing an intersectional lens, the following research question: How do women survivors of child sexual abuse from marginalized racial and/or ethnic groups experience counseling? This study is among the first to apply intersectionality theory within an interpretative phenomenological analysis design to explore child sexual abuse survivors' counseling experiences. Ten cisgender women survivors of child sexual abuse residing in Canada who identified with a marginalized racial and/or ethnic group completed semi-structured interviews that directly explored their experiences with counseling. Analysis of interview transcripts produced three Group Experiential Themes: (1) shared social identities between survivors and counselors facilitated connection through shared struggles, (2) racism and White privilege had disparate impacts in counseling for survivors, and (3) counselor cultural competence and humility were perceived as priorities. The findings demonstrated how the social location of survivors, and particularly the nexus of race, ethnicity, and gender and the concomitant systems of oppression, influenced their counseling experiences. Clinical implications will be discussed, highlighting the critical role of psychologists and other mental health professionals in addressing systemic inequities by integrating intersectionality and sexual violence survivors' lived experiences into clinical practice.

Abstract 3465

EMPOWERING STUDENTS THROUGH PHOTOVOICE: QUALITATIVE INNOVATION FOR ACADEMIC CHANGE

Novara C.*, Di Napoli G., Marino I., Todaro V., Siringo S., Graziano R., Amenta L.

University of Palermo ~ Palermo ~ Italy

Educational innovation has increasingly embraced models that place students at the center as active partners in the learning process rather than passive recipients. Within this framework, the classroom is no longer the sole space of knowledge production, which instead expands into multiple contexts where competencies are enacted and transformed. This perspective highlights the potential of qualitative methods as tools for social and institutional change.

This contribution presents a photovoice project conducted within the Community Psychology course for pedagogists and community educators at the University of Palermo. The initiative pursued a dual objective: on the one hand, to foster students' critical reflection on their academic community; on the other, to promote empowerment processes and encourage active proposals addressed to the university governance.

Students were asked to produce ten photographs depicting an informal space on campus—a wooded green area commonly used for studying, socializing, and sharing breaks. The images were analyzed using the SHOWED method, which supports collective discussion and the co-construction of meaning. Group narratives were then developed into concrete proposals, which were publicly presented to the university governance during a collective event.

The photovoice process made visible everyday experiences and meanings often overlooked, emphasizing the role of informal spaces as relational environments that foster a sense of belonging to the academic community. The students' proposals focused on improving the quality of campus life through creating the first map of the campus, producing reels to raise awareness on aspects of ecosystem sustainability and leading to the establishment of a STUDENT-VOICE space.

The innovative use of qualitative methods, such as photovoice, can foster institutional and cultural change. Student participation emerges not only as an educational practice but also as a form of active citizenship, capable of generating both personal and collective empowerment within the academic community.

CARING FOR CHILDREN WITH AUTISM SPECTRUM DISORDER IN URBAN LIMA, PERU: EXPERIENCES AND CHALLENGES FROM CAREGIVERS, HEALTH PERSONNEL, AND COMMUNITY LEADERS

Contreras C.*[1], Ticona E.[1], Garcia M.[1], Galea J.[2]

[1]National University of San Marcos ~ Lima ~ Peru, [2]University of South Florida ~ Florida ~ United States of America

Autism spectrum disorder (ASD) is a neurodevelopmental condition with significant implications for children, families, and service systems. In low- and middle-income countries, early identification and sustained multidisciplinary care are frequently constrained by structural inequities, centralized service delivery, and restricted institutional capacity. Although global awareness of ASD has expanded, fewer studies have examined how caregivers, frontline health professionals working with children with ASD, and other community members directly involved in care confront these systemic challenges in everyday practice. Understanding these perspectives is critical to inform culturally grounded and scalable responses.

Methods: A qualitative study was conducted in a low-resource urban districts of Peru. Data were generated through focus groups and semi-structured interviews designed to capture multi-actor perspectives on caregiving, service access, and institutional coordination. All sessions were audio-recorded, transcribed verbatim, and analyzed using reflexive thematic analysis to identify recurrent patterns across participant groups.

Results: Two focus groups comprising N=15 caregivers of children with ASD and N=10 semi-structured interviews with health personnel (psychologists, physicians, and nurses) and community leaders (schoolteachers and community health promoters) were conducted. Six interconnected themes emerged: (1) community-level invisibility and stigma surrounding ASD; (2) substantial emotional and financial burden on mothers as primary caregivers; (3) structural barriers within health and educational systems, including delayed diagnoses and long waiting lists; (4) weak intersectoral coordination across services; (5) development of family-based coping strategies and active advocacy; and (6) calls for community awareness and service decentralization. Families assume a disproportionate share of responsibility in sustaining care amid limited institutional response.

Conclusions: ASD care in urban Lima, a low-resource setting, relies heavily on family resilience amid persistent systemic gaps. These findings offer practice-informed insights to guide family-centered interventions, community-strengthening strategies, and

intersectoral service models aimed at improving early detection, educational inclusion, and equitable access to specialized support in similar global contexts.

Abstract 723

EFFECTS OF PREMATURE BIRTH AND POSTPARTUM DEPRESSION ON EARLY CHILDHOOD EMOTIONAL AND BEHAVIORAL ADJUSTMENT: CHILD- AND ENVIRONMENT-RELATED MEDIATING FACTORS

Sencan Karakus B.*[3], Uluç S.[1], Çelik H.T.[2], Özmert E.N.[3]

[1]Hacettepe University Psychology ~ Ankara ~ Turkey, [2]Hacettepe University Neonatology ~ Ankara ~ Turkey, [3]Hacettepe University Developmental Pediatrics ~ Ankara ~ Turkey

Children born prematurely are subject to a range of psychosocial risks in addition to the biological risks associated with their early birth. The effects of prematurity on the family unit and the attitudes of parents toward their child are significant factors that may influence development. The present study aims to evaluate the emotional and behavioural problems, as well as the social adjustment difficulties, of children born prematurely in early childhood. In addition, it examines the role of child emotion regulation skills, together with family-specific and child-specific variables that may affect these skills.

The mediating role of child emotion regulation in the relationship between social adjustment difficulties, emotional and behavioural problems, and family- and child-specific mechanisms was tested using structural equation modelling. The sample comprised 97 prematurely born children and their parents. A risk model was developed that included factors affecting emotional and behavioural problems and social adjustment difficulties of premature children.

Findings indicated that maternal emotion regulation difficulties predicted child emotion regulation difficulties via maternal negative emotion socialisation styles. These maternal socialisation styles, in turn, predicted child social adjustment difficulties and emotional and behavioural problems through child emotion dysregulation. Moreover, maternal postpartum depression symptoms predicted maternal dysregulation difficulties and child dysregulation difficulties via current maternal depression symptoms. The study also demonstrated moderating effects of children's reactive temperament traits and current maternal depression symptoms within this model.

It is suggested that this model provides a framework for identifying intervention points for addressing early childhood emotional and behavioural problems and social adjustment difficulties in preterm infants.

Abstract 210

PARENTING ALLIANCE AND STRESS IN COUPLES WITH AN INFANT: A DYADIC STUDY ON THE MODERATING ROLE OF CHILDHOOD INTERPERSONAL TRAUMA

Rassart C.*, Paradis A., Godbout N.

Université du Québec à Montréal ~ Montréal ~ Canada

Welcoming a new child is a life-changing event that may deeply impact the mental health of parents, with parenting stress remaining one of the most commonly reported difficulties of the postpartum period. Parenting alliance, a specific component of the couple's relationship focused on parenting, has emerged as a key asset to deal with the stressful demands of early parenting. Although studies have confirmed that a sound parenting alliance is related to lower parenting stress, fathers are often understudied, and the reciprocal influences between coparents are still misunderstood. In addition, the potential influence of parents' history of childhood interpersonal trauma is still unclear. Since parents exposed to cumulative childhood interpersonal trauma (CCIT) are more likely to report early parenting difficulties and later adverse family outcomes, further investigation is needed into how CCIT may disrupt the relationship between parenting alliance and parenting stress. Using a dyadic longitudinal approach, this study examined the moderating role of CCIT in the association between parenting alliance and parenting stress. A randomly selected community sample of 958 parental couples with an infant completed online questionnaires across the first year postpartum. Results showed that higher parenting alliance predicted lower parenting stress 10 months later, with significant interdependence between coparents' functioning and dyadic associations. The strength of the associations varied based on parents' CCIT levels, with higher exposure weakening the positive influence of parenting alliance on parenting stress for mothers and fathers (R2 = 20.8%; 14.8%). These findings reveal the role of CCIT in shaping couple dynamics during postpartum and highlight the need for trauma-informed approaches in prevention and intervention efforts targeting the mental health of parents.

Abstract 93

FROM PARENTING TO MATE PREFERENCES: THE MEDIATING ROLE OF RECIPROCAL FILIAL PIETY IN CHINESE EMERGING ADULTS

Zhang L.R.*

University of Macau ~ Macau ~ Macao

This study aimed at examining the relations between emerging adults' perceived parenting styles and their mate preferences, with the potential mediators of their dual filial piety beliefs. We also explored the dyadic relations between adult children and their parents' perceptions of parenting styles and both their preferences on children's potential mates, with children's filial piety beliefs as potential mediators. We recruited 368 emerging adults in study 1 and included 283 valid parent-child dyads in study 2. Emerging adults completed self-report measures assessing their perceived parenting (authoritative and authoritarian), dual filial piety beliefs (reciprocal and authoritarian), and mate preferences, while parents reported their preferences for potential in-laws and parenting styles.

Results from study 1, using structural equation modeling, indicated that both authoritative and authoritarian parenting were correlated with mate preferences for good genes and good resources. When dual filial piety beliefs were included as mediators, reciprocal filial piety belief fully mediated the relations between authoritative parenting and mate preferences for good genes, but authoritarian filial piety belief could not work as a mediator. In study 2, cross-sectional actor-partner interdependence models showed that children's perceived authoritative parenting had actor effects on preferences for good resources and partner effects on preferences for good genes. Parents' perceived authoritarian parenting had both actor and partner effects on preferences for both good genes and good resources. When children's dual filial piety beliefs were included as mediators, reciprocal filial piety belief fully mediated the actor effects of authoritative parenting on preferences for good genes.

The findings reveal the significant roles of parenting styles and filial piety beliefs in shaping Chinese emerging adults' mate preferences, highlighting the importance of cultural and familial context in understanding romantic preferences.

Abstract 544

MEDIATING AND MODERATING VARIABLES ON THE PATH TO PARENTAL BURNOUT

Uysal E.*[1], Kindap Tepe Y.[2]

[1]Yalova University ~ Yalova ~ Turkey, [2]Ondokuz Mayis University ~ Samsun ~ Turkey

Introduction: Parental identity refers to the degree to which individuals internalize a specific parenting understanding. Parental identity is a relatively new area in the literatüre and it has been found to significantly influence parenting experiences and both individual and family well-being.

Purpose: This study aimed to examine the roles of parental identity, anxiety levels, and basic psychological needs support in explaining parental burnout. Two models were tested: (1) the mediating role of anxiety in the relationship between parental identity and burnout, and (2) the moderating role of basic psychological needs satisfaction in the relationship between anxiety and burnout.

Method: A relational survey design was employed. Participants consisted of 224 parents (123 mothers, 101 fathers) aged between 21 and 55. Data were collected online via snowball sampling. Measures included a Demographic Information Form, the Parental Burnout Assessment, the Utrecht-Management of Identity Commitments Scale–Parental Identity, and the State-Trait Anxiety Inventory.

Results: Mediation analyses conducted using Hayes' PROCESS macro (Model 4) indicated that higher parental identity was associated with lower anxiety levels, which in turn predicted lower parental burnout. These findings suggest that anxiety fully mediates the relationship between parental identity and burnout. Additionally, a moderation analysis (Model 1) revealed that the level of basic psychological needs satisfaction significantly moderated the relationship between anxiety and burnout. Specifically, the positive association between anxiety and burnout was stronger when needs satisfaction was low and weaker when it was high.

Conclusion: These findings emphasize the protective role of a supportive environment in strengthening parents' psychological resilience. Enhancing parental identity and supporting basic psychological needs may be crucial targets for interventions aiming to prevent parental burnout.

Abstract 522

PREDICTORS OF PARENTAL BURNOUT IN PARENTS OF PRESCHOOL-AGED CHILDREN: THE ROLE OF PARENTAL IDENTITY, PSYCHOLOGICAL NEEDS, AND STRESSORS

Uysal E.*[1], Kindap Tepe Y.[2]

[1]Yalova University ~ Yalova ~ Turkey, [2]Ondokuz Mayis University ~ Samsun ~ Turkey

Introduction: Parenting is widely regarded as a sacred role across cultures and is typically associated with positive emotions and experiences. However, it is also a journey marked by challenges. Understanding the resources and risk factors inherent in parenting is essential for guiding parents in this complex process. When risk factors outweigh available resources, the risk of parental burnout increases. Recent studies suggest that parental burnout is linked to demographic features, personality traits, partner relationships, and psychological well-being.

Purpose: This study aimed to identify variables associated with parental burnout and explore its potential predictors among parents of children aged 3 to 6. Specifically, it sought to examine how parental identity, basic psychological needs, marital harmony, and economic anxiety contribute to the development of burnout symptoms.

Method: The study employed a relational survey design and collected data from 419 parents (252 mothers, 167 fathers) via online questionnaires using snowball sampling. Instruments included a Demographic Information Form, the Parental Burnout Assessment, the Parental Identity Scale, the Marital Harmony Scale, and the Economic Strain Index.

Results: Analyses indicated that demographic variables such as gender, age, education level, employment status, and marriage duration were not significantly associated with burnout. However, the identification dimension of parental identity, satisfaction of basic psychological needs, and marital harmony were negatively associated with parental burnout. Conversely, the rumination dimension of parental identity, frustration of psychological needs, and economic anxiety were positively associated with burnout. Regression results showed that identification and marital harmony negatively predicted burnout, whereas needs frustration and financial anxiety positively predicted it. Finally, satisfaction and frustration of basic psychological needs were found to mediate the relationship between identification and burnout.

Conclusion: These findings contribute to a deeper understanding of the psychological and contextual factors influencing parental burnout and offer valuable insight for future research and intervention development.

06 - Division 6: Clinical and Community Psychology

DETECTION AND INTERVENTION ON THE PSYCHOTIC SPECTRUM I

Wednesday 22 July 2026 from 15:30 to 17:00

(M-Lorenese)

Clara Gesteira (Complutense University of Madrid ~ Madri), Chair and Presenter

Psychosis is a serious mental health problem with social and economic impact. Schizophrenia is among the 25 leading causes of disability worldwide (GBD 2021 Diseases and Injuries Collaborators, 2024). In this symposium, more effective procedures of detection and intervention will be examined.

Ways are currently being sought to refine traditional psychosis risk detection, through the study of its risk factors. Family environment represents a significant risk factor that impacts psychosis prognosis, nevertheless not much is known about its effect on the at-risk of psychosis symptoms. M.D. Ricardo Guinea will examine the effect of a range of family factors related to family functioning in the psychotic-like symptoms. Other factors, such as childhood adversity, are robust environmental factors for both psychosis and high-risk states for psychosis. However, the relationships between types of adversity and subclinical psychotic symptoms remain unclear. Dr. Clara Gesteira will discuss the relationship between types of childhood abuse and neglect and kinds of psychotic-like experiences, while Dr. Beatriz Cobos will focus on the impact of bullying on high risk for psychosis.

Besides, the results of standard treatments for fully developed psychotic disorders are very limited (Jaaskelainen et al., 2013), and although early interventions for patients who are still experiencing their first psychotic episode have been proven as effective in improving the course of the disorder, there is no solid evidence that early treatments can prevent future relapses (Fusar-Poli et al., 2017). The study of risk factors, again, could be crucial in this field. Dr. Nina Mørkved will analyze the relationship between childhood trauma, cognitive performance, parental mental health status and antipsychotic effectiveness in schizophrenia spectrum disorder. For her part, Dr. Rita Roncone will explore the role of cognitive biases in the psychosis continuum, testing whether a metacognitive approach in early psychosis can be promising in the prevention of psychotic crises.

Abstract 3510

BULLYING AS A RISK FACTOR FOR THE PSYCHOMETRIC HIGH-RISK OF PSYCHOSIS

Cobos B.*[1], Fausor R.[2], Guinea R.[3], Gesteira C.[1], Morán N.[1]

[1]Complutense University of Madrid ~ Madrid ~ Spain, [2]Valencian International University ~ Valencia ~ Spain, [3]Montreal psychiatric institute ~ Madrid ~ Spain

Childhood adversities appear to be a major risk factor in the development of psychotic-like symptomatology (Egerton et al., 2016; Husted et al., 2012; Velthorst et al., 2013). However, most studies in this field have focused on child maltreatment. Although this is a very important domain, there are other adversities that need further investigation, such as bullying (Sætren et al., 2024). To date, several reviews have examined the relationship between bullying and psychosis (Cunningham et al., 2016; Moore et al., 2017; van Dam et al., 2012). Overall, these reviews support the relationship between bullying and the subsequent development of psychotic symptoms. However, studies on the role of bullying in high-risk states of psychosis are fewer (e.g., Bearden et al., 2022; Vargas et al. 2019). The main objective of this study is to empirically test the relationship between bullying/cyberbullying and psychometric high-risk of psychosis. A clinical sample of adolescents and young adults who attend a day hospital will complete the Spanish version of the Prodromal Questionnaire – Brief version (PQ-B, Fonseca-Pedrero et al., 2021) as a measure of psychometric high-risk of psychosis. Bullying related variables (i.e., occurrence, type, frequency, distress and existence of cyberbullying) will be tested comparing the differences between those with psychometric at-risk of psychosis and those without it according to the PQ-B. The control of the contexts where children develop their childhood, the early detection of bullying and the work with victims and aggressors should be fundamental objectives in the prevention of psychotic disorders.

Abstract 3508

THE RELATIONSHIP BETWEEN FAMILY FUNCTIONING AND PSYCHOMETRIC HIGH-RISK OF PSYCHOSIS

Guinea R.*[1], Gesteira C.[2], Morán N.[2], Cobos B.[2], Fausor R.[3]

[1]Montreal psychiatric institute ~ Madrid ~ Spain, [2]Complutense University of Madrid ~ Madrid ~ Spain, [3]Valencian International University ~ Valencia ~ Spain

Transition to psychosis status in vulnerable adolescents is an interesting domain in studying the possibility of designing more specific and individually tailored interventions to find out whether it is possible to prevent the transition to proper Schizophrenia. The Vulnerability- Stress Model (Zubin, Spring 1977) is a well stablished theoretical framework to study this domain. Several variables have been considered as specific risk factors associates to the likelihood of transition: urbanicity, laterality, drugs consumption, migration, early trauma, etc.

The presentation will consider variables associated with the family, as found in the data collected in a research project conducted on 170 adolescents treated in a psychiatric day hospital. As expected, preliminary rough data found significant differences between our sample and general population in domains as trauma, anhedonia, gender bias, and global functioning. Also found significative correlation with level of psychopathology in parents, however, did not find significant differences in other domains assessed in the Interview (i.e. divorce rates). However, there is a strong suspect that this lack of correlation is due to lack of sensibility of the semi-structure interview, given the interview was not designed to assess other important traits in families (i.e. qualitative dysfunctional relations among parents of within the family).

The presentation will consider data from available literature regarding this topic and propose a panel discussion.

Abstract 3509

EXPLORING THE ASSOCIATION BETWEEN CHILDHOOD ABUSE AND NEGLECT AND SUBCLINICAL PSYCHOTIC SYMPTOMS

Gesteira C.*[1], Morán N.[1], Cobos B.[1], Fausor R.[2], Guinea R.[3]

[1]Complutense University of Madrid ~ Madrid ~ Spain, [2]Valencian International University ~ Valencia ~ Spain, [3]Montreal psychiatric institute ~ Madrid ~ Spain

Trauma associated with abuse in childhood is not only a consolidated risk factor for the onset of psychosis, but also for the immediately preceding states, known as at-risk mental states (ARMS) or ultra-high risk (UHR). These states would be fundamentally characterized by the concurrence of subclinical psychotic symptoms (SPS). While the scientific literature indicates that in people with UHR, abuse experiences are associated with more severe SPS and a higher rate of transition to psychosis, it is not yet clear whether there are specific associations between types of maltreatment (physical, emotional, or sexual abuse and physical or emotional neglect) and kinds of SPS (positive and negative). While some studies argue for the non-specificity of the consequences of trauma, others would link some types of abuse to specific domains of SPS. The inconsistency of the data could be due to the fact that most studies do not consider the presence of post-traumatic symptoms that could arise from abuse situations. Additionally, studies with ARMS populations normally take into account very high-risk populations, usually patients who attend early care services, who have many more risk factors and a higher and more homogeneous levels of both trauma and SPS. Considering these limitations and trying to overcome them, this study intends to explore the relationships between types of abuse, post-traumatic symptomatology and types of SPS with young people who attend a day hospital and who make up a more heterogeneous clinical sample. The deeper knowledge about the relationship between childhood trauma associated with maltreatment and SPS that comes from this study could provide victimization profiles associated with types of SPS that could help improve both early detection and intervention.

Abstract 3511

CHILDHOOD TRAUMA AND CLINICAL FEATURES IN PSYCHOSIS

MØrkved N.*[1], Johnsen E.[2], Kroken R.[2], Bartz--Johannessen C.[2], Rettenbacher M.[3], Joa I.[4], Løberg E.M.[2]

[1]DEPARTMENT OF RESEARCH AND INNOVATION, HELGELAND HOSPITAL INSTITUTE FOR PSYCHOLOGY, FACULTY OF HEALTH SCIENCES, UIT THE ARCTIC UNIVERSITY OF NORWAY ~ SANDNESSJØEN ~ Norway, [2]Haukeland University Hospital; University of Bergen, [3]Medizinische Universität Innsbruck, [4]TIPS; Stavanger University Hospital

Background: Childhood trauma (CT) has increasingly been tied to psychosis and schizophrenia spectrum disorders (SSDs). CT includes physical, sexual, and emotional abuse and physical and emotional neglect. Studies have pointed to more CT in psychosis compared to healthy controls, however, comparison to other patient groups has been less researched. Research on CT in relation to clinical features such as cognitive functioning and the effect of antipsychotic medication has been mixed. This knowledge is imperative to enhance trauma-informed care for patients with psychosis.
Methods: Based on data from the Bergen-Stavanger-Innsbruck-Trondheim (BeSt InTro) study, we have examined CT in relation to 1) other clinical groups, 2) cognitive performance, 3) parental mental health status, and 4) effect of antipsychotic medication. Patients (n=98) within F20-29 in the ICD-10 were assessed with the Childhood Trauma Questionnaire Short-Form and PANSS scales, in addition to a comprehensive cognitive test battery and interviews about parental mental health.
Results:
1) Patients with SSDs reported more severe CT and more types of CT compared to patients with other mental health disorders. When compared to substance abuse disorders, we found no significant differences in the number or severity of CT.
2) Physical neglect significantly predicted decreased attention and working memory abilities in SSDs
3) We found a dose-response relation between CT and psychosis, not moderated by parental mental health.
4) CT was associated with a slower effectiveness of antipsychotic medication from baseline to 52 weeks of treatment. CT subtypes were significant predictors for effect of antipsychotics; sexual abuse on positive psychosis symptoms and physical neglect for general symptoms.
Conclusions: We found CT to be frequently reported in our sample of SSDs, and CT is related to important clinical features of psychosis based on samples from our studies. Our results highlight the need for trauma-informed care for SSDs.

Abstract 3512

COGNITIVE BIASES, METACOGNITION AND EARLY STAGES OF PSYCHOSIS: OVERVIEW OF PROMISING INTERVENTIONS FOR YOUNG PEOPLE

Roncone R.[1], Giusti L.[2], Mammarella S.*[2], De Luca D.[2]

[1]University of L'Aquila, Italy ~ L'Aquila ~ Italy, [2]Department of Life, Health and Environmental Sciences, University of L'Aquila ~ L'Aquila ~ Italy

Introduction: Core features of psychotic disorders seem represented by Jumping to Conclusions, JTC, bias or inaccuracy in emotion recognition and theory of mind abilities, underlying the formation and maintenance of delusions and hallucinations, with a negative impact on the person's social functioning. In line with existing knowledge, cognitive biases are observed along the continuum of psychosis, from psychotic-like experiences to full-blown psychosis. A poorer performance in metacognition can be seen as a marker of developing a psychotic illness and confirms the potential value of assessing metacognitive beliefs in individuals vulnerable to psychosis.

Purpose: To explore whether the metacognitive approach in early psychosis offers a promising perspective in early intervention by focusing on improving metacognitive competence to prevent psychotic crises (Baumgartner et al., 2020).

Method: A literature search of published literature since 2010 was conducted to investigate the efficacy of Metacognitive Training (MCT) (Moritz et al., 2010) on different stages of psychosis.

Results: Concerning the appropriate treatment of cognitive biases in psychotic users and individuals with recent onset of psychosis, several studies and meta-analyses confirmed the efficacy of MCT on positive symptoms, neurocognition, cognitive insight, cognitive biases, and social functioning. Also, MCT showed promising outcomes in young at-risk mental states, ARMS, population, and in young subjects in the early stages of psychosis independently by their Duration of Untreated Psychosis over two years (Ussorio et al., 2016).

Conclusions: MCT seems to be a promising treatment in clinical practice, taking into account the positive results in cognitive insight improvement that may act to improve treatment adherence and prevent psychotic episodes. A future web adaptation of MCT could represent a challenge in reaching more young users at high risk of transit to psychosis.

ATTACHMENT AND EXTREME SOCIAL WITHDRAWAL: THE MODERATING ROLE OF MEANING IN LIFE IN A COMMUNITY SAMPLE OF ITALIAN ADOLESCENTS

Salcuni S.[1], Lis A.*[2], Sukhija V.J.[3], Bassi G.[1]

[1]Department of Developmental and Social psychology, University of Padova; ; Human-inspired Technologies Research Centre, University of Padova ~ Padova ~ Italy, [2]Department of Developmental and Social psychology, University of Padova ~ Padova ~ Italy, [3]Department of Developmental and Social psychology, University of Padova; Department of Surgery, Medicine, Dentistry and Morphological Sciences with Transplant Surgery, Oncology and Regenerative Medicine Relevance, University of Modena & Reggio Emilia ~ P

Introduction: Extreme social withdrawal (ESW) is described as a prolonged isolation from the outside world, emerging mainly in adolescence. Once considered primarily a Japanese phenomenon (hikikomori), ESW is now recognized as a global issue, with cases documented across different cultural contexts. ESW is associated with profound psychosocial impairment, reduced functioning, and significant emotional distress. Understanding the mechanisms underlying this condition has become a growing priority, and recent research has begun to investigate both risk and protective factors. A crucial developmental task in adolescence is the construction of a coherent sense of meaning in life (MiL), which contributes to psychological well-being, resilience, and motivation to engage in social roles. Evidence suggests that adolescents who experience ESW frequently report a lack of MiL, perceiving their lives as purposeless and disconnected, which sustains withdrawal. In contrast, secure parent-child attachment fosters trust, self-efficacy, and openness to social engagement, representing a protective factor. Purpose: This study examined the interplay between attachment, MiL, and ESW in a community sample of 837 Italian adolescents. We hypothesized that secure attachment to both parents would enhance MiL and, in turn, reduce the risk of ESW. Method: An online survey was administered in high schools during class hours to assess attachment using the Inventory of Parent and Peer Attachment, MiL with the Meaning in Life Questionnaire, and ESW with the Hikikomori Questionnaire. Results: Path and regression analyses converged in support of the hypothesized moderation model. Greater attachment security to both parents was positively associated with MiL, and MiL -as secure attachment- was inversely associated with ESW. Conclusions: MiL emerged as a key psychological mechanism linking secure parent-child attachment with reduced risk of ESW. These findings suggest that interventions which strengthen parent-adolescent bonds and actively cultivate a sense of meaning and purpose may help prevent or mitigate ESW.

MIGRANT MUMPRENEURS: NAVIGATING MULTIPLE ROLES AND WELL-BEING

Akay N.[1], Samur--Teraman S.B.[1], Morales De Labra E.S.[1], Öztürk I.*[2]

[1]Birmingham City University ~ Birmingham ~ United Kingdom, [2]University of Leeds ~ Leeds ~ United Kingdom

Cross-country migration is a role-challenging experience as it requires adaptation to different customs, interaction patterns, and regulations of a new country. Failure to adapt may affect the migrant's mental health negatively: depression and anxiety disorders and post-traumatic stress disorder are found to be associated with migration, with women under higher risk. This may be further exacerbated when the migrant is a mumpreneur (i.e., a female entrepreneur with children) who is already juggling entrepreneurship and motherhood, and this adaptation may be further complicated if the mumpreneur has just started or is about to start her own business. Despite these risks on mental health, this group has been paid relatively little research attention in the past.

Based on this gap, this study aimed to explore migrant mumpreneurs' experiences related to their multiple roles and the potential impact of this on their mental health and wellbeing, through conducting one-to-one interviews with fifteen Turkish mumpreneurs living in the UK under the ECAA visa (i.e., a European visa which requires the recipient to start a business in the migrated country). We analysed interview scripts using thematic analysis as our main methodology and Bronfenbrenner's Ecological Model as our theoretical framework. The analysis revealed rich experiences, including the child's future as the main motivation for migration, adaptation challenges, issues with balancing multiple roles, and presence or absence of social networks as a crucial factor. The participants also mentioned worry, loneliness, and stress, but strength based on overcoming these challenges.

The findings highlight the need to provide structured support to migrant mumpreneurs via governmental bodies as well as non-government organizations, and hint at the type of support they would benefit from. This oral presentation will end with a brief discussion and suggestions regarding these.

Abstract 576

ENHANCING SELF-ACTUALIZATION AND SELF-COMPASSION IN EMERGING ADULTS: A POSITIVE PSYCHOLOGY GROUP INTERVENTION

Turhan Z.*

Bartin University ~ Bartin ~ Turkey

This study details the development and qualitative evaluation of a positive psychology–based psychoeducational group intervention aimed at promoting self-actualization and self-compassion among emerging adults (ages 18–25). Grounded in Maslow's self-actualization theory, Neff's self-compassion model, Seligman's positive psychology framework, and Turkle's insights into the digital impact on communication, the intervention sought to enhance identity formation, psychological resilience, and interpersonal skills. Core themes addressed include self-awareness, identifying personal strengths, setting healthy boundaries and communicating effectively, and managing digital influences on relationships.

Qualitative data from thematic analysis of participant observation notes revealed five principal domains of change: heightened self-awareness and recognition of strengths, improved communication and boundary-setting, increased emotional regulation and resilience, critical awareness of digital impacts, and enhanced social connection and sense of belonging. Participants reported gains in self-reflection, emotional balance, and coping skills through experiential group dynamics, scenario work, and mindfulness techniques. The group context fostered empathy, mutual support, and reframed digital-to-face relational priorities. Overall, this intervention exemplifies how applied psychological science can innovate to bolster individual well-being and societal cohesion, especially amid challenges posed by digital culture. The findings underscore the transformative potential of structured group-based, positive psychology applications in promoting psychological resilience and well-being in a critical developmental phase.

STRATEGIES TO IMPROVE ENGAGEMENT AND ADHERENCE TO PSYCHOLOGICAL INTERVENTIONS IN MEN

Bassi De Toni M.*, Di Consglio M., Couyoumdjian A.

Department of Psychology, Faculty of Medicine and Psychology, Sapienza University of Rome ~ Rome ~ Italy

This work examines gender differences in mental health, focusing on men's lower likelihood of seeking psychological support. A critical review of the literature identifies key barriers that hinder men's access to care services, including individual and social factors such as internalized stigma and rigid models of masculinity, as well as structural factors related to the inadequate capacity of services to respond to men's specific needs. The factors and organizational characteristics that an intervention should possess to increase male participation and adherence to treatment pathways are addressed through two main dimensions: (1) professionals' skills and characteristics, and (2) intervention features and approaches. For professionals, essential requirements include solid knowledge of masculinity and gender socialization, awareness of personal biases, and the adoption of direct, validating, and collaborative communication styles. Regarding intervention design, the literature highlights the value of co-design strategies that incorporate the diverse needs of male populations, the utilization of evidence-based frameworks, clear and goal-oriented structures, and the adoption of a strength-based approach that shifts the focus from deficit models of masculinity to a focus on positive functioning. Effective interventions should adapt language to men's perspective, use informal communication, appropriate humor, and involve respected male role models to normalize help-seeking and reduce stigma. Group-based approaches, action-oriented activities, and transparent goal setting are also recommended to enhance participation and adherence. These approaches aim to make mental health services more inclusive and effective for the male population. It is hypothesized that such strategies may encourage men to seek help, improve their well-being, reduce suicide risk, and generate significant social effects, such as the prevention of gender-based violence and the reduction of healthcare costs.

LIVED EXPERIENCES OF PEOPLE WITH OBESITY: A QUALITATIVE RESEARCH

Bekçi Gökçeoglu N.*, Manka M., Gençöz T.

Middle East Technical University ~ Ankara ~ Turkey

Abstract

Obesity is a chronic disease characterized by excessive body fat that compromises health. It is not merely an aesthetic concern since it is associated with a wide range of health problems, including cardiovascular diseases, diabetes, hypertension, sleep apnea, joint problems, and certain types of cancer. Beyond its physical effects, obesity also negatively influences individuals' self-esteem and psychological well-being as well. The consequences of obesity are not limited to the individual level, as they extend to society through increased healthcare costs, economic and cognitive productivity losses, and reductions in overall quality of life. Therefore, addressing obesity and conducting research on this issue are crucial both for individuals and for society at large. This study aims to deeply explore the experiences of individuals diagnosed with obesity and to examine how they interpret obesity within the context of their subjective experience, while taking into account social, cultural, and relational factors. To achieve this aim, five to ten participants will be recruited through purposive sampling, and semi-structured interviews will be conducted. Data will be analyzed through Interpretative Phenomenological Analysis (IPA), which allows for an in-depth understanding and interpretation of personal experiences. Participants' statements will be grouped into themes and interpreted from a psychoanalytic perspective, primarily utilizing the Lacanian framework. The findings are expected to provide rich insights into how individuals experience and make sense of obesity, while also highlighting both personal and societal dimensions of this complex phenomenon.

Abstract 1949

FROM CLIMATE ANXIETY TO SOCIAL CONFLICT: A SECOND BRAIN PSYCHOLOGY PERSPECTIVE

Ingegnieri A.A.*

Università Internazionale della Pace (UNIPACE) ONU ~ Roma ~ Italy

Introduction: Traditional psychological models often struggle to explain the deep roots of psychosomatic suffering and the impact of macro-environmental stressors like climate change. The rise of "eco-anxiety" highlights the need for a framework that connects environmental instability to individual and social behavior.

Purpose: This presentation introduces Second Brain Psychology (SBP) as a novel theoretical and clinical model to understand this connection. The purpose is to demonstrate how SBP provides a neurobiological explanation for the link between climate-induced anxiety, maladaptive behaviors such as compulsive accumulation, and resulting social conflict.

Method: The SBP model is a dynamic framework integrating over 24 years of clinical practice with more than 1,135 cases. It posits that the enteric nervous system (the "second brain") is the seat of the unconscious, where unresolved emotional memories are stored. The methodology involves diagnosing the individual's "Emotional Matrix" and using targeted protocols to dissolve these somatic memories, drawing on evidence from neuroscience and clinical narrative.

Results: Clinical application of SBP demonstrates a significant resolution of anxiety, panic, and psychosomatic symptoms. Case studies show that by strengthening the individual's "inner filter," the method enhances resilience to both personal and environmental stressors. The model successfully predicts how visceral insecurity can lead to a compensatory drive for external security (accumulation).

Conclusions: The SBP framework offers a powerful diagnostic tool for some of the most pressing social pathologies of our time. By understanding the gut-brain axis response to environmental threat, we can develop new therapeutic and social interventions aimed at the root cause of our collective unease, rather than merely its symptoms.

Abstract 2691

DIFFERENT BUFFERS AGAINST DEPRESSION? EXPLORING GENDER-SPECIFIC INFLUENCES OF EMOTION REGULATION AND RELATIONSHIPS

Lehenbauer--Baum M.*, Balžanka S., Klaps A., Kovacovsky Z., Stetina B.U.

Sigmund Freud Private University, Faculty of Psychology ~ Vienna ~ Austria

Introduction: Emotion regulation and relationship quality are protective factors against depression. Their relative strength may vary by gender; men appear to benefit more from social support, reflecting contextual and socialized differences.

Purpose: We examined differences in emotion regulation and relationships quality as buffers against depression, highlighting gender-related contextual protective factors.

Method: 382 adults (274 women, 108 men) participated in an online survey and provided data on the PERMA Profiler (subscale "Relationships" to measure perceived social support, relationships quality), Emotion Regulation Questionnaire (assessing cognitive reappraisal, emotional suppression), and PHQ-9 (depression). Hierarchical regressions were conducted separately by gender; model 1 included emotion regulation strategies (reappraisal, suppression), model 2 added perceived relationships quality to examine the incremental predictive value.

Results: Women and men did not significantly differ in cognitive reappraisal ($p = .784$), but women reported significantly lower emotional suppression than men ($p < .001$) and significantly higher relationships quality on the PERMA Profiler ($p = .004$). For women, model 1 explained 19.5% of depression variance, with both emotion regulation strategies as significant predictors. Prediction increased significantly to 29.8% when adding relationships quality in model 2 (all predictors remained significant). For men, model 1 explained 13.6% of depression variance, only reappraisal was significant. In model 2, only relationships quality remained significant, increasing prediction to 38.5%.

Conclusions: Like previous studies, we found that protective factors against depression are contextually shaped by gender. For women, emotion regulation and supportive relationships buffered against depression, with lower reappraisal and higher suppression predicting higher symptoms. For men, emotion regulation explained less variance, and emotional suppression was nonsignificant. Once added, perceived social support and relationships quality became the only significant predictor. Our results highlight the need for gender-sensitive, context-aware prevention and clinical strategies that strengthen emotional flexibility and adaptive regulation in women and foster relational connectedness and supportive interpersonal functioning in men.

SENTIMENT ANALYSIS OF SUPPORT NETWORKS DURING MATERNAL TRANSITION: A LONGITUDINAL COMPARATIVE STUDY DURING PREGNANCY AND POSTPARTUM

Doval Moreno S.*[1], Calderón S.[2], Correas Á.[2], Giménez--Dasí M.[2], Martín G.[2], Quintanilla L.[3]

[1]Faculty of Health, International University of La Rioja (UNIR) ~ La Rioja ~ Spain, [2]Faculty of Psychology, Complutense University of Madrid ~ Madrid ~ Spain, [3]Faculty of Psychology, UNED ~ Madrid ~ Spain

Background: The transition to motherhood involves significant changes in support networks and women's perceptions of their social and family environment. Sentiment analysis provides an objective methodology to examine these changes through the language used by participants.

Objective: To analyze variations in expressed sentiments about different support categories between pregnancy and postpartum periods using sentiment analysis techniques applied to longitudinal interviews.

Methods: A longitudinal qualitative study with sentiment analysis was conducted on interviews with women at two time points: pregnancy and postpartum. Lexical and contextual analysis was applied considering negators, intensifiers, and language moderators. Thirteen support categories were analyzed: family support, partner support, emotional support, professional support, community support, informational support, practical support, self-care, psycho-emotional support, and inverse categories (conflict, support conflict, lack of support). Sentiment values were calculated on a scale from -2 (very negative) to +2 (very positive).

Results: Differentiated patterns were observed between periods. Family support showed a general decrease in frequency of mentions from pregnancy to postpartum. Professional support increased its relevance in the postpartum period. Emotional support showed significant individual variations. Inverse categories (conflict and lack of support) evidenced changes in perception of relational tensions. The relationship with mother showed predominantly positive sentiments, with some cases of reevaluation of maternal care memories after pregnancy.

Conclusions: Sentiment analysis reveals complex transformations in support perceptions during maternal transition. A transition from dependence on informal support (family/partner) toward greater appreciation of professional and institutional support after childbirth was evidenced. Results suggest the need for differentiated interventions according to the stage of maternal transition.

Abstract 1901

THE ROLES OF WORRY AND FAMILY FUNCTIONING IN THE ASSOCIATION BETWEEN INTOLERANCE OF UNCERTAINTY AND DEPRESSION

Harmancı Ş.B.*

Ankara University ~ Ankara ~ Turkey

Intolerance of uncertainty (IU) has been identified as a transdiagnostic vulnerability factor, closely linked to a range of psychological difficulties. Although worry is considered the core mechanism through which IU has its impact, less is known about how family-level processes shape this pathway. Family functioning, which reflects the quality of communication, support, and problem-solving within the family system, may influence whether worry escalates into depressive symptoms. The present study examined how family functioning moderates the pathway from IU to depression through worry. A total of 520 adults completed validated self-report scales assessing IU, worry, depressive symptoms, and family functioning. Data were analyzed using Hayes' PROCESS macro. Results indicated that IU did not directly predict depressive symptoms; rather, its effect was mediated by worry. Higher IU was associated with greater worry. This in turn was linked to elevated depressive symptoms. Family functioning moderated both stages of this indirect pathway, showing a dual pattern. Specifically, the association between IU and worry was stronger at higher levels of family functioning, suggesting that well-functioning family contexts may contribute to heightened anxiety when facing uncertainty. In contrast, family functioning weakened the association between worry and depressive symptoms, indicating a buffering effect against the progression of worry into depressive outcomes. These findings highlight the dual role of family functioning. It can operate as a vulnerability factor by strengthening the impact of uncertainty on worry and as a protective factor by reducing the influence of worry on depressive symptoms. This dual pattern provides novel evidence that family processes are not uniformly beneficial or harmful but show context-dependent influences across different stages of psychological pathways. The study emphasizes the complexity of family influences on mental health, with implications for both theory and clinical practice.

Abstract 2046

THE CHANGING LANDSCAPE OF FAMILY THERAPY IN INDIA: A QUALITATIVE EXPLORATION OF HELP- SEEKING BEHAVIOURS

Mukherjee C.M.*[1], Agrawal C.[2], Ahluwalia A.[1]

[1]Artemis Hospital, Gurugram, Haryana ~ Gurugram ~ India, [2]SAM Global University ~ Bhopal ~ India

Traditionally, families have been a support system for an individual in India. Lately, with widespread rural- urban migration and confluence of Western ideas, this system has come under pressure to remain relevant and survive the changes. The explosion of information through social media, distractions provided through technology and the consequent cultural invasion has resulted in invisibility, inaccessibility and unresponsiveness of family members for each other. The loneliness and clash of ideas between generations and couples has led to break down of the support system that family was for an individual in India. As a consequence, the mental health burden in India is on a rise. Family therapy could help to put families back in the map as a resource for the individual but there appears underutilization of family therapy. The objective of this study was to explore and compare the perceptions, attitudes, help-seeking behaviors, and beliefs regarding family therapy among three groups: (i) individuals with prior exposure to family therapy, (ii) individuals without exposure to family therapy, and (iii) practicing family therapists in India. Qualitative study was conducted using semi-structured interviews and focused group discussions. It was a purposive sample of 15 individuals each from families who were in or had family therapy, families with no prior experience of family therapy and 10 therapists practicing family therapy. Participants were recruited from Northern India and the thematic analysis method by Braun and Clarke was used. Results showed that contrary to popular belief, participants showed openness and willingness towards family therapy in light of rising intergenerational, couple and parent-child conflicts. However, paucity of trained professionals, rising cost of therapy, and attitudes of shame and secrecy shrouded the help-seeking behavior.

Abstract 1778

THE ROLE OF PARENT-CHILD RELATIONSHIP AND THEIR IMPACT ON PSYCHOLOGICAL IMMUNITY AND PURPOSE IN LIFE AMONG EMERGING ADULTS

Rosy T.E.R.*, Tushar S.

Tamanna e rukshar ~ varanasi ~ Italy

Psychological immunity refers to those mental process and personal resources that protect an individual's mental well-being from stress, trauma, and other negative life events. A strong body of research have indicated that purpose in life of an individual is significantly related with psychological immunity. Research also shows that psychological well-being is significantly related with Purpose in life. However, the exact mechanism underlying this relationship is yet to be explored. The present paper is an attempt to understand the relationship between parent child relationship, psychological immunity, purpose in life among Indian emerging adults and to understand the ways in which parent-child relationship shows a significant impact on psychological immunity and purpose in life.

A total 200 emerging adults (100 Male and 100 Female) between the age range of 18 to 25 years were administered questionnaires assessing Parent child relationship, psychological immunity and purpose in life. Results revealed a significant relationship between parent child relationship, psychological immunity and purpose in life. It was also observed that parent-child relationship significantly moderates the relationship between psychological immunity and purpose in life. A significant interaction of gender was also observed in these relationships. These results are important as they help us to understand how parent child relationship impact psychological immunity and purpose in life of emerging adults and advocates of effective parenting training/counselling for first time parents.

GLOBAL PERSPECTIVES ON ETHICAL PRACTICE WITH LGBTQ+ COMMUNITIES: NAVIGATING PSYCHOLOGY AND CULTURE THROUGH A JUSTICE CENTERED LENS

Wednesday 22 July 2026 from 17:30 to 19:00

(B- Spadolini)

Franco Dispenza (Department of Counseling and Psychologic), Chair
Nadine Nakamura, Discussant

The intersections of ethical care and psychological practice usher unique challenges and opportunities when
working with lesbian, gay, bisexual, transgender, and queer (LGBTQ+) individuals from a global context.
Grounded in the values of clinical/community and counseling psychology, we examine how international
psychologists (from the United States, Canada, Iran, Portugal, and South Africa) draw from Ethical Principles
(e.g., APA, Yogyakarta) and UN Sustainable Development Goals (3, 5, and 10) to advance LGBTQ+ mental
health. The session will explore critical ethical challenges including confidentiality, competency development
across cultural boundaries, informed consent with vulnerable populations, and advocacy within professional roles.
Presenters will demonstrate ethical decision-making that balances clinical rigor with community empowerment,
particularly when working with LGBTQ+ individuals facing structural oppression and minority stress in different
countries.What distinguishes this symposium is its integration of international perspectives with clinical/community,
counseling, and professional psychologists' ecological approach to address an urgent global need: culturally
responsive care that centers healing and systemic change. With rising displacement of LGBTQ+ people from
restrictive regions, psychologists require ethical frameworks that transcend pathology and deficit saturated
clinical models while maintaining ethical integrity.Additionally, presentations will explore how to foster
culturally sensitive therapeutic relationships, adapt assessments and psychological evaluations, and implement
training that respects diverse identities and experiences.
Our multinational panel brings diverse expertise.Dispenza(US; Chair)opens the session with a theoretical
overview of psychological ethics, whereas Nakamura(US; Discussant)closes the session with a global view of
ethics across international contexts.Farhadi Langroudi(US and Iran)contextualizes ethical frameworks when
providing psychological care to diverse LGBTQ+communities across the Arab and Middle Eastern diaspora, and
Carvalho (Portugal) addresses structural stigma from a European context and explores ethical adaptations to the
clinical assessment and practice with LGBTQ+ clients living with chronic physical illness. Fuks (Canada)
explores immigrants and refugees navigating intersecting pressures of cultural adaptation

and queer identity
development in Canada, and Nel(South Africa)considers ethical and legal considerations when upholding
human rights and challenging discriminatory practices in aSouth African context. Lastly, Skinta (US) integrates
ethicalpracticewithsociopoliticalawarenessininternational LGBTQ+training.

Abstract 4439

SAFE HAVEN OR SHIFTING GROUND? ETHICAL CARE FOR LGBTQIA2S+ IMMIGRANTS IN CANADA

Fuks N.*

Faculty, Yorkville University ~ Toronto, Ontario, ~ Canada

This presentation examines the ethical and clinical complexities of working with LGBTQIA2S+ immigrants and refugees as they navigate the intersecting pressures of cultural adaptation and queer identity development in Canada. Drawing on empirical research and clinical practice, the presentation explores how experiences of migration, systemic discrimination, and identity concealment interact to shape mental health outcomes. Despite Canada's image as a safe and affirming destination, LGBTQIA2S+ newcomers often face layered minority stress tied to racialization, xenophobia, and cisheteronormativity, raising critical ethical questions about clinician preparedness, informed consent, and cultural humility. Particular focus is placed on ethical dilemmas that arise in therapy when clients' cultural norms conflict with affirming care models, or when clinicians must balance trauma-informed approaches with advocacy and systems-level interventions. The presentation considers how principles from liberation psychology, anti-oppressive practice, and social justice ethics can help reframe traditional psychotherapy models, shifting from deficit-based perspectives to resilience- and community-centered frameworks. Attendees will gain practical strategies for supporting LGBTQIA2S+ immigrants with sensitivity to cultural loss, family estrangement, and intersectional trauma. Emphasis will be placed on adapting assessment and treatment practices in ways that uphold dignity, agency, and ethical responsibility. This session contributes a vital perspective to the global discourse on ethical care for LGBTQIA2S+ communities in transnational and diasporic contexts.

Abstract 4441

RELATIONAL ETHICS IN GLOBAL LGBTQ EDUCATION: LEARNING, LISTENING, AND COLLABORATING

Skinta M.*

Associate Professor, Department of Psychology, Roosevelt University ~ Chicago, Illinois, ~ United States of America

This presentation explores relational ethics in global LGBTQ+ education and training (e.g., Stanley, 2017), emphasizing the importance of interdisciplinary approaches to improve clinical competence and address LGBTQ+ psychological health in a global context. With a focus on developing ethical standards that honor cultural nuances, the session highlights the need for international competence training to support LGBTQ+ clients worldwide (Bidell & Stepleman, 2017; Leach & Leong, 2010). The presenter will discuss strategies for enhancing cultural competence, understanding intersecting identities, and navigating acculturation challenges when engaging in international training. These considerations are critical for fostering inclusive practices that respect the unique experiences of international LGBTQ+ populations while addressing the challenges posed by diverse legal, cultural, and social contexts (Kuo & Leach, 2017). The session will also explore the ongoing effort to develop competency standards that balance universal principles with cultural specificity. By integrating ethical principles with practical strategies, this session equips practitioners to navigate the complexities of global LGBTQ+ education, ensuring their work reflects a commitment to learning, listening, and fostering inclusive collaboration in a culturally varied world.

Abstract 4442

ETHICS OF CHRONIC PHYSICAL ILLNESS CARE FOR LGBTQ+ CLIENTS: NAVIGATING SCREENING, TREATMENT, AND MENTAL HEALTH ISSUES

Carvalho S.*

Clinical Psychology Researcher, Center for Research in Neuropsychology and Cognitive and Behavioral Intervention (CINEICC), University of Coimbra ~ Coimbra, ~ Portugal

Minority status-related stressors seem to contribute to the disproportionately higher physical health problems experienced by LGBTQ+ individuals, namely through stress-related systemic inflammatory processes. However, research suggests that LGBTQ+ individuals report lower access to healthcare services than cisheterosexual individuals due to interpersonal (e.g., fear of discrimination from healthcare personnel), institutional (e.g., lack of appropriate training in affirmative healthcare), and structural (e.g., affordability of specialized treatment options) barriers. Good medical practice standards and clinical decision guidelines for screening and treatment options lack specificity for LGBTQ+ patients, both in terms of their strictly biophysiological consequences (e.g., the interpretation of PSA results in transgender women with prostate cancer on gender affirming hormone therapy) as well as psychosocial impact (e.g., the nefarious impact of cisheteronormative guidelines on mental and sexual health of LGBT+ clients with chronic illness). This presentation will provide an overview of empirical scholarship, discuss ethical issues in research and clinical practice, and describe tentative affirmative adaptations to the clinical assessment and practice with LGBTQ+ clients with chronic physical illness.

Abstract 4443

ETHICAL CONSIDERATIONS IN AFFIRMATIVE (PSYCHOLOGICAL) HEALTHCARE PROVISION FOR SEXUALLY AND GENDER-DIVERSE CLIENTS

Nel J.*

Department of Psychology, University of South Africa ~ Pretoria ~ South Africa

This presentation highlights the ethical imperative for psychology professionals to provide inclusive, context-aware, accessible, intersectional and competent (mental) healthcare for sexually and gender-diverse clients. Towards this end, it is important to understand local and international trends in human rights violations against LGBTQIA+ people. Applying the revised Psychological Society of South Africa Affirmative Practice Guidelines in working with sexually and gender-diverse clients, I consider ethical and legal considerations in upholding human rights and challenging discriminatory practices, minimising economic and structural barriers to competent care, and bridging the gap between policy and lived reality. When working with sexually and genderdiverse clients, psychology professionals, among others, have a responsibility to: i) uphold autonomy, dignity, and informed consent; ii) move away from deficit-based models toward strengths-based, affirmative practices that recognise resilience and community-based coping strategies, and respect selfdetermination
and lived experience; iii) understand the psychological impact of social and structural violence; iv) recognise and actively oppose overt and covert forms of conversion efforts; and v) understand the compounded challenges faced by the sexually and gender-diverse, in general, and in particular those clients with intersecting marginalised identities, such as race, gender, disability, and socioeconomic status.

Abstract 2158

PREDICTING ARAB MUSLIM ATTITUDES ON MENTAL HEALTH HELP-SEEKING FROM RELIGIOSITY, CULTURAL BELIEFS, ACCULTURATION, AND MICROAGGRESSION.

Alqasir A., Ohtsuka K.*

Victoria University, Melbourne, Australia ~ Melbourne ~ Australia

Background:
Religious and cultural beliefs and stigma suppress mental health help-seeking among Arab Muslims (Alqasir & Ohtsuka, 2024). This study explored how acculturation and microaggressions shape the help-seeking attitudes of Arab Muslims in Australia.

Objectives:
This paper aims to test prediction models of help-seeking attitudes based on religiosity, cultural beliefs, acculturation, and microaggression experience.

Methods:
163 self-identified Arab Muslims in Australia (84 male, 74 female, 5 unknown) completed electronic questionnaires on the Qualtrics platform. The questionnaire comprised demographics, acculturation (Stephenson Multigroup Acculturation Scale), religiosity (Muslim Religiosity Scale), help-seeking (Attitudes towards seeking mental health services), cultural misconceptions, mental health knowledge, and ethnic microaggression (EMA).

Results:
Multiple regression analysis was used to evaluate the prediction model of help-seeking attitudes based on knowledge of Mental Health Services, Muslim Religiosity, Cultural Misconceptions of mental health, Dominant Society Immersion, Ethnic Society Immersion, and the Emotional Impact of Microaggressions. The prediction model accounted for 42.9% of the variance in help-seeking attitudes ($R^2 = .429$), $F(6, 117) = 14.656$, $MSE = 53.657$, $p < .001$).

Muslim Religiosity ($\beta = .219$, $t = 2.736$, $p = .007$) was found to be a significant positive predictor, meaning that higher levels of religiosity among Muslims are associated with more positive attitudes towards seeking help. Cultural Misconceptions ($\beta = -.592$, $t = -7.754$, $p < .001$) were identified as a significant negative predictor of help-seeking attitudes.
Thus, while cultural misconceptions predicted negative help-seeking attitudes, it is important to note that Muslim religiosity was a positive predictor of help-seeking

attitudes.

Conclusion/Implications:
Mental health help-seeking and the utilisation of formal mental health services are predicted by acculturation to society at large. Since Muslim religiosity and cultural misconceptions play different roles in terms of enhancing and suppressing help-seeking, mental health service promotion should focus on misconceptions about mental health.

Abstract 517

BREAKING THE POVERTY GAP AFTER LEAVING THE CHILD PROTECTION SYSTEM IN SPAIN: AROPE RATE AND RELATED INDICATORS

Vallejo Slocker L.*[1], García De León Robles C.[2]

[1]Universidad Complutense de Madrid and Aldeas Infantiles SOS ~ Madrid ~ Spain, [2]Aldeas Infantiles SOS ~ Madrid ~ Spain

Introduction: This study examines the living conditions of young people in Spain who have exited the Child Protection System, particularly those who experienced residential care. It highlights their vulnerability to poverty and social exclusion, emphasizing the need for targeted support and policy reform.

Purpose: Analyze the socioeconomic status of care leavers using national statistics and AROPE indicators.; Demonstrate how continued support beyond age 18 can improve integration and reduce vulnerability.

Method: The research is divided into two phases: Phase I uses quantitative data from the Spanish National Statistics Institute (INE), focusing on individuals over 26 who were in residential care. Phase II involves qualitative insights from 27 discussion groups, including professionals and care leavers aged 18–25 and over 25, coordinated by Aldeas Infantiles SOS.

Results: Care leavers show significantly higher AROPE rates (40.9%) than the general population (24.5%), with elevated risks in poverty, material deprivation, and low work intensity. They face challenges in education, employment, housing, and mental health. Despite these barriers, 59.1% have successfully broken the cycle of intergenerational poverty. The study also reveals statistical invisibility of care leavers under 26 and the need for better data collection

Conclusions: Care leavers are the most vulnerable social group in Spain. Early and sustained support—especially in housing, education, employment, and mental health—is crucial. The report calls for policy changes, including extending care until age 25, recognizing care leavers as a vulnerable group, and ensuring their participation in decision-making. Reducing stigma and addressing care leaver's mental health also identified as a priority. Programs like those from Aldeas Infantiles SOS demonstrate that with the right support, care leavers can thrive.

Abstract 1259

INTERGENERATIONAL TRANSMISSION OF COLLECTIVE TRAUMA: INSIGHTS FROM A SYSTEMATIC REVIEW AND CLINICAL REFLECTIONS.

El--Khalil C.*, Caculidis--Tudor D., Nedelcea C.

Faculty of Psychology and Educational Sciences, University of Bucharest ~ Bucharest ~ Romania

Collective traumas, such as war, genocide, natural disasters, and systemic oppression, have profound and lasting effects, not only on survivors but also on their descendants. Understanding how these traumas are transmitted across generations is essential for shaping effective interventions and policy.

This presentation is based on a systematic review of quantitative studies examining psychological and physiological outcomes in second-generation descendants of individuals exposed to collective trauma (published in BMC Psychology, July 2025; DOI: 10.1186/s40359-025-03012-4). From 3,904 records the review synthesized 18 peer-reviewed quantitative studies published between 1997 and 2022, highlighting three key domains of impact.

• Physiological: Altered stress regulation and brain structure point to biological embedding of trauma across generations.

• Psychological: Second-generation descendants frequently exhibit elevated distress and trauma-related symptoms, with parental PTSD emerging as a consistent predictor.

• Social: Trauma shaped identity and relationships, often fostering mistrust and emotional restraint.

While these findings underscore the reality of intergenerational trauma, the evidence base remains limited by small samples, cross-sectional designs, and reliance on self-report measures. More rigorous, longitudinal studies are needed to deepen understanding of transmission pathways.

Beyond synthesizing evidence, this talk will draw clinical and cultural reflections from practice in Lebanon, a context where both historical and ongoing traumas converge. By bridging research and frontline insights, the presentation highlights the need for multifaceted responses, integrating trauma-focused therapies, early screening for stress sensitivity, and culturally informed, community-level interventions.

Abstract 1398

SECONDARY TRAUMATIC STRESS AS A MEDIATOR OF TRAUMA EXPOSURE AND VICARIOUS TRAUMA: BUFFERING ROLES OF ORGANIZATIONAL SUPPORT AND PSYCHOLOGICAL CAPITAL

Ibdah M.*

Faculty of Psychology, University of Valencia ~ Valencia ~ Spain

Humanitarian workers are frequently exposed to the traumatic experiences of others, placing them at risk for significant psychological consequences. While previous studies have examined some psychological impacts of this secondary exposure to trauma (SET), such as secondary traumatic stress (STS) and vicarious trauma (VT) separately, limited research has investigated the mechanisms linking SET to VT and the workplace and personal resources that may buffer these effects. The purpose of this study was to test the mediating role of STS in the relatiobship between SET and VT among humanitarian workers, and to examine whether perceived organizational support (POS) and psychological capital (PsyCap) moderated these pathways. Data were collected through an online survey using validated instruments from 51 humanitarian workers. PROCESS Model 75 in SPSS was applied to test a moderated mediation model. Results showed that SET significantly predicted STS. POS and PsyCap did not moderate the relatiobship between SET and STS, but both significantly moderated the path between STS and VT. Higher levels of POS and PsyCap weakened the positive association between STS and VT, confirming their buffering roles. Conditional indirect effects further revealed that STS mediated the link between SET and VT only when POS and PsyCap were low or moderate. These findings support the conservation of resources theory by highlighting STS as a mediator between trauma exposure and vicarious trauma, and underscore the importance of strengthening organizational and psychological resources to mitigate trauma-related outcomes among humanitarian workers.

Abstract 1944

THE ROLE OF MOTHER–CHILD BOUNDARIES IN THE RELATIONSHIP BETWEEN DOMESTIC VIOLENCE AND ADOLESCENT PSYCHOLOGICAL ADJUSTMENT

Erel S.*[1], Uluç S.[2]

[1]Mersin University ~ Mersin ~ Turkey, [2]Hacettepe University ~ Ankara ~ Turkey

Domestic violence is a serious problem that negatively affects both the women who are exposed to it and the children who witness it. This study aimed to investigate the effects of domestic violence on mother-child boundaries and the psychological adjustment of adolescents. In line with this aim, 302 mother–adolescent pairs were recruited for the study. After conducting missing value and outlier analyses, data from 208 mother–adolescent pairs were included in the main analyses. Structural equation models examining the mediating role of boundary dissolutions in the relationship between domestic violence and adolescents' internalizing-externalizing problems were tested using AMOS. It was shown that boundary dissolutions fully mediated the relationship between adolescents' level of witnessing domestic violence and behavioral problems, and the model fit indices were at acceptable to good level ($\chi 2$ /df = 1.95, CFI = .95, RMSEA = .07). The indirect effect of the level of domestic violence reported by the mother on adolescents' behavioral problems was found to be significant through the mother's psychological symptoms and boundary dissolutions; the model fit indices were at acceptable to good level ($\chi 2$ / df = 1.37, CFI = .98, RMSEA = .04). The standardized estimates of boundary dissolutions in the relationship between domestic violence and adolescent problem behaviors were large for psychological control, infantilization, and hostile spousification (β = .75 - .86); moderate for triangulation and parentification (β =.40-.50); and small for enmeshment and adultification subscales (β =.24-.26). Findings indicated that boundary violations within the family are an important mechanism influencing adolescents' well-being in cases of domestic violence, and interventions targeting the establishment of healthy boundaries are therefore highly important.

Abstract 1168

PERCEIVED STRESS AND DEPRESSIVE SYMPTOMS AMONG FIREFIGHTERS DURING FLOOD RESCUE: A CROSS-LAGGED PANEL NETWORK ANALYSIS

Li M.*, Yang Q., Liang W., Liu B.

Air Force Medical University ~ Xi'an ~ China

Abstract:

Background: Firefighters are frequently exposed to high-pressure environments and traumatic events, making them more susceptible to stress and depression. Despite this, limited research has explored the dynamic relationship between perceived stress and depressive symptoms in this high-risk profession. This study aims to investigate this relationship using cross-lagged panel network analysis among firefighters involved in flood rescue operations.
Methods: Data were collected from 522 firefighters in Shaanxi Province, China, during two waves in July and October 2024. Perceived stress was assessed using the Perceived Stress Scale (PSS), and depressive symptoms were measured using the Patient Health Questionnaire-9 (PHQ-9). A cross-lagged panel network (CLPN) model was used to analyze the temporal relationship between stress and depression.
Results: Through comparing the two cross-sectional networks, we found that the central symptoms and bridge symptoms of perceived stress and depression symptoms changed over time. The findings of CLPN indicate that node D7 (Trouble concentrating) represents high level of Out-Expected Influence (OEI) symptom, while node S8 (Can't cope with things had to do) was identified as high level of In-Expected Influence (IEI) symptom.
Conclusion:
This study aims to explore the dynamic relationship between perceived stress and depressive symptoms among firefighters during flood rescue operations using cross-lagged panel network analysis. The study provides insights into potential intervention points that could help alleviate the psychological burden on firefighters.

DYNAMIC RELATIONS AMONG ANXIETY, EMOTION REGULATION, AND NON-SUICIDAL SELF-INJURY IN ADOLESCENTS: A RANDOM INTERCEPT CROSS-LAGGED PANEL ANALYSIS

Ling F.*[1], Wang Y.[2], Zhang Z.[1], Lei H.[1], Zhang C.[1]

[1]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]Faculty of Psychology, Beijing Normal University ~ Beijing ~ China

Non-suicidal self-injury (NSSI) among adolescents is a global public health concern, characterized by deliberate self-harm without suicidal intent. The Experiential Avoidance Model posits that individuals engage in behaviors such as NSSI to escape aversive internal experiences (e.g., anxiety, distress), gaining temporary emotional relief at the cost of long-term emotional dysregulation. The Ego Depletion Theory further suggests that chronic anxiety and emotional control demands consume limited self-regulatory resources, weakening emotion regulation capacity and making NSSI a maladaptive yet low-cost alternative for affect regulation.

Based on these theoretical frameworks, the present study employed a Random Intercept Cross-Lagged Panel Model (RI-CLPM) to disentangle within-person dynamics from between-person stability in the longitudinal associations among anxiety, emotion regulation, and NSSI. Data were drawn from 11,115 students (54.1% female; Mage = 11.03 ± 0.60) in grades 5–6 from Beijing, surveyed across four annual waves (2021–2024).

Results revealed that: (1) anxiety and NSSI formed a reciprocal vicious cycle—higher anxiety predicted increased subsequent NSSI, and elevated NSSI further intensified later anxiety; (2) both anxiety and NSSI consistently undermined emotion regulation, reflecting cumulative depletion of regulatory resources; and (3) emotion regulation exhibited a delayed protective effect, negatively predicting NSSI from the second year onward.

These findings reveal a self-reinforcing mechanism in adolescent NSSI, driven by rising anxiety and declining emotion regulation. Integrating the experiential avoidance and ego depletion frameworks, this study highlights the importance of strengthening emotion regulation skills during high-anxiety periods to disrupt the maintenance of self-injurious behavior.

Abstract 2382

SENSORY-FOCUSED NUR METHOD VERSUS COGNITIVE BEHAVIORAL THERAPY FOR BORDERLINE PERSONALITY DISORDER: A RANDOMIZED CONTROLLED TRIAL ON ANXIETY, DEPRESSION, AND SUICIDAL BEHAVIOR

Montejo N.*, Alba J.

Nuria ~ Bilbao ~ Spain

Background: Borderline Personality Disorder (BPD) entails severe emotional dysregulation, unstable relationships, impulsivity, and elevated suicidal behavior, frequently linked to unresolved early trauma. The NUR psychotherapeutic method targets implicit traumatic memory through a guided sensory-focus state and integration across sensory, emotional, and cognitive levels. It is operationalized via a protocol with phased procedures tailored to the body zone activated during sessions.
Objective: To compare the effectiveness of the NUR method against Cognitive Behavioral Therapy (CBT; treatment as usual) in reducing anxiety, depression, and suicidal behavior in adults with BPD; and to assess maintenance of gains three months after treatment.
Methods: Open-label randomized controlled trial with two parallel arms (NUR vs. CBT). Adults (18–65) with BPD will receive 10 weekly sessions. Assessments at baseline, post-treatment, and 3-month follow-up include GHQ-12, PHQ-9, BSL-23, DASS-21, and DTS; analysis via repeated-measures ANOVA to test time×group effects.
Expected Results: We hypothesize greater reductions in anxiety, depressive symptoms, and suicidal behavior for NUR versus CBT, with effects sustained at follow-up.
Conclusions: By systematically engaging sensory pathways to access and integrate implicit traumatic memory, NUR may complement established treatments and enhance outcomes in BPD, particularly in domains linked to suicidal risk and affective dysregulation. The trial adheres to ethical principles (Declaration of Helsinki) and GDPR-compliant data management; oversight by the UNIR bioethics committee is described in the study protocol.
Keywords: Borderline Personality Disorder; NUR method; trauma-focused psychotherapy; suicidal behavior; anxiety; depression; randomized controlled trial.

Abstract 2076

EXPERIENCES OF INDIVIDUALS GRIEVED BY SUICIDE IN THE PRESENCE OF THE SUICIDE LETTERS: A QUALITATIVE RESEARCH

Yildirim I.*[1], Göksu Ç.[1], Demir E.C.[2]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Adiyaman Üniversitesi ~ Adiyaman ~ Turkey

Introduction: Suicide notes have been widely studied as windows into the mental state of the deceased, often used for psychological or forensic purposes. However, little attention has been paid to how these final messages are experienced by those left behind. For individuals bereaved by suicide—a group already facing complicated grief processes—the presence of a note may uniquely shape their mourning, either as a potential source of meaning or as a further burden.

Purpose: This study aims to understand the loss experiences of individuals whose first-degree relatives or romantic partners ended their lives by leaving a suicide note and to examine how they attribute meaning to that final message.

Method: We conducted semi-structured, online interviews with four women (ages between 30–56) whose first-degree relative or romantic partner died by suicide and left a note. Transcripts of the interviews were analyzed idiographically using Interpretative Phenomenological Analysis (IPA), moving from line-by-line coding to clustered themes through an iterative, reflexive process.

Results: Through the interpretative analysis, three superordinate themes emerged: (1) “The Absence of the Other Side of the Relationship,” (2) “A(void)ance of Meaning: Difficulty in Processing the Suicide,” and (3) “A Lens Overshadowing the Voice of the Deceased.”

Conclusions: The findings suggest that suicide letters may not necessarily facilitate grieving; instead, they can complicate the process. Due to the one-way nature of these messages, since the deceased is non-responding, the individuals bereaved by suicide themselves establish a one-sided relationship with the deceased, a relationship characterized by anger since they remain unanswered.

Abstract 1138

ENHANCING SUICIDE RISK ASSESSMENT THROUGH NATURAL LANGUAGE PROCESSING: A MULTIMODAL APPROACH TO C-SSRS RESPONSE ANALYSIS

Doval Moreno S.*[1], Fausor R.[2], Garcia Ramos A.[3], Alejandro D.L.T.[4]

[1]Departmental Section of Research and Psychology in Education, Universidad Complutense de Madrid (UCM), 28223, Madrid, Spain. ~ Madrid ~ Spain, [2]Faculty of health, Valencian International University (VIU), 46002 Valencia, Spain. ~ Valencian ~ Spain, [3]Department of Psychiatry, Universidad Autonoma de Madrid, Spain ~ Madrid ~ Spain, [4]Department of Legal Medicine, Psychiatry and Pathology, School of Medicine, Universidad Complutense de Madrid, Spain. ~ Madrid ~ Spain

Background: Traditional suicide risk assessment relies primarily on quantitative measures, yet predictive accuracy remains limited. This study examined whether systematic analysis of qualitative clinical interview content using advanced Natural Language Processing (NLP) enhances suicide risk prediction beyond conventional assessment approaches.

Methods: Data from 1,443 patients recruited from psychiatric emergency departments across ten Spanish university hospitals following suicide attempts were analyzed. Participants completed the Columbia-Suicide Severity Rating Scale (C-SSRS), Brief Symptom Inventory, Barratt Impulsiveness Scale, Reflective Functioning Questionnaire, and Acquired Capability for Suicide Scale. Qualitative C-SSRS responses were classified using BERT-based models into categories including desire to die, method-specific ideation, and preparatory acts. Three hierarchical models were compared: sociodemographic variables only, sociodemographic plus quantitative psychological measures, and a complete model incorporating NLP-derived qualitative features.

Results: BERT-based classification achieved high accuracy across suicide-related categories (77.3%-94.44%), with exceptional performance for active ideation (F1-score: 0.98) and preparatory acts (F1-score: 0.97). The complete multimodal model demonstrated superior predictive performance across all outcomes. Most notably, for Potential Lethality, incorporating qualitative variables increased performance from below-chance (pseudo-R^2 = -0.002) to excellent prediction (pseudo-R^2 = 0.895). For Ideation Intensity, explained variance increased from 17.2% to 44.2%.

Conclusions: Systematic integration of qualitative clinical interview content through NLP significantly enhances suicide risk prediction. These findings suggest that incorporating automated analysis of patient verbal expressions into clinical protocols could substantially improve the identification of high-risk individuals.

Abstract 4544

WHAT IS IT LIKE TO BE A UKRAINIAN COMBAT-WOUNDED VETERAN? MEN'S SEXUAL INTIMACY REINTEGRATION: INTERPRETATIVE PHENOMENOLOGICAL ANALYSIS.

Hak D.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction

During Russia`s war against Ukraine, Ukraine mobilized approximately 880,000 people to the Armed Forces of Ukraine; of them, 390,000 people got injured and needed reintegration into civilian life. This theme is not broadly learned. Thus, there is obviously a lack of studies with Interpretative Phenomenological Analysis (IPA) that will reveal the underlying aspects of the injured person's sexual experience.

Purpose

The research focuses on the key aspects of the sexual reintegration experience of Ukrainian combat-wounded veterans.

Method

This research examines the experience of sexual intimacy reintegration of six Ukrainian heterosexual male veterans (aged 25-45), injured during the 2022 Russian invasion of Ukraine. The data was collected via semi-structured interviews and analyzed using IPA.

Results

Sexual reintegration experience of combat-wounded veterans reveals three super categories.

1) The impairment of body transparency: feeling that the body after the injury becomes visible to others; returning body transparency via sexual arousal.

2) Horizon of possibility restriction caused by body injury: a narrowed sense of sexuality; the gradual normalization of the altered body within everyday experience.

3) Appearance of physical inconveniences: reduction of sex practices diversity; lifestyle changes.

Conclusions

In summary, the research demonstrates the central role of intersubjective relationships in sexual reintegration. For example, through the partner’s gaze, the injured body regains its transparency. This intersubjective recognition expands the horizon of possibilities, both in sexual experience and lived experience more broadly. Furthermore, the research revealed that sexual impairment is not

experienced as a loss of masculinity but reveals the existential problematic of everydayness. The research is focused only on men`s experience. Future studies should include interviewing both male and female veterans, their partners, and describing the experiences of LGBTQI+ people.

Abstract 2333

FROM RUINS TO REMEMBRANCE: PSYCHOLOGICAL INSIGHTS FROM FIFTEEN YEARS OF THE PICTURESCUE MOVEMENT AFTER THE GREAT EAST JAPAN EARTHQUAKE

Miyamae R.*

Fukuyama City University ~ Hiroshima ~ Japan

In the aftermath of the 2011 Great East Japan Earthquake, the Picturescue Movement emerged as a volunteer effort to clean and return family photographs recovered from the debris. Over fifteen years, this activity has evolved into a psychosocial practice that reveals how people remember, mourn, and reconnect in the wake of loss.

Drawing on Kai Erikson's concept of collective trauma, this presentation explores recovery not as an individual process of healing but as the reconstruction of communality—the social fabric that binds people together. In contrast to models that treat trauma as accumulated individual wounds, the collective perspective emphasizes the destruction of relationships and shared meanings. Field observations from affected communities show how photo-return gatherings functioned as spaces of relational care: moments where residents collectively negotiated absence, exchanged memories, and quietly rebuilt a sense of "we."

These findings suggest that post-disaster recovery must be understood as both psychological and relational. While "mental care" focuses on the inner world of survivors, relational care supports the restoration of social bonds through shared acts of remembrance. The Picturescue Movement thus exemplifies how applied psychology can engage with community-based practices that transform grief into solidarity and loss into renewed belonging.

By situating the fifteen-year trajectory of this movement within Erikson's framework, the study highlights a form of memory activism that connects individual mourning with collective resilience. It invites a rethinking of recovery not as the restoration of what was destroyed, but as the creation of new forms of togetherness sustained by the work of remembering.

Abstract 1423

INVISIBLE EPIDEMICS: APPLYING LESSONS FROM GERM THEORY TO INTEGRATE CHILDHOOD TRAUMA INTO HEALTH SYSTEMS

Navsaria A.*

Nelson Mandela University ~ Port Elizabeth ~ South Africa

The nineteenth-century acceptance of germ theory transformed medicine and public health by revealing that invisible microorganisms shaped disease and could be controlled through systemic interventions. More than a century later, the Adverse Childhood Experiences (ACE) framework exposes another set of hidden determinants: childhood traumas that profoundly influence mental and physical health across the lifespan. Evidence consistently links ACEs to depression, substance use, chronic disease, and premature mortality, yet trauma-informed approaches remain marginal in many health systems.

This presentation will argue that the history of germ theory offers a powerful analogy for integrating ACEs into South African primary care. Like germs, trauma is invisible, stigmatised, and transmitted across generations; and like germs, it requires systemic rather than individual solutions. Using applied psychology as a lens, the presentation will explore barriers to integration, including limited visibility of trauma in clinical encounters, resource constraints, cultural pluralism, and policy gaps. Lessons drawn from germ theory highlight strategies that applied psychologists can advance: developing culturally adapted screening tools, training and empowering community health workers to deliver trauma-informed interventions, embedding evidence-based programmes into maternal and child health services, and advocating for alignment with National Health Insurance reforms.

By reframing ACEs as an unseen but actionable determinant of health, this presentation will demonstrate how applied psychology can contribute to systemic reforms that reduce intergenerational trauma and promote equity. For South Africa, and comparable contexts globally, integrating ACEs into primary care represents both a clinical necessity and a public health imperative.

Abstract 2411

NAVIGATING INSECURITY: PSYCHO-SOCIAL AND COMMUNAL IMPACTS OF PERCEIVED SECURITY THREATS IN SWAT VALLEY, PAKISTAN

Mihser I.[1], Mujeeb A.*[2]

[1]Quaid-i-Azam University ~ Swat ~ Pakistan, [2]Shaheed Zulfikar Ali Bhutto Institute of Science and Technology (SZABIST) ~ Islamabad ~ Pakistan

The present study explored the psychological, social, and communal consequences of perceived security threats among residents of Swat Valley in Pakistan and filled a critical gap in the literature by providing nuanced understanding of how perceived security threats affect the psychosocial fabric of a conflict-ridden region. Utilizing a exploratory qualitative research approach, in-depth interviews were conducted with 14 participants (young and middle-hood adults) who were actively involved in community services within various threat-prone areas of Swat. Reflexive Thematic Analysis was employed to identify key themes from the data. Analysis identified four major themes including Perceived Security Threats and Uncertainty, Psychological Impact, Social Consequences, and Public Perception and Response. First theme of Perceived Security Threats and Uncertainty included perceptions regarding current situation, narratives on presence of militants, and insecurity related challenges. The second theme of Psychological Impacts included sub-themes on personal safety and psychological vulnerability, existential reflections, mental disturbance and trauma, and impact on vulnerable populations. Impact on daily life, role of the Jirga system, and erosion of cultural practices were sub-themes of Social Consequences. Role of authorities, leadership and accountability, role of media, community organizations' peace efforts, and public resistance were studied under fourth theme of Public Perception and Response. The analysis revealed that perceived security threats significantly impact the psychological health of individuals, manifesting in heightened anxiety, stress, and fear of victimization. Socially, these threats disrupt community cohesion, erode trust in traditional institutions like the Jirga, and alter cultural practices. Despite these challenges, the community has demonstrated resilience through collective action, public resistance, and the formation of grassroots organizations aimed at promoting peace and stability. Utilizing the findings of current research for understanding the fabric of indigenous man-made disasters alongwith its micro and macro level impacts and directing informed policymaking are the most relevant implications of the research.

INTERGENERATIONAL TRAUMA, TRANSMISSION, AND PATHWAYS TO HEALING ACROSS GENERATIONS OF CONFLICT: LESSONS DRAWN FROM THE LEBANESE CASE

Thursday 23 July 2026 from 08:00 to 09:30

(T-Monumentale)

Brigitte Khoury, Chair
Saths Cooper, Co-Chair

This symposium examines the intergenerational and cumulative impact of trauma in Lebanon, a country where decades of conflict and instability have left deep psychological and social imprints. Drawing from published qualitative research on “The Lebanese Civil War: Transmission and Impact on Second-Generation Descendants” and extensive clinical and community work with families affected by war, the presentation explores how the legacy of a civil war, one fought among neighbors, within families, and across communities, continues to shape the inner and relational worlds of those born after its end. Unlike external wars, civil wars rupture both the social fabric and the sense of collective belonging, leaving wounds that are intimate, complex, and enduring.

Through in-depth interviews and focus groups with survivors and their adult children, two central themes emerged: “From Generation to Generation: The Passing of a Nation’s Scars”, highlighting the transmission of emotional residues through family narratives, silence, and collective memory; and “Carrying the Burden of an Unlived War”, reflecting the second generation’s struggles with identity, belonging, and inherited anxiety in a society still divided by its past.

These insights resonate within Lebanon’s current context of chronic instability, economic collapse, and recurring armed conflict, where children and adolescents continue to face cumulative and overlapping traumas. Ongoing research by our team since 2014 has shown a high prevalence of psychiatric symptoms and a significant treatment gap among Lebanese youth, alongside notable protective factors such as family cohesion and community connectedness.

Finally, the symposium situates these findings within the broader literature on trauma interventions, ranging from CPT, PE, ACT, NET, and EMDR to DBT-based approaches, questioning their cultural relevance and adaptability in contexts of prolonged and intergenerational trauma. It calls for culturally sensitive, contextually grounded frameworks for both research and clinical practice in societies marked by chronic adversity

Abstract 3913

CHILD IN HIGH-STRESS AND INSECURE ENVIRONMENTS: THE LEBANESE EXPERIENCE

Barakat M.*

American University of Beirut ~ Beirut ~ Lebanon

Children and adolescents growing up in Lebanon have faced an exceptionally challenging environment marked by chronic instability and cumulative traumatic experiences. Over the past decades, they have endured multiple episodes of armed conflict, sustained economic and political uncertainty, a severe financial collapse, an unprecedented public health crisis during the COVID-19 pandemic, and the catastrophic Beirut port explosion in August 2020. More recently, the war of 2024 added yet another layer of collective trauma to this already vulnerable population.

Since 2014, our research team has been systematically investigating the mental health outcomes and psychosocial correlates among Lebanese youth. Across several waves of assessment, our findings have consistently demonstrated a high prevalence of psychiatric symptoms, including anxiety, depression, and behavioral difficulties, alongside an alarming treatment gap reflecting limited access to psychological services. Importantly, our studies have also identified a number of protective factors, such as family cohesion, community connectedness, and adaptive coping strategies, which appear to mitigate distress and foster resilience. These results highlight the urgent need for culturally informed mental health interventions and the promotion of resilience-building resources within this at-risk population.

Abstract 3912

ECHOES OF A CIVIL WAR ACROSS GENERATIONS: QUALITATIVE TRANSMISSION

Khalil C.*

University of Bucharest ~ Bucharest ~ Romania

Drawing from published qualitative research on “The Lebanese Civil War: Transmission and Impact on Second-Generation Descendants” and from extensive clinical and community work with families affected by conflict, this presentation explores how the legacy of civil war, a war fought among neighbors, within families, and across communities, continues to shape the inner and relational worlds of those born after its end. Unlike external wars, civil wars fracture both the social fabric and the sense of collective belonging, leaving behind wounds that are both intimate and enduring.

Based on in-depth interviews and focus groups with survivors and their adult children, the study identified two central themes: “From Generation to Generation: The Passing of a Nation’s Scars,” capturing how the war’s emotional and symbolic residues are transmitted through family narratives, silence, and collective memory; and “Carrying the Burden of an Unlived War,” reflecting the second generation’s struggle with identity, belonging, and inherited anxiety in a society still divided by its past.

By situating these findings within Lebanon’s current crises, the presentation underscores how the psychological legacy of a civil war—marked by both proximity and ambiguity—extends across time, shaping new generations. The discussion invites comparative reflection with other societies marked by internal conflict and division where collective healing requires not only remembrance, but the reconstruction of trust within the social fabric itself.

Abstract 4955

HEALING THROUGH MULTIPLE CRISES:THE EXAMPLE OF LEBANON

Khoury B.*

AN ECOLOGICAL APPROACH TO ADOLESCENT MENTAL HEALTH AND RESILIENCE: UNDERSTANDING INDIVIDUAL, PARENTAL, COMMUNITY-BASED, AND ONLINE INFLUENCES AND INTERVENTIONS

Thursday 23 July 2026 from 09:30 to 11:00

(S-Monumentale)

Kate Fogarty (University of Florida ~ Gainesville, ~ U), Chair and Presenter

This symposium explores the multidimensional nature of protective factors and resilience across adolescence and emerging adulthood, integrating psychological, familial, and community-based perspectives. It offers a novel and timely contribution to the understanding of resilience by addressing contemporary challenges − such as digitalization, mental health vulnerability, political disaffection, and youth service gaps − through empirical data and applied research across diverse contexts and countries.

The first presentation (Novara et al.) investigates adolescents' use of AI technologies, showing how digital literacy, emotional intelligence, parenting styles, and social support influence the construction of digital identity. It uniquely highlights how multiple variables shape adolescents' digital resilience.

The second contribution (Fogarty et al.) focuses on the moderating role of Positive Childhood Experiences (PCEs) in the relationship between Adverse Childhood Experiences (ACEs) and suicidality in U.S. adolescents. This large-scale study demonstrates how family, school, and community-based PCEs act as protective buffers, offering a population-level insight into the developmental pathways of resilience and suicide prevention.

García-Leiva et al. shift the focus to civic engagement, analyzing how structured, inclusive citizen participation fosters psychological empowerment and reduces political disaffection in youth. This study provides a unique sociopolitical lens, illustrating how democratic engagement can strengthen the sense of belonging, the climate of cooperation, and social cohesion during early adolescence. Silke explores the impact of community-based mentoring in partnership with mental health services in Ireland. Through qualitative data, she reveals how mentoring supports youth mental health and promotes positive developmental outcomes, while also identifying implementation challenges. Her work offers an applied, service-oriented perspective on resilience promotion through integrated care models.

Finally, Lynne explores links between adolescent smartphone use and mental health, recognizing online engagement as a normative part of human development. Their survey assessed mood and smartphone engagement every day for 21 days, finding correlations with subsequent anxiety and depression.

Contributionsofferanuancedandcomplementaryperspectiveonthethemeofresilience,whilead dressingseeminglydiverseareas.Thestrengthofthesymposiumlies preciselyinitsabilitytointegrateclinicalandcommunity-basedperspectives,highlightinghowprotectivefactorsemergewithin meaningfulrelationships that develop acrossfamily,educational,social,andcommunitycontexts.

Abstract 4136

THE DIGITAL IDENTITY OF CHILDREN: PERSONAL, FAMILIAL, AND COMMUNITY DETERMINANTS IN THE ASSESSMENT OF RISKS AND OPPORTUNITIES IN THE USE OF AI-BASED TECHNOLOGIES

Novara C.*, Piombo A.M., Di Napoli G., La Grutta S.

University of Palermo ~ Palermo ~ Italy

The increasing use of AI-based technologies presents new educational challenges for children and adolescents. This research explores the personal, familial, and community factors influencing adolescents' critical use of these technologies. Specifically, it examines the relationship between AI use and trust, digital literacy of both adolescents and parents, parental involvement, parenting styles, adolescents' emotional intelligence, and perceived social support.

The study involved 170 adolescents (ages 13-17) and 175 parents, with data collected through separate structured questionnaires. A sub-analysis was conducted on 47 matched parent-adolescent pairs.

Descriptive results show significant differences in AI usage between parents and adolescents. Adolescents use AI more for educational support (χ^2=20.428, p<.001), behavioral advice (χ^2=11.788, p=.019), and perceive greater data security (χ^2=29.010, p<.001). Parents, however, show more caution and lower trust in AI's accuracy (χ^2=11.812, p=.019).

Correlational analysis revealed that an authoritative parenting style is positively linked to higher digital literacy (r=0.331, p<.001) and negatively correlated with excessive, uncritical AI use (r=-0.178, p=.019). Conversely, authoritarian parenting was associated with higher risk for dependency and uncritical use. Emotional intelligence in adolescents was found to be a protective factor, negatively correlating with problematic AI behaviors like sharing personal data (r=-0.172, p=.001) and relying on AI for advice (r=-0.183, p<.001).

A Two-Step Cluster Analysis identified two adolescent profiles: a "high-risk" group (36.2%) with intensive AI use and low family support, and a "balanced" group (63.8%) with more critical AI use, higher emotional intelligence, and stronger parental involvement.

In conclusion, parenting style and emotional intelligence are key factors in shaping adolescent AI use, highlighting the need for targeted educational interventions involving families and communities.

Abstract 4137

DO POSITIVE CHILDHOOD EXPERIENCES (“COUNTER ACES”) DISRUPT THE LINK BETWEEN ADVERSE CHILDHOOD EXPERIENCES AND SUICIDALITY IN ADOLESCENCE?

Fogarty K.*, Song J., Zhang J., Pracht D., Lynne S.

University of Florida ~ Gainesville, ~ United States of America

Suicide is the third leading cause of death for adolescents globally (World Health Organization, 2025). Having 4 or more adverse childhood experiences (ACEs) were found to predict suicidal behavior. In a recent representative sample in the U.S. 76.1% of 14- to 18-year-olds reported having experienced at least 1 ACE. Further, those who reported 2-3 ACEs were 5 times more likely to have seriously considered suicide than peers without any reported childhood adversity (Swedo et al., 2024). The buffering impact of positive childhood experiences (PCEs) or “counter-ACEs” shows promise for fostering young people’s resilience and preventing problematic mental health outcomes (Bethell et al., 2019).

Over 22,000 adolescents, age 14 to 18, completed questionnaires in Florida in early 2024, via state-based stratified sampling within schools by county. Participants self-reported on depression, suicidal thoughts, plans, and attempts, with 8 school- and family-related positive childhood experiences (PCEs) items, and 10 ACEs. Emotional self-regulation and parent education were covariates in the analyses.

Binary logistic regression models with interactions were tested, explaining 28% of the variance in depression and 20 to 24% of the variance in suicidal thoughts and behaviors, respectively. ACEs and PCEs were significantly associated with suicidal thoughts (AOR=7.59 for 4+ ACEs compared to 0 ACEs, p<.000; AOR=1.88 for 0-7 PCEs vs. 9 PCEs, p<.000) and suicide attempts (AOR=7.31 for 4+ACEs vs. 0 ACEs, p<.000; AOR=2.47 for 0-7 PCEs vs. 9 PCEs, p<.000). There were significantly greater suicidality risks for: females, younger adolescents (age 13-15), and those with military parents/guardians.

Findings indicated PCEs significantly interacted with (moderated) ACEs for depression and suicidality outcomes. Protective effects included positive interactions with family and teachers and faith-based community influences. PCEs hold potential for promoting mental health resilience amid traumatic experiences. Effective suicide prevention hinges on trauma-informed approaches, proceeding along evidenced developmental pathways for well-being across the lifespan.

Abstract 4138

CITIZEN PARTICIPATION AS A PROTECTIVE MECHANISM AGAINST POLITICAL POLARIZATION AND DISAFFECTION IN YOUTH: EVIDENCE FROM FIELD STUDIES

García--Leiva P.*, Albornoz N., Montenegro J., Gálvez--Palacios M.S.

University of Malaga ~ Malaga ~ Spain

In a context of growing ideological polarization and social fragmentation, promoting citizen participation among adolescents and emerging adults appears as a key strategy to strengthen democratic resilience. This contribution analyzes the results of three field studies conducted in Spain, involving a total of 592 children aged 10 to 12 years.

The evaluation was based on transversal and longitudinal field studies, combining tailored questionnaires adapted to the objectives of each intervention and systematic observation of group dynamics. The analyzed programs, "Ágora Infantil" and "Ágora OS!", implemented deliberative participation methodologies, focusing on cooperative dynamics, games, and collective decision-making processes.

The results show that participation fosters psychological empowerment (intrapersonal and interactional dimensions) and strengthens group identification. In addition, systematic observation during the "Ágora Infantil" program revealed a significant improvement in positive peer interactions, promoting a climate of cooperation and respect. Furthermore, the analysis of the "Ágora OS!" program shows that deliberative participation can reduce issue-based polarization, particularly among those with initially lower levels of concern about climate change, although no significant changes were observed regarding affective polarization.

These findings highlight that early citizen participation, when inclusive, deliberative, and structured, not only promotes democratic skills and critical thinking but also acts as a protective mechanism for the psychosocial well-being of young people, fostering their sense of belonging, empowerment, and emotional health. In this way, participation decisively contributes to strengthening democratic resilience by promoting more cohesive, critical, and engaged societies.

Abstract 4139

SUPPORTING YOUTH MENTAL HEALTH THROUGH COMMUNITY-BASED MENTORING: A QUALITATIVE EXPLORATION

Silke C., Brady B.*

University of Galway ~ Galway ~ Ireland

Prevalence rates for youth mental health difficulties appear to be rising and there is a critical need for greater intervention and prevention work in this area. While statutory mental health services play a vital role in supporting youth mental health, the need for additional community-based supports that can complement these clinical services is being increasingly emphasised in international research and policy. Youth mentoring is one such model that may act as a supportive resource for youth who are experiencing significant mental health challenges.

Through a qualitative research design, this study examines the partnership between a community-based mentoring organisation and Child and Adolescent Mental Health Services (CAMHS) in Ireland, and explores stakeholders' perceptions of the utility of mentoring as a supportive resource for young people who are involved with CAMHS. Semi-structured interviews were carried out with 40 participants, including young people, parents, mentors, and practitioners, where they discussed their experiences and perceptions of the mentoring partnership.

Through the use of thematic analysis, a number of key themes were identified. Notably, findings indicated that mentoring was perceived to act as a supportive resource for young people who experience mental health concerns, and was linked to an array of positive developmental outcomes. Additionally, participants identified key practices and procedures which they believe moderate the effectiveness of mentoring interventions. Finally, participants outlined practical considerations and challenges associated with the implementation of the partnership model.

Overall, this research provides timely insights into how youth mentoring can complement clinical mental health services and contribute to broader mental health promotion efforts. Findings inform ongoing international conversations about integrated models of youth mental health care and community-based supports.

Abstract 4140

EXPLORING LINKS BETWEEN ADOLESCENT SMARTPHONE USE AND MENTAL HEALTH IN THE UNITED STATES

Lynne S.*, Gabrielli J., Zhang X., Corbin C., Splett J., Bryan J., Wydra N., Jin X., Sullivan P., Ravet M., Alqueza K., Shaffer E.

University of Florida ~ Gainesville ~ United States of America

Introduction: Adolescent mental health issues are rising alongside increased social media and online activity. While media narratives suggest a direct link, scientific literature shows mixed associations. Current research in this area is limited in that it primarily focuses on time spent online and lacks understanding of longitudinal associations.

Purpose: Recognizing online engagement as a normative part of human development, the study aims to elucidate how smartphone engagement relates to future well-being with the goal of identifying targets for prevention, promotion, and intervention initiatives.

Method: This study utilizes data from an ongoing pilot project. The current sample consists of adolescents (n=53) ages 13-15 years old from the United States (53% male; 47% female). Severity of depression and anxiety were assessed via a self-report survey instrument. Ecological momentary assessment (EMA) surveys assessed mood and smartphone engagement every day for 21 days. Average scores across the 21-day EMA survey constructs were correlated with subsequent anxiety and depression to begin to understand patterns of associations between smartphone engagement and mental health among adolescents.

Results: Higher exposure to mature content on a smartphone was correlated with higher reports of subsequent anxiety ($r(n=23)=0.57$; $p=.004$). We also found preliminary evidence of differences in smartphone engagement by sex. Males ($M=3.16$) reported playing interactive games on their smartphones significantly more than females ($M=2.43$; $t(46)=-2.29$, $p=.026$). There were trends approaching significance where females ($M=3.10$) reported getting on their smartphones to escape reality more frequently than males ($M=2.58$; $t(46)=-1.99$, $p=.052$) and males ($M=2.30$) reported seeing discriminatory content on their smartphones more frequently than females ($M=1.85$; $t(45)=1.73$, $p=.090$).

Conclusions: These findings support patterns of associations between smartphone engagement and subsequent mental health for adolescents age 13-15. Final analyses will also explore the possibility of adaptive pathways between smartphone engagement and youth competencies as well as additional maladaptive pathways to other risk behaviors

06 - Division 6: Clinical and Community Psychology

DETECTION AND INTERVENTION ON THE PSYCHOTIC SPECTRUM II

Thursday 23 July 2026 from 14:00 to 15:30

(S-Monumentale)

Rocío Fausor (Valencian International University ~ Val), Chair and Presenter

Psychosis is a serious mental health problem with a clear social and economic impact. Schizophrenia is among the 25
leading causes of disability worldwide (GBD 2021 Diseases and Injuries Collaborators, 2024). In this symposium,
more effective procedures of detection and intervention will be examined.
The assessment of so-called at-risk mental states (ARMS) or ultra-high risk (UHR) is currently considered the gold
standard for early detection of psychosis. However, UHR criteria are not perfect and lead to many false positives. To
refine these criteria, some studies use the combination of this high clinical risk paradigm with what is known as
“high psychometric risk” of psychosis, that uses self-reports to early detection. Dr. Noelia Moran will examine the
difference between those two paradigms in a sample of youth from a clinical sample of day hospitals in Spain. Dr.
Rocío Fausor will analyze the gender profile in high-risk of psychosis clinical sample.
Detection and intervention protocols for psychosis have also been criticized as being a highly specialized (Oliver et
al., 2019), and not necessarily accepted by those who must apply it. Dr. Clara Gesteira will analyze the degree of
acceptability of a high-risk psychosis screening protocol by Spanish clinical staff at a day care center, while Dr. Nina
Mørkved will provide not only some preliminary findings related to the feasibility of a large national Randomized
Clinical Trial testing trauma focused therapy for patients with psychosis and trauma in Norway. But also some results related to the effect of the treatment and the impact on other symptoms and personalization of treatment. Additionally,
meta-analysis reviews have shown low effectiveness of early interventions in people with ARMS (Oliver et al., 2018).
Dr. Lorenzo Pelizza will show the results on the effectiveness of an early intervention for people at high-risk of
psychosis in Italy.

Abstract 4427

PSYCHOMETRIC HIGH RISK FOR PSYCHOSIS IN ADOLESCENTS AND YOUNG ADULTS FROM A DAY HOSPITAL

Morán N.*[1], Cobos B.[1], Fausor R.[2], Guinea R.[3], Gesteira C.[1]

[1]Complutense University of Madrid ~ Madrid ~ Spain, [2]Valencian International University ~ Valencia ~ Spain, [3]Montreal Psychiatric Institute ~ Madrid ~ Spain

The so-called “Clinical High Risk” or “Ultra High Risk” for psychosis (CHR or UHR) constitutes a paradigm used to detect those people who are more likely to develop a psychotic disorder. Even though CHR is the most commonly used procedure for early detection in this field, it shows some limitations: 1) The CHR detection is made through the use of semi structured interviews that can only be applied by clinicians with specialized training; 2) The evaluation is only conducted when there is a suspicion from a professional, therefore, is more subjective and heterogeneous; 3) The CHR evaluation with this especially risky patients could be overestimating the prevalence of high risk of psychosis. The “psychometric high risk” paradigm tries to overcome these difficulties, through the generalized, objective and structured use of self-reports to the early detection of people with a greater vulnerability to psychosis. The objective of the present study is to find the prevalence of people with high psychometric risk for psychosis when the procedure is applied systematically per protocol to a general population of adolescents and young adults from a day hospital. A sample of adolescents and young adults, users of a day hospital, will complete the Spanish version
of the Prodromal Questionnaire – Brief version (PQ-B, Fonseca-Pedrero et al., 2021) as a measure of psychometric high-risk of psychosis. The prevalences found will be compared with the prevalence of both psychometric and clinical high-risk for psychosis in both general and clinical populations. The advantages and disadvantages of these two
different approaches will be discussed.

Abstract 4428

SEX AND PSYCHOMETRIC RISK FOR PSYCHOSIS IN A CLINICAL ADOLESCENT AND YOUNG ADULT SAMPLE FROM A SPANISH DAY HOSPITAL

Fausor R.*[1], Guinea R.[2], Gesteira C.[3], Morán N.[3], Cobos B.[3]

[1]Valencian international University ~ Valencia ~ Spain, [2]Montreal Psychiatric Institute ~ Madrid ~ Spain, [3]Complutense University of Madrid ~ Madrid ~ Spain

Scientific literature provides evidence that male gender is a risk factor for psychosis. (Radua et al., 2017). However, it is quite common for clinical studies to have an overrepresentation of women compared to men, perhaps because women's characteristic
way of expressing distress aligns more closely with the criteria for accessing mental health services (Rietdijk et al., 2011). This imbalance in research is problematic not only because it presents a distorted representation of reality, but also because it contradicts epidemiological data on psychosis and fails to identify male individuals, who are those at higher risk. Furthermore, it is known that the prevalence of clinical high-risk of psychosis is higher in studies whose sample is predominantly female, and this is most likely because in these samples there could be more false positives, given the fact that the rate of transition to psychosis is higher in men (Salazar de Pablo et al., 2021). To address this issue, we present the findings of a study examining the role of gender and its implications when detecting high risk of psychosis. The objective of the present study is to analyze the gender profile in a clinical sample of adolescents and young adults from a day hospital. Participants will complete the Spanish version of the Prodromal Questionnaire – Brief version (PQ-B, Fonseca-Pedrero et al., 2021) as a measure of psychometric high-risk of psychosis. Based on these results, possible recruitment strategies aimed at compensating for this lack of gender balance will be discussed, as well as necessary mechanisms for controlling the gender variable in research in this field.

Abstract 4429

ACCEPTABILITY OF AN EARLY DETECTION PROTOCOL FOR PSYCHOSIS: A QUALITATIVE APPROACH

Gesteira C.*[1], Morán N.[1], Cobos B.[1], Fausor R.[2], Guinea R.[3]

[1]Complutense University of Madrid ~ Madrid ~ Spain, [2]Valencian International University ~ Valencia ~ Spain, [3]Montreal Psychiatric Institute ~ Madrid ~ Spain

The assessment of so-called at-risk mental states (ARMS) or ultra-high risk (UHR) is currently considered the gold standard for early detection of psychosis. The UHR criteria assess subclinical psychotic symptoms (SPS) through structured interviews such
as the Comprehensive Assessment of At-Risk Mental States (CAARMS).
Despite the clear benefits of detecting these individuals before they develop the psychotic disorders, the acceptance of these protocols by the people who ultimately must use them should not be taken for granted. The general objective of this qualitative study is to gather qualitative data from a group of clinicians who work at day hospitals to explore their views on barriers and enablers of successful implementation of an early detection protocol for psychosis. The qualitative interviews designed for the staff at the centres participating in this study are based on normalization process theory (NPT), a widely used theory to explain the processes by which an intervention—in this case, a protocolized psychosis risk assessment—can or cannot be integrated into routine care (May et al., 2009, 2018). Convenience sampling has been conducted, intentionally taking into account sociodemographic and professional variables to ensure the greatest possible variety in key characteristics (e.g., age, gender, professional/educational background, position, etc.). The interviews have been transcribed verbatim and coded at
the time of transcription. The National Centre for Social Research's "Frame" analysis approach (Ritchie and Spencer, 1994) will be used to analyse and interpret the interview data

Abstract 4430

TRAUMA-FOCUSED THERAPY FOR PSYCHOSIS AND TRAUMA: IMPLEMENTATION OF AN RCT STUDY OF EMDR IN NORWAY

MØrkved N.*[1], Ottesen A.[2], Sætren Sjur S.[3], Ten Velden Hegelstad W.[3], Sandstad G.[4], Høye A.[5], Blindheim A.[6], Gjestad R.[6], Løberg E.M.[7]

[1]DEPARTMENT OF RESEARCH AND INNOVATION, HELGELAND HOSPITAL INSTITUTE FOR PSYCHOLOGY, FACULTY OF HEALTH SCIENCES, UIT THE ARCTIC UNIVERSITY OF NORWAY ~ SANDNESSJØEN ~ Norway, [2]Oslo University Hospital, [3]TIPS, Stavanger University Hospital, [4]St Olavs Hospital, [5]University Hospital of Northern Norway; UiT Arctic University of Norway, [6]Haukeland University Hospital, [7]Haukeland University Hospital; University of Bergen

Many patients with psychosis and schizophrenia spectrum disorders (SSDs) have experienced trauma. However, trauma-focused therapy is not routinely offered in mental health care. According to a recent systematic review by our research group, research suggests that trauma-focused (TF) treatments such as TF Cognitive Behavioral Therapy for psychosis (TF-CBTp) and Eye Movement Desensitization and Reprocessing for psychosis (EMDRp) are safe and feasible in patients with trauma and psychosis. Results
for effects on symptoms of psychosis, anxiety, and depression, and psychosocial functioning are mixed. The Key to Integrated Trauma Treatment in Psychosis (KIT) trial is a pragmatic, assessor-blinded, parallel 2-group, superiority randomized trial comparing the trauma-focused therapies EMDR and TF-CBTp to a waiting list and treatment-as-usual group on symptoms of trauma in patients with psychosis. Patients are
randomized (1:1, block randomization by center and gender) to trauma-focused therapy or waiting list from 2025 to 2028. The KIT trial is a multicenter study aiming to include 187 patients from all health regions in Norway. The primary goal is to examine the effect of TF treatment on symptoms of trauma in psychosis, with secondary aims related to the impact on other symptoms and personalization of treatment (what works for whom). Preliminary data related to the implementation and initial feasibility of the KIT trial will be presented, and this will be discussed in light of available published research on TF treatment for trauma and psychosis.

Abstract 4431

EARLY INTERVENTION FOR PEOPLE AT HIGH RISK OF PSYCHOSIS IN ITALY: INSIGHT FROM EMILIA- ROMAGNA EXPERIENCE, NORTHERN ITALY.

Pelizza L.*

Department of Biomedical and Neuromotor Sciences, Alma Mater Studiorum University of Bologna ~ Bologna ~ Italy

Introduction: From January 2013, the Departments of Mental Health (DMHs) in Emilia-Romagna region (Northern Italy) developed specialized care protocols for early intervention in psychosis. Within this common organizational context, the Parma DMH first created the “Parma At-Risk Mental States” (PARMS) program as a diffused (“liquid”) service for early detection and intervention for individuals at “Clinical High Risk for Psychosis” (CHR-P). The aims of this presentation were: (1) to carefully describe the PARMS structural organization and its development over time, (2) to discuss the subsequent implementation of CHR-P services in the other regional DMHs, and (3) to examine specific process and outcome indicators across 10 years of clinical activity.
Methods: All participants were adolescent and young adult help-seekers (aged 12-25 years) at CHR-P in accordance with well-defined psychometric criteria (CAARMS). The program included a 2-year comprehensive treatment package combining psychosocial interventions (i.e., individual psychotherapy, psychoeducational sessions for family members, and a recovery- oriented case management), together with pharmacological therapy (where appropriate).
Results: At entry, 180 CHR-P individuals were provided with our dedicated protocol of care. Specifically, 15% of them dropped out across the follow-up. The “Duration of Untreated Illness” (DUI) overall decreased over time. Most of them had “Attenuated Psychotic Symptoms” (75.1%). The most common DSM-5 diagnoses were anxiousdepressive
disorders, personality disorders (especially schizotypal and borderline personality disorder), and brief psychotic disorder. Along the follow-up period, there was a statistically significant improvement in several clinical and functioning outcomes scales (i.e., CAARMS, PANSS, GAF, and HoNOS scores).
Conclusions: A specialized, evidence-based care protocol for CHR-P individuals within Italian adult and child/adolescent psychiatric services is feasible and lead to improvement in clinical and functioning outcomes. This also allows CHR-P adolescents to reduce the high risk of falling through the child/adult service gap.

THE INTERSECTION BETWEEN SEXUAL ORIENTATION, GENDER IDENTITY, AND DISABILITY: CROSS-CULTURAL AND CROSS-GENERATIONAL INSIGHTS

Friday 24 July 2026 from 08:00 to 09:30

(G-Spadolini)

Alexander Moreno (Department of Psychology, Université de), Chair and Discussant

Disability can affect anyone, including individuals who identify as lesbian, gay, bisexual, transgender, queer/questioning, intersex, asexual, and other sexual orientations and gender expressions (LGBTQIA+). However, people with disabilities are often subject to infantilization and are frequently perceived as asexual. These misconceptions contribute to additional layers of marginalization for those who navigate both LGBTQIA+ and disability identities. At this intersection, challenges are often amplified, and new barriers to inclusion and recognition may arise, leading to heightened stigmatization, exclusion, and limited access to resources and support. Research indicates that LGBTQIA+ individuals report higher rates of disability than their non-LGBTQIA+ counterparts. This symposium aims to deepen understanding of the intersection between sexual orientation, gender identity, and disability. It will also offer psychological and social perspectives to inform inclusive interventions that enhance community participation and foster belonging for LGBTQIA+ individuals with disabilities. The symposium will begin with a literature review focused on the social participation of individuals with disabilities who identify as LGBTQIA+. It will then feature the lived experiences and self-advocacy efforts of visually impaired LGBTQIA+ youth in South Africa, highlighting their fight for recognition and rights. Additionally, findings from a study in the province of Quebec in Canada will be presented, examining the social determinants of health, community inclusion, and technology experiences of adults with disabilities who identify as LGBTQIA+. These cross-cultural and cross-generational insights, from youth to adults, will help illuminate the lived realities of this underserved population. By exploring common themes and challenges, the symposium will foster critical reflection on how to create more inclusive, affirming environments that recognize intersectional identities, build trust, and counter stigma. Ultimately, it seeks to inspire action toward greater equity, visibility, and empowerment for LGBTQIA+ people with disabilities across various contexts.

Abstract 3387

PRELIMINARY FINDINGS OF A SYSTEMATIC REVIEW ON BARRIERS AND FACILITATORS TO SOCIAL PARTICIPATION AMONG LGBTQIA+ INDIVIDUALS WITH DISABILITIES

Pelletier P.*[1], Chourot--Ferland S.[2], Hong--Kim A.[3], Croteau M.[4], Martino A.[5], Yule A.[6], Neumann--Mascis A.[7]

[1]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [2]Faculté de science politique et de droit, Université du Québec à Montreal ~ Montreal ~ Canada, [3]Department of Educational and Counselling Psychology, McGill University ~ Montreal ~ Canada, [4]Bibliothèque Thérèse-Gouin-Décarie, Université de Montréal ~ Montreal ~ Canada, [5]Community Rehabilitation and Disability Studies, Department of Community Health Sciences, University of Calgary ~ Calgary ~ Canada, [6]Ashleigh Yule Child Psychology, Athabasca University ~ Calgary ~ Canada, [7]The Meeting Point ~ Boston ~ United States of America

Introduction:
Individuals who identify as lesbian, gay, bisexual, transgender, queer/questioning, intersex, asexual, or other sexual orientations and forms of gender expression (LGBTQIA+) frequently encounter substantial and systemic barriers to social participation. Healthcare, employment, education, and community life represent core pillars of meaningful social participation.

Purpose:
To examine the barriers and facilitators to social participation among people with disabilities who identify as LGBTQIA+.

Method:
The search was conducted across several electronic databases, including MEDLINE (Ovid), APA PsycINFO (Ovid), Embase (Ovid), CINAHL Complete (EBSCOhost), and Web of Science. The search strategy was developed and validated by two professional librarians in accordance with the PRESS Guideline Statement and incorporated a combination of free-text keywords and controlled vocabulary related to social participation, disability, and sexual and gender diversity. Eligible studies included those published from each database's inception through February 2025, with no language restrictions. We considered studies involving various types of disabilities, including but not limited to motor, visual, auditory, intellectual, language, and cognitive disabilities. Data management and extraction followed established protocols using Covidence software. Two independent reviewers performed study selection, data extraction, risk of bias assessment, and quality appraisal using the Mixed Methods Appraisal Tool (MMAT). Discrepancies were resolved through discussion or consultation with a third reviewer.

Results:
From the 13,902 records identified, 4,920 duplicates were removed and 8,626 records excluded based on eligibility criteria. Currently, 244 full-text articles are under review to finalize study selection.

Conclusions:
This systematic review will synthesize current evidence on strategies designed to promote the social participation of people with disabilities who identify as LGBTQIA+. Updating knowledge on barriers and facilitators can support clinicians in enhancing their practice and in adopting inclusive strategies to improve the quality of life of people with disabilities within the context of sexual and gender diversity.

Abstract 3391

SOCIAL PARTICIPATION IN ADULTS WITH DISABILITIES WHO IDENTIFY AS LGBTQIA+

Moreno A.*[1], Yule A.[2], Neumann--Mascis A.[3], Caamano C.[4], Pelletier P.[1], Chourot--Ferland S.[5], Dubois M.[1], Rigoulat C.[1], Hong--Kim A.[6], Turk C.[1], Martino A.[7]

[1]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [2]Ashleigh Yule Child Psychology, Athabasca University ~ Calgary ~ Canada, [3]The Meeting Point ~ Boston ~ United States of America, [4]Centre de recherche de l'Institut universitaire de gériatrie de Montréal (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada, [5]Faculté de science politique et de droit, Université du Québec à Montreal ~ Montreal ~ Canada, [6]Department of Educational and Counselling Psychology, McGill University ~ Montreal ~ Canada, [7]Community Rehabilitation and Disability Studies, Department of Community Health Sciences, University of Calgary ~ Calgary ~ Canada

Introduction:
Individuals who identify as lesbian, gay, bisexual, transgender, queer/questioning, intersex, asexual, and other sexual orientations and gender expressions (LGBTQIA+) often face significant barriers to social participation in areas such as healthcare, employment, education, and community life.

Purpose:
To explore social participation of adults with disabilities who identify as LGBTQIA+ in the province of Quebec, Canada.

Method:
A cross-sectional study was conducted with 14 individuals with disabilities who identify as LGBTQIA+, with a mean age of 35.4 years (SD = 11), residing in the province of Quebec, Canada. The majority reported physical (71.4%) and mental health-related (78.6%) disabilities. Most participants were white (78.6%) and cisgender women (42.9%), with the most common level of education being a high school diploma (28.6%). Participants reported receiving between one and four disability diagnoses. They completed the Client's Intervention Priorities (CIP©), a self-assessment tool designed to evaluate life habits. The assessment includes two domains: Daily Activities (21 items), which covers nutrition, physical fitness, personal care, communication, housing, and mobility; and Social Roles (20 items), which encompasses responsibilities, interpersonal relationships, community life, education, employment, and recreation.

Results:
Descriptive analyses revealed low levels of social participation, as indicated by the overall CIP total score (M = 3.7; SD = 1.65). The Social Roles domain (M = 3.0; SD = 0.8) was more impacted than the Daily Activities domain (M = 4.5; SD = 0.3). The lowest

levels of participation were reported in areas related to education, employment, and community life.

Conclusions:
Individuals with disabilities who identify as LGBTQIA+ in the province of Quebec report greater challenges in fulfilling social roles related to education, employment, and community life. Exploring their priorities in these areas of social participation can help inform targeted recommendations to support and enhance their inclusion and engagement at these levels.

Abstract 3396

UNDERSTANDING THE IMPACT OF SEXUAL DIVERSITY AND DISABILITY INTERSECTIONALITY: AMPLIFYING LGBTQIA+ VOICES ON SOCIAL PARTICIPATION

Pelletier P.*[1], Rigoulat C.[2], Coveny V.[1], Malamud G.[1], Caamano C.[4], Martino A.[3], Yule A.[5], Neumann--Mascis A.[6], Chourot--Ferland S.[7], Dubois M.[1], Hong--Kim A.[8], Turk C.[1], Moreno A.[1]

[1]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [2]École Universitaire de Recherche (EUR) Healthy, Université Côte d'Azur ~ Nice ~ France, [3]Community Rehabilitation and Disability Studies, Department of Community Health Sciences ~ Calgary ~ Canada, [4]Centre de recherche de l'Institut universitaire de gériatrie de Montréal (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada, [5]Ashleigh Yule Child Psychology, Athabasca University ~ Calgary ~ Canada, [6]The Meeting Point ~ Boston ~ United States of America, [7]Faculté de science politique et de droit, Université du Québec à Montreal ~ Montreal ~ Canada, [8]Department of Educational and Counselling Psychology, McGill University ~ Montreal ~ Canada

Introduction:
People with disabilities who identify as lesbian, gay, bisexual, transgender, queer/questioning, intersex, asexual, and other sexual orientations and gender identities (LGBTQIA+) often face compounded barriers to social participation. To develop effective recommendations that enhance their inclusion and social participation, it is essential to center the voices of those most affected, actively listening to their lived experiences and involving them meaningfully in the decision-making process.

Purpose:
To examine the priorities in social participation of people with disabilities who identify as LGBTQIA+ in Quebec, Canada.

Method:
Fourteen people with disabilities, as defined by the Quebec government, who identify as LGBTQIA+ responded to the open question: “How does the intersection between your disability and your gender identity/sexual orientation affect your ability to perform daily activities?” Participants identified the six most challenging daily activities from a list of 41 options and explored various solutions to enhance their social participation.

Results:
Qualitative analyses revealed several key themes regarding the impact of intersecting disability and sexual and gender diversity on daily activities and social participation. These included the scarcity of accessible LGBTQIA+ spaces, limited acceptance of sexual and gender diversity by professional caregivers, and a lack of representation and opportunities to connect with others who share both identities. The most frequently prioritized challenges involved participating in physical activities, navigating indoor and

outdoor environments, and establishing and maintaining emotional relationships.

Conclusions:
People with disabilities who identify as LGBTQIA+ face numerous challenges in daily activities and social participation arising from the intersection of these identities within the societal context of Quebec. By centering their disclosures and priorities, targeted recommendations will be developed for the Quebec government to enhance social participation and promote greater inclusion. Based on these findings, increasing the availability of accessible LGBTQIA+ spaces, expanding adapted transportation services, and training professional caregivers on LGBTQIA+ realities should be prioritized.

Abstract 3401

EXAMINING SOCIAL DETERMINANTS OF HEALTH IN ADULTS WITH DISABILITIES WHO IDENTIFY AS LGBTQIA+: A CALL TO ADDRESS PERSISTENT HEALTH INEQUITIES

Rigoulat C.*[1], Martino A.[2], Yule A.[3], Neumann--Mascis A.[4], Caamano C.[5], Pelletier P.[6], Chourot--Ferland S.[7], Dubois M.[6], Hong--Kim A.[8], Turk C.[6], Moreno A.[6]

[1]École Universitaire de Recherche (EUR) Healthy, Université Côte d'Azur ~ Nice ~ France, [2]Community Rehabilitation and Disability Studies, Department of Community Health Sciences, University of Calgary ~ Calgary ~ Canada, [3]Ashleigh Yule Child Psychology, Athabasca University ~ Calgary ~ Canada, [4]The Meeting Point ~ Boston ~ United States of America, [5]Centre de recherche de l'Institut universitaire de gériatrie de Montréal (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada, [6]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [7]Faculté de science politique et de droit, Université du Québec à Montreal ~ Montreal ~ Canada, [8]Department of Educational and Counselling Psychology, McGill University ~ Montreal ~ Canada

Introduction:
Social determinants of health play a critical role in shaping health outcomes and driving inequities. However, there is little knowledge on how these social determinants uniquely affect individuals who identify as lesbian, gay, bisexual, transgender, queer/questioning, intersex, asexual, and other sexual orientations and gender expressions (LGBTQIA+).

Purpose:
To investigate how social determinants of health shape the experiences, health outcomes, and community participation of adults with disabilities who identify as LGBTQIA+ in the province of Quebec, Canada.

Method:
Fourteen adults with disabilities who identify as LGBTQIA+ completed the 49-item SPARK tool (Screening for Poverty And Related social determinants and intervening to improve Knowledge of and links to resources). Developed in Canada, The SPARK tool is a standardized instrument developed to systematically collect data on social determinants of health, facilitating targeted interventions and resource linkage. The tool is structured around two main domains (i.e., sociodemographic characteristics and social needs that directly impact well-being and access to care).

Results:
Eleven participants reported living with at least one mental health condition, and an equal number disclosed experiencing physical or emotional abuse (78.6%). Although the majority reported having a family doctor and access to public insurance, the results reveal gaps in access to health services. Only two participants (14.3%) had a

professional caregiver and just one (7.1%) had access to a nurse navigator. Additionally, nearly half of the participants (42.9%) have already been unable to obtain medication due to cost. In the past 12 months, 50% were unable to attend their appointments due to a lack of transportation, and an equal number reported not having private insurance.

Conclusion:
This study reveals social inequalities in healthcare faced by adults with disabilities who identify as LGBTQIA+ and underscores the urgent need to integrate their social, economic, and relational contexts into healthcare policies and practices to effectively mitigate these disparities.

Abstract 3403

TECHNOLOGY EXPERIENCE IN ADULTS WITH DISABILITIES WHO IDENTIFY AS LGBTQIA+

Dubois M.*[1], Rigoulat C.[2], Martino A.[3], Yule A.[4], Neumann--Mascis A.[5], Caamano C.[6], Pelletier P.[1], Chourot--Ferland S.[7], Hong--Kim A.[8], Turk C.[1], Moreno A.[1]

[1]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [2]École Universitaire de Recherche (EUR) Healthy, Université Côte d'Azur ~ Nice ~ France, [3]Community Rehabilitation and Disability Studies, Department of Community Health Sciences, University of Calgary ~ Calgary ~ Canada, [4]Ashleigh Yule Child Psychology, Athabasca University ~ Calgary ~ Canada, [5]The Meeting Point ~ Boston ~ United States of America, [6]Centre de recherche de l'Institut universitaire de gériatrie de Montréal (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada, [7]Faculté de science politique et de droit, Université du Québec à Montreal ~ Montreal ~ Canada, [8]Department of Educational and Counselling Psychology, McGill University ~ Montreal ~ Canada

Introduction:
While technology use has been studied among LGBTQIA+ adults and among people with disabilities, research rarely addresses the experiences of those at the intersection of these identities. Existing literature on LGBTQIA+ populations primarily highlights the role of technology in facilitating communication, fostering online communities, and providing social support. Research focused on people with disabilities, meanwhile, tends to concentrate on assistive technologies and accessibility challenges. This leaves a significant gap in understanding how technology is used and experienced by disabilities who identify as LGBTQIA+, as a space for identity expression, community-building, and empowerment.

Purpose:
To explore the technology experience of adults with disabilities who identify as LGBTQIA+ in the province of Quebec, Canada.

Method:
Fourteen adults with disabilities who identify as LGBTQIA+ residing in the province of Quebec, Canada. Participants reported receiving between one and four disability diagnoses. Participants completed the 36-item self-report questionnaire Technology Experience Profile, a standardized measure designed to assess frequency of use across a wide range of common technologies within the last 12 months.

Results:
Descriptive analysis revealed that participants reported the lowest levels of technology use in the domains of transportation technology (M = 3.5; SD = 0.6) and health technology (M = 3.0; SD = 0.7). In contrast, the highest levels of use were observed in

computer technology (M = 4.5; SD = 0.2), followed by communication technology (M = 4.3; SD = 0.5). According to TEP criteria, all participants were classified in the highest category of technology experience, corresponding to expert-level skill.

Conclusion:
These preliminary findings suggest that computer and communication technologies are a useful tool to promote social participation in adults with disabilities who identify as LGBTQIA+. However, lower reliance on health and transportation technologies underscores the need for future research and inclusive technology design that address broader aspects of daily living—not just specialized or assistive tools.

Abstract 864

THE FACTORS OF EFFECTIVE TREATMENT FOR INVOLUNTARY SEXUAL OFFENDERS IN TAIWAN

Yuanhsien L.*[2], Chiachih W.[1]

[1]Department of Psychology University of North Texas ~ Texas ~ United States of America, [2]Department of Life-and-Death Studies Nanhua University, Taiwan ~ chiayi county ~ Taiwan

It has been consistently documented in literature that mental health treatment for involuntary sex offenders is challenging work. Unfortunately, comprehensive research examining treatment process factors for this unique population in Asian countries remains extremely rare. With 20+ years of experiences serving as the supervisor and mental health provider designated by a county's health department in Taiwan, the presenter analyzed treatment process data from six involuntary sex offenders (all men), aged between 32 and 45 years old, after they successfully completed the required 2-year counseling program. None of these offenders reoffended within three years following the conclusion of the treatment.

The analysis of the data revealed several critical factors contributing to the effectiveness of the treatment. First, close collaboration by multiple networks of agencies plays a key role. For instance, several governmental branches (e.g., health, police, and social departments) and community organizations shared information about clients' needs/situations to provide timely supervision and home visits when early warning signs were noticed. Second, psychoeducational programs were repeatedly recognized by clients as helpful components of the program in teaching them legal knowledge, strengthening their understanding of the rationale of abiding the law, and increasing their awareness of the negative consequences associated with recidivism. Third, the implementation of relational, cognitive, behavioral, and emotion-focused interventions also contributed to effective outcomes. The counseling process focused on challenging their distorted beliefs about sexually offending others, helping clients recognize their negative emotions and establish more effective coping skills to reduce extreme negative emotions and avoid reacting to their emotions with sexual behavior, enhancing clients' abilities to release their sexual impulses appropriately, and improving their problem-solving abilities, including seeking help when needed.

In this section, the presenter will share examples of challenges, considerations, and specific interventions for working with this population. Discussion will highlight culturally sensitive treatments with multidisciplinary collaborations.

Abstract 1569

PSYCHOLOGISTS' ROLE IN CULTURALLY ADAPTING STANDARDISED LANGUAGE MEASURES FOR AT-RISK CHILDREN UNDER TWO IN INDONESIA'S COMMUNITY HEALTH SYSTEM

Kolopaking R.*[1], Dockrell J.[3], Fahmida U.[2]

[1]Faculty of Psychology, Universitas Islam Negeri Syarif Hidayatullah Jakarta ~ Jakarta ~ Indonesia, [2]Department of Nutrition, Faculty of Medicine, Universitas Indonesia – Dr. Cipto Mangunkusumo General Hospital, Jakarta ~ Jakarta ~ Indonesia, [3]Department of Psychology and Human Development, IOE, UCL's Faculty of Education and Society, London ~ London ~ United Kingdom

Introduction:
Early language development is strongly influenced by children's health, nutrition, and caregiving environments. Children under two in low-resource settings are particularly vulnerable to developmental risks. Standardised tools such as the Bayley-4 Language Scale are widely used for professional assessment, yet they are typically developed for Western, monolingual populations and may not align with the linguistic and cultural realities of non-Western contexts. Adapting these measures is essential to ensure validity, equity, and cultural relevance within diverse health systems.
Purpose:
This presentation highlights the role of psychologists, and the collaboration between Indonesian and UK experts, in adapting the Bayley-4 Language Scale for bilingual children under two. It illustrates how psychological expertise contributed to both psychometric rigor and practical applicability within Indonesia's community health system.
Method:
Fieldwork in East Lombok integrated construct mapping, decentering and translation, caregiver response-process interviews, and psychometric validation. Indonesian psychologists led the psychometric analysis, ensuring construct validity and cultural alignment. UK psychologists, with expertise in early language development, provided developmental frameworks and supported the adaptation of English-based constructs to the Indonesian linguistic and caregiving context.
Results:
The adapted Bayley-4 Language Scale retained professional standards while achieving strong cultural and linguistic relevance. Although administered by trained professionals, the tool generated findings applicable to primary-level community health services, supporting early identification, developmental monitoring, and caregiver. This strengthened the relevance of professional assessment within locally embedded systems such as Integrated Health Service Post (Posyandu).
Conclusion:

This model demonstrates how psychologists can bridge clinical science with implementation in community health contexts. It offers a scalable, culturally responsive approach for LMICs seeking to embed valid early assessments into child health systems, promoting equitable developmental support during the critical first 1,000 days. This study was conducted as part of the UKRI–GCRF Action Against Stunting Hub (AASH), reflecting a cross-national effort to advance health equity and scientific collaboration.

Abstract 1506

SELF-ESTEEM AND HIGHLY SENSITIVE PERSON (HSP) TRAITS AMONG NEPALESE UNIVERSITY STUDENTS: A CORRELATIONAL ANALYSIS

Nishaat A.*

Higashi Nippon International University ~ Fukushima ~ Japan

Objective: This study investigated the relationship between self-esteem and high sensitivity among Nepalese university students, with particular attention to gender differences. A total of 327 students aged 18 to 24 (137 males and 190 females) completed validated measures of Self-Esteem Scale (Rosenberg,1965) and the Highly Sensitive Person (HSP) Scale (Pluess et al., 2023), which includes three subscales: Aesthetic Sensitivity (AES), Low Sensory Threshold (LST), and Ease of Excitation (EOE).

Methods: Descriptive analyses indicated that students reported moderate to high levels of sensitivity. Females scored significantly higher than males on LST, EOE, and overall sensitivity, whereas males reported slightly higher self-esteem. Correlation analyses revealed a significant negative association between overall HSP scores and self-esteem ($r = –.180$, $p < .01$). Among the sensitivity dimensions, EOE showed the strongest negative correlation with self-esteem ($r = –.232$, $p < .01$), suggesting that students who are more easily overwhelmed by external or internal stimuli tend to report lower self-worth.

Gender-Based Findings: For males, self-esteem was negatively associated only with EOE ($r = –.218$, $p < .05$). For females, self-esteem was negatively related to both EOE ($r = –.213$, $p < .01$) and overall HSP scores ($r = –.195$, $p < .01$). Neither LST nor AES showed significant associations with self-esteem in either gender.

Conclusion: The findings suggest that heightened sensitivity particularly ease of excitation may serve as a risk factor for lower self-esteem among Nepalese university students. As self-esteem plays a crucial role in academic achievement, resilience, and overall psychological well-being, these results underscore the need to recognize high sensitivity within student populations and to develop supportive interventions. Cultural context should also be considered, as the meaning and implications of sensitivity may differ within Nepalese society.

Abstract 2728

TESTING MULTIPLE INTERVENTIONS WITH SECONDARY INVESTIGATORS AND ANALYSTS TO IMPROVE THEIR MENTAL HEALTH AND WELLBEING

Duran F.*

university of Birmingham ~ Birmingham ~ United Kingdom

Introduction:
Secondary Investigative Analysts (SIAs) working within police and law enforcement organisations are repeatedly exposed to distressing experiences of others as part of their routine duties. This indirect exposure places SIAs at elevated risk of mental ill-health, yet tailored wellbeing interventions for this occupational group are lacking.

Purpose:
This study aimed to pilot-test multiple brief wellbeing interventions targeting known mental health concerns among SIAs, to inform future research and organisational wellbeing policy.

Method:
A controlled trial design was used to evaluate the effectiveness of a four-week wellbeing programme. Ninety participants were allocated to one of five groups: Control, Image Rescripting, Mindful Nature Walks, Psychoeducation, or Tetris Breaks. Participants engaged in their assigned intervention for 30 minutes per day and attended weekly researcher-led sessions for training and wellbeing check-ins. Self-report measures of perceived stress, anxiety, depression, wellbeing, and post-traumatic stress symptoms were completed at baseline and post-intervention. Outcomes were analysed using mixed-effects modelling.

Results:
All four interventions outperformed the control condition. While the control group showed worsening wellbeing and increasing PTSD symptoms, brief, targeted interventions—from psychoeducation to Tetris gameplay—produced meaningful improvements across anxiety, wellbeing, and trauma-related outcomes. Individual responses varied, highlighting the need for flexible, personalised support that can be proactively tailored to SIAs' preferences and needs in high-stress investigative roles.

Conclusions:
These findings suggest that targeted interventions can meaningfully support SIAs' mental health. Prototype approaches can address specific mental health concerns, ranging from structured strategies such as psychoeducation and image rescripting to

brief, accessible approaches including Tetris gameplay or mindful nature walks. By offering a menu of evidence-informed options, organisations can provide support that is both proactive and adaptable, accommodating the diverse coping styles, symptom profiles, and engagement preferences of SIAs.

Abstract 1205

MENTAL CONTAMINATION ACROSS CULTURES: AN EXPERIMENTAL STUDY OF CULTURAL VARIATIONS IN PATHWAYS TO WASHING URGES

Üzümcü E.*[1], Erol Y.[1], Usta E.[2], Ergin Ayan Ö.[2], Myers N.S.[3], Friedman J.B.[3], Juel E.[3], Abramowitz J.S.[3], Inozu M.[2]

[1]Baskent University ~ Ankara ~ Turkey, [2]Hacettepe University ~ Ankara ~ Turkey, [3]University of North Carolina at Chapel Hill ~ North Carolina ~ United States of America

Mental contamination (MC) refers to feelings of internal dirtiness or moral pollution without direct physical contact. While constructs such as fear of self (FoS), scrupulosity, obsessive beliefs, and inferential confusion (IC) have been linked to MC and the urge to wash, these relationships remain underexplored, especially in experimental and cross-cultural contexts. This experimental cross-cultural study investigated whether MC and MC-specific emotions (MCSE) such as disgust and guilt mediate relationships between cognitive vulnerabilities and urge to wash, with particular emphasis on identifying cultural variations in these psychological processes between Turkish and American populations. This study employed a between-subjects cross-cultural design comparing participants from Turkey (n = 85) and the United States (n = 75). Following completion of baseline measures assessing FoS, scrupulosity, subdimensions of obsessive beliefs, and inferential confusion, participants engaged in a controlled experimental manipulation where they imagined themselves as perpetrators in a non-consensual kissing scenario (MC manipulation). Post-manipulation assessments measured MC, MCSE, and urge to wash responses. Cross-cultural comparisons and serial mediation analyses were conducted using SPSS PROCESS. Analyses revealed distinct mediation patterns between Turkish and American samples. For Turkish participants significant indirect effects of FoS, IC, scrupulosity and obsessive beliefs related to threat, perfectionism, and intolerance of uncertainty on the urge to wash were mediated through MC and MCSE pathways. In contrast, the American sample showed more limited mediation effects, with only obsessive beliefs about threat and importance/control demonstrating significant indirect effects via MC. This experimental cross-cultural investigation demonstrates that MC and MCSE significantly mediate cognitive vulnerabilities' effects on cleansing urges, with markedly stronger mediation pathways in Turkish compared to American participants. These cross-cultural differences highlight the role of culture-specific cognitive mechanisms in MC processing. The study provides the first experimental evidence for cross-cultural variations in MC mechanisms and offers important implications for developing culturally-adapted therapeutic interventions.

Abstract 1144

THE CHARACTERISTICS AND MECHANISMS OF TRUST IN OLDER ADULTS IN SITUATIONS INDUCING LONELINESS STEREOTYPES

Zhang B.*, Chen Y.

School of Psychology, Shaanxi Normal University ~ Xi'an ~ China

The present study investigates the relationship between loneliness stereotypes and trust decision-making, as well as the underlying mechanisms involved. It consists of three experiments. Specifically, Study 1 examines the impact of loneliness stereotypes on trust decision-making. Seventy-two older adults were randomly assigned to either the stereotype activation group or the control group, where they read a paragraph of descriptive material before completing a trust game. Study 2 explores whether cognitive resources mediate the relationship between loneliness stereotypes and trust decision-making. Study 3 investigates whether emotional motivation serves as the underlying mechanism in the relationship between loneliness stereotypes and trust decision-making. The results show that loneliness stereotypes increase the trust levels of older adults (Study 1). Moreover, this effect is moderated by cognitive resources: adequate cognitive resources amplify the impact of loneliness stereotypes on trust, consistent with predictions of the motivational mechanism (Study 2). Finally, unconscious goal priming, as an intervention manipulating motivation, can effectively reduce the effect of loneliness stereotypes on trust decision-making. Specifically, after priming older adults' unconscious goals, the influence of loneliness stereotypes on trust was no longer significant (Study 3). These findings suggest that in the relationship between loneliness stereotypes and trust, motivations related to emotional significance may play a more crucial role. This study makes several theoretical and practical contributions. First, it focuses on the loneliness stereotype, a longstanding yet underexplored construct, thereby expanding research on the content of aging-related stereotypes. Second, it examines the relationship between loneliness stereotypes and trust decision-making, along with its mechanisms, enhancing our understanding of how negative stereotypes about aging influence trust. This also contributes to the fields of aging stereotypes, socioemotional selectivity theory, and dynamic integration theory. Finally, it offers valuable insights for future tailored interventions aimed at reducing blind trust among older adults in real-world situations.

Abstract 641

HOW FAMILY BEHAVIORAL CONTROL SHAPES ADDICTION: THE MEDIATING ROLE OF LIFE SATISFACTION

Dogan Ü.M.*, Gürsoy A., Gençöz T.

Middle East Technical University ~ Ankara ~ Turkey

Repetitive addictive behaviors can be understood in terms of Freud's concept of repetition compulsion, whereby the subject persists in a cycle of enjoyment (jouissance in Lacanian terms) that exceeds the pleasure principle and even becomes painful. From a Lacanian perspective, addiction is closely linked to the drive, which emerges from the subject's (subject is a Lacanian term for unique -idiosyncratic- individual) relation to the symbolic register and the constitutive lack inherent to subjectivity. The present study examined the mediating role of life satisfaction in the relationship between behavioral control within the family and addictive behaviors. Seventy-nine adults who self-identified as addicted participated in the study. The Behavioral Control subscale of the Family Assessment Device was employed as the independent variable, the Satisfaction with Life Scale as the mediator, and the Addiction Profile Index as the dependent variable. Mediation analysis was conducted using Hayes' PROCESS macro. Results indicated that behavioral control negatively predicted life satisfaction ($\beta = -1.16$, $p < .05$), and life satisfaction negatively predicted addiction severity ($\beta = -0.93$, $p < .05$). The direct effect of behavioral control on addiction was not significant ($\beta = 0.39$, $p > .05$), whereas the indirect effect through life satisfaction was significant ($\beta = 1.08$, $p < .05$). Findings indicate that dysfunctions in behavioral control within the family lower individuals' life satisfaction and thereby lay the groundwork for addictive behavior. While an overly controlling family may rigidly regulate an imaginary sense of wholeness and undermine the subject's autonomy, an overly permissive family may hinder the child's integration into the symbolic order, that is, into a network of language and meaning organized through norms like laws and boundaries. Thus, both family structures tend to prevent the subject from sufficiently engaging with the symbolic order, thus through reducing life satisfaction and potentially triggering addictive behaviors.

Abstract 981

INTRAFAMILY RELATIONSHIPS AND STRENGTHS IN MEXICAN ADOLESCENTS: A STRUCTURAL EQUATION MODELING APPROACH

Bravo Andrade H.R.*, Orozco Estrada V.O., Ruvalcaba Romero N.A., Orozco Solis M.G., Macias Espinoza F.

Universidad de Guadalajara ~ Guadalajara ~ Mexico

Introduction: Intrafamily relationships are conceptualized as unity, support and emotional expression, as well as perception of difficulties that may arise in a family. Concurrently, internal and external strengths are key resources that promote positive adolescent development. External strengths are rooted in interactions with adults and institutions, while internal strengths are personal competencies developed through experience. Despite their importance, few studies have examined the relationship between these constructs in Latin American contexts. Aim: To assess the predictive influence of intrafamily relationships on strengths in Mexican adolescents. Method: A cross-sectional explanatory study using latent variables was conducted with 315 high school students in Mexico. Participants completed the brief reviewed version of the Intrafamily Relationships Assessment Scale and the reviewed version of the Internal and External Strengths for Teenagers. Separate structural equation models were tested for external and internal strengths. Results: The model for external strengths demonstrated an excellent fit: X2/gl = 1.40, CFI = .966, SRMR = .043, RMSEA = .036 [.031, .041]. Union, support, and expression strongly predicted maternal support (β = .73***), and paternal support/supervision (β = .62***). Conversely, the perception of difficulties predicted maternal supervision (β = -.38***) and friends without risky behaviors (β = .58***). The internal strengths model also showed a strong fit: X2/gl = 1.43, CFI = .961, SRMR = .050, RMSEA = .037 [.032, .042]. In this model, union, support, and expression predicted resistance to pressure (β = .64***), and the importance of health (β = .31**), while difficulties predicted resistance to pressure (β = .83***), and importance of religion (β = .20*). Discussion: The dimensions of intrafamily relationships predicted different strengths in adolescents. These findings highlight specific pathways that should be considered in comprehensive interventions aimed at strengthening students and their families.

Abstract 1617

THE EFFECT OF PARENTIFICATON ON CODEPENDENCY AND RELATIONSHIP AVOIDANCE IN ROMANTIC RELATIONSHIPS: THE MEDIATING ROLE OF SHAME AND GUILT PRONENESS, AND REJECTION SENSITIVITY

Hamarat Sümerkan H.*[2], Fidantek H.[1], Durak Batigün A.[2]

[1]Istanbul Kültür Üniversitesi ~ Istanbul ~ Turkey, [2]Ankara Üniversitesi ~ Ankara ~ Turkey

Parentification, the reversal of parent–child roles, has lasting adverse consequences that extend into adulthood. Prior research suggests that adults exposed to parentification may oscillate between two maladaptive relational patterns-codependency and avoidance-yet the underlying mechanisms remain unclear. The present study examined whether shame proneness, guilt proneness, and rejection sensitivity mediate the link between parentification and these relational outcomes. A total of 533 young adults (ages 18–26; M = 21.53, SD = 2.25) completed standardized self-report measures, and data were analyzed using multiple mediation models. Results showed that shame proneness, guilt proneness, and rejection sensitivity partially mediated the association between parentification and codependency. Shame-proneness and rejection sensitivity fully mediated the association between parentification and relationship avoidance. Taken together, these findings provide new insight into the emotional pathways through which parentification shapes adult romantic relationships, extending knowledge on relational dysfunction and developmental risk, and highlighting the need for longitudinal and cross-cultural research.

Abstract 987

GENDER ROLE ATTITUDES AS A MEDIATOR BETWEEN IDENTITY AND PARENTING EMOTIONS: DIFFERENCES BY DAYCARE CENTER USAGE

Shitara S.*

Sakushin Gakuin Univesity College ~ Utsunomiya ~ Japan

Introduction: Although childcare support typically emphasises children's needs, less attention has been devoted to the lifelong developmental support of parents. A stable sense of identity is widely recognised as essential for positive adaptation to childcare. Gender role attitudes are also associated with adaptation, yet their role in the relationship between identity and parenting emotions remains unclear. Furthermore, access to childcare resources differs depending on whether parents rely on home-based care or daycare centres, potentially shaping their experiences.

Purpose: This study investigated the mediating effect of gender role attitudes on the association between identity and parenting emotions and examined whether this relationship varied according to daycare center usage.

Method: Participants were 300 mothers with children aged 0–2 years (150 providing home-based childcare, 150 using daycare centres). Data on parenting emotions (parenting stress, parental satisfaction), identity (synthesis, confusion), and gender role attitudes were collected through a web-based survey.

Results: Identity confusion was significantly lower among mothers providing home-based childcare than among daycare centre users. Structural equation modelling indicated that gender role attitudes mediated the association between identity synthesis and parental satisfaction, with the model demonstrating good fit. This mediating effect was significant only for mothers providing home-based childcare.

Conclusions: Gender role attitudes play a pivotal role in linking parental identity to parenting satisfaction, particularly among mothers providing home-based childcare. The findings underscore the importance of providing adaptive, lifelong developmental support that incorporates identity formation and gender role attitudes as integral components of childcare services.

Abstract 1377

INVESTIGATING PREVALENCE AND RISK FACTORS OF POST-TRAUMATIC STRESS DISORDER AMONG WOMEN EXPOSED TO INTIMATE PARTNER VIOLENCE

Hung F.*, Lin Y.

Chung Yuan Christian University ~ Taoyuan ~ Taiwan

Introduction: Intimate partner violence (IPV) is a pervasive global issue that severely affects the physical and mental health of abused women. This is particularly evident in its association with post-traumatic stress disorder (PTSD). Despite limited domestic research on this topic, recent data offers an opportunity for a comprehensive analysis to understand the prevalence of PTSD among women exposed to IPV in Taiwan. Purpose: This study aims to estimate the prevalence of PTSD in this population and to explore the associated risk factors. Methods: This is a cross-sectional study involved a sample of 291 women aged 20 to 65 who have experienced IPV. All participants completed questionnaires, including Intimate partner violence questionnaire and the Posttraumatic Diagnostic Scale for DSM-5 (PDS-5). Results: Data analysis using t-tests, chi-square tests, and odds ratios revealed the following findings: (1) The estimated prevalence of PTSD among women experiencing IPV in Taiwan ranged from approximately 49% to 57%; (2) Among pretraumatic factors, poorer economic status and shorter duration of marriage/cohabitation were significantly associated with higher rates of PTSD diagnoses; (3) Among peritraumatic factors, physical, psychological, and sexual violence were all significantly associated with higher rates of PTSD diagnoses, with sexual violence demonstrating the strongest association overall; (4) Among posttraumatic factors, women with help-seeking experiences were significantly more likely to be diagnosed with PTSD. Conclusion: This study highlights the high prevalence of PTSD among women exposed to IPV in Taiwan and provides valuable insights for mental health professionals and researchers. It emphasizes the critical impact of various forms and contexts of violence on the risk of developing PTSD, thereby enhancing the identification of these scenarios and improving support systems and assistance for affected individuals.

Abstract 1372

COGNITIVE BIASES AND SOCIAL ANXIETY: INVESTIGATION OF THE MEDIATING EFFECT OF INTERPRETATION BIAS BETWEEN ATTENTIONAL BIAS AND MEMORY BIAS

Liang C.*, Chiang Y.

Chung Yuan Christian University ~ Taoyuan City ~ Taiwan

Introduction: Cognitive-behavioral models of social anxiety suggest that cognitive biases play a critical role in maintaining social anxiety. Prior research has consistently demonstrated that individuals with social anxiety exhibit various cognitive biases, including attentional, memory, and interpretation biases. The Combined Cognitive Biases Hypothesis (CCBH) proposes that these biases may interact with one another in significant way. However, few studies have examined interrelationships among multiple cognitive biases. Purpose: The object of this study is to investigate the relationships among attention bias, interpretation bias, and memory bias in individuals with social anxiety. Method: A total of 116 participants (56 male, 60 female = 60; Mean age = 20.03) participated in this study. They first completed a modified version of the Word Sentence Association Paradigm (modified WSAP), integrated with eye-tracking technology to simultaneously measures attentional and interpretation biases. After completing the modified WSAP, participants were unexpectedly asked to perform a free recall and recognition task for faces and words presented during the modified WSAP. Lastly, participants completed the Social Interaction Anxiety Scale and Social Phobia Scale. Results: Participants exhibiting higher levels of social anxiety displayed a greater attentional bias towards threats and demonstrated more negative interpretation bias. Notably, social anxiety did not correlate with memory bias. The results showed that longer dwell times on threatening faces were associated with a greater negative interpretation bias. Negative interpretation bias adversely affected memory performance for positive stimuli. Additionally, negative interpretation bias mediated the relationship between negative attentional bias and positive memory bias. In particular, participants who had difficulty disengaging from threatening faces demonstrated more negative interpretations and recognized fewer positive stimuli. Conclusions: This study suggests that sustained attention to threat increases negative interpretation bias, leading to a reduction in memory for positive stimuli.

SOCIODEMOGRAPHIC, BEHAVIORAL, MOTIVATIONAL, AND PSYCHOLOGICAL DIFFERENCES BETWEEN CASINO TABLE GAMBLERS AND SPORTS BETTORS IN A CLINICAL SAMPLE

Lim T.*, Yoo S., Seo J., Kim J.

Chungnam National University ~ Daejeon ~ Korea, Republic of

Casino table games and sports betting have the highest prevalence among gambling types. This study compared sociodemographic, behavioral, motivational, and psychological correlates between casino table gamblers and sports bettors in a clinical sample of male problem gamblers in South Korea (N = 1,459; casino table gamblers = 406; sports bettors = 1,053; M = 33.80; SD = 8.47). We assessed sociodemographics; gambling mode; legal status; gambling duration; gambling frequency in the past four weeks; total losses; problem gambling severity; gambling motives; depression; anxiety; and suicidal ideation. Sports bettors were younger ($\chi^2(3) = 23.54$, $p < .001$), more often unmarried ($\chi^2(2) = 11.78$, $p = .003$), and more highly educated ($\chi^2(1) = 4.95$, $p = .026$) than casino table gamblers, with no group differences in employment or debt. Sports bettors more frequently gambled online ($\chi^2(1) = 73.37$, $p < .001$). Gambling duration differed by gambling type such that sports betting was overrepresented at 13–120 months, whereas casino table gambling was overrepresented at ≤12 and ≥121 months ($\chi^2(3) = 28.40$, $p < .001$). In the past four weeks, daily participation was more common among sports bettors, whereas participation once or twice per week was more typical among casino table gamblers ($\chi^2(4) = 25.85$, $p < .001$). Casino table gamblers were in the ≥US$741,000 loss band ($\chi^2(4) = 26.54$, $p < .001$). Legal status did not differ between groups. Compared with sports bettors, casino table gamblers endorsed higher social ($p < .001$), avoidance ($p < .001$), and amusement motives ($p = .020$) and reported higher depression ($p = .016$) and anxiety ($p = .006$), with no group differences in problem gambling severity or suicidal ideation. Collectively, these findings suggest that casino table gamblers and sports bettors differ in ways that support tailoring clinical interventions to gambling type.

Abstract 1159

THE MODERATING ROLE OF CHILD TEMPERAMENT IN THE CONTEXT OF PARENTAL DISTRESS AND COVID-19 RELATED STRESSORS: TRAJECTORIES OF SOCIAL-EMOTIONAL FUNCTIONING

Zarra--Nezhad M.*[7], Perasto L.[1], Tervahartiala K.[2], Lindblom J.[3], Tuulari J.[2], Karukivi M.[4], Kiuru N.[5], Karlsson L.[1], Karlsson H.[1], Korja R.[6], Nolvi S.[6]

[1]Centre for Population Health Research, University of Turku and Turku University Hospital ~ Turku ~ Finland, [2]Centre for Population Health Research, University of Turku and Turku University Hospital, Turku, Finland ~ Turku ~ Finland, [3]Faculty of Social Sciences, University of Tampere ~ Tampere ~ Finland, [4]Department of Adolescent Psychiatry, University of Turku and Turku University Hospital ~ Turku ~ Finland, [5]Department of Psychology, University of Jyväskylä ~ Jyväskylä ~ Finland, [6]Department of Psychology and Speech-Language Pathology, University of Turku ~ Turku ~ Finland, [7]Turku Research Institute of Learning Analytics, Faculty of Science, University of Turku ~ Turku ~ Finland

Introduction: Child social-emotional functioning is a cornerstone of healthy development, forming the basis for well-being, relationships, and learning. The COVID-19 pandemic created a context of widespread disruption and environmental stress, including increased parental distress, making children's social-emotional functioning especially important to examine.

Purpose: This preregistered study examined the role of early childhood temperament in shaping children's trajectories of social-emotional functioning across the COVID-19 pandemic, with focus on how temperament moderated the impact of parental distress (depression and anxiety) and pandemic-related stressors.

Method: Participants were drawn from the FinnBrain Birth Cohort Study, a longitudinal population-based study investigating the impact of early-life distress on brain development and health. Families were recruited between December 2011 and April 2015 from maternal welfare clinics in Turku and the Åland Islands, Finland. Data were available from 1,305 children (46% girls, up to age 9) with reports from both mothers and fathers. Of these, 567 children participated in COVID-19 follow-up surveys across five time points (T1–T5) between spring 2020 and summer 2021. Parental distress was assessed before the pandemic (children aged 4–5) and repeatedly during it (T1–T5; children aged 5–9), alongside COVID-related stressors (T1–T5), child temperament (age 2.5), and social-emotional functioning (T1–T5, except T4).

Results: Mixed-effects models revealed that high negative affectivity amplified the impact of COVID-related stressors on emotional symptoms at T1 but attenuated their impact on conduct problems at T3. Effortful control reduced the influence of parental distress on conduct problems at T1 and hyperactivity at T3.

Conclusions: Findings highlight the dual role of temperament—as both a vulnerability and a buffer—in shaping children's adaptation to parental and contextual stressors. Recognizing the interplay between child temperament and parental well-being is critical for identifying at-risk children and developing interventions to promote healthy social-emotional trajectories during periods of societal stress.

Abstract 1358

"JUST BECAUSE I WASN'T BORN HERE DOESN'T MEAN I CAN'T DO THIS WORK": INTRAGROUP PROCESSES WITHIN AN INDIGENOUS DECOLONIAL MOVEMENT

Meno C.*

University of Guam ~ Mangilao ~ Guam

Psychology has long been interested in both intergroup and intragroup contacts, and how such inevitable liaisons can lead to cooperation or conflict. However, despite the proliferation of research on intergroup dynamics in psychology, intragroup dynamics remain relatively undertheorized, especially in the context of Indigenous diaspora communities who maintain ties with both newly settled communities as well as their homelands. Reviewing findings from a qualitative study on Indigenous decolonial activism in Guåhan, this presentation will explore the value of an intragroup perspective to understand the complex negotiations of identity, place, and belonging in diasporic Indigenous CHamoru activists. Discussion will examine how unique experiences of Indigenous diaspora groups have the potential to expand our understanding of intragroup and acculturation processes, with implications for strategies to promote group cohesion and transnational Indigenous identity.

Abstract 1115

DISTRESS, INTOLERANCE TO UNCERTAINTY, TIME PERSPECTIVES AND PERCEIVED SOCIAL SUPPORT IN PARENTS OF CHILDREN WITH AUTISM

Mitrovic M.*, Cirovic N., Jankovic I., Spasic Šnele M., Opsenica Kostić J., Todorovic J.

Department of Psychology, Faculty of Philosophy, University of Niš ~ Niš ~ Serbia

Introduction: Parents of children with autism face specific daily stressors related to the disorder and its associated disabilities. As a result, they often show higher levels of distress, emotional exhaustion, and depression compared to other parents.
Purpose: This study examined differences in distress, intolerance of uncertainty, perceived social support, and time perspectives between parents of children with autism and parents of typically developing children, as well as their predictive values for distress.
Method: The sample included 192 parents (137 of typically developing children, 55 of children with autism). Instruments used: Intolerance of Uncertainty Scale, Zimbardo Time Perspective Inventory, Multidimensional Scale of Perceived Social Support, and Depression Anxiety Stress Scale.
Results: Parents of children with autism reported higher distress ($t(190) = -5.32$, $p < .001$) and negative future orientation ($t(190) = -3.24$, $p = .001$), while parents of typically developing children reported higher family support ($t(190) = 3.33$, $p = .001$). Hierarchical regression analysis showed that intolerance of uncertainty (ß = .28, $p < .001$) and negative future orientation (ß = .39, $p < .001$) significantly predicted distress, controlling for group membership. This final model explains 49% of the variance in the criterion ($F(7, 184) = 27.19$, $p < .001$). In the two subsamples, the same predictors of distress emerged, with the addition that in the autism group, friends support also predicted distress (ß = .22, $p = .042$).
Conclusions: The results confirm higher distress among parents of children with autism. A stronger negative future orientation likely reflects concerns about their child's future. Findings suggest the need for psychological interventions to balance time perspectives, increase tolerance of uncertainty, and develop social skills, as these constructs are shown to contribute to their distress. Greater negative future and its role in distress highlight the need for therapeutic focus.

Abstract 1238

RECOGNITION OF MALE SEXUAL VICTIMIZATION IN JAPAN.

Miyazaki H.*

Ritsumeikan University ~ Osaka ~ Japan

The criminal law on sexual offenses in Japan was revised in 2017 to recognize men as potential victims of rape involving penile penetration. Until this legislative change, men were not legally regarded as rape victims. Male sexual victimization remains a highly invisible phenomenon. Even after the press worldwide reported sexual violence by Johnny's production to boys and men, it is extremely difficult for male victimization to be recognized. This study explored the lived experiences of male victims of sexual violence and analyzed it from phenomenological perspectives. The findings revealed that gender and sexuality norms influenced the process of recognizing the events, which was sexually involuntary or unwanted, as sexual violence. Moreover, two concepts were generated as essential for the formation of victim recognition – "access to reliable information" and "relativization of positionality of masculinities." These factors enabled them to move forward to gain a sense of being a victim and acknowledge their experiences as sexual violence. Japanese society continues to be shaped by rigid gender and sexuality norms, which create challenges not only for public recognition of male victimization but also for survivors' self-recognition. Therefore, psychological support must consider the pervasive influence of social norms to providing individual care.

TRAJECTORIES OF CHILDREN'S SOCIO-EMOTIONAL DEVELOPMENT FROM PRE- TO POST-PANDEMIC: FAMILY RISK AND RESILIENCE IN THE FINNBRAIN BIRTH COHORT

Moazami--Goodarzi A.*[1], Zarra--Nezhad M.[2], Tervahartiala K.[1], Zarra--Nezhad M.[3], Karukivi M.[4], Karlsson L.[5], Karlsson H.[5], Lindblom J.[6], Juntunen P.[5], Luotola A.[5], Huovinen V.[5], Korja R.[1], Nolvi S.[1]

[1]Department of Psychology and Speech-Language Pathology, University of Turku ~ Turku ~ Finland, [2]Turku Research Institute of Learning Analytics, Faculty of Science, University of Turku ~ Turku ~ Finland, [3]Department of Economics, Shahid Chamran University of Ahvaz ~ Ahvaz ~ Iran, Islamic Republic of, [4]Department of Adolescent Psychiatry, University of Turku and Turku University Hospital ~ Turku ~ Finland, [5]Centre for Population Health Research, University of Turku and Turku University Hospital ~ Turku ~ Finland, [6]Faculty of Social Sciences, University of Tampere ~ Tampere ~ Finland

Introduction: The COVID-19 pandemic reshaped children's everyday lives by disrupting schools, limiting peer interactions, and increasing family stress. Such large-scale changes to developmental contexts raised concerns about how children's socio-emotional skills, critical for later adjustment in school, relationships, and mental health, would adapt over time.

Purpose: This study examined trajectories of Finnish children's socio-emotional development across the COVID-19 pandemic and into post-pandemic recovery, and their associations with parental distress, COVID-19 stressors, and family resilience.

Method: Participants were drawn from the FinnBrain Birth Cohort Study, a population-based longitudinal project investigating early life factors contributing to children's health and development. The cohort originally recruited families during pregnancy between 2011 and 2015 in Southwest Finland and the Åland Islands. The present analyses included 1,990 children (53% boys) assessed at ages 4, 5, and 9 years, together with five pandemic survey waves: T1 (May 2020), T2 (Aug 2020), T3 (Dec 2020), T4 (Jun 2021), and T5 (Jan 2024). Age 4 assessments occurred pre-pandemic, whereas age 5 and 9 assessments spanned pre- and post-pandemic periods. At each wave, mothers (71.3%) and fathers (28.7%) provided reports on children's socio-emotional development, parental distress, COVID-19 stressors, and family resilience.

Results: Children's prosocial behavior rose at the onset of the pandemic, then declined modestly but remained above pre-pandemic levels. Internalizing problems were stable, while externalizing problems declined with age without pandemic-specific shifts. Parental distress consistently predicted poorer socio-emotional outcomes, while family resilience, particularly social support, was broadly protective. Dynamic Stochastic General Equilibrium modeling showed family resilience had lasting effects, parental distress temporary disruptions, and COVID-19 stressors short-lived effects.

Conclusions: Findings highlight the enduring importance of resilience resources in buffering children from contextual stressors. Parental distress emerged as a key risk

factor, whereas family resilience exerted lasting positive effects on children's socio-emotional trajectories across and beyond the pandemic.

Abstract 1136

MENTAL HEALTH AND ALGORITHMS: WHO DECIDES IN THE ERA OF ARTIFICIAL INTELLIGENCE? ETHICAL CONSIDERATIONS AND INFORMED CONSENT IN AI APPLICATIONS FOR MENTAL HEALTH

Doval Moreno S.*[1], Fausor R.[2], Tavira--Sánchez F.J.[2], Arribas--GarcÍa S.[1], Morales Gil I.[1]

[1]Facultad de Salud. Universidad Internacional de La Rioja (UNIR). ~ La Rioja ~ Spain, [2]Facultad de Salud. Universidad Internacional de Valencia (VIU) (VIU), 46002 Valencia, Spain. ~ Valencia ~ Spain

Background: The integration of artificial intelligence (AI) in mental health services has experienced exponential growth, with global market projections from USD 1.13 billion (2023) to USD 5.08 billion (2030). This expansion raises specific ethical challenges that exceed traditional bioethical frameworks, particularly regarding algorithmic opacity, systematic biases, and preservation of therapeutic relationships.

Objective: To conduct a narrative review examining ethical aspects and informed consent challenges in AI applications for mental health, analyzing international regulatory frameworks, and proposing guidelines for responsible implementation.

Methods: Narrative review of scientific literature (2019-2025) across PsycINFO, Scopus, PubMed, and Web of Science. The inclusion criteria focused on studies with specific ethical components related to AI in mental health, encompassing controlled empirical studies, systematic reviews, international regulatory frameworks, and theoretical foundations.

Results: Controlled empirical studies demonstrate preliminary effectiveness in specific populations, although they reveal limitations in longitudinal validation and vulnerable populations. International regulatory frameworks converge on fundamental principles—transparency, human oversight, equity—but differ substantially in implementation mechanisms. Systematic reviews identify critical tensions between technological scalability and clinical singularity, and between automation and preservation of professional judgment.

Conclusions: AI should be conceptualized as a tool for clinical enhancement rather than therapeutic substitution. Responsible implementation requires multidimensional validation frameworks, gradual multi-stakeholder adoption processes, and preservation of the therapeutic relationship as an irreplaceable core. Robust longitudinal studies and international consensus on ethical standards are urgently needed.

Abstract 1253

DETERMINANTS OF TREATMENT DROPOUT AND COMPLETION IN ILLEGAL ONLINE GAMBLERS

Lee J., Kim J., Seo J.*

Chungnam National University ~ Daejeon ~ Korea, Republic of

Objective: Reducing treatment dropout in gambling disorder is a critical clinical challenge. Despite the high treatment dropout rates in gambling treatment, research exploring the factors influencing this issue remains limited. This study analyzed sociodemographic characteristics, problem gambling severity, and readiness and commitment to change by comparing treatment dropout and treatment completion groups among gamblers who presented to gambling treatment centers. Method: Participants were 979 adult South Korean men who engaged in illegal online gambling (M = 32.34 years; SD = 6.70) and sought treatment between 2015 and 2023. Baseline assessments included sociodemographic characteristics (e.g., age, marital status, debt), problem gambling severity (Problem Gambling Severity Index), and The Stages of Change Readiness and Treatment Eagerness Scale - Gambling, including the subscales of Recognition, Ambivalence, and Taking Steps. Results: A total of 160 participants (16.3%) completed treatment. Readiness and Commitment to Change showed significant differences between the groups. The dropout group reported higher ambivalence (M = 10.43; SD = 3.53) compared to the completion group (M = 9.89; SD = 3.07; p = .05), while the completion group scored higher on taking steps (M = 29.51; SD = 6.92) than the dropout group (M = 27.95; SD = 7.47; p = .01). However, the analysis revealed no significant differences in sociodemographic characteristics or problem gambling severity. Conclusions: These findings suggest that clearly assessing readiness and commitment to change at the initial stage of treatment for individuals with problem gambling, and providing tailored interventions accordingly, are critical factors in enhancing long-term treatment retention and recovery potential.

Abstract 1317

THE INTERPLAY OF PARENTAL STYLES, MALADAPTIVE SCHEMAS DOMAINS, AND PSYCHOPATHOLOGICAL FACTOR: A NETWORK ANALYSIS

Stefan I.N.*

University Of Bucharest ~ Bucharest ~ Romania

Introduction: Adverse relational experiences in childhood, such as the perception of parental rejection, are frequently described in the literature as risk factors for the development of early maladaptive cognitive schemas and psychopathology in adulthood. Applying network analysis to these structures provides a more nuanced understanding of their interactions, going beyond the limitations of traditional linear models.

Objective: The present study aims to investigate the systemic interplay between perceived maternal and paternal parenting styles, core schema domains, and general psychopathology.

Method: The study included a community sample of 103 participants (78% female; M_age = 26.4 years, range: 18-60). Participants completed the Parental Acceptance-Rejection Questionnaire (PARQ), the Young Schema Questionnaire (YSQ), and the Clinical Outcomes in Routine Evaluation - Outcome Measure (CORE-OM). A regularized partial correlation network was estimated, and centrality indices (Strength, Betweenness, Expected Influence) were calculated.

Results: The analysis revealed a stable network where the schema domain of Disconnection and Rejection emerged as the most central node, showing the highest Strength and Expected Influence. Maternal Indifference and Psychopathology functioned as key bridges, evidenced by high Betweenness scores, connecting different clusters of variables. The Impaired Limits schema domain exhibited the most negative expected influence, suggesting a potentially inhibitory role.

Conclusions: These preliminary findings underscore the pivotal role of the Disconnection and Rejection schema domain as a core mechanism linking parental behaviors to psychological distress. The central bridging role of maternal indifference and psychopathology highlights their importance in the network. Clinically, these results suggest that targeting the Disconnection schema could be an effective intervention point, though further research on larger samples is needed to validate this network structure.

Abstract 1375

"BOTTEGHE DI COMUNITÀ": AN EXPERIMENT OF COMMUNITY MEDICINE

Zunno R.*[1], Cozzuto A.[2], Cioffi P.[1], Grandinetti A.[1]

[1]ASL Salerno ~ Salerno ~ Italy, [2]Order of Psychologists of the Campania Region ~ Campania ~ Italy

Introduction

"Botteghe di Comunità" is a management experiment of Community Medicine by ASL Salerno (local health company) to respond to the health and social needs of the internal areas of Cilento (district n° 69 and 70), that are affected by logistical problems due to the distance from accident and emergency points or hospitals, or due to the presence of difficult mountain routes to cross, and where there is a high percentage of elderly population.

Purpose

The aim of "Botteghe di Comunità" is to promote the health through the continuity of care services, supporting the activities of primary care in 29 locations of the internal areas, named "spoke". Their centrality is given by the functions of initiative health: taking charge, unified access, filtering access, and directing patients.

Method

"Botteghe di Comunità" HUB are local socio-healthcare centres where a nurse is assisted by specialists and other local professionals, and by civil service volunteers and city competence. The Botteghe also host General Practitioners and the Territorial Functional Aggregations - AFT of the area. The service is provided 5 days a week, and each day is dedicated to a specific branch, also through telemedicine, for the management of chronic diseases with higher prevalence, i.e. diabetes, cardiovascular diseases, chronic respiratory diseases, cerebrovascular pathologies including dementia and poly-pathologies of the frail elderly.

Results

With "Botteghe di Comunità", ASL Salerno spreads Community Medicine around the territory, specifically in the internal areas, through an healthcare model for managing chronic diseases based on proactive assistance to the individual from the stages of prevention and health education to the early and established phases of the illness.

Conclusions

"Botteghe di Comunità" experiment increases quality of life of people who live in the internal areas and improves the manage of chronic diseases to reduce the inequalities

of health care.

Abstract 2171

BENIGN AND MALICIOUS ENVY AS A PREDICTOR OF DEPRESSION SEVERITY IN UKRAINIAN ADULTS LIVING IN WARTIME

Popudrenko V.*, Ieriomina V., Musiiaka I., Chernysh N., Deputatov V., Velykodna M.

Ukraine Sigmund Freud University ~ Kyiv ~ Ukraine

Objective. Russia's war against Ukraine, which escalated in 2022, with related losses, injuries, and forced displacements, resulted in numerous mental health issues in Ukrainians, including a rise in the prevalence of depression. Researchers report various psychosocial factors that predict, mediate, or moderate depressive symptoms in Ukrainian adults facing war. However, among psychological factors, they focus mostly on resilience or well-being. While personality traits such as dispositional envy were not explored enough.

Methods. This study was organised as an online survey, which included a questionnaire on sociodemographic data, Dispositional Benign and Malicious Envy Scale (BeMaS), and PHQ-9 for depression assessment. 3026 Ukrainian adults (52.2% males; 76.5% married) aged from 18 to 74 (M=42.4, SD=9.72) filled in the survey in January-March 2025.

Results. Although dispositional malicious envy weakly correlated with depressive symptoms (r=.039, p<.05), both dispositional envy types did not succeed in explaining depression levels more than 0.2% of its variance. Female gender, younger age, and higher educational degree, along with malicious envy, contributed to depression altogether, explaining 4.61% of its variance. Interestingly, both dispositions of envy had a strong correlation with each other (r=.381, p.<.001).

Conclusion. Dispositional envy type does not predict depression levels in Ukrainian adults during wartime. Generally, the role of envy in the development of depressive symptoms may be overrated.

THE TEMAS NARRATIVE TRAUMA THERAPY: MULTICULTURAL CLINICAL TECHNIQUES

Cardalda E.*, Costantino E.

American Multicultural Institute ~ New York ~ United States of America

As an evidence-based therapy TNTT is based on the principles of role modeling and integrates story telling with pictures targeted to deal with issues of trauma, anxiety and depression. TNTT is rooted in storytelling and administered in a group format. TNTT was first used with Hispanic children in 1994 and showed to be effective in reducing anxiety and aggressive behavior. TNTT was also successfully used to treat trauma in Hispanic children in a multisite study, after 9/11 terrorist attacks and later, in a large school-based trauma project in New York City. In the latter study, three hundred and sixty-four Hispanic students attending public schools, ages 6 to 11 were treated. Treatment outcomes were assessed with the UCLA PTSD Reaction Index for DSM-IV, Children's Depression Inventory, and the Revised Children's Manifest Anxiety Scale-2. Pre-therapy children evidenced considerable risk for PTSD. After 14 sessions of TNTT children improved significantly. Post-intervention data indicated dramatic improvements in psychological wellbeing across all levels of PTSD, depression and anxiety. After the treatment, only 7.1% of children exceeded the 37-score threshold of the UCLA scale associated with a PTSD diagnosis, as compared to 20% pre-treatment. Additionally, moderate PTSD was reduced from 25.7% pre-treatment to 15.9% post-treatment, and mild PTSD was reduced from 22.3% to 10.6%. Results indicated that when compared, CBT and TNTT therapy were equally significant in reducing PTSD; however, only TNTT significantly reduced depression and anxiety symptoms. Our research concluded that TNTT offered in school settings, is a valid, cost-efficient method of clinical intervention with at risk Hispanic children. The objectives of the presentation are to show that TNTT: (1) is a useful clinical therapeutic tool for children, (2) is a valid multicultural evidence-based therapy (3) has been expanded with versions for screening sexual abuse, depression, suicide risk, bullying, obesity, and pandemic COVID.

Abstract 1026

INTERPRETING THE RELATIONSHIP WITH MOTORCYCLES AND EXPERIENCES OF A MALE MOTORCYCLIST WHO SURVIVED A MOTORCYCLE CRASH

Dogan Ü.M.*[1], Mat E.[1], Demir E.C.[2]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]University of Adiyaman ~ Adiyaman ~ Turkey

Life-threatening motorcycle accidents profoundly influence riders' risk perception and riding behaviors. Despite the individual and social significance of motorcycling, the ways in which riders reconstruct their relationship with motorcycles following serious accidents remain underexplored. This study aims to address this gap by examining male riders' post-accident decisions to continue riding, alongside the psychological, emotional, and social transformations experienced during this process. Additionally, the study highlights the role of motorcycle passion and community affiliation in post-traumatic coping mechanisms. A qualitative approach, Interpretative Phenomenological Analysis (IPA), was employed. The sample comprised seven male participants, aged 23–28, who were either university students or graduates and continued riding motorcycles despite experiencing life-threatening accidents. Participants were recruited through university motorcycle clubs. Semi-structured interviews explored participants' engagement with motorcycles, accident experiences, post-accident behaviors, emotional responses, and sense of belonging within motorcycle communities. Three superordinate themes were identified: (1) At the Edge and Beyond: Freedom and Risk, (2) Emotional Relaxation: Pleasure Derived from Motorcycling, and (3) Motorcycle as Part of the Self. Findings indicate that although risky behaviors decreased following accidents, they did not entirely cease, suggesting that motorcycles serve not merely as a means of transportation but also occupy a central role in participants' subjectivity. Participants repeatedly confronted the death drive during rides that brought them face-to-face with mortality, while simultaneously transforming their experiences into a self-constructed cultural framework through the motorcycle community. Consequently, motorcycles function both as objects through which the subject transcends boundaries and as social objects that reinforce the integrity of the self. For riders, this may reflect a psychological state in which engagement with risk is transformed into a source of structure and meaning, providing a sense of emotional relief.

Abstract 2576

EXAMINING THE MEDIATING ROLE OF SELF-EFFICACY IN THE ASSOCIATION BETWEEN SPONTANEOUS SELF-AFFIRMATION AND PSYCHOLOGICAL ADJUSTMENT

Kaynak Malatyali M.*, Yalçin M.

Çanakkale Onsekiz Mart University ~ Çanakkale ~ Turkey

Emerging evidence suggests that individuals who spontaneously engage in self-affirmation—by reflecting on their personal strengths, values, or social relationships—tend to demonstrate greater psychological resilience and well-being in the face of everyday psychological threats. Despite growing interest in this construct, the mechanisms through which spontaneous self-affirmation contributes to adaptive outcomes remain underexamined. This study draws on theoretical perspectives that emphasize self-adequacy as a key mechanism underlying the beneficial effects of self-affirmation. We propose that spontaneous self-affirmation enhances psychological adjustment by strengthening individuals' beliefs in their ability to manage life demands effectively. To test this hypothesis, we designed a two-wave longitudinal study. In the first wave, conducted in early October 2025, 385 participants completed self-report measures assessing spontaneous self-affirmation, general self-efficacy, and psychological adjustment. Cross-sectional analyses of the first-wave data supported our expectations that spontaneous self-affirmation was positively associated with self-efficacy, which, in turn, was positively associated with higher psychological adjustment. Furthermore, self-efficacy mediated the relationship between spontaneous self-affirmation and psychological adjustment. Although these preliminary findings are cross-sectional, they point to the proposed indirect effect through self-efficacy. The second wave, to be collected in early January 2026, will provide a stronger longitudinal test of these pathways using structural equation modeling. Together, the findings suggest that spontaneous self-affirmation may serve as an individual resource that promotes psychological adjustment through enhanced self-efficacy.

Abstract 4594

PARENTS' PERSPECTIVES ON THEIR CHILDREN'S BEHAVIOUR FOLLOWING TRADITIONAL MALE INITIATION

Mahlaela G., Modipane M.*

University of Mpumalanga ~ Mbombela ~ South Africa

Abstract

Introduction: Traditional male initiation (TMI) is an important cultural practice in many African societies, which marks transition from boyhood to adulthood. Considerable attention has been given to the cultural dimensions of these initiations, but limited research has been conducted on how parents perceive changes in theirs in their children's behaviour post traditional initiation. Purpose: This qualitative study explored parents' perspectives on their children's behaviours after undergoing traditional male initiation. Methods: Using non-probability, snowball sampling, a sample of 13 parents of children who attended TMI, between the years 2022 and 2023 in Limpopo Province, South Africa. Semi-structured interviews were conducted with the participants, and the data was analysed using thematic analysis. Results: Although there are parents who observed positive signs of maturity, many parents observed undesirable behavioural changes in some initiates, which include: disrespect toward elders, premature sexual engagement, and substance abuse. Conclusion: These findings suggest that parents hold multifaceted views on the behavioural changes post attendance of traditional initiation, acknowledging both positive and negative behavioural shifts. Therefore, this study highlights the importance of culturally sensitive support structures that can assist families in navigating behavioural adjustments during the post-initiation period.

General Abstract
This symposium examines the perinatal period through diverse perspectives and methods, highlighting its complexity as both a time of vulnerability and growth.
The perinatal stage is a uniquely sensitive phase, marked by profound psychological, biological, and relational changes. Becoming a parent requires reorganizing one's identity and integrating new roles while facing the upheavals that accompany the arrival of a child. While this process may foster development and fulfilment, it also heightens the risk of psychological distress, particularly when combined with earlier adversities or limited support.
Therefore, understanding how mothers and fathers navigate this transition is crucial for promoting well-being and healthy child development. Mental health in this period must be viewed developmentally, spanning early experiences and parenthood. Childhood adversity, birth-related stressors, and preventive resources all significantly shape parental adjustment and the emerging parent–child relationship.
For these reasons, this symposium brings together research on how adverse experiences, perinatal challenges, and targeted interventions interact to influence parental well-being. Its novelty lies in integrating longitudinal data, computational methods, cross-cultural evidence, and clinically informed preventive practices. Together, these contributions highlight risk and resilience pathways and demonstrate how empirical findings can guide more effective strategies.
The first contribution focuses on pregnancy and applies machine learning to identify psychosocial predictors of prenatal depressive symptoms and highlights the protective role of reflective function. The second examines how adverse childhood experiences affect paternal antenatal bonding through depression, emphasizing early screening for fathers. The third investigates depressive symptom trajectories in 3,700 mothers and co-parents, identifying shared and gender-specific predictors. The fourth draws on data from 11,000 women across 31 countries to describe universal and culture-specific profiles of childbirth-related PTSD. Finally, the fifth introduces an online psychodynamic video-feedback intervention for vulnerable mothers, showing promising effects on reflective function, sensitivity, and well-being.

Abstract 3271

THE ROLE OF PERINATAL PSYCHOLOGICAL AND BEHAVIORAL FACTORS IN PSYCHOPATHOLOGY RISK PATHWAYS: A MACHINE LEARNING APPROACH

Antonucci L.A.*[1], Rollo S.[1], Fanizza A.[1], Franciosa G.[1], Dispoto E.[1], Asselti M.G.[1], Pennacchio T.C.[1], Pergola G.[1], Infurna M.R.[2]

Introduction: The perinatal period is characterized by burdening physical and psychological changes which may lead to psychopathology. Many psychosocial factors modulate the coping strategies that pregnant women might rely on during pregnancy. Amongst those, reflective function (RF) seems to act as a protective factor in pregnant women. We aimed (i) at training and validating a machine learning (ML) algorithm discriminating higher vs. lower perinatal depressive symptoms (PDS), (ii) at investigating its prognostic relevance by verifying associations between ML decisions and post-partum depression, and (iii) at investigating the mediating role of RF in the relationship between ML decisions and PDS.

Method: We recruited 851 pregnant women, which were split in a Discovery Sample (DS, N=509 form Palermo), and three Validation Samples (VS, N=59 from Bari, N=228 from Lecce, N=55 from Messina). In 41 women, post-partum depression was assessed 6 months after delivery. We trained in DS and validated in VS a ML algorithm discriminating higher vs. lower PDS based on item-wise information on attachment style, stressful life events, social support, childhood trauma, and coping strategies. Prognostic relevance of the algorithm to post-partum depression was investigated via ANOVA, while moderation analysis testing the role of RF in the relationship between ML decisions and PDS via R.

Results: The algorithm discriminated higher vs.lower PDS with 71.8% accuracy in DS, and with accuracies ranging between 69.3% and 81.6% in VS. Higher ML decision scores were associated with subsequent post-partum depression (p=0.001). RF significantly mediated the association between ML decisions and PDS.

Conclusion: We identified specific psychosocial impacting PDS levels, which might therefore specifically be targeted in early intervention programs. Our mediation findings suggest that such findings should involve personalized actions aimed at boosting RF to make pregnant women able to better cope with the challenges of the perinatal period and prevent post-partum psychopathology.

Abstract 3280

FROM CHILDHOOD TRAUMA TO FATHERHOOD: THE IMPACT OF ADVERSE CHILDHOOD EXPERIENCES ON PATERNAL PRENATAL BONDING AND DEPRESSION

Infurna M.R.[3], Bevacqua E.[3], Riolo M.[3], Guarneri C.[3], Mineo R.*[3], Rini C.[3], Sottile J.[3], Garthus--Niegel S.[2], Fazio L.[1]

[1]LUM University 'Giuseppe Degennaro', Casamassima ~ Bari ~ Italy, [2]Institute and Policlinic of Occupational and Social Medicine, Faculty of Medicine, TU Dresden ~ Dresden ~ Germany, [3]Department of Psychology, Educational Science and Human Movement, University of Palermo ~ Palermo ~ Italy

Introduction. The transition to fatherhood represents a critical stage in individual development, involving psychological and relational changes that contribute to the construction of paternal identity. In recent years, fathers' involvement during pregnancy and the early stages of parenthood has steadily increased, paralleled by growing scholarly interest in their emotional connection with the unborn child. Despite this, the factors influencing antenatal bonding remain insufficiently understood.

Purpose. This study aimed to investigate whether experiences of childhood emotional abuse and neglect influence paternal antenatal bonding and to test whether antenatal depressive symptoms mediate this relationship.

Methods. A sample of expectant fathers (N = 276) completed self-report questionnaires assessing childhood maltreatment (CTQ), depressive symptoms (EPDS), and paternal antenatal attachment (PAAS). Correlational analyses and structural equation modeling (SEM) were performed to examine direct and mediated effects of childhood trauma and depressive symptoms on paternal antenatal bonding.

Results. Both childhood emotional abuse ($r = 0.24$, $p < 0.001$) and neglect ($r = 0.27$, $p < 0.001$) were positively associated with depressive symptoms. Depressive symptoms, in turn, were negatively related to attachment quality ($r = –0.35$, $p < 0.001$) and intensity of concern ($r = –0.14$, $p = 0.028$). Neglect showed a stronger negative association with attachment quality ($r = –0.31$, $p < 0.001$) compared to abuse ($r = –0.12$, $p = 0.42$; $z = 2.35$, $p = 0.018$). SEM confirmed that depressive symptoms mediated the relationship between childhood maltreatment and antenatal attachment, improving overall model fit.

Conclusions. Findings indicate that childhood maltreatment, particularly neglect, may undermine paternal antenatal bonding through increased vulnerability to depressive symptoms. These results highlight the importance of early screening and targeted interventions to identify fathers at risk and promote healthy father–infant relationships during the perinatal period.

Abstract 3289

TRAJECTORIES OF DEPRESSIVE SYMPTOMS IN MOTHERS AND CO-PARENTS ACROSS THE TRANSITION TO PARENTHOOD: A GROWTH MIXTURE MODELING APPROACH

Staudt A.[2], Horsch A.[1], Asselmann E.[3], Unger S.*[2], Garthus--Niegel S.[2]

[1]Institute of Higher Education and Research in Healthcare, University of Lausanne ~ Lausanne ~ Switzerland, [2]Institute and Policlinic of Occupational and Social Medicine, Faculty of Medicine, TU Dresden ~ Dresden ~ Germany, [3]Faculty of Health, HMU Health and Medical University ~ Potsdam ~ Germany

Background. The transition to parenthood is characterised by substantial biological and psychosocial changes that increase parents' susceptibility to mental health difficulties. This study aimed to identify trajectories of parental depressive symptoms and to investigate whether these trajectories, their predictors, and their associations with parental health-related quality of life and child development differ between mothers and co-parents.

Methods. Longitudinal data from the population-based "Dresden Study on Parenting, Work, and Mental Health" (DREAM) cohort were used. In total, 2,131 mothers (57%) and 1,576 co-parents (43%) completed self-report measures during pregnancy and at 8 weeks, 14, 24, and 36 months postpartum. Depressive symptoms were measured using the Edinburgh Postnatal Depression Scale. Growth Mixture Modeling was applied to identify latent symptom trajectories, and potential predictors were tested via multinomial logistic regression.

Results. Four distinct depressive symptom trajectories were identified among mothers and three among co-parents. Most mothers (74%) and co-parents (88%) displayed a "stable-low" course, while 13% of mothers and 9% of co-parents showed rising symptom levels after birth. Shared predictors included lifetime depression, major life events, perceived social support, neuroticism, and negative beliefs about uncontrollability of thoughts. Only mothers (9%) experienced persistently high depressive symptoms, with education and relationship satisfaction emerging as significant predictors. Generally, depressive symptom trajectories were linked to impaired parental health-related quality of life, but no differences in children's development at 36 months were detected.

Conclusions. To our knowledge, this is among the first large cohort studies to directly compare depressive symptom trajectories in mothers and co-parents. While both groups share common longitudinal patterns and risk factors, mothers face unique burdens and vulnerabilities. These findings underscore the need for sustained, context-sensitive perinatal mental health care that addresses individual, relational, and social dimensions.

Abstract 3292

DEVELOPMENT OF A PSYCHODYNAMICALLY ORIENTED INTERVENTION MODEL FOR MOTHERS IN VULNERABLE POSTNATAL CONDITIONS

Tambelli R.[1], Favieri F.*[2], Mazza C.[3]

[1]Department of Dynamic and Clinical Psychology and Health Studies, "Sapienza" University of Rome ~ Rome ~ Italy, [2]Department of Psychology, G. D'Annunzio University of Chieti-Pescara ~ Chieti ~ Italy, [3]Department of Human Neuroscience, "Sapienza" University of Rome ~ Rome ~ Italy

Introduction. The perinatal period is a window of developmental plasticity in which parental affect regulation, sensitivity, and mentalizing shape early socio-emotional trajectories and child well-being. Video-feedback interventions (VFI), especially when delivered as stand-alone techniques, have been shown to promote parental reflective functioning and moment-to-moment sensitivity, offering a low-cost and flexible strategy with promising outcomes for prevention and early intervention in contexts of psychosocial vulnerability.

Purpose. This study introduces a remote (online) VFI for mothers experiencing postpartum depressive symptoms, delivered within a psychodynamic framework. Preliminary clinical evidence from its early implementation is reported.

Method. Eligible participants were identified through screening between the 2rd and 3th postpartum month. The program includes a first assessment, ten bi-weekly remote VFI sessions (full video review, selection of salient frames, and guided reflective discussion), a post-intervention assessment and a conclusive meeting, followed by a four-month follow-up. Outcome measures include maternal reflective functioning, observed sensitivity, depressive and anxiety symptoms, parental stress, child socio-emotional indicators, and general distress. Evaluation of the intervention is currently ongoing within a pre–post study comparing an intervention group and a waitlist control group.

Results. Preliminary clinical evidence suggests improvements across multiple domains. Participants reported reductions in depressive and anxious symptoms, increased reflective capacity regarding the infant's mental states, and greater sensitivity during interaction sequences. General functioning scores showed favorable trends, and clinical notes highlighted enhanced parental agency and emotional availability. These changes underscore the intervention's potential to strengthen the parent–infant relationship. The online delivery format also appears promising.

Conclusions. A remote, psychodynamically oriented VFI appears feasible, well accepted, and associated with encouraging changes in maternal mentalizing, sensitivity, and psychological well-being. While evaluation is ongoing, preliminary findings support the importance of controlled trials to establish efficacy and inform dissemination in community and clinical settings.

The work was supported by Research and University Ministry, PRIN Research Found 2022.

Abstract 40

MEDIATING ROLE OF DIGITAL GAME ADDICTION BETWEEN SOCIAL ANXIETY AND SOCIAL CONNECTEDNESS

Aktaş D.*, Erten I., Gençöz T.

Middle East Technical University ~ Ankara ~ Turkey

The role of social connectedness in promoting mental-health is well-established. Thus, it is essential to understand the factors associated with social connectedness. Reseach indicates that social anxiety and social connectedness are closely associated. However, the mediating mechanisms linking social anxiety to social connectedness are not well-understood. The aim of the present research proposal is to investigate the mediating role of addiction, in particular digital game addiction, in the association between social anxiety and social connectedness. Participants (n=151) filled out demographic information form, Game Addiction Scale (GAS), Liebowitz Social Anxiety Scale (LSAS), and Social Connectedness Scale (SCS) online. Hayes PROCESS macro was used to test the hypothesized mediational model. It was hypothesized that social anxiety would be negatively associated with social connectedness and positively associated with digital game addiction, and that digital game addiction would mediate this relationship. Analyses provided empirical support for the proposed hypotheses. Specifically, higher levels of social anxiety were associated with increased tendency for digital game addiction, which, in turn, was negatively associated with social connectedness. These findings suggest a potential mediating role of digital game addiction in the relationship between social anxiety and social connectedness. The results are discussed within the framework of Lacanian psychoanalytic theory, which offers a distinctive perspective on the subject's relation to social interaction, lack, and addiction. This perspective suggests that digital game addiction can be viewed as a maladaptive defense mechanism that prevents engagement with anxiety-provoking social situations, thereby inhibiting symbolic integration. The study contributes to a more comprehensive understanding of how addictive behaviors operate not merely at the behavioral level, but as psychic strategies that hinder one's capacity for meaningful social connections. Accordingly, the study offers theoretical and practical recommendations to strengthen social connectedness by addressing social anxiety and the use of digital games as an avoidance strategy.

TRAPPED IN FOMO: REFLECTIVE FUNCTIONING AND PROBLEMATIC SMARTPHONE USE IN EMERGING ADULTS

Bassi G.*[1], Mancinelli E.[2], Sukhija V.J.[3], Valente A.[2], Salcuni S.[2]

[1]Dipartimento di Psicologia dello Sviluppo e della Socializzazione, Università degli Studi di Padova; Human-inspired Technologies Research Centre, Università degli Studi di Padova ~ Padova ~ Italy, [2]Dipartimento di Psicologia dello Sviluppo e della Socializzazione, Università degli Studi di Padova ~ Padova ~ Italy, [3]Dipartimento di Psicologia dello Sviluppo e della Socializzazione, Università degli Studi di Padova; Department of Surgery, Medicine, Dentistry and Morphological Sciences with Transplant Surgery, Oncology and Regenerative Medicine Relevance, Università di

Introduction: Fear of Missing Out (FoMO) is a pervasive apprehension about missing rewarding experiences that others might be having, typically accompanied by a strong drive to remain constantly connected. Prior work links FoMO to regulatory vulnerabilities and problematic digital behaviors, often positioning FoMO as a mechanism translating dispositional risk into maladaptive smartphone use. However, no studies to date have examined reflective functioning, described as the capacity to comprehend one's own and others' mental states, as a potential protective moderator of FoMO's impact on behavior. Purpose: This study explored the relationships among FoMO, psychological distress, problematic smartphone use, and reflective functioning (both certainty and uncertainty about mental states) in a sample of emerging adults, with the aim of clarifying how individual differences in reflective functioning capacities may shape vulnerability to maladaptive digital behaviors. Method: An online survey disseminated through social network platforms was completed by 322 emerging adults aged 18 to 35 years (Mage = 24.83, SD = 3.96). Participants provided sociodemographic information and completed a standardized set of self-report questionnaires, including the Depression Anxiety Stress Scales-21, the Online FoMO Scale, the Reflective Functioning Questionnaire (certainty and uncertainty subscales), and the Smartphone Addiction Inventory. Results: FoMO showed a strong positive association with problematic smartphone use, and moderate positive associations with psychological distress and uncertainty about mental states. Conversely, FoMO correlated negatively with certainty about mental states and with age. Conclusions: These findings highlighted that both reflective functioning dimensions showed associations with FoMO; specifically, greater uncertainty about mental states emerged as a significant correlate of FoMO, suggesting that difficulties in reflective functioning may intensify the tendency to remain constantly connected. Targeting reflective uncertainty may thus represent a valuable direction for interventions designed to reduce FoMO and its maladaptive behavioral outcomes.

TELEPSYCHOLOGY AND ADDICTION TREATMENT - A CONTRADICTION IN TERMS?

Beiglboeck W.*

Anton-Proksch-Institute ~ Vienna ~ Austria

Telepsychological treatment of mental illnesses such as post-traumatic stress disorder or certain anxiety disorders is now regarded as an effective and generally well-evaluated treatment. In the area of addiction treatment, however, there are reservations on the part of clinical psychologists. Is it effective at all? How can abstinence be ensured? What about adherence?

This presentation will outline the scientific status quo with regard to this type of treatment and provide evidence that telepsychology can be more than just an adjuvant form of treatment in the treatment of substance use disorders.

Abstract 720

FACILITATORS AND BARRIERS TO ENGAGING WITH DIGITALLY BASED INTERVENTIONS FOR WOMEN WITH LIVED/LIVING EXPERIENCE OF EATING DISORDERS AND/OR TRAUMA SYMPTOMS

Radatti S.*, Gnatt I., Tremain H., Nedeljkovic M.

Swinburne University of Technology ~ Melbourne ~ Australia

Introduction/Purpose: Online interventions (OIs) are increasingly used in mental health care due to benefits such as flexibility, convenience, accessibility, and cost-efficiency. While OIs show promise across various mental health conditions, research on their use for complex comorbid presentations, such as co-occurring eating disorders (EDs) and trauma symptoms, remains limited. EDs are serious psychiatric conditions, and co-occurring trauma contributes to poorer treatment outcomes, higher dropout rates, and relapse, with women being disproportionately affected. Given these challenges, trauma-informed, integrative approaches that address both EDs and trauma symptoms simultaneously are essential, but remain under-researched, particularly from the perspectives of those with lived/living experience – an important consideration for designing such interventions. The aim of this study was to explore the perceived facilitators and barriers to engagement with OIs among women with living/lived experience of EDs and/or trauma symptoms.

Method: Qualitative interviews with 13 women were conducted and reflexive thematic analysis was employed.

Results: Five themes were identified relating to the facilitators and barriers to engagement with OIs: 1) Safety, 2) Stability and Continuity, 3) Shared Experience, 4) Access and, 5) Content and Design.

Conclusion: The insights from this study have offered some clinical and research suggestions which are hoped to inform the future development of tailored and effective OIs for individuals experiencing concurrent EDs and trauma symptoms.

Abstract 3

ASSOCIATION BETWEEN SOCIAL MEDIA USE, PERCEIVED SOCIAL ISOLATION, AND EMOTIONAL DIFFICULTIES

Toh A.*

National University of Singapore ~ Singapore ~ Singapore

Introduction

Social media use (SMU) has emerged as a ubiquitous aspect of daily life among university students, serving as both a resource for social connection and a potential risk factor for psychological maladjustment. Problematic SMU, defined by compulsive engagement and interference with daily functioning, has been linked to heightened depressive symptoms, anxiety, and perceived social isolation (PSI). This study seeks to elucidate the mechanisms underpinning these relationships, with a focus on PSI as a mediating variable.

Purpose

The objectives of this longitudinal investigation were threefold: (1) to examine the associations between problematic SMU, PSI, and emotional difficulties (i.e., depression, anxiety, and social anxiety); (2) to evaluate the mediating role of PSI in the relationship between SMU and emotional difficulties; and (3) to explore the temporal dynamics of these constructs using cross-lagged panel modeling.

Method

A sample of 187 university students participated in the study, completing surveys at three time points over one month. Validated psychometric instruments, including the Social Media Disorder Scale, Short Loneliness Scale, PHQ-8, GAD-7, and SPIN, were employed. Regression and mediation analyses, alongside cross-lagged panel models (CLPM), were conducted to assess associations, mediation effects, and temporal stability.

Results

Problematic SMU was significantly associated with depressive symptoms ($\beta = 0.23$, $p < .001$), anxiety ($\beta = 0.17$, $p < .001$), and social anxiety ($\beta = 0.45$, $p < .001$). PSI partially mediated the relationship between SMU and depressive symptoms ($\beta = 0.02$, $p = .024$). CLPM analyses revealed strong autoregressive effects for all constructs but weak cross-lagged effects.

Conclusions

The findings suggest that problematic SMU exacerbates emotional difficulties, with PSI

serving as a partial mediator. Interventions targeting digital literacy, moderation of SMU, and fostering offline connections may ameliorate these psychological risks. This research advances understanding of the complex interplay between SMU, PSI, and emotional well-being in university populations.

Abstract 1977

MEASURING THE DIGITAL DEPENDENCE: RELIABILITY ANALYSIS OF A BI-PERSPECTIVE SCALE FOR INTERNET AND ONLINE GAMING ADDICTION IN INDIAN ADOLESCENTS

Paliwal V.*[1], Ghosh S.[2]

[1]Deen Dayal Upadhyaya Gorakhpur University ~ Gorakhpur ~ India, [2]Amity University Rajasthan ~ Jaipur ~ India

Background: The growing prevalence of Internet addiction and online gaming addiction (IA/OGA) among Indian adolescents calls for culturally sensitive and psychometrically sound assessment tools. Existing diagnostic scales lack parental insight and weak contextual relevance.

Objectives: This study aimed to develop and evaluate the validity and reliability of a dual-perspective tool, the Internet and Online Gaming Addiction Scale (IOGAS), with separate versions for adolescents and their respective parents.

Methods: Guided by Gratification Theory and General Strain Theory, items were constructed based on DSM-5 criteria, literature synthesis, and expert input from psychiatry, clinical psychology, sociology, cybersecurity, and computer science. A focused group of experts provided feedback to ensure content validity and item formation, which led to the formation of two questionnaires: Internet and Online Gaming Addiction Scale (for Adolescents) and Internet and Online Gaming Addiction Scale (for the Parents with respect to their ward). The scales were administered on 160 adolescents and their respective parents across five zones (North, East, West, South, and North-East) of India. Reliability and criterion validity of the tools were also calculated.

Results: Meta-analysis for item formation and content validity from experts was considered for item discrimination; further criterion validity was evaluated at $\alpha = 0.05$ ($r > 0.1593$) and $\alpha = 0.10$ ($r > 0.1339$). The majority of items showed statistically significant positive correlations with the total score ($r > 0.1593$), indicating strong correlations ($r \geq 0.60$). Reliability analysis using Cronbach's Alpha revealed high internal consistency for both the adolescent version ($\alpha = 0.9$) and parent version ($\alpha = 0.8$), confirming the tool's robustness.

Conclusion: The IOGAS demonstrates strong validity and reliability and is a contextually appropriate instrument to assess internet and online gaming addiction in Indian adolescents from both self and parental perspectives.

THE INTERSECTIONS OF POWER, SUBSTANCE ABUSE, AND TRAUMA: A LITERATURE REVIEW ON DOMESTIC VIOLENCE IN INTIMATE RELATIONSHIPS

Bin Qamar R.A.*

Istanbul Rumeli University ~ Istanbul ~ Turkey

This literature review explores the sophisticated dimensions of domestic violence, focusing on power dynamics, substance abuse, and psychological effects within intimate relationships. The study challenges social conventions in order to empower victims by shedding light on the widespread influence of traditional gender roles, economic inequality, and the abuser's desire for domination. The review, which investigates the link between drug use and domestic abuse, emphasizes the role of dependency, impaired judgment, and increased aggression, advocating for integrated treatment programs, education initiatives, and legal support. Addressing the profound psychological effects on victims, including anxiety, depression, PTSD, and diminished self-worth, the study underscores the necessity of tailored support systems encompassing mental health care, counseling, and advocacy. The collective understanding resulting from this exploration emphasizes the interconnected nature of these themes, advocating for interventions to break the cycle of domestic violence and foster a safer, more equitable world.

REPRODUCTIVE HEALTH AND TRAJECTORIES AMONG THE ITALIAN REPRODUCTIVE-AGED POPULATION

Della Casa V.*, Trombini E., Andrei F.

Department of Psychology, University of Bologna ~ Bologna ~ Italy

Fertility awareness, parenthood aspirations, and reproductive intentions are key psychosocial dimensions shaping reproductive health trajectories. However, these factors remain underexplored in minoritized groups facing fertility-impacting conditions. Trans* populations, in particular, often face systemic obstacles such as discrimination, limited access to inclusive fertility services, socio-legal restrictions, and pervasive cisnormative assumptions. Understanding how these barriers affect reproductive knowledge and desires is critical to designing equitable clinical and policy interventions. This study aimed to examine fertility awareness, parenthood aspirations, and reproductive intentions across diverse reproductive-aged populations in Italy, with a focus on high-risk groups. Specific objectives include assessing demographic and health-related influences on reproductive knowledge and desires, comparing trans* and cisgender participants, and identifying unique predictors of parenthood aspirations. A cross-sectional survey was administered online to participants aged 18–49, residing in Italy. Stratified sampling ensured adequate representation across gender identities. Recruitment occurred through social media, reproductive clinics, universities, and LGBTQ+ associations. The measures used included a sociodemographic questionnaire, Cardiff Fertility Knowledge Scale, Parenthood Motivation List, Reproductive Intentions Scale, and open-ended questions addressing decision-making and barriers. Results revealed moderate overall fertility awareness with notable gaps among men, younger participants, those with lower education, and marginalized groups, underscoring uneven reproductive knowledge distribution. Trans* participants reported comparable parenthood aspirations but lower reproductive intentions, reflecting systemic barriers rather than lack of desire. Parenthood aspirations in trans* individuals were linked to non-traditional family forms and flexible affective configurations. Overall, the findings contribute to understanding reproductive health disparities, inform inclusive reproductive health education, and guide policies fostering equitable access to family-building resources for marginalized populations.

ACADEMIC PSYCHOLOGICAL DISTRESS SCALE: DEVELOPMENT AND VALIDATION OF A MULTIDIMENSIONAL MEASURE FOR UNIVERSITY STUDENTS

Martino M.L.*, Scandurra C., Pizzo R., Passeggia R., Esposito G., Freda M.F.

Federico II University ~ Naples ~ Italy

Introduction: Psychological distress among university students is a growing concern, impacting academic performance, mental health, and well-being. Existing measures often capture distress only partially, focusing on single domains such as anxiety or stress.

Purpose: This study aimed to develop and validate the Academic Psychological Distress Scale (APDS), a multidimensional tool designed to comprehensively assess distress in higher education students.

Method: Two independent samples of Italian university students participated (Sample 1: N = 310; Sample 2: N = 367). In Sample 1, exploratory factor analysis (EFA) was conducted to identify the latent structure of the preliminary scale. In Sample 2, confirmatory factor analysis (CFA) was performed to test model fit and refine the item set. Concurrent measures of academic stress, general psychological distress, and academic engagement were administered to assess validity.

Results: EFA revealed a six-factor solution comprising 37 items, which was refined to 25 items after CFA, yielding excellent model fit ($\chi^2/df = 2.31$; RMSEA = .06 [95% CI = .05, .06]; CFI = .94; TLI = .93; SRMR = .04). The six factors were academic anxiety, stress-related somatic responses, loneliness, negative self-worth, fatigue, and demoralization. The APDS demonstrated high internal consistency, strong convergent and discriminant validity, and meaningful correlations with academic stress (positive), general psychological distress (positive), and academic engagement and performance (negative).

Conclusions: The APDS is a psychometrically robust, multidimensional measure of academic psychological distress. It provides a comprehensive assessment that can inform targeted support strategies and guide intervention development for university students.

Abstract 1588

SELF-DEFINING AUTOBIOGRAPHICAL MEMORIES AND BODY IMAGE FOR BREAST CANCER SURVIVORS: AN INNOVATIVE PSYCHOLOGICAL INTERVENTION PROPOSAL

Martino M.L.*[1], Sebri V.[2], Singer J.[3], Pravettoni G.[4]

[1]Federico II University ~ Naples ~ Italy, [2]Applied Research Division for Cognitive and Psychological Science, IEO European, Institute of Oncology. ~ Milan ~ Italy, [3]Connecticut College ~ New London ~ United States of America, [4]University of Milan ~ Milan ~ Italy

Oncological care significantly impacts autobiographical memories that contribute to narrative identity, which provides information about self and plays a crucial role in interpreting events. These memories include specific episodic recollections of experiences and conceptual schemas, particularly concerning the body. In this regard, body image refers to the mental representation of one's own body, and it is often characterized by dissatisfaction and a negative perception following a cancer diagnosis. Research shows that psychological interventions can be effective in improving body image among breast cancer survivors. However, few studies have explored the relationship between body image and autobiographical memories. Our proposal presents a personalized psychological intervention designed to enhance both a positive body image and a reappraisal and restructuring of imprinted critical autobiographical memories reflecting oncological care in breast cancer survivors. It is essential to implement specific, tailored psychological interventions that focus on body image and autobiographical memories, considering the unique characteristics of the oncological journey and the emotional and cognitive challenges individuals face.

Abstract 1521

RELATIONSHIP BETWEEN DEPRESSION AND SELF-ATTENTION IN UNIVERSITY STUDENTS IMAGES EVOKED BY TSUBO IMAGERY THERAPY WITH OPEN EYES

Matsumura K.*, Ozawa E.

Kyushu University ~ Fukuoka ~ Japan

Tsubo Imagery Therapy (Tajima & Naruse, 2000) was developed in Japan as a psychotherapeutic method that encourages individuals to confront distressing experiences while maintaining a sense of reassurance and safety. In recent years, the method has been adapted under open-eye conditions to enhance safety. While Tsubo Imagery Therapy with open eyes has been reported to reduce depressive symptoms in adolescence, the effect of the images it evokes during therapy remains insufficiently explored. This study investigated the relationship between depression and self-attention in university students, focusing on the content of the imagery elicited during Tsubo Imagery Therapy with open eyes. Thirty-two university students participated in the therapy, which involved imagining a container to hold the feelings and bodily sensations associated with their personal concerns. Participants were then asked to mentally modify or reposition the container to create a stronger sense of emotional safety, and to carry out these changes within their mental imagery. Participants completed the Rumination-Reflection Questionnaire (Trapnell & Campbell, 1999) before the therapy and the Self-rating Depression Scale (Zung, 1965), both before and after the therapy. Verbal transcripts of the imagery process were recorded and analyzed. Based on the results, the recalled containers were categorized into three types: “Fragile containers,” “Non-Fragile containers,” and “Containers with special effects.” Analysis of variance revealed that those who imagined “Containers with special effects” had significantly higher rumination scores than other participants. In contrast, those who visualized “Fragile containers” or those who performed the positional change bringing the container closer, experienced a significant reduction in depressive symptoms. These findings suggest that, during the implementation of Tsubo imagery therapy with open eyes, it is important to focus on individuals’ rumination tendencies and to support individuals who visualize “Fragile containers” or “Containers with special effects” while monitoring emotional changes throughout the imagery process.

Abstract 1433

WELL-BEING AMONG YOUNGER ADULTS WITH LOW VISION

Miyazaki H.*[1], Suzuki H.[1], Fukuichi A.[1], Miyake T.[3], Nakadomari S.[2], Isaka T.[2], Takahashi M.[2]

[1]Ritsumeikan University ~ Osaka ~ Japan, [2]Ritsumeikan University ~ Shiga ~ Japan, [3]NEXT VISION ~ Hyogo ~ Japan

According to a 2008 report by the Ministry of Health, Labour and Welfare, there are about 310,000 people with visual impairments in Japan. Majority of people with visual impairments have low vision (LV), as opposed to blind without sights and/or lights, and most of them are older adults. Since many LV individuals are older adults, most previous studies have primarily focused on elderly populations. Consequently, research on younger adults with LV remains insufficient, and their current circumstances are not clear. In this study, we focused on the “roles” and “future directions” of the younger adults with LV. We conducted interviews with seven people with LV who were aged 49 or younger and specifically who considered themselves doing relatively well. The results of the analysis, regarding the perspective of “roles,” generated three categories: “expanding the choices of work” “establishing a peer support group” and “giving feedback on visual support tools.” Regarding their “future directions,” two categories were generated: one related to society, and another related to themselves. For young adults with LV, who are often situated in environments that eliminate their opportunities for social and community participation, engaging in roles and having future directions were related to well-being, as the roles and the future directions involved hopes for becoming better themselves and achieving social change. The findings suggest that Japanese society continues to treat visual impairment as a condition strongly associated with social exclusion. This underscores the need to reframe support systems away from individual adaptation to the impairment alone and to move towards the mechanisms that enhance both psychological empowerment and structural transformation.

Abstract 1591

TIME SINCE SPOUSAL BEREAVEMENT AND PSYCHOLOGICAL DISTRESS AMONG OLDER ADULTS IN JAPAN: A MARRIED-REFERENCED ANALYSIS USING K6

Nagaoka C.*[1], Komori M.[2], Tani H.[3], Uneno Y.[4]

[1]Otemon Gakuin University ~ Osaka ~ Japan, [2]Osaka Electro-Communication University ~ Osaka ~ Japan, [3]Osaka University ~ Osaka ~ Japan, [4]Kyoto University ~ Kyoto ~ Japan

Introduction: Evidence from Japan on how psychological distress changes with time since spousal loss in the general population is limited. Prior reports rarely index years since bereavement or separate early from later stages.

Purpose: To describe married-referenced differences in psychological distress among widowed older adults in Japan and to examine gradients by time since bereavement, with attention to socioeconomic and health correlates.

Method: We conducted a secondary analysis of the National Survey of the Middle-aged and Older (Wave 1, 2010; SSJDA). Eligible respondents were aged 55–84 with complete data (N=2,750). Psychological distress was assessed using a five-item form of the Kessler scale (K6); scores were rescaled by 1.2 to the conventional 0–24 metric. We summarized crude proportions meeting thresholds for moderate (K6≥5) and serious (K6≥13) distress. Analyses focused on widowed versus continuously married respondents, stratified by sex and bereavement duration in four bins: <3 years, 3–<6 years, 6–<10 years, and ≥10 years. Married-referenced contrasts were reported as percentages, percentage-point differences, and prevalence ratios, alongside age-stratified summaries.

Results: Compared with the continuously married, widowed adults showed higher proportions of moderate distress. Within widowhood, elevation was most pronounced in the early period (<3 years) and remained raised at 3–<6 years, with attenuation by 6–<10 years and ≥10 years. A small subset met the serious-distress threshold, concentrated nearer to the loss. Among men, the early spike appeared sharper with a steeper subsequent decline; among women, levels remained comparatively elevated even ≥10 years after bereavement. Widowed respondents were more frequently in lower-income and non-employment categories and reported poorer self-rated health.

Conclusions: Distress following spousal loss shows a time-sensitive elevation that partly diminishes over years, with sex-specific trajectories and socioeconomic patterning. These descriptive findings provide a baseline for preregistered, minimally adjusted estimation in subsequent work.

Abstract 1659

ACTION RESEARCH ON INTERGENERATIONAL RELATIONSHIP BUILDING THROUGH KIKIGAKI（LIFE-STORY LISTENING AND WRITING）

Nagata M.*

Kyoto University ~ Kyoto ~ Japan

In recent years, Japan has witnessed the collapse of collectivism and the accompanying progression of individualization, which has led to a weakening of community ties, particularly intergenerational connections. Such weakening not only undermines local communities but also adversely affects individual well-being. This study explores kikigaki (life-story listening and writing) as a relational tool, focusing on how it can foster intergenerational connections and contribute to community building. In this study, kikigaki is defined as a process in which one listens to another's life story, distills its essence, documents it in writing, and shares it with others. Action research was conducted in collaboration with a high school, utilizing its "Inquiry-Based Cross-Disciplinary Study" curriculum. After receiving training in kikigaki, high school students were paired with local residents and engaged in listening to and documenting their life experiences. Data were collected through interviews and questionnaires to examine the impact of kikigaki on the relationships between students and residents, and to explore how these relationships could be extended to community development initiatives. The findings are discussed within the framework of Gergen's theory of co-action, highlighting the potential of kikigaki as a practice for intergenerational relationship-building and community well-being.

Abstract 1520

UTILIZATION AND CHALLENGES OF PSYCHOLOGICAL ASSESSMENT IN JAPAN'S CHILD WELFARE PROFESSIONS

Ozawa E.*

Kyushu University ~ Fukuoka ~ Japan

Psychological professionals in Japan's child welfare system perform diverse roles, including protecting children from maltreatment and supporting those with disabilities. Psychological assessments are crucial in these contexts because they offer valuable insights into children's cognitive, emotional, and behavioral functioning. However, the wide range of available tools and frequent updates of test versions have left the actual patterns of use—and the challenges faced by practitioners—unclear. This study examined how psychological professionals in child welfare services utilize assessments, the challenges they encounter, and their training needs, to inform professional development. A questionnaire survey was administered to 20 psychologists employed in local government child welfare offices. Participants evaluated 13 commonly used assessments for children, including intelligence and personality measures. Using a five-point Likert scale, they rated four domains: (a) administration accuracy, (b) appropriateness of interpretation, (c) adequacy of feedback, and (d) effectiveness of information sharing with families and stakeholders. Participants also reported their professional experience and provided open-ended responses on particularly important assessments and the reasons behind their selections. Mean differences were examined using analysis of variance. Respondents reported an average of 5.95 years of professional experience (range = 1–15, SD = 4.73). The Wechsler Intelligence Scale for Children and Tanaka-Binet Intelligence Test were most frequently identified as essential for understanding and supporting children. Simultaneously, the Rosenzweig Picture-Frustration Study was valued for assessing interpersonal and behavioral difficulties. Although administration accuracy was generally high, difficulties persisted in providing feedback and communicating results to families and stakeholders. These findings suggest that while test administration skills are relatively well-developed, targeted training is necessary to enhance the application of assessment results and to strengthen collaboration with families and other stakeholders.

Abstract 1576

EXPERIENCES ON THE POLISH-BELARUSIAN BORDER AND THE PSYCHOLOGICAL CHARACTERISTICS OF ACTIVISTS

Szmidka A.*, Zdun--Ryzewska A.

Department of Quality of Life Research, Medical University of Gdansk ~ Gdansk ~ Poland

Humanitarian activists are distinguished not only by their motivation to help others, but also by psychological characteristics that may shape both resilience and vulnerability to trauma. This pilot study examined factors associated with PTSD symptoms among activists working on the Polish-Belarusian border, a highly stressful and socially significant context. Twenty activists participated by completing the Revised Impact of Events Scale, the Mini-COPE Stress Coping Inventory, the IPIP-BFM-20 Brief Big Five Questionnaire, the SPP-25 Stress Measurement Scale, and answering questions about their border experiences.

Although the small sample size limited the ability to detect group differences in PTSD severity, several significant correlations emerged. The number of humanitarian interventions was positively related to coping through religion and PTSD intensity, as well as to agreeableness and acceptance as stress responses. Furthermore, activists experiencing stronger PTSD symptoms were more likely to seek psychiatric help, while those showing resilience and openness to experience tended to turn to psychological support.

The findings confirm a high level of traumatization in this group and illustrate the complex interplay between coping styles, personality traits, and mental health outcomes. From an applied perspective, the results highlight the urgent need for targeted psychological interventions, accessible counseling services, and preventive strategies aimed at reducing mental health risks among humanitarian activists. Supporting these individuals is essential not only for their personal well-being, but also for promoting social resilience in humanitarian crises.

This study provides an initial contribution to understanding vulnerability and resilience factors in humanitarian activism. It emphasizes the importance of further research and applied interventions that address trauma, strengthen psychological resources, and reduce inequalities in access to care.

Abstract 1531

A DAILY LIFE WORTH LIVING: A QUALITATIVE DESCRIPTION OF THE DAILY LIVING FUNCTIONING OF PEOPLE DIAGNOSED WITH BORDERLINE PERSONALITY DISORDER (BPD)

Tepper D.*, Shipley S., Sellar B., Smith R., Murray C.

University of South Australia ~ Adelaide ~ Australia

Introduction
People diagnosed with borderline personality disorder (BPD) experience persistent functional impairment despite current psychotherapeutic treatment. Functional impairment traditionally refers to vocational and relational domains. However, daily life extends beyond symptoms, work and relationships. Daily living functioning encompasses multiple domains, including routine establishment, sleep, leisure and self-care.

Purpose
This qualitative study aimed to describe the daily living functioning of people diagnosed with BPD using a multi-stakeholder approach, triangulating perspectives of consumers, carers and clinicians.

Method
Purposive sampling recruited consumers diagnosed with BPD (n = 4), carers (n = 5) and clinicians (n = 13). Semi-structured interviews explored participants' perspectives of the daily living functioning of people diagnosed with BPD. Interview transcripts were analysed using Braun and Clarke's reflexive thematic analysis.

Results
Four themes emerged. First, emotional intensity disrupts daily living functioning. While cognitive ability to perform activities was retained, emotional activation made self-care and other important activities difficult. Further, masking emotions required considerable energy.
Second, external structure provides stability. External obligations offered routine that reduced the functional impacts of emotional intensity. Lack of structure increased risk, aimlessness and made it harder to establish new routines.
Third, boom and bust activity patterns dominated. Intense activity levels when feeling good were followed by crashes, rather than balanced, sustainable activity levels. All-or-nothing thinking and swings from totally perfect to utterly incapable influenced both activity levels and self-expectations.
Fourth, meaning depends on external validation. People diagnosed with BPD struggle

to find inherent meaning in daily activities, relying instead on others' approval. Without an internal values compass, they allowed others to dictate time use and activity choices. Daily living functioning was also linked to relationship states.

Conclusions

Functional recovery for people diagnosed with BPD extends beyond traditional work and relationship domains. These findings highlight the need to emphasise all activities and routines in daily life to inform a more person-centred, comprehensive and integrated treatment approach.

TOGETHERNESS IN THE CONTEMPORARY WORLD: WHAT ARE THE DISCONMFORTS, AND WHAT COMMUNITY-BASED INTERVENTIONS?

Friday 24 July 2026 from 11:00 to 12:30

(G-Spadolini)

Immacolata Di Napoli (University of Naples Federico II ~ Naple), Chair

In a world marked by accelerating temporality, global instability, and technological transformation, the concept of togetherness, the capacity to be meaningfully connected with others (Procentese & Gatti, 2021; Procentese, & Gatti & Falanga, 2019), is increasingly under strain.

Wars, social violence, migration crises, and growing inequalities not only generate collective discomforms, but also severely disrupt trust, social cohesion, and the very possibility of sustaining long-term human relationships. In this context, temporality plays a crucial role: the time of crisis, of continuous emergency, and of pervasive precarity shapes how individuals experience themselves, others, and the future. This symposium aims to explore the challenges of togetherness in today's temporal world, focusing on how armed conflict, systemic violence, and marginalization impact everyday life and the possibility of shared existence. These conditions often lead to emotional isolation, relational distrust, a lack of hope, and existential fatigue—challenges that require both social and psychological responses.

The symposium examines the community-based interventions and rebuilding bonds, restoring a sense of safety, hope, and cultivating belonging.

Abstract 3486

SOCIAL DISINTEGRATION AND THE RECONSTRUCTION OF RELATIONAL CAPITAL: A PSYCHOSOCIAL INTERPRETATION

Fortuna P.*

University of Naples ~ Naples ~ Italy

In recent years, we have witnessed the emergence of disaggregating collective phenomena that, by fueling widespread anxiety, distrust in institutions, relational isolation, and civic disengagement, appear to seriously undermine the social capital of communities. This attack on the shared relational fabric generates significant psychosocial effects, manifesting both at the individual and collective levels, and weakening the bonds of trust, reciprocity, and collaboration. However, from a community psychosocial perspective, it is possible not only to observe and analyze the negative impacts of such transformations, but also to identify signs of resilience and the transformative potential embedded within these crises. Indeed, social and relational instability may open up opportunities for new forms of commitment, solidarity, and participation, encouraging the reactivation of cooperative, mutualistic processes and the shared construction of the common good.

In this context, collective interventions are needed that promote active citizen participation through co-design practices, the activation of local networks, community empowerment pathways, and inclusive spaces for dialogue. Social labs, civic forums, active citizenship initiatives, and shared care of common goods represent key tools for rebuilding trust, stimulating mutual engagement, and strengthening the relational infrastructures that sustain democratic life and social cohesion.

The presentation will discuss data from research and practical experiences aimed at fostering a greater sense of responsibility togetherness, and following the collective engagement.

Abstract 3487

INDIVIDUAL AND COLLECTIVE HOPE – A TRANSDISCIPLINARY MODEL AND CROSS-CULTURAL RESEARCH FINDINGS

Krafft A.M.*

University of St. Gallen ~ San Gallo ~ Switzerland

The current experiences of a crisis-ridden world have fundamentally shaken many people's beliefs and trust in a better future. This triggers negative feelings of fear and helplessness and has a massive impact on mental health, especially among young people. Against this background, the question is whether there is still reason for hope and, if so, what keeps our hope alive. How we look into the future—whether with confidence, fear, or indifference—will determine how we feel, think, and act in the present, both individually and as a community. Based on the existential and multi-layered nature of hope, we present an interdisciplinary approach to studying individual and collective hope in diverse cultural contexts. The presentation integrates concepts of positive psychology, futures studies, and pragmatist philosophy into a comprehensive model. The proposed concept seeks to honor the fundamental nature of hope by considering the diversity of situations in which people can hope and being sensitive to different cultural worldviews and values. We report on research findings gathered from the International Hope Barometer Research Program in several countries, which offers valuable insights into people's expectations for the future, their hopes and fears for both individual and collective futures, and their psychological and social well-being.

Abstract 3488

HOW INTERPERSONAL AND INSTITUTIONAL TRUST PREDICT CIVIC HONESTY ACROSS VARYING LEVELS OF MAFIA INFLUENCE AND STATE RESILIENCE

Travaglino G.*[1], Mirisola A.[2]

[1]Royal Holloway ~ London ~ United Kingdom, [2]University of Palermo ~ Palermo ~ Italy

Introduction. Civic honesty, the moral standards that define citizens' commitment to the public good, is fundamental for social cooperation and collective well-being. Prior research has emphasized the role of trust in institutions and in fellow citizens as predictors of such standards. However, much of this evidence comes from the Global North, where state authority is relatively secure. Less is known about how these dynamics unfold in contexts where the state's monopoly over governance functions is contested by powerful criminal organisations, such as mafia-type groups. Purpose. This study examines whether country-level criminal groups' influence and state resilience moderate the relationship between interpersonal and institutional trust and civic honesty. Method. We employed mixed-effects multilevel modelling combined with an extended Johnson–Neyman technique to probe multiple moderators simultaneously. The dataset comprised 132,602 individuals across 84 countries. Country-level indicators of mafia influence and state resilience were integrated with individual-level measures of interpersonal and institutional trust, enabling cross-level analyses. Results. Institutional trust was positively associated with civic honesty in contexts characterised by weaker mafia presence and stronger state resilience. However, this relationship reversed in environments with high mafia influence and fragile state institutions, suggesting that confidence in compromised institutions is linked to reduced civic honesty. Interpersonal trust, by contrast, was negatively associated with civic honesty only in states with low resilience, indicating that trust in others does not necessarily translate into commitment to the public good when institutional safeguards are weak. Conclusions. These findings demonstrate that the impact of trust on civic honesty is contingent on broader political and criminal contexts. They underscore the importance of considering how political features such as criminal governance and state fragility reshape the meaning and consequences of trust. Policy implications for strengthening civic values under contested governance are discussed.

Abstract 3489

SIGNIFICANCE AND FAIRNESS IN COMMUNITY LIFE: EXPLORING THE INTERPLAY BETWEEN MATTERING, SOCIAL JUSTICE, AND WELL-BEING

Esposito C.[1], Di Napoli I.*[2], Di Martino S.[3]

[1]University of Foggia ~ Foggia ~ Italy, [2]University of Naples Federico II ~ Naples ~ Italy, [3]Univrsity of Bradford ~ Bradford ~ United Kingdom

The literature on well-being has increasingly recognized the importance of mattering, a construct that refers to the perception of being significant, valued, and capable of adding value to others and to one's broader social contexts. Previous studies have demonstrated that mattering plays a critical role in fostering happiness and wellbeing at individual and relational level, yet the relationship between mattering and the multiple domains of wellbeing and social justice has not been sufficiently explored.

This study addresses that gap by investigating the role of mattering across seven domains of wellbeing as measured by the I COPPE scale (Interpersonal, Community, Occupational, Physical, Psychological, Economic, and Overall wellbeing). Data were collected from a national convenience sample of 3,163 Italian citizens, with analyses conducted on 2,524 valid cases. Using Structural Equation Modeling (SEM) and Latent Path Analyses, findings confirm that mattering is a strong determinant of each domain of multidimensional well-being. Importantly, the study also highlights a mediating role of social justice, conceptualized through the Belief in a Just World construct, in the relationship between mattering and wellbeing outcomes.

The results offer robust empirical evidence of the interconnectedness between mattering, perceptions of social justice, and multidimensional wellbeing. This contributes to advancing theoretical understanding by situating mattering not only as an intrapersonal construct but also as one embedded within multiple life contexts, such as family, friendships, work, and community. The study provides further validation of mattering as a key determinant of wellbeing and the findings underscore the importance of designing interventions and policies aimed at strengthening people's sense of significance and fairness in society, as a pathway to enhance overall wellbeing.

Abstract 4968

A QUANTITATIVE SURVEY OF GENDER DIFFERENCES IN DEPRESSIVE SYMPTOMS AMONG UNIVERSITY STUDENTS

Kimong P.J.*[1], Ayub N.[1], Halik Murnizam Hj.[1], Erford Bradley T.[2], Cosmas G.[1], Matshah N.[1], Ismail M.S.[1], Idang J.[1]

[1]Faculty of Psychology and Social Work, Universiti Malaysia Sabah, Jalan UMS, 88400 Kota Kinabalu, MALAYSIA, [2]Department of Human and Organization Development, Peabody College of Education and Human Department, Vanderbilt University,Peabody

University students often exposed to various events such as development transitions, academic
burden, and interpersonal challenges that may increase their vulnerability to depressive symptoms. This study employed a quantitative survey design to examine gender differences in
depressive symptoms among Malaysian university students using the Malay version of the
Center for Epidemiologic Studies Depression Scale–Revised (MCESD-R). A total of 319 participants from the general population completed the self-report instrument. The Malay
MCESD-R demonstrated excellent internal consistency, with a Cronbach's alpha of .941.
Descriptive results indicated that females reported higher mean depressive symptom scores (M
= 17.96, SD = 14.56) than males (M = 15.20, SD = 12.95). However, an independent samples
t-test revealed that the gender difference was not statistically significant, t(318) = −1.56, p =
.119. Effect size analysis using Cohen's d (−0.20) indicated a small and practically negligible
difference between genders. Overall, the findings suggest minimal gender-related variation in
depressive symptoms within this Malaysian sample. Additionally, the results further support
the Malay CESD-R as a reliable screening tool for assessing depressive symptoms across
diverse population groups in Malaysia.

Abstract 1611

EXTENDING THE CULTURAL SOCIALIZATION MODEL: LGBTQ+ SOCIALIZATION, IDENTITY PRIDE, INTERNALIZED STIGMA, AND PSYCHOLOGICAL WELL-BEING

Clements Z.*[1], Skidmore S.[2], Huynh K.[3]

[1]Loyola University Chicago ~ Chicago ~ United States of America, [2]University of Miami ~ Coral Gables ~ United States of America, [3]University of North Texas ~ Denton ~ United States of America

INTRODUCTION: LGBTQ+ people experience higher rates of mental health issues than their cisgender heterosexual counterparts. Minority stress theory identifies internalized stigma as a key risk factor, while identity pride is protective. Thus, more research is needed on promoting LGBQT+ well-being. One useful model, the Cultural Socialization Model, posits individuals with marginalized racial/ethnic identities develop a healthy sense of self when caregivers teach them positive aspects of their identity and prepare them for oppression (i.e., cultural socialization). This model has not been tested in LGBTQ+ samples.

PURPOSE: We tested the Cultural Socialization Model with LGBTQ+ adults to determine the influence of LGBTQ+ socialization on well-being, and indirect influence through LGBTQ+ internalized identity stigma and identity pride.

METHODS: Participants were 597 LGBTQ+ adults in the U.S. Structural equation modeling tested hypotheses.

RESULTS: LGBTQ+ socialization was directly associated with greater well-being (β = .15, SE = .04, z = 3.93, p < .001). LGBTQ+ socialization was indirectly associated with greater well-being through identity pride (β = .07, SE = .02, z = 4.90, p < .001): higher levels of LGBTQ+ socialization predicted higher levels of identity pride, which in turn predicted greater well-being. In contrast, internalized stigma alone did not mediate the association between LGBTQ+ socialization and well-being. However, a significant serial mediation emerged: LGBTQ+ socialization predicted lower internalized stigma, which was associated with higher identity pride, which in turn predicted greater well-being (β = .02, SE = .01, z = 2.37, p < .001). The model accounted for 18% of the variance in psychological well-being.

CONCLUSIONS: Findings extend the Cultural Socialization Model to LGBTQ+ populations, highlighting the role of caregiver socialization in fostering well-being. Thus, identity pride may serve as a critical mechanism through which LGBTQ+ socialization promotes well-being. Interventions aiming to reduce stigma and enhance positive identity development may benefit from incorporating cultural socialization strategies.

TRANSGENDER INTIMATE PARTNER VIOLENCE: A GROUNDED THEORY STUDY WITH AN ECOLOGICAL APPROACH

De Falco F.M.*[1], Arcidiacono C.[2], Valerio P.[3]

[1]University of Naples "Federico II" ~ Napoli ~ Italy, [2]EFPA Board of Directors ~ Brussels ~ Belgium, [3]Fondation Genere Identità e Cultura (ONIG) ~ Napoli ~ Italy

Fulfilling and meaningful relationships are key aspects of social and psychological well-being. (Intimate Partner Violence) IPV among Transgender and Gender Diverse populations remains an underexplored phenomenon, particularly in European and Italian contexts, as do psychological services designed to address it. This study employed a Grounded Theory approach with an ecological perspective to explore romantic relationships and IPV experiences among 50 transgender individuals in Italy. The research followed an iterative process of data collection, analysis, and discussion, leading to the emergence of several macro-categories.

The first, Instrumentalization of Cisnormativity, highlights how perpetrators exploit transphobic social norms to maintain psychological control and devalue their victims. The Impact of Norms on Relational Well-being category shows how these same norms affect the opportunities of transgender individuals to form and sustain healthy relationships, despite their strong need for affection. At the same time, participants described processes of Identity Construction, where they mobilize personal resources to affirm their identity and seek appropriate social support. Participants also expressed a strong demand for specialized psychological support, emphasizing the need for training that incorporates gender identity issues and for increased representation of transgender professionals. This shaped the category Support for Anti-violence and Well-being. The core category, Construction of Identity in Vulnerability, conceptualizes how structural vulnerabilities deeply shape identity development, with romantic relationships becoming key sites where identity is either affirmed or negated.

Overall, this study highlights the need to translate findings into psychological training and services that address the specific psychosocial needs and structural vulnerabilities of transgender individuals.

Abstract 1082

PASSING, GENDER EUPHORIA, AND MENTAL HEALTH AMONG TRANSGENDER AND GENDER DIVERSE INDIVIDUALS

Randolph Chun Ho C.*

The Chinese University of Hong Kong ~ Shatin ~ Hong Kong

While research on the mental health of transgender and gender diverse (TGD) individuals has often focused on minority stress and discrimination, emerging scholarship calls for greater attention to affirming experiences such as gender euphoria, which is the joy and comfort associated with being recognized in one's authentic gender. Another particularly salient affirming experience is passing, or being perceived by others in alignment with one's gender identity. Despite its relevance, the psychological mechanisms linking passing to mental health remain underexplored, and little is known about how these relationships may differ across gender identities. This study addresses these gaps by examining the associations among passing, gender euphoria, and mental health among TGD individuals in Hong Kong. A total of 179 participants (18.4% transmasculine, 17.3% transfeminine, and 64.2% non-binary), with a mean age of 27.5 years, were recruited for the study. The results showed that passing was positively associated with both gender euphoria. Gender euphoria significantly mediated the relationship between passing and mental health outcomes, including depression and well-being. Furthermore, gender identity moderated the relationship between passing and gender euphoria, with stronger effects observed among transmasculine and transfeminine individuals compared to non-binary individuals. Similarly, the indirect effects of passing on depression and well-being via gender euphoria were also more pronounced among transmasculine and transfeminine individuals than non-binary individuals. These findings contribute to a growing movement in applied psychology that emphasizes not only harm reduction but also the cultivation of well-being. They underscore the importance of integrating affirming experiences into psychological interventions that support the mental health of TGD individuals. Clinical practices should actively engage with experiences of gender euphoria, including those related to passing, as part of holistic mental health support. Additionally, community-level efforts should foster affirming environments across schools, workplaces, healthcare systems, and community settings.

Abstract 1698

EXPERIENCES OF TRANSGENDER PEOPLE: A QUALITATIVE STUDY

Saraç D.*, Manka M.

Middle East Technical University ~ Ankara ~ Turkey

Transgender is a general term for individuals whose gender identity and expression does not align with the conventional norms linked to the sex they were assigned at birth. Across societies, transgender people frequently experience prejudice, discrimination, and gender-based violence that function as a mechanism of “punishment” for transgressing the binary gender norm. This gender fundamentalism works by denying, stigmatizing, and marginalizing any form of gender nonconformity. As a result, transgender people tend to encounter various forms of social oppression that creates significant challenges throughout their lives. According to the Social Exclusion Knowledge Network’s social exclusion model, they face exclusion across four main dimensions—economic, political, social, and cultural—occurring at multiple levels ranging from the individual and household to the community, national, and global scale. Thus, addressing these challenges is essential for promoting gender equality, protecting their well-being, and reducing inequalities experienced by these individuals. In the current study, in order to comprehend transgender individuals’ lived experiences and the difficulties that they encounter in depth, qualitative research, which provides a comprehensive and interior perspective, will be carried out. For this purpose, semi-structured interviews will be conducted with 5 to 10 Turkish individuals who define themselves as transgender, and interpretative phenomenological analysis will be utilized in analyzing the data. By striving to grasp transgender individuals’ experiences thoroughly and from a closer perspective by means of qualitative research, it is asserted that understanding the hardship they face and challenges they have to go through on a daily basis will be better understood. In this way, possible ways of assisting them and improving their quality of life will also become clearer. Accordingly, the aim of the present study will be to introduce ideas that might help in enhancing both mental and physical well-being of transgender individuals.

GENDER, STIGMA, AND SUPPORT: UNDERSTANDING MENTAL-HEALTH INEQUALITIES AMONG MEN AND WOMEN IN KENYA. A QUALITATIVE STUDY.

Sharif N.J.*, Mwangala P., Abubakar A.

Aga Khan University ~ Nairobi ~ Kenya

Introduction:
This qualitative survey explored to understand societies' perceptions, experiences on gender, and factors shaping mental-health outcomes. Among these were prevalence of alcohol and substance use, anxiety, depression and suicidal ideation. Additionally, this study explored source and impact of gender-based violence in the community.
Objectives:
To explore community knowledge, perceptions, and attitudes in relation to mental-health; examine help-seeking behaviors, existing support systems, and barriers to accessing care; and assess gender on mental-health impact.
Methodology:
This descriptive qualitative study executed between December 2022 and February 2023 in Kenya. Data collection was acquired through 16 key informant interviews and 15 focus group discussions, comprising a total of 31 interviews of participants aged 21 to 64 years. Participants included healthcare workers, religious leaders, community-based organization representatives, community health promoters, and other community members. Thematic analysis was performed on key patterns and gendered experiences.
Results:
Themes revealed limited mental-health literacy, immense sense of stigma, extreme reliance on traditional and religious healing. COVID-19 intensified economic stress, domestic violence and caregiving burdens, especially among women. Men coped privately through substance and alcohol use and avoidance, women on the other hand faced compounded stress from caregiving, financial insecurity, and social isolation. Barriers to care included stigma, cultural norms, discouraging disclosure, limited services, financial constraints, and inadequate health-worker training. Physical, verbal and sexual abuse against women associated with persistent gender inequality, economic dependence, and cultural tolerance of violence.
Conclusion:
Findings underscore the urgent need for gender-responsive mental health promotion, community sensitization, and capacity-building of both frontline workers and spiritual leaders and traditional healers. Integration of mental health into community structures, strengthening social protection, and addressing gender-based violence to improve

mental-wellbeing across communities in Kenya.

Abstract 1546

NAVIGATING REPRODUCTIVE HEALTH ACROSS DIVERSE GENDER IDENTITIES: STRUCTURAL AND EMOTIONAL CHALLENGES EXPLORED THROUGH PARTICIPATORY ACTION APPROACH

Della Casa V.*, Trombini E., Andrei F.

Department of Psychology, University of Bologna ~ Bologna ~ Italy

Reproductive health needs and parenthood aspirations remain insufficiently explored among individuals facing fertility-impacting conditions such as trans* populations. Traditional standardized measures often fail to capture the emotional, structural, and socio-legal barriers experienced by marginalized groups. Participatory Action Research (PAR) provides a community-based approach emphasizing collaboration and empowerment, ensuring that participants' voices directly inform scientific inquiry, clinical practice, and policy. This study aims to investigate reproductive health experiences across diverse gender identities and fertility-impacting conditions in Italy, with a focus on trans* participants. Objectives include identifying barriers and unmet needs, co-constructing new narratives on parenthood, and producing participant-driven recommendations to improve reproductive healthcare and policy. A PAR methodology was implemented in collaboration with Advisory Committee Members (ACM), composed of LGBTQ+ community leaders, health professionals, and organization workers. Participants aged 18–49 were recruited via social media, reproductive clinics, university networks, and LGBTQ+ associations. Data collection involved focus groups guided by semi-structured questions and collaborative activities. Sessions included three phases: (1) open-ended reflection on reproductive experiences, (2) co-construction of group concept maps to visualize decision-making factors, and (3) consensus-building to generate community-informed materials, including recommendations for healthcare professionals, educational resources, and advocacy tools. Data (transcripts, concept maps, artifacts, and researcher/ACM notes) were analyzed through inductive Thematic Analysis using NVivo. Findings provided in-depth qualitative insights capturing the individual complexity of navigating parenthood desire across diverse gender identities and fertility-impacting conditions. Moreover, structural and emotional barriers specific to trans* participants have been identified—such as medical gatekeeping, misgendering by providers, and lack of tailored reproductive information. PAR methodology fostered empowerment, enhancing participants' agency in reproductive decision-making and strengthening community connections. Results inform inclusive reproductive health services, psychological practices, and policies, promoting equitable access to parenthood for marginalized populations.

Abstract 909

PSYCHOTHERAPY FOR MEN: A SCOPING REVIEW OF CLINICAL TRIALS

O"Hara R.*[1], Dickmeyer A.[1], Casey R.[1], Jordan S.[1], Seidler Z.[2], Young M.[1]

[1]University of Newcastle ~ Newcastle ~ Australia, [2]Movember Institute of Men's Health ~ Melbourne ~ Australia

Introduction: There is a substantial empirical evidence base endorsing psychotherapy interventions as effective evidence-based treatments for a range of mental, physical and behavioural health conditions. However, rates of help-seeking, engagement, and retention in therapy are significantly lower among men compared to women globally. Despite growing interest in men's mental health, trials specifically targeting men remain rare, with psychotherapy research often overlooking men's unique needs.

Purpose: This scoping review examined randomised controlled trials (RCTs) that delivered psychotherapy interventions to men. To map the field, we aimed to identify the populations studied, intervention types, outcomes assessed, and male-specific recommendations to inform future research and the adaptation of services to better align with men's needs.

Method: Five databases were searched in August 2024 for relevant RCTs published from 2015 onwards. We included trials investigating a psychotherapy intervention delivered by licensed mental health professionals to men. Data extraction focused on information about male population groups, psychotherapy interventions, primary outcomes and male-specific recommendations for future research.

Results: Database searching yielded 5,734 titles of which 50 were considered eligible for inclusion. Most studies targeted specific subgroups (e.g., convicted offenders, sexual minority men, veterans). Few focused on men from the general population, while none targeted disabled men, indigenous men or men from low socioeconomic backgrounds. Cognitive Behavioural Therapy was the most delivered psychotherapy intervention (n=22, 44%) across studies, while maladaptive behaviour reduction was the most frequently examined primary outcome (n=19, 38%). Only one study (2%) focused on suicide prevention. Reporting of male-specific outcomes was limited, with only n=13 (26%) studies reporting gender-informed adaptations of psychotherapy interventions, while just n=10 (20%) reported male-specific recommendations for future research.

Conclusions: Our scoping review highlights promising developments in research targeting men. We recommend broader examination of gender-informed psychotherapy interventions and reporting of male-specific recommendations for future research to advance the field.

SIX-MONTH FOLLOW-UP OUTCOMES OF THE SUPERKIDS PROGRAM: A SOCIAL-EMOTIONAL SKILLS INTERVENTION FOR CHILDREN AGED 4–6

Orgilés M., Serrano--Ortiz M., Amorós--Reche V.*, Espada J.P.

Miguel Hernández University of Elche, Child and Adolescent Research Center ~ Elche ~ Spain

Background: Early childhood is a critical period for developing emotional and social competencies. SuperKids is a school-based program designed to enhance emotional and social skills in early childhood through play-based activities. Although short-term efficacy has been previously demonstrated, evidence on the maintenance of these gains over time is still limited. Objective: To examine the maintenance of emotional recognition, emotional understanding, and social functioning outcomes in children aged 4 to 6, six months after participating in the SuperKids program. Method: A total of 254 children (44.9% female; 90% Spanish nationality) participated in the study. Measures were administered at three time points: baseline (pretest), immediately after the intervention (posttest), and six months later (follow-up). Measures included tasks on emotional recognition, emotional understanding (including identification of specific emotions such as happiness, anger, sadness, and fear), and social execution. Sociodemographic variables were also collected. Results: From pretest to posttest, statistically significant improvements were found in all outcome domains ($p < .001$). These gains remained stable at the six-month follow-up, with some indicators even showing continued improvement. Notably, emotional understanding continued to improve between posttest and follow-up (e.g., total score increased from $M = 10.79$ to $M = 11.66$, $p < .001$). Social execution also showed sustained gains ($M = 8.53$ to $M = 8.86$, $p < .001$). Some emotional indicators (e.g., anger recognition) showed small but significant changes at follow-up ($p = .02$). Conclusion: The SuperKids program produced significant improvements in emotional and social competencies in young children, with gains largely maintained or further enhanced at the six-month follow-up. These findings highlight the potential of early preventive interventions to produce lasting changes in foundational socio-emotional skills during a critical developmental window.

Abstract 1699

FROM STIGMA TO RESILIENCE: SELF-EFFICACY AND SOCIAL SUPPORT IN PSYCHOLOGICAL ADJUSTMENT OF WOMAN REQUESTING ABORTION

Cianciolo I., Busuito D.*, Mineo R., Gullo S., Infurna M.R.

Università degli Studi di Palermo ~ Palermo ~ Italy

Introduction

Women who choose to terminate a pregnancy may face stigma and psychological vulnerability. While self-efficacy and perceived social support are known as protective factors, stigma significantly increases risk of distress and symptoms. Investigating how these dimensions interrelate is crucial to inform interventions promoting resilience and well-being.

Purpose

This study examined whether perceived social support moderates the relationship between self-efficacy and post-traumatic symptoms, and explored the associations of abortion stigma with trauma-related distress.

Method

A sample of N = 115 women who terminated their pregnancy completed a digital battery including the General Self-Efficacy Scale (GSE), the Multidimensional Scale of Perceived Social Support (MSPSS), the Individual Level of Abortion Stigma (ILAS), the Depression Anxiety Stress Scales-21 (DASS-21), and the PTSD Checklist for DSM-5 – Past Week Version (PCL-5). Moderation analyses were conducted with Hayes' PROCESS macro.

Results

Bivariate correlations showed that abortion stigma was positively associated with post-traumatic symptoms (PCL-5, $p < .01$) and psychological distress (DASS-21, $p < .01$). Neither self-efficacy ($p = .28$) nor social support ($p = .11$) displayed significant effects on trauma symptoms. However, their interaction was significant ($p < .05$). Therefore, moderation analyses were conducted to examine the role of self-efficacy in relation to levels of social support. Conditional effects revealed that self-efficacy was not protective at low social support, but reduced symptoms at medium (B = –1.10, 95% CI [–1.76; –0.43]) and high levels of support (B = –1.32, 95% CI [–2.12; –0.52]).

Conclusions

The results highlight abortion stigma as a relevant risk factor linked to both post-traumatic and general psychological distress. Moreover, self-efficacy emerged as a significant protective factor only when present adequate or high perceived social support. Together, these results underscore the need for interventions that simultaneously reduce stigma and strengthen both in individual and in relational resources.

Abstract 1917

BEHAVIORAL MANIFESTATIONS BETWEEN HORSES AND CHILDREN WITH AUTISM DURING INITIAL INTERACTION: AN ETHOLOGICAL AND RELATIONAL STUDY

Diegues Gomes Da Cruz V.*

Centro de Equoterapia Cafarnaum ~ São Vicente ~ Brazil

This study proposes to explore the behavioral manifestations that emerge during the initial moments of interaction between horses and children with autism, with an emphasis on ethological and relational dynamics.

Previous research on interspecies interactions and horse-assisted therapies indicates that the presence of animals can enhance communicative behaviors in children with autism. Horses appear to act as facilitators of social expression, and the initial moments of interaction are crucial for emotional regulation and communication, as they allow for the observation of how the relationship begins to develop.

The aim of the study is to analyze individual behaviors of the child (distance, steps toward the horse, eye contact, gestures, touch, posture, vocalizations, and latency), and horse (ear position, head/neck posture, body movement, olfactory/contact behaviors, signs of relaxation or tension, and latency), combined with interspecific behaviors (exchange sequence, reciprocity, quality of approach, co-occurrence of positive signals, and progression of the sequence) throughout the interactions.

Structured as an observational and longitudinal study, this research will include video recordings and ethological coding of both individual and relational behaviors. The sample will consist of 10 children diagnosed with autism spectrum disorder and 3 horses involved in equine-assisted therapy activities. Over the course of 12 behavioral observation sessions, we will analyze the initial phase of approach and the first establishment of contact between the child and the horse in each encounter, documenting the behaviors that emerge during this specific moment.

This project seeks to understand how interspecific engagement between the child and the horse occurs, identifying factors that facilitate or hinder the development of the relationship, communication, and bonding, providing a foundation for future studies and practical applications in equine-assisted therapy, animal welfare, and the promotion of social skills in children with autism.

Abstract 1798

THE ROLE OF EMOTION-RELATED IMPULSIVITY TRAJECTORIES IN THE ASSOCIATION BETWEEN DYSFUNCTIONAL FAMILY PROCESSES AND ADOLESCENT SMARTPHONE ADDICTION

Gao Y.*[1], Liang Y.[2], Liu X.[2], Wang Y.[2]

[1]Zhejiang Normal University ~ Jinhua ~ China, [2]Beijing Normal University ~ Beijing ~ China

Introduction: While dysfunctional family processes are recognized risk factors for adolescent smartphone addiction, existing research often focuses on isolated factors and leaves longitudinal mechanisms unclear. The development of emotion-related impulsivity has been suggested as a potential mechanism underlying these associations. Purpose: This study investigated how specific dysfunctional family processes predict later smartphone addiction in Chinese adolescents and whether heterogeneous developmental trajectories of emotion-related impulsivity explain these relationships. Method: A sample of 1,434 Chinese adolescents (Mage = 12.64; SDage = 0.68 at Time 1; 56.8% boys) was assessed across four waves over two years, at six- to nine-month intervals. Dysfunctional family processes (physical/emotional abuse, physical/emotional neglect, interparental conflict, and paternal/maternal rejection) were measured at baseline. Emotion-related impulsivity was assessed at all four time points, and smartphone addiction was assessed at the final 2-year follow-up. Results: Latent class growth models revealed four latent classes of emotion-related impulsivity: high-stable (6.7%), high-decreasing (10.9%), low-increasing (24.4%), and low-stable (58.0%). Emotional abuse, interparental conflict, and paternal rejection were significant longitudinal predictors of smartphone addiction. These relationships were mediated by developmental trajectories of emotion-related impulsivity. Specifically, interparental conflict had indirect effects on smartphone addiction through membership in the high-stable, high-decreasing, and low-increasing groups of emotion-related impulsivity. Emotional neglect and paternal rejection had indirect effects via the high-stable group of emotion-related impulsivity, while emotional abuse was mediated by the high-decreasing group of emotion-related impulsivity. Conclusions: The findings demonstrate distinct pathways through which dysfunctional family processes contribute to smartphone addiction via impaired impulse control, highlighting interparental conflict as a particularly potent risk factor. These results underscore the critical need for intervention programs that target impulse regulation skills, particularly for adolescents exposed to familial adversity.

Abstract 1810

VULNERABLE NARCISSISM, SOCIAL MEDIA USE, AND SENSE OF COMMUNITY IN ADOLESCENTS: THE MEDIATING ROLE OF SELF-ESTEEM

Marino I.*, Di Napoli G., Piombo A.M.

University of Palermo ~ Palermo ~ Italy

Social networking sites (SNS) play a central role in shaping adolescents' identity, offering constant spaces for exposure and comparison. Empirical evidence highlights a link between intensive SNS use and narcissistic traits, particularly vulnerable narcissism, which is characterized by communicative ambivalence and a persistent need for approval. Passive SNS use, defined as browsing without active interaction, has been associated with reduced self-esteem and heightened personal insecurity. Moreover, while SNSs can foster digital connections, they may negatively affect adolescents' sense of community, understood as perceived belonging, value sharing, and active participation. This study examined the relationships among vulnerable narcissism, self-esteem, SNS use, and sense of community in adolescence. A sample of 467 Italian high school students (aged 15–22 years) completed validated self-report measures of these constructs. Results revealed a negative association between vulnerable narcissism and sense of community, with self-esteem mediating this relationship. Specifically, higher levels of vulnerable narcissism predicted lower self-esteem, which in turn was associated with reduced community connectedness. Furthermore, SNS use moderated these associations: under low SNS use, vulnerable narcissism was negatively related to both self-esteem and sense of community, whereas under high SNS use, these relationships became positive. These findings underscore the complex role of SNSs in adolescent development. While limited use may amplify tendencies toward withdrawal, more frequent engagement can provide protective feedback mechanisms that reinforce self-worth and support community integration. The results suggest that interventions should not simply discourage SNS use but rather promote conscious and balanced engagement. Programs fostering emotional awareness, critical reflection on online feedback, and authentic self-esteem development may help adolescents transform vulnerable narcissistic tendencies into opportunities for constructive community participation.

Abstract 1715

"SOMETIMES SUNNY, SOMETIMES CLOUDY": THE POWER OF METAPHOR IN INTERNATIONAL STUDENTS' PSYCHOLOGICAL ADAPTATION PROCESS

Soheili F.*, Lanz M.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Introduction:
Psychological adaptation to major life changes like studying abroad may involve complex emotional and cognitive challenges. Metaphors provide a symbolic way for individuals to express and understand experiences, especially when they are difficult to articulate directly. Therefore, metaphors are useful tools for exploring how people manage and adjust psychologically during such transitions.
Purpose:
This study investigates how international students use metaphorical language to represent their experiences of adapting to a new cultural context. It explores how metaphors reflect the internal processes of coping, emotional regulation, and meaning-making that accompany psychological adaptation.
Method:
Drawing from a broader qualitative study on psychological adaptation, this analysis focuses on participants' metaphorical descriptions of their experiences. Semi-structured interviews were conducted with 18 international students from 12 countries studying in Milan universities. Ethical approval was granted by the Università Cattolica del Sacro Cuore Ethics Committee. Data were analyzed using Braun and Clarke's reflexive thematic analysis.
Results:
Themes such as the fluctuation between turmoil and calm emotional states, confronting ambiguity and uncertainty, and the dynamic reconstruction of meaning were developed, each reflected through participants' personal metaphors. Metaphors like "a sky that is sometimes cloudy and sometimes sunny," "a roller coaster," and "a strong elephant" illustrated variable emotional experiences, feelings of instability, and efforts to regain control and meaning within a new cultural context.
Conclusion:
The results highlight the active role of metaphors as tools for processing experience, regulating emotions, and redefining the self during adaptation to a new cultural context. By symbolically expressing complex emotions and restructuring their experiences, students actively engage in coping and self-reflection. Metaphorical language reveals how individuals interpret, manage, and adapt to new cultural experiences.

A META-ANALYTIC REVIEW ABOUT THE INTER-GROUP EFFICACY OF SUPER SKILLS FOR LIFE ON DEPRESSION, ANXIETY AND EXTERNALIZING SYMPTOMS IN CHILDREN AND ADOLESCENTS

Amorós--Reche V.*[1], Orgilés M.[1], Espada J.P.[1], Botella J.[2]

[1]Miguel Hernández University of Elche, Child and Adolescent Research Center ~ Elche ~ Spain, [2]Autonomous University of Madrid ~ Madrid ~ Spain

The Super Skills for Life (SSL) program was designed to prevent anxiety and depressive symptoms among children and adolescents from a transdiagnostic approach. Several studies have tested its efficacy in reducing emotional symptoms, but also conduct problems. The present study conducted a systematic review and meta-analysis to evaluate the effectiveness of SSL in reducing symptoms of depression, anxiety and externalizing symptoms in children and adolescents, in comparison to a control group. Relevant literature was identified through comprehensive searches in PubMed, Scopus, Web of Science, PsycInfo, and gray literature sources. 6 studies with control group and the outcomes of interest were included in the analysis, conducted in Spain (k = 4), United Kingdom (k = 1) and Malaysia (k = 1). Random effects models were fitted, with significant differences in changes between intervention and control group found for the three outcomes: depression (g = .41), anxiety (g = .51) and externalizing symptoms (g = .31). Moderation of variables concerning participants and the intervention delivery format was examined. Despite the heterogeneity among studies, the findings support the efficacy of Super Skills for Life in reducing anxiety, depressive and externalizing symptoms.

Abstract 224

SPIRITUALITY IN PSYCHOTHERAPY : NARRATIVES OF MENTAL HEALTH PRACTITIONERS IN THE MILIEU OF CHILDHOOD CANCER

Bhagwan R.*, Munshi N.

Durban University of Technology ~ KwaZulu Natal ~ South Africa

Spirituality serves as a huge source of strength and resilience, when parents must confront a diagnosis of paediatric cancer. The unpredictable trajectory of paediatric cancer can contribute to huge levels of anxiety, depression and fear which can exacerbate the physical and mental health of the child and parents alike. This paper explores the role of spirituality through the lens of parents and mental health professionals, with a particular view, to understanding how paediatric cancer impacted the emotional well-being of parents, but more importantly to understand how spiritual practices can be used to support their psychological well-being. Although seemingly silent spirituality has a huge influence on psychotherapy, as spirituality can be particularly beneficial for families managing the mental health sequelae of anxiety, fear and depression, which is linked to a child with cancer. Using a qualitative case study design, this study sought to understand the mental health effects of paediatric cancer on children and their parents and how spirituality was used to support their coping and well-being as they transitioned through the complexities of treatment and recovery related to childhood cancer. Interviews were held with twelve parents and ten psychologists and social workers to understand how spirituality had benefitted paediatric cancer patients and their families. The interviews were audio-recorded, transcribed verbatim and analysed to develop major themes and subthemes by inductive and constant comparison. Four themes were identified namely, the mental health impact of cancer on the child and family, seeking peace and strength through spirituality, the integration of spirituality into psychotherapeutic practice; connecting with spiritually based interventions to heal and transcend the struggle with cancer. The study found that spiritually based practices such as mindfulness meditation, and other religious rituals were hugely therapeutic for both the child and their family providing comfort and hope.

Abstract 2651

IMPACTS OF INTERSECTING CHILDHOOD ADVERSITIES ON COSMETIC SURGERY DESIRE: PARALLEL MEDIATING MECHANISMS OF APPEARANCE ANXIETY AND BODY APPRECIATION

Ho W.Y.*, Cui K.

Hong Kong Metropolitan University ~ Hong Kong ~ Hong Kong

This study examined the serial mediating effects of appearance anxiety and body appreciation in the relationship between intersecting childhood adversity and cosmetic surgery desire in emerging adulthood. The worldwide rise in cosmetic surgery interest, projected to continue beyond 2026, highlights the importance of understanding how early-life adversities influence appearance-related attitudes.

From an ecological systems perspective, children are embedded in multiple environments that shape their psychological development. Adverse experiences within the family (microsystem) may interact with bullying victimization at school (another microsystem), creating cross-contextual stress amplification. This intersection of family- and school-based adversity may foster appearance-related insecurity and influence later cosmetic surgery intentions. Although cosmetic surgery can temporarily enhance confidence and body image, it also carries potential complications, failures, or dissatisfaction.

A total of 320 emerging adults (aged 18–29 years) completed an online survey distributed via social media. The study employed the Childhood Trauma Questionnaire–Short Form, Multidimensional Bullying Victimization Scale, Appearance Anxiety Inventory, Body Appreciation Scale-2, and Acceptance of Cosmetic Surgery Scale to investigate the relationships between adverse childhood experiences, together with multidimensional bullying victimization, and cosmetic surgery desire.

The findings indicate that higher levels of childhood adversity are associated with greater exposure to bullying, increased appearance anxiety, reduced body appreciation, and a stronger desire for cosmetic surgery. Appearance anxiety and body appreciation functioned as significant parallel mediators, highlighting the emotional and perceptual pathways through which early adverse experiences may shape body-related decisions in emerging adulthood.

This study underscores the importance of preventing family violence and school bullying and addressing appearance-related distress to foster positive body image. The results provide insights for developing prevention and intervention strategies targeting the long-term consequences of intersecting childhood adversity and appearance anxiety.

Abstract 146

ASSOCIATIONS BETWEEN COMPLEX POST-TRAUMATIC STRESS DISORDER SYMPTOMS, LONELINESS, AND SENSE OF SECURITY: A FOUR-WAVE LONGITUDINAL STUDY IN CHILDREN

Liang Y.*, Wei C., Xi J.

School of Psychology and Cognitive Science, East China Normal University ~ Shanghai ~ China

Introduction: Complex post-traumatic stress disorder (CPTSD) refers to a mental disorder formed in repeated interpersonal traumatic events and includes two symptom clusters: post-traumatic stress disorder (PTSD) and disturbance in self-organization (DSO). De facto unattended children are vulnerable to CPTSD symptoms because the absence of effective parental caregiving in childhood leads to heightened exposure to trauma. There is a dearth of existing research exploring the mechanisms of CPTSD symptoms among children.

Purpose: This study aims to explore the roles of loneliness and sense of security in the developmental of children's CPTSD symptoms.

Methods: 298 de facto unattended children participated in a four-wave longitudinal study. CPTSD symptoms, loneliness, and sense of security were measured between 2021.12 and 2023.12. We conducted two random intercept cross-lagged models for PTSD, DSO symptoms and loneliness, and PTSD, DSO symptoms and security, respectively.

Results: The longitudinal relationships between loneliness, security and CPTSD symptoms were different. Loneliness was only significantly related to DSO, rather than PTSD. There were three stages in the relationship between loneliness and DSO. From T1 to T2, DSO symptoms positively predicted loneliness. From T2 to T3, they had a positive predictive relationship with each other. From T3 to T4, loneliness sustained the development of the DSO symptoms. In terms of security, security significantly predicted both PTSD and DSO symptoms from T2 to T4, but they didn't predict security.

Conclusions: This study found that loneliness and security played an important role in the development of CPTSD symptoms. DSO symptoms can destroy interpersonal communication, so it may lead to loneliness, in turn, loneliness maintain DSO symptoms. When the security mechanism collapses, it will not only cause PTSD but also DSO symptoms. Targeting loneliness and sense of security in the intervention of children with repeated trauma may help alleviate CPTSD symptoms.

Abstract 140

HOW DOES CHILD MALTREATMENT AFFECTS COMPLEX POSTTRAUMATIC STRESS DISORDER: THE ROLE OF EARLY MALADAPTIVE SCHEMAS IN THE DOMAIN OF DISCONNECTION/REJECTION

Lu T.*[1], Gong J.[2], Liang Y.[1]

[1]School of Psychology and Cognitive Science, East China Normal University ~ Shanghai ~ China, [2]Shanghai Changning Mental Health Centre, Affiliated Mental Health Center of East China Normal University ~ Shanghai ~ China

Introduction

Complex Posttraumatic Stress Disorder (CPTSD) is closely related to childhood maltreatment. Early Maladaptive Schemas (EMS) refer to persistent negative cognitive patterns formed in childhood. EMS are well-established mediators between childhood maltreatment and psychopathology. However, how EMS affect CPTSD symptoms among adolescents with child maltreatment remains unclear, particularly regarding different effects on distinct EMS domains.

Purpose

This study aims to investigate the mediating role of EMS between child maltreatment and CPTSD, and to identify which EMS dimension is critical in influencing CPTSD.

Method

Child maltreatment was assessed in November 2023 (T1) using the Childhood Trauma Questionnaire. EMS was assessed in April 2024 (T2) using the Young Schema Questionnaire-Short Form, including 3 domains of EMS (impaired autonomy and performance, disconnection and rejection, over-vigilance and inhibition). CPTSD symptoms were assessed in November 2024 (T3) using the International Trauma Questionnaire, including posttraumatic stress disorder (PTSD) and disordered self-organization (DSO) symptoms. The 3-waves longitudinal data included 722 adolescents with child maltreatment. Path analysis was used to estimate the effects of child maltreatment on PTSD and DSO symptoms and potential mediating roles of the three EMS domains.

Results

Child maltreatment positively predicted all three EMS domains. Only disconnection and rejection significantly predicted PTSD and DSO symptoms and mediated the relationships between child maltreatment and PTSD and DSO symptoms.

Conclusions

This study found that the disconnection and rejection domain of EMS is a potential mechanism for the development of CPTSD symptoms among adolescents with childhood maltreatment. This domain manifests the fragmentation of self-concept and disconnections with others after child maltreatment, which may trigger the important avoidance symptoms in PTSD. In addition, negative perceptions of self and others may also contribute to DSO symptoms. In future interventions for maltreatment, the inclusion of EMS interventions targeting disconnection and rejection may alleviate CPTSD symptoms.

Abstract 1790

UNDERSTANDING FILIPINO CHILDREN'S PERCEPTION OF HOTLINES AND HELPLINES: IMPLICATIONS FOR CHILD PROTECTION

Tarroja M.C.*[1], Morales M.R.[2], Villegas A.[1], Galacgac N.[1]

[1]De La Salle University Manila ~ Manila ~ Philippines, [2]University of the Philippines Diliman ~ Quezon City ~ Philippines

This mixed-methods study investigated Filipino children's perceptions of hotlines and helplines, examining their understanding and engagement with these services through the lens of child participation and child protection. The quantitative phase indicated that although very few children had prior direct experience with these services, it revealed a promising openness to future utilization, and demonstrated clear expectations regarding the potential functions and benefits of hotlines. The survey also showed that they have clear expectations about what hotlines can do for them. Qualitative findings corroborated the general acknowledgment of the importance of hotlines, but concurrently revealed significant barriers, including persistent concerns related to trust, confidentiality, and practical accessibility challenges. The focus group discussions revealed the underlying reasons, experiences, and contextual factors influencing these perceptions. The integrated analysis highlights the critical need for child-sensitive reporting mechanisms that are culturally sensitive approaches to enhance children's confidence in and utilization of these vital protection mechanisms. The results further support the need to advocate for different ways of disclosing and reporting incidents of abuse, including hotlines and helplines services.

Abstract 1990

SELF-CRITICISM IN PREVENTIVE GUIDED SELF-HELP INTERVENTIONS: GREATER GAINS OR GREATER RISKS? ITS EFFECT ON ADHERENCE, TREATMENT SUCCESS, AND WORKING ALLIANCE

Di Consglio M.[1], Bassi De Toni M.*[1], D"Olimpio F.[2], Couyoumdjian A.[1]

[1]Department of Psychology, Faculty of Medicine and Psychology, Sapienza University of Rome ~ Rome ~ Italy, [2]Department of Psychology, University of Campania Luigi Vanvitelli ~ Caserta ~ Italy

Self-criticism increases vulnerability to psychological distress and is linked to various psychopathologies. In psychotherapy, it is typically associated with greater symptom severity, lower adherence, poorer outcomes, and higher dropout. However, evidence from preventive interventions suggests that self-criticism can sometimes act as a facilitator of change, with higher baseline levels predicting greater improvements. This study aims to expand this line of research by examining how self-criticism affects adherence, working alliance, and outcomes within NoiBene, a guided self-help program designed to promote well-being and prevent distress among nonclinical university students. A total of 455 participants (82% female; M = 23.5 years) were included in the study. Before and after the intervention, participants completed measures of self-criticism, psychological well-being, emotional awareness, rumination, worry, perfectionism, psychological inflexibility, and assertiveness. After the intervention, adherence and working alliance were assessed. Following the assessment phase, participants began the NoiBene intervention. Baseline levels of self-criticism were used to categorize participants into three groups: mild, moderate, and severe, based on tertile splits. Most participants concluded the entire NoiBene intervention (90.8%). Contrary to evidence from clinical settings, high self-criticism was not associated with increased dropout or weaker alliance. Furthermore, those with severe self-criticism showed greater improvements in emotion awareness, perfectionism, rumination, and psychological inflexibility. They also started with higher baseline difficulties, indicating both greater need and more room for change. These findings suggest that, in preventive guided self-help contexts, self-criticism does not necessarily hinder engagement or outcomes and may, under certain conditions, function as a catalyst for change. Limitations include the self-selected sample, which may limit generalizability; the lack of qualitative data to understand reasons for dropout; and the assessment of working alliance only at post-intervention, which may not capture its development over time. Implications for tailoring digital preventive interventions and addressing dropout risk are discussed.

HOW DO MECHANISMS OF CHANGE UNFOLD OVER TIME? EMOTION REGULATION AND QUALITY OF LIFE AFTER TD-CBT IN PRIMARY CARE

Carpallo--González M.*[1], Esteller--Collado G.[2], Prieto--Vila M.[2], Cano--Vindel A.[3], González--Blanch C.[4], Ruiz--Rodríguez P.[5], Muñoz--Navarro R.[2]

[1]Department of Personality, Assessment and Psychological Treatments, Faculty of Psychology. Universitat de València. Valencia, Spain ~ Valencia ~ Spain, [2]Department of Personality, Assessment and Psychological Treatments, Faculty of Psychology. Universitat de Valencia. Valencia, Spain ~ Valencia ~ Spain, [3]Faculty of Psychology, Complutense University of Madrid. Madrid. ~ Madrid ~ Spain, [4]Mental Health Centre, Marqués de Valdecilla University Hospital-IDIVAL, Santander, Spain ~ Cantabria ~ Spain, [5]Tres Cantos, Primary Care Center, Health Service of Madrid, Tres Cantos, Madrid, Spain ~ Madrid ~ Spain

Introduction. A total of 1,061 patients presenting with emotional disorder symptoms (anxiety, depression, and somatization) were enrolled in the PsicAP trial, a randomized, single-blind, two-arm clinical trial conducted across 22 primary care centers in Spain. Of these, 631 participants (TAU = 316; TD-CBT + TAU = 315) completed the full intervention and all pre- and post-treatment assessments; 511 participants (TAU = 238; TD-CBT + TAU = 273) completed baseline and 3-month follow-up assessments; and 388 participants (TAU = 180; TD-CBT + TAU = 208) also completed the 12-month follow-up. The assessment battery included measures of symptoms, emotion regulation strategies (ERS), and quality of life (QoL).

Purpose. The present study examines the potential mediating effect of several ERS—adaptive (reappraisal) and maladaptive (suppression, metacognition, rumination, and worry)—in the relationship between treatment group assignment and the four QoL domains (physical, psychological, social, and environmental) at short- and long-term follow-up.

Method. Multivariate mediation analyses will be conducted using the PROCESS macro for SPSS (Hayes, 2017), with 10,000 bootstrap resamples. Treatment group assignment (TAU vs. TAU + TD-CBT) will be entered as the independent variable, ERS as mediators, and QoL domains at 3 and 12 months as dependent variables.

Results. The findings will address the role of ERS as potential mechanisms of change underlying the transdiagnostic treatment in primary care, particularly in enhancing QoL in the TD-CBT + TAU condition, as well as the variance across QoL domains.

Conclusions. These results will contribute to a better understanding of the mechanisms of change driving the efficacy of TD-CBT, with a specific focus on the mediating role of ERS in improving quality of life.

Abstract 1714

PSYCHOLOGICAL BARRIERS AND FACILITATORS TO MENTAL HEALTH HELP-SEEKING ACROSS THE AUSTRALIAN LANDSCAPE: SHAME, STIGMA AND SELF-COMPASSION

Freire M.*, Dumaine T., Loder C.

The University of Newcastle, Australia ~ Callaghan, New South Wales ~ Australia

Introduction

Suicide rates in very remote areas of Australia are more than twice those in major cities, with 21.0 deaths per 100,000 population compared to 10.0 in urban areas. This stark difference points to underlying disparities in mental health outcomes. While engaging with professional mental health services is essential, barriers to help-seeking remain a persistent challenge, particularly in regional and remote communities. Shame and stigma are widely recognized as psychological obstacles to seeking help for mental health, whereas self-compassion may offer a protective pathway toward engagement. However, the interplay among these factors across geographic contexts remains poorly understood.

Purpose

This study explores how shame and stigma influence help-seeking intentions, and whether self-compassion moderates these effects across urban, inner regional, and outer regional/remote Australian populations.

Method

Participants (N = 747) completed validated measures of mental health distress, shame, stigma, self-compassion, and help-seeking intentions. Hierarchical multiple regression analyses were conducted for each geographic group, controlling for mental health distress and testing interaction terms. Preliminary analyses are reported here.

Results

Initial findings indicate that stigma consistently suppresses help-seeking across all geographic groups, while shame demonstrates limited direct influence. Self-compassion appears to facilitate help-seeking, but only within inner regional contexts, where it also shows evidence of buffering the impact of shame. Mental health distress is a stronger predictor of help-seeking in urban and inner regional populations, but plays a less prominent role in remote areas. Multicollinearity among interaction terms affected the reliability of moderation effects, prompting further modeling to clarify these relationships and explore underlying mechanisms.

Conclusions

Preliminary results highlight stigma as a key barrier to help-seeking, with self-compassion showing promise as a protective factor in regional settings. Geographic differences suggest that tailored interventions may be needed. Further analyses will

refine these findings and explore structural pathways, to inform policy and practice.

Abstract 1606

A PHOTO-ELICITATION STUDY ON THE HEALTH-SEEKING EXPERIENCES OF WOMEN WITH BIPOLAR DISORDER

Mansukhani R.*, Cheung A.C.

De La Salle University ~ Manila ~ Philippines

This qualitative study delves into the health-seeking experiences of women with Bipolar Disorder, shedding light on their pursuit of holistic health and well-being amidst the challenges posed by this erratic and chronic condition. Employing a photo-elicitation approach, the research illustrates the dynamic interplay between psychological and socio-contextual resources, framed within Antonovsky's salutogenic model of health. Employing reflexive thematic analysis on the interviews with six women (mean age of 28.67 years) diagnosed with Bipolar Disorder, the findings elucidate a dual approach to their pursuit of health. First, it illustrates how women with Bipolar Disorder actively maintain their well-being, driven by a strong sense of agency in health management and empowered by a profound religious faith, which empowers them to do what they can and entrust what they cannot, encouraging them to take practical steps to establishing health behaviors and sustaining their sense of hope and resolve in seeking health. Second, the study underscores the crucial role of external supports amidst turbulent mood swings and suicidal ideations. This includes receiving a deep personal connection with God, ensuring security even when personal and interpersonal resources falter. Simultaneously, being supported by nurturing communities that provide civil, social, domestic, and material support play a pivotal role in enabling women with Bipolar Disorder to engage actively in societal roles, fostering a sense of purpose and a clear vision of their continued commitment to life. Participant-captured photographs provide insights into the multi-faceted nature of health, highlighting the defining feature of 'stability' in health for women with Bipolar Disorder. This study advocates for a socioecological approach and provides practical recommendations for enhancing comprehensive support for women with Bipolar Disorder.

REIMAGINING APPLIED PSYCHOLOGY IN RESTRICTIVE CONTEXTS: TRUST, RESPONSIBILITY, AND COMMUNITY-BASED PATHWAYS TO WELL-BEING

Khombo S.*, Christopher J.

Midlands State University ~ Gweru ~ Zimbabwe

Introduction

Applied psychology is increasingly being asked to respond to everyday realities shaped by inequality, uncertainty, and declining trust in public institutions. In many low- and middle-income countries, psychologists work in social and institutional environments that place real limits on how mental health care can be understood, accessed, and sustained. These conditions invite a rethinking of applied psychological practice, one that looks beyond individual distress and pays closer attention to communities, relationships, and local ways of coping.

Purpose

This study explores how trust, responsibility, and hope are understood and put into practice within community-based psychological work in restrictive contexts. Using Zimbabwe as a case study, the study aims to contribute to emerging conversations in applied psychology by highlighting culturally grounded and socially responsive practices that support meaningful and sustainable community well-being.

Method

The study adopted a qualitative case study design. Data were collected through semi-structured interviews with applied psychology practitioners and community stakeholders who are actively involved in community-based psychological initiatives in Zimbabwe. The data were analysed thematically to identify shared experiences and perspectives related to trust-building, responsibility, community engagement, and well-being.

Results

The findings suggest that trust lies at the heart of effective applied psychological work in restrictive contexts. Participants described how culturally grounded, participatory, and asset-based approaches help strengthen psychological resilience, social connection, and a sense of collective agency. Responsibility for well-being was understood as something shared between practitioners and community members, allowing locally meaningful pathways to emerge even in the face of ongoing structural challenges.

Conclusions

This study highlights the potential of applied psychology to support community well-being and social cohesion when practice is ethically grounded and responsive to local realities. Paying attention to trust, shared responsibility, and community participation offers a promising way of reimagining applied psychological practice in settings marked

by social and institutional constraints.

Abstract 1892

APPLIED PSYCHOLOGY IN THE TRENCHES: METHODOLOGICAL BEST PRACTICES FOR CONDUCTING COMMUNITY-BASED, PARTICIPATORY RESEARCH WITH VULNERABLE FARMWORKERS

Smith N.*[1], Martinez L.[1], Hammer L.[2], Brockwood K.[2]

[1]The University of Texas at Arlington ~ Arlington ~ United States of America, [2]Oregon Health & Science University ~ Portland ~ United States of America

There are approximately 2.4 million farmworkers in the United States, the majority of whom are Latino immigrants. Work is an important social determinant of health that has a powerful influence on health disparities, and farmworkers are at greater risk of exposure to physical and psychosocial work hazards, lower wages and economic insecurity, unfavorable employment policies, and barriers to accessing healthcare. For example, farmworkers typically work long hours but in the US are federally excluded from receiving guaranteed overtime pay. In spite of these challenges, U.S. farmworkers have built strong structures to promote greater health and well-being, including networks of community-based organizations, farmworker unions, and informal community groups.

The purpose of this presentation is to share our transdisciplinary approach in this emerging field. Specifically, we share our development and implementation of a longitudinal, mixed-methods, and community-based participatory research (CBPR) study to examine risk and protective factors for farmworker health and well-being, and to evaluate the impact of a policy intervention, in the form of the implementation of a State-level farmworker overtime legislation over its 5-year phase-in period.

For years, we have been working in partnership with the farmworker community through community-based organizations, academic research institutions, and a community advisory board. We share how this partnership was built and our collaborative processes for conceptualizing and implementing each phase of our research partnership. We also share our methodological approach to data collection and dissemination to this point, including interviews, focus groups, and two waves of surveys. We also discuss our approach to dissemination of findings to community stakeholders.

Overall, we believe that these CBPR approaches serve as important examples for research teams to draw from to build trust and enhance societal applications when engaging in research activities considering work as a social determinant of health for at-risk or vulnerable community members.

VOICES, CHOICES AND RIGHTS: DEMOCRATISING COMMUNITY COHESION THROUGH COMMUNITY PSYCHOLOGY

Wilson S.*

University of Lancashire ~ Preston ~ United Kingdom

Public trust in institutions is at a critically low level worldwide, posing a risk to community cohesion. This presentation will cover a decade of community research in low-income coastal communities in the UK, which aimed to build capacity and connections between communities and institutions, thereby contributing to community cohesion. A range of Participatory Action Research (PAR) approaches will be described, including peer interviews, doorstep surveys, and photovoice, all of which were conducted in collaboration with local institutions, such as schools, the police, and local government. The transdisciplinary theoretical scope of the work covered social psychology, sociology and activism, all of which are central to community psychology. A synthesis of the data revealed that perceived relationships between communities and institutions are a significant contributor to the success of interventions aimed at building community capacity and connections. Collectively, the experiences of participants have been collated and contributed to a co-produced 'relational wealth building' framework (Wilson, 2024). The research had a significant impact in building sustainable communities by enhancing capacity and fostering relationships between communities and institutions. New grassroots community organisations have created employment opportunities for local activists, which address the needs of the community as identified through their research (Wilson & Morris, 2022). The findings have also been used by local government to develop new mechanisms for engaging and involving diverse communities in local decision-making (Wilson, 2025). Moreover, the methodologies that have evolved throughout the course of the research have recently been commissioned by a leading UK philanthropy charity to develop community-led grant-making strategies. The challenges of building relational wealth and relational democracy between communities and institutions will be critically discussed. It is hoped that this session will inspire others to develop relational research and practice, cultivating conditions of hope, responsibility and democratic values.

Abstract 2700

FORCED MIGRATION TRAUMA, CURRENT DAILY STRESSORS, MENTAL HEALTH, AND SLEEP QUALITY AMONG ELDERLY ROHINGYA REFUGEE PEOPLE RESETTLED IN BANGLADESH

Haque S.*, Borak Z.

Monash University Malaysia ~ Bandar Sunway ~ Malaysia

The relationship between trauma and mental health is well-documented, but how trauma experienced during a forceful migration and ongoing daily stressors affect the mental health and quality of sleep of elderly refugee populations is scarce. We recruited 207 forcibly displaced Myanmar nationals, aged 60 to 100 years, resettled in Cox's Bazar and Bhasanchar, Bangladesh. The participants completed the Questionnaire for Traumatic Events Assessment and the Brief Daily Stressors Screening Tool to report the types and frequency of traumatic incidents they were exposed to and their ongoing general stressors. We also assessed their religious coping, sleep quality, PTSD, depression, and generalized anxiety using standardized, Rohingya-translated tools. Hierarchical multiple regression analyses revealed that exposure to trauma and daily stressors significantly predicted PTSD, depression, and sleep quality after controlling for the participants' age and gender, in which daily stressors appeared to be a stronger predictor. Parallel mediation analyses showed that daily stressors mediated the predictive relationship between trauma and PTSD positively; however, negative religious coping mediated this relationship negatively. Daily stressors also positively mediated the trauma-depression and trauma-sleep quality relationships. The results indicate that practitioners should address daily stressors, besides past trauma, while devising any intervention programmes for refugee mental health and their sleep disturbances.

Abstract 1057

TRANSDISCIPLINARY COLLABORATION TO SUPPORT SURVIVORS OF HUMAN TRAFFICKING AND FORCED LABOR

Dryjanska L.*[1], Andrea L.[2]

[1]Uniwersytet Kardynala Stefana Wyszynskiego ~ Warsaw ~ Poland, [2]Universitat Basel ~ Basel ~ Switzerland

This presentation examines the psychological and legal dimensions of human trafficking and forced labor at sea through the lens of the dialogical approach in social representations theory. Drawing on the transdisciplinary collaboration fostered by COST Action Blue Rights (the COST Action focuses on the protection of liberty at sea, rooted in the ethical assumptions about human dignity and freedom, inherent to the concept of human rights), we explore how insights from psychology – particularly regarding complex trauma, coercion, and isolation – can inform the practices of legal professionals, policymakers, and government representatives engaged in protecting human rights at sea. Forced labor will be contextualized within broader discussions of decent work and responsible consumption, highlighting the structural push and pull factors that drive trafficking and exploitation. We will point out how this type of interdisciplinary collaboration might contribute towards specific SDGs, including “Life Below Water” that is rarely considered by psychologists, as forced labor and trafficking are particularly relevant in fishing activities (what in legal studies is referred to as “the conservation and management of fisheries resources”).

Using narratives from migrants trafficked into exploitative labor, we discuss how lived experience can both enrich and complicate policy responses, while interrogating the legal weight of personal testimony in judicial proceedings. We argue that while survivors’ stories are essential in shaping public understanding and accountability, expectations placed on individual testimony often overlook the psychological realities of trauma disclosure. In this respect, we consider the role of professionals such as psychologists, social workers, and lawyers in co-constructing and mediating such narratives. By integrating psychological knowledge with legal frameworks, we aim to demonstrate how a human-rights-based approach can more effectively address the complexities of forced labor at sea and strengthen protections of liberty and dignity.

Abstract 1451

A PRACTICAL GUIDELINE FOR CO-CREATING KNOWLEDGE WITH MIGRANT DOMESTIC WORKERS USING THE PHOTOVOICE METHOD

Liem A.*

Universitas Sebela Maret ~ Surakarta ~ Indonesia

This paper presents a comprehensive psychological guideline for implementing photovoice methodology with migrant domestic workers (MDWs), grounded in feminist participatory action research and applied psychology principles. The framework addresses critical mental health disparities and psychological vulnerabilities experienced by MDWs, including social isolation, identity challenges, acculturative stress, and limited psychological support systems within host countries. The guideline emerged from extensive applied psychology research conducted across multiple Asian contexts, examining the psychological well-being and coping mechanisms of MDWs through culturally responsive methodologies. Our approach integrates visual storytelling techniques with psychological assessment frameworks, enabling MDWs to articulate their mental health experiences, resilience strategies, and psychosocial needs through collaborative knowledge creation. The methodology encompasses psychological safety protocols, trauma-informed practices, and culturally adapted interview techniques that respect participants' emotional boundaries while facilitating meaningful psychological exploration. Training modules incorporate basic photography skills, narrative therapy principles, and psychoeducational components about mental health literacy. The framework emphasises psychological empowerment, therapeutic benefits of creative expression, and the development of critical consciousness regarding structural factors affecting mental health outcomes. Data collection procedures include photo-elicitation interviews informed by phenomenological psychology, focus groups utilizing group therapy dynamics, and collaborative analysis processes that validate participants' psychological insights. The approach demonstrates significant therapeutic value, promoting emotional processing, identity reconstruction, and collective healing among participants. This guideline offers applied psychologists, researchers, and practitioners evidence-based tools for conducting psychologically informed participatory research with vulnerable populations. It provides practical applications for community psychology interventions, cross-cultural psychological assessment, and policy development addressing migrant mental health. The interdisciplinary framework ensures methodologically rigorous and ethically sound applications across diverse psychological practice contexts globally.

CLINICAL EFFECTS OF DANCE MOVEMENT THERAPY AND SOCIAL IMPACT ON THE RECOVERY PROCESS OF WOMEN REFUGEES: A COMPARATIVE LONGITUDINAL STUDY

Tomaszewski C.[1], Ho T.C.T.*[4], Steltmann S.[3], Drikaki D.[5], Efthyvoulou A.[6], Mruszczyk K.J.[7], Idrizi F.[8], Belot R.[2], Essadek A.[9], Clesse C.[10], Koch S.C.[11]

[1]University of Marie and Louis Pasteur; University of Lyon ~ Besançon, Lyon ~ France, [2]University of Marie and Louis Pasteur ~ Besançon ~ France, [3]University of Heidelberg; University of Mainz ~ Heidelberg, Mainz ~ Germany, [4]University of Limerick ~ Limerick ~ Ireland, [5]Sapienza University of Rome ~ Rome ~ Italy, [6]N/A ~ N/A ~ Cyprus, [7]N/A ~ N/A ~ Italy, [8]N/A ~ N/A ~ United States of America, [9]University of Lorraine; EOS PSY; Saint-Maurice Hospitals ~ Nancy, Paris, Saint-Maurice ~ France, [10]University of Roehampton ~ London ~ United Kingdom, [11]Alanus University of Arts and Social Sciences; SRH University Heidelberg ~ Alfter, Heidelberg ~ Germany

Introduction: Women affected by migration are often at increased risk of developing post-traumatic stress disorder (PTSD), depression, and anxiety. Dance movement therapy (DMT) can be effective in alleviating these symptoms. Psychotherapeutic interventions, including DMT, are more effective when addressing structural vulnerabilities linked to migration, including exposure to violence, material insecurity, and social isolation.

Purpose: Our study explored whether social factors, such as access to food, housing, employment, and social support, moderate the effectiveness of DMT.

Method: This comparative longitudinal study examined the role of social determinants in the effectiveness of DMT among migration-affected women (N = 28). Participants were assigned to either an experimental group receiving the DMT intervention or a control group without intervention. Data were collected at baseline (T0) and after two months (T1). Measures included a socio-demographic questionnaire, the DASS-21 for depression, stress, and anxiety, the PCLS for PTSD symptoms, and the SSQ6 for social support (which assessed perceived availability of social support sources and satisfaction of the support). Within- and between-group comparisons were conducted using Mann-Whitney U tests, and robust linear regressions estimated adjusted associations with contextual covariates.

Results: Participants in the DMT group showed greater reductions in depression and hyper-arousal compared to controls. Social support was the most consistent predictor of improvement, while food access, housing stability, and employment had limited or inconsistent effects.

Conclusions: These findings indicate that clinical interventions should not only implement DMT but also actively integrate social determinants of health, ensuring care is both therapeutic and context sensitive. From a research perspective, this study underscores the need for further research on how social variables moderate the effects

of DMT, especially among migration-affected women. Larger studies are required to clarify the complex interactions between mental health, social contexts, and therapeutic outcomes.

Abstract 607

THE IMPACT OF ACCULTURATION GAP ON PSYCHOLOGICAL WELLBEING: THE ROLE OF LANGUAGE BROKERING AND PARENT-CHILD DYNAMICS

Toyama S.*, Wang C.D.

University of North Texas ~ Denton ~ United States of America

Introduction & Purpose: Acculturation gap (AG) occurs when immigrant parents acculturate slower than their children (Bazanez et al., 2014). Due to differences in values and preferred behaviors, greater AG is likely to increase conflicts and affect parent-child relationship quality (PCRQ), which in turn may lead to poorer psychosocial outcomes for children of immigrants. Additionally, higher AG may result in greater occurrence of language brokering (LB) served by children, which in turn may negatively impact their psychological wellbeing (PW). The influences of AG, LB, and PCRQ on PW of adult children from immigrant families have not been thoroughly studied. The current study aimed to explore the indirect effects of AG on PW of adult children with immigrant parents via LB frequency and PCRQ.

Method: A total of 228 (M=21.12; SD=3.43) adult children of immigrants completed online surveys. The following measures with adequate psychometric properties were used: Acculturation Gap Conflict Inventory (Basaenz et al., 2014), Depression, Anxiety, and Stress Scale (Lovibond & Lovibond, 1995), Generalized Self-Efficacy Scale (Schwarzer & Jerusalem, 1995), Rosenberg Self-Esteem Scale (Rosenberg, 1979), three questions assessing language brokering frequency, and Parental Environment Questionnaire (Elkins et al., 1997).

Results: Findings of the PROCESS Model 4 (Hayes, 2017) indicated significant indirect effects of AG on psychological distress (95%CI [.62, 1.91], self-esteem (95%CI [-.11, -.04]), and self-efficacy (95%CI [-.08, -.01]) via PCRQ. However, the indirect effect of AG through LB frequency was not significant on any of the PW variables.

Conclusions: The results indicated that for adult children of immigrants, AG was negatively associated with PCRQ, which in turn led to greater psychological distress, lower self-efficacy and self-esteem. However, LB frequency was not a significant mediator. Findings highlight the importance of facilitating dialogue about acculturation processes and its relational impact when working with immigrant families. Further implications and limitations will be discussed.

MYTH, MESS & MASTERY (CHILDHOOD SEXUAL ABUSE)

Bassman S.*

Bassman Mental Health Services ~ Cincinnati, Ohio ~ United States of America

Abstract: Therapeutic Services that focus on the synthesis of research and clinical practice are
vital in providing efficacious change for the individuals who have been victims of childhood
sexual abuse. This presentation will address what processes have been helpful in being a catalyst
in changing one's inner life as well as providing meaningful applications and fulfilling experiences.
Those that has been victimized quite frequently finds themselves stuck in an emotional impasse
where they are not able to move forward in their life and find themselves repeating a pattern of
self-defeating decisions and actions. The key to amelioration is helping the person become
aware and cognizant of their habitual choices and interrupt this cyclic repetition and acquire a
more productive framework to advance the quality of their life. This process can be simply
described as "reframing". Reframing in therapy is used to help clients view a situation, thought,
or emotion from a different perspective—often a more positive or constructive one. The goal is
to shift how the client interprets or understands their experiences, which can lead to changes in
emotional responses and behavior.
In this presentation, initially focusing on the MYTHS regarding childhood sexual abuse.
Subsequently, addressing the MESS that follows from not recognizing the adverse and
impairments that could result from Childhood Sexual Abuse. Finally, concluding by looking at
the MASTERY that could arise from moving from being a Victim, to a Survivor and possibly a
Thriver.

DIFFERENCES BETWEEN MEN AND WOMEN IN INTRAFAMILIAL RELATIONSHIPS AND STRENGTHS IN ADOLESCENTS

Macias Espinoza F.*, Bravo Andrade H.R., Orozco Estrada V.O., Ruvalcaba Romero N.A., Orozco Solis M.G.

Universidad de Guadalajara ~ Guadalajara ~ Mexico

Introduction: Intrafamilial relationships are the interactions and bonds established between family members. During adolescence, they are essential for achieving comprehensive development. Together with strengths, their balance provides each individual with the ability to act responsibly within their family and social environment. When these relationships and strengths are well established, they contribute to overall well-being. It is important to know whether there are differences between men and women with regard to these variables. Objective: To compare gender differences in intrafamilial relationships and strengths in high school students. Method: A cross-sectional correlational study was conducted with 315 students from a public university in Mexico. The revised short version of the intrafamilial relationship assessment scale and the adolescent strengths assessment scale were applied. Mean comparisons were made using Student's t-test for independent samples. Results: No statistically significant differences were found between males and females in intrafamilial relationships. In terms of external strengths, differences were detected in maternal support $t(313) = -2.04$, $p = .042$, $d = -0.23$ and maternal supervision $t(313) = -3.60$, $p < .001$, $d = -0.42$ in favor of women. Meanwhile, in internal strengths, differences were found in resistance to pressure, $t(313) = 2.79$, $p = .006$, $d = 0.32$, with higher means in men, and expression of anger, $t(313) = -3.81$, $p < .001$, $d = -0.44$; and school expectations, $t(313) = -2.51$, $p = .013$, $d = -0.29$, with higher scores in women. Discussion: The results show that there are differences between the strengths related to male and female adolescents that should be taken into account in interventions.

USING VIGNETTE METHODOLOGY TO INVESTIGATE PUBLIC PERCEPTIONS OF MENTAL HEALTH: INSIGHTS FROM A MULTICULTURAL PROJECT ABOUT ADHD

Stecko L.*[1], Salajková A.[2], Frontczak A.[3], Pignatelli C.[4], Kalita L.[5], Ranjbaran S.[6], Gonçalves T.[7], Jaworska Z.[8], Akcan D.[8], Macassa G.[9]

[1]Wyzsza Szkola Ksztalcenia Zawodowego ~ Wroclaw ~ Poland, [2]University of Innsbruck ~ Innsbruck ~ Austria, [3]Univesity of Social Science ~ Lódz ~ Poland, [4]Research Lab - CIDESD - Centro de Investigação em Desporto, Saúde e Desenvolvimento Humano Universidade Europea Lisboa ~ Lisboa ~ Portugal, [5]University of Ljubljana ~ Ljubljana ~ Slovenia, [6]University of Pavia ~ Pavia ~ Italy, [7]University of Porto ~ Porto ~ Portugal, [8]Uni of Padova ~ Padua ~ Italy, [9]University of Gävle ~ Gävle ~ Sweden

Understanding how individuals perceive and evaluate social phenomena is a central task in the social sciences. Traditionally, these processes have been examined with attitude questionnaires, which conceptualize attitudes as relatively enduring organizations of beliefs, feelings, and behavioral tendencies toward socially significant objects, groups, or events. Such measures typically rely on single statements requiring respondents to indicate agreement or disagreement.

In contrast, vignette methodology employs brief, contextualized narratives describing a protagonist's behavior in specific situations. This approach offers greater ecological validity and experimental control, enabling quasi-experimental manipulation of vignette features analogous to A–B testing. Researchers can thereby explore how contextual factors influence perception and judgment.

Research on public perceptions of attention-deficit/hyperactivity disorder (ADHD) has focused largely on attitudes and knowledge, with limited use of vignette methods. To address this gap, an international project developed vignettes explicitly grounded in DSM-5 diagnostic criteria. Each depicted one of the 18 core ADHD symptoms. Thirty-two psychiatrists and clinical psychologists from five European countries evaluated these vignettes for construct validity. Based on feedback, several were revised, and eight additional vignettes were created to capture social functioning difficulties and emotional dysregulation beyond DSM-5 symptoms.

The revised vignettes were piloted with over 1,000 participants. Results showed significant differences in perceptions of commonality and typicality depending on the protagonist's gender. Using network and factor analyses, the set was refined to 12 validated items for efficient application.

Findings highlight the influence of contextual and demographic factors on interpretations of ADHD symptoms, demonstrating the value of vignette methods for capturing nuanced

understandings of behavioral disorders. The developed tool provides a standardized, cross-culturally adaptable method to investigate social perceptions of ADHD, with applications in psychoeducation, stigma reduction, and clinical communication, advancing both assessment practices and applied research.

LONGITUDINAL ASSOCIATIONS BETWEEN COMPLEX POSTTRAUMATIC STRESS DISORDER AND DEPRESSION SYMPTOMS: A FOUR-WAVE STUDY AMONG DE FACTO UNATTENDED CHILDREN IN CHINA

Xu J.*, Xi J., Liang Y.

School of Psychology and Cognitive Science, East China Normal University ~ Shanghai ~ China

Complex posttraumatic stress disorder (CPTSD) is widely comorbid with depression. However, how CPTSD and depressive symptoms interact with each other at the within-person level remains unclear. The current study aimed to conduct a random intercept cross-lagged panel model (RI-CLPM) to explore how depressive and CPTSD symptoms interact with each other during two years among de facto unattended children in China. We collected 4-wave data from 403 de facto unattended children in China over 2 years. The RI-CLPM was conducted to explore the longitudinal relationship between depressive symptoms, PTSD and disturbances in self-organization (DSO) symptoms of CPTSD. The results revealed that (a) depressive symptoms significantly predict PTSD symptoms and DSO symptoms, but CPTSD symptoms did not predict depressive symptoms at the within-person level, and (b) depressive symptoms were stronger predictors of DSO symptoms of CPTSD than PTSD symptoms. Our study suggests that depressive symptoms play a dominant role in maintaining the development of CPTSD among children. Furthermore, DSO symptoms of CPTSD play a key role in the maintenance of comorbid depression and CPTSD. In clinical settings, treating depressive symptoms as a priority target in interventions may improve the effectiveness of interventions for comorbid depression and CPTSD.

Abstract 1305

EFFECTIVENESS OF A SCHOOL-BASED MENTAL HEALTH TRAINING PROGRAMME: THE TRANSFORMATIVE, RESILIENT, YOUTH-LED (TRY) GYM

Yuen W.*[1], Chui R.[1], Chiu C.[1], Fung J.[1], Jiang F.[2], Beryl F.[2]

[1]Hong Kong Shue Yan University ~ Hong Kong ~ Hong Kong, [2]Tung Wah College ~ Hong Kong ~ Hong Kong

Introduction: Adolescent mental health is an escalating concern globally. While approximately one in seven youth aged 10–19 worldwide experience mental health conditions, a survey conducted in Hong Kong revealed that 24.4% of students aged 6–17 has at least one mental disorder. These alarming figures highlight the need for innovative, youth-centred approaches to prevention and improve adolescents' mental health. The Transformative, Resilient, and Youth-Led (TRY) Gym is a school-based, co-creative mental health training programme guided by positive psychology theories and the Positive Youth Development framework. It comprised three phases, including training, self-practice, and implementation of youth-created mental health promotion activities, to enhance adolescents' mental well-being.

Purpose: This study aimed to evaluate the effect of the TRY Gym programme on improving resilience, competence, and overall well-being among Hong Kong secondary school students.

Method: A mixed-methods design was used to assess programme outcomes. Eighty school students were recruited and completed surveys at baseline, post-training, and post-implementation, with 19 interviewed to assess changes in resilience, different domains of competence, and mental well-being. Quantitative data were analysed using ANOVA or Friedman tests, while qualitative responses were thematically coded for emerging insights.

Results: Significant improvements were observed from baseline to post-implementation in social (χ^2=20.22, p<.001), cognitive (χ^2= 13.25, p = .003), and emotional competence (χ^2=9.02, p=.022), resilience (χ^2= 16.050, p=.001), and overall well-being (χ^2= 14.68, p=.002). Additionally, positive changes in emotional competence (r=0.32, p=.004) and resilience (r=0.37, p<.001) were significantly associated with increased mental well-being. Meanwhile, improve in self-compassion was marginally significant associated with post-implementation change in mental well-being Qualitative data highlighted that, beyond gaining mental health knowledge, the co-creative process played a key role in participants' improved mental health.

Conclusions: The positive outcomes of the programme underscores its effectiveness

and a co-creative and youth driven approach in improving mental health among adolescents.

ASSOCIATIONS BETWEEN PERSONAL VALUES AND PROSOCIAL BEHAVIOR IN CHINESE ADOLESCENTS: EVIDENCE FROM A LONGITUDINAL PANEL NETWORK ANALYSIS

Zhang Y.*[1], Lai X.[2], Yang Z.[1], Wang H.[1], Xiang K.[1], Wang Y.[1]

[1]State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University ~ Beijing ~ China, [2]Institute of Digital Education, China National Academy of Educational Sciences ~ Beijing ~ China

Personal values are generally regarded as important motivational goals that influence an individual's prosocial behavior. Concurrently, prosocial behavior can help to internalize corresponding personal values by shaping self-perception and providing positive social feedback, particularly among adolescents who are still developing their values. Existing empirical studies have primarily focused on the unidirectional effects of personal values on prosocial behavior, overlooking potential reciprocal influences. Furthermore, these studies are often constrained by traditional methodologies, such as regression analysis or cross-lagged panel models, and tend to examine only a few values. This makes it challenging to capture the intricate and systematic relationships between various personal values and prosocial behavior. This study used cross-lagged panel network models based on two waves of annual follow-up data from 4,363 adolescents (Mean age = 13.38 years, SD age = 2.51; 51.2% female) to examine the dynamic relationships between the ten personal values proposed by Schwartz's circular model of values (self-direction, stimulation, hedonism, achievement, power, security, conformity, tradition, benevolence, and universalism) and prosocial behavior. Results showed that: (1) prosocial behavior showed the highest out-expected influence and the lowest in-expected influence in the network, suggesting that it primarily influenced personal values rather than being influenced by them. (2) Prosocial behavior exerted primary positive effects on universalism, benevolence, stimulation, self-direction, and achievement. (3) Benevolence and universalism, in turn, were the main personal values that predicted prosocial behavior positively. The findings reveal a bidirectional relationship between personal values and prosocial behavior. This highlights the crucial role of promoting prosocial behavior among adolescents in shaping their personal values. Therefore, encouraging young people to engage in prosocial activities is an effective way of fostering these values.

Abstract 156

SOCIAL STORY TELE-INTERVENTION WITH AFFECTIVE MUSIC TO ENHANCE EMOTIONAL STATE TERMS IN PRESCHOOLERS WITH AUTISM SPECTRUM DISORDER

Huang Y.*[1], Lu H.[2]

[1]Department of Child and Adolescent Psychiatry, Chang Gung Memorial Hospital, Kaohsiung Medical Center ~ Kaohsiung ~ Taiwan, [2]Division of Clinical Psychology, Graduate Institute of Behavioral Sciences, College of Medicine, Chang Gung University ~ Taoyuan ~ Taiwan

Introduction/Purpose: Preschoolers with autism spectrum disorder (ASD) had poor emotional terms. This study examined whether the effectiveness of a social story tele-intervention with affective music (SSTI-AM) in enhancing the expression of emotional state terms (EST) among preschoolers with ASD.

Methods: Twenty-eight preschoolers with ASD aged 5–6 years were included and randomly assigned to the experimental group (n = 14, Mage= 6.07 years) and the control group (n = 14, Mage= 5.91 years). All participants had a nonverbal index score of 80 or above on the WPPSI-IV. The SSTI-AM program consisted of four weekly sessions (one session per week), each lasting 50 minutes, during which emotional state terms—happy, sad, angry, and fear—were taught. Only the experimental group listened to corresponding original music excerpts while learning the emotional terms. The Emotional Lexicon Task (ELT) was used to assess expressive emotional vocabulary at four time points: pre-test, pre-intervention, post-intervention, and follow-up post test.

Results: A two-way mixed-design ANOVA was conducted with group and time as factors. A significant group × time interaction was found for EST accuracy, $F(3,78) = 4.899$, $p = .004$, $\eta p2 = .159$. Simple main effects analysis showed a significant group effect at the post-intervention time point, $F(1, 104) = 4.74$, $p = .032$, $\eta p2 = .044$, with the group receiving affective music scoring higher than the group without music.

Conclusions: The SSTI-AM significantly enhanced the expression of basic emotional state terms in preschoolers with ASD. These findings highlight the potential of SSTI-AM as a distance-friendly and effective approach to enhancing emotional lexicon acquisition in this population.

Abstract 115

FACIAL EMOTION PERCEPTION IN SCHOOL-AGED CHILDREN WITH AUTISM SPECTRUM DISORDER UNDER AFFECTIVE MUSIC CONDITIONS

Liao Y.*[1], Lu H.[2]

[1]Department of Child and Adolescent Psychiatry, Chang Gung Memorial Hospital, Kaohsiung Medical Center ~ Kaohsiung ~ Taiwan, [2]Division of Clinical Psychology, Graduate Institute of Behavioral Sciences, College of Medicine, Chang Gung University ; Department of Child Psychiatry, Chang Gung Memorial Hospital at Linkou ~ Taoyuan ~ Taiwan

Introduction/Purpose: Previous research has shown that individuals with autism spectrum disorder (ASD) exhibit deficits in facial emotion perception (FEP). This study examined the FEP in children with ASD under affective conditions taking age differences into account.
Method: This study included 70 children with ASD (Young: n = 35 ; Mage (SD) = 7.18 (0.42) years; Old: n = 35; Mage (SD) = 9.18 (1.08) years) and 70 typical developing children (TD; Young: n = 35 ; Mage (SD) = 7.64 (0.21) years; Old: n = 35 ; Mage (SD) = 9.52 (1.42) years), all with a Verbal Intelligence Quotient above 70 using PPVT-Chinese version. Participants' FEP was assessed using the Facial Expression Recognition Task, involving 30 photos (10 neutral, 10 happy, 10 angry) presented under three music conditions (none, happy, angry). Photo stimuli and music conditions were counterbalanced across participants, accuracy and reaction time (RT) were recorded.
Results: Two three-way mixed-design ANOVA were conducted with group (ASD vs. TD), age (Young vs. Old), and music condition (none, happy, angry) as independent variables. For accuracy, the three-way interaction was significant in recognizing neutral faces ($F(2, 258) = 6.32$, $p = .002$). Furthermore, the old ASD and young TD groups showed significantly higher accuracy in the happy and angry music conditions compared to the no-music condition. For RT, the main effect of music was significant across the three facial expressions ($F(2,250) = 8.90$, $F(2,270) = 9.78$, $F(2,268) = 8.62$, $ps < .001$), indicating that both groups showed significantly shorter RTs in the music conditions than in the no-music condition.
Conclusion: The study found that FEP in children with ASD improved under affective music conditions. These findings provide empirical support for developing multisensory FEP interventions for school-aged children with ASD.

Abstract 86

NATURAL LANGUAGE PROCESSING OF PERSONAL NARRATIVES REVEALS COGNITIVE AND BEHAVIORAL SIGNATURES OF SELF-COMPASSION

Okano H.*, Nomura M.

Kyoto University ~ Kyoto ~ Japan

Introduction: Self-compassion is a psychosocial resource that associated with resilience, mental health, and performance across clinical, educational, and organizational contexts. For applied psychologists aiming to translate theory into evidence-based interventions, identifying the concrete cognitions and behaviors that constitute self-compassion in daily adversity is essential but remains a challenge. Natural language processing (NLP) applied to large-scale free-text data can capture subtle, context-dependent psychological patterns beyond the reach of traditional rating scales, offering deeper insights for applied practice.
Purpose: This study aimed to identify context-specific cognitive and behavioral patterns distinguish individuals with higher vs. lower levels of self-compassion.
Method: We collected 9,360 free-text narratives from 780 Japanese adults (by 12 prompts regarding thoughts and actions during experiences of suffering, personal shortcomings, and failure). Structural topic modeling was used to extract latent topics from the texts. Regression and network analyses examined links between topic proportions and self-compassion.
Results: Forty-seven interpretable topics emerged. Higher self-compassion was associated with topics characterized by problem-solving orientation, balanced optimism, and flexible self-improvement. Lower self-compassion predicted contrasting topics featuring self-criticism, upward social comparison with envy, depressive affect, and behavioral inaction. Topic prevalence varied by context: balanced optimism predominated during suffering and failure, whereas flexible self-improvement was more frequent in responses to personal shortcomings.
Conclusions: A large-scale, data-driven natural language approach sheds light on how self-compassion manifests across everyday challenges. Identifying context-dependent cognitive and behavioral signatures provides actionable targets for tailored interventions and demonstrates the value of integrating NLP into applied psychological research and practice.

BEYOND SYMPTOMS: INTEGRATING QUALITY OF LIFE IN THE EVALUATION OF PSYCHOLOGICAL INTERVENTIONS

Carpallo--González M.*[1], Doval Moreno S.[2], Tavira--Sánchez F.J.[3], Fausor R.[3]

[1]Department of Personality, Assessment and Psychological Treatments, Faculty of Psychology. Universitat de València. Valencia, Spain ~ Valencia ~ Spain, [2]Faculty of Health, International University of La Rioja (UNIR) ~ La Rioja ~ Spain, [3]Faculty of Health, Valencian International University (VIU), 46002, Valencia, Spain ~ Valencia ~ Spain

Introduction: The most prevalent emotional disorders in the general population—such as depression, anxiety, and somatization—exert a substantial impact on well-being and impose a considerable burden on healthcare systems. Traditionally, both research and clinical practice have emphasized symptom reduction as the primary indicator of therapeutic success and treatment efficacy. However, this approach is insufficient to capture subjective well-being and the broader impact on daily functioning. Quality of life (QoL), defined by the World Health Organization as an individual's perception of their position in life in relation to their cultural context, values, goals, and expectations (WHOQOL Group, 1994), represents a multidimensional construct encompassing physical health, psychological status, social relationships, and environmental factors.

Purpose: The present work aims to highlight the need to integrate QoL as a key outcome measure in the evaluation of psychological interventions, complementing traditional symptom-based assessments.

Method: A systematic review with exploratory elements was conducted across PubMed, PsycINFO, and Web of Science databases. Studies published between September 2015 and September 2025 addressing large-scale psychotherapy programs implemented in healthcare contexts were included.

Results: The systematic review identifies relevant studies examining the outcomes of including QoLmeasures. EUROHISQoL and WHOQOL-BREF are the most cited instruments.The increasingly used in recent research to provide a multidimensional appraisal of QoL, is underscored.

Conclusions: The systematic incorporation of QoL into clinical evaluation is expected to yield a more comprehensive understanding of the real-world impact of psychological interventions, moving beyond the sole reduction of psychopathological symptoms. Positioning QoL as a central outcome will generate valuable insights into the physical, psychological, social, and environmental dimensions that shape overall well-being, thereby advancing a more integrative and patient-centered approach in clinical practice.

Abstract 2107

MACHINE LEARNING MODELS FOR PREDICTIVE ASSESSMENT OF PSYCHOLOGICAL DISTRESS IN CRISIS CONTEXTS

Doval Moreno S.*[1], Fausor R.[2], Carpallo--González M.[3], Tavira--Sánchez F.J.[2]

[1]Faculty of Health, International University of La Rioja (UNIR) ~ La Rioja ~ Spain, [2]Faculty of Health, Valencian International University (VIU), 46002, Valencia, Spain ~ Valencia ~ Spain, [3]Department of Personality, Assessment and Psychological Treatments, Faculty of Psychology. Universitat de València. Valencia, Spain ~ Valencia ~ Spain

Introduction: Psychological distress has emerged as a significant public health concern during health crises, with prevalence rates reaching 25-45% globally. Traditional statistical methods present limitations in capturing complex non-linear interactions between multiple predictive variables. Machine learning (ML) techniques offer enhanced sensitivity for detecting patterns and developing clinically applicable predictive models.
Purpose: To develop and validate ML models for identifying the most predictive factors of psychological distress during health crises in adult populations, comparing eight different algorithms through systematic evaluation.
Method: Data from 1,605 adult participants from Madrid collected during a major health crisis were analysed. Psychological distress was assessed using the GHQ-12 questionnaire. Forty-five predictor variables were organized into seven theoretical categories: sociodemographic, economic, social, health exposure, institutional evaluations, specific health concerns, and housing conditions. Eight ML algorithms were compared using hyperparameter optimization and stratified cross-validation to select the optimal model.
Results: Psychological distress prevalence was 54.1%. LightGBM emerged as the best-performing algorithm, achieving an F1-Score of 0.707 and sensitivity of 77%. Economic factors dominated predictive capacity (26.1% of total importance), with personal economic concerns as the most relevant predictor. These were followed by institutional management evaluations (19.9%) and specific health-related concerns (17.5%). Psychosocial and economic factors predominated over direct health exposure.
Conclusions: ML models, particularly LightGBM, demonstrated clinically useful predictive capacity for identifying individuals at risk of psychological distress. The predominance of psychosocial and economic factors over direct exposure suggests that preventive interventions should focus on economic and social support during future health crises.

SUPPORTING PSYCHOLOGISTS IN THE DIGITAL ERA: USABILITY EVALUATION OF LOOMEE HEALTH

Fausor R.*[1], Tavira--Sánchez F.J.[1], Carpallo--González M.[2], Doval Moreno S.[3]

[1]Valencian International University (VIU) ~ Valencia ~ Spain, [2]Europe University of Madrid ~ Madrid ~ Spain, [3]Faculty of Health, International University of La Rioja ~ La Rioja ~ Spain

Introduction: Digital transformation in mental healthcare requires platforms that integrate effectively into clinical workflows. LOOMEE Health is a SaaS platform combining administrative management and clinical tools for psychology professionals, supporting blended therapy approaches.

Purpose: To evaluate the usability and acceptance of LOOMEE Health among clinical psychology professionals during initial onboarding and explore user experience patterns.

Method: Clinical psychologists with varying experience levels (0 - >10 years, primarily cognitive-behavioural orientation) participated in a usability assessment during platform onboarding. Data collection included the System Usability Scale (SUS), perceived utility ratings (1-5 scale), learning time assessment, and qualitative feedback on first impressions, missing features, and overall platform evaluation.

Results: Most participants achieved platform competency in under one hour. SUS scores demonstrated above-average usability performance, with perceived utility ratings averaging 4.1/5. The total score of SuS was 83.43, considered acceptable. Participants consistently rated the platform's visual design positively, highlighting a clean interface and intuitive organization. Key strengths identified included a detailed evidence-based resource library (600+ materials), an integrated calendar system, and structured intervention planning. Areas for improvement included enhanced colour differentiation and expanded resource categories for specific populations.

Conclusions: LOOMEE Health demonstrates strong usability characteristics with rapid learning curves and high user acceptance among clinical psychologists. The platform successfully integrates administrative and clinical functions while maintaining workflow efficiency. Results support the platform's potential for widespread adoption in clinical psychology practice, with targeted improvements enhancing user experience across diverse professional profiles.

Abstract 2120

CO-CONSTRUCTING KNOWLEDGE ON ASYLUM SEEKERS' WELLBEING: A PARTICIPATORY PHOTOVOICE STUDY IN ITALIAN EMERGENCY RECEPTION CENTERS

Forcella M.*[1], Ceccon C.[1], Costa S.[2], Pirchio S.[3], Miconi D.[4], Moscardino U.M.M.[1]

[1]University of Padova ~ Padova ~ Italy, [2]Università Roma Tre ~ Roma ~ Italy, [3]La Sapienza University of Rome ~ Roma ~ Italy, [4]Université de Montréal ~ Montréal ~ Canada

Introduction

Global conflicts have displaced millions, raising concern about migrants' mental health (Pelletier et al., 2024). Although many studies highlight the role of living conditions in host countries, few examined how different asylum policies and reception practices affect well-being (MacFarlane et al., 2024; WHO, 2022). This is especially relevant in Italy, where recent reception reforms have reduced access to legal, educational, and psychological support, increasing the need for local-level knowledge on how structural and social determinants shape migrants' well-being (UNHCR, 2023).

Purpose

Within this context, Photovoice emerged as a valuable participatory action research (PAR) method, used with migrant communities to promote critical reflection, power-sharing, and communication (Cubero et al., 2024; MacFarlane et al., 2024; Wang & Burris, 1997). This study aims to explore how young adults seeking asylum in Italy represent their experiences, while co-producing knowledge to inform interventions and policy development.

Methods

42 male participants (Mage = 27; 36% from Western African and 32% from Northern African countries) participated in five Photovoice groups in Padua and Rome. Over six weekly workshops, participants took photographs and discussed how legal status and reception conditions affected their well-being. Themes were identified collaboratively and further analyzed by academic researchers. Three participatory circles were also held to co-design advocacy actions, including public exhibitions and conference contributions.

Results

The 204 photographs show prolonged uncertainty, isolation, and systemic exclusion. Participants described life as a state of "limbo", but also highlighted social connections, routines, and cultural learning as protective factors. They called for more inclusive educational and social opportunities.

Conclusions

Photovoice proves to be a powerful tool for generating community-based knowledge, centering affected voices, and informing inclusive policies and interventions. By actively

involving participants in the research and dissemination process, this approach promotes empowerment and contributes to rethinking reception practices from the perspective of those directly affected.

Abstract 2172

TOWARD A CULTURALLY ADAPTED MODEL OF PSILOCYBIN-ASSISTED PSYCHOTHERAPY: POTENTIAL MECHANISMS FOR ADDRESSING THE PSYCHONEUROIMMUNOLOGICAL CONSEQUENCES OF ACCULTURATION STRESS IN LATINX IMMIGRANTS

Gonzalez--Alonso M.*

Columbia University, Teachers College ~ New York ~ United States of America

Latinx immigrants account for nearly half of the foreign-born population in the United States, with more than 20 million individuals residing in the country. Although they often arrive with similar overall health to U.S.-born individuals, research shows that over time the cumulative burden of stressors before, during, and after migration—persisting as acculturation stress—frequently leads to a decline in both mental and physical health that worsens with years spent in the U.S. and across generations. Stressors such as discrimination, language barriers, legal concerns, identity conflicts, and social isolation compound risk for depression, anxiety, posttraumatic stress disorder (PTSD), substance use disorders, diabetes, and cardiovascular disease. Despite these needs, Latinx immigrants remain underrepresented in treatment, being 40% less likely to access care and nearly 70% more likely to discontinue services after the first visit.

Acculturation stress undermines psychological well-being and also produces psychoneuroimmunological (PNI) consequences, including dysregulation of the hypothalamic-pituitary-adrenal axis, disrupted cortisol rhythms, and elevated inflammatory markers such as CRP and IL-6, which increase vulnerability to chronic disease. However, few interventions address both the psychological and biological effects of acculturation.

Psilocybin-assisted psychotherapy (PAP) has emerged as a promising approach, with evidence of rapid and sustained improvements in PTSD, depression, and substance use after only one or two treatments. It has also shown potential for alleviating racial trauma, reducing identity-based stigma and shame, and fostering belonging, self-compassion, and stronger ethnic identity among marginalized groups. Early findings further suggest psilocybin may help restore healthy HPA and immune stress responses by promoting neuroplasticity, enhancing network connectivity, and reducing pro-inflammatory biomarkers.

By integrating psychological and biological evidence, this poster presents the potential of a culturally adapted PAP intervention for addressing acculturation stress and its associated health consequences in Latinx immigrants. It provides a conceptual

framework for future research and encourages dialogue on reducing health disparities in underserved communities.

Abstract 2109

DIGITAL TRANSFORMATION IN MENTAL HEALTH: CHATBOTS AS DIAGNOSTIC AND THERAPEUTIC SUPPORT TOOLS

Morales Gil I.*[1], Arribas--GarcÍa S.[1], Doval Moreno S.[1], Fausor R.[2], José Miguel G.[3], Inés M.[4], Macarena Q.[5], Francisco Javier Q.G.[6]

[1]Faculty of Health, International University of La Rioja (UNIR) ~ Madrid ~ Spain, [2]International University of Valencia ~ Valencia ~ Spain, [3]Cabueñes University Hospital ~ Gijón ~ Spain, [4]Niño Jesús University Hospital ~ Madrid ~ Spain, [5]Francisco de Vitoria University ~ Madrid ~ Spain, [6]Complutense University of Madrid ~ Madrid ~ Spain

Introduction: The growing demand for mental health care and limited access to specialized services have driven the development of AI-based digital solutions. Conversational chatbots emerge as promising diagnostic and therapeutic support tools, yet their clinical effectiveness and safety requirements remain under investigation.
Purpose: To analyse the current state of AI-powered chatbots in mental health, examining their effectiveness, technical requirements, and user/professional perceptions as complementary tools in clinical practice.
Method: A narrative review with exploratory elements was conducted across PubMed, PsycINFO, and Web of Science databases. Studies published between August 2019 and August 2025 addressing AI applications in mental health, specifically chatbots for diagnostic or therapeutic support, were included. Search terms combined artificial intelligence, conversational agents, mental health, and clinical processes. After duplicate removal and screening, 26 studies were analysed.
Results: The review included 11 randomized controlled trials, 6 systematic reviews, 7 observational studies, and 2 technical development studies. Evidence shows modest but consistent positive effects on depressive and anxiety symptoms, with small-to-moderate effect sizes in short-term interventions. Rule-based systems demonstrated good adherence and structured outcomes, while generative models showed greater conversational flexibility but required enhanced safety protocols. Critical limitations include lack of robust clinical validation, interpretation errors, and inability to manage crisis situations autonomously. Users valued accessibility and privacy, while professionals emphasized the need for complementary rather than substitutive use.
Conclusions: Chatbots show potential for transforming mental health care access but require rigorous evaluation, safety protocols, and clear regulatory frameworks. Implementation demands technical safeguards, clinical supervision, and ethical guidelines ensuring responsible integration into healthcare systems while maintaining human clinical judgment as fundamental.

Abstract 2035

DEPRESSIVE SYMPTOMS AND EMPLOYMENT STATUS CHANGE IN SOUTH AFRICA: A LONGITUDINAL STUDY

Muchemwa M., Sodi T.*

University of Limpopo ~ Sovenga ~ South Africa

Depression is a growing public health concern in South Africa, particularly as the nation faces high unemployment rates and fluctuations in the labour market. This study examines the association between changes in employment status and levels of depression in South Africa over time. Using longitudinal data from the National Income Dynamics Study (NIDS) Waves 1–5 (2008–2017), we assess how transitions in employment—such as moving from employment to unemployment, unemployment to employment, and continuous unemployment—affect individuals' mental health. Results indicate that individuals who transitioned from employment to unemployment were more likely to experience depressive symptoms compared to those who remained continuously employed (OR = 1.202). Those who were continuously unemployed had an increased likelihood of experiencing depressive symptoms compared to continuously employed individuals (OR = 1.172). Individuals who transitioned from being unemployed to employed had higher depressive symptoms compared to the continuously employed (OR = 1.097). These findings highlight the mental health risks associated with employment status change. Targeted mental health support, such as counselling and therapy, is needed for both long-term unemployed individuals and newly employed workers. This support can be delivered through community-based mental health programmes and the integration of mental health services within the workplace.

Abstract 1478

"THEY DON'T LOOK AT YOU AS A PERSON, THEY LOOK AT YOU AS A PROBLEM": ADOLESCENT PERSPECTIVES ON MENTAL-HEALTH HELP-SEEKING

Golding J.*, Freire M., Gauld C., Liddell B.

The University of Newcastle ~ Newcastle ~ Australia

Introduction

Mental health problems are prevalent in adolescence, yet one in three adolescents do not seek help. There is a dearth of research on adolescent help-seeking that incorporates perspectives from adolescents themselves. It is important to understand adolescent beliefs about mental health help-seeking to promote service uptake and earlier intervention for mental health problems.

Purpose

This study investigates adolescents' underlying beliefs about mental health help-seeking.

Method

We conducted focus groups at high schools with adolescents aged 14-18 years old. Using the Theory of Plan Behaviour (Ajzen, 1991), focus group discussions explored attitudes, subjective norms and control beliefs regarding mental health help-seeking. We also sought to understand perspectives on mental health intervention preferences. Qualitative data was analysed thematically, using NVivo, to identify perceived barriers and facilitators to mental health help-seeking.

Results

Several core themes emerged. Exploration of attitudes towards mental health help-seeking suggested that mental health literacy, stigma and gender roles were key factors that would influence help-seeking. Approval from family and friends was viewed as a strong facilitator of mental health help-seeking, with approval of parents being particularly important. Negative consequences to seeking help (e.g. dismissal, judgment, confidentiality breach) were viewed as prohibitive to help-seeking. Control belief themes relating to autonomy and mental health literacy were deemed to facilitate mental health help-seeking, however a perceived lack of control over practical aspects such as transport or financial resources were seen to preclude access to professional services, particularly in the absence of parental support. Adolescent preferences for

interventions involved relatability, anonymity, online delivery, peer design and/or leadership.

Conclusions

Understanding adolescent underlying beliefs about mental health help-seeking is crucial to improving access to mental health services and promoting earlier intervention. These findings provide valuable adolescent perspectives on barriers and facilitators to mental health help-seeking.

Abstract 1434

CONNECTING WITH NATURE, CONNECTING COMMUNITIES: PROMOTING ADOLESCENTS' WELL-BEING IN INTERCULTURAL CONTEXT.

Madera F.*[1], Olcese M.[1], Cardinali P.[2], Migliorini L.[1]

[1]Department of Educational Science, University of Genoa ~ Genoa ~ Italy, [2]Department of Human and Social Science, Mercatorum University ~ Rome ~ Italy

Introduction

Rising urbanisation, environmental crises, and increasing psychosocial distress among young people intersect with migration-related experiences, which may further challenge social bonds and well-being. These overlapping pressures highlight the need to understand protective factors and local dynamics through context-sensitive approaches in order to strengthen inclusion and support positive development in diverse communities. In this context, nature connectedness has emerged as a promising protective factor, yet its role among adolescents from migrant backgrounds remains under-explored.

Purpose

This study investigates how nature connectedness may support stress reduction, psychological well-being, and sense of community, aiming to inform inclusive and sustainable interventions for young people.

Method

A total of 400 adolescents—both with and without migrant background—from disadvantaged neighborhoods completed self-report measures assessing nature connectedness, perceived stress, psychological well-being, and sense of community. A mixed-methods approach was adopted: quantitative data were analysed using person-centred techniques to identify distinct profiles of connection and well-being, while a parallel community assessment provided contextual insights to support interpretation and practical relevance.

Results

Preliminary results suggest that adolescents with stronger nature connectedness experience lower stress levels, higher well-being and a stronger sense of community. Person-centred profiles reveal significant differences between highly and less-connected individuals. The analyses were supplemented by a community assessment to better understand contextual factors and also examined differences between adolescents with and without a migrant background.

Conclusions

The study identifies nature connectedness as a socially relevant factor linked to youth well-being, stress, and sense of community. The distinct patterns observed across migrant and non-migrant adolescents emphasise the importance of considering

ecological and social contexts, supported by a community assessment, when designing initiatives for young people. These findings may offer valuable insights for aligning interventions with Sustainable Development Goals, particularly Good Health and Well-Being, Quality Education, and Sustainable Cities and Communities, to foster inclusive and collective well-being.

Abstract 1427

DOES GROUP PSYCHOTHERAPY WORK FOR ALL? A TYPOLOGY OF ADOLESCENTS AND YOUNG ADULTS ATTENDING GROUP PSYCHOTHERAPY

Sabatella F.*, Von Wyl A., Wehrli R.M.

ZHAW ~ Zürich ~ Switzerland

Introduction. Unemployment during adolescence and young adulthood presents significant societal and individual challenges, negatively impacting social structures and personal well-being. A key issue is the transition from compulsory education to further education and employment. Not all emerging adults successfully navigate this transition. In Switzerland, vocational integration programs ("motivational semesters") aim to bridge this gap. However, participants in these programs often show elevated levels of psychological distress or mental health disorders. We therefore designed a group psychotherapy implemented in vocational integration programs.
Purpose. The present study therefore aims to explore how adolescents experience group psychotherapy. By identifying distinct typologies, this research seeks to inform clinical practice: to better understand for whom group therapy is effective, and for whom it may not be the best fit.
Method. The sample of the main study comprised 231 adolescents and young adults. It was a longitudinal study wir pre, post and follow up measurements. 139 took part in the interviews conducted at t1 when the adolescents and young adults left the program. Several interviews had to be excluded. The total sample size therefore consisted of 119 interviews. The collected transcripts were initially analyzed using focused content analysis, followed by a type-forming analysis.

Results. Five types of different adolescent group experiences were formed from the interviews: The group-oriented emotional type, the self-oriented observant type, the self-oriented rational type, the negatively evaluated type and the group-oriented altruistic type.

Conclusions. Our analysis revealed that not all participants profit at the same level from group psychotherapy, and that their experience can vary among the different types. These findings give a deeper insight into group psychotherapy for emerging adults

Abstract 1570

THE PREDICTIVE ROLE OF EMOTION DYSREGULATION AND PROBLEMATIC MOBILE PHONE USE AMONG CHINESE ADOLESCENTS: A CROSS-SECTIONAL AND CROSS-LAGGED NETWORK ANALYSES

Yang Z.*[1], Luo X.[2], Zeng H.[3]

[1]Beijing Normal - Hong Kong Baptist University ~ Zhuhai ~ China, [2]Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [3]Guangzhou University ~ Guangzhou ~ China

According to the compensatory internet use theory, adolescents with emotional dysregulation may increasingly rely on mobile phones to alleviate negative emotions. Conversely, problematic mobile phone use (PMPU), which has been identified as a behavioral addiction, can impair emotional processing and regulation abilities, potentially creating a vicious cycle. However, previous studies have explored PMPU and emotional regulation using latent variables. To address this gap, this study employed network analysis to (i) examine cross-sectional networks of adolescents' PMPU and emotional dysregulation symptoms and evaluate their replicability and (ii) explore their longitudinal cross-lagged comorbidity network. A sample of 1,527 students from grades 7 and 11 (M = 15.16, SD = 1.68) completed questionnaires on PMPU and emotional dysregulation at two time points spaced six months apart. The Problematic Mobile Phone Use Scale and the Brief Emotional Regulation Difficulty Scale were used to measure the symptoms of PMPU and emotional dysregulation, respectively. The study found that adolescents' emotional dysregulation directly influenced their PMPU. Additionally, lack of emotional clarity (a dimension of emotional regulation difficulties) and withdrawal symptoms (a dimension of PMPU) demonstrated the greatest predictive power within the comorbidity network, while limited access to emotion regulation strategies had the highest in-strength centrality. This study enriches the understanding of the dynamic association between PMPU and emotional dysregulation among adolescents, and emotional dysregulation was identified as a key factor influencing PMPU among adolescents. Developing prevention and intervention programs that target these core influencing factors would be more cost-effective.

Abstract 725

DEVELOPMENT AND VALIDATION OF THE PARTNER RUMINATION SCALE

Machado D., Dozois D.*

University of Western Ontario ~ London, Ontario ~ Canada

Decades of research demonstrate clear bidirectional — and likely cyclical — links between depression and relationship distress; however, the precise mechanisms underlying this association remain unclear (Whisman et al., 2021). Rumination (the tendency to focus on negative thoughts and emotions in a repetitive and perseverative manner) has been studied extensively and is associated with both depression and relationship distress. Investigating this construct in an interpersonal context, however, may better elucidate the role rumination plays in both outcomes. This presentation focuses on the development and validation of the Partner Rumination Scale (PRS), a novel measure that assesses the proclivity to ruminate about a romantic partner. This instrument is comprised of 20 items (e.g., “I often have trouble letting go of negative thoughts about my partner; I think a lot about my partner’s flaws”). The PRS showed excellent internal consistency (Cronbach’s alpha = .95) and test-retest reliability (r = .81). Evidence of convergent and discriminant validity was demonstrated through correlations with several existing measures of rumination, an index of depressive symptom severity, and numerous instruments of relationship-related constructs. Exploratory factor analyses yielded a one-factor model that was supported via confirmatory factor analysis and cross-validated in an independent sample. Finally, the incremental validity of the PRS over two existing measures of rumination was supported in a representative sample of individuals with past depression. This study is the first to link partner rumination to depression, and the findings support the use of the PRS in both mood and relationship-specific contexts. The implications for research and practice will be discussed.

TITLE: BIZI PROGRAMME: AN INTERACTIVE, SELF-MANAGED AND OPEN-ACCESS ONLINE COURSE TO PROMOTE SUICIDE PREVENTION IN COMMUNITY SETTINGS

Muela Aparicio A., Eguren Ikazuriaga A.*

University of the Basque Country ~ Donostia San Sebastián ~ Spain

Abstract

Introduction: Suicide is a major public health issue affecting individuals across all demographics. Despite growing awareness, many community members lack the training necessary to identify and respond to individuals at risk. This highlights a critical gap in suicide prevention strategies: the need to empower non-clinical individuals to act as effective gatekeepers.

Purpose: The aim of this project was to design, implement, and evaluate BIZI, an accessible, evidence-based, online training program intended to equip the general population with the knowledge and skills required to recognize suicide warning signs and intervene appropriately.

Method: Developed by a multidisciplinary team from the University of the Basque Country, in partnership with Osakidetza and third-sector organizations, BIZI is a fully online, self-paced training program. The program comprises approximately 9 hours of content, including theoretical modules and four interactive, decision-based case scenarios. Data on completion rates, participant feedback, and self-reported learning outcomes were collected and analyzed.

Results: To date, BIZI has trained over 4,000 individuals, including teachers, social workers, and other community members. The program achieved an 86% completion rate. Participants reported significant improvements in suicide-related knowledge, confidence in responding to risk, and long-term retention of intervention strategies. The program's accessibility and no-cost model have contributed to its high engagement and broad reach. BIZI has also received recognition from the European Parliament as an innovative and scalable approach to suicide prevention.

Conclusions: BIZI demonstrates that community-based, online training programs can play a vital role in suicide prevention by bridging the gap between awareness and action. Its success underscores the potential for large-scale implementation across Europe, particularly in rural regions. Universities and public institutions have a critical role in promoting and expanding such initiatives, making suicide prevention a collective and achievable priority.

TOWARDS SENSITIVITY IN MENTAL HEALTH CARE: A QUALITATIVE STUDY ON THE PERSPECTIVES OF PATIENTS AND PROFESSIONALS

Goorden P.*, Uysal--Bozkir Ö., Hiemstra A., Truijens F., Denktas S.

Erasmus University Rotterdam ~ Rotterdam ~ Netherlands

Introduction: In increasingly diverse societies, mental health care must move beyond standardized, protocol-driven approaches to meet the needs of all patients (Wampold et al., 2017; Westen et al., 2004). Sensitivity challenges the assumption of uniformity in treatment and emphasizes person-centred care (McLeod & Elliot, 2011; Slade, 2009). It is essential for reducing disparities in mental health outcomes, particularly among psychologically diverse populations (Powell, 2015). Psychological diversity refers to complex clinical presentations such as comorbidity, chronicity, and non-linear recovery trajectories (Slade, 2009). Despite growing attention, little is known about how sensitive care translates into everyday practice and how patients and professionals define it.

Purpose: This study explores the perspectives and experiences of patients and mental health professionals regarding psychologically sensitive care, aiming to identify gaps and opportunities to improve education, postgraduate training, and practice, ultimately promoting more equitable and inclusive care.

Method: This qualitative study will be conducted in the Netherlands with two groups: mental health patients with complex psychological needs and professionals working with this population. An expert group will inform topic lists and help interpret findings to ensure clinical relevance. Data will be gathered through (1) semi-structured interviews with former patients and (2) focus groups with professionals. Sampling will aim for variation in diagnoses, roles, and settings. Data will be analysed thematically.

Results, conclusion and discussion: Data collection is expected to be completed before March 2026. Analysis and discussion will focus on identifying challenges to implement sensitive care in everyday practice, strategies used by professionals to navigate psychological complexity, and points of alignment and divergence between patients and professionals perspectives. The study aims to promote equitable care by providing recommendations for professionals and educators to improve sensitivity in mental health care for psychologically diverse populations.

EPISTEMIC TRUST IN PSYCHOTHERAPY: A SYSTEMATIC REVIEW

Koçyigit H.*, Yilmaz T.

Marmara University ~ Istanbul ~ Turkey

Epistemic trust (ET), the ability to evaluate and accept knowledge from others, has gained increasing recognition as a core process in psychotherapy. Disruptions in this capacity, often rooted in early adverse experiences, can reduce patients' openness to therapeutic input and limit treatment gains. This systematic review synthesizes 17 empirical studies (2014–2024) that investigated epistemic trust across diverse psychotherapies, including mentalization-based treatment, psychodynamic therapy, and multimodal rehabilitation. Findings highlight epistemic trust as both a mechanism of therapeutic change and an outcome of successful intervention, closely tied to alliance formation, engagement, and symptom improvement. Measurement approaches varied widely: self-report tools such as the ETMCQ and observational systems such as the ETRS demonstrated promising validity, yet methodological heterogeneity and limited cross-study comparability remain challenges. Importantly, current observational methods are still in early stages and require refinement to capture the dynamic, interactional, and culturally embedded nature of ET in psychotherapy. Notably, most studies relied on WEIRD samples, with underrepresentation of children, older adults, and non-Western populations. ET is emerging as a clinically actionable and transdiagnostic construct that underpins alliance, engagement, and outcomes across psychotherapies. Future research should adopt longitudinal, culturally sensitive designs to clarify developmental trajectories of ET and its role in sustaining therapeutic change.

INVESTIGATING THE INFLUENCE OF BILINGUAL EXPERIENCE ON COGNITIVE RESERVE VIA SEMANTIC NETWORK ANALYSIS

Kuo T.*, Chen H.

Tsai-Wei, Kuo ~ Taichung ~ Taiwan

Purpose: Bilingual proficiency may be one of the contributing factors to cognitive reserve, and bilingual experience appears to influence not only language itself but also general cognitive functions and the neural networks that support both language and cognition. In older adults, semantic networks tend to be smaller, have lower semantic associations, higher density, and deviate from small-world characteristics. Analyzing the structural features of semantic networks may help describe and predict cognitive performance in aging populations and distinguish between normal and pathological aging. This study employed semantic network analysis to examine differences in cognitive reserve between bilingual and monolingual older adults. It was hypothesized that bilingualism has a positive impact on cognitive reserve in later life. Methods: A total of 200 community-dwelling older adults aged 65 and above were recruited from central and southern Taiwan. Using a quasi-experimental design (non-randomized between-subjects variable: bilingual vs. monolingual), participants completed the Cognitive Reserve Index questionnaire (CRIq), the Mini-Mental State Examination (MMSE), and the Montreal Cognitive Assessment (MoCA) to assess their cognitive function. During testing, a Semantic Fluency Test was also administered to collect semantic network data, which was analyzed using Snafu software. Hierarchical multiple regression analysis was conducted to test the study hypotheses. Results: Bilingual older adults outperformed monolingual peers in cognitive function measures (MoCA, MMSE) and showed higher cognitive reserve scores (CRIq). Their semantic networks also resembled those of individuals with higher cognitive reserve—characterized by a greater number of nodes, higher average node degree (semantic association), and lower network density. Conclusion: Findings suggest that bilingual experience positively contributes to cognitive reserve in older adults. Bilingualism may enhance cognitive functioning and help delay age-related cognitive decline.

Abstract 609

THE IMPACT OF BORDERLINE PERSONALITY FEATURES ON DEPRESSION: A SERIAL MEDIATION MODEL OF EMOTION DYSREGULATION AND PERCEIVED BURDENSOMENESS

Yeh Z.T.*

Zai Ting Yeh ~ Taipei ~ Taiwan

Purpose: The features characteristic of Borderline Personality (BPF) encompass instability in interpersonal relationships, self-perception, and emotional expression, with emotional dysregulation as a central component. This instability can lead to interpersonal challenges and an increased perception of burdensomeness (PB), where individuals view themselves as burdens to others. This perception is a recognized form of interpersonal stress and a significant predictor of depressive states. This study aims to clarify the relationship between BPF and depression, specifically investigating the sequential mediating effects of emotional dysregulation and perceived burdensomeness. Methods: A cohort of 339 participants, aged 18 to 30, was recruited for the study. Each participant completed the Personality Assessment Inventory – Borderline Features Scale (PAI-BOR), the Difficulties in Emotion Regulation Scale (DERS), the Interpersonal Needs Questionnaire (INQ), and the Beck Depression Inventory-II (BDI-II). Spearman's correlation analysis was employed to assess the interconnections between variables, while regression analysis was used to determine the predictive capacity of each variable. Additionally, mediation analyses were conducted to evaluate the mediating role of emotional dysregulation in the relationship between Borderline Personality Features and perceived burdensomeness, as well as the sequential mediation effects of emotional dysregulation and perceived burdensomeness in the relationship between Borderline Personality Features and depression. Results: The study produced four key findings: (1) BPF is a positive predictor of both PB and depression. (2) PB is a positive predictor of depression. (3) Emotional dysregulation acts as a mediator between BPF and PB. (4) Emotional dysregulation and PB sequentially mediate the relationship between BPF and depression. Conclusions: This research highlights the mediating roles of emotional dysregulation and perceived burdensomeness in the context of Borderline Personality Functioning (BPF) and depression, providing valuable insights into the mechanisms underlying the comorbidity of these conditions. Future longitudinal studies are recommended to further explore the causal pathways among these variables.

Abstract 2292

A REAL-WORLD SAFETY AND EFFECTIVENESS STUDY OF PSILOCYBIN THERAPY IN OREGON: A PRELIMINARY REPORT

Gordon Alexandra R.*, Kronman H., Carrithers Brennan M., Liftin S., Goldway N., Ross S., Pagni Broc A., Zeifman R.

NYU Grossman School of Medicine ~ New York ~ United States of America

Background:
Clinical trials have shown that psilocybin therapy with psychological support can improve depression, anxiety, and well-being. However, concerns have been raised that findings from clinical trials may not generalize to real-world practice due to exclusion criteria, sampling bias, controlled environments, and limited participant diversity. Oregon's Psilocybin Services Act established the first legal framework for psilocybin therapy outside clinical trials, providing a unique opportunity to evaluate outcomes in community settings. This ongoing longitudinal study assesses the real-world safety and effectiveness of psilocybin therapy and examines factors associated with therapeutic outcomes across multiple follow-up periods.

Methods:
Up to 3,000 adults receiving psilocybin therapy from licensed facilitators across 10 treatment sites in Oregon are being enrolled prior to treatment and followed for 12 months through online assessments. The primary outcome is well-being (WHO-5) at the primary endpoint of one month post-treatment. Secondary outcomes include depression (PHQ-9), anxiety (GAD-7), and psychological flexibility (Psy-Flex), with additional disorder-specific measures based on clinical presentation (e.g., borderline personality disorder, posttraumatic stress disorder, substance use). Safety is tracked throughout using the Swiss Psychedelic Side Effects Inventory (SPSEI) and measurement of symptom exacerbation. Acute experiences are assessed with the Mystical Experience Questionnaire, Emotional Breakthrough Inventory, and Challenging Experience Questionnaire. Analyses include ANCOVAs and linear mixed-effects models controlling for baseline characteristics, and latent variable modeling to identify predictors and mechanisms of change. The study also examines variation in psychotherapeutic approach and level of psychological support, offering insight into process factors that influence outcomes and guide training.

Results:
Data collection is ongoing. Preliminary findings on feasibility, safety, and early effectiveness outcomes will be presented.

Conclusions:
This first large-scale, multi-site, prospective evaluation of psilocybin therapy in naturalistic practice will generate crucial real-world evidence. Findings will guide safe implementation, refine therapeutic frameworks, inform training and regulation, and advance applied psychological science in psychedelic-assisted therapy.
