Applied Psychology addresses current and relevant issues such as (but not limited to) work, the environment, health, education, society, and political participation, while paying close attention to both individual and collective concerns, all driven by the major challenge of global sustainability.

The International Association of Applied Psychology (IAAP), a long-established international scientific association, comprising 18 divisions, involves academics, experts, professionals, and students from across the globe to gather and share experiences, insights, and scientific contributions, aiming to tackle the challenges and future directions of psychological practice.

The last few years have seen the UN 2030 agenda push forward Sustainable Development Goals (SDGs), dealing with epistemological, methodological, ethical, and professional implications for the psychology profession and practice across its various fields. These issues were the focus of the 31st ICAP 2026 (International Congress of Applied Psychology), hosted in Florence from July 21 to 25 2026, promoted by IAAP together with AIP (Italian Association of Psychology) and the Universities of Bergamo, Milano Cattolica, Firenze.

The contributions gathered in this volume reflect the richness and diversity of experiences showcased during the Congress, giving access to the abstracts of the researchers' interventions representing over 90 countries, coming from all the continents.

This broad spectrum of studies highlights promising directions that can inspire new trajectories and inquiry's paths for contemporary applied psychology practice.

ANNAMARIA DI FABIO, PHD, is full professor of Work and Organizational Psychology at the Department of Education and Psychology (Psychology section) at University of Florence. Her international profile encompasses studies on sustainability, decent work and career counseling

EDOARDO LOZZA, PHD, is full professor of Economic Psychology and Consumer and Marketing Psychology at the Faculty of Psychology at Catholic University in Milan. He authored scientific publications in the fields of economic psychology, consumer psychology and marketing research.

GIUSEPPE SCARATTI, PHD, is full professor of Work and Organizational Psychology at the Department of Human and Social Science at University of Bergamo.His scientific activity is about organizational learning and qualitative methodologies for the study of organizational life.

PEOPLE @ WORK: EMERGING TOPICS IN ORGANIZATIONAL PSYCHOLOGY

Wednesday 22 July 2026 from 08:00 to 09:30

(R-Arsenale)

Pedro Neves (Nova School of Business and Economics ~), Chair
Alex Newman (Melbourne Business School ~ Melbourne ~), Discussant

The workplace has undergone dramatic changes in the past few years. From remote and hybrid work to digital transformation, from an increased focus on well-being to an emphasis on employee engagement, a multitude of topics have emerged in the literature. In this symposium, we gather a collection of four presentations that advance our knowledge of organizational behavior by examining specific aspects of organizational life that have gathered attention in recent years. The first presentation (Costa & Coyle-Shapiro) introduces a measure of post-violation contract states and examines four profiles of such states and their impact of several outcomes in samples collected both in the UK and USA. Drawing on motivated identity construction theory, the second presentation (Canhilal, Abrantes & Bakici) examines the relationship between organizational injustice and employee withdrawal behavior, and the conditional roles of occupational social value and occupational prestige. The third presentation (Noormandipour, Dimas, Bairrada, Gama, Pereira & Coelho) focuses on financial decision makers and relies on upper echelons theory to examine how the psychological traits of such decision makers, in this case mindfulness, influence their firms' strategic financial choices. Our fourth presentation (Castanheira & Neves) focuses on the relationship between employees' meta-perceptions of deviant work behaviors and their emotional exhaustion and proposes that such process unfolds via an increase in ruminative thoughts and is conditional of the existing levels of technostress. Finally, in light of the state of the art, these contributions will be discussed by Professor Alex Newman, Professor at the Melbourne Business School and Editor of AP:IR, who will also invite questions from the audience.

Abstract 3616

POST-VIOLATION PSYCHOLOGICAL CONTRACT STATES: A LATENT PROFILE ANALYSIS

Costa S.*[1], Coyle--Shapiro J.[2]

[1]ISCTE ~ Lisboa ~ Portugal, [2]London School of Economics and Political Science ~ London ~ United Kingdom

What happens to psychological contracts after a violation? Theoretical work has identified four psychological contract (PC) states capturing how individuals respond in the aftermath of a violation. However, these ideas have not been empirically examined. To address this issue, we develop and validate a measure of post-violation contract states (PVCS). We then take a profile-based approach using latent profile analysis (LPA) to investigate post-violation psychological contract profiles (Phase 1) and their differential impacts on outcomes (Phase 2). In Phase 1, using two independent samples (from the UK and USA), we found and replicated four profiles: deteriorated, compromised, recovering, and flourishing PCs. Moreover, in the second sample, a new profile emerged: PCs in renegotiation. In Phase 2, we found that these profiles differentially predicted relevant work outcomes commonly used in PC research, including organizational membership (identity and identity loss), social exchange (gratitude and relative deprivation), performance (proactive behaviors and silence), and attitudes (turnover intention). Our study expands and complements research that uses variable-centered approaches by revealing new theoretical and practical insights into psychological contracts.

Abstract 3617

WHEN PRESTIGE AND VALUE COLLIDE: OCCUPATIONAL EVALUATIONS, IDENTITY MOTIVES, AND EMPLOYEE WITHDRAWAL

Canhilal K.[2], Abrantes A.*[1], Bakici T.[3]

[1]TBS Business School ~ Toulouse ~ France, [2]ISG Institut Supérior de Gestion ~ Paris ~ France, [3]EDHEC Business School ~ Roubaix ~ France

Building on prior justice theories and Motivated Identity Construction Theory, this paper seeks to map identity motives onto justice motives to explain how employees respond to organizational injustice. Both justice and identity are socially constructed, and in this paper, we argue that their importance stems from the same underlying motives that make individuals care about them. Justice theories emphasize instrumental, relational, and moral motives. Motivated Identity Construction Theory similarly identifies six core identity motives: efficacy, distinctiveness, belonging, self-esteem, meaning, and continuity. These perspectives converge, such that injustice frustrates identity motives and initiates withdrawal responses. Employees often react to injustice with psychological withdrawal such as acquiescent silence and then with cognitive withdrawal in the form of turnover intention. We further argue that these responses are shaped by societal evaluations of occupations that influence which identity motives become most salient. Occupational social value (OSV), the perceived contribution of an occupation to society (e.g. paramedics, firefighters) supports meaning and continuity motives (moral justice motives) and helps employees sustain purpose despite injustice. OSV therefore buffers the effect of injustice on turnover intention by anchoring identity in societal recognition. Yet this buffering is conditional. Occupational prestige (OP), the societal respect accorded to an occupation (e.g. surgeons, Supreme Court judges), heightens efficacy and distinctiveness motives (instrumental justice motives). We theorize that, in high OSV and OP occupations, meaning is tightly coupled with competence, so injustice that undermines recognition of efficacy and distinctiveness also erodes meaning and continuity. We test these hypotheses using a three-wave, time-lagged survey of 411 UK employees combined with externally sourced societal ratings of OSV and OP. Results support our theorizing, showing that injustice predicts turnover intention through silence, buffered by OSV but with this buffer diminished when OP is high.

Abstract 3618

FINANCIAL DECISION MAKERS' MINDFULNESS AND CASH-HOLDINGS: DOES FIRM AGE AND BORROWER DISCOURAGEMENT MATTER?

Noormandipour R.*, Dimas I., Bairrada C., Gama P., Pereira M., Fernandes Coelho F.J.

Universidade de Coimbra, CeBER, Faculdade de Economia ~ Coimbra ~ Portugal

Introduction

Grounded in Upper Echelons Theory (UET), this study explores how a psychological trait of financial decision makers (FDMs) may influence a specific facet of a firm's strategic financial choices. Specifically, this study innovates by investigating the relationship between the mindfulness of FDM and firm cash-holdings, while accounting for relevant contingency factors.

Among financial decisions, cash-holding is particularly important, as it provides liquidity, serves as a buffer against uncertainty, and can finance potential investments. Given the central responsibility for financial management, the FDMs characteristics are likely to exert a considerable influence over such policies.

In this context, mindfulness, defined as heightened present-centered awareness, emerges as a key trait. Mindful FDMs, through greater clarity, deliberate decision-making, and heightened ethical awareness, tend to hold more cash to meet obligations during downturns, maintain flexibility for unforeseen challenges, and seize potential investment opportunities.

However, following UET, the relationship between FDMs' mindfulness and cash-holding is likely to be moderated by personal and contextual factors. Older firms, with deeper-rooted inertia and greater pressure to meet expectations, tend to be more conservative, potentially amplifying the effect of mindfulness. Likewise, when FDMs are discouraged from seeking external financing, the emphasis on liquidity may increase further.

Purpose

This study investigates the impact of FDMs' mindfulness on firm cash-holding policies, extending UET to FDMs, while also examining the moderating effects of firm age and borrower discouragement.

Method

Survey data were collected from 468 FDMs of manufacturing and service firms in mainland Portugal, with minimum of 10 employees. Analyses controlled for UET-related role characteristics and individual-specific factors.

Results

FDMs' mindfulness is positively associated with cash-holdings. This relationship is stronger in older firms and under borrower discouragement.

Conclusions

This study extends UET to FDMs, demonstrating the role of mindfulness in shaping

cash-holding decisions and clarifying financial decision-making by addressing potential decision biases, with implications for hiring processes.

WORK AND ORGANIZATIONAL PSYCHOLOGY AROUND THE WORLD: LATIN AMERICA, AFRICA, BALKANS, AND CHINA

Wednesday 22 July 2026 from 08:00 to 09:30

(O-Arsenale)

Kristina Potočnik (University of Edinburgh Business School), Chair
Vicente Martinez-Tur (IDOCAL-University of Valencia ~ Valenci), Co-Chair

Traditionally, work and organizational psychology has focused on advancements, designs, and applications arising from the United States and Europe. However, in other regions, often underrepresented at conferences and high-impact publications, work and organizational psychology has been developed along their own unique paths. Understanding these alternative "psychologies" offers a richer perspective on scientific progress and a more comprehensive worldview. This symposium will discuss the state of work and organizational psychology in four regions—Latin America, Africa, the Balkans, and China. Dr. Borges-Andrade analyzes the history, professional training and performance, scientific productivity, and dissemination of work and organizational psychology in Latin America, describing the differences among countries in the region. He also provides information about the region's scientific societies, regular conferences, and journals. Namutebi refers to the work and organizational psychology situation in Africa. She describes the challenges of the discipline in the region, as well as existing opportunities. Despite the existence of a rich and diverse African culture, contextual factors such as unemployment and the informal economy hinder the development of work and organizational psychology. Dr. Sotiroska refers to work and organizational psychology in the Balkans, explaining how contextual factors (economic instability, political uncertainty, and cultural dynamics) impact the development of the discipline in the region. The existence of workplace bullying and toxic cultures as well as obstacles to retaining talent are stressed by Dr. Sotiroska. Dr. Wang explains the evolution of work and organizational psychology in China. She explains the transition from an early phase with minimal interaction between Western and Chinese scholars to the surge in cross-cultural studies and publications in Western journals influenced by China's academic expansion. Finally, officers of IAAP Division 1 explain the results of their project, "This Works in My Place!", whose first two reports focused on Latin America and Africa. This project is based on international dialogue with the regions to identify, through a contextualized approach, practices and strategies from work and organizational psychology that help to achieve sustainable development goals and a better life for everyone while considering the unique contexts of the regions.

Abstract 3976

WORK AND ORGANIZATIONAL PSYCHOLOGY IN LATIN AMERICA

Borges--Andrade J.E., Porto J.B.*

University of Brasilia ~ Brasilia ~ Brazil

The presentation will be based on an entry authored by the presenter and published in the 2024 Elgar Encyclopedia of Organizational Psychology - organized by P. Matthijs Bal. The entry compares Latin American (LA) Work and Organizational Psychology (W&OP)'s shared centenary beginnings with its diverse contemporary deployments, based on an analysis of 14 LA countries by the presenter and two other authors from Colombia and Chile. This analysis included history, professional training and performance, scientific productivity, and dissemination of Psychology and W&OP. It critically suggests contextual factors that may explain differences between these countries. It describes how professional regulation evolved in them and when they created undergraduate and graduate courses and professional councils or boards. The establishment of scientific societies, regular conferences, and journals is also mentioned, as well as the institutionalization of policies for accreditation and constant evaluation of those courses. In parallel, the number of individuals dedicated to W&OP activities in public and private organizations or in consulting services has increased in LA. These activities evolved from applying measurement techniques to various individual, group, and organizational pursuits. Academic networks of graduate program professors and the publication of books and articles escalated - in a few countries due to a combination of factors that did not occur in other LA countries. A virtuous cycle would have improved those countries' teaching, research, and professional practice. The entry also mentions a recent participative process by IAAP, with W&OP experts in LA, that analyzed opportunities and obstacles for achieving five UN Sustainable Development Goals. It identified unequal advances between these Goals and several practices-strategies to promote those advances. A strategic plan was outlined for the future of W&OP in LA.

Abstract 3977

ADVANCING WORK AND ORGANIZATIONAL PSYCHOLOGY IN AFRICA

Namutebi J.*

Nkumba University School of Business Administration and Consultant at Bantu Concepts (U) Ltd. ~ Kampala, ~ Uganda

Work and Organizational Psychology (WOP) in Africa is impacted by a host of socio economic and cultural factors which are both a challenge but also present opportunities. Even though the need and demand for organizational psychologists is increasing, the field is still not as developed as it is in other regions. One of the main issues faced is the lack of trained professionals. Africa has less than 5% of the global population of organizational psychologists, despite the region comprising over 17% of the world's population. This gap emphasizes the dire need for professional development in the field. In most African nations, WOP is in its infancy and not many discipline-specific academic and professional bodies exist to promote its growth. Furthermore, the work conditions in Africa present obstacles such as rising unemployment rates among the youth (unemployment for South African youth is over 50%) and more than 80% of employment opportunities in many countries being informal. In many cases, organizational psychologists are tasked with dealing with low resource settings while trying to make significant improvements in diversity, employee wellbeing, as well as leadership management and organizational change. Additionally, Africa has a rich culture and more than 2000 languages are spoken within the continent, giving it unparalleled diversity. Developing contextualised approaches, investment in education and research, creation of regional networks of professionals, and facilitation of cross border collaboration is fundamental to advance WOP in Africa. However, sustainable solutions in this area is often hindered by insufficient funding, poor access to international networks, and lack of coordination between different universities.

Furthermore, incorporating indigenous knowledge with WOP practices could lead to more effective solutions to the organizational and workplace problems Africa faces.

With focused efforts, Africa WOP has the potential to advance great economic growth.

Abstract 3978

CHALLENGES OF WORK AND ORGANIZATIONAL PSYCHOLOGY IN THE BALKANS: A REGIONAL PERSPECTIVE

Sotiroska Ivanoska K.*

Ss. Cyril and Methodius University in Skopje ~ Skopje ~ North Macedonia, Republic of

Work and Organizational Psychology in the Balkans face significant challenges shaped by economic instability, political uncertainty, and cultural dynamics. Frequent economic crises and fluctuating job markets create insecurity, deterring the implementation of long-term strategies for organizational well-being and performance.

Workplace bullying and toxic cultures are prevalent issues that undermine psychological safety and trust, while a lack of policies addressing these problems impairs their impact. Talent retention is another critical concern, as emigration and workforce mobility result in a persistent “brain drain”. Organizations struggle to retain skilled professionals and maintain leadership continuity, further limiting their ability to grow sustainably.

A key challenge is the underutilization of psychological expertise in organizational decision-making, which leaves evidence-based practices underexplored in areas like employee motivation, leadership, and productivity. Generational and cultural differences also pose difficulties for workplace cohesion, as younger employees bring new expectations for flexibility and inclusivity, often clashing with traditional norms.

Additionally, limited resources for workplace well-being programs, a disconnect between academic research and practice, and weak labor law enforcement hinder progress. Organizations often prioritize financial outcomes over employee development, resulting in inadequate attention to work-life balance and mental health.

Despite these challenges, the Balkans offer significant opportunities to advance WOP. Promoting evidence-based practices, addressing workplace bullying, and implementing policies that protect employee rights can drive meaningful change. This symposium will serve as a platform to bridge gaps between research, practice, and policy while fostering the development of a regional network for implementing good practices from other countries, ultimately promoting healthier, more productive, and inclusive workplaces in the Balkans.

Abstract 3979

THE EVOLUTION OF WORK AND ORGANIZATIONAL PSYCHOLOGY IN CHINA: HISTORICAL DEVELOPMENTS AND CONTEMPORARY TRENDS

Wang J.*

Nottingham University Business School China ~ Ningbo ~ China

The trajectory of Work and Organizational Psychology (WOP) in China has mirrored the nation's remarkable economic ascent since 1978. With the world's second-largest economy today, China's integration into the global market has spurred significant interest in understanding Chinese WOP's nuances among practitioners and scholars.

This presentation will chronicle the evolution of WOP research in China, highlighting the transition from an early phase with minimal interaction between Western and Chinese scholars, to the surge in cross-cultural studies and publications in Western journals influenced by China's academic expansion and the wave of scholars studying abroad since the 1990s. Initially, research from China predominantly applied Western theories, with limited consideration for local context or indigenous theory development.

Anne Tsui's (2004) seminal work distinguished context-embedded research from context-specific indigenous research, underlining the importance of contextualization in WOP studies. Post-2000, there has been a conscious shift toward an explicit theorization of the Chinese context, including variables unique to China within research models.

However, these efforts still grappled with capturing the distinctiveness of the Chinese milieu. Around 2010, a surge in Chinese indigenous theories emerged, reflected in special issues of leading journals, marking a maturation in the field. With global shifts and the normalization of Chinese data usage in recent years, there is a discernible trend away from emphasizing Chinese exceptionalism in research. This talk will review this historical progression and discuss the current state of Chinese WOP research, considering the challenges and opportunities within this vibrant and evolving field.

Abstract 3980

THIS WORKS IN MY PLACE!: LATIN AMERICA AND AFRICA

Martinez--Tur V.*, Potočnik K., Davcheva M., Moliner C., Pérez--Nebra A.

IDOCAL-University of Valencia ~ valencia ~ Spain

The International Association of Applied Psychology (IAAP), Division 1, is currently undertaking a project called “This Works in My Place” to illustrate how Work and Organizational Psychology can contribute to the United Nations Sustainable Development Goals in different geographical regions. The first two reports have been dedicated to Latin America and Africa. Modernization and the knowledge society demand highly educated citizens and workers who embrace values associated with democratic participation and achieving a sustainable and inclusive world. However, there is a risk that the dialogue between Western societies and other regions lacks a contextualized approach. Genuine dialogue requires acknowledging and respecting different regions’ particularities, cultural values, and history. Essentially, international dialogue should be defined through a contextualized approach by pursuing sustainable development goals and a better life for everyone while considering the unique contexts in which these goals are translated into specific strategies and practices. With this in mind, “This works in my place” in Latin America and Africa focused on three objectives, the results of which are presented in this work:

1 - We identify contextual factors in Latin America and African associated with achieving a better life for all (as the attainment of the UN Sustainable Development Goals). We define a contextual factor as any political, social, economic, and cultural factor that characterizes these regions, acting either as a facilitator or an obstacle (or perhaps even both) to achieve sustainable goals.

2 - We describe how contextual factors in the African region can either facilitate or constrain the achievement of the Sustainable Development Goals, with a focus on "no poverty," "good health and well-being," "gender equality," "decent work," and "innovation”.

3 - We identify WOP practices and strategies that can contribute to achieving the afore mentioned goals in both regions, considering contextual factors and examining the importance and feasibility of practices and strategies.

Abstract 722

DEALING WITH THE ENTREPRENEURIAL ROLLER COASTER; CHANGES IN EMOTION REGULATION IN RESPONSE TO STRESS

Gorgievski M.*[1], Denoo L.[2]

[1]Erasmus University Rotterdam ~ Rotterdam ~ Netherlands, [2]Tilburg University ~ Tilburg ~ Netherlands

Entrepreneurs face intense emotions in a dynamic world and emotion regulation tendencies such as cognitive reappraisal and expressive suppression can play an essential role in staying healthy and productive and building sustainable entrepreneurial careers. Emotion regulation is generally considered stable over time. However, evidence has shown that people may adjust their use of emotion regulation in a more turbulent environment. We contend that this is the case for entrepreneurs and we aim to shed light on factors that may influence entrepreneurs' use of emotion regulation over time. We contend that entrepreneurs may change their emotion regulation tendencies in response to financial hardship and enduring entrepreneurial job demands (24/7 availability, work pressure and risk taking).

A total of 125 entrepreneurs registered at a Dutch insurance company participated in a two-wave survey study with a one-year time lag (response rate = 1,9 %; attrition 73.1 %). The majority were men (64.8 %), had at least a bachelor degree 86,4 %, were solo self-employed (59.2 %), and worked in health care (28.8 %) or consultancy (24 %). Average age was 54.13 years (SD = 6.60). Study variables (Emotion regulation, financial hardship, Entrepreneurial job demands, and exhaustion) were measured with pre-existing scales.

Paired samples T-tests and structural equation modelling (SEM) showed significant changes in entrepreneurs' emotion regulation over time. SEM showed that financial hardship negatively predicted expressive suppression one year later. Being available 24/7 showed a positive relationship over time, which was suppressed by financial hardship. Risk taking and a high workload did not relate to changes in emotion regulation. Contrary to expectations, exhaustion did not mediate these relationships.

We conclude that the turbulent entrepreneurial occupation indeed invites changes in emotion regulation. This phenomenon deserves further investigation and it should not be overlooked when investigating their role in dealing with entrepreneurial demands.

Abstract 1602

WORK FATIGUE AND ABSENTEEISM AMONG PUBLIC HEALTH WORKERS

Durán Lara K.A.*, Moyano Díaz E.

Universidad de Talca ~ Talca ~ Chile

Introduction: Work fatigue (WF) is a multidimensional phenomenon resulting from prolonged work activity. Globally, its prevalence ranges between 10% and 33%, with reaching costs approximately 3.5% of GDP in health expenditures and productivity losses. In the health sector, WF represents a critical issue: in Chile, more than 40% of clinical workers report high levels of fatigue, a condition linked to higher absenteeism rates. In the public system, absenteeism generates a structural impact exceeding USD 1.8 billion annually. Research has mainly focused on clinical staff, overlooking administrative employees of the Health Service Directorates (HSD). However, in 2023, in one HSD, an average of 49.21 days of absenteeism per person was recorded, and 65% reported high mental workload, suggesting that WF could be a determining factor of absenteeism.

Purpose: To analyze the relationship between WF and absenteeism in an HSD and its association with work-related factors such as salary, employment tenure, job type, and frequency of overtime.

Method: A cross-sectional, quantitative design will be employed with a sample of N>400 HSD employees. WF will be measured using the Three-Dimensional Work Fatigue Inventory, and additional questions on work-related factors will be included. The absenteeism index will be provided by the institution.

Results: It is expected to demonstrate an association between WF and absenteeism, as well as to verify the role of work-related factors in the variation of this phenomenon.

Conclusions: The study seeks to fill a knowledge gap by providing empirical evidence to design preventive interventions aimed at reducing WF and, consequently, absenteeism, thereby promoting staff well-being and strengthening the efficiency of Chile's public health system.

Abstract 570

TOO MUCH OF A GOOD THING: THE RELATIONSHIP BETWEEN TOXIC POSITIVITY, SHAME, EMOTIONAL EXHAUSTION AND JOB WITHDRAWAL

Loi N.*, Grosvenor S., Gudex B.

University of New England ~ Armidale ~ Australia

Introduction: A psychologically safe work environment plays a crucial role in shaping employees' wellbeing. Studies have consistently linked supportive and authentic workplace cultures to improved mental and physical health outcomes. In contrast, when organisations promote a culture of relentless forced positivity – referred to as toxic positivity – it can have adverse effects on employees' mental health. Despite its growing recognition, toxic positivity remains underexplored in workplace research. Purpose: This study investigated whether shame and emotional exhaustion, in serial, would mediate the relationship between toxic positivity in the workplace and the tendency toward job withdrawal behaviours. Method: A sample of 301 Australian employees (Mage = 34.2, SD = 10.6; 76.4% female), recruited via university platforms and social media sites, completed an online, confidential, and anonymous survey. Results: The results indicated that higher levels of toxic positivity in the workplace were associated with increased experiences of shame, emotional exhaustion, and a greater likelihood of job withdrawal. Moreover, the results supported a serial mediation model in which shame and emotional exhaustion jointly explained the relationship between toxic positivity in the workplace and job withdrawal. Conclusions: These findings highlight the potential risks of promoting overly positive narratives in workplace culture, emphasising that such approaches may undermine employee wellbeing. Organisations are therefore encouraged to recognise the nuanced effects of positivity and avoid blanket applications of optimistic messaging. Further investigation is needed to deepen our understanding of how toxic positivity contributes to emotional strain and behavioural responses on an individual level.

Abstract 2430

ROADBLOCKS TO WORKPLACE HEALTH AND WELLBEING PRACTICES IN A HEALTHCARE ORGANISATION: A HRM STRENGTH APPROACH

Gifkins J.*, Chan X.W.(., Wilkinson A., Brough P., Shang S.

Griffith University ~ Brisbane ~ Australia

Introduction

Despite growing organisational investment in workplace health and wellbeing practices (WHWPs), particularly in healthcare settings where worker wellbeing is critical for employee (e.g fatigue), patient (e.g quality of care) and organisational (e.g staff attrition) outcomes, evidence on WHWPs effectiveness is mixed.

Purpose

The aim of this research is to examine multi-level perceptions of WHWP implementation using HRM strength theory to identify organisational roadblocks.

Method

A qualitative case study collected data from three organisational levels: senior managers (n = 11), frontline managers (n = 15), and frontline employees (n = 59) in a healthcare organisation through semi-structured interviews and focus groups. Questions about if and how the organisation cared for worker wellbeing were asked.

Results

Significant incongruences emerged across organisational levels regarding WHWP effectiveness and organisational support for wellbeing. Using HRM strength analysis, we identified specific implementation roadblocks: limited access to IT/HRM communication systems, high job demands and staff shortages preventing WHWP access, and a reinforcing cycle wherein low participation rates strengthened employee perceptions that WHWPs were not fit for purpose. These roadblocks were framed around HRM strength theory meta-features of distinctiveness, consistency and consensus; and occurred despite widespread agreement that the organisation and managers valued employee wellbeing, and the presence of valued resources such as pastoral care and peer social support.

Conclusions

Organisations can address these multi-level design and implementation barriers by improving communication infrastructure, ensuring adequate IT and temporal access for employees, designing contextually relevant WHWPs, and creating alignment between espoused values and enacted HRM systems to enhance HRM strength and signal genuine organisational commitment to worker wellbeing.

Abstract 1463

SOCIAL LUBRICANT OR BURDEN? THE DUAL MECHANISMS OF VOLUNTARY AND INVOLUNTARY SMALL TALK ON WORK ENGAGEMENT

Huang T.*

National Changhua University of Education ~ Changhua City ~ Taiwan

Introduction: Workplace small talk is often viewed ambivalently, as either a social lubricant that builds rapport or a burden that disrupts workflow. Existing research has largely treated small talk as a single concept, overlooking the crucial role of employee motivation. This study distinguishes between intrinsically-motivated "voluntary small talk" and instrumentally-motivated "involuntary small talk" to provide a more nuanced understanding of the effects of small talk in the workplace.

Purpose: Drawing on Conservation of Resources (COR) Theory, this study aimed to investigate the dual mechanisms through which voluntary and involuntary small talk affect daily work engagement. We hypothesized that these effects are mediated by the parallel processes of gaining emotional support (a resource gain) and experiencing emotional exhaustion (a resource loss).

Method: An experience sampling methodology was used to track 130 full-time employees over 10 consecutive workdays. Participants completed daily surveys assessing their small talk experiences, perceived emotional support, emotional exhaustion, and work engagement. Data were analyzed using multilevel path analysis.

Results: As hypothesized, voluntary small talk functioned as a resource-gaining mechanism, positively predicting work engagement by both increasing emotional support and decreasing emotional exhaustion. Involuntary small talk revealed a "double-edged sword" effect: it significantly increased emotional exhaustion, which in turn harmed work engagement. However, it also provided emotional support, thereby offering a weaker, indirect positive path to engagement.

Conclusions: The impact of workplace small talk is not monolithic; its value is contingent upon its voluntariness. While voluntary interactions are a clear asset for enhancing employee engagement, involuntary small talk presents a trade-off, offering potential relational benefits but at a significant psychological cost. This highlights the complexity of informal social interactions in the workplace.

Abstract 696

THE ROLES OF WORK-FAMILY CONFLICT AND ORGANIZATIONAL SUPPORT IN WELL-BEING OF CANADIAN ARMED FORCES MEMBERS:

Skomorovsky A.*, Charanek N.

Department of National Defence ~ Ottawa ~ Canada

The military and the family are often described as “greedy” institutions, in that they have competing demands and may cause a work-family conflict among military members. Work-family conflict has been found to be an important contributor not only for organizational outcomes, including job engagement and burnout, but also for military members’ psychological health. Although organizational support has been linked to better organizational outcomes, there has been limited research examining the role of organizational support to members and families in well-being of military members in Canada. Therefore, the aim of the study was to examine the role of work-family conflict and the unique and protective roles of organizational support to members and families in the well-being of military members.

Hierarchical regression analyses were conducted to examine the roles of work-family conflict, family-work conflict and organizational support in predicting job engagement, burnout, and psychological distress of military members (N = 3,852). It was found that work-family and family-work conflicts were predictive of the organizational outcomes and well-being of CAF members. Organizational and family support also served as moderators in some aspects of organizational outcomes.

This study demonstrates the importance of maintaining balance between work and family domains. Organizational support provided to the member and the family was found to be directly related to better organizational and members’ well-being outcomes, and also to buffer the negative impact of the conflict between work and family. Providing support to military members and their families plays an important protective role by mitigating some of the negative impacts of work and family conflicts on organizational outcomes and members’ well-being. It is, therefore, recommended that leaders not only reinforce the importance of work-life balance, but also focus their efforts on providing organizational support to members and families in order to improve the organizational outcomes and well-being among military members.

SIGNALING INNOVATION: HOW FOUNDERS' PASSION DRIVES EMPLOYEE INNOVATIVE BEHAVIOR

Abuliezi Z.*

Tongji University ~ Shanghai ~ China

Introduction: Founders of innovation-oriented firms often serve as cultural anchors whose passion can energize organizational performance. Yet little is known about how founder innovation passion—defined as a strong and sustained emotional engagement with technological or product innovation—travels across organizational levels to influence employee innovative behavior.

Purpose: This study explores how founder passion becomes visible, credible, and actionable inside organizations. We ask: (a) how founders express passion through observable signals, (b) how these signals are interpreted and transmitted across organizational levels, and (c) under what conditions they activate employee innovation.

Method: We conducted a qualitative case study (2018–2025) of a high-growth technology firm in China. Data included 20 in-depth interviews with the founder, senior managers, and product engineers, complemented by field notes, internal documents, and public materials. Using Gioia procedures, we inductively developed a grounded process model.

Results: We identified three types of passion signals: identity signals (e.g., self-narratives, founding stories), action signals (e.g., visible effort, personal involvement), and vision signals (e.g., aspirational goals, cultural framing). Their interpretation varied across organizational levels and was often mediated by middle managers. We further found that employee innovation depended not only on proactive motivation ("can do," "reason to," "energized to") but also on perceived permission to innovate. While recent work introduces proactive permission as an individual judgment, our findings extend this construct by showing how permission is socially constructed through founder signals, managerial translation, and contextual norms.

Conclusions: Innovation passion does not diffuse automatically but requires deliberate signaling and organizational embedding. By integrating signaling theory with emerging research on proactivity, this study advances understanding of how founder passion is transmitted across levels and contributes to developing the proactive permission construct. It offers a multilevel account of how founder passion activates innovation in founder-led enterprises.

Abstract 964

SWIPE RIGHT ON LEADERSHIP: GEN Z'S SEARCH FOR AUTHENTICITY AT WORK

Camire M.*

Husson University ~ Bangor ~ United States of America

As Generation Z (born 1997–2012) enters the workforce, managers face a potential shift in expectations and supervisory dynamics. Unlike previous cohorts, Gen Z has been shaped by a fully digital upbringing, resulting in both advanced tech fluency and heightened anxiety from navigating between online and offline worlds. Existing research has focused largely on Baby Boomers, Generation X, and Millennials, leaving a gap in understanding how Gen Z's needs may differ from those of the leaders who will manage them. This study investigates Gen Z's preferences for supervisory behaviors and workplace conditions through an anonymous online survey distributed via social media platforms. Participants identify their generational cohort, rank ten workplace priorities, and describe ten supervisory practices they most value. Preliminary hypotheses suggest that Gen Z will prioritize meaningful, engaging work, authentic leadership, and stronger work–life balance over traditional career-centered approaches. By illuminating generational differences, this research seeks to inform leadership strategies that foster connection, authenticity, and productivity in the modern workplace.

Abstract 513

"HE'S MY BOSS, SO I DO WHAT HE SAYS." A GROUNDED THEORY STUDY ON FRAMING AND MAKING MEANING OF OBEDIENCE IN POLICE, MILITARY, AND HEALTHCARE INSTITUTIONS

Kärgel K.*

SRH University ~ Heidelberg ~ Germany

Empirical evidence indicates that a significant proportion of employees comply with their superiors' orders, even when they raise moral concerns or result in organizational misconduct. While a growing body of suggests that people's identification with the authority figure as strong predictor of authoritarian obedience, the underlying framing and meaning making processes remain underexplored. Using the example of German and Swiss police authorities, military institutions and university hospitals, the present qualitative interview study (N = 54) analyzed using Grounded Theory examines how employees frame and make meaning of obedience in their everyday working life. Drawing on social identity theorizing the potential impact of occupational dress is considered by comparing uniformed employees (N = 37) and non-uniformed employees (N = 17).

The findings reveal that both uniformed and non-uniformed employees primarily frame obedience to their superior's orders as functional necessity (e.g. as precondition for vocational actionability) and as a normative construct (e.g. obedience as behavioral norm). This reflects how they make meaning of their occupational role whereby "everyone has to contribute their bit to make the big picture a success." This framing highlights the interviewees' authoritarian submissiveness, which translates into a willingness to obey stemming from their hierarchical position. Employees in leadership roles correspondingly interpret it as their responsibility to persuade subordinates of the necessity of following orders. Unlike non-uniformed employees, uniformed employees make use of sanctions or threats of sanctions for this purpose. This This highlights the varying degrees to which uniformed and non-uniformed employees have internalized obedience as a norm. While uniformed employees' willingness tends to be absolute, non-uniformed employees' willingness tends to be conditional due to perceived feelings of ambivalence. These findings emphasize the critical need for tailored leadership development to foster ethical decision-making and cultivate organizational cultures that balance hierarchical expectations with psychological safety for dissent.

WE-AS-US OR WE-VS-THEM? HOW POLITICIANS' PRONOUN USE SHAPES ENDORSEMENT

Robin B.*[1], Gerpott F.H.[2], Kerschreiter R.[1]

[1]Freie Universität Berlin ~ Berlin ~ Germany, [2]WHU - Otto Beisheim School of Mangement ~ Duesseldorf ~ Germany

Introduction: Plenary speeches provide politicians with a crucial means to demonstrate leadership and seek endorsement, defined as the voluntary recognition by others that a focal actor is granted influence. A common rhetorical device is the use of "we"-language, often treated as a uniform signal of alignment between speaker and audience. Yet, communication research distinguishes between inclusive "we" (we-as-us) and exclusive "we" (we-versus-them), suggesting they may evoke distinct responses.

Purpose: We disentangle whether politicians' inclusive and exclusive uses of "we"-language differentially predict their immediate and distal endorsement.

Method: We conducted an analysis of 3,606 members of parliament and 119,344 plenary speeches delivered in the German Parliament. Moving beyond traditional word-counting methods, we used new computational text analysis tools (contextual word embeddings with vector projection analysis) to identify inclusive and exclusive "we"-language in plenary speeches. We linked them to two indicators of endorsement: (1) immediate approval through applause and interruptions by fellow members of parliament, and (2) longer-term electoral outcomes.

Results: Inclusive and exclusive uses of "we" were only moderately correlated at both the speech and the speaker level, suggesting that politicians typically emphasized one form over the other – both within individual speeches and across their broader political profile. Inclusive and exclusive "we"-language showed distinct associations with audience reactions: While both were linked to applause, inclusive "we"-language was associated with fewer and exclusive "we" language with more interruptions. Combining the two tended to weaken these effects, indicating that each works best on its own. Both inclusive and exclusive "we"-language was associated with higher reelection likelihood. Combining them did not alter this association, indicating neither benefit nor harm.

Conclusions: By disentangling inclusive and exclusive forms of "we"-language with new computational text analysis tools, this study provides a more nuanced understanding of how collective pronouns shape leader endorsement in the political context.

Abstract 994

ADDRESSING EMPLOYEES' RELUCTANCE TO BECOME MANAGERS: THE ROLES OF SUPERVISOR ROLE-MODELING AND SOCIAL LEARNING

Shishido T.*

Musashino University ~ Tokyo ~ Japan

1. Research Background and Purpose

Employees' reluctance to pursue managerial roles has been studied in prior research (Nguyen, 2023). In Japan, managerial posts are sometimes even described as a "penalty." This tendency is often linked to employees' own belief that they are ill-suited to leadership or uncomfortable with taking on such roles—conceptualized as low affective-identity motivation to lead (AI-MTL; Chan & Drasgow, 2001). This study investigates what helps employees with low levels of AI-MTL become more willing to accept managerial roles, focusing on the role-modeling of supervisors.

2. Method

We collected data from 361 non-managerial employees working across a range of industries in Japan. The average age was 32.75 years, and 187 participants were female.

3. Results

AI-MTL moderated the association between supervisors' role-modeling and management role acceptance: the positive effect of role-modeling emerged only when AI-MTL was low. A moderated-mediation analysis further showed that social-normative motivation to lead (SN-MTL; the felt normative obligation to assume leadership roles) mediated this relationship. The bootstrapped conditional indirect effects were significant at low levels of AI-MTL, but not at high levels. In sum, for employees with low AI-MTL, exposure to supervisors' role-modeling increases SN-MTL, which in turn enhances management role acceptance.

4. Conclusions

For employees who doubt their fit for leadership, supervisors who model managerial behavior are crucial. Such modeling cultivates the perception that "becoming a manager is normative," thereby increasing acceptance. When identity-based internal motives are weak, external social learning (Bandura, 1977) appears effective. Many organizations rely solely on transactional incentives (e.g., higher pay) to address reluctance toward managerial roles, but overlook a more critical lever—strengthening normative expectations through deliberate role-modeling.

Abstract 520

WHEN DOING NOTHING SPEAKS VOLUMES: PASSIVE LEADERSHIP, FELT STIGMA, AND THE TOLL ON WORKERS WITH DISABILITIES

Dupré K.*[1], Dionisi A.[2]

[1]Carleton University, Department of Psychology ~ Ottawa ~ Canada, [2]Carleton University, Sprott School of Business ~ Ottawa ~ Canada

Introduction: As organizations strive for more inclusive workplaces, understanding what discourages the participation and flourishing of employees with disabilities is critically important. Recent estimates suggest that while over one billion people worldwide have a disability, this diverse community is among the most under-employed and disproportionately subjected to unfair treatment.

Purpose: When it comes to the welfare of employees with disabilities, the role of leadership -and passive leadership in particular– has received little attention. Thus, we asked: What impact does the absence of leadership from a superior have on the well-being and retention of employees with disabilities? Drawing on social safety theory, we conceptualized passive leadership as a social threat that can trigger feelings of stigma, which may lead to loneliness and turnover intentions. We also explored whether close friendships in the workplace could buffer these effects.

Method: An online survey was used. Recruited via Prolific, 233 employees (M age = 40.53 years, range = 19–68 years; 43.8% women) from the U.K, U.S.A, and Canada who self-identified as having a disability (16.4% visible; 73.3% non-visible; 10.3% both) participated.

Results: A moderated mediation model was analyzed. Passive leadership was a cue for social exclusion, evoking feelings of stigma that led to increased loneliness. Passive leadership also led to turnover intentions. Additionally, workplace friendships emerged as a buffer against these negative effects.

Conclusions: This study highlights the negative impact of passive leadership on employees with disabilities and is the first to apply social safety theory to both areas of scholarship. From an equity, diversity and inclusion perspective, it is vital to recognize how leaders may work against or unintentionally undermine the integration, retention, and flourishing of those with disabilities. From a practical perspective, results highlight two critical areas of focus for intervention –leadership behaviour and the cultivation of workplace friendships.

Abstract 311

ENGAGE OR WORKAHOLIC? THE PARADOXICAL INFLUENCE OF SERVANT LEADERS ON EMPLOYEE HEAVY WORK INVESTMENTS

Berger R.*[1], Abrome A.[2], Swanzy E.K.[1]

[1]University of Barcelona ~ Barcelona ~ Spain, [2]University of Bologna ~ Bologna ~ Italy

Introduction: In today's fast-paced work environment, technological advancements, evolving workplace dynamics, and organizational preference for high-performing employees have intensified employees' time and energy investment known as Heavy Work Investment (HWI), expressed through two contrasting forms—work engagement and workaholism. Although both constructs have been studied, existing merely cross-sectional research examines them separately, neglecting shared predictors, underlying mechanisms, the role of leadership and multilevel longitudinal designs, to understand HWIs evolving nature.

Purpose: Building on servant leadership (SL) emphasis on employee development and well-being, we introduce thriving at work (learning, vitality) as a mechanism linking SL to employee HWI. Drawing on Social Exchange Theory, we argue that when SL influence employee thriving, employees might reciprocate back by investing greater time and energy in work, leading to positive and negative HWI.

Methodology: Data were collected online at seven time points across three waves (two-month intervals) from 234 full-time employees with diverse professions. We run multilevel path analysis using the 'lavaan' package in R.

Findings: SL had a paradoxical impact on employee HWI. Specifically, SL significantly had a positive influence on employee vitality ($\beta = 0.22$, $p < .001$), which in turn, had a positive impact on work engagement ($\beta = 0.77$, $p < .001$) and workaholism ($\beta = 0.24$, $p < .001$). Also, SL had a positive impact on employee learning ($\beta = 0.21$, $p < .001$), which in turn, had a positive influence on work engagement ($\beta = 0.51$, $p < .001$) and workaholism ($\beta = 0.25$, $p < .001$).

Conclusion: SL can have a paradoxical influence on employee HWI, influencing its positive and negative forms. To sustain positive forms of HWI, while minimizing negative forms, SL must actively promote healthy work boundaries by encouraging regular breaks, limiting excessive overtime, supporting the use of vacation days, and discouraging work during personal time.

Abstract 118

THE CONDITIONAL PROCESS OF WORKPLACE BULLYING ON OCB:THE JOINT PROTECTIVE ROLES OF RESILIENCE AND PSYCHOLOGICAL SECURITY CLIMATE

Chen J.W.*, Yu P.C.

Soochow University ~ Taipei ~ Taiwan

Grounded in Conservation of Resources (COR) theory and the resource caravan perspective, this study investigates how workplace bullying reduces organizational citizenship behavior (OCB) through ego depletion. We further propose a moderated mediation model, examining how resilience and perceived psychosocial safety climate (PSC) jointly buffer the effects of bullying on OCB. A two-wave panel study was conducted with a three-month interval, involving 236 employees from various industries in Taiwan. The results reveal that PSC significantly moderates the indirect effect of workplace bullying on OCB via ego depletion. Specifically, the negative link between ego depletion and OCB is strongest when both resilience and PSC are low, but this relationship reverses when PSC is high, regardless of individual resilience levels. These findings highlight the complex interplay of personal and organizational resources in mitigating the adverse effects of workplace bullying on employee prosocial behavior. Theoretical and practical implications are discussed.

WAGE IN THE WATER: SOCIAL REPRESENTATIONS OF LIVING WAGE IN GUAM

Dobrowolski S.*, Arjona J., Atienza M., Quinto J., Cruz E., Taisipic L., Baquiano M.

University of Guam ~ Mangilao ~ United States of America

The pay of workers is generally regulated by minimum wage laws designed to protect their incomes and prevent labor exploitation. However, the minimum wage has not kept pace with inflation or the rising cost of living. There has been a call to raise the minimum wage to the level of a living wage. This study explores the residents of Guam's shared understanding of a living wage through the lens of Social Representations Theory. We conducted six in-depth interviews, a focus group discussion, and a qualitative survey. All participants came from diverse workforce sectors and represented different groups within the island. Our analysis identified themes indicating that a living wage is key to a decent life: it is above the mandatory minimum wage, allows for financial security, promotes mental well-being, supports dependents, enables autonomy, and is a pressing social concern. Our research indicates that the people of Guam believe a living wage is essential for enabling wage workers to attain a satisfactory standard of living, underscoring the need to advocate for a wage significantly higher than the minimum wage: a living wage. This study not only contributes to the existing literature on decent wages but also helps shape Guam's living wage policies.

Abstract 9

THE INFLUENCE OF WELL-BEING AT WORK ON WORK PRODUCTIVITY OF UNIVERSITY STAFF.

Janyam K.*

Prince of Songkla University ~ Songkhla ~ Thailand

While previous research has indicated that well-being at work is an important factor influencing the long-term effectiveness of organizations (Diener et al., 2003), limited research in Thailand has explored this relationship, particularly within higher education. Therefore, this study aims to investigate the level of well-being at work among university staff and its influence on their work productivity. The study evaluated work well-being based on Seligman's (2018) PERMA Model. The sample group consisted of 105 staff members from a faculty at a university in Thailand. Participants were recruited through simple random sampling. The research instrument was a self-assessment questionnaire with an 11-point Likert scale, comprising a work well-being assessment and a work productivity assessment. Data were analyzed using descriptive statistics: mean, standard deviation, and multiple regression. The results revealed that university staff had a good level of well-being at work across the aspects of positive emotion, relationships, engagement, meaning, achievement, and health. Negative emotion and loneliness at work were rated at a slightly low level. The results from multiple regression indicated that negative emotion, achievement, meaning, and health could predict 51.7% of the variance in work productivity at a statistical significance level of $p < .001$. Negative emotion was found to have the greatest impact on work productivity. These findings can benefit the university's human resource development initiatives, particularly in self-emotional management training, which would benefit both staff well-being and university productivity.

Abstract 13

UNDERSTANDING HOW AND WHEN LEADERS DEVELOP STRATEGIC ABUSIVE SUPERVISION CLIMATE

Liang S.*

Yuan Ze University ~ Taoyuan City ~ Taiwan

Extant research on abusive supervision (i.e., subordinates' perceptions of the extent to which supervisors engage in the sustained display of hostile verbal and nonverbal behaviors, excluding physical contact; Tepper, 2000) posits that supervisors will strategically behave abusively (e.g., Huai, Lian, Farh, & Wang, 2024) and argues that it can occur at the group level in the form of abusive supervision climate (Priesemuth, Schminke, Ambrose, & Folger, 2014). However, little or no attention has so far been paid to supervisors' strategic use of abusive supervision climate in group settings. We introduce the concept of strategic abusive supervision climate, defined as acts of abuse toward the group as a whole that are thoughtful, deliberate, and driven by leaders' goals. Drawing on the theory of strategic self-presentation (Jones & Pittman, 1982), we examine how and when poor group performance may lead to strategic abusive supervision climate. Specifically, we conceptualize poor group performance as signaling failure regarding leaders' facilitating individual and collective efforts. We theorize that, under certain circumstances, poor group performance may elicit supervisors' perceptions of threat to their leadership ability, and then tackle poor group performance and try to manage their impressions by strategically using abusive supervision climate that gives the attribution of being a competent leader. Specifically, we propose that such a dynamic is more likely to ensue when supervisors are otherwise highly concerned about their reputation maintenance (i.e., reputation maintenance concerns). To provide support for our reasoning, we collected multi-wave data (i.e., three time points with one month in between) from 158 supervisors in Taiwan. Last, we discuss the theoretical and practical implications of these findings and directions for future research.

Abstract 414

PSYCHOLOGICAL CONTRACT FULFILLMENT AND WELL-BEING: THE MODERATING ROLE OF WORK FORMAT IN PUBLIC SECTOR WORKERS

Marques M.L.*[1], Lopes S.[1], Ribeiro Viseu J.[2]

[1]Universidade de Coimbra ~ Coimbra ~ Portugal, [2]CIEP, Universidade de Évora ~ Évora ~ Portugal

The fulfilment of psychological contracts has gained significant attention due to their impact on employee attitudes, behaviors, and well-being. With its distinctive organizational characteristics and transformations, the public sector presents a unique context to explore the association between psychological contract fulfilment and individual well-being outcomes (work engagement, overall job satisfaction, and overall life satisfaction). The theoretical foundation supporting these relationships was based on the Social Exchange Theory (SET), Job Demands- Resources Theory (JD-R), and the Spillover Effect. The moderating effect of the work format (telework, on-site, and hybrid) was also studied. A quantitative method with a cross-sectional and descriptive-correlational design was followed, using non-probability sampling techniques (convenience and snowball sampling) for data collection through an online platform (LimeSurvey) using a self-report research protocol. The total sample comprised 351 Portuguese public sector employees (72.6% women and 27.4% men). The results supported the positive relationship between psychological contract fulfillment and both work engagement and overall job satisfaction, as well as between overall job satisfaction and overall life satisfaction. However, no significant relationship was found between work engagement and overall life satisfaction. Additionally, the moderating effect of work format was not supported in any of the tested relationships. These findings highlight the crucial role of psychological contract fulfillment in increasing employee well-being in the Portuguese public sector. They also provide practical contributions to promote a healthy work environment, focusing on employee well-being across the various work formats.

Abstract 66

VALIDATION OF ORGANISATIONAL CULTURE ASSESSMENT INSTRUMENT IN A DEVELOPING COUNTRY

Mitonga--Monga J.*, Monyai D.P.

University of Johannesburg ~ Johannesburg ~ South Africa

Background: Organisational culture (OC) plays an increasingly important role in shaping practices and management approaches in state-owned enterprises (SOEs). Despite this importance, there is a paucity of research addressing the validation and contextual adaptation of the Organisational Culture Assessment Instrument (OCAI) for use in SOEs, particularly in developing countries such as South Africa. Purpose: This study aims to validate the OCAI in the context of South African SOEs by conducting rigorous psychometric assessments and confirmatory factor analyses (CFA). Methods: This study followed a positivist research philosophy and adopted a quantitative approach with a stratified sample of (N=373) permanent employees in a South African state-owned enterprise. After an initial screening, psychometric testing and confirmatory factor analyses were conducted to determine the internal reliability and construct validity of the instrument. Results: The results show that the OCAI represents a four-dimensional structure of organisational culture with good internal consistency for clan culture, adhocracy culture, market culture and hierarchy culture. The CFA showed that the loading coefficients of most factors of the culture model had moderate to high values ranging from 0.39 to 0.92. Furthermore, the results showed that the model had an adequate fit. Conclusion: The results of the study indicate that the OCAI has good reliability and validity, which speaks in favour of its applicability in SOEs in South Africa and similar cultural contexts

Abstract 180

AFFECTIVE EVENTS AT WORK AND EMPLOYEES' PSYCHOLOGICAL WELLBEING: THE MODERATING ROLE OF EXTRAVERSION, NEUROTICISM AND SERVANT LEADERSHIP

Huang J.[1], Panaccio A.*[2]

[1]SSENSE ~ Toronto ~ Canada, [2]John Molson School of Business, Concordia University ~ Montreal ~ Canada

Affective events at work have a significant impact on employees. However, much remains unknow about the processes involved. This study draws on Affective Events Theory (Weiss & Cropanzano, 1996), servant leadership (Liden et al., 2008) and personality research to further our understanding of how affective events influence employees' psychological wellbeing. Specifically, we examine the impact of positive and negative events on hedonic and eudaimonic wellbeing, accounting for employees' extraversion and neuroticism and their supervisors' servant leadership.

We conducted an online survey with 209 employees (45.5% women, mean age 32) using previously validated scales. Variance Inflation Factor (VIF) tests suggest multicollinearity was not an issue in this study. We conducted confirmatory factor analyses (CFA) and multiple regression analyses.

Affective work events were significantly related to employees' psychological well-being, and relationships were in the expected direction. For instance, positive events were positively associated with subjective vitality and eudaimonic wellbeing and negatively associated with burnout, while negative events displayed relationships in the opposite direction with these variables. Employee extraversion moderated relationships with some dimensions of wellbeing. For example, the relationship between positive events and eudaimonic wellbeing was weaker among extraverted individuals. Contrary to hypotheses, neuroticism did not significantly moderate relationships. Interestingly, servant leadership strengthened the negative relationship between negative events and subjective vitality.

This study highlights the relevance and complex functioning of how affective work events may impact employees' psychological wellbeing. The moderating role of extraversion, for instance, could result from the fact that extraverted individuals tend to expect positive events, while such events may exceed introverted individuals' expectations, thus having a greater impact on their wellbeing. Similarly, employees with a servant leader may generally expect fewer negative events at work, and experiencing such events may lead them to exert more effort. This study however has limitations, and further research is warranted.

Abstract 30

DEVELOPMENT AND VALIDITY OF THE DARK SIDE LEADERS SCALE（DSPLS）

Tokuyoshi Y.*

Coaching Psychology Center ~ Tokyo ~ Japan

Purpose

Throughout history and in modern times, leaders with a "dark side" have emerged across various domains, such as politics and economics. To address the issue of effectively managing such leaders, we developed a scale of dark side Leaders. This scale aims to measure personality traits often associated with workplace bullying and harassment—such as the Dark Triad traits (Narcissism, Machiavellianism, and Psychopathy), Extreme egocentrism, and Sadism—while emphasizing leadership perspectives. Hypothetically, this scale was assumed to relate some of the Dark Triad and Big Five personality traits.

Method

In this study, the Dark Side Personality Leader Scale (DSPLS) was developed, comprising 20 items representing five factors (Narcissism, Machiavellianism, Psychopathy, Extreme egocentrism, and Sadistic leadership). The total of 1,988 participants (mean age = 51, SD = 15) completed an internet-based questionnaire. The collected data were analyzed using confirmatory factor analysis (CFA).

Results

The results supported a five-factor model, demonstrating a good model fit to the data (CFI = .949, TLI = .939, RMSEA = .066, 90% CI = [.063, .069]). The Cronbach's alpha coefficients for each factor in the DSPLS ranged from .72 to .92. Furthermore, the scale achieved an optimal score in the Mokken Scale Analysis (Ht ≥ .42). The DSPLS score showed significant positive correlations with the Dark Triad Dirty Dozen traits (Jonason & Webster, 2010). Additionally, it exhibited significant negative correlations with agreeableness as measured by the TIPI-J (Gosling et al., 2008).

Discussion

The DSPLS was validated against the Dark Triad scale, confirming its hypothesis and validity through a negative correlation with agreeableness in the Big Five Personality. Leaders with dark personality traits, marked by low empathy, likely exhibit weaker cooperativeness. Future research will explore links between leadership styles and workplace harassment.

Abstract 460

EMPOWERING LEADERSHIP AND MEMBERS' SATISFACTION WITH THE GROUP: THE MEDIATING ROLE OF TEAM AFFECTIVE COMMITMENT

Vasconcelos Torres G.*[1], Lourenço P.R.[1], Rebelo T.[1], Soriano A.[2], Dimas I.[3], Alves M.[4]

[1]University of Coimbra ~ Coimbra ~ Portugal, [2]University of Valencia ~ Valencia ~ Spain, [3]Centre of Business and Economics Research (CeBER), University of Coimbra, Portugal, [4]Research Center in Business Sciences (NECE-UBI), University of Beira Interior, Portugal

Empowering leadership is defined as a process of sharing power by granting autonomy and responsibilities to followers through specific leadership behaviours that enhance intrinsic motivation. Recent research indicates a positive relationship between empowering leadership and members' satisfaction with the group, with team affective commitment serving both as a consequence of empowering leadership and as an antecedent to members' satisfaction with the group. This research, focused on team members with some degree of virtuality, aimed to deepen the understanding of how empowering leadership influences the functioning of work teams by examining the relationships between empowering leadership, team affective commitment, and members' satisfaction with the group, specifically analysing the mediating role of team affective commitment. The approach was rooted in the job demands-resources model and social exchange theory. Data were collected through a questionnaire survey administered to work teams from various organizations, using a quantitative, two-wave design with a two-month interval. The study is based on a sample of 122 participants, pertaining to 33 work teams from 16 organizations, all operating in the services and commerce sector in Portugal. The relationships between the variables were analysed through correlations and simple mediation. The results showed that empowering leadership is positively related to both team affective commitment and members' satisfaction with the group, and that team affective commitment is positively related to members' satisfaction with the group. Furthermore, team affective commitment mediated the relationship between empowering leadership and members' satisfaction with the group, highlighting the importance of emotional bonds within teams as a mechanism through which empowering practices influence satisfaction. These findings deepen the understanding of how empowering leadership shapes team outcomes and underscore the relevance of these dynamics in virtual contexts, providing a strong basis for future research and leadership development initiatives.

Abstract 4969

TUNING INTO TRAITS: PERSONALITY, TEMPERAMENT, AND DAILY MUSIC ENGAGEMENT

Wang J.*[1], Zhang Q.[2], Suh K.[3]

[1]School of Music Education, Zhejiang Conservatory of Music, China, [2]Conservatory of Music, Xianda College of Economics and Humanities, Shanghai International Studies University, China, [3]Department of Counseling Psychology, Sahmyook University, South Korea

Background

Music is widely used in everyday life for a variety of psychological functions, including emotion regulation, stress management, and the enhancement of well-being (Weinberg & Joseph, 2017). Previous studies have shown that engagement with music is associated with life satisfaction, happiness, and psychological adjustment, suggesting that music serves as an important resource in daily life (Wang & Suh, 2024a; Wang & Suh, 2024b).

Research has also demonstrated that individual differences in music use are related to personality characteristics, with traits such as extraversion and openness being associated with greater musical engagement (Chamorro-Premuzic & Furnham, 2007). However, relatively little is known about how both broad personality traits and temperamental dispositions, such as the Behavioral Activation System (BAS) and Behavioral Inhibition System (BIS), contribute to everyday music use. Understanding these relationships may provide insight into the psychological mechanisms underlying musical engagement in daily life.

This study examined the relationships between personality characteristics and everyday music use among Chinese adults. Specifically, we investigated (a) correlations between everyday music use and the Big Five personality traits, BAS, and BIS; (b) the predictive effects of the Big Five personality traits and BAS/BIS dispositions on everyday music use; and (c) the relative contributions of personality traits and temperamental factors using stepwise regression analysis.

Methods

Participants

The sample consisted of 270 Chinese adults who completed an online survey (135 men and 135 women), aged 18–65 years (M = 41.14, SD = 12.94).

Instruments

Everyday music use was measured using the Use of Music Inventory developed by Chamorro-Premuzic and Furnham. Personality traits were measured using the Chinese Big Five Personality Inventory-15 (CBF-PI-15) developed by Zhang et al., assessing neuroticism, extraversion, conscientiousness, openness, and agreeableness. Temperamental dispositions were measured using the BAS/BIS Scale developed by Carver and White, including the BAS subscales of reward responsiveness, drive, and

fun seeking, as well as BIS. Internal consistency was acceptable, with Cronbach's α ranging from .70 to .87 for the Big Five traits, .86 for BAS, .80 for BIS, and .78 for music use.

Data collection and analysis

Following IRB approval and adherence to research ethics standards, data were collected online through a professional survey agency. Analyses were conducted using SPSS 26.0, including Pearson correlation, multiple regression, and stepwise regression analyses.

Results

Correlation analyses showed that everyday music use was positively associated with neuroticism, extraversion, openness, and agreeableness, whereas conscientiousness was not significantly related to music use (Table 1). Among the temperamental variables, drive and fun seeking were negatively correlated with everyday music use, while reward responsiveness, overall BAS, and BIS showed no significant associations. Extraversion demonstrated the strongest positive correlation with everyday music use ($r=.39$, $p<.001$).

Multiple regression analysis indicated that the Big Five personality traits explained 19.3% of the variance in everyday music use (Table 2). Neuroticism, extraversion, and openness emerged as significant positive predictors, whereas conscientiousness and agreeableness did not make unique contributions after controlling for the other personality traits.

Stepwise regression analysis identified extraversion, neuroticism, and openness as significant predictors of everyday music use (Table 3). Extraversion emerged as the strongest predictor, accounting for 14.8% of the variance ($\beta=.385$, $p<.001$), followed by openness and neuroticism. Overall, the findings suggest that individuals who are more extraverted, emotionally sensitive, and open to new experiences are more likely to engage with music in their daily lives.

Discussion and Conclusion

The findings suggest that personality plays an important role in explaining individual differences in everyday music use. Extraversion emerged as the strongest predictor, indicating that individuals who are more sociable, energetic, and stimulation-seeking are more likely to engage with music in their daily lives. Neuroticism and openness also contributed positively, suggesting that music may serve both emotional and experiential functions for these individuals. In contrast, temperamental variables showed relatively limited accountability compared with the Big Five personality traits. Overall, the results emphasize the importance of personality characteristics, particularly extraversion, neuroticism, and openness, in understanding everyday musical engagement.

APPLIED PSYCHOLOGY RESEARCH: A COMPARISON OF DELUSIONS AND HALLUCINATIONS

Barrett G.*, Barrett A., Barrett K., Plunkett G., Barrett J., Barrett C.P.

Barrett & Associates ~ Stow ~ United States of America

Meta-Analytical reviews of personnel selection reviews based on delusions were compared with Artificial Intelligence reviews with their hallucinations.

An Artificial Intelligence database of over 100,000 full text documents was used to identify alternative selection procedures, and compare the results with all major personnel selection meta-analyses. This included the major personnel selection meta-analyses cited by I/O experts in U.S. class action discrimination law suits.

The focus was upon alternative selection procedures advocated by expert witnesses. Experts cited a core number of highly cited personnel selection meta-analyses. The meta-analyses were used as the scientific basis for testimony that alternative selection procedures had equivalent validity to cognitive tests with less adverse impact. Alternative tests included personality traits, achievement records, physical ability, bio data, and situational judgement. Meta-analysis results were compared with Artificial Intelligence results. The comparisons included transparency, verification, replication, primary validity studies, adverse impact, and U.S. court decisions. Based on the results, the future of artificial intelligence was compared with meta-analyses.

Abstract 1696

ESTABLISHING THE CONTENT VALIDITY OF A NEW MEASURE OF ADAPTIVE PERFORMANCE: DISTINGUISHING BETWEEN PROTECTIVE AND PROMOTIVE ADAPTATION

Boudrias J.*[1], Ouellette S.[1], Montani F.[2], Daljeet K.[1]

[1]Department of Psychology, University of Montreal ~ Montreal ~ Canada, [2]School of Public Health (ESPUM), University of Montreal ~ Montreal ~ Canada

Accurately assessing adaptive performance is essential for understanding how individuals respond to change, yet existing measures rarely distinguish between qualitatively different forms of adaptation. This research introduces a new instrument designed to capture adaptive performance along two complementary orientations. The first is protective adaptation, which refers to behaviors aimed at maintaining desirable conditions (e.g., preserving performance standards or team cohesion). The second is promotive adaptation, which refers to behaviors aimed at improving or advancing a situation (e.g., implementing new practices or making better use of technologies).

Building on a Delphi study that identified dimensions of adaptive performance, we developed 96 items reflecting these two orientations. This paper reports the results from two studies examining their content validity and perceived relevance.

In Study 1, 21 Ph.D. students in I/O psychology classified the items along the two orientations (protective vs. promotive) and evaluated their clarity and conciseness. Applying established criteria for strong content validity (psa ≥ .82; csv ≥ .61; Colquitt et al., 2019), 10 items failed to meet the thresholds and another 10 were judged insufficiently clear or concise.

In Study 2, 45 managers from diverse backgrounds assessed how frequently the items occurred in their work environment and the extent to which each represented an indicator of performance in dynamic conditions. Results showed that 10 items were rated as infrequently displayed. Managers consistently viewed protective adaptation dimensions as highly relevant performance indicators, whereas some promotive dimensions (e.g., enhancing stress management in dynamic situations, shaping organizational changes) were perceived as less relevant.

Together, these findings support the conceptual distinction between protective and promotive adaptive performance and provide empirical guidance for refining the items. A reduced version of the questionnaire will be developed and validated with employee samples to offer a more nuanced and evidence-based assessment of adaptive performance in dynamic organizational contexts.

Abstract 1686

TOOLS ASSESSING THE CORE RESOURCES OF THE HYBRID WORK: A SYSTEMATIC REVIEW OF THE LITERATURE

Bravo A.*[1], Negrini A.[1], Nauche B.[1], Cournoyer L.[2], Nadeau--Tremblay J.[2], Corbière M.[3]

[1]Institut de recherche Robert-Sauvé en santé et en sécurité du travail (IRSST) ~ Montréal ~ Canada, [2]Centre de recherche de l'Institut universitaire en santé mentale de Montréal (CR-IUSMM) ~ Montréal ~ Canada, [3]Université du Québec à Montréal (UQAM) ~ Montréal ~ Canada

Introduction: In recent years, there has been a significant increase in the possibility of doing hybrid work (i.e., working on-site at the employer's location and remotely from home). This can contribute to promoting work-life balance. However, it could also be associated with health problems, such as stress and mental fatigue. Some core resources of the hybrid work (i.e., functional remote workstations, agile offices within the organization, flex-time, and engaging management) could facilitate performance and prevent health problems among workers. Therefore, it is essential to have validated tools for assessing these core resources.

Purpose: The objective of this study is to identify the validated tools existing to evaluate the four core resources of hybrid work, which can promote worker health and prevent psychological health issues, mental disorders and/or musculoskeletal disorders.

Method: A systematic review of the scientific literature is conducted to identify the tools assessing the four core resources of hybrid work. The target publications are quantitative studies published between 2005 and 2025, and available in English, French, Spanish, or Italian. The databases PsycInfo, Medline, and Scopus are used. The PRISMA guidelines for reporting systematic reviews are followed.

Results: The identified tools in the selected studies will be classified according to the four core resources of hybrid work. In addition, the reported psychometric (e.g., internal consistency) and practical (e.g., time administration) properties of these tools will be reported as well.

Conclusion: Recommendations regarding the use of these tools in research and into prevention programs will be made based on their qualities. The identified tools could be used to recognize and promote quality hybrid working conditions to improve workers' health and performance.

Abstract 1759

WORKWITHSKILLS – A COLLABORATION WITH MAJOR DUTCH ENERGY-INFRASTRUCTURE COMPANIES TO ASSESS THE EFFECTS OF SKILLS-BASED HR METHODS

Dix J.*, Born M., Serlie A.

Erasmus University Rotterdam ~ Rotterdam ~ Netherlands

The WorkWithSkills-project (WWS) is a government-backed collaborative project between the Erasmus University Rotterdam (EUR), Tilburg University (TiU), ArbeidsMatchPlatform (AMP) and the employers' association WENB.

In order to successfully complete the energy-transition, a large number of (technically) skilled workers are needed. At the same time, these workers are becoming increasingly hard to find and retain. WWS aim to evaluate whether Skills-Based HR methods (SBHR) could be part of the solution.

In recruitment and selection for example, organisations traditionally look for the appropriate degrees, formal qualifications and past experience. With SBHR, companies would focus on the skills a candidate or employee has acquired instead, allowing them to find candidates from a much larger pool than just those that already possess the required qualifications.

Using action research methods, our consortium is working with ten major Dutch energy-organisations to help them adopt SBHR methods, so that we can then evaluate it's effects. Our goal is to gather data on 1000 participants; ten per team, ten team per company and ten companies total. We aim to evaluate all parts of the HR-cycle; recruitment and selection, onboarding, learning and development etc.

The EUR focusses on the individual level psychological outcomes of SBHR, such as work performance and satisfaction, engagement, Person-Job or Person-Organisation fit, fairness and acceptance by peers; for candidates, (existing) employees, leaders and HR-personnel.

A cross-sectional study into the current state of SBHR-adoption nationwide is ongoing, we aim to present the results at ICAP. We're also looking to identify factors that predict whether or not HR-professionals and organisations are open to or interested in SBHR. Our goal is to gather information from +/- 200 participants from a similar amount of organisations, spanning different sectors and sizes, to get a sample that is

representative of Dutch employers in general.

Abstract 1678

FACETIME OR FACELESS? AN EXPERIMENTAL STUDY ON EXPLOITATIVE LEADERSHIP AND EMPLOYEES' PERCEPTIONS ACROSS DIFFERENT COMMUNICATION CHANNELS

Holzapfel M.[1], Vilser M.*[2], Böhm M.[3], Schmid E.[2], Hauser A.[1]

[1]Munich Business School ~ Munich ~ Germany, [2]University of the Bundeswehr Munich ~ Neubiberg (Munich) ~ Germany, [3]University of Applied Science Landshut ~ Landshut ~ Germany

Introduction. In digital work environments, physical distance makes it more challenging to develop and maintain work relationships. As a result, leadership behavior and how leaders engage with employees have become especially important. Previous research has shown that the choice of communication tools and the level of situational stress significantly influence leadership behavior. However, the ways these factors affect exploitative leadership (i.e., a leadership style where leaders focus on their own interests and take advantage of subordinates) are still not well understood. Drawing on Media Richness Theory, Construal Level Theory, and Conservation of Resources Theory, it is proposed that lean communication media (e.g., text-based channels like email and chat) and higher stress increase psychological distance between leaders and employees, promoting exploitative leadership behavior.

Purpose. This study aims to explore how communication media and leaders' situational stress influence exploitative leadership in digital work environments. It examines whether using leaner communication channels and higher stress levels increase psychological distance, thereby raising the likelihood of exploitative leadership.

Method. A series of laboratory experiments is conducted where the communication channel (i.e., text, audio, video, face-to-face, free choice) and stress condition (neutral vs. stressed) are systematically manipulated. Participants are assigned tasks under either predetermined or freely chosen communication channels. Leadership behavior, stress responses, and psychological distance are assessed using physiological measures (i.e., heart rate, heart rate variability, skin temperature) alongside self-report instruments.

Results. Data analysis is ongoing. It is anticipated that the findings will demonstrate that lean communication channels and heightened stress contribute to increased psychological distance, which in turn facilitates exploitative leadership behaviors.

Conclusions. The expected outcomes are projected to advance the theoretical understanding of the interplay between media use, situational stress, and exploitative leadership in digital collaboration. Practical implications concern the development of communication strategies and training interventions designed to mitigate exploitative tendencies in digital collaboration.

Abstract 1624

TYPES OF CRISES AND LEADERSHIP EVALUATION

Kokubo M.*

Ritsumeikan University ~ Ibaraki ~ Japan

This study examines how leadership evaluation differs depending on the type of organizational crisis and the gender of leaders. Building on Coombs and Holladay's (1996) attribution-based typology, crises were categorized by locus of control and intentionality. This yields four types: internal–unintentional (e.g., production failures), internal–intentional (e.g., corporate scandals), external–unintentional (e.g., natural disasters), and external–intentional (e.g., terrorism). Collins et al. (2023) have noted that distinct leadership themes emerge across these types. Extending this framework, the present study incorporates the gender of leader. Bruckmüller and Branscombe (2010) suggested that "glass cliff" occurs because feminine characteristics (e.g., warmth) are suitable for leadership in times of crisis. So, we also examine how feminine characteristics (communion) and masculine ones (agency) of leaders are evaluated depending on the type of crisis. Online experiments were conducted in late 2024 with 800 participants recruited via a research company. Respondents were randomly assigned to one of eight conditions crossing 4 crises type (internal vs. external × intentional vs. unintentional) with leader gender (male vs. female). Each participant read a crisis scenario and a leader's short biography and then completed evaluation measures. Dependent variables included organizational reputation and leader evaluation (communion, agency, task-oriented leadership behaviour, person-oriented one and change potential). Two-way ANOVAs revealed that crisis type affected organizational reputation, and that leader gender affected person-oriented leadership behaviour significantly. Significant interactions emerged for task-oriented leadership behaviour, person-oriented one, and change potential. Notably, evaluations of male leaders remained stable across crises, whereas female leaders were judged differently depending on crisis type. These results echo Kokubo's (2023) findings that female leaders' evaluations vary with organizational performance, while male leaders' evaluations remain consistent. Overall, the study highlights the situational nature of leader evaluations, particularly for women, and suggests that gendered expectations shape perceptions of effective crisis leadership.

Abstract 1740

PLURALISTIC IGNORANCE OF NEW GRADUATE WORKERS IN JAPANESE ORGANIZATIONS

Matsumoto T.*[2], Yoshida T.[1]

[1]Gifu Shotoku Gakuen University ~ Gifu ~ Japan, [2]Kyoto Women's University ~ Kyoto ~ Japan

Many organizational silences exist in Japanese workplaces. Pluralistic ignorance is a mechanism of organizational silence that occurs when members of an organization recognize discrepancies between their opinions and that of others. Specifically, new graduate workers would keep silent to avoid conflict with the others' opinion in adapting themselves to their organization. This study examines new graduate workers' possible pluralistic ignorance in Japanese organizations. A web survey was conducted on 90 Japanese new graduate workers (35 males, 54 females, and one participant who did not indicate gender). The average age was 23.02 (range 19–26). The survey contained questions on five workplace behaviors (i.e., taking a moderate rest out of break times, going home at the fixed time, proposing improvement, refusing an additional task, and obeying the regular procedure). Participants responded by either agreeing or disagreeing to each behavior on a 9-point scale. For the same behaviors, they inferred the degree of agreement by Japanese society and their organization on a 9-point scale. We conducted ANOVAs on each behavior in which attitude (participant vs. the Japanese society vs. their organizations) is the independent variable, and attitude score (degree of agreement for a behavior) is the dependent variable. The results revealed that the scores of the Japanese society and their organizations were significantly lower than their own attitude score for only three behaviors (i.e., taking a moderate rest out of break times, going home at the fixed time, and proposing improvement). The results indicate that new graduate workers' pluralistic ignorance could occur, depending on the kind of behavior.

Abstract 1720

THE IMPACT OF HOSPITAL WORKERS' SOCIAL ENVIRONMENT ON WORKING IN HIGH-RISK SITUATIONS

Müller N.*

Friedrich Schiller University ~ Jena ~ Germany

Dealing with high-risk situations is a persistent challenge faced by hospital workers (HWs). The consequences of these risks are not confined to patients, hospitals, or the broader health system; they also exert a significant influence on HWs themselves and their social surroundings. The way HWs perceive high-risk scenarios shapes their coping mechanisms and actions. An essential, yet frequently overlooked, factor are the perceptions of the social environment. The support or strain provided by family and friends can profoundly influence a worker's resilience. Existing research suggests that individual, team and organisational resilience are correlated. Consequently, the social environment has the potential to influence outcomes across all these domains.

In this research project, resilience levels are conceptualised as interdependent perceptions that influence HWs decision-making and thus their behaviour in the workplace. The social environment is defined as a multidimensional construct composed of perceived social support, strain, worries and stigmatization experiences.

The interplay between various aspects of the social environment and their impact on perceptions of risk and resilience was explored through three case studies conducted in Germany. The first two case studies, carried out between 2018 and 2020 in two German hospitals (N = 58/48), investigated HWs' perceptions of their own, their team's, and their hospital's preparedness for managing patients with high-consequence infectious diseases (HCID). The third case study examined experiences and perceptions during the COVID-19 pandemic in 2020 (N = 1710).

The findings indicate that the social environment is not perceived uniformly, both positive and negative aspects coexist and interrelate. These aspects vary in their impact on perceived risks and resilience, and interactions subsequently shape workplace behaviour. In summary, the social environment may function as a resource or challenge for HWs facing high-risk situations. Understanding these complex interactions is essential for improving resilience and outcomes for HWs in high-risk contexts.

Abstract 1655

DEVELOPING THE ENGLISH VERSION OF THE CAREER URGENCY SCALE (CUS-E)

Ono H.*

University of Tsukuba ~ Tokyo ~ Japan

Background: In contemporary careers, individuals are expected to proactively manage and develop their own paths. “Career urgency,” originally conceptualized in Japan, captures three affective–cognitive facets—“feeling of being pressurized,” “urge to develop one’s career,” and “concern for one’s career”—that relate to turnover intention and mental health.

Objective: To develop an English version of the Career Urgency Scale (CUS-E) and examine its factor structure, reliability, and validity among U.S. young adult workers.

Methods: Following the ISPOR Task Force guidelines, the original Japanese items were forward-translated, reconciled, back-translated, reviewed by the original authors, and cognitively debriefed with native English-speaking workers. The main study used a web panel survey of full-time U.S. employees aged 23–35 (N = 200; 100 men, 100 women; M_age = 29.52, SD = 3.98), with data collected August 25–31, 2025. Participants completed 16 preliminary CUS-E items (4-point scale), turnover intention (Mobley et al., 1978), introjected regulation from the Work Extrinsic and Intrinsic Motivation Scale (Tremblay et al., 2009), and the GHQ-12.

Results: Cognitive debriefing led to minor wording revisions. Confirmatory factor analysis of the 16 items prompted removal of two low-loading items ($\lambda < .30$). The final 14-item model showed satisfactory fit, $\chi^2(74) = 212.673$, $p < .001$; CFI = .915; RMSEA = .097; SRMR = .064. Internal consistency was acceptable: “feeling of being pressurized” α/ω = .91/.91, “urge to develop one’s career” .75/.75, and “concern for one’s career” .79/.79. Correlations were as follows: “feeling of being pressurized” and “concern for one’s career” correlated ($r > .50$) with turnover intention and GHQ-12; “urge to develop one’s career” correlated ($r > .20$) with turnover intention, introjected regulation, and GHQ-12.

Conclusions: The CUS-E replicated the original three-factor structure, showed adequate psychometrics, and exhibited expected external correlates. Findings support the cross-linguistic applicability of career urgency and provide a tool for comparative research on early-career adaptation and well-being.

Abstract 1666

COGNITIVE OUTSOURCING AND THE AI WORKPLACE: FROM “WORKSLOP" TO COMPETENCE PENALTY

Pietrantoni L.*, De Angelis M., Fraboni F., Aksy F., Abdulgader A., Mezentseva A., Cioffi G., Mabel S.R.N., Morandini S.

Univeristy of Bologna ~ Bologna ~ Italy

The integration of AI at work raises concerns about its impact on cognition and collaboration. Historical anxieties about technology eroding mental capacity, from Socrates' critique of writing to fears of digital dependency, reappear in current debates. While AI promises efficiency, it reshapes how individuals think and interact. Recent work on "System 0" describes a AI-mediated layer of cognition preceding Kahneman's dual-process model, complicating notions of ownership, expertise, and responsibility. This intersects with distributed cognition (Hutchins, 1995), activity theory (Engeström, 2001), and extended mind theory (Clark & Chalmers, 1998), which view cognition as distributed across people and artifacts. AI intensifies this extension, but also introduces "competence penalty", professionals judged less capable when their work is linked to AI, even if quality remains unchanged (Gai, 2025). We conducted a review of AI-related cognitive outsourcing at work and its effects on workplace dynamics. Cognitive outsourcing is conceptually broader the “cognitive offloading" and is foundational to distributed cognition and transactive memory systems. Cognitive automation is a newer concept driven by advances in AI/ML, related to knowledge work and human-AI collaboration. Our review shows that cognitive outsourcing impacts the nature of work, affecting job design, skill requirements, and organizational performance, reshaping work by automating tasks, shifting skill requirements, and altering job meaning. A parallel phenomenon is "workslop," low-effort and low-quality AI output lacking contextual understanding (Niederhoffer, 2025). In collaborative environments, this creates a "cognitive commons" problem: individuals maximize efficiency but collective outcomes decline. At the same time, competence penalty pressures workers to obscure AI use, producing tensions between reliance and credibility. These dynamics weaken trust, mentorship, and peer learning, as AI-mediated content lacks the subtle markers of human reasoning that sustain professional growth. Future directions should focus on developing synergies between human and AI cognition, exploring hybridization processes that sustain expertise while amplifying organizational innovation.

Abstract 1749

BEYOND THE CLOCK: HOW AFTER-HOURS WORK CONNECTIVITY ENHANCES PROMOTION PROSPECTS

Yuan Y.[1], Wu Z.*[2]

[1]Faculty of Business and Economics, The University of Hong Kong ~ Hong Kong ~ China, [2]School of Economics and Management, Tsinghua University ~ Beijing ~ China

The pervasive use of information and communication technologies has blurred the boundaries between work and personal life, making after-hours work connectivity (AHC) a common phenomenon. While existing research often highlights its detrimental effects on work outcomes, this study explores its potential upside for career advancement. The results support our hypothesized model. After-hours work connectivity was positively related to perceived mattering to the leader, which subsequently was associated with a higher possibility of promotion. Crucially, upward mobility motivation significantly moderated the first stage of this mediation. The positive link between AHC and perceived mattering was significantly stronger for employees with high (vs. low) upward mobility motivation. This study offers a nuanced perspective on the career implications of AHC by identifying a positive psychological pathway (perceived mattering) and a critical boundary condition (upward mobility motivation). It shifts the narrative from AHC as a mere stressor to a potential strategic behavior for career advancement, contingent on individual motives.

Abstract 1654

INVESTIGATING MECHANISMS LINKING LEADER GRATITUDE EXPRESSION AND WORK ENGAGEMENT: THE MODERATING ROLE OF PAY SATISFACTION

Yu H.*[2], Tsai W.[1]

[1]National Chengchi University ~ Taipei ~ Taiwan, [2]National Dong Hwa University ~ Hualien ~ Taiwan

Introduction:
Leader expressions of gratitude toward subordinates represent a fundamental interpersonal dynamic within organizations and are often associated with improved employee attitudes and behaviors. Conceptually, such expressions reflect verbal signals through which leaders convey appreciation and recognition of employees' contributions. Although commonly regarded as an inherently positive signal, emerging evidence indicates that such expressions may elicit more complex responses. Some employees respond with positive emotions that enhance work engagement, whereas others may experience negative emotions that undermine it.

Purpose:
The present study investigates whether both positive and negative emotions operate simultaneously as mediators in the relationship between leader gratitude expression and follower work engagement, and whether employee pay satisfaction serves as a critical moderator shaping these effects.

Method:
We adopted a multi-source, multi-wave research design with data collected at two time points. The final sample comprised 199 leader–follower dyads nested within 76 work teams across 43 companies in Taiwan.

Results:
Results revealed that leader gratitude expression was positively related to followers' positive emotions and negatively related to their negative emotions. Both emotions mediated the relationship between leader gratitude expression and work engagement, although the indirect effect through positive emotions was substantially stronger. Pay satisfaction moderated these relationships by strengthening the link between leader gratitude expression and positive emotions and weakening the link with negative emotions. Moreover, analyses of conditional indirect effects showed that the indirect pathway through negative emotions emerged only when pay satisfaction was relatively low; when pay satisfaction was relatively high, the negative emotional pathway became nonsignificant.

Conclusions:
Overall, this study demonstrates that leader gratitude expression can activate dual emotional mechanisms, highlights the stronger role of positive emotions, and identifies pay satisfaction as a boundary condition that constrains the negative pathway. These findings advance theory on workplace gratitude and guide leaders in fostering engagement through context-sensitive appreciation.

01 - Division 1: Work and Organizational Psychology

WORKPLACE INNOVATION FOR SUSTAINABLE WELL-BEING (WISEWORK-C)

Wednesday 22 July 2026 from 09:30 to 11:00

(O-Arsenale)

Marisa Salanova (Universitat Jaume I ~ Castellón ~ Spain), Chair and Presenter
Jaime Martín (Universitat Jaume I ~ Castellón ~ Spain), Co-Chair
José María Peiró (Universitat Jaume I ~ Castellón ~ Spain), Discussant

Workplaces across Europe are undergoing profound transformations driven by digitalisation, climate change, demographic ageing, and the integration of artificial intelligence. These shifts create both opportunities and risks for employees' health and well-being, demanding innovative, evidence-based responses. The WISEWORK-C Cluster, which unites five Horizon Europe projects, offers a unique platform to understand how workplaces can be redesigned to become healthier, more inclusive, and sustainable.
The novelty of this symposium lies in its multi-dimensional, cross-sectoral approach. Rather than focusing on isolated risks, WISEWORK-C explores how organisations can proactively foster resilience while addressing societal megatrends. This makes the symposium highly pertinent to ICAP, as it highlights psychology's role in shaping future-ready workplaces across Europe and beyond.
Each presentation will bring a complementary perspective:
● WAge tackles the challenges of an ageing workforce by developing the WAge Index and applying the HERO model to promote health across life stages.
● INTERCAMBIO investigates how climate change and the green transition affect work, combining biomonitoring, surveys, and co-creation to design preventive interventions.
● EU-CoWork addresses end-of-life situations at work, proposing Compassionate Workplace Programmes to foster inclusion and organisational support.
By presenting these diverse but interconnected projects, the symposium will provide an integrative view of psychosocial measures and interventions for healthier and more resilient organisations.
The session will conclude with reflections from Professor José María Peiró, Emeritus Professor of Work and Organizational Psychology at the University of Valencia, who will serve as discussant.

Abstract 3186

WHAT IS WISEWORK-C? GENERAL CONCEPT OF THE CLÚSTER AND PREVIOUS WORK IN MENTAL HEALTH TEAM

Martín J.*, Merhi R., Salanova M.

Universitat Jaume I ~ Castellón de la Plana ~ Spain

WiseWork-C is a robust cluster of five projects funded by the European Union's Horizon Europe Research and Innovation Programme. With a wide-reaching network of 50 partners across 25 countries, the cluster is at the forefront of developing evidence-based interventions to promote mental and physical health in a rapidly evolving work landscape, particularly shaped by the digital and green transitions and the post-pandemic era.

To achieve this, WiseWork-C has already spearheaded several key initiatives. It facilitates internal benchmarks, allowing projects to share best practices on essential tools and variables within organizational psychology. The cluster also hosts informative webinars that translate complex research into practical examples, demonstrating the critical importance of mental health in the workplace through the concrete work of each project.

Within the cluster, a dedicated mental health task force plays a crucial role, providing a focused perspective and organizing key events. A core part of their mission is to hold symposiums where they present not only the initial results of the projects but also their overarching methodologies and key tools. A central objective of these presentations is to engage the audience in a brainstorming session on WiseWork-C's future lines of action. This collaborative approach serves a dual purpose: it allows for the effective dissemination of the project's findings while also building a community of followers who can help shape the cluster's trajectory. This reflects the group's proactive goal of becoming a leading voice in advancing workplace health.

Abstract 3187

‘WAGE: A EUROPEAN FRAMEWORK TO ADDRESS AGEING AT WORK AND PROMOTE HEALTHY WORKING ENVIRONMENTS’.

Merhi R.*, Llorens S., Martín J., Salanova M.

Universitat Jaume I ~ Castellón de la Plana ~ Spain

Europe is facing a growing challenge: an aging population. Since 1950, the proportion of people over 65 has increased from 12% to 19.2%, and is expected to surpass 36% by 2050. While life expectancy is rising, this does not guarantee a healthy or active old age, particularly in the workplace, where issues such as physical frailty, functional decline, and managing multigenerational teams are becoming more pressing.

In this context, the European project WAge (“Healthy Working Environments for All Ages”), funded by the HORIZON-HLTH-2023 programme of the European Commission, was launched. Its goal is to develop a comprehensive framework to enhance the physical and psychosocial health of workers across age groups, with a focus on industrial sectors. The project involves nine organisations from Europe and Malaysia, and studies over 400 workers in car factories across Spain, Portugal, and Poland.

WAge assesses both physical and psychosocial aspects of work. A key innovation is the focus on well-being, its causes, and its outcomes. Central to this is the HERO (Healthy & Resilient Organisation) model, a validated tool that analyses psychosocial well-being at individual, team, leadership, and organisational levels. Using the HEROCheck instrument, both qualitative and quantitative data are gathered to identify risks, protective factors, and to develop tailored Positive Psychological recommendations and guidelines for each age group.

One of the main outputs will be the WAge Index, a tool to accurately measure physical health (e.g. musculoskeletal disorders), functional decline, and psychosocial well-being factors like work engagement, considering age and gender. Grounded in scientific evidence and cutting-edge methods, this framework aims to support the creation of healthier, more inclusive and sustainable working environments throughout the entire working life.

Abstract 3189

EU-COWORK: CREATING COMPASSIONATE WORKPLACES IN EUROPE

Vasquez C.*

Sheffield ~ South Yorkshire ~ United Kingdom

Europe's workplaces are undergoing major changes driven by the digital and green transitions, creating new challenges for employee wellbeing. These shifts particularly affect workers dealing with end-of-life (EoL) experiences—such as serious illness, caregiving duties, or grief—which are often ignored in workplace policies and culture. Despite affecting millions of employees each year, support for these situations remains limited, leading to mental health issues, reduced wellbeing, and productivity loss.

The EU-CoWork project (2024–2028), funded by the HORIZON-HLTH-2023 programme of the European Commission, seeks to address this gap. It aims to build a comprehensive framework to improve workplace support for employees facing EoL challenges, and for their colleagues, across various sectors and countries. The project unites five academic and three dissemination partners from Belgium, Sweden, Austria, Greece, and the UK, working with 12 workplaces in four European nations.

EU-CoWork includes two interconnected studies: a co-creative, developmental evaluation of tailored Compassionate Workplace Programmes (CWPs), and a mixed-methods impact evaluation using surveys, interviews, fieldwork, and policy analysis. A core element is co-creation—moving away from one-size-fits-all approaches by involving organisations directly in designing their own CWPs. These may include developing policies, adapting workspaces, reshaping wellbeing services, and boosting employee skills.

The project maps both organisational and individual factors and creates tools based on real workplace needs through workshops, communities of practice, and shared resources.

Expected outcomes include evidence-based tools to help organisations design inclusive environments that support employees dealing with EoL situations. By applying participatory and context-sensitive approaches, EU-CoWork aims to foster more compassionate, resilient, and sustainable work environments in line with Europe's changing workplace landscape.

DECENT WORK AS A PATHWAY TO FLOURISHING: SHOWCASING THE NEW "RESEARCH HANDBOOK ON DECENT WORK"

Wednesday 22 July 2026 from 09:30 to 11:00

(R-Arsenale)

Ishbel McWha-Herman (University of Edinburgh ~ Edinburgh ~ Un), Chair and Presenter

This symposium showcases the forthcoming Research Handbook of Decent Work. The book takes an interdisciplinary and international approach to explore the concept of decent work and its importance in today's society. Decent work refers to employment that is productive, provides a fair income, offers social protection, and respects workers' rights. It is a fundamental human right, essential for promoting economic growth, reducing poverty, and achieving sustainable development. It is featured in the United Nations' Sustainable Development Goal 8 and is linked to many more, including quality education, the elimination of poverty, and gender equality.

Research on decent work has accelerated over the past decade, drawing attention to its importance beyond disciplinary boundaries, and across various geographic, economic, and social contexts. Academic researchers have operationalized the concept and scrutinized its applicability in different contexts and for various workers across the globe. Beyond all this scrutiny, what has emerged is a compelling case for decent work as a means to promote social justice and well-being and create a more equitable and sustainable society. The strength of this session is the diversity of voices and perspectives, with speakers from across the globe sharing their research. Following an introduction from the Chair, David Blustein will take a contemporary perspective to explore if/how existing ideas of decent work may be understood through a neo liberal lens. This is important because initiatives to enhance decent work should prioritise universal concepts such as dignity and decency. Providing a clear exemplar of how decent work experiences can vary indifferent locations, Esther Garcia-Buades will share insights from empirical research undertaken in the tourism sector in the Balearic Islands. Moving to a different regions of the globe, Ines Meyer will focus on how decent work is understood and studied in "Africa", highlighting how certain perspectives might be excluded and the need for inclusion of diverse voices in conceptualisation. Examining migrant workers experiences of decent work, Maha Yomn Sbaa's research will focus on how individual perceptions of decent work can change due to life experiences, and what we can understand from this about the fundamental meaning of decent work. The symposium brings this all together with Tania Ferraro's work interrogating the role of HR managers inside organisations in shaping decent work for employees.

Abstract 3958

A NEOLIBERAL CRITIQUE OF DECENT WORK

Blustein D.*

Boston College ~ Boston ~ United States of America

In this presentation, we offer a contemporary analysis of the decent work concept from the lens of a neoliberal critique. After defining these terms, we identify the historical overlap between the development of the decent work agenda and neoliberalism. We articulate ways in which the ILO's Decent Work Agenda (and the decent work concept) can be expanded to more fully embrace a social justice and human rights ethos. A core aspect of this expansive and inclusive vision includes framing decent work via a vision of work that centers decency and dignity, which counters the neoliberal trend of commodifying work. Specific attributes of this broadened vision incorporate a focus on equity, diversity, and inclusion as well as pathways for meaningful and purposeful work. This critique includes ideas about how to manage work in an environment characterized by precarity, AI-based work technologies and other forces that may mitigate decent and dignified work.

Abstract 3959

DECENT AND PRECARIOUS WORK IN THE TOURISM SECTOR: CHALLENGES AND OPPORTUNITIES

Garcia--Buades E.*

University of the Balearic Islands ~ Palma ~ Spain

The hospitality sector in the Balearic Islands (in Spain), a major tourism-dependent region, exemplifies the duality of decent and precarious work. Tourism employs 28% of the workforce, yet faces persistent challenges tied to precarious employment, such as seasonal contracts, high living costs, and demanding working conditions. While collective agreements have improved wages and job stability, many workers still experience financial strain and limited career prospects. These conditions undermine well-being, increase turnover, and threaten the long-term sustainability of tourism. However, efforts to enhance work conditions, such as stable contracts, increased wages, and improved human resource practices, demonstrate the potential for improvement. Balancing economic imperatives with social equity requires strategic collaboration among businesses, policymakers, and unions. This presentation explores the interplay between employment conditions and sustainable tourism in the Balearics, offering insights into how decent work can promote social sustainability and align with the Sustainable Development Goals (SDGs) in a highly tourism-dependent context

Abstract 3960

DECENT WORK IN “AFRICA”

Meyer I.*

University of Cape Town ~ Cape Town ~ South Africa

Whenever we label different types of work as “good” or “bad,” decent or non-decent, we adopt a specific lens on what work means, shaped by the discipline-specific and cultural socialisations of those who defined the categories. The stories of three diverse individuals working in South Africa show the value of Duffy et al.’s Psychology of Working Theory (PWT). They highlight the theory’s value and conceptual concerns in South Africa. From this, the presentation (a) underlines why we have to think critically about what constitutes decent work, (b) advocate for the importance of considering individuals’ stories about their experiences of and with work to generate more diverse views on work, its purpose and what it could be, (c) empirically underline some of the constraints of the PWT and (d) propose future areas of research to develop further thinking around the PWT.

Abstract 3962

DECENT WORK AND HUMAN RESOURCE MANAGEMENT

Ferraro T.*

Coimbra University ~ Coimbra ~ Portugal

This presentation discusses aspects and trends in human resource management processes that promote decent work in organisations, and the organisational responsibility to do so. We structure our argument around the different facets of human resource management commonly outlined in the literature, to demonstrate how decisions at all stages of the HR process can impact an overarching experience of work as decent. Drawing on research about the importance of HR managers for shaping fair and decent working conditions, we highlight how HR managers are a key site of intervention to shape decent work. By raising awareness of the importance of decisions across the whole employee lifecycle, we demonstrate how much agency HR managers have over decent work. Furthermore, while the concept of decent work is often considered from a moral perspective, we will argue for the importance of HR managers making a business case for decent work within their organisations. In doing so not only will individual experiences of work be improved but so too will organisational effectiveness increase.

Abstract 3284

OPTIMIZING SURGICAL TALENT: A TEN-YEAR JOURNEY IN SELECTION SCIENCE INTEGRATION

Gardner A.*

SurgWise ~ Denver ~ United States of America

Selecting individuals into the future surgeon workforce in the United States comes with an array of inefficiencies and high costs. Traditional selection methods – typically consisting of test score cutoffs and unstructured interviews can be inequitable, costly, inconsistent, and poorly predictive of later success in the role. Given the high attrition rates associated with these high-stakes and demanding roles, more rigor and implementation of evidence-backed approaches from applied psychology are warranted.

This presentation describes a ten-year effort of integrating data and approaches from the organizational psychology literature into selection systems for surgeons across the United States. While incorporating assessments such as structured interviews, personality assessments, and situational judgment tests have successfully enhanced efficiency, reduced remediation and attrition, and improved equity, these efforts have brought with them an array of lessons learned regarding barriers to integrating applied psychology into the healthcare selection realm. This presentation provides an overview of the most common barriers experienced during this ten-year experience integrating these two industries and the strategies we undertook to address them, with the hopes of aiding other practitioners similarly intending to integrate approaches from applied psychology into a new field or industry.

Abstract 2087

PSYCHOSOCIAL AND ORGANIZATIONAL FACTORS INFLUENCING NURSES' WELL-BEING AND BURNOUT IN HOSPITAL SETTINGS

Khaoudi A.*[1], Belhaj A.[2]

[1]Moulay Ismail University (FLSH) ~ Meknes ~ Morocco, [2]Higher School of Psychology ~ Casablanca ~ Morocco

Nurses play a central role in healthcare systems (ICN, 2023; Ndenzako, 2023), yet they are exposed to multiple professional and psychosocial constraints that can undermine their psychological health. Job demands such as workplace violence, workload, atypical schedules, and emotional demands are major sources of stress, often leading to psychological distress and burnout (Vitale et al., 2023; Guay, Goncalves, & Jarvis, 2014, 2015; Wang et al., 2021; Montgomery & Lainidi, 2024). Conversely, organizational and personal resources such as job autonomy, social support, work climate, coping strategies, and perceived job utility may act as protective factors (Gilbert, 2009; Azouaghe, 2019). This research aims to examine the combined effects of job demands and resources on nurses' psychological well-being and burnout, in line with the Job Demands-Resources model (Bakker & Demerouti, 2017, 2023).

A series of self-administered surveys were conducted among samples of 442 nurses working in public hospitals. The instruments included scales assessing burnout, psychological well-being at work, job demands, and job resources. Multiple regression analyses were performed following methodological guidelines (Judd et al., 2018). Findings indicate that workplace violence, atypical schedules, workload, and emotional demands are negatively associated with well-being and positively related to burnout. In contrast, autonomy, work climate, social support, coping strategies, and perceived job utility are positively correlated with well-being and negatively with burnout;

These results confirm that prolonged job demands generate emotional overload and threaten psychological health, whereas resources serve as protective buffers that foster resilience and well-being among nurses (Bakker & Demerouti, 2017, 2023). Improving nurses' well-being requires a dual organizational approach: reducing structural job demands while strengthening available resources. These findings provide evidence-based insights for designing interventions aimed at preventing burnout and promoting quality of work life in hospital settings.

Abstract 1402

LATENT PROFILES OF WORKAHOLISM, PERFECTIONISM, AND CORE SELF-EVALUATIONS: IMPLICATIONS FOR JOB BURNOUT

Hirva L.*, Saija M., Anne M.

Tampere Universities, Faculty of Social Sciences, Work Research Centre ~ Tampere ~ Finland

This study aimed to identify individual profiles based on three trait-like burnout risk factors: workaholism, perfectionism, and low level of core self-evaluations (CSE). Using a person-centred approach and cross-sectional survey data from a multi-industrial sample of Finnish employees (n=10,470), we examined how these individual risk factors combine, and how the combinations relate to job burnout (i.e., exhaustion, mental distance, cognitive impairment, and emotional impairment). Results indicated six distinct profiles based on the combinations of the studied trait-like phenomena. Profiles characterized by elevated workaholism and perfectionism and low core self-evaluations showed higher job burnout symptoms, particularly exhaustion. The profiles that combined higher CSE with low workaholism and low perfectionism were associated with higher mental distancing. Only among one profile, "positive perfectionism", characterized by low workaholism, but high level of perfectionism and high CSE, burnout was lower. Additional analyses examined the impact of work- and individual-related predictors (e.g., occupational status, remote work, gender, age, and previous burnout) on the profile membership. Women and those with previously diagnosed job burnout were more likely to be in the high perfectionism-high workaholism profile compared to other profiles. Older workers were less likely to belong to this risk profile than other profiles. The findings suggest that the combination of high workaholism and perfectionism together with low core self-evaluations is a risk for all burnout symptoms. The emergence of a “positive perfectionism” profile emphasizes that perfectionism and workaholism are distinct constructs. Although perfectionism and workaholism may often co-occur, high perfectionism can also occur without workaholism, especially in individuals with high CSE. Overall, low core self-evaluations appear to be a more critical risk factor for job burnout than high perfectionism or workaholism alone. Our study contributes to the understanding of trait-like vulnerability factors behind job burnout. The results can help design targeted interventions to better support employee well-being.

Abstract 1927

BURNOUT AND PSYCHOLOGICAL WELL-BEING AT WORK AMONG EMPLOYEES WITH DISABILITIES: A QUALITATIVE STUDY IN THE MOROCCAN PUBLIC SECTOR

Khaoudi A.*[1], Azouaghe S.[2]

[1]Moulay Ismail University (FLSH) ~ Meknes ~ Morocco, [2]Mohammed V University (FLSH) ~ Rabat ~ Morocco

Psychological health in the workplace is widely recognized as a fundamental determinant of job satisfaction, organizational engagement, and overall quality of life (Schaufeli & Bakker, 2004; Bakker et al., 2016; Upadyaya et al., 2016). For employees with disabilities, work is not only a source of income but also a critical dimension of social inclusion and identity (Akkerman et al., 2018). Previous research among employees with disabilities has highlighted that they experience both generic demands (e.g., workload, time pressure) and disability-specific stressors (work environment barriers), while valuing resources such as supportive social relations and inclusive work climate (Efimov et al., 2022; Flores et al., 2021; Tuan et al., 2021; Ybema et al., 2020). Consistent with the Job Demands–Resources (JD-R) Theory (Bakker & Demerouti, 2017; Bakker et al., 2023), high demands and limited resources predict burnout, whereas resources foster engagement and psychological health (Kordsmeyer et al., 2022; Bakker & Demerouti, 2023). Building on this theoretical framework, the present study aims to identify both general and disability-specific factors that influence well-being and burnout among employees with physical disabilities working in the Moroccan public sector. Results show that these workers are exposed to various job demands, including workload, discrimination, and physical work environment. Moreover, the findings reveal that an inclusive work environment, job autonomy, social support, recognition and appreciation of skills have been the most significant resources promoting well-being of workers with physical disabilities. In line with previous research, the present findings emphasize the importance of the work context in order to enhance psychological health and well-being of workers with physical disabilities (Alcover & al., 2018; Flores & al., 2011; Li & al., 2015). Theoretical and practical implications, limitations of the study and recommendations for improving the well-being of workers with disabilities will also be discussed during the conference.

Abstract 1098

WHEN SUPPORT MATTERS: THE ROLE OF PERCEIVED ORGANIZATIONAL SUPPORT IN MITIGATING BURNOUT

Rodrigues A.*, Castro P., Pinto V., Peixoto R.

Universidade Católica Portuguesa Centro Regional de Braga Faculdade de Filosofia e Ciências Sociais ~ Braga ~ Portugal

Burnout has become one of the most significant psychosocial risks in modern workplaces, adversely impacting employees' well-being and job satisfaction. Perceived organizational support (POS), the extent to which employees feel valued and supported by their organization, is recognized as a crucial protective factor against burnout. This study aims to explore the relationship between burnout and job satisfaction while investigating the potential moderating role of POS. A total of 288 employees from various occupational sectors in Portugal participated by completing an online questionnaire. The survey included validated measures for burnout (using the Copenhagen Burnout Inventory), job satisfaction (via the Short Index of Job Satisfaction), and perceived organizational support (using the colleague and supervisor support subscales of the COPSOQ III). The results showed that burnout is negatively related to job satisfaction, indicating that higher levels of exhaustion are associated with lower satisfaction at work. In contrast, perceived organizational support (POS) is positively correlated with job satisfaction and negatively correlated with burnout, with supervisor support being particularly significant. The hypothesized role of perceived organizational support (POS) as a moderator in the relationship between burnout and job satisfaction was not confirmed. These findings highlight that while POS directly contributes to increased job satisfaction and reduced burnout, it may not be enough to mitigate the negative effects of burnout on its own. The study emphasizes the importance of organizations enhancing their support structures and implementing additional strategies—such as workload management, leadership training, and well-being programs—to create healthier and more sustainable workplaces.

Abstract 2108

SHE GETS IT: SUPERVISOR GENDER MODERATES WORK–FAMILY CONFLICT AND BURNOUT

Patras L.*[1], Villajos E.[2], Soriano A.[2], Plamenova Djourova N.[3]

[1]ESIC Business & Marketing School ~ Barcelona ~ Spain, [2]IDOCAL, University of Valencia ~ Valencia ~ Spain, [3]UPF - Barcelona School of Management ~ Barcelona ~ Spain

Introduction. Work–family conflict arises when demands from work and family roles interfere, and is a known antecedent of burnout. Supervisors can buffer or amplify these effects, yet the role of supervisor gender remains unclear.

Purpose. We examined whether the gender of the direct supervisor moderates associations between two directions of work–family conflict—work-to-family and family-to-work—and multiple burnout dimensions.

Method. A two-wave longitudinal survey (three-month interval) was completed online by 327 employed adults with immediate supervision and ≥6 months of experience. Burnout dimensions included exhaustion, mental distance, cognitive and emotional impairment, and psychological/psychosomatic symptoms. Structural models showed acceptable fit (RMSEA=.063, CFI=.983, TLI=.965, SRMR=.065).

Results. Moderator analyses revealed distinct patterns. With a male supervisor, work-to-family conflict positively predicted exhaustion, mental distance, cognitive impairment, emotional impairment, and psychological symptoms; family-to-work conflict showed no significant links to burnout. With a female supervisor, work-to-family conflict positively predicted exhaustion, whereas family-to-work conflict was negatively associated with exhaustion and psychosomatic symptoms.

Conclusions. Supervisor gender appears to shape how different directions of work–family conflict translate into burnout. Our results underscore the value of distinguishing both conflict directions and multiple burnout dimensions and encourage organisations to reduce work–family interference and adopt burnout-mitigation practices. Promoting women's leadership may contribute to healthier workplaces, potentially through greater recognition and empathetic handling of role conflict, thereby lessening its adverse consequences for employees and organizations.

EMPOWERING LEADERSHIP, ENGAGEMENT, AND SATISFACTION OF HYBRID TEAM MEMBERS: THE MODERATING ROLE OF THE DEGREE OF VIRTUALITY

Arenas Melendez H.Y.*, Rebelo T., Lourenço P.R.

Universidade de Coimbra ~ Coimbra ~ Portugal

Working modalities have become more relevant since pandemic, which has generated an increase in hybrid work settings, has become a new normal in work-life, as long as the job functions allow it. In consequence, the role of empowering leadership gains more relevance. These emerging work settings require consideration of factors such as job demands and resources, empowering leadership, employee engagement, team member interactions, and the degree of technology use. Grounded in Social Exchange Theory and the Job Demands–Resources model, this study examines these dynamics by testing two hypotheses: team engagement mediates the positive relationship between empowering leadership and job satisfaction, and the degree of virtuality moderates this indirect relationship, such that the mediation is stronger at lower levels of virtuality. The study analyzed data from a sample of 121 participants distributed across 32 hybrid teams using a survey questionnaire. The proposed moderated mediation model was tested using the PROCESS. The findings support the significant association of empowering leadership with work engagement, which subsequently predicts job satisfaction

Consistent with the JDR model, engagement emerged as a significant mediator, highlighting how empowering leadership serves as a valuable resource in fostering employee satisfaction. Results supported both hypotheses: empowering leadership was positively associated with engagement, which in turn significantly predicted job satisfaction. Furthermore, the strength of this indirect effect decreased as the degree of virtuality increased, highlighting the contextual sensitivity of leadership processes in virtual work settings. These findings contribute to leadership and virtual team literature by underscoring the importance of adapting leadership strategies to sustain employee engagement and satisfaction across varying degrees of virtuality. These results emphasize the contextual sensitivity and complexity of leadership processes in modern, increasingly virtual organizations and highlight the importance of adapting leadership practices to maintain engagement and satisfaction in hybrid work environments.

Abstract 1413

SUPERVISOR–SUBORDINATE GUANXI AND SUBORDINATES' PERCEIVED SUPERVISOR OSTRACISM: THE ROLES OF PERCEIVED INSIDER STATUS AND TEAM MEMBER'S SIMILARITY TO LEADERS

Siu O.L., Guo P.*, Lam H.W.H.

Department of Psychology, Lingnan University ~ Hong Kong ~ China

Purpose

Perceived ostracism from supervisor undermines employees' efficacy needs, yet its antecedents remain underexplored. Prior research has linked supervisor ostracism to low leader–member exchange (LMX), which primarily focuses on work-related interactions only. However, employees' evaluation of supervisor ostracism is also developed through non-work interactions, such as shared meals or holiday greetings. This personal, informal, and outside-work exchanges is captured by the concept of Supervisor-Subordinate Guanxi (SSG), which includes affective, hierarchical, and personal involvement aspects of social connections. Drawing on social identity theory, we test whether perceived insider status (PIS) mediates the SSG–supervisor ostracism relationship and whether this indirect effect is moderated by perceived leader–member similarity. We control for LMX to rule out work-related interactions explanations and to assess SSG's incremental value.

Design/methodology/approach

We tested our hypotheses using longitudinal cross-level moderated mediation design with 134 Chinese employees across 30 teams. Data were collected in two waves with a 4.5-month lag.

Findings

Controlling for team-level LMX (T1), individual PIS (T2) fully mediated the negative relationship between team-level SSG (T1) and individual perceived supervisor ostracism (T2). The negative indirect effect was stronger when team members perceived low similarity with their supervisor (T2) compared to high similarity.

Theoretical Contribution

This study identifies novel antecedents and boundary conditions of perceived supervisor ostracism. It expands social identity theory by integrating SSG, perceived insider status, and team member-leader similarity. Additionally, it highlights the spillover of social exchange from private to work domains, as SSG explains incremental value beyond work-related exchanges.

Research limitations/implications

Although the two-wave design supports temporal precedence, future research using larger samples with three-wave longitudinal design is recommended to establish causal ordering more robustly.

Abstract 1287

PERSONALITY TRAITS AND EMOTIONAL INTELLIGENCE INFLUENCE HOW SOUTH AFRICAN LEADERS FUNCTION OPTIMALLY IN THE CORPORATE WORLD POST THE COVID-19 PANDEMIC

Coetzee N., Ndlovu P.*

University of Pretoria ~ Pretoria ~ South Africa

Introduction: Personality traits and emotional intelligence (EQ) are key components in the optimal functioning of leaders navigating the corporate world post-Covid-19 (Ndlovu, 2025). After the pandemic, leaders shifted from traditional management roles to more empathetic ones, showing sensitivity toward employees affected by illness or loss. Bergner (2020) linked personality traits to optimal leadership. George et al. (2022) emphasized that leaders with high EQ are more attuned to others' emotions, aiding recovery from workplace challenges post-pandemic. This aligns with Goleman's (2011) view that EQ fosters strong interpersonal relationships. However, limited research has focused on the South African (SA) context.

Purpose: To (1) identify prevalent personality traits and EQ facets among SA corporate leaders post-pandemic, and (2) determine whether a relationship exists between personality traits and EQ.

Methods: Participants included 70 corporate leaders (45 males, 25 females), aged 31–65. Each completed a biographical questionnaire, the Hogan Personality Inventory, and the EQi2.0. Data were analyzed using SPSS Version 26©, employing descriptive statistics and Spearman's Correlation Coefficient.

Results: Prevalent personality traits were Ambition, Sociability, Interpersonal Sensitivity (IS), Inquisitiveness and Learning Approach (LA). Self-perception (SP), Self-expression (SE), Interpersonality, Decision-making (DM) and Stress Management (SM) were the prevalent facets of EQ. With p p ≤ 0.01, SP displayed moderate relationships with Adjustment (r = 0.04), IS (r = 0.37) and LA (r = 0.33). SE showed moderate correlations with Adjustment (r = 0.43), Ambition (r = 0.33) and IS (r = 0.38). DM showed moderate relationships with Adjustment (r = 0.52) and LA (r = 0.49). SM displayed moderate relationships with Adjustment (r = 0.46), Ambition (r = 0.36) and IS (r = 0.39).

Conclusions: The findings underscore the importance of personality traits and emotional intelligence in supporting the optimal functioning of South African corporate leaders in the aftermath of the Covid-19 pandemic.

Abstract 1041

EXPANDING LEADERSHIP RESEARCH BEYOND WEIRD: A GENDERED ANALYSIS IN COLOMBIAN SMES

Escobar M.*, Cedeño V.

Universidad de La Sabana ~ Bogota ~ Colombia

Introduction

In Colombia, where cultural diversity, inequality, and gender dynamics shape organizational life (Uniandinos, 2023), leadership is a driver of performance and social transformation (Holland & Knight, 2023). Yet, women continue to face barriers to leadership opportunities (Great Place to Work, 2023). Globally, they account for 50% of the working-age population and 40% of the labor force (World Bank Open Data, 2022), but remain underrepresented in managerial roles (Buss et al., 2024). These disparities limit growth and inclusion. Leadership research has largely focused on WEIRD contexts, overlooking regions such as Latin America, where small and medium-sized enterprises (SMEs) dominate the economic landscape.

Purpose

This study examines leadership behaviors—task, relationship, change, and external environment orientations (Yukl, 2012)—from a comparative gender perspective within SMEs in Antioquia and Cundinamarca, two regions that significantly contribute to Colombia's GDP. It seeks to analyze the relationships between leadership behaviors and organizational outcomes (sales, growth, profitability), considering the mediating role of occupational well-being and the moderating role of gender (Post & Byron, 2015). By doing so, it broadens leadership research beyond WEIRD settings.

Method

A quantitative-comparative cross-sectional design was employed. Data collection averaged 200 participants per region, including SME leaders and employees. Structural equation modeling (SEM) with Mplus version 8 (Muthén & Muthén, 2017) tested hypothesized relationships, with occupational well-being modeled as a latent construct (burnout, job satisfaction, absenteeism).

Results and Conclusions

Results on mediation and moderation, including gender-based group comparisons, will be presented. Findings are expected to enrich understanding of gendered leadership in Colombian SMEs, offering evidence from a non-WEIRD context to inform inclusive practices aligned with SDG 5 (Gender Equality) and SDG 8 (Decent Work and Economic Growth).

Abstract 1104

EMOTIONAL INTELLIGENCE AS A BUFFER? EXPLORING THE ROLE OF EMOTIONAL INTELLIGENCE IN THE LINK BETWEEN TOXIC LEADERSHIP AND LIFE SATISFACTION

Rodrigues A.[1], Lopes S.*[2], Carvalho C.[2], Pereira S.A.[3]

[1]Universidade Católica Portuguesa Centro Regional de Braga Faculdade de Filosofia e Ciências da Educação ~ Braga ~ Portugal, [2]Faculdade de Psicologia e de Ciências da Educação, Universidade de Coimbra ~ Coimbra ~ Portugal, [3]Universidade da Maia ~ Maia ~ Portugal

Toxic leadership is characterized by abusive, authoritarian, narcissistic, and unpredictable behaviors. It has increasingly been recognized as a destructive phenomenon within organizations, significantly impacting employees' overall well-being and extending its effects beyond the workplace. On the other hand, emotional intelligence (EI) is seen as an essential personal resource that can enhance resilience and promote healthier adaptation in challenging environments. This study aimed to examine the relationship between toxic leadership and overall life satisfaction while testing the moderating role of emotional intelligence. The study involved 329 employees from various professional sectors in Portugal, who were recruited through a non-probabilistic convenience sample. Participants completed a sociodemographic questionnaire, the Toxic Leadership Scale (TLS), the Satisfaction with Life Scale (SWLS), and the Wong and Law Emotional Intelligence Scale (WLEIS). The results did not support the expected negative relationship between toxic leadership and life satisfaction, showing that perceived toxic leadership was not a significant predictor of well-being. However, a positive and moderate association was identified between emotional intelligence (EI) and life satisfaction, indicating that individuals with higher EI experience greater life satisfaction. Additionally, EI moderated the relationship between toxic leadership and life satisfaction, with those possessing higher EI being more sensitive to toxic behaviors, sometimes intensifying the negative impact on their well-being. These findings offer valuable insights into the complex role of emotional intelligence (EI) in organizational settings. While EI typically promotes well-being, in toxic environments it can also increase awareness of dysfunctional leadership behaviors, potentially worsening their negative effects. The study emphasizes the importance of organizations not only investing in EI training but also implementing preventive measures and leadership development programs aimed at reducing toxic behaviors and safeguarding employees' well-being.

Abstract 504

THE IGÉTETROPIC EFFECT: WHY WE NATURALLY LEAD AND HOW WORKPLACES SHOULD RESPOND

Camire M.*

Husson University ~ Bangor ~ United States of America

What if leadership isn't assigned, but awakened? In this fast-paced, practice-forward session, Dr. Michael Camire introduces The Igétetropic Effect, a groundbreaking framework grounded in industrial-organizational and positive psychology. This theory proposes that humans are naturally inclined to step into leadership roles when certain social, emotional, and contextual cues are present. Leadership, in this view, is less about hierarchy and more about attunement, action, and shared responsibility.

Drawing on examples from his book The Igétetropic Effect, Dr. Camire blends scientific insight with stories from organizations where leadership emerges organically. Attendees will explore how this effect can be seen in high-performing teams, during crises, and in inclusive workplaces, and how organizations can activate it intentionally.

This session includes a brief interactive moment to surface personal experiences of emergent leadership and leaves applied psychologists with tools to recognize, nurture, and design for everyday leadership in their work with clients, teams, and systems.

Abstract 503

THE DIFFERENTIAL ASSOCIATIONS BETWEEN EMPLOYEE EXPERIENCE AND RETENTION INTENTION ACROSS GENERATIONAL COHORTS: INVESTIGATING THE MEDIATING ROLE OF RELATIONAL PSYCHOLOGICAL CONTRACT

Chen J.W.*, Chen C.W.

Soochow University ~ New Taipei city ~ Taiwan

This study explores the relationships among employee experience, relational psychological contract, Intention to stay, and generation differences. In the face of ongoing labor shortages and high turnover costs, retaining existing talent has become a strategic priority for organizations. Rather than focusing solely on recruitment, organizations are encouraged to enhance employee experience as a means to foster long-term commitment. The research proposes the relational psychological contract as a mediator between employee experience and intention to stay, with generational differences serving as a moderator. A structured questionnaire was administered to full-time employees in Taiwan aged 20 and above, using both online and paper-based formats, yielding 345 valid responses. Results reveal that employee experience has a significant positive impact on relational psychological contract, which in turn positively affects intention to stay. The relational psychological contract mediates the relationship between employee experience and intention to stay. Moreover, generational differences moderate both the relationship between employee experience and relational psychological contract and between relational psychological contract and intention to stay, indicating that different age cohorts perceive and respond to workplace experiences and expectations differently. These findings suggest that organizations aiming to improve employee retention should tailor human resource strategies to align with generational characteristics. Understanding the psychological mechanisms behind employee attitudes and behaviors can enable more targeted and effective HR interventions. The study contributes to both theory and practice by highlighting the importance of generational diversity in shaping the employee-employer relationship and its impact on retention outcomes.

KEEPING CONNECTED: UNDERSTANDING HOW AWE HELPS US EXPAND WITHIN ORGANIZATIONS

Jean--Baptiste T.*[1], Hart K.[3], King D.[2]

[1]PhD Candidate Rice University ~ Houston ~ United States of America, [2]Rice University ~ Houston ~ United States of America, [3]PhD Candidate University of South Florida ~ Tampa ~ United States of America

Awe experience requires employees to perceive vast stimuli and mentally accommodate (Keltner & Haidt, 2003). Positively valenced awe experiences (i.e., positive awe) are characterized by feelings of pleasantness (e.g., hearing an inspiring story from a leader). In contrast, negatively valenced awe experiences (i.e., threat awe) are characterized by feelings of fear (e.g., hearing a distressing story from a leader; Keltner & Haidt, 2003). Previous research has delineated that talking with people with whom we have close relationships (e.g., between coworkers who are friends) can catalyze a positive awe experience (Graziosi & Yaden, 2021). In contrast, talking with people with whom we have more oppressive relationships (e.g., between employee and coercive leader) may trigger a threatening awe experience (Keltner & Haidt, 2003). This suggests that individuals' interpersonal interactions may influence their experience of awe in the workplace. This paper develops and tests a model of awe that considers both the work and non-work environments. Grounded in Broaden and Build Theory (Fredrickson, 2004), the proposed model examines how the experience of positive awe broadens our cognitive capacity, leading us to build personal resources, while threat awe restricts and limits cognitive processes and outcomes. This work allows us to better understand the link between awe and creativity, the generation of novel ideas and/or products (Hennessey & Amabile, 2010), and prosocial behavior, voluntary action that benefits someone else or the greater society (Penner et al., 2005).

Abstract 610

TURNING IMPOSTOR FEELINGS INTO HUMBLE LEADERSHIP

Lai H.*

National Chung Cheng University ~ Chiayi ~ Taiwan

Although the impostor phenomenon has received growing attention in the leadership domain, little is known about its implications for leaders' positive behaviors. This study examines the relationship between leader impostor phenomenon and humble leadership, as well as the boundary condition of perceived organizational support.

Using a three-wave survey with 168 supervisor–subordinate dyads in Taiwan, the findings reveal that leader impostor phenomenon is positively associated with humble leadership, and this relationship is strengthened when leaders perceive higher levels of organizational support. These results contribute to a more nuanced understanding of the bright side of leader impostor phenomenon and highlight the role of organizational support in fostering constructive leadership behaviors.

M-HEALTH BASED TRAINING FOR EMOTION REGULATION AND SELF-EFFICACY IN SPANISH FIREFIGHTERS: BIOMARKER-VALIDATED EFFECTS ON STRESS, BURNOUT, AND WELL-BEING

Arenas A.*[1], Torrado M.[1], Sanclemente F.J.[2], Castillo--MayÉn R.[3], Rubio S.[3], Tabernero C.[4]

[1]Universidad de Sevilla ~ Sevilla ~ Spain, [2]Universidad de Málaga ~ Málaga ~ Spain, [3]Universidad de Córdoba ~ Córdoba ~ Spain, [4]Universidad de Salamanca ~ Salamanca ~ Spain

Firefighting exposes personnel to intense psychosocial demands that elevate stress, erode well-being, and heighten burnout risk. m-Health tools may offer scalable, low-cost support for emotion regulation and stress coping in operational settings. The aim was to evaluate the short-term effects of a brief m-Health program, on psychological outcomes (emotion regulation, self-efficacy to cope with stress, perceived stress, well-being, and burnout) and biomarkers (cortisol, alpha-amylase) in professional firefighters. A quasi-experimental design with non-probability, accessibility sampling was implemented. Sixty four firefighters (experimental n=32; control n=32; 96.9% men; mean age=44.11, SD=9.13) participated. The experimental group used the m-health tool for one month; the control group followed routine practice. Saliva samples (08:00, end of 24-h shift) and questionnaires were collected at baseline and post-intervention. Normality of post–pre differences was tested (Shapiro–Wilk). Depending on distribution, intra-group changes were analysed with t-tests or Wilcoxon tests; inter-group differences (post–pre) with independent t or Mann–Whitney. Effect sizes were reported (Cohen's d; r). In the experimental group, emotion regulation improved (p=.002, d=0.43), well-being increased (p=.018, d=0.30), emotional exhaustion decreased (p=.014, d=0.37), and total burnout declined (p=.044, d=0.24). Cognitive impairment showed a small-to-moderate effect suggesting improvement. In the control group, small gains emerged in emotion regulation (p=.044, r=0.36) and well-being (p=.002, d=0.50), while three burnout components were stable or slightly worse and total burnout rose marginally. Between-group analyses indicated a greater reduction in total burnout in the intervention group (p=.034, r=0.30). Biomarkers showed no significant between-group effects; morning cortisol remained within expected ranges on average, with a substantial subset >10 ng/mL at both assessments. Findings support the potential of brief m-Health interventions for psychosocial risk mitigation in firefighters, while underscoring limitations of a small, non-random sample, uncontrolled contextual factors (e.g., vacation periods), limited exposure time, and program adherence.

Abstract 1972

EXPLORING THE COGNITIVE PROCESSES LINKING INTERNAL CUSTOMER COMPLAINTS TO HR PROFESSIONALS' VOICE AND DEVIANT BEHAVIORS: THE MODERATING EFFECTS OF SUPERVISOR SUPPORT AND PROACTIVE PERSONALITY

Chi N.*[1], Chen P.[2], Hu H.[1]

[1]National Sun Yat-Sen University ~ Kaohsiung ~ Taiwan, [2]National Dong Hwa University ~ Hualien ~ Taiwan

Introduction
The human resources (HR) department plays a critical role in supporting organizational functions. Yet, HR professionals increasingly encounter complaints and unreasonable demands from internal customers (i.e., employees and supervisors). How and when such complaints lead to either constructive or deviant outcomes remains unclear.
Purpose
Drawing on cognitive theories of rumination and stress-coping theory, this study examines the psychological mechanisms linking internal customer complaints to HR professionals' customer-directed voice and deviant behaviors. We further investigate the moderating roles of supervisory support and proactive personality.
Method
We employed a weekly experience sampling design across four consecutive weeks, collecting data from 140 HR professional–coworker dyads, yielding 404 valid weekly paired observations. Hypotheses were tested using multilevel path analysis.
Results
Findings revealed two distinct pathways. First, weekly internal customer complaints heightened HR professionals' affective rumination, which subsequently increased their customer-directed deviant behaviors. However, this detrimental indirect effect was attenuated when supervisors were supportive. Second, for HR professionals high in proactive personality, internal customer complaints increased their problem-solving pondering, which enhanced subsequent customer-directed voice. However, this constructive indirect effect was not significant for less proactive HR professionals.
Conclusions
This study demonstrates that internal customer complaints can trigger divergent outcomes for HR professionals, depending on contextual and individual factors. By integrating affective rumination and problem-solving pondering as dual mechanisms, and identifying supervisory support and proactive personality as boundary conditions, the findings contribute to research on workplace stress and proactive behaviors. Practically, the results highlight the importance of fostering supervisors' support and developing HR professionals' proactivity to encourage constructive responses and

mitigate harmful consequences of customer complaints.

TEAMWORK READINESS PROFILES AND GROUP IDENTIFICATION: A STUDY WITH INDUSTRY EMPLOYEES

Gomes R.*[1], Simães C.[2], Borralho R.[3]

[1]University of Minho, Psychology Research Centre, School of Psychology. ~ Braga ~ Portugal, [2]Health Sciences Research Unit: Nursing (UICISA: E), Nursing School of Coimbra (ESEnfC), Coimbra, Portugal. University of Minho, School of Nursing. ~ Braga ~ Portugal, [3]University of Minho. Adaptation, Performance, and Human Development Research Group, School of Psychology. ~ Braga ~ Portugal

Introduction: In modern organizations, the shift from rigid, function-based hierarchies to more flexible, team-oriented structures has become increasingly important. In this context, the connection between teamwork and group identity is evident in both measurable results, such as productivity and profit, and in intangible feelings, including commitment, satisfaction, and motivation. However, studying teamwork remains crucial because many organizational tasks today go beyond what a single person can accomplish.

Purpose: Based on the Teamwork Efficacy Model, this study analyzed the relationship between teamwork readiness and group identification among employees from an industry organization, considering their sociodemographic characteristics.

Method: The study includes 188 professionals (52 females, 28.1%; 125 males, 67.6%), with ages ranging from 19 to 67 years old (M = 38; SD = 10.39) and years of professional experience ranging from 0 to 49 years (M = 10.95; SD = 11.31). The evaluation protocol included a Sociodemographic Questionnaire, the Teamwork Readiness Questionnaire, and the Group Identification Measure. Cluster analysis using the K-means method was employed to identify profiles of participants' perceptions of teamwork readiness in their professional activities.

Results: The findings showed that: (a) teamwork readiness levels are high; (b) the group with higher teamwork readiness reported greater group identification than the group with lower teamwork readiness; and (c) differences in teamwork readiness within the profiles do not vary based on participants' sociodemographic variables. In summary, higher teamwork readiness is associated with greater group identification, and this pattern remains consistent across various sociodemographic factors.

Conclusions: Teams benefit from having a clear understanding of why they work together (structure), increased motivation to collaborate (processes), and pride in the potential positive results of their teamwork (products) because this fosters a greater sense of social identification with their teams. Enhancing teamwork can foster a more positive experience for individuals, benefiting their professional and personal growth.

Abstract 1815

THE MODERATING ROLE OF RESILIENCE IN THE RELATIONSHIP BETWEEN PSYCHOLOGICAL WELL-BEING AND WORK ENGAGEMENT IN A DEVELOPING COUNTRY

Makhubele B.*, Mitonga--Monga J.

University of Johannesburg ~ Johannesburg ~ South Africa

Teachers in developing countries often work under difficult conditions that strain their psychological resources and affect their performance. Understanding the factors that promote psychological well-being, and engagement is therefore critical to maintaining teacher effectiveness and well-being. This study investigated the role of resilience in the relationship between psychological well-being and work engagement among high school teachers in the Democratic Republic of Congo (DRC). A quantitative cross-sectional design was used with a random sample of 469 public school teachers. Participants completed the Psychological Resilience Scale, the Psychological Well-Being Scale, and the Utrecht Work Engagement Scale. A hierarchical regression analysis was conducted to test the moderating effect of resilience. The results showed that resilience was positively and significantly associated with both psychological well-being and work engagement. In addition, resilience moderated the relationships between the key dimensions of psychological well-being (autonomy, personal growth, environmental mastery, positive relations with others, purpose in life and self-acceptance) and work engagement. Teachers with higher levels of resilience reported higher levels of psychological well-being and work engagement compared to those with lower levels of resilience These findings suggest that resilience is an important psychological resource that strengthens the link between well-being and engagement. The study emphasises the importance of developing the resilience of public high school teachers to strengthen their wellbeing and engagement and thus promote optimal functioning in the education sector.

Abstract 1787

THE MEDIATING ROLE OF GUILT IN THE RELATIONSHIP BETWEEN WORKPLACE TELEPRESSURE AND BURNOUT

Mardones--Mendez P.*, Gil--Monte P., Figueiredo--Ferraz H.

Universitat de València ~ Valencia ~ Spain

Introduction: The implementation of information and communication technologies (ICT) in organizations has introduced new work modalities that impact productivity. However, the extensive use of digital communication brings concerns regarding organizational effectiveness and workers' mental health, particularly through new psychosocial factors impacting work-life balance. A prominent concept is workplace telepressure, defined as the perceived urgency and pressure to promptly respond to work-related messages, especially outside regular working hours. Previous research links workplace telepressure to burnout syndrome, including emotional exhaustion, depersonalization, and reduced personal accomplishment.

Purpose: This study investigates the mediating role of guilt in the relationship between workplace telepressure and burnout, addressing a critical gap in the literature. Specifically, it examines how the constant connectivity demands generate telepressure, potentially increasing employees' guilt for delayed or inadequate responses, thereby contributing to burnout development.

Methods: Using a quantitative, cross-sectional design, the study will survey Chilean workers from various industries and organizational levels. Validated scales, including the Workplace Telepressure Scale (WPT) and the Spanish Burnout Inventory (SBI), will be adapted and psychometrically tested in this population. Structural equation modeling will explore the mediation effects of Guilt on the dimensions of burnout: Enthusiasm toward the job, Psychological Exhaustion, and Indolence.

Results: Preliminary results are expected to validate these instruments culturally and linguistically, confirm the mediation role of Guilt, and delineate profiles of workers with elevated telepressure and burnout, considering sociodemographic and organizational variables.
Preliminary data collection is expected to be completed by 04/2026, with initial results available by 06/2026, in time for presentation at the conference.

Conclusions: This research contributes to understanding how telepressure affects occupational well-being by clarifying guilt's role between workplace telepressure and burnout, providing theoretical and practical insights for managing digital work demands

and protecting employee mental health.

Abstract 1889

RELATIONSHIP BETWEEN LEADERSHIP READINESS AND CONFLICT MANAGEMENT STYLES FROM THE FOLLOWERS' PERSPECTIVE

Simães C.*[1], Gomes R.[2], Morais C.[3], Silva I.[4]

[1]Health Sciences Research Unit: Nursing (UICISA: E), Nursing School of Coimbra (ESEnfC), Coimbra, Portugal. University of Minho, School of Nursing. ~ Braga ~ Portugal, [2]University of Minho, Psychology Research Centre, School of Psychology. ~ Braga ~ Portugal, [3]Research Centre for Human Development, Faculty of Education and Psychology, Universidade Católica Portuguesa. ~ Porto ~ Portugal, [4]University of Minho. Adaptation, Performance, and Human Development Research Group, School of Psychology. ~ Braga ~ Portugal

Introduction: Leaders in competitive settings guide organizations by addressing needs, managing expectations, and promoting teamwork. They must continually adapt and develop their skills. Conflicts, caused by differing values and beliefs, are inevitable, ranging from minor disputes to serious issues like misinformation or hostility. Slater notes that leaders spend about 20% of their time resolving conflicts. Thus, understanding leadership and conflict management is crucial.

Purpose: This study analyzes the relationship between leadership and conflict management styles, specifically examining how followers' perceptions of managers' leadership readiness relate to their perceptions of managers' conflict management styles.

Method: The study included 185 participants (67.6% men, 28.1% women), employees of a metalworking company, with ages ranging from 19 to 67 years old (M = 38.14, SD = 10.94). The evaluation protocol included the Multidimensional Scale of Leadership, the Leadership Cycles Questionnaire, the Leadership Antecedent Factors Questionnaire, and the Conflict Management Styles Questionnaire, allowing for the evaluation of leadership (cycles, styles, and antecedent factors) and conflict management styles. A cluster analysis was performed using the k-means method.

Results: Findings showed that: (a) followers perceived that managers should make their leadership philosophy, practice, and criteria clearer; (b) positive perceptions of managers' leadership were associated with higher levels of transformational conflict management style and lower levels of hesitant and competitive conflict management styles; and (c) leadership readiness profiles do not vary according to the followers' personal and professional characteristics (e.g., age, gender, type of contract).

Conclusions: This study highlights a gap between followers' and managers' perceptions of leadership, revealing more positive views on leadership readiness associated with better management styles. Managers should improve their leadership and conflict strategies. Followers also benefit, as leadership and conflict management are active,

reciprocal processes that require engagement from both parties. Including both helps organizations foster collaboration and achieve sustainable, effective results.

Abstract 1784

THE ROLE OF COGNITIVE APPRAISAL ON TEACHERS' MENTAL HEALTH

Simães C.*[1], Seixas A.[2], Gomes R.[3]

[1]Health Sciences Research Unit: Nursing (UICISA: E), Nursing School of Coimbra (ESEnfC), Coimbra, Portugal. University of Minho, School of Nursing. ~ Braga ~ Portugal, [2]FP-I3ID, FP-BHS, Escola Superior de Saúde Fernando Pessoa. ~ Porto ~ Portugal, [3]University of Minho, Psychology Research Centre, School of Psychology. ~ Braga ~ Portugal

Introduction: Occupational stress in Teaching has been considered a significant health problem related to its impact on teachers' mental health. Besides this assumption, the process underlying human adaptation to occupational stress in schoolteachers is still scarce.

Purpose: Based on the Interactive Model of Human Adaptation to Stress, this study analyzed the relationship between cognitive appraisal and psychological distress, examining whether gender moderates this relationship.

Method: We conducted a cross-sectional study with a sample of 402 Portuguese schoolteachers (Age: M = 47.04, SD = 7.69). The measures consisted of a Sociodemographic Questionnaire, the Primary and Secondary Cognitive Appraisal Scale, and the General Health Questionnaire-12. We used structural equation modelling with multigroup analysis to test the hypothesis.

Results: Results showed a high prevalence of clinical cases of psychological distress in teachers (87%). The model tested fitted well to the data ($\chi2(239\ df) = 420.798$, $p < .001$; $\chi2/df = 1.761$; RMSEA = .044, 90 % CI [.037, .050]; SRMR = .0505; CFI = .956; NFI = .905; TLI = .949). Male teachers presented a significantly worse psychological profile, with more clinical symptoms of anxiety/depression. Significant main effects were found for gender regarding challenge and coping perceptions, with males reporting higher coping and females more challenge perceptions. Threat perception constituted the main predictor of teachers' mental health.

Conclusions: Educational organizations (e.g., head teachers) should implement work strategies that make the academic environment less threatening and more challenging, and controllable for teachers, thereby promoting a positive and participatory climate with shared leadership and supporting teachers' mental health.

Division 1: Work and Organizational Psychology SDG 3: Good Health and Well-being

Abstract 1831

BEYOND TECHNICAL SKILLS: SOFT SKILLS AS A DRIVER OF PERFORMANCE IN EMERGENCY HEALTHCARE

Poderico I., Trocino M.F.*, Schettino G., Capone V.

Dipartimento di studi umanistici, Università degli studi di Napoli "Federico II" ~ Napoli ~ Italy

The effectiveness of healthcare workers (HCWs) is not determined only by their technical and professional expertise. Indeed, soft skills play a pivotal role, as these competencies can bridge the gap between theory and practice by enabling HCWs to translate theoretical knowledge into effective professional behaviours. Nevertheless, the existing literature on this topic has predominantly focused on individual skills, while limited research has examined the integrated contribution of multiple soft skills to performance, particularly within the healthcare context. Accordingly, this study aims to explore the role of soft skills related to decision-making—also known as non-technical skills (NTS)—as personal resources for HCWs in hospital emergency departments. Specifically, it investigates the relationships among transversal competencies, organizational resources, and performance. A sample of 78 hospital emergency HCWs (51.3% female; M_{age} = 43.60, SD_{age} = 11.91) completed an online self-report questionnaire assessing the variables under investigation. Key findings indicate that problem-solving-oriented decision-making, perceived self-efficacy, relational competencies, and emotional intelligence were positively associated with job performance. This study underscores the multidimensional nature of healthcare performance, which depends not only on technical expertise but also on its integration with organizational resources and a combination of cognitive, emotional, and relational soft skills.

INSIGHTS FROM WORK PSYCHOLOGY RESEARCH IN AFRICA - FOR AFRICA AND BEYOND

Wednesday 22 July 2026 from 11:00 to 12:30

(O-Arsenale)

Ines Meyer (University of Cape Town ~ Cape Town ~ So), Chair

According to the United Nations (2017), by 2100 one in three people will reside in Africa. As many here have long lived with the turbulences increasingly common elsewhere, African contexts enable insights into how to address societal concerns such as political instability, declining “standard” forms of employment, inequality, poverty, or different forms of organizing, like solidarity-based systems. Yet, scientific methods and theories relevant to African contexts and data from African samples remain rare. This is despite a growing interest among European and North American scholars to conduct research in Africa and to collaborate with African colleagues. Implicit in much of this work is that Africa needs to be developed, that it must catch up: African researchers must adopt knowledge created elsewhere and benefit from capacity building led by scholars from outside Africa. Unintentionally, this reproduces colonial power structures. The five presentations by academics in work psychology from north, west and southern Africa encourage a mindset shift towards trust in African scholarship and its potential to create knowledge relevant beyond African borders.
Presenters:

Abstract 3817

JOB DEMANDS, PERCEIVED JOB UTILITY, AND PSYCHOLOGICAL HEALTH AT WORK AMONG TEACHERS AND NURSES IN MOROCCO: EVIDENCE FROM TWO EMPIRICAL STUDIES

Azouaghe S.*[1], Khaoudi A.[2]

[1]Faculty of Letters and Human Sciences, Mohammed V University ~ Rabat ~ Morocco, [2]Faculty of Letters and Human Sciences, Moulay Ismail University ~ Meknes ~ Morocco

In a changing world of work characterized by globalization, competitiveness, and organizational transformations, employees in human contact professions are increasingly exposed to complex emotional, social, and professional demands. Within these challenging contexts, psychological health at work has become a major concern in Morocco and across the Global South, particularly in education and healthcare, where interpersonal engagement forms the core of professional identity. Drawing on the Job Demands–Resources (JD-R) theory (Bakker & Demerouti, 2017), this communication presents two complementary empirical studies conducted in educational and hospital settings to identify key predictors of psychological heath at work.

The first study (Azouaghe, 2019), carried out among Moroccan primary and secondary school teachers (N=1107), explored how job demands, including poor material conditions, emotional overload, and financial dissatisfaction, are associated with higher psychological distress and reduced well-being. Conversely, job resources such as social support, work climate, and particularly the perceived social utility of teaching enhances well-being and buffer the negative effects of demands on psychological health at work.

The second study (Khaoudi, 2020), conducted with 442 nurses from public hospitals in Morocco, confirmed that high job demands (e.g., heavy workloads, difficult schedules, emotional labor) predicted lower well-being and higher burnout. In contrast, resources such as autonomy, social support, and the perceived job utility of caregiving fostered well-being, commitment, and lower exhaustion levels.

Together, these studies extend the JD-R framework (Bakker & Demerouti, 2017, 2023) by emphasizing the role of perceived job utility as a crucial determinant of psychological health in relational professions. They contribute to a broader African contextualization of work and organizational psychology, recognizing the symbolic and cultural dimensions that shape work meaning in the Global South. Enhancing these psychosocial resources may thus represent a strategic avenue for preventing burnout and promoting occupational well-being in human service professions across Africa.

Abstract 3818

A LAYERED-MIDDLE PART: PROFESSIONAL SOUTH AFRICAN AND NIGERIAN WOMEN NEGOTIATING THEIR HAIR AND PROFESSIONAL IDENTITY

Makapela L.*

University of Bern ~ Bern ~ Switzerland

This study explores how socio-political-historical factors influence hair and professional identity construction among Black South African and Nigerian women professionals. Drawing on ten life stories, it compares the experiences in a settler and non-settler colonial context. In South Africa, the enduring legacy of apartheid and racial segregation continues to shape workplace dynamics. Black women experience pressure to conform to Eurocentric beauty standards, including hair straightening to regulate their hair, to appear "neater" —a term frequently used during their childhoods. The results indicate that South African women developed a racial consciousness from an early age They reflect ongoing struggles with internalized colonialism and efforts to gain acceptance in predominantly white corporate environments. Their professional identity negotiation involves navigating Eurocentric beauty standards and overcoming racial discrimination. In Nigerian women's life stories, tribal and ethnic identities assumed greater significance than race. Nigerian women started in childhood to contend with ethnic stereotypes, colourism, and patriarchal expectations. Nonetheless, colonial influences persist, manifesting in preferences for lighter skin tones and "professional" hairstyles, which include the wearing of wigs to project socio-economic success. The professional women in both contexts navigated complex intersections of ethnicity, gender, and class in their hair choices to conform to Eurocentric norms in professional settings. South African women encountered more overt racial discrimination, while Nigerian women grappled with ethnic biases. Hair emerged as a site of identity negotiation and resistance, with the women balancing authentic self-expression against career advancement. Natural hairstyles may be embraced as cultural pride or avoided due to discrimination-fears. The study offers insights into the varied manifestations of hair politics across African professional settings. It calls for more nuanced understandings of how colonial legacies together with specific local contexts continue to impact Black women's navigation of personal and professional identities in contemporary workplaces.

Abstract 3819

HEALING AND FLOURISHING IN (POST) COLONIAL SOUTH AFRICAN WORKPLACES

Zungu Z.*

University of Cape Town ~ Cape Town ~ South Africa

Employees and leaders in contemporary for-profit South African organizations are facing a complex array of challenges that negatively affect their mental health and well-being. Occupational stress, workplace strain coupled with broader socio-historical factors continue to shape South African organizational life. Despite these issues, many organizational practices, specifically well-being initiatives remain grounded in Western-centric, individual-based models that fail to consider the lived realities and cultural contexts of the majority of South African employees.

The persistence of intergenerational trauma, inequality, and psychosocial risks within these spaces underscores the urgent need for organizations to move beyond individual-based models of well-being and embrace healing practices that are culturally grounded. This necessitates the need for healing practices that embodies African understandings of well-being centered in values such as interconnectedness or Ubuntu.

This presentation will share initial findings and thoughts from an ongoing study exploring the facilitators and barriers to healing and flourishing within South African organizations. It will examine the key challenges faced by both employees and leaders, while critically engaging with the limitations of current organizational well-being practices and policies. Overall, the presentation advocates for the development of contextually relevant, culturally embodied well-being and healing models that consider South Africa's diverse social realities.

Abstract 3820

HOW FAR IS WORK AND ORGANIZATIONAL PSYCHOLOGY IN FRENCH SPEAKING AFRICA?

Ngueutsa R., Tchagneno C.*

University Marie and Louis Pasteur ~ Besancon ~ France

Currently, occupational and organizational psychology is not widely included in psychology programmes in French-speaking African countries and research in the field is not firmly rooted in local contexts. Most studies do not address the specific demands and issues encountered in relation to work in the local populations. Very often, research is based on formal work analysis models developed in Europe and North America, even though in francophone African countries economies are largely based on informal work. These models struggle to decipher informal work and related behaviours as they cannot account for contextual variables and their associated logic and beliefs. A psychology of work that takes these variables into account would align with current efforts towards the decolonization of psychology. It requires training, practices and research in psychology that explore ways of thinking, beliefs and rationales rooted in local contexts, which could enrich the current dominant models to better understand behaviours in context. Knowledge of these ways of thinking, logics and beliefs could lead to a better understanding of economic, organizational and social behaviours, which, when taken into account, can be a vector for sustainable development.

01 - Division 1: Work and Organizational Psychology

THE 'GOOD, BAD, AND UGLY': THE DARK SIDE OF PERSONALITY

Wednesday 22 July 2026 from 11:00 to 12:30

(R-Arsenale)

Donald Saklofske (University of Western Ontario ~ London ~), Chair
Annamaria Di Fabio, Discussant

Interest in the Dark Triad/Tetrad has grown immensely in personality psychology and the public sphere, as evidenced from relatively frequent mentions in the news media and popular tv shows. The papers presented here describe new research on these 'negative' personality traits of narcissism, Machiavellianism, and psychopathy and consider their characteristics and manifestations on a continuum. Focusing on the 'good', the papers will discuss the adaptiveness and positive attributes of varying levels of dark personality traits, while the 'ugly/bad' side examines the negative side of these personality traits. We believe prioritizing these areas may contribute to finding ways to structure environments to maximize positive outcomes associated with higher-than-average dark traits but also minimize potential socially undesirable outcomes. We also discuss areas of importance in which research, theory building and measurement on the Dark Triad are needed and must be improved upon become more practically useful.

Abstract 4006

ODYSSEUS UNVEILED: THE ADAPTIVE AND MALADAPTIVE EXPRESSION OF DARK TRAITS IN A HO-MERIC HERO

Welsh C.[1], Papageorgiou A.[3], Moore A.[2], Dempsie A.[4], Papageorgiou K.*[1]

[1]Queen's University ~ Belfast ~ United Kingdom, [2]University of Belfast ~ Belfast ~ United Kingdom, [3]University of Amsterdam ~ Amsterdam ~ Netherlands, [4]Methodist College Belfast ~ Belfast ~ United Kingdom

Traditional personality research has often categorized dark traits simplistically as detrimental or pathological. However, emerging empirical evidence highlights the critical role of context in shaping their expression—showing that these traits can sometimes enable individuals to cope with demanding or stressful situations and even sustain cognitive performance under pressure. Historically, literature has long portrayed such complex traits in nuanced ways, anecdotally illustrating their potential to be both adaptive and problematic depending on the circumstances. Despite this, there remains a notable lack of systematic ex-ploration into how dark traits have been represented and interpreted across history. This study addressed this gap by qualitatively examining the manifestation and function of dark personality traits in a character from one of the world's oldest and most iconic works of classical literature: Odysseus, the Homeric hero of the Odyssey. Odysseus is frequently characterized as cunning, manipulative, and morally ambiguous, qualities that closely align with modern conceptions of the Dark Triad: Machiavellianism, narcissism, and psychopathy. However, these traits are not portrayed as straightforwardly negative in the narrative. In-stead, they often serve adaptive purposes, enabling Odysseus to navigate complex social, political, and existential challenges. By applying thematic content analysis to the Odyssey, the study systematically coded textual instances, where Odysseus exhibits dark traits and interpret how these traits contribute both to his survival and to the ethical complexity of his character. This approach allows a nuanced examination of the tension between adaptive and maladaptive expressions of dark traits within a rich historical and cultural context. Situated within a foundational text that has influenced conceptions of heroism and morality for millennia, this study contributes to a broader understanding of how dark personality traits are embedded within human history and culture. It exemplifies how the value or cost of dark traits depends heavily on situational demands and cultural frameworks.

Abstract 4007

DARK TRIAD AND EMOTIONAL INTELLIGENCE: A SYSTEMATIC REVIEW

Palazzeschi L.*

University of Florence ~ Florence ~ Italy

The relationships between the Dark Triad traits (Machiavellianism, Narcissism, and Psychopathy) and Emotional Intelligence (EI) have continued to attract considerable scholarly attention. Previous comprehensive works, including the meta-analysis by Michels and Schulze (2021) and the systematic review by Walker et al. (2021), synthesized the literature available up to that point, highlighting complex and sometimes inconsistent associations between these constructs and suggesting the need for further research. Since 2022, an increasing number of studies have introduced new theoretical perspectives and produced novel empirical results, expanding the understanding of how these dark personality traits interact with emotional intelligence. Given these developments, an updated and rigorous systematic review is warranted. The present contribution therefore aims to synthesize empirical studies about the relationships between the Dark Triad and Emotional Intelligence (published from 2022 onward) through a systematic review conducted according to the PRISMA standards. The review includes data retrieved from Scopus, Web of Science, PubMed, and APA PsycArticles databases, resulting in an initial pool of 1,396 records currently under analysis. By integrating the most recent findings, this systematic review seeks to shed light on how the Dark Triad traits and Emotional Intelligence are associated across different contexts and targets. The results are promising and useful to contribute to clarify previous inconsistencies, refine theoretical frameworks, and point to new directions for both future research and practical interventions.

Abstract 4008

NARCISSISM IN ACTION AND REACTION IN INTERPERSONAL CONFLICT SITUATIONS

Trahair C.*, Tremblay P., Saklofske D.

University of Western Ontario ~ London ~ Canada

The aim of this study was to explore how varying degrees of narcissistic admiration and rivalry relate to negative affective responses in different interpersonal conflict scenarios. Participants included 297 English-speaking adults (157 women, 139 men, 1 undisclosed gender; Mage = 42.34 years; SD = 13.35) from Canada, USA, Australia and the UK. Participants read a series of vignettes depicting different hypothetical interpersonal conflict scenarios in different contexts (e.g., with a coworker or friend). For each vignette, participants imagined themselves in that scenario and rated their anticipated affect, aggression, and perceptions of the warmth and dominance of the other person involved in the scenario. We employed a multilevel modelling (MLM) approach to investigate how situation (vignette type) and personality (narcissism) predict negative affect. An initial intercept only model revealed significant variation in negative affect scores both within and between participants. Preliminary results revealed that both the specific conflict vignette type and narcissistic rivalry were significant predictors of negative affect, with certain situations evoking more negative affect than others. Narcissistic admiration, however, was not a significant predictor of negative affect. Overall, these findings suggest that negative affective responses to interpersonal conflict situations are shaped by both the context of the situation as well as the individual's level of narcissism. By identifying specific situational triggers that lead individuals scoring high on narcissism to exhibit maladaptive behaviours, the study offers practical insights for policymakers and clinicians that can inform the development of strategies and interventions aimed at mitigating the negative impacts of narcissistic behaviour in various contexts.

Abstract 4009

THE RESOURCEFUL MACHIAVELLIAN? A PERSON-CENTRED EXPLORATION OF LINKS WITH NON-COGNITIVE SKILLS, MENTAL HEALTH AND WORKPLACE FUNCTIONING

Denovan A.*

Liverpool John Moores University ~ Liverpool ~ United Kingdom

Traditional, unidimensional portrayals of Machiavellians as chiefly antagonistic and impulsive are flawed. Recent advances in structural theories and assessment instead depict Machiavellians in a more resourceful, multidimensional way. Explicitly, as planful and agentic alongside antagonistic, encompassing cynical views of humanity with a willingness to use tactics to achieve goals. However, due to previous issues with measurement few research studies have examined how multifaceted depictions of Machiavellianism associate with psychological resources. Hence, this paper firstly explored if the combination of Machiavellianism and psychological resources (non-cognitive skills of resilience, mental toughness, self-efficacy, and emotional intelligence) yielded meaningful profiles using a person-centred approach (latent profile analysis, LPA). Secondly, a comparison of emergent profiles occurred in relation to outcomes of stress, time pressure, and workplace functioning. A sample of 513 working adults (215 men, 298 women) completed standardised measures indexing the study constructs. The optimal LPA solution comprised three profiles: 'Resourceful, antagonistic and tactical' (23.1%), 'Resourceful and goal-oriented' (29.5%), and 'Antagonistic and cynical, less resourceful' (47.4%). Multivariate analysis of variance indicated that the 'Resourceful and goal-oriented' group possessed significantly lower stress, feelings of time pressure, perceived occupational demands, and were less likely to behave in deceptive ways in the workplace. However, the 'Resourceful, antagonistic and tactical' group were significantly more likely to behave in deceptive ways in the workplace. The 'Antagonistic and cynical, less resourceful' group exhibited the highest stress and time pressure alongside the greatest perceived occupational demands. Identification of the homogeneous profiles provided a nuanced understanding of the relative contribution of multidimensional Machiavellianism and non-cognitive skills to differences in mental health and workplace functioning. Specifically, that certain Machiavellianism qualities align with greater resources and more positive mental health / workplace outcomes. Future research should use similar approaches to examine other multidimensional Dark Triad constructs (i.e., narcissism and psychopathy).

Abstract 4974

TOO MUCH OF A GOOD THING? THE LIGHT TRIAD AND MENTAL HEALTH RISKS AMONG CANADIAN ARMED FORCES VETERANS

Plouffe Rachel A.*[1], Gargala D.[2], Le T.[2], Richardson D.[2], Nazarov A.[2]

[1]University of Dundee, United Kingdom, [2]MacDonald Franklin OSI Research Centre, Lawson Health Research Institute, London, Canada

Canadian Armed Forces (CAF) personnel encounter unique challenges associated with their service, including exposure to potentially morally injurious experiences (PMIEs). PMIEs are defined as events involving perpetrating, observing, or failing to prevent acts that transgress one's moral beliefs. Often, PMIEs lead to psychological distress associated with morally transgressive acts, known as moral injury. Despite its clinical importance, few studies have investigated risk factors for moral injury. It is, however, plausible that the "Light Triad" personality traits may place Veterans at greater risk for developing moral injury due to their relations with guilt and shame. The purpose of this research is to evaluate associations between the Light Triad of personality on moral injury among CAF Veterans. We hypothesized that Veterans reporting higher levels of the Light Triad traits would report higher levels of moral injury outcomes associated with both their experiences in the military and hypothetical PMIE-based scenarios than those lower in the Light Triad traits. We administered an online survey to a sample of 98 CAF Veterans (77 men, 21 women) with representation from each province. Contrary to expectations, regression analyses revealed that faith in humanity was strongly and negatively associated with moral injury, whereas as predicted, it was unrelated to PTSD. Ordinal logistic regression further showed that the Light Triad was not significantly associated with perceived psychological distress following presentation of morally injurious or fear-based scenarios. Although findings were unexpected, it is possible that limited statistical power influenced the results. For instance, a non-significant Bonferroni-corrected correlation of -.23 between trust violation-related moral injury and humanism represents a small-to-medium effect, suggesting that this association may have reached significance with a larger sample. Future research should replicate these findings with greater statistical power and examine the potential unexpected yet protective role of prosocial dispositions in mitigating the impact of moral injury.

FAITH AT WORK: EXAMINING THE RELATIONSHIP BETWEEN SPIRITUAL SUPPORT, BURNOUT, AND WELL-BEING IN CHILD WELFAR

Wilke N.[1], Medefind J.[3], Howard A.*[2]

[1]CAFO Center on Applied Research for Vulnerable Children and Families ~ Arquipa ~ Peru, [2]Samford University ~ United States of America, [3]Christian Alliance for Orphans ~ McLean ~ United States of America

ntroduction: Child welfare professionals often experience high stress and exposure to trauma, placing them at risk for burnout and reduced well-being. Although faith and spirituality have been identified as potential protective factors, limited research has examined how organizational faith identity and support for spiritual practices relate to professional quality of life.

Purpose: This study examined whether organizational faith identity, perceived organizational support for spiritual practices, and perceived ability to engage in those practices predicted well-being and professional quality of life among child welfare professionals.

Method: Participants were 262 child welfare professionals (74% female; Mage=45.04) from 19 nations who worked directly with children and families affected by adversity or trauma. They completed standardized measures of life satisfaction, resilience, compassion satisfaction, burnout, and secondary traumatic stress, along with items assessing organizational faith identity, perceived support for spiritual practices, and perceived ability to implement those practices.

Results: Hierarchical regression analyses were conducted controlling for demographic and religious variables. Organizational faith identity did not predict any well-being outcomes. The regression model predicting life satisfaction was significant, $F(10,261)=5.63$, $p<.001$, explaining 15.1% of the variance. Perceived organizational support for spiritual practices uniquely predicted higher life satisfaction ($\beta=.20$, $p<.05$). The model for resilience was significant, $F(10,261)=2.92$, $p<.001$, with perceived ability to engage in spiritual practices emerging as the only significant predictor ($\beta=.20$, $p<.05$). Compassion satisfaction was predicted by both faith-based employment ($\beta=.14$, $p<.05$) and perceived implementation ability ($\beta=.23$, $p<.001$), $F(10,261)=5.63$, $p<.001$. Burnout was inversely predicted by perceived support ($\beta=–.14$, $p<.05$) and implementation ability ($\beta=–.22$, $p<.01$), $F(10,261)=5.25$, $p<.001$. No predictors were related to secondary traumatic stress.

REFRAMING EMOTIONAL EXHAUSTION IN THE AGE OF DIGITAL EDUCATION: A CONCEPTUAL REVIEW OF PSYCHOLOGICAL ADAPTATION STRATEGIES

Alzubaidi U.*

University of Hafr Al-Batin ~ Hafr Al-Batin ~ Saudi Arabia

Background:
Emotional exhaustion has emerged as a prevalent psychological concern in the context of digital education, especially in the wake of rapid technological integration and increased reliance on online learning platforms. This form of psychological fatigue not only affects academic performance but also undermines long-term mental well-being.

Objective:
This conceptual review aims to reconceptualize emotional exhaustion in digital educational environments by examining it through the lens of psychological adaptation. The paper seeks to shift the narrative from emotional exhaustion as a purely negative outcome to a potentially constructive signal that can prompt adaptive responses.

Method:
Adopting a conceptual review methodology, this paper synthesizes findings from recent theoretical and empirical literature on emotional exhaustion, cognitive-emotional regulation, and psychological resilience. It identifies key adaptation strategies that individuals use to cope with stress in digital learning environments, including emotional self-regulation, cognitive reframing, and the use of social support systems.

Findings:
The analysis reveals that emotional exhaustion, when appropriately reframed, can serve as a catalyst for positive psychological adaptation. This includes the development of resilience, improved emotional awareness, and the refinement of coping strategies that are essential in navigating the demands of digital education.

Conclusion and Implications:
Rather than treating emotional exhaustion as a threat, educational institutions and psychologists should consider it a signal for systemic and personal intervention. Promoting adaptive strategies through digital well-being programs and mental health literacy can enhance both student and educator resilience. This conceptual reframing invites a broader understanding of how stress responses function in technologically mediated academic environments and offers practical pathways for fostering

sustainable educational development.

UNDERSTANDING EMOTION (DIS)REGULATION IN NURSES: EVIDENCE FROM CLUSTER ANALYSIS

Colledani D.[1], Cunico L.[2], Tommasi F.[3], Mignolli G.[4], De Cordova F.[4], Meneghini A.M.*[4]

[1]Department of Psychology, Sapienza University of Rome ~ Rome ~ Italy, [2]School of Nursing ~ Verona ~ Italy, [3]Department of Social and Political Sciences, University of Milano ~ Milano ~ Italy, [4]Department of Human Sciences, University of Verona ~ Verona ~ Italy

Research has recently focused on the dynamic process of emotion regulation, seeking to shed light both on its implementation/maintenance and on the factors that predispose it to be flexible and adaptive (e.g., repertoires of strategies, variability). Nurses are frequently confronted with emotionally demanding situations that may expose them to significant psychological strain. The ability to regulate their emotions is a crucial resource, not only for safeguarding personal mental health but also for sustaining professional motivation and ensuring quality of care. Understanding how emotion regulation processes work in these professionals is therefore essential for preventing illness and promoting well-being both personally and professionally.

A total of 637 nurses completed an online survey including, among others, the Regulation of Emotion System Survey (RESS) and the Difficulties in Emotion Regulation Scale (IT-DERS-SF). A k-means cluster analysis (NbClust in R) identified three distinct profiles based on RESS subscales (assessing the use of six emotion regulation strategies).

The analysis yielded three clusters: an engagement propensity profile, a suppression propensity profile, and an average profile. Notably, the profiles align with patterns documented in previous research across different cultural and professional contexts, including studies employing latent profile analysis. In addition to systematic differences in the range/patterns of repertoires the participants rely on, the profiles that emerged showed differences in their associations with dysregulation of negative emotions. The results indicated significantly lower levels of emotion regulation difficulties among those in the average profile and significant differences in the specific types of difficulties (e.g. clarity, impulsiveness, etc.) between the other two groups.

The findings highlight the heterogeneity of emotion regulation among nurses and suggest meaningful distinctions that can guide the development of tailored interventions. Recognizing these profiles offers practical directions for fostering adaptive regulation strategies, reducing emotional vulnerability, and supporting well-being within healthcare organizations.

TEAM IDENTIFICATION, TEAM MEMBER POSITIVE AFFECT AND PSYCHOLOGICAL HEALTH AMONG HOTEL EMPLOYEES: MEDIATING ROLE OF TEAM-MEMBER EXCHANGE QUALITY

Srivastava U.R.*[1], Singh V.[2]

[1]BHU, VARANASI, UP, INDIA ~ VARANASI ~ India, [2]~ Kaushambi, U.P. India ~ India

Hotel employees are the link between the customer and the organization and that successful hotel depends on its teamwork and relationship between individual and his team members. Interestingly, little research has attempted to connect team identification, team member positive affect to psychological health by taking team-member exchange (TMX) into consideration. In the present study, the constructs of organizational identification and positive affect have been extended and examined in the work team setting. Identification, reflecting the degree to which individual team members experience a sense of oneness with a particular organizationally based team. Recently, scholars have also begun to investigate affective processes in teams and through emotional contagion, emotions are induced and transferred to other team members. With this background, the major objective of the present study to explore the mediating role of team-member exchange quality in the relationship between team identification, team member positive affect and psychological health among hotel employees. Data were collected from 279 managers and employees of different star hotels of Varanasi. The results indicated that team identification, team member positive affect was significantly positively predicted team-member exchange quality and psychological health of employees, after controlling the effect of socio-demographic variables. The results of mediated regression analysis revealed that team-member exchange quality significantly partially mediated the relationship between team identification, team member positive affect and psychological health. The Sobel test confirmed the statistically significance of this relationship. The findings of the present study indicated the importance of team-member exchange quality for enhancing mental health of the employees. This will give employees the feeling the organization cares for their well-being and fosters positive emotions among them. Furthermore, organization/managers should promote an affective climate to make employees aware they are not isolated from team members.

Abstract 932

THE RELATIONSHIP BETWEEN NARCISSISM AND WORK ADDICTION: THE MEDIATING ROLE OF SELF-REGULATORY NEEDS

Morkevičiūtė M.*, Buciuniene I.

ISM University of Management and Economics ~ Vilnius ~ Lithuania

Introduction. According to Bandura's (1991) Theory of Self-Regulation, self-regulatory systems provide the foundation for purposeful action and guide individuals in regulating their feelings through behavior. In this context, employees high in vulnerable or grandiose narcissism may engage in work addiction to manage their internal states, using excessive work to meet their needs for approval and attention. However, these assumptions have not yet been directly tested empirically, highlighting the need for research to confirm or challenge these proposed mechanisms.

Purpose. The aim of the present study was to examine the mediating role of self-regulatory needs (i.e., needs for approval and attention) in the relationship between different types of employee narcissism and work addiction.

Method. The study surveyed 1,001 individuals from Lithuanian organizations using a cross-sectional design with online self-report questionnaires. Work addiction was measured with the Bergen Work Addiction Scale (BWAS; Andreassen et al., 2012). Grandiose narcissism was assessed using the 16-item Narcissistic Personality Inventory (NPI-16; Ames et al., 2006), and vulnerable narcissism with the 10-item Hypersensitive Narcissism Scale (HSNS; Hendin & Cheek, 1997). Need for approval was measured with the 20-item Revised Martin-Larsen Approval Motivation Scale (MLAM; Martin, 1984), and need for attention with the 5-item attention-seeking subscale of the Brief Histrionic Personality Scale (BHPS; Ferguson & Negy, 2014).

Results. Vulnerable narcissism was positively related to work addiction through higher need for approval, and grandiose narcissism was positively related to work addiction through higher need for attention. Moreover, vulnerable narcissism showed a direct positive association with work addiction, whereas the direct link between grandiose narcissism and work addiction was not significant.

Conclusions. Our study confirmed the hypothesized mediating effects and advanced understanding of work addiction by demonstrating how personality-driven self-regulatory mechanisms contribute to its development and maintenance.

Abstract 518

NAVIGATING THE TOXIC TERRAIN: IMPACT OF WORKPLACE BULLYING ON EMPLOYEE BEHAVIOUR IN THE HEALTHCARE SECTOR

Prakash S.*, Srivastava K.

Indian Institute of Technology, Kharagpur ~ Kharagpur, West Bengal ~ India

The healthcare sector's vulnerability to toxic leadership is amplified by its hierarchy, which can foster workplace bullying and lead to significant emotional, behavioural, and psychological consequences for its employees. Specifically, this study examines how toxic leadership may lead to psychological consequences such as moral injury and job burnout. It tests the mediating role of workplace bullying in this relationship. The data were collected from 215 full-time early-career Indian doctors and nurses. The results reveal that toxic leadership significantly affects moral injury and job burnout. In addition, the findings confirmed the partially mediating role of workplace bullying in this relationship. The present study aims to address the adverse outcomes experienced by healthcare employees, highlighting the urgent need to improve organisational health by promoting healthier leadership practices, creating a positive work environment, fostering meaningful work relationships and also how management can reduce workplace bullying by providing information and instruction on workplace bullying policies and procedures, ultimately helping healthcare professionals cope with toxic work environments.

HOW WORK-CENTRIC LEADERSHIP BEHAVIORS INFLUENCE EMPLOYEE WORK-FAMILY INTERFACE: A META-ANALYSIS BEYOND WORK-FAMILY SUPPORTIVE LEADERSHIP

Shang S.*[1], Sheng Z.[2], He Y.[3], Brough P.[4], Gould R.[1]

[1]Griffith University ~ Gold Coast ~ Australia, [2]Deakin University ~ Melbourne ~ Australia, [3]University of Georgia ~ Athens ~ United States of America, [4]Griffith University ~ Brisbane ~ Australia

Leadership plays a critical role in shaping employees' management of work and family responsibilities, yet the work-family literature has predominantly focused on how leaders support employees, particularly through work-family supportive leadership (WFSL). This narrow perspective overlooks the broader implications of other well-established leadership behaviors for employees' work-family interface. To address this gap, the current meta-analysis systematically examines the relationships between a comprehensive taxonomy of work-centric leadership behaviors—encompassing relational-oriented, task-oriented, change-oriented, ethics-oriented, and destructive leadership—and employees' work-to-family conflict (WFC) and work-to-family enrichment (WFE), while comparing their effects with those of WFSL. A total of 292 independent samples from 269 studies eligible for inclusion in our meta-analysis. Our findings reveal that several work-centric leadership behaviors, such as ethics-oriented, change-oriented and destructive leadership, influence employees' work-family interface in ways that extend beyond WFSL's supportive function, contributing unique variance to WFC and WFE. These results highlight that WFSL should not be the sole focus when exploring how leadership impacts the work-family interface, and that work-centric leadership behaviors involve unique characteristics that shape their followers' work-family experiences. By integrating mainstream leadership theories with the work-family literature, this study makes a significant theoretical contribution by better connecting the leadership and work-family research fields and offering a more holistic understanding of leadership's role in employees' work-family interface.

Abstract 2105

BALANCING STATUS THREAT AND RESOURCES IN AGE-REVERSED TEAMS: EMOTION REGULATION, PARADOXICAL LEADERSHIP, AND LEADER RELATIONAL ENERGY

Takeuchi N.*, Jung Y.

Waseda University ~ Tokyo ~ Japan

Introduction: Many workplaces now assign younger supervisors to lead older subordinates. Prior research emphasizes horizontal age diversity and largely neglects vertical age gaps in leader–member relationships. Drawing on status characteristics and conservation of resources theories, we argue that the proportion of older subordinates can simultaneously elicit status threat and provide resources for leaders. These dual signals may shape paradoxical leader behavior (PLB) and leaders' relational energy (LRE), defined as the psychological vitality derived from interactions with subordinates.
Purpose: We examine whether the proportion of older subordinates relates to PLB in a curvilinear (inverted-U) manner and whether leaders' emotion regulation—cognitive reappraisal and expressive suppression—conditions that relationship and the indirect effect on LRE.

Method: We administered four-wave surveys to 893 managers in Japanese organizations. We measured the older-subordinate proportion at baseline, assessed emotion regulation at wave two, and collected PLB and LRE at waves three and four, respectively. We included standard leader- and unit-level controls and applied established conditional process procedures.

Results: Analyses indicate an inverted-U association between the proportion and PLB: PLB peaks at moderate levels and declines at very low or very high levels. PLB positively relates to LRE, producing a negative indirect effect of the proportion on LRE via PLB. Reappraisal and suppression each show positive main effects on PLB and attenuate the adverse curvature in the proportion–PLB association. The conditional indirect effect is strongest when emotion regulation is low and diminishes as it increases; reappraisal provides stronger conditioning than suppression.

Conclusions: Vertical age diversity is not uniformly detrimental. Emotion regulation serves as a personal resource that helps leaders manage status-threat dynamics and sustain paradoxical behavior and vitality. Practitioners should avoid extreme age configurations and develop leaders' reappraisal and judicious suppression skills to support PLB and LRE.

Abstract 2260

CARROTS AND STICKS: A PERSON-CENTERED APPROACH TO LEADERSHIP AFFORDANCES

Zhu N.*[1], Chang L.[1], Lu H.J.[2], Chen B.B.[3]

[1]University of Macau ~ Macao ~ Macao, [2]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [3]Fudan University ~ Shanghai ~ China

The effectiveness and popularity of leaders can be ascribed to a myriad of qualities and styles. In three studies, we attempt to distill them into three key affordance aspects (exerting influence, inflicting costs, and generating benefits) and examine their antecedents, consequences, and conceptual connections. A preliminary list of items for the Leadership Quality Inventory (LQI) was developed in Study 1, based on three types of data: expert input, multidimensional pilot ratings, and an exploratory factor analysis using a separate sample (Total N = 403). Studies 2 and 3 (Ns = 510 and 248) served as validation of the LQI measure. Study 2 generated leadership profiles on other-ratings using Latent Profile Analysis and examined their relations to a wide range of established measures of leadership styles and leader-follower dynamics (e.g., tendencies of followers to seek advice or blindly follow a specific type of leader). Study 3 ascertained the longitudinal stability and shifts in self-reported leader qualities using a two-wave survey. Additionally, we examined the links of these leader quality profiles to factors such as gender, age, leadership position, and organizational types in both studies. Three distinct leader quality profiles consistently emerged in these studies, labelled low-standing (low in general status, cost-infliction, and benefit-generation), prestigious (high in general status and benefit-generation but low in cost-infliction), and mixed-strategy (high in all three aspects). The results supported the distinctiveness and organizational implications of the three leadership profiles. Finally, Study 3 provided preliminary evidence for the short-term measurement invariance of leadership profiles and external factors (e.g., uncertainty in organizational environment) predicting profile transitions. We discuss how the findings support the compensatory account of negative and positive affordances and inform organizational management.

Abstract 728

BEYOND OVERT BIAS: AGE-RELATED MICROAGGRESSIONS AND INCLUSIVE HR PRACTICES

Dadkhah Tirani M.*[1], Bellotti L.[1], Zaniboni S.[1], Condom Bosch J.L.[2]

[1]Department of Psychology, University of Bologna ~ Bologna ~ Italy, [2]Department of Sociology, University of Barcelona ~ Barcelona ~ Spain

Introduction: Age-related microaggressions are subtle, often overlooked discriminatory behaviours that may undermine inclusion and well-being. While prior research has examined ageism in isolation, little is known about how it interacts with other identity dimensions. This study investigated whether employees' perceptions of age-inclusive HR practices are associated with lower microaggression perception and better work outcomes, while also testing how intersecting identities, such as LGBTQ+ status, shape vulnerability to subtle exclusion.

Method: Cross-sectional survey of N = 1,702 in-office public administration employees in Italy (mean age = 50.6, SD = 9.35). Measures included perceived age-related microaggressions, age-inclusive HR practices, job satisfaction, intrinsic motivation and psychological safety.

Results: Younger employees (23–39) reported higher levels of microaggressions (M = 1.85) than middle-aged (M = 1.34) and older workers (M = 1.45); ANOVA $F(2,1693) = 22.96$, $p < .001$, $\eta^2 = .03$. LGBTQ+ participants reported higher means (M = 2.03 vs 1.44), $t(54.06) = 2.89$, $p = .006$, $d = 0.57$. Logistic regression (N = 1,338) showed reduced odds for older groups (ORs = 0.41 and 0.44, $p < .001$) and increased odds for LGBTQ+ respondents (OR = 2.35, $p = .003$). Perceived age-inclusive HR practices correlated negatively with microaggressions ($r = –.26$, $p < .001$) and positively with job satisfaction ($r = .31$) and psychological safety ($r = .33$); subgroup regressions showed strongest protective effects for youngest and oldest cohorts ($\beta = –.28$ and $–.34$, $p < .001$) but not for LGBTQ+ ($\beta = –.203$, $p = .146$).

Conclusions: Findings prompt organisations toward targeted, intersectional HR interventions (e.g., training on subtle bias, intergenerational knowledge-sharing programs, and explicit intersectional policies for employees with multiple marginalised identities). The cross-sectional design limits causal inference and generalisability. Longitudinal, experimental, and multi-source studies are recommended.

Abstract 4592

RESPONDING TO HARM AT WORK: THE MISTREATMENT EXPERIENCES OF EMPLOYEES WITH DISABILITIES

Dionisi A., Dupré K.*, Rawlings B.

Carleton University ~ Ottawa ~ Canada

Introduction: It is difficult to speak out about workplace mistreatment; targets often respond passively to their experiences, either ignoring, denying, or dismissing their mistreatment. Yet, speaking up is central to target support and to circumventing this problem. While some researchers investigate the antecedents of workplace mistreatment responses, absent from this literature are the lived experiences of those with disabilities – an omission that hinders the discovery of impactful differences in experience.

Purpose: Guided by an interest in how workplace mistreatment is experienced and navigated by employees with disabilities, this study examines the forms that responses may take and the factors that shape them. Attention is given to individual characteristics, organizational dynamics, and contextual conditions that may either facilitate or restrict certain responses. The study also considers implications for how organizations might better foster supportive environments when mistreatment arises.

Method: This study utilizes free-response data from Prolific. Participants were eligible if they identified as having a disability, were employed either full- or part-time, were English-speaking, and had experienced workplace mistreatment within the past year. Drawing on a critical incident methodology, participants were invited to describe in detail a specific mistreatment event that was particularly impactful. They subsequently answered open-ended questions regarding their responses to the incident and the factors they perceived as shaping those responses. Data collection is currently ongoing, with a projected final sample of approximately 250 participants.

Results: Data collection is ongoing, but is projected to be complete by March 2026.

Conclusion: This research will contribute empirically and theoretically to the workplace mistreatment and disability literatures, revealing more about the barriers, facilitators, and well-being impacts of speaking up about workplace mistreatment, for those with disabilities. These findings can inform choices about mistreatment interventions, target supports, and how training and workplace policies can be tailored to better address the needs of this underserved community.

Abstract 800

"VENTING" PATTERNS AMONG GEN-Z STUDENTS: INSIGHTS FROM PREDICTIVE ANALYTICS AND FUTURE IMPLICATIONS

Choubisa R.*, Kaur S.A., Dhiman S., Bhatia N.

Birla Institute of Technology & Science ~ Pilani ~ India

Research indicates that organizational climate and relational dynamics between different generations may differ because people express their frustrations and negative emotions through varied cathartic mechanisms. This blowing off of the steam through catharsis is also known as venting. Considering the recent events in Nepal where Gen-Z burnt down the entire country because of reasons such as ban on social media usage and others, it is imperative to understand the cultural and country-wise differences of venting patterns of Gen-Z individuals. We explore the venting ties among students in a residential institution from North India to understand the ways in which the Gen-Z students engage in venting behaviors. The available data shows that Gen-Z frequently use informal digital and face-to-face communication for venting which strengthens their relationships but sometimes creates persistent negative thinking. Using a grounded theory approach, we will collect data to establish the themes which we will categorize once we reach the stage of saturation. We will use MAXQDA for generating the themes and classifying the themes to predict the patters. We later plan to use predictive analytics to check what patterns these Gen-Z students would be using when they enter workforce. Following the ideas from the recent paper on workplace venting (Zhu, He, Solanelles & Cullen-Lester, 2025), we will categorize the venting patterns which will be helpful for the human resource professionals while selecting, testing and recruiting Gen-Z as employees.

Abstract 672

DISASTER OR CHANCE? HOW CRISIS STRENGTH INFLUENCES EMPLOYEES' FATIGUE AND JOB PERFORMANCE

Dong Y.*[1], Wu X.[1], Jiang J.[2]

[1]Beihang University ~ Beijing ~ China, [2]Beijing University Of Posts and Telecommunications ~ Beijing ~ China

Crisis event strength has been linked to various negative outcomes for employees. However, recent research suggests that it may also lead to positive outcomes, depending on the different underlying mechanisms. Extending this line of inquiry, the present study, grounded in event system theory and the stressor-detachment model, examines how crisis event strength distinctly influences employee fatigue and job performance through cognitive (i.e., problem-solving pondering) and emotional (i.e., affective rumination) process, along with the moderating role of family support. We examined our hypotheses across two studies. Study 1 (150 participants from various organizations) supported the positive effect of crisis event strength on problem-solving pondering and affective rumination. Study 2 (214 flight attendants at a major Chinese civil aviation company) replicated the findings of Study 1 and found that crisis event strength increases employee fatigue through affective rumination, while also enhancing job performance through problem-solving pondering. Moreover, family support reduces the impact of crisis strength on affective rumination. These results contribute to a more nuanced understanding of the dual impact of crisis events and offer practical implications for how organizations can transform crises into opportunities for growth.

ECHOES OF TWO WORLDS: A META-ANALYTIC CULTURAL DIALOGUE BETWEEN LEADER–MEMBER GUANXI AND LEADER–MEMBER EXCHANGE

Cheng M.Y.*

Feng Chia University ~ Taichung ~ Taiwan

Both leader-member guanxi (LMG) and leader-member exchange (LMX) measure the quality of relationship between leaders and members with the former focuses on work-related social exchange in the work domain and the latter centers on non-work related social exchange in the private domain. However, it has long been a controversy topic in the literature that whether LMG and LMX are theoretically distinct and whether LMG can explain extra variance beyond LMX. This meta-analysis not only clarify the similarities and differences of theoretical logics underling LMG and LMX, but also, provides the empirical results of meta-analysis to show the complex relationship between LMG and LMX. The meta-analysis resulting from 37 primary studies and 10,722 subjects, demonstrated that LMG and LMX are positively related but are distinct constructs. LMG explains an incremental variance over and beyond LMX in the prediction of work outcomes such as job satisfaction, job performance, organizational commitment, and citizenship behaviors. However, LMG does not explain a significant incremental variance over and beyond LMX in the prediction of turnover intention. Further, the result of dominance analysis shows that LMX demonstrated the better predictive capability of work outcomes that did LMG, except for job satisfaction.

Abstract 743

EXPLORING THE ROLE OF COMPASSION AND POSITIVE OUTLOOK IN MANAGING WORKPLACE STRESS IN THE PRESENCE OF WORK DEMANDS

Putnik T.*[1], De Angelis M.[2], Silla I.[1]

[1]University of Valencia ~ Valencia ~ Spain, [2]University of Bologna ~ Bologna ~ Italy

Workplace stress is a significant concern in modern working environments. With stress being a known health and psychological risk factor, it is essential to understand how best to mitigate it. The existing literature has established that different coping strategies can be beneficial for stress management. However, the role of compassion towards others has yet to be extensively examined regarding its stress-mitigating properties– especially in the workplace. Through this study, we examine how both positive outlook and compassion towards others can serve as adaptive coping mechanisms, particularly when influenced by intense work demands.

This paper aims to explore the role of emotional mechanisms, such as positive outlook and compassion in mitigating the adverse effects of stress. First, we will look at the direct effect of compassion on stress, where we propose that compassion will reduce perceived stress. Second, we investigate the mediating role of positive outlook, proposing that compassion will enhance positive outlook which will in turn reduce perceived stress. Third, we look at how external factors such as work demands can moderate the relationship between compassion and positive outlook, where high work demands will weaken the relationship. As a result, the indirect effect between compassion and stress will be stronger under low work demands and weaker under high work demands. By understanding how compassion influences perceived stress through positive outlook, this paper can provide insights into improving employee resilience, stress management, and overall well-being.

Results revealed that most hypothesized relationships were not statistically supported. However, a significant moderation effect was found, showing that the relationship between compassion and stress was moderated by work demands.

Abstract 810

MOTIVATION AND WELLBEING OF PLATFORM-BASED DELIVERY RIDERS: A SELF-DETERMINATION THEORY APPROACH

Koekemoer E.*, Olckers C., Baldry K.

University of Pretoria ~ Pretoria ~ South Africa

Introduction: Digital platforms have reshaped labour markets worldwide, increasing gig work opportunities. Platform-based motorbike delivery riders have become an increasingly visible and vital part of the urban labour force. Yet, they often lack employment protection, and while it offers income-opportunities, the precariousness of their work stand in contrast with the International Labour Organisation's decent work principles.

Purpose: Against the backdrop of the Psychology of Working Theory (PWT), which foregrounds how structural constraints affect access to decent work and its psychological impact, this study explores how motorbike delivery work promote and/or undermine the basic psychological needs of competence, relatedness and autonomy for such riders (i.e., the Self-Determination Theory embedded within the PWT).

Method: Within a constructivist paradigm, this study adopted a qualitative descriptive design, with 10 motorbike delivery riders in South Africa, each being interviewed twice. Data were analysed through hybrid thematic analysis.

Results: Findings show how platform-based motorbike delivery work both promoted and undermined riders' basic psychological needs, influenced by structural and socio-economic constraints. Amidst high unemployment and limited job opportunities in South Africa, platform-based motorbike delivery work could satisfy riders' psychological needs, particularly through interactions with customers and co-workers, fostering relatedness. As independent contractors, riders enjoyed more labour market flexibility, and often earned more than in previous jobs. However, challenges like limited training, social stigmatisation, and procedural injustice often restricted their needs for competence, relatedness and autonomy. As such, while certain aspects of their work offered partial fulfilment of needs, the realities of precarious employment often limit these experiences.

Conclusion: This study extends the PWT by explaining how structural constraints not only limited access to decent work, but also impact the quality and sustainability of psychological need fulfilment in precarious labour contexts. Therefore, precarious workers, facing limited choice due to economic constraints and marginalisation, experience restricted need satisfaction.

Abstract 684

NEW DIRECTIONS IN TEACHING REFLEXIVE PRACTICE TO PHD CONSULTING PSYCHOLOGY STUDENTS: AN ETHNOGRAPHICALLY GROUNDED CONCEPTUAL MODEL

Flotman A.*, Barnard A.

University of South Africa ~ Pretoria ~ South Africa

Self-reflexive practice is the process and way of being in the form of a critically informed stance of reflexive dialogue with the self, regarding conscious and unconscious realities. This study explores how self-reflexive practice is taught to students in a PhD consulting psychology program and to offer a conceptual model to reflexive practitioners. The authors reflect on their experiences as lecturers who facilitate self-reflexive (identity work) with students in becoming reflexive and relational consulting psychologists. An extensive body of research exists concerning reflexive practice models and frameworks. However, less explored is a qualitative conceptual analysis, which demonstrates how self-reflexive practice is taught and facilitated. A qualitative, ethnographic approach was used. The authors reflected on the content of the PhD consulting psychology program and how the reflexive practice component of the programme is taught to students. The most appropriate written vignettes were used for thematic analysis and to develop the conceptual model. The programme positions the “self as primary instrument” of consulting; students are enrolled to step into reflexive spaces to hone their reflexive competence. They are guided, in the form of a reflexive theoretical lens, reflexive-oriented methodologies and, written reflections are offered by the lecturing staff on the students’ reflective essays. The primary role identities of lecturers are expressed by adopting a reflexive facilitative stance, creating a safe space through holding and containment and effective boundary management. The outcome of this analysis is an ethnographically grounded conceptual model of how reflexive practice is taught. The study has implications for teaching reflexive practice in different disciplinary contexts as well as for consulting, coaching and research. The study’s contribution lies in how it positions and embeds reflexive competence as a critical consulting, coaching and research skill. New methodologies and a conceptual model are offered to teach reflexive practice.

Abstract 829

REMOTE WORK AND EMPLOYEE CREATIVITY: SELF-DETERMINATION OUTWEIGHS FLOW

Chen W.*, Xu T., Lam H.W.H.

Lingnan University ~ Hongkong ~ Hong Kong

Employee creativity is a critical source of competitive advantage for organizations, particularly in the context of increasing remote work arrangements. However, the mechanism of how remote work affects employee creativity is not well understood, thus limiting evidence-based recommendations on managing employees who work remotely but are often evaluated as less creative. Specifically, two competing theories, self-determination theory and flow theory, each proposed a unique process. In this study, we investigate job autonomy and work-related flow as parallel mechanisms linking remote work and creativity. Data were collected from 152 employees in China through a three-wave time-lagged survey design. The results showed a significant indirect effect of remote work on creativity through job autonomy (b = 0.18, SE = 0.11, 95% CI = [0.01, 0.42]), but no significant mediating effect was observed through work-related flow. Employees with an increasing remote work percentage are more likely to experience greater job autonomy, which in turn enhances their creativity. Our conclusion remains unchanged with and without including age and gender as control variables. These findings clarify a key theoretical mechanism for remote work's positive effect on creativity, highlighting the critical role of autonomy-driven intrinsic motivation, rather than facilitating the state of flow. We discuss the implications for research on remote work and work motivation, as well as for practice in fostering creativity.

THE ANATOMY OF A PROACTIVE DAY: PROFILES OF EVENT CHARACTERISTICS AND THEIR RELATION WITH ENACTED EMOTIONAL INTELLIGENCE AND CONSTRUCTIVE CHANGE

Zampetakis L.*

University of Crete ~ Rethymnon ~ Greece

In the present study we adopt a person-centered perspective to understand how daily work unfolds. We used a 5-day diary study with 350 employees to: (a) identify distinct profiles of important daily work events based on their underlying psychological characteristics, (b) examine the stability of these profiles, and (c) test a theoretical model linking event profiles to momentary emotional intelligence (EI) dimensions and change-oriented organizational citizenship behavior (OCB-CH) enactment. Latent profile analysis revealed five distinct event profiles: the “ideal productive day”, “demanding but manageable day” “relaxed social day”, “challenging interpersonal day”, and “crisis/toxic day”. Day-to-day transition analysis showed that profile membership was highly dynamic, though the “ideal productive day” emerged as a stable attractor state and was associated with the highest levels of OCB-CH, an indirect relationship through the use of emotions dimension of EI. In contrast, “challenging interpersonal” and “crisis/toxic” days triggered regulatory and monitoring aspects of EI but failed to foster functional emotional use. Interpreted through event system theory and the episodic model of EI, our findings show how daily events trigger distinct psychological processes that enable or constrain proactive contributions.

Abstract 837

THE CONTRIBUTION OF LEADERS TO PSYCHOLOGICAL SAFETY: A SYSTEMATIC REVIEW AND META-ANALYSIS IN TRANSFORMATIONAL LEADERSHIP AND LEADER MEMBER EXCHANGE

Guimaraes M.*, Tordera N., Rodríguez I.

Universitat de València ~ València ~ Spain

Introduction. While leadership has been identified as a critical factor influencing psychological safety, a quantitative analysis of this relationship across different leadership approaches remains necessary. Purpose. This study aims to synthesise empirical evidence on the relationship between (1) transformational leadership and psychological safety and (2) Leader-Member-Exchange and psychological safety in organisational settings. We hypothesise a positive relationship between both constructs and psychological safety. Method. A systematic literature review was conducted in four databases. A total of 23 studies were included in this analysis. The associations will be quantified using Pearson's r correlation coefficients, and two separate meta-analyses will be conducted: one examining the relationship of psychological safety with transformational leadership (13 studies) , and another exploring its relationship with LMX(10 studies). Results. A preliminary review of the literature (2020-2024) reveals research across multiple disciplines, with most research being developed in China, for both transformational leadership (21.4%) and LMX studies (50%). Cross-sectional designs predominate (72.4% transformational leadership, 60% LMX), with limited longitudinal research. Edmondson's 1999 scale is most used (85.7% transformational leadership, 60% LMX studies). Statistical analyses primarily employ SEM and regression techniques. Psychological safety is considered a mediating mechanism between leadership and outcomes in 90% of studies from both approaches. LMX research focuses on procedural outcomes (job crafting, voice behaviour) and attitudinal outcomes (turnover, discretionary behaviours).In contrast, transformational leadership research examines broader outcomes, including hedonic well-being (job satisfaction) and eudaimonic well-being (engagement, work meaning). Conclusion. Our initial analysis shows evidence of the contribution of leaders and good leadership to psychological safety. Moreover, psychological safety is identified as a relevant mechanism in the relationships between leadership and organisational outcomes . The completed meta-analysis will provide quantitative estimates of the strength of these relationships and examine how results vary among the identified subgroups.

EXPLORING THE MODEL OF CAREER SELF-MANAGEMENT BEHAVIOR IN THE PERIOD OF EMERGING ADULTHOOD: CONTRIBUTION TOWARDS SUSTAINABLE CAREER

Blazhevska Stoilkovska B.*[1], Tomevska Ilievska E.[2], Frichand A.[1]

[1]Institute of Psychology, Faculty of Philosophy, Ss. Cyril and Methodius University in Skopje ~ Skopje ~ North Macedonia, Republic of, [2]Institute of Pedagogy, Faculty of Philosophy, Ss. Cyril and Methodius University in Skopje ~ Skopje ~ North Macedonia, Republic of

Based on social cognitive career theory (SCCT) and theory of panned behavior, this ongoing study aim to explore the career self-management model, i.e. the role of self-efficacy beliefs, career adaptability, and goal expectations in adaptive behaviors i.e. career goals clarity, learning, career exploration, and career planning. Meaning of work (work orientations) will be also included in the model.

As was pointed out, career management model as proposed in the SCCT, can help to investigate/explain engagement in career adaptive behaviors by inclusion of SCCT constructs, as well as social support and personality traits, particularly consciousness. Furthermore, exploration of a model of career adaptive behaviors may contribute to development or strengthening of career decision making skills, job search skills and skills for successful/optimal career transitions
The conducted pilot study demonstrated good internal consistency of the administered measures with Cronbach alpha coefficients varying from α=.73 to α=.97. Preliminary analyses showed patterns of correlation among study variables as expected.

The mentioned model will be analyzed using equation modeling and results will be discussed in the light of SCCT and theory of planned behavior. Implications in the field of career guidance and career counseling, as well as contribution towards sustainable career paths will be discussed, too.

Abstract 2217

TOWARD A CIRCUMPLEX MODEL OF PSYCHOLOGICAL OWNERSHIP

Di Stefano G.*, Ambrosetti A., Giordano M.

University of Palermo ~ Palermo ~ Italy

Introduction. Psychological ownership (PO) has gained prominence in organizational psychology, yet literature remains fragmented as studies focus on various facets, limiting comprehensive understanding of the phenomenon.

Purpose. This research proposes and empirically tests a theoretical circumplex model of psychological ownership based on two main axes: cognitive versus affective, and promotive versus preventive. Crossing these axes yields four distinct ownership forms: Proud (promotive-affective), Efficacious (promotive-cognitive), Protective (preventive-affective), and Secured (preventive-cognitive), each hypothesized to generate different organizational outcomes.

Method. Two longitudinal studies were conducted to test the model. Study 1 (N=358) employed ipsative measurement across five organizational domains (brand, work objects, professional role, work group, organization). Study 2 (N=225) used Likert-scale measures and included convergent validity scales (organizational identification, commitment, attachment, job insecurity, territoriality). Confirmatory factor analysis for ipsative data was performed implementing specific constraints to address linear dependencies inherent in ipsative measures.

Results. Study 1 supported the three-factor circumplex structure (excluding Protective due to ipsative constraints) with adequate model fit. Factor correlations aligned with theoretical predictions. Study 2 confirmed convergent-discriminant validity, with ownership factors significantly showing the expected relationships in most cases. Cluster analysis revealed four distinct ownership profiles, each demonstrating unique patterns across criterion variables.

Conclusions. This circumplex model provides the first integrated framework explaining psychological ownership's multifaceted nature. The findings demonstrate that psychological ownership encompasses distinct cognitive and affective orientations with different motivational bases, offering both theoretical coherence and practical implications for organizational interventions targeting specific ownership orientations.

Abstract 2096

VALIDATION OF THE COPENHAGEN PSYCHOSOCIAL QUESTIONNAIRE III IN MEXICAN WORKERS

Macias--Vazquez E.*

National Autonomous University of Mexico (UNAM) ~ México ~ Mexico

Introduction

It has been recognized that, regardless of workers' lifestyles and individual vulnerabilities, and beyond occupational diseases, exposure to certain psychosocial factors at work is crucial for the prevention, causation of illness, and health promotion. Furthermore, various theoretical models have incorporated the variable of self-efficacy due to the impact it has on health behaviors and outcomes. Occupational risk factors for workers' health have been identified in Mexico.

The Copenhagen Psychosocial Questionnaire (COPSOQ) has been recognized for its psychometric quality and theoretical foundation. COPSOQ-Istas21 III is available in Spanish.

Purpose

The purpose of the study was to adapt and assess the psychometric quality of the COPSOQ-III instrument and associated measures for psychosocial risk assessment and research in a sample of Mexican workers.

Method

Fifteen psychosocial risk factor scales of the COPSOQ-Istas21 III, and the self-efficacy scale of the international COPSOQ III were adapted. The self-efficacy scale was translated, reconciled, back-translated, and peer-reviewed. The syntax of 7 items from the psychosocial risk factor scales was adapted. The resulting instrument underwent content validation. The battery was administered to a sample of workers (n=325) with different occupational profiles, including managers, professionals, and operational workers. Psychometric quality was assessed.

Results

High item clarity scores were obtained, with Aiken's V between .875 and 1.

The adapted COPSOQ III showed a factor structure similar to the Spanish version. Most items were retained, with loadings between .40 and ≥ .80, and ≥ 3 items per factor. Except for one scale, reliability coefficients were ≥ .70. The psychometric quality is adequate.

Conclusions

The COPSOQ III for the Mexican population can be used for psychosocial assessment and interventions, providing a broader range of factors assessed with a theoretically sound instrument.

Abstract 2039

THE VALIDITY OF AN ORGANISATIONAL JUSTICE MEASURE IN A DEVELOPING COUNTRY

Makhubele B.*, Mitonga--Monga J.

University of Johannesburg ~ Johannesburg ~ South Africa

Employees' perceptions of fairness are crucial not only for their well-being and job satisfaction but also for the achievement of organisational goals. The organisational justice scale (OJS) by Colquitt (2001) is used extensively for assessing procedural, interactional, informational and distributive justice in the workplace. However, its reliability and validity in the Democratic Republic of Congo (DRC) sample have not yet been documented. The purpose of this study was to assess the construct validity of the OJS on a sample of (N= 201) employees of a manufacturing company in the DRC. Item analysis was performed to determine reliability. The exploratory factor analysis was used to test the dimensionality of OJS sub-dimensions. The first and second-order factor structures underlying the models of organisational justice were tested using the confirmatory factor analysis. The results indicated that the OJS is a reliable and valid measure of organisational justice. The study finds good psychometric properties of the OJS in the DRC organisation work context, therefore, the OJS can confidently be used for assessing justice and fairness perceptions in DRC organisations.

Abstract 2408

UNDERSTANDING EMPLOYEES' INTENTION TO USE MENTAL HEALTH APPS: EXTENDING THE TECHNOLOGY ACCEPTANCE MODEL

Pjeranovic J.*

Università della Svizzera italiana (USI) ~ Lugano ~ Switzerland

Background
Mental health (MH) apps are increasingly available, particularly as a part of workplace health promotion programs. However, little is known about factors influencing employees' intention to use MH apps, especially considering employees who currently experience mental health problems.
Objectives
This study aimed to examine predictors of employees' intention to use MH apps by extending the Technology Acceptance Model (TAM) with user-specific factors, including mental health literacy and digital literacy.
Methods
A cross-sectional study was conducted among 111 European employees (aged 21 – 65). Participants completed an online survey assessing perceived usefulness, perceived ease of use, mental-health literacy, digital literacy, trust in MH apps, and intention to use MH apps. Multiple regression, moderation, and mediation analyses were performed.
Results
Perceived usefulness of MH apps positively predicted employees' intention to use them, supporting the first hypothesis. In contrast, perceived ease of use of MH apps did not predict intention to use them. Mental health literacy and digital literacy did not moderate the relationships between perceived usefulness and intention to use MH apps, or between perceived ease of use and intention to use MH apps. Among control variables, trust in MH apps, time spent using MH apps, and female gender positively predicted intention to use MH apps. Exploratory analyses further suggested that perceived usefulness was a stronger predictor of intention among employees with current mental-health problems.
Conclusion
These findings highlight the central role of perceived usefulness and trust in driving employees' intention to use MH apps. Understanding these mechanisms can guide organisations in designing interventions that promote MH app uptake and effectiveness, especially among employees with current mental health problems.

Abstract 2325

WOMEN IN ENTREPRENEURSHIP: MOTIVATIONS, CHALLENGES, AND IDENTITY INTEGRATION

Rosen L.*, Scott S.

Texas Woman's University ~ Denton ~ United States of America

Despite women's long-standing involvement in business ownership, research examining women's entrepreneurial efforts first emerged in the mid-1970s and later picked up momentum in the late 1990s (Brush et al., 2022). At this time, scholars became motivated to explore the distinctions between male and female business owners due to emerging research findings suggesting entrepreneurial activity is gendered (Greene et al., 2003; Mirchandani, 1999). These data indicated that socially constructed gender expectations within Western culture promulgate conscious and unconscious gender bias and reduce women's propensity for entrepreneurial endeavors (Greene et al., 2003). However, a marked shift has occurred in the recent decade, particularly following the economic downturn facilitated by the COVID-19 crisis, in which economic trends suggest a proliferation of female entrepreneurs (U.S. Census Bureau, 2025).

The purpose of the current study was to explore the entrepreneurial experiences of American women, in the context of a recent increase in female-driven entrepreneurial activity in the United States. The sample included 16 women who self-identified as entrepreneurs. Participants were interviewed and responded to open-ended questions exploring the motivations of and challenges experienced by women pursuing entrepreneurial roles. Thematic analyses revealed that most participants experienced push-based motivations (e.g., need for flexibility) when deciding to pursue entrepreneurship. Participants also reported encountering obstacles including self-doubt and other-minimization as barriers to entrepreneurship. Several subthemes emerged from participants' reflections on their alignment with or endorsement of an entrepreneurial identity including empowerment, pride, autonomy, meaning-making, changes in self-perception, and challenging patriarchal systems. The results from this study add to emerging literature on women's entrepreneurship and highlight the need for gender equity in entrepreneurial spaces. The findings suggest implications on how to support women in their entrepreneurial journeys.

Abstract 2324

WORKING MOTHERS' CAREER ASPIRATIONS AND PRIORITIES FOLLOWING THE COVID-19 PANDEMIC

Rosen L.*, Scott S.

Texas Woman's University ~ Denton ~ United States of America

The COVID-19 crisis sparked a period of vocational reconsideration amongst workers (Jiskrova, 2022). The pandemic appeared to largely impact the employment decisions of working mothers who either reduced their working hours or exited the workforce completely at higher rates than any other demographic group (Yarvosky et al., 2021). Some data have suggested the working mothers' resignation trends were due to childcare responsibilities (Hite & McDonald, 2020). Other findings have noted feelings of burnout and the ways that COVID-19 disproportionately impacted occupational sectors dominated by women (Donald, 2020). Previous work also highlighted the vocational setbacks working mothers endured due to the familial responsibilities and financial stressors induced by the COVID-19 pandemic (Rosen et al., 2023).

To build on previous findings, it may be helpful to explore the reconsideration process working mothers underwent in the years following the pandemic and how their priorities and career aspirations shifted. As such, the purpose of the current study is to explore working mothers' career aspirations and priorities in the aftermath of the COVID-19 pandemic.

The current sample consisted of 168 working mothers in the United States. Participants responded to open-ended questions developed to understand how the COVID-19 pandemic affected their career progression, career aspirations, and priorities. Thematic analysis of these open-ended questions revealed change in career aspirations for many working mothers as a result of the COVID-19 pandemic. Additionally, thematic analysis also indicated that some working mothers shifted their priorities away from their career trajectory and towards family, health, and stability. The findings of the present study add to the body of research exploring the impact of the COVID-19 pandemic on working mothers and attempt to gain a more nuanced understanding of the pandemic's effect on working mothers' attitudes towards their career trajectory and priorities in a post-pandemic worker landscape. Study implications will be discussed.

Abstract 2180

IT'S A PAIN IN THE DECK: WORKSTATION DISCOMFORT AND HEALTH RISKS ACROSS NAVY SHIP CLASSES

Rosopa P.*[1], Rosopa E.[1], Liu Y.[1], Russell D.[2]

[1]Clemson University ~ Clemson ~ United States of America, [2]Uniformed Services University ~ Bethesda ~ United States of America

Introduction

Musculoskeletal disorders are a significant concern in military environments, particularly in the confined workstations aboard U.S. Navy ships. While physical discomfort is an early indicator of suboptimal ergonomic conditions, limited research has explored how it contributes to physical and mental health risks (PHR and MHR, respectively) across different ship-classes. Addressing this gap is critical for reducing injuries, healthcare costs, and improving mission readiness.

Purpose

This study had two primary objectives: 1) validate a brief assessment of workstation discomfort and 2) investigate its association with health risks among U.S. Navy sailors, while also exploring how relationships vary by ship-class. By focusing on discomfort as a precursor to injury, the study aimed to inform targeted, human-centered interventions.

Method

Survey data were analyzed from 5,957 enlisted U.S. Navy sailors serving on three ship-classes: cruisers-destroyers, amphibious ships, and littoral combat ships. A nine-item measure assessing physical discomfort from workstation design was evaluated using exploratory factor analysis (EFA). The associations between the resulting discomfort factors and health risks were then examined using generalized linear mixed models.

Results

The EFA identified three dimensions of discomfort: upper extremity, postural/lower body, and head/visual. All three dimensions were positively associated with increased PHR. In contrast, only postural/lower body and head/visual discomfort were significantly associated with MHR. Importantly, the analysis revealed that ship-class moderated the relationship between upper extremity and head/visual discomfort on PHR, indicating that the impact of this discomfort varied depending on the vessel type.

Conclusions

Our findings highlight the impact of workstation discomfort on the physical and mental health of sailors. The results strongly support the need for ergonomic interventions tailored to specific ship-classes to effectively reduce health risks. The brief scale serves as a practical tool for assessing discomfort and guiding improvements in workstation design, ultimately enhancing sailor well-being and operational effectiveness.

Abstract 2343

RE-ANALYSIS OF LARGE-SCALE ACCUMULATED DATA ON OCCUPATIONAL SAFETY AND HEALTH: FOCUS ON INTERNATIONAL COMPARISON AND CAUSAL RELATIONSHIP OF "LOW-VALIDITY"

Shin H.*

Tokiwa University ~ Mito ~ Japan

From the personality and behavior scale data for safety (approximately 420,000 people) accumulated over a quarter century, we reanalyzed 5 years' worth of data from approximately 190,000 people for whom permission to use the data for research had been obtained. The purpose of the reanalysis was to report the results of a comparison between Japan and overseas, and to clarify the causal relationship between “low-validity(not answer honestly)” and personality and error tendency. From the comparison between Japan and overseas, some results were shown that the overseas group had many people with low validity and the average values of each tendency were different. It was also shown that the content of the scale needs to be modified to take into account text interpretation and cultural differences.

In addition to interpretation based on the average values by tendency and years of experience, covariance structure analysis and simultaneous multi-population analysis were performed for both the domestic and overseas groups. As a result, regarding the causal relationship with low validity, it became clear that factors such as "mental health" and "self-control" influenced error tendency and other personality traits, indirectly influencing "validity(answer honestly)."

Abstract 2159

JOB SATISFACTION AMONG HOSPITAL DOCTORS: THE ROLE OF AGEISM AND PERCEPTIONS OF COMMUNICATIVE EFFICACY

Curcio C., Trocino M.F.*, Tudisco F., Solombrino A., Fiorillo F., Donizzetti A.R.

University of Naples "Federico II" ~ Naples ~ Italy

Introduction: In recent years, we have been witnessing a significant demographic shift, characterised by an exponential increase in the elderly population. This requires a reorganisation of the societies and institutions involved, including the hospital system, which will have to take care of a growing number of elderly people. The effectiveness of care and patient satisfaction depend greatly on communication between doctor and patient. Although studies emphasise the importance of clear, empathetic and personalised communication, dynamics that can compromise effective communication persist, including gender and age stereotypes. Elderly patients, for example, are frequently seen as less capable of understanding or actively participating in the decision-making process, which can lead doctors to treat them in a paternalistic manner. These prejudices can influence communication processes even when doctors are not fully aware of them, leading to dynamics that do not encourage genuine patient involvement. Objectives: To investigate the role that stereotypes and prejudices about older people have on the communicative efficacy of physicians, as well as the role of the latter on the communication skills of physicians and their resulting job satisfaction. Method: A total of 194 hospital physicians (52.1% male; averageage: 46.6 years) were contacted and given a specially designed self-report questionnaire containing various measures such as: doctors' communicative efficacy towards elderly patients, communication skills, ageism, knowledge of ageing and support from colleagues and bosses (CFI= 0.988; TLI= 0.981; SRMR= 0.045; RMSEA= 0.03). Results: A path analysis was conducted, which revealed the predictive role of ageism with respect to the communicative efficacy of doctors, which in turn predicts communication skills. Furthermore, communication skills and support from superiors predict job satisfaction. Limitations: The sample contacted is small. Innovative aspects: The study focuses on a particularly topical issue and provides guidance for the training of future doctors and refresher courses for practising doctors.

INTUITION AND CREATIVE INTELLIGENCE: THE ONTOPSYCHOLOGICAL BUSINESS CONSULTANCY

Fleck Da Silva B.*, Rothmann A.R., Wazlawick P.

Antonio Meneghetti Faculdade ~ Restinga Sêca, RS ~ Brazil

Organizational Psychology, from a leader-centered perspective, finds an innovative proposal in the ontopsychological model of business consultancy. Developed by Antonio Meneghetti (1936-2013), the ontopsychological business consultancy is an intervention tool that starts from the reading of the business or organizational environment as a reflection of the leader's psychological condition. The company is read as a psychosomatic reality, in the sense that the intentionality of the leader and their close agents conditions the functionality or non-functionality of the company. Beyond the technical analysis of administration, the psychic dynamic operating in the leader is analyzed. The ontopsychological practitioner reads the leader by identifying the core of the psyche, called the ontic In-Itself, from which the intuition for business action comes. In this sense, the model presented seeks to act based on the biological method: rationality and intuition. In addition to decisions at a rational level, the leader is led to consider the intuitive plane, which comes from the ontic In-Itself itself, one of the discoveries of Ontopsychology. For Meneghetti, the leader is defined by the possession of intuition. Intuition is understood as the moment information passes from the ontic In-Itself to the ego, allowing for accuracy between being and thinking within the business context. Thus, creativity in the field of business action results from the possession of intuition. Therefore, the ontopsychological model of business consultancy, already structured in undergraduate and graduate courses, provides a significantly important contribution to the broad area of Organizational Psychology.

Abstract 2663

COUNTERING THE SNOWBALLING, GLOBAL LEADERSHIP CRISIS: LEADERS IN PURSUIT OF MORAL, WORTHY, AND INSPIRING QUESTS

Bolozan M.[1], Veldsman T.*[2]

[1]IEDC Business School ~ Bled ~ Slovenia, [2]University of Johannesburg ~ Johannesburg ~ South Africa

Leadership worldwide is in crisis. The VUCA world is rendering leaders incompetent and unwise. Ethical misconduct by leaders, as well as toxic leadership, are on the rise. There are more frequent public demonstrations/ revolts against leaders. Trust in leaders is eroding, and followers increasingly are disengaged.

Our contention is that the answer to the current directionless, clueless, and opportunistic leadership, is leaders who are in pursuit of moral, worthy, and inspiring quests, making a true value-adding, lasting difference, in this way countering the growing leadership crisis. A literature review unveiled that the concept of a leadership quest has not been systematically researched. The closed concept is 'calling', which has received some attention.

Our research investigated the overarching postulate that leaders who pursue a worthy quest aimed at serving others, arising from their authentic selves, will be able to mobilise followers to join them in the relentless pursuit of worthy causes for the betterment of their communities, society, and humanity. Our research set out to: firstly, construct; and, secondly, validate a model regarding the discovery and pursuit of a leadership quest. Because of the lack of such a model, we opted for a qualitative research approach, specifically grounded theory, underpinned by a social constructivist philosophy.

The purpose of our research paper is to present our validated, leadership quest model, and to take the first step towards the development of a fully-fledged leadership quest theory by proposing a set of hypotheses derived from our validated model. The following topics are covered: first, defining the concept 'leadership quest', and the related concept 'calling'; second, explicating our adopted research design; third, discussing our validated model; fourth, proposing a set of hypotheses to trigger the construction of a leadership quest theory; and, lastly, outlining the theoretical and practical contributions of our research.

Abstract 4394

SOUTH AFRICAN PSYCHOLOGY: FROM APARTHEID TO DEMOCRACY

Watts A.*

PAPU ~ Durban ~ South Africa

South African psychology has evolved from its complicity in the apartheid regime to an engaged, socially responsive discipline formed by democracy, decolonisation, and social justice. Under apartheid, psychology was predominantly characterised by Eurocentric theoretical frameworks and practices that perpetuated racial hierarchies and individualised social problems, thereby aligning with the ideological imperatives of the state. The democratic transition of 1994 led to a critical re-examination of psychology's role, prompting transformation toward inclusivity, relevance, and human rights. The Psychological Society of South Africa (PsySSA) that was established shortly before the dawn of democracy, has been pivotal to this process. The Society's international engagement reconnected South African psychology with global discourse and advanced its uniquely African perspective. Notwithstanding, some of what has emerged is now antithetical to the discipline's transformative achievements. This presentation will critically examine these ongoing challenges and explore South African psychology's ongoing interrogation of its identity within the context of global integration, local relevance, and epistemic justice.

Abstract 1160

CAN BEING "TOO GOOD" AT YOUR JOB HARM YOUR HOME LIFE? RECONCILING THE MOTIVATIONAL AND CAPABILITY-BASED VIEWS OF PERCEIVED OVERQUALIFICATION

Dong Y.*[1], Wu X.[1], Jiang J.[2]

[1]Beihang University ~ Beijing ~ China, [2]Beijing University of Posts and Telecommunications ~ Beijing ~ China

Introduction

The relationship between perceived overqualification and work-family conflict (WFC) is unclear because it can be either negative or positive. Our research proposes that the nature of this linkage depends on work-family centrality.

Purpose

Building on motivation-based approach to overqualification, we argue that, for employees who value work more than family, perceived overqualification is positively associated with strain-based WFC via heightened career anxiety. Yet, drawing on the capability-based approach to overqualification, we propose that, for employees who value family more than work, perceived overqualification is negatively related to time-based WFC via reduced work role overload.

Method & Results

Our hypotheses were supported across two studies (Study 1: a sample of 252 employees from a large Chinese banking group and their spouses; and Study 2: a time-lagged design with employees from various industries (N = 280). In Study 2, we also examined the alternative mediators (i.e., anger toward employment situation and depressive symptoms), re-tested our model with behavior-based WFC, and showed the construct validity of career anxiety.

Conclusions

These results suggest that managers should take into account the work-family values of overqualified workers in attempt to better manage their WFC.

Abstract 799

SOCIODEMOGRAPHIC AND PROFESSIONAL PROFILES OF PORTUGUESE UNIVERSITY PROFESSORS: COMPARING TWO STUDIES ON WORK-FAMILY BALANCE, WORK ENGAGEMENT, AND ORGANIZATIONAL COMMITMENT

Oliveira Coelho H.*, Santos De Carvalho C., Santos Mendes Mónico L., Pinto A.

University of Coimbra ~ Coimbra ~ Portugal

This research investigates how sociodemographic and professional variables shape work-family balance (WFB), work engagement (WE), and organizational commitment (OC) among university professors in Portugal. While prior research has examined the relationship between these constructs, limited attention has been given to how personal and professional characteristics can influence such experiences in academic contexts. Addressing this gap, the study adopts an exploratory and comparative design, analyzing two independent cross-sectional samples: Study 1 (N = 409, collected between 2015-2019) and Study 2 (N = 311, collected between 2024-2025). Participants responded to validated instruments: the Utrecht Work Engagement Scale (Schaufeli & Bakker, 2003), the Organizational Commitment Scale (Allen & Meyer, 1990), and the Work-Family Scale (Carvalho & Peralta, 2009), along with a sociodemographic questionnaire including age, sex, marital status, number of children, seniority and working hours per week at the current place of work, and institution type (public vs. private). Analyses included descriptive statistics, correlation analyses, t-tests, ANOVAs, and post-hoc comparisons. Results partially supported the study's hypotheses: women and mothers consistently reported higher levels of work-family conflict (WFC), while marital status had mixed effects. Across both studies, profiles combining gender and parental status revealed important interaction patterns. Study 2 showed a significant decline in organizational commitment and an increase in WFC and dedication – pointing to a shift in how faculty members relate to their institutions amid evolving work conditions. By integrating individual and contextual variables, this research contributes to the understanding of psychosocial experiences in higher education and informs organizational practices promoting equity, well-being, and retention.

Abstract 308

CHRONOLOGICAL AND SUBJECTIVE AGE AT WORK: ITS MODERATING ROLE IN ORGANIZATIONAL WELL-BEING FROM THE HERO MODEL. META-ANALYSIS.

Martín J.*, Merhi R., Salanova M.

Universitat Jaume I ~ Castellón de la Plana ~ Spain

Introduction

The aging European population presents growing challenges for sustaining workplace well-being, as the average working age increases (Eurofound, 2025). The coexistence of multiple generations in the workforce also introduces new issues, both in terms of health—such as increased attention to occupational risks (Oxley, 2009)—and social dynamics, particularly in intergenerational teams (Kunze, 2015). Research on healthy aging suggests that chronological age alone is insufficient to understand the complexity of aging and its impact on well-being; subjective age—how old a person feels—must also be considered. This aligns with the HERO model (Healthy & Resilient Organizations; Salanova et al., 2012), which integrates psychosocial factors as both predictors and outcomes of organizational well-being.

Objective

This study conducts a meta-analysis to examine how chronological and subjective age relate to the HERO model's psychosocial resources and organizational well-being. It also explores how both forms of age moderate the relationship between these resources and well-being across different age groups.

Method

A meta-analysis was performed on empirical studies addressing these relationships in work contexts. A total of 288 studies were initially identified from Scopus, Web of Science, PsycInfo, and Business Source Premier. Inclusion criteria were: peer-reviewed studies or books in English or Spanish, addressing chronological and/or subjective age in relation to well-being in organizational settings, and incorporating HERO model variables. Experimental interventions were excluded, focusing solely on relational or comparative studies. Studies had to examine age as a moderator between HERO resources and well-being.

Expected Results

The final sample included 9 studies. Findings suggest that a lower perceived age correlates positively with both hedonic and eudaimonic well-being. Autonomy emerged as a key mediating variable. These results highlight the relevance of subjective age in predicting well-being at work.

Abstract 472

PSYCHOMETRIC ASSESSMENT OF THE PORTUGUESE ADAPTATION OF THE SELF-CARE PRACTICES SCALE (SCPS): IMPLICATIONS FOR TEACHER WELL-BEING AND BURNOUT PREVENTION

Oliveira S.*[1], Batista G.[2], Marques--Pinto A.[3]

[1]ISCTE - Instituto Universitário de Lisboa, Business Research Unit (BRU-Iscte) ~ Lisbon ~ Portugal, [2]Universidade de Lisboa, Faculdade de Psicologia ~ Lisbon ~ Portugal, [3]Universidade de Lisboa, Faculdade de Psicologia, CICPSI ~ Lisbon ~ Portugal

Self-care practices are crucial for promoting well-being and are particularly relevant for workers in the human services sector, helping them manage work-related stress and maintain their occupational health. However, there is a lack of psychometrically sound instruments to measure self-care practices among workers. We aimed to assess the psychometric properties of the Self-Care Practices Scale (SCPS) for Portuguese workers and explore its association with well-being and burnout. Two related studies were conducted. Study 1 reports the adaptation and the psychometric assessment of the SCPS with a sample of 654 Portuguese employees (74.2% female, M = 47.29 years, SD = 11.04). Factor analysis indicated that a bi-factorial model provided a better fit to the data, with an 18-item general factor and two 9-item factors assessing personal and professional self-care practices. The scale offers adequate evidence of reliability. Study 2 assesses the adequacy of SCPS in a sample of educators (N = 657, 75.5% female, M = 51.43 years, SD = 8.78) and examines the relationships between teachers' self-care practices and occupational health outcomes. Findings supported the structural validity of the instrument's bi-factorial solution and adequate reliability. Multi-group invariance was attained across gender, work context, and instructional level. Results also supported the SCPS's discriminant and criterion validities against external measures. Independent samples t-test revealed that teachers engaged in fewer self-care practices than workers in non-educational contexts, particularly in terms of professional self-care practices. Multiple hierarchical regression analyses supported the predictive role of teachers' self-care practices on their personal well-being, work engagement, and burnout. Findings help answer relevant questions about the role of self-care in the occupational health and well-being of teachers, contributing to an evidence-based discussion on the importance of promoting self-care practices in work settings.

Abstract 285

LEADING FOR HEALTH: A MULTILEVEL LONGITUDINAL STUDY EXPLORING HOW GOOD AND BAD BOSSES SHAPE EMPLOYEE PHYSICAL WELL-BEING.

Swanzy E.K.*, Urena D.L., Berger R.

University of Barcelona ~ Barcelona ~ Spain

Despite the relationship between leaders and employee physical well-being being widely investigated in organizational research, the interconnected nature of the specific motivational and affective mechanisms that explains this relationship remains unexplored. Furthermore, previous studies have largely overlooked the simultaneous examination of short-term and long-term underlying mechanisms in the leadership-employee well-being relationship.

This study integrates positive and negative leadership theories with the Conservation of Resource theory to examine this interconnected nature of motivational (role clarity and meaningful work) and affective (positive affect and thriving at work) mechanisms through which transformational and abusive leadership influence employee physical well-being.

Data were collected online via Qualtrics at seven time-point through a three-wave longitudinal design (with one-month intervals) from 204 full-time workers in Ghana. Given the nested structure of our data (repeated monthly measures nested within individuals), we conducted a multi-level analysis to examine our proposed model.

Our results from a multilevel path analysis showed that transformational and abusive leadership had, respectively, positive and negative impacts on employee physical well-being through the sequential mediation of motivational mechanisms (role clarity and meaningful work) and short-term (positive affect) and long-term (thriving at work) affective mechanisms. Additionally, our findings showed that positive affect (a short-term affective mechanism) played a more critical role than thriving at work (a long-term affective mechanism) in explaining how both transformational and abusive leadership influenced employee physical well-being via motivational mechanisms.

This study underscores the vital role of leadership in shaping employee physical well-being through interconnected motivational and affective pathways. Furthermore, the findings emphasize the importance of considering both short-term and long-term outcomes in the development of leadership interventions to improve employee physical well-being. Finally, addressing both supportive and harmful leadership behaviors is essential for promoting healthier workforce.

Abstract 25

WHY DO EMPLOYEES DIFFER IN THEIR ACCESS TO FLEXIBILITY I-DEALS?

Wu C.[1], Xu A.*[2], Berghoff N.[3], Jiang Z.[4], Zhou Q.[5]

[1]Department of Human Resource Management & Employment Relations, King's Business School, King's College London ~ London ~ United Kingdom, [2]Bay Area International Business School, Beijing Normal University ~ Zhuhai ~ China, [3]Department of Management & Marketing, Durham University Business School, Durham University ~ Durham ~ United Kingdom, [4]College of Business and Law, RMIT University ~ Melbourne ~ Australia, [5]Leeds University Business School, University of Leeds ~ Leeds ~ United Kingdom

Flexibility idiosyncratic deals (i-deals), defined as customized flexible work arrangements that employees negotiate with their employers (Hornung et al., 2008), have become prevalent in organizations as they have been used as a response to a diverse workforce (Bal & Rousseau, 2016), especially as remote and hybrid work become more widespread. While there is extensive knowledge about the positive effects of flexibility i-deals on employees and organizations (see Wasti et al., 2022, for a review), little is known about who receives these i-deals, under what circumstances, and why.

Drawing on a social capital perspective, we propose that individuals with high political skill, due to their ability to influence and build relationships (Ferris et al., 2005), are more likely to develop high-quality leader-member exchange (LMX) relationships with their supervisors and leverage these relationships well to secure flexibility i-deals. Additionally, we propose that this is more likely to occur when their supervisors exhibit servant leadership, characterized by a tendency to serve and support subordinates (Liden et al., 2008). Results from a two-wave survey study involving 221 employees in managerial roles at a pharmaceutical firm in China support our hypotheses.

Our study contributes to literature in multiple ways. First, in the context of flexibility i-deals research, our findings reveal who is more likely to secure flexibility i-deals and under what conditions, extending the understanding of why employees differ in their access to flexibility i-deals from a social capital perspective. Second, our research contributes to political skill research, by revealing its function in the cultivation and utilization of the LMX relationship with the supervisor. Finally, by identifying the effect of servant leadership, our study reinforces the point that supportive leaders are one of the key elements in facilitating employees' access to flexibility i-deals.

EXPLORING THE EMOTIONAL MECHANISMS LINKING WORKPLACE IMPOSTER THOUGHTS ON SELF-IMPROVEMENT AND SILENT BEHAVIORS: THE MODERATING EFFECTS OF SUPERVISOR FEEDBACK

Chi N.*, Chen H.

National Sun Yat-Sen University ~ Kaohsiung ~ Taiwan

Introduction.
Workplace imposter thoughts have attracted increasing attention in organizational research. However, little is known about how such thoughts shape employees' positive and negative behaviors. The underlying mechanisms and boundary conditions also remain unclear.
Purpose.
Drawing on self-discrepancy theory, this study develops a dual-pathway model to examine whether workplace imposter thoughts influence employees' self-improvement and silence behaviors through the emotional mechanisms of shame and fear. It also explores whether these behaviors affect subsequent imposter thoughts and how supervisors' positive and negative feedback differentially moderate these processes.
Method.
We conducted a longitudinal study and collected 256 valid employee-coworker dyads across 4 time points. Hypotheses were tested using multilevel path analysis.
Results.
Findings revealed two distinct pathways. First, workplace imposter thoughts increased self-improvement behaviors via enhanced shame, with supervisor positive feedback amplifying this effect. Second, workplace imposter thoughts increased silence behaviors via increased fear, with supervisor negative feedback weakening this effect. Longitudinal analyses further showed that employees' self-improvement behaviors reduced their subsequent imposter thoughts, whereas silence behaviors reinforced them.
Conclusions.
This study highlights the complex dynamics of workplace imposter thoughts, demonstrating that they can produce divergent outcomes depending on underlying emotional processes and contextual factors. By identifying the dual roles of shame and fear, as well as the moderating influence of supervisor feedback, this research advances theoretical understanding of imposter thoughts and offers practical insights into how organizations can foster constructive rather than detrimental responses.

Abstract 933

EXPLAINING WORK ADDICTION: THE JOINT ROLE OF NARCISSISM AND ORGANIZATIONAL FACTORS

Morkevičiūtė M.*, Buciuniene I.

ISM University of Management and Economics ~ Vilnius ~ Lithuania

Introduction. Grounded in Trait Activation Theory (Tett & Burnett, 2003), work behavior can be understood as the joint outcome of personality traits and organizational factors. From this perspective, it may be assumed that in environments characterized by overwork climates and heavy workloads, individuals high in narcissism are more likely to develop work addiction. Yet, the proposed moderating effects have largely been overlooked and warrant further investigation.

Purpose. The present study aimed to examine whether overwork climate and workload moderate the relationship between different types of employee narcissism and work addiction.

Method. The study was conducted with a sample of 1,001 employees from Lithuanian organizations. Data were collected using a cross-sectional self-report survey design. Work addiction was measured with the Bergen Work Addiction Scale (BWAS; Andreassen et al., 2012). Grandiose narcissism was assessed using the 16-item Narcissistic Personality Inventory (NPI-16; Ames et al., 2006), while vulnerable narcissism was measured with the 10-item Hypersensitive Narcissism Scale (HSNS; Hendin & Cheek, 1997). Overwork climate was captured with the 8-item scale developed by Mazzetti et al. (2014), and workload was measured with the 5-item Quantitative Workload Inventory (QWI; Spector & Jex, 1998).

Results. Findings provided partial support for the hypothesized moderation effects. Specifically, the positive association between vulnerable narcissism and work addiction was amplified under conditions of higher workload. However, the moderating effect of overwork climate was not significant for this relationship. Similarly, neither overwork climate nor workload moderated the relationship between grandiose narcissism and work addiction.

Conclusions. This study advances scholarly understanding of work addiction by highlighting its potential to emerge from the complex interplay between personality traits and organizational factors. However, the absence of several anticipated effects highlights the need for further research to replicate and extend these findings.

Abstract 1143

EFFECT OF PSYCHOSOCIAL RISK FACTORS AND BURNOUT ON MENTAL HEALTH IN MEXICAN WORKERS

Patlan--Perez J.*, Macias--Vazquez E.

Psychology Faculty, UNAM-MEXICO ~ Mexico City ~ Mexico

Purpose: To determine the significant effect of psycho-social risk factors and burnout on mental health in a sample of Mexican workers.

Method: An explanatory, ex post-facto, cross-sectional research was conducted on a sample of 356 workers from three public and three private organizations. The procedure consisted of applying: a) Reference Guide III of NOM-035 (STPS, 2018) to measure psycho-social risk factors, b) the Occupational Burnout Scale (Uribe, 2010) to measure burnout, and c) the Mental Health Inventory (Gutierrez & Guido, 2017) to measure mental health (both poor and functional).

Results: The results of the hierarchical multiple linear regression analysis indicated a significant and negative effect of burnout (exhaustion [beta = -0.201, p = 0.001] and achievement dissatisfaction [beta = -0.258, p = 0.001]) on functional mental health. In contrast, work control [beta = -0.134, p = 0.001] and the de-personalization factor [beta = 0.318, p = 0.001] also had a positive effect on functional mental health. Work-family interference was found to have a negative and significant effect [beta = -0.349, p = 0.001]. Regarding poor mental health, exhaustion [beta = 0.299, p = 0.001], and achievement dissatisfaction [beta = 0.241, p = 0.001] showed a significant positive effect. The greater the worker's burnout and job dissatisfaction, the more their mental health deficits increase. conversely, de-personalization [beta = -0.261, p = 0.001] has a negative effect on mental health deficits. Additionally, work-family interference was found to have a positive and significant effect [beta = 0.276, p = 0.001] on poor mental health.

Conclusions: a) Two psycho-social risk factors (low work control and work-family interference) and the three burnout factors have a significant effect on functional mental health, and b) One psycho-social risk factor (interference in the work-family relationship) and the three burnout factors have a significant effect on poor mental health.

Abstract 1593

CO-CONSTRUCTING THE ASSESSMENT OF CARE BURDEN: A MULTIDIMENSIONAL TOOL FOR FAMILY CAREGIVERS

Ruggeri G.*, Scaratti G., Gambirasio M.

Università degli studi di Bergamo ~ Bergamo ~ Italy

In Italy, more than seven million people provide daily care to a non-self-sufficient family member. Despite their crucial role, caregivers often remain invisible and lack adequate recognition within welfare systems. The needs arising from the caregiving experience are manifold—psychological, physical, social, and economic—yet they are rarely considered in an integrated way, leading to fragmented and disproportionate interventions.

To address this gap, a new multidimensional tool for stratifying care burden has been developed within the project “Caregiver Bergamo – Supporting Those Who Care”, promoted by the Bergamo Health Protection Agency (ATS) in collaboration with work and organizational psychologists from the University of Bergamo.

The distinctiveness of the tool lies in its construction method: a participatory process involving researchers, health and social care professionals (Family and Community Nurses, Social Workers), and caregivers’ associations. This approach fostered the integration of experiential knowledge and professional expertise.

The outcome is a multidimensional questionnaire that enables a systemic reading of the different dimensions of burden—physical, psychological, social, familial, economic, informational, logistical, and spiritual—producing differentiated profiles that can be shared among multiple actors in the service network. The aim is not only the scientific assessment of the phenomenon but also the creation of an operational instrument capable of guiding professional practices, promoting targeted interventions, and supporting institutional recognition processes for family caregivers.

The co-construction of the tool demonstrates how collaboration among academic research, professional practice, and social representation can generate innovative devices with strong transformative potential, laying the groundwork for a new integrated model of care support.

UNITED IN CARE: UNMASKING STRESSORS AND COPING STRATEGIES ACROSS VETERINARY SPECIALTIES

Stetina B.U.*[1], Soukup K.[1], Aden J.[1], Klaps A.[1], Kovacovsky Z.[2], Hametner K.[1], Smetaczek C.[2]

[1]Faculty of Psychology Sigmund Feud University Vienna ~ Vienna ~ Austria, [2]Psychological Outpatient Clinic, Sigmund Freud University Vienna ~ Vienna ~ Austria

Introduction: Veterinarians experience a unique set of stressors that can be grouped into a bio-psycho-social model of the veterinary job reality and several severe mental health consequences, such as depression and suicidal risk (Stetina & Krouzecky, 2022). However, there are still not a lot of findings, how veterinarians in different fields of veterinary experience their specific stressors and their coping strategies.

Purpose: The study aims to systematically examine coping strategies and stressors across the veterinary profession in Austria analyzing different fields of veterinary medicine; to develop specific treatment approaches for better support.

Methodology: Using a cross-sectional design in cooperation with the Austrian Veterinary Chamber online questionnaires are sent out yearly to Austrian veterinarians on a voluntary basis. The presented analysis includes demographic data, work-related details, a coping strategy inventory (SVF-120) and open-ended questions with regards to subjective stressors. Data from March 2019 (n=339), September 2021 (n=332), March 2022 (n=191), and June 2023 (n=230), were used.

Results: Several specific fields exist in veterinary medicine; the presented analysis focused on small and large animal practice and official veterinarians. In general, all veterinary fields differ significantly from the general population in all coping scales. However, the differences between the fields are significant as well and show that small animal veterinarians reported the highest use of negative maladaptive coping strategies (eg Avoidance: $F(2,549)=5.086, p=.06, \eta 2=.18$)) and official veterinarians report the lowest use of positive coping strategies (eg Minimization: $F(2,549)=8.337, p<.001, \eta 2=.30$)).

Conclusion: The results highlight the need to address the well-being crisis in the veterinary profession and that the different fields differ significantly, yet closer similarities to each other than to the general population. The findings highlight the necessity for tailored interventions specific to each veterinary field.

Abstract 4586

NOT JUST A BURDEN: HOW WORKPLACE IMPOSTOR THOUGHTS SHAPE HELP-SEEKING

Wang J.*, Tang N.

Shanghai Jiao Tong University ~ Shanghai ~ China

Workplace impostor thoughts—defined as the belief that others overestimate one's competence at work—are widespread in organizations. Prior research has primarily portrayed such thoughts as an intrapersonal psychological burden, emphasizing their associations with stress, anxiety, and impaired well-being. However, this perspective offers an incomplete account of how employees actively respond to perceived evaluative discrepancies in everyday work interactions. Drawing on the impression management two-component model, we conceptualize workplace impostor thoughts as a socially embedded signal of evaluative discrepancy that heightens concerns about social image, thereby motivating strategic behavioral regulation.

Using a three-wave, multilevel field study of 297 employees nested within 64 work teams in China, we examine how, why, and when workplace impostor thoughts shape distinct forms of help-seeking behavior. Results show that workplace impostor thoughts increase perceived image risk, which in turn promotes autonomous help-seeking (i.e., seeking guidance to solve problems independently) while discouraging dependent help-seeking (i.e., requesting others to provide complete solutions). Moreover, team task interdependence moderates these relationships: when task interdependence is high, the positive effect of workplace impostor thoughts on image risk is stronger, and the indirect effects on both forms of help-seeking via image risk are amplified.

By shifting attention from the psychological costs of impostor thoughts to employees' active behavioral responses, this research advances a more agentic and socially embedded account of the impostor experience. In addition, by distinguishing between autonomous and dependent help-seeking, we integrate learning-oriented and image-regulatory perspectives on help-seeking behavior, highlighting how employees regulate not whether they seek help, but how they do so in evaluative contexts. Finally, our findings underscore the importance of task structure in shaping when impostor-related evaluative discrepancies become socially consequential, offering a more context-sensitive understanding of workplace impostor thoughts and their behavioral implications.

ADDRESSING THE CREATIVITY RECOGNITION PARADOX: CONTRADICTORY EFFECTS OF INTERGROUP RELATIONS ON CREATIVITY EVALUATIONS OF THE CREATORS AND THEIR CREATIONS

Bai X.*[1], Qi S.[1], Lin L.[2]

[1]Institute of Psychology, Chinese Academy of Sciences ~ Beijing ~ China, [2]Central University of Finance and Economics ~ Beijing ~ China

While the creativity and innovation literature has focused extensively on the generation and implementation of creative ideas, less is known about the factors that influence how creative potential is recognized in individuals and their work. This study examines how intergroup relations between evaluators and the targets of evaluation (i.e., creators and their ideas) serve as a social cue to influence creativity recognition. Social identity theory suggests that evaluators will perceive ingroup members as more creative than outgroup members. In contrast, construal level theory posits that the psychological distance associated with outgroups will lead evaluators to perceive greater creativity in the work of outgroup members than in that of ingroup members. Four studies provide converging evidence for this paradox. Specifically, Study 1 revealed that evaluators rated ingroup creators as having higher creative potential but judged their ideas as less creative compared to their outgroup counterparts. Study 2 found that this favoritism toward ingroup creators was mediated by intergroup bias. By contrast, Study 3 demonstrated that the preference for outgroup members' ideas was mediated by the higher-level construal adopted when evaluating these psychologically distant targets. Finally, Study 4 tested the full model, confirming that intergroup bias and construal level function as parallel mediators, explaining the contradictory effects of intergroup relations on evaluations of creators and creations, respectively. Overall, our findings suggest that social cues like intergroup relations have complex and paradoxical effects on how creativity is recognized.

Abstract 1700

TEAM COMMUNICATION ACTIONS AND THEIR IMPACT ON TEAMWORK PROCESSES AND TEAM PERFORMANCE

Perez--Sepulveda I.*[1], Axtell C.[2], Dawson J.[2]

[1]School of Psychology, Universidad Adolfo Ibáñez ~ Santiago ~ Chile, [2]Sheffield University Management School ~ Sheffield ~ United Kingdom

Introduction: Advances in information and communication technologies (ICTs) have transformed how teams collaborate, increasingly combining face-to-face and virtual exchanges. However, prior research has often treated ICTs and face-to-face communication as opposites, overlooking their overlapping and complementary capabilities (Dennis et al., 2008) and the ways team members actively shape media use through their agency. The emerging concept of team communication actions (Perez-Sepulveda et al., 2026) addresses this gap, but its links to teamwork processes and performance remain empirically untested.

Purpose: This study investigates the relationships between team communication actions, teamwork processes, and team performance, considering the moderating role of team tenure.

Method: Data were collected from 517 members in 143 teams across two organisations. We examined the direct effects of eight communication actions on transition, action, and interpersonal processes, as well as their indirect effects on team performance through these processes. Team tenure was included as a moderator.

Results: Team communication actions influenced effectiveness in nuanced ways. Verbal, non-verbal, and refining communications enhanced coordination, trust, and performance, and helped teams manage task conflict constructively to improve outcomes, even if conflict levels did not decrease. Reviewing communications often undermined processes, while graphical communications benefited early-stage teams. Overall, results suggest managers should tailor media use to team maturity and focus on meaning-driven communication to support teamwork and performance.

Conclusions: The study provides the first empirical support for the concept of team communication actions, offering a more nuanced understanding than traditional ICT versus face-to-face comparisons. Results contribute to theory by clarifying how communication behaviours shape teamwork processes and performance, and to practice by informing managers' decisions about communication media use depending on team maturity.

Abstract 1495

BEYOND ENGAGEMENT AND SATISFACTION: THE UNIQUE PREDICTIVE VALUE OF EMPLOYEE NET PROMOTER SCORE FOR ORGANIZATIONAL RETENTION

Valencia M.*

University of the Philippines ~ Quezon City ~ Philippines

The Employee Net Promoter Score (eNPS) has become one of the most widely adopted human resource metrics for gauging employee advocacy and organizational attractiveness. Despite its popularity, questions remain about whether eNPS is merely a proxy for employee engagement and job satisfaction, or whether it offers unique value in predicting critical organizational outcomes. This study examined the construct and predictive validity of eNPS in relation to engagement, job satisfaction, and intention to stay at the organizational level.

Data were drawn from 69 organizations in the Philippines, representing approximately 18,000 employees across diverse industries. Each organization provided aggregated scores on eNPS, engagement, job satisfaction, and intention to stay. Analyses compared the relative contributions of these metrics in predicting organizational retention.

The findings revealed that engagement was strongly related to intention to stay, while job satisfaction added little predictive value. Crucially, eNPS contributed additional explanatory power, emerging as a distinct predictor of organizational retention even when engagement and job satisfaction were taken into account. This indicates that eNPS is not simply redundant with existing measures but captures unique aspects of how employees perceive and advocate for their organization as a place to work.

These results have both theoretical and practical significance. From a scientific perspective, they support the nomological validity of eNPS within the broader network of employee attitudes and outcomes. From a practical standpoint, the study suggests that organizations can use eNPS as a parsimonious yet powerful indicator of retention risk, while continuing to rely on engagement and satisfaction measures for a fuller picture of employee experience and well-being. By clarifying the role of eNPS, this study contributes to bridging the gap between psychological theory and HR practice.

HUMAN CAPITAL SUSTAINABILITY LEADERSHIP AND CAREER SUSTAINABILITY: THE ROLE OF FEEDBACK ENVIRONMENT AND FEEDBACK ORIENTATION IN PUBLIC ADMINISTRATION

Mariani M.G.*, Lo Piccolo E., Petruzziello G.

University of Bologna, Department of Psychology "Renzo Canestrari" ~ Milano ~ Italy

Introduction. Promoting sustainable careers is a strategic challenge for public organizations, where aging workforces and limited mobility constrain opportunities for growth. Human Capital Sustainability Leadership (HCSL) is a leadership style oriented toward ethical, sustainable, and mindful use of human resources. By shaping a supportive Feedback Environment (FBE), leaders can foster developmental perceptions of performance appraisal (DEV), encouraging employees to view appraisal as an opportunity for growth rather than as a control tool. However, the conversion of supportive contexts (FBE) into developmental appraisal reactions (DEV) may depend on employees' Feedback Orientation (FO), which in this study is explicitly tested as a moderator, capturing the degree to which individuals value, seek, and use feedback at work.

Purpose. This study tests whether FBE and DEV sequentially mediate the relationship between HCSL and Career Sustainability (CS), and whether FO moderates the FBE → DEV pathway.

Method. A moderated serial mediation model (PROCESS Model 91, Hayes) was tested with survey data from 320 employees in a large Italian public administration.

Results. HCSL showed no direct effect on CS. Its influence was fully indirect: HCSL enhanced FBE, which promoted DEV, ultimately increasing CS. FO significantly moderated the FBE → DEV link, amplifying the serial indirect effect of HCSL on CS.

Conclusions. The study shows that Human Capital Sustainability Leadership does not directly predict Career Sustainability, but operates indirectly by fostering supportive Feedback Environments and strengthening employees' developmental perceptions of performance appraisal. Moreover, employees' Feedback Orientation plays a crucial moderating role, enhancing the translation of supportive contexts into developmental appraisal reactions. These findings suggest that in public administration, leadership behaviors that promote sustainable use of human resources can enhance career sustainability primarily through the creation of favorable feedback conditions and employees' receptivity to them.

Abstract 1043

DESIGNING FOR COMPASSION AT WORK: AN INVESTIGATION OF HOW AND WHEN COMPASSION ORGANIZING IMPACTS EMPLOYEE PERFORMANCE, INNOVATION AND JOB SATISFACTION

Montani F.*[1], Vandenberghe C.[2]

[1]Université de Montréal ~ Montréal ~ Canada, [2]HEC Montréal ~ Montréal ~ Canada

A key challenge for organizations in the post-pandemic era is to reconcile managers' demands for performance and innovation, on the one hand, and employees' needs for well-being, on the other hand. Indeed, as never before, today's organizations are exposed to acute external disruptions, such as financial shocks, geopolitical turmoil, pandemic crises and commercial wars, which dramatically threaten not only the employees' capacity to meet ambitious performance and innovation targets, but also the possibility for them to preserve of a worthy quality of life at work. However, despite need for "healthy" organizational practices – i.e., that are supportive of both employee performance/innovation and well-being – research has surprisingly fallen short to address this critical issue.

In the present manuscript, we build on and extend current theorizing on compassion at work by unveiling compassion organizing – defined as organizational repurposing and redirecting routines used for normal work to address members' suffering – as a new bundle of organizational practices that are expected to support organizations' capacity to conciliate the performance/innovation-well-being corundum in the workplace. Drawing on two complementary theories, attachment theory and cue consistency theory, as well as on the literature on workplace compassion, we hypothesize that: a) job autonomy transmits (i.e., mediates) the benefits of compassion organizing for benefit employee performance, innovation and job satisfaction; and b) transformational leadership amplifies (i.e., moderates) these positive indirect effects.

To test our research model, we conducted a three-wave and multi-source study on 369 employees working in a Canadian provincial government organization. Hierarchical linear modeling results fully supported our predictions. Our study contributes to a new theoretical, empirical and practical understanding of how organizational practices that are supportive of compassion at work can help organizations conciliate the managerial demands for heightened performance and innovation with employees' needs for improved psychological health at work.

Abstract 265

PSYCHOLOGICAL SAFETY, WORK ENGAGEMENT, RESILIENCE, JOB SATISFACTION, AND TRANSFORMATIONAL LEADERSHIP IN PORTUGUESE FAMILY BUSINESSES

Pereira S.A.*[1], Veiga P.M.[2]

[1]Susana Alves Pereira ~ Maia ~ Portugal, [2]Pedro Mota Veiga ~ Maia ~ Portugal

Family businesses are a cornerstone of the Portuguese economy, representing around 80% of all enterprises, generating two-thirds of GDP, and employing half of the national workforce. Despite their long-term orientation and resilience, these organisations face key challenges, such as succession, professionalisation of management, and resistance to change. In this context, psychological safety emerges as a pivotal construct in promoting work engagement and employee wellbeing. This study investigates the effect of psychological safety on work engagement, considering job satisfaction and resilience as mediating variables. It also examines the mediating role of psychological safety in the relationship between transformational leadership and work engagement. A cross-sectional survey was conducted among 800 employees from Portuguese family businesses. Participants completed a self-report questionnaire comprising validated measures: Team Psychological Safety Scale, Utrecht Work Engagement Scale (UWES-3), Short Index of Job Satisfaction, Psychological Capital Questionnaire (resilience subscale), and the Global Transformational Leadership Scale. Data collection followed ethical approval and informed consent procedures. Preliminary analyses suggest that psychological safety is positively associated with engagement, job satisfaction, and resilience. Mediation analyses are being conducted to assess the indirect effects of job satisfaction and resilience on the relationship between psychological safety and engagement. Additionally, results are expected to demonstrate that transformational leadership positively influences psychological safety, which in turn fosters work engagement. Findings are expected to offer both theoretical and practical contributions to organizational psychology by clarifying the mechanisms through which psychological safety enhances motivation and performance in family business contexts. The study highlights the relevance of promoting psychologically safe environments, supported by transformational leaders, as a pathway to sustained employee engagement and organisational adaptability.

Abstract 2675

PRELIMINARY PSYCHOMETRIC EVIDENCE ON AN ORGANISATIONAL LEADERSHIP COMPETENCY QUESTIONNAIRE

Pienaar J.*, Theron C.

University of Stellenbosch ~ Stellenbosch ~ South Africa

Background: Leadership is arguably the most important theme in the social sciences, yet our understanding of the development of organisational leadership is still fragmented and incomplete.
Aim: We examine the psychometric properties of a leadership competency questionnaire to evaluate the reliability and validity of the instrument as a feedback tool for developing effective leader behaviour.
Setting: The questionnaire was administered on a South Africa sample (N = 133) of leaders-in-training that were part of management development programmes around the country.
Method: Data was collected via online surveys from a conveniently available pool of respondents. Classical item analysis as well as dimensionality analysis was performed on each of the questionnaire subscales. The measurement model was fitted via Structural Equation Modelling.
Results: Reliability analysis demonstrated that the instrument had high internal consistency in the sample. Confirmatory factor analysis confirmed the unidimensionality of all 9 subscales. The competency questionnaire measurement model obtained close fit in the parameter.
Conclusion: We provisionally conclude that the rating instrument provides a valid and reliable tool to measure and provide feedback on burgeoning leaders' standing on critical organisation-specific leadership competencies.
Contribution: The available evidence supports the permissibility of the use of the questionnaire to gauge management trainees' standing on the organisational leadership performance construct, and to provide them with formative feedback as part of an overarching performance review process in support of their leadership development journey.

Abstract 888

THE IMPACT OF POSITIVE LEADERSHIP, PERCEIVED ORGANIZATIONAL SUPPORT ON WORK ENGAGEMENT AND SOCIAL RELATIONSHIPS: MEDIATING ROLE OF POSITIVE PSYCHOLOGICAL CAPITAL

Srivastava K.*

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

The paper has examined the role of positive leadership and perceived organizational support in developing psychological capital (PsyCap), and the mediating role of psychological capital (PsyCap) between positive leadership, perceived organizational support (POS), work engagement, and social relationships. We collected data from 375 executives using a structured interview schedule from the eastern part of the Indian manufacturing sector. We analyzed the data using structural equation modelling to test he proposed model. The results support the model empirically, suggesting that positive leadership and perceived organizational support enhance psychological capital, while PsyCap partially mediated the relationship between independent and dependent measures.. It has implications for management to adopt positive leadership, provide support, and value their contribution. Organizations must cultivate an empowering environment through communication, accountability, and motivating employees to enhance their engagement level. Management should also connect with employees to improve social relationships by fostering a positive atmosphere of trust, respect, honesty, and appreciation. The study contributes to the literature by identifying the role of positive leadership and organizational support in developing social capital and engagement via psychological capital in the Indian manufacturing sector. The study supports the theory of psychological capital and social exchange, which helps build a resilient, hopeful, optimistic, and efficient workforce, resulting in better engagement and strong social relationships to achieve a competitive advantage in an uncertain environment, as it provides the necessary resources to cope with the challenges of the environment.

Abstract 625

ORGANIZATIONAL CLIMATE FOR APPRECIATION: SCALE DEVELOPMENT AND VALIDATION

Wahl I.*, Einwiller S.

University of Vienna ~ Vienna ~ Austria

Introduction and Purpose
Employees want to be appreciated in the workplace for various reasons, including individual traits and work-related behaviors. The perception and signals of appreciation are shared among employees and can therefore be experienced as an organizational climate of appreciation. An appreciative climate is defined as an organizational environment in which employees receive signals that their individual characteristics, work behaviors, and competencies are valued. While existing appreciation measures primarily capture the appreciation directed at and perceived by individual employees, this study aims to develop a one-dimensional, reliable, and valid scale for assessing the organizational climate of appreciation.
Method
An extensive item generation process was followed, comprising: (1) reviewing literature for suitable items, (2) conducting interviews with employees (N = 5), and (3) incorporating feedback from experts (N = 5). The resulting item pool of 15 items was piloted with an online-survey on a sample of 133 German-speaking employees. Using the same online-survey, dimensionality was established using a sample of 284 German-speaking employees and replicated with a second sample of 293. This second sample was also used to evaluate the scale's validity and reliability. To demonstrate criterion validity, the surveys included scales on job satisfaction, organizational identification, and turnover intention. Construct validity was assessed using items related to appreciation by colleagues and superiors. The study was deemed ethically sound and was pre-registered on the Open Science Framework.
Results
We created a one-dimensional scale consisting of six items that measures the organizational appreciation climate. The scale demonstrated reliability as well as criterion and construct validity.
Implications and future research
This scale enables researchers and work psychologists to assess the prevailing appreciation climate in organizations. A revalidation of the scale in Scandinavia and the US is already planned, with data collection starting in October 2025.

NEW SCENARIOS AND TRAINING STRATEGIES TO IMPROVE THE WELL-BEING OF UNIVERSITY TEACHING AND TECHNICAL STAFF

Wednesday 22 July 2026 from 14:00 to 15:30

(O-Arsenale)

Massimo Miglioretti (University of Milano-Bicocca ~ Milan ~ I), Chair and Presenter
Silvia Pignata (university of South Australia ~ Adelaide), Discussant

The well-being of academic and technical-administrative staff has become a central issue for higher education institutions, with growing evidence linking staff health to both educational quality and student outcomes. This symposium brings together international scholars to present innovative research and training strategies addressing mental health, burnout prevention, gender-inclusive language, and stress management in university contexts.

The session opens with the contribution of Silvia Pignata and colleagues, who illustrate how a comprehensive Student Mental Health Framework can be adapted to support university staff. Their work demonstrates the importance of systemic and multi-layered approaches, highlighting the strong interdependence between student and educator well-being.

Building on this theme, Alain Marchand and colleagues present results from a large Canadian longitudinal study on burnout among university employees. Findings show that academic managers and professors-researchers are particularly at risk, pointing to the need for targeted preventive interventions.

A further contribution is offered by Elisa De Carlo and colleagues, who describe an experiential training program for teachers designed to enhance resilience, engagement, and professional development. The significant improvements observed underscore the potential of continuing education to strengthen psychosocial resources and foster more sustainable educational practices.

The symposium then turns to inclusion, with Vittorio Scuderi and colleagues presenting the results of a quasi-experimental study on gender-inclusive language training for Italian university staff. Their findings confirm the key role of inclusive environments in encouraging positive attitudes and the practical adoption of inclusive communication.

Finally, Massimo Miglioretti and colleagues share the evaluation of a stress management program for technical-administrative personnel. Beyond high participant satisfaction, the study highlights how tailored interventions can increase awareness of stressors, strengthen coping strategies, and provide a foundation for broader organizational initiatives aimed at long-term impact.

Abstract 3144

ADAPTING A COMPREHENSIVE UNIVERSITY STUDENT MENTAL HEALTH FRAMEWORK TO AUSTRALIAN UNIVERSITY STAFF

Pignata S.*

University of South Australia ~ Adelaide ~ Australia

There is strong evidence that university students report high levels of psychological stress. This paper reports on the development and implementation of a university-wide Student Mental Health Framework (SMHF) to foster student mental wellbeing in an Australian university. We outline the multi-layered systems approach and four key framework principles: recognising students as partners; integrating wellbeing into teaching and learning to drive academic success; aligning online and on-campus learning, social and operational environments to support wellbeing; and connecting students to services and supports and collaborating effectively with experts, stakeholders, and the sector itself. Mental wellbeing was recognised across eight domains: emotional, social, physical, intellectual, spiritual, environmental, financial, and digital.

First, a university-wide analysis of existing initiatives identified 124 wellbeing activities. Next, the SMHF was developed with input from a student consultative group. Lastly, several brainstorming sessions were held with the group to gather ideas on how best to improve student wellbeing. After reviewing the current state analysis and engaging with peers, the student group identified 138 proposed wellbeing actions for implementation. After preliminary analyses, 27 proposed actions were retained that— if implemented— were expected to have a lasting impact beyond 2025. Actions identified included: piloting a peer-led wellbeing support service; and providing clearer communications to neurodiverse students about accessing services.

Informed by this approach and evidence-based literature, we propose the development of a comparable conceptual framework and systemic implementation to enhance the mental wellbeing of university educators, who report high levels of stress due to factors in the teaching, institution, and external environment (Laundon & Grant-Smith, 2023). This healthy settings-based approach acknowledges the inherent complexity of university communities and that the health of university educators and students is intertwined (Okanagan Charter, 2015). The need for targeted strategies is critical so that a healthier workforce can provide better learning outcomes for students.

Abstract 3146

FOSTERING WELL-BEING IN EVOLVING ACADEMIC CONTEXTS: A TRAINING PRACTICE IN ITALIAN UNIVERSITY

De Carlo E.*[1], Signore F.[2], Artigas M.V.[3], Catalano A.[1], Ingusci E.[1]

[1]Unisalento ~ Lecce ~ Italy, [2]Unimercatorum ~ Roma ~ Italy, [3]Universidad Nacional del Mar del Plata ~ Mar del Plata ~ Argentina

Introduction

Supporting teachers' well-being is essential to creating educational environments capable of responding effectively to the challenges of evolving academic contexts. Promoting such well-being—particularly during students' transitional phases—requires educators to integrate guidance-related skills with professional reflexivity. In this perspective, continuing teacher education represents a valuable opportunity to strengthen their role as both promoters of well-being and agents of change.

Objectives

This contribution presents a residential training program addressed to university and upper secondary school teachers. The intervention aimed to enhance transversal competences with the broader goal of fostering professional well-being by improving work engagement, emotional resilience, and perceived professional development. It also sought to promote dialogue and the co-construction of competences among various stakeholders in the educational system.

Method

The intervention involved N=26 teachers in an experiential learning process including individual, collaborative, and reflective activities. The variables measured were work engagement, emotional resilience, guidance competences, and perceived professional development. Data were analyzed using paired-sample t-tests (Jamovi software).

Results

Statistically significant increases were found in several dimensions: work engagement, emotional resilience, guidance competences (e.g., promotion of self-efficacy), and perceived professional development. These improvements, considered together, suggest a strengthening of teachers' psychosocial well-being—expressed through greater engagement, improved coping strategies, and a stronger sense of efficacy in their educational role.

Limitations and Innovative Aspects

Although this was a preliminary and exploratory study, the adoption of an integrated approach—focused on well-being and guidance training—yielded encouraging results. The findings highlight the potential of such interventions to reinforce teachers' personal and professional resources and to support the development of more sustainable and inclusive educational practices.

Abstract 3147

TRAINING TECHNICAL AND ADMINISTRATIVE STAFF IN ITALIAN UNIVERSITIES ON GENDER-INCLUSIVE LANGUAGE: PRELIMINARY RESULTS OF A QUASI-EXPERIMENTAL STUDY

Scuderi V.*[1], Platania S.[2], Paolillo A.[1]

[1]Kingston University London ~ London ~ United Kingdom, [2]University of Catania ~ Catania ~ Italy

In increasingly diverse workplaces, characterised by greater participation of women, and members of the LGBTQ+ community, the adoption of gender-inclusive language is an asset for the promotion of fair work environments. Research suggests that inclusive work environments encourage employees to communicate more inclusively, which could foster a sense of inclusion. However, there is a lack of empirical studies investigating the relationship between inclusive work environments and inclusive language use, particularly in Italian workplaces where institutions still debate on its implementation.

To investigate how inclusive environments promote the use of gender-inclusive language to accommodate demographic changes, a pilot study focusing on the relationship between perceptions of inclusion at work and the use of gender-inclusive language (GIL) among 223 Italian public administration employees was conducted. Using a cross-sectional research design, 223 questionnaires were analysed to explore the associations between climate for inclusion, positive attitudes towards GIL and intentions to use GIL. The results showed a positive correlation between employees' perception of inclusion at work and behaviours favoring the use of GIL. Mediation analysis showed that, in work contexts perceived as inclusive, employees are more likely to have positive perceptions of inclusive language and, consequently, to embrace its use. These results suggest that individuals are more likely to adopt inclusive language in work environments that are perceived as inclusive, which contributes to greater communicative fairness. They also demonstrate the crucial role of fostering inclusive work environments and the need to offer training on inclusive language as a key competence for cultivating inclusive communication at work. Due to the exploratory nature of this study, the sample is not representative, which limits the generalisability of the results. Future experimental studies should focus on verifying whether groups of workers who use GIL perceive greater inclusion at work than those who do not use GIL.

Abstract 3148

FROM DESIGN TO IMPACT: EVALUATING STRESS MANAGEMENT PROGRAMS FOR UNIVERSITY TECHNICAL-ADMINISTRATIVE PERSONNEL

Miglioretti M.*, Simbula S., Dell''Aversana G.

University of Milano-Bicocca ~ Milan ~ Italy

In recent years, the well-being of technical and administrative staff (PTA) in Italian universities has garnered increasing attention, especially in light of institutional changes and the intensified pressures of the COVID-19 pandemic. This study evaluates a tailored workplace intervention aimed at supporting stress management among PTA within the academic context.

The intervention was delivered at a Northern Italian university through two group sessions held two weeks apart. A total of 66 PTA employees voluntarily participated and were assigned to small groups of 10–15 individuals based on professional role. The sessions incorporated experiential exercises, reflective writing, and case discussions to enhance awareness of stressors and bolster both individual and organizational coping resources.

Pre- and post-intervention assessments were conducted using validated measures of work engagement, emotional exhaustion, perceived stress, and psychological capital. Valid responses included in the analyses comprised 28 participants in the intervention group and 21 in the control group. Participant satisfaction and process data were also collected via facilitator field notes.

Findings indicated high participant satisfaction and perceived usefulness of the intervention in raising stress management awareness. However, repeated-measures analyses revealed no statistically significant changes over time or differences between groups on psychological outcomes. The brief duration and individual-level focus of the intervention may have limited its capacity to yield measurable effects.

Despite its implementation within a single institution, this study underscores the complexity of designing and evaluating stress-reduction programs in academic settings. It offers practical insights for future multi-level interventions aimed at enhancing PTA psychological well-being, highlighting the need for sustained engagement and organizational support to foster lasting impact.

01 - Division 1: Work and Organizational Psychology

RETHINKING OCCUPATIONAL HEALTH AND WELL-BEING IN THE DIGITAL WORKPLACE: CHALLENGES AND STRATEGIES

Wednesday 22 July 2026 from 14:00 to 15:30

(R-Arsenale)

Oi Ling Siu (Lingnan University ~ Hong Kong ~ Hong K), Chair and Discussant

The integration of digital technologies into workplaces has transformed how employees interact, perform, and experience their work. Advancements such as AI, social media, and IT systems offer opportunities for efficiency, inclusion, and resource optimization. However, they also bring challenges like technostress, dehumanization, and the need for proactive strategies to maximize their benefits. At the same time, physical workplace conditions, such as indoor air quality, remain an often-overlooked factor with significant implications for employee well-being. This symposium examines the multifaceted impact of both digital transformation and physical environments on employees' well-being, inclusion, and performance, offering actionable insights into the interfaces between technology, environment, and human behavior.

The first presentation highlights an unrecognized threat to well-being: the impact of secondary emissions from indoor ozone chemistry on employees' emotions. This study identifies how specific pollutants, such as ozonolysis products, negatively affect workers' emotional states, with implications for improving indoor air quality in office settings.
The second presentation focuses on the darker side of digital transformation, showing how technostress contributes to workplace loneliness through organizational dehumanization. It also highlights the buffering role of nature exposure in mitigating these effects, offering strategies to enhance employee well-being.
The third presentation explores how social media affordances like anonymity and association empower neurodivergent employees to participate meaningfully in workplace decision-making, even when traditional support systems are lacking.
The fourth presentation examines AI as a resourceful work event, demonstrating how reflective practices like savoring and sharing can help employees transform AI use into sustainable energy and performance gains.
Finally, the fifth presentation investigates the paradox of control in human-AI collaboration, showing how task-level attributions of control influence employees' creative self-efficacy and agency.
Together, these studies provide a multidisciplinary perspective on navigating the challenges and opportunities of modern workplaces, offering valuable insights for fostering well-being, inclusion, and innovation.

Abstract 3801

DEHUMANIZATION IN THE DIGITAL WORKPLACE: LINKING TECHNOSTRESS TO EMPLOYEES' LONELINESS AND THE ROLE OF NATURE EXPOSURE

Lu C.*

School of Psychological and Cognitive Sciences, Peking University ~ Beijing ~ China

Introduction - The implementation of advanced IT and widespread digital transformation in the workplace has brought lots of significant benefits, including enhancing productivity and efficiency. Nevertheless, people also confront the dark sides of IT use, among which the most concerning phenomenon is technostress. This type of technology-induced stressors could make employees feel severely lonely in the workplace.
Purpose: The current study is to investigate the impact of technostress on employees' loneliness in the workplace, with focus on the mediating mechanism of organizational dehumanization and the buffering effect of employees' exposure to natural environments.
Method - A time-lag designed study was conducted, and data were collected from 340 employees across various industries and companies in China.
Results - The results showed that technostress was positively related to employees' workplace loneliness, and organizational dehumanization significantly mediated the positive relationship. Moreover, employees' nature exposure was found to moderate the indirect relationship between technostress and employees' workplace loneliness via organizational dehumanization, such that the indirect relationship is weaker when nature exposure is high (vs. low).

Conclusion - Our findings demonstrate that nature exposure can mitigate the impact of technostress on employees' loneliness through alleviating their experience of dehumanization in the workplace. This study would provide insight into our understanding of human-technology interaction in contemporary work contexts, and offers practical implications for employers and employees seeking to promote well-being through increasing access to restorative natural environments.

Abstract 3802

FROM THEORY TO PRACTICE: HOW SOCIAL MEDIA AFFORDANCES ENABLE NEURODIVERGENT EMPLOYEE PARTICIPATION IN WORKPLACE DECISION-MAKING

Chan X.W.(.*

School of Applied Psychology, Griffith University ~ Brisbane ~ Australia

This presentation bridges conceptual understanding with empirical evidence on how digital technologies can foster meaningful inclusion for neurodivergent employees (NDEs). Drawing from two complementary studies, I first present a comprehensive technology-inclusion framework that identifies how social media affordances, particularly anonymity and association, can facilitate workplace inclusion across multiple dimensions. Building on this theoretical foundation, I then share findings from a 10-day experience sampling study (N = 185 NDEs) that examines how these affordances activate proactive motivational states, ultimately enabling NDEs to influence workplace decisions. The empirical results reveal that association affordances enhance both psychological empowerment and positive affect, while anonymity primarily operates through affective pathways. Notably, these digital pathways become particularly valuable when traditional interpersonal support is lacking, suggesting a compensatory rather than complementary relationship. Together, these studies offer both theoretical insights and practical guidance for leveraging social media as an inclusion tool, moving beyond general accommodation calls to specify actionable mechanisms for meaningful neurodivergent participation in organisational decision-making.

Abstract 3803

HOW AND WHEN AI USE ENHANCES POSITIVE WORK EXPERIENCE: A COGNITIVE RESOURCE CRAFTING PERSPECTIVE

Wang H.*

Department of Psychology, Lingnan University, Hong Kong ~ Hong Kong ~ Hong Kong

AI has become increasingly embedded into employees' everyday lives. However, we still lack a comprehensive understanding of how and under what conditions AI use can shape employee positive work experience. Based on the affective event theory (AET) and the job demands-resources (JD-R) theory, we conceptualize AI use as a resourceful work event, but its positive impact depends on the extent to which employees can turn this resourceful event into cognitive resources. Specifically, we hypothesize that the joint effects of AI use and positive reflection—comprising intrapersonal savoring (personal reflection on what went well) and interpersonal sharing (capitalization with others)—will boost cognitive resource crafting (CRC). In turn, CRC is expected to foster higher energy levels and better performance.

We conducted a weekly diary study over 4 consecutive weeks with 114 knowledge workers in China who regularly used AI tools. Multilevel analysis revealed that AI use was more strongly associated with CRC during weeks when employees engaged in high levels of intrapersonal savoring and interpersonal sharing. Further, conditional indirect effects analysis showed that weekly AI use indirectly influenced energy and performance via CRC, with these effects being amplified when employees engaged in high levels of savoring and sharing.

By integrating JD-R and AET theories, our findings demonstrate that the benefits of AI use extend beyond mere tool adoption. Instead, AI use functions as a positive work event that, when reflectively processed, can be transformed into enduring cognitive resources. We further highlight the importance of agentic reflective practices, such as savoring and sharing small "AI wins", in maximizing the positive impact of AI use on employees' cognitive resource crafting, energy, and performance.

Abstract 3804

THE PARADOX OF CONTROL IN HUMAN–AI COLLABORATION: HOW ATTRIBUTIONS SHAPE CREATIVE SELF-EFFICACY

Van Gool P.*

Human Performance Management Group, Eindhoven University of Technology ~ Eindhoven ~ Netherlands

The increasing use of artificial intelligence (AI) in knowledge-intensive work raises questions about how it affects employees' sense of creative capability. Some perspectives view AI as scaffolding that augments creativity, while others highlight its potential to undermine agency and ownership. We address this debate by examining how AI use relates to creative self-efficacy through task-level attributions of control. Data were collected on 389 tasks reported by 58 engineers in a leading global semiconductor company. For each task, employees rated their performance, creativity demands, AI use, locus of control, and creative self-efficacy. Multilevel analyses revealed that AI use amplified attributional patterns. When performance was high, particularly in creativity-intensive tasks, employees were more likely to attribute control to themselves and reported higher creative self-efficacy. When performance was low, they were more likely to attribute control to the AI and reported lower creative self-efficacy. These findings suggest that AI does not simply empower or disempower employees but acts as an attributional amplifier, magnifying self-serving biases that shape beliefs about creative capability. The study extends attribution and self-efficacy theories to AI-supported work and highlights practical risks of overconfidence after AI-assisted successes and reduced self-belief after failures.

WHEN LEADERS DISAPPEAR: THE QUIET COST OF LAISSEZ-FAIRE LEADERSHIP ON EMPLOYEE QUIET QUITTING AND THE BUFFERING ROLE OF PSYCHOLOGICAL DETACHMENT

Swanzy E.K.[1], Abrome A.*[2], Desouza M.[3], Berger R.[1]

[1]University of Barcelona ~ Barcelona ~ Spain, [2]University of Bologna ~ Bologna ~ Italy, [3]University of Professional Studies ~ Accra ~ Ghana

Quiet Quitting in recent times has emerged as a significant global organizational challenge, leading to adverse consequences for organizations. Despite its growing relevance, research on this phenomenon remains limited, particularly regarding the role of leadership. This study investigates the influence of laissez-faire leadership (LFL) on employee quiet quitting behaviours via the mediating effects of role stress and exhaustion and the moderating role of psychological detachment. A four-wave time-lagged survey was conducted among 367 full-time employees in Ghana, with data collected at one-month intervals. Regression analyses revealed that LFL was indirectly associated with higher levels of quiet quitting via increased role stress and exhaustion. However, this indirect positive effect of LFL on employees' quiet quitting behaviours was lower for employees who were able to psychologically detach after work. These findings emphasize the subtle yet harmful effects of leader passivity on employee disengagement and highlight the critical role of recovery experiences in mitigating these effects. Organizations should prioritize leadership development programs to address the negative effects of laissez-faire leadership and foster a work environment that encourages employees to psychologically detach after work, mitigating stress and exhaustion.

Abstract 1767

A SYSTEMIC–CONSTRUCTIVIST VIEW OF LEADERSHIP: FROM DYADIC INTERACTION TO SEMANTIC POSITIONING

Padrone A.*, Ivaldi S.

Università degli Studi di Bergamo ~ Bergamo ~ Italy

In contemporary organizations, transformation is a constant rather than an exception. This raises the question of how leadership can sustain change without reducing conflict and resistance to dysfunctions, but instead considering them as occasions to reveal systemic development potential. Building on transformational leadership theory (Bass & Riggio, 2008) and integrating systemic–constructivist insights (Harré & van Langenhove, 1999; Ugazio, 2013, 2018), the doctoral research project “Leadership and Organizational Change: The Transformational Leadership and Its Semantics” explores leadership as a semantic and dialogical phenomenon.

The guiding research question is: How do semantic polarities in organizational contexts influence transformational leadership, and can we conceptualize a form of “semantic leadership”?

Adopting a critical realist epistemology (Bhaskar, 2008) with systemic–constructivist orientation, the study employs a mixed-methods design. Quantitative measures explore associations between interpersonal functioning styles, leadership perceptions and leader–member exchange, while qualitative methods—such as semi-structured interviews, focus groups, and narrative/projective techniques—allow an in-depth analysis of how meanings and positions are negotiated in organizational contexts. Data collection is ongoing, and first results are expected in spring 2026.

Anticipated findings concern the emergence of semantic leadership as an organizational imagination device. Rather than aiming for static alignment, semantic leadership fosters semantic mutual understanding between leaders and followers, and across the wider organization. This mutual understanding is expected to foster transformational leadership behaviors and enhance the quality of leader–member exchange, psychological safety, and well-being at work, while supporting the reconfiguration of practices and roles in sustainable ways.

In line with the ICAP framework, this work-in-progress contribution highlights how Work and Organizational Psychology can enhance its impact by rethinking epistemological categories and bridging research and practice. Semantic leadership could suggest new ways to mobilize organizations through transformations that are not idealized but “good

enough” (Winnicott, 1965): realistic, responsible, and embedded in the contradictions of organizational life.

Abstract 249

WHEN DARKNESS REIGNS: AN INVESTIGATION INTO DARK PERSONALITY TRAITS AND ABUSIVE SUPERVISION INTENT

Bramley J.E., Göncü--Köse A.*

Çankaya University ~ Ankara ~ Turkey

The present study examined the Dark Triad personality traits—Machiavellianism, psychopathy, and narcissism—as antecedents to abusive supervision intent, incorporating previously unexamined mediating mechanisms within a semi-experimental design. Grounded in the Dark Triad Theory of personality (Paulhus & Williams, 2002) and guided by Morf and Rhodewalt's (2001) Self-Regulatory Model of narcissism, the study employed a bi-factor model to differentiate between grandiose and vulnerable narcissism (Wink, 1991), offering a refined understanding of narcissism's complex role in abusive supervisory behavior.

Achievement threat and self-esteem threat were proposed as mediators, and their influence was examined sequentially: first across all conditions combined, then separately within each level of followers' supervisor-directed deviance (low, medium, and high). Data from 303 participants revealed that all Dark Triad traits were positively associated with abusive supervision intent, though underlying motivations differed across deviance conditions. Across all levels, grandiose narcissism was linked to lower perceptions of both threats, whereas vulnerable narcissism was associated with heightened perceptions of threat. Self-esteem threat was positively associated with abusive supervision intent, as were grandiose narcissism and psychopathy. Machiavellianism did not reliably predict threat perceptions or abusive intent in the overall model.

The role of mediation varied by deviance condition. Under high follower deviance, neither mediator explained the relationship between personality traits and abusive intent; instead, direct effects from grandiose narcissism and psychopathy remained significant. Under moderate deviance, self-esteem threat mediated the link between vulnerable narcissism and abusive intent. In the low deviance condition, although vulnerable narcissism predicted higher threat perceptions, these threats did not explain abusive intent. Psychopathy consistently predicted abusive intent across all conditions.

Viewed collectively, the findings suggest that while certain dark personality traits reliably predict abusive intent across all contexts, others exert their influence more selectively, emerging through heightened threat sensitivity in specific interpersonal conditions.

Abstract 110

FRONT LINE LEADERSHIP IN ORGANIZATIONS FOR PERSONS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES: A SYSTEMATIC REVIEW

Martinez--Tur V.*, Fajardo--Castro L.V., Jalili S.

IDOCAL-University of Valencia ~ Valencia ~ Spain

Introduction: Leadership is crucial for frontline managers who lead direct support staff in organizations serving persons with intellectual and developmental disabilities. Leaders are uniquely positioned to translate organizational missions, values, and policies into practical, day-to-day operations that impact staff and service users. However, reviews that address research on this leadership are still limited.

Purpose: We conducted a systematic review of the leadership research on organizations serving persons with intellectual and developmental disabilities. The specific aims are to: (a) synthesize the theoretical models employed in leadership research within the intellectual disability services sector, (b) identify the essential competencies for frontline managers, (c) examine the types of services most frequently studied in the context, (d) analyze the impact of leadership on variables such as quality of life and performance, and (e) explore the obstacles identified in existing studies within this field.

Method: A systematic review using CADIMA software, guided by the 2020 Prisma statement, analyzed 32 articles from the Scopus, Web of Science, PsycINFO, and EBSCO databases.

Results: The findings revealed that Practice Leadership (PL) emerges as the most commonly applied theoretical model in the field, although other approaches such as transformational leadership are also utilized. PL showed significant associations with positive outcomes for service users (improved quality of life, fewer challenging behaviors, higher active support) and staff (lower stress, higher job satisfaction). The research also identified specific competencies frontline managers need across multiple domains. Despite its demonstrated benefits, numerous barriers impede the implementation of effective leadership, including funding constraints, high staff turnover, and increased administrative demands.

Conclusions: Although PL provides a valuable framework for understanding leadership in intellectual disability services, significant organizational obstacles hinder its implementation. Future research should focus on testing effective leadership interventions and extending studies to different contexts to address these barriers.

Abstract 473

PSYCHOMETRIC ASSESSMENT AND COMPARISON OF LEADER AND EMPLOYEE PERCEPTIONS ON LEADERSHIP PRACTICES IN PORTUGUESE EDUCATIONAL AND NON-EDUCATIONAL WORK SETTINGS

Oliveira S.*[1], Marques--Pinto A.[2]

[1]ISCTE - Instituto Universitário de Lisboa, Business Research Unit (BRU-Iscte) ~ Lisbon ~ Portugal, [2]Universidade de Lisboa, Faculdade de Psicologia, CICPSI ~ Lisbon ~ Portugal

Coaching-based leadership (CBL) is recognized for its positive effects on employee growth, well-being, and performance. Although school leadership is vital for enhancing teachers' well-being and performance, school leadership practices have received less attention. Additionally, no existing scale has been found to assess teacher-oriented CBL. This study evaluates the psychometric properties of the Portuguese adaptation of the Coaching-Based Leadership Scale (CBLS) and compares cross-group perceptions of CBL practices. We adapted two versions of the CBLS (General Survey and Teacher Survey), each containing both leader and employee versions.. Two samples were collected: 501 general workers (323 employees and 178 leaders) and 992 teachers (620 non-leaders and 372 leaders). Data analyses supported the scale's bi-factorial structure and reliability. The 16-item CBLS measures one general factor and four sub-factors: working alliance, open communication, learning and development, and progress and results. Multi-group invariance was attained across gender, work context, and instructional level. Group comparisons showed no significant differences in the perceptions of CBL between educational and non-educational employees. However, teachers reported fewer leadership practices supporting learning and development compared to non-educational workers. Leaders in educational settings also rated their CBL behaviors lower than those in non-educational contexts. Comparing leaders' and employees' perceptions revealed consistent gaps, with employees rating leaders' coaching behaviors lower than leaders' self-assessments across all subscales. Our findings highlight three key ideas. First, non-leader teachers appear to have less access to developmental support and growth opportunities than their counterparts outside the education sector. Second, school leaders face more challenges in providing effective, supportive, and goal-oriented leadership. Third, we found mismatched perceptions of leadership practices between employees and leaders, which may undermine the motivational and developmental impact of CBL. Overall, this study contributes to an evidence-based discussion on the importance of addressing CBL in educational settings and warns of assessment and training needs.

Abstract 1608

FLOURISHING IN TRANSITION: EXPLORING THE WELL-BEING AND CAPABILITIES OF EMERGING ACADEMICS IN HIGHER EDUCATION

Arendse B.J.*[1], Rothmann I.[2]

[1]University of Cape Town ~ Cape Town ~ South Africa, [2]North-West University ~ North-West Province ~ South Africa

Higher Education (HE) has become increasingly complex to navigate for emerging academics, particularly in transforming contexts such as South Africa, where institutions are mandated to increase the representation of historically excluded groups, resulting in additional burdens. Systemic inequalities and identity-based stressors, such as race and gender, heighten well-being risks and mental health challenges, threatening retention and the achievement of transformation goals.
A scoping review conducted by the authors examined the strain experienced by emerging academics. Findings highlighted factors at three levels: individual (e.g., professional identity, race, gender), relational (e.g., friendships, social identity, bullying), and organisational (e.g., culture, work–family impact). Together, these factors influence the mental health of emerging academics, their risk of burnout, and their perceptions of organisational justice. This study builds on these findings of the scoping review by employing the Capability Approach (CA), a social justice framework that emphasises equal opportunities rather than equal resources. Equality of opportunity is seen as more inclusive and enabling, offering a stronger pathway to achieving social justice.

Using a qualitative research design, we conducted interviews and focus groups with emerging academics to explore their work values, and the contextual factors shaping their capabilities and well-being. ATLAS.ti was used to analyse the data.

Given their strategic role as future scientific leaders, supporting the well-being and flourishing of emerging academics is essential. Empirical insights into their experiences inform organisational policies that advance diversity, inclusion, and transformation in South Africa, while also contributing to global efforts to reduce inequality and promote organisational justice, particularly for emerging Black academics.

Abstract 949

EVENT-BASED PSYCHOLOGICAL CONTRACT BREACH AND IT'S SPILLOVER EFFECTS

Abuliezi Z.*

Tongji University ~ Shanghai ~ China

Introduction: Psychological contracts—unwritten expectations between employees and employers—play a critical role in shaping workplace behavior and well-being. Breaches of these contracts (PCB) have been shown to undermine satisfaction, motivation, and interpersonal relations. However, most research has focused on employees' perceptions rather than the discrete workplace events that trigger breaches. Drawing on Event System Theory and Conservation of Resources Theory, this study investigates how event-based PCB emerges, its consequences for employees, and its spillover into personal relationships.

Purpose: We aimed to (a) identify workplace events that trigger PCB, (b) develop and validate the Psychological Contract Breach Triggering Events Questionnaire (PCBTEQ), and (c) examine the consequences of event-based PCB for workplace and interpersonal behaviors.

Method: A mixed-methods design was employed across three studies. Study 1 involved interviews with 24 employees to identify breach-triggering events, leading to the development of the PCBTEQ. Study 2 validated the tool using survey data from 416 employees, testing its psychometric properties. Study 3 examined spillover effects in 164 dual-earner couples, focusing on interpersonal dynamics both at work and at home.

Results: Forty-seven breach-triggering events were identified, clustered into six categories such as unmet promises, leadership changes, and unfair treatment. Validation results confirmed the PCBTEQ's reliability and convergent, discriminant, and criterion validity. Event-based PCB predicted reduced helping behaviors and increased interpersonal deviance at work. Importantly, spillover analyses revealed negative effects on personal relationships, with reduced support and heightened conflict in dual-earner couples. Resource depletion, rather than revenge cognitions, emerged as the primary mechanism.

Conclusions: This research advances PCB literature by shifting attention from perceptions to event-based triggers and by documenting spillover effects into personal life. The PCBTEQ offers organizations a practical tool to identify and manage

psychological contract risks, thereby safeguarding employee well-being and relational dynamics.

Abstract 943

SAFE FIVE: A COMPETENCY MODEL FOR SECURITY-SENSITIVE ENVIRONMENTS

Boss P.*

ZHAW Zurich University of Applied Sciences ~ Zurich ~ Switzerland

In high reliability organizations, a chain of even the smallest errors can have significant implications. For this reason, these organisations consistently design their processes in such ways that errors are identified early and either quickly amended or actually prevented. This places high demands on technology, organisation, and personnel.
Humans still represent one of the most significant risk factors in those organizations. For this reason, we looked for the specific competencies that make people in security-sensitive environments able to act reliably. Extensive research combined with our special expertise led us to five competencies, the 'Safe Five':

- Situation awareness: maintain an overview and be ready to act at all times
- Conformity to rules: act following guidelines/plans
- Critical attitude: high degree of self-reflection in order not to overlook errors
- Readiness to take a stand: be actively involved to point out dangerous system states
- Capability in an emergency: take targeted action in unfamiliar contexts

Safe Five can be used in a variety of organisations with high security requirements, such as security, protection, and rescue organisations, health organisations, transportation services and traffic control systems, nuclear power plants or the chemical industry.
This model has proven highly effective in personnel selection in practice. Besides, we were able to confirm its effectiveness in the development of the qualification criteria for ship captains and nuclear reactor operators.

Abstract 878

HUMOR STYLES AS MODERATORS IN THE RELATIONSHIP BETWEEN PERCEIVED WORK STRESS, JOB SATISFACTION, AND PSYCHOLOGICAL WELL-BEING AMONG TAIWANESE POLICE OFFICERS

Chen C.*[4], Chen H.[4], Wu C.[1], Chang R.[2], Tsai M.[3]

[1]Police Communication Office, National Police Agency ~ Taipei ~ Taiwan, [2]Institute of Ethnology, Academia Sinica ~ Taipei ~ Taiwan, [3]Center for Institutional Research, Chang Gung University ~ Taoyuan ~ Taiwan, [4]Department of Educational Psychology and Counseling, National Taiwan Normal University ~ Taipei ~ Taiwan

Humor styles have been shown to play a stress-moderating role when individuals encounter difficulties and stressful events, and they are also associated with job satisfaction and psychological health. However, little is known about how different humor styles uniquely buffer or exacerbate the impact of work stress on job-related and psychological outcomes in high-stress professions such as policing. This study investigated the moderating effects of humor styles on the relationships between perceived work stress, job satisfaction, and psychological well-being among 438 Taiwanese police officers. Participants completed the Humor Styles Questionnaire, a perceived work stress scale, and measures of life satisfaction, positive and negative affect, and depression. Results indicated significant moderating effects of aggressive and self-defeating humor. The interaction between perceived work stress and aggressive humor significantly predicted job satisfaction and positive affect: officers high in aggressive humor showed no significant associations, whereas those low or moderate in aggressive humor showed negative associations. Furthermore, the interaction with aggressive humor also negatively predicted life satisfaction and positively predicted negative affect and depression across all levels, with the steepest effects among officers low in aggressive humor. Similarly, self-defeating humor moderated the effects of work stress on job satisfaction, positive affect, and depression: officers high in self-defeating humor, perceived work stress did not significantly predict outcomes, while for those low or moderate in self-defeating humor, higher stress was linked to lower job satisfaction and positive affect, as well as greater depression. By contrast, affiliative and self-enhancing humor did not show significant moderating effects. These findings highlight the complex and differential functions of humor styles in occupational stress contexts. While some humor styles appear to buffer against the detrimental effects of stress, others may exacerbate vulnerability.

Abstract 1015

ASSESSING DIGITAL ARREST AND ITS PSYCHOLOGICAL FACTORS: A PERSPECTIVE IN INDIAN POPULATION

Dubey A.*[2], Roy S.[1], Sharma G.[1]

[1]Christ University, Delhi NCR ~ Ghaziabad ~ India, [2]Prestige Institute of Management and Research, PIMR, Bhopal, MP, India

Background: India as a major user of digital space has witnessed a rise in different variety of cybercrimes. One such type of crime is Digital Arrest, in which, an individual with criminal intent impersonates as a law enforcement personnel, and uses the fake authority to steal the victim's sensitive data, like identificaton number, bank details etc. Digital arrest focuses more on fears like getting arrested or getting warrent. Effectiveness of these crimes depends on poor human judegment, and improved understanding of major psychological factors, can help us understand why many individual's fall victims to such crimes.

Methods: The present research aims to understand how different psychological factors can determine our chances of falling victim or in detection of such crimes. The present research uses measures of life-satisfaction, self-efficacy, burnout and well-being to understanding the psychological states. Two types of tasks were given to participants to collect data on fake call detection/ identification. Tasks include 10 stimuli both visual and auditory (N=73). The data was collected in lab to ensure controlled set up and avoid distraction from other stimulus.

Findings: We analysed our data using ordinal logistic regression to determine which psychological factor predicts the identification of potential threat or behaviour to fall victim in such cyber cases. Our findings indicated that all variables showed a significant relationship with each other.

Conclusion: The major implication of our study is to assess and understand the significance of selected constructs in predicting behaviour connected to such crimes. We also explored how this result can play a vital role in further developing applications in form of an awareness programs or measures, which can be utilized in different social contexts. Our research aligns with sustainable development goals (SDG 3, SDG 4, SDG 16) that can be used for social and economic development.

Abstract 1044

RESEARCH ON THE IMPACT OF ATTITUDES ON THE PROMOTION OF AUTONOMOUS WORK IN JAPANESE ORGANIZATIONS

Imashiro S.*

Recruit Management Solutions Co. Ltd., ~ Tokyo ~ Japan

Major Japanese companies have increasingly demanded that employees work autonomously. However, while some individuals desire to do so, others remain skeptical of their organization's expectation for their being autonomous. One reason for this divergence lies in the multifaceted nature of autonomy within organizations. Autonomy in organizations can be broadly categorized into two types: "proactive behavior," where individuals set their own tasks, and "self-directed task performance," where individuals take initiative in executing assigned tasks. This study focused on these two distinct types of autonomy. Based on the Theory of Planned Behavior (Ajzen, 1991), I examined how an individual's attitudes towards a particular behavior, as well as their perception of their colleagues' attitudes towards that behavior, influence their own behavior. Through an online survey, 2,130 office workers in Japan yielded responses. Respondents were asked to report their own attitudes toward setting tasks themselves and toward deferring task setting to the organization, and perception of their colleagues' attitudes toward these two-types of task-setting. I measured self-directed behavior as the outcome variable, which is expected to increase with positive attitudes, regardless of who sets the tasks. Structural Equation Modelling (SEM) was used to analyse the data. The results showed that one's own attitude with self-set tasks strongly related to self-directed behavior, while the influence of corresponding colleague attitudes was significant, but small. Conversely, for organization-set tasks, both one's own attitude and the perceived colleague attitudes promoted self-directed behavior. The study demonstrated that the extent to which perceived norms influence behavior varies depending on the feature of the behavior, either proactive or self-directed. Practical implication is that individual-level approaches are effective for encouraging proactive behavior, while organization-level approaches are more effective for promoting self-directed task performance.

Abstract 1038

LOWER-STATUS MEMBERS UNDERESTIMATE PSYCHOLOGICAL SAFETY: PERCEIVED AND ACTUAL PSYCHOLOGICAL SAFETY IN A SCHOOL ENVIRONMENT

Iwatani S.*[2], Nakamura T.[1], Masaki I.[3], Muramoto Y.[1], Imashiro S.[4]

[1]the University of Tokyo ~ Tokyo ~ Japan, [2]Kwansei Gakuin University ~ Hyogo ~ Japan, [3]Tokyo Woman's Christian University ~ Tokyo ~ Japan, [4]Recruit Management Solutions Co., Ltd. ~ Tokyo ~ Japan

Psychological safety is a group-level concept defined as the shared belief that a team is safe for interpersonal risk-taking; however, contrary to its definition, the belief is not always shared. Previous studies have demonstrated that, even in a same group, low-status members perceive lower levels of psychological safety than high-status members. To understand this gap between theoretical assumption and empirical findings, we distinguished between perceived safety (i.e., how much each member believes other members are tolerant of interpersonal risk-taking) and actual safety (i.e., how much each member is actually tolerant of other members' interpersonal risk-taking) and examined the difference between them. This approach can help us understand whether lower-status members underestimate psychological safety and whether higher-status members overestimate it. We surveyed 739 students in a school to measure each student's perceived level of psychological safety (e.g., "My classmates would not blame me, even when I point out an issue in the class") and their status (e.g., "My friendship group has a central position in my class"). We also calculated each class's actual level of psychological safety by averaging students' actual attitudes (e.g., "I would not blame my classmates, even when they point out an issue in class"). The results demonstrated that perceived psychological safety was lower than actual safety, and this gap was greater among lower-status students. Perceived psychological safety among lower-status students was lower than actual safety, while no difference was found among higher-status students. The results imply that lower-status members underestimate psychological safety, while higher-status members accurately estimate it. Since psychological safety can increase a member's performance, job satisfaction, and work-engagement, informing lower-status members of their actual psychological safety and modifying their underestimated psychological safety can increase their performance.

Abstract 959

REMOTE WORK AND MENTAL HEALTH: A TWO-FOLD MULTI-LEVEL META-ANALYSIS

Lupu V.*, Podina I.

University of Bucharest ~ Bucharest ~ Romania

Objective. We synthesized evidence on how remote work relates to mental health, distinguishing between Remote Work Use (RWU) and Remote Work Intensity (RWI). We also examined whether contextual and individual factors moderate these links across stress, anxiety, depression, and burnout.

Methods. Following PRISMA standards, we conducted a systematic review and two multilevel meta-analyses of studies available through 2024, drawing from Web of Science, Scopus, PubMed, ProQuest, PsycINFO, and MEDLINE. The dataset comprised 69 effect sizes (32 for RWI; 37 for RWU) from 50 studies totaling 54,311 participants. We applied random-effects models and robust variance estimation (RVE).

Results. Pooled associations between remote work and mental health were small and not statistically significant (RWI: r = 0.0018; RWU: r = 0.104). Moderator analyses indicated that the direction of association, educational level, and assessment period significantly shaped effect magnitudes—most notably in the RWU model. Additional moderators appeared significant under conventional random-effects estimation but did not remain significant with RVE.

Conclusions. Remote work does not emerge as a reliable predictor of mental health outcomes. Its psychological consequences seem to hinge on contextual conditions and person-level differences. Future work should prioritize moderator testing, strengthen control for confounding, and employ longitudinal or experimental designs to clarify causal mechanisms.

Abstract 1008

WORK VALUES IN CONTEMPORARY ITALY: A QUALITATIVE EXPLORATION

Sacchi A., Sanseverino D., Castellano A., Ghislieri C.*, Molino M.

University of Turin, Department of Psychology ~ Turin ~ Italy

Introduction. In recent times, profound socio-economic changes have altered the role of work in people's lives and raised the need to rethink the values guiding professional choices. While several theoretical models of work values exist, this study adopts a contemporary and situated perspective by collecting data to capture how people in Italy currently define and prioritize work values.

Purpose. The study qualitatively explores the values that individuals seek to realize through work in contemporary society, and compares the emerging categories with those identified in existing literature.

Method. A convenience sample of 589 participants completed an anonymous online questionnaire via social media and direct invitations. The survey included an open-ended question ("What purposes do you want to achieve through work?") and demographic information. The sample comprised 359 women (61.8%) and 222 men (38.2%), with a mean age of 38.7 years (SD = 13.81; range: 18–80). Most participants (75.9%) were employed, and nearly half (47.39%) held a permanent contract. Valid responses (N = 579) were analyzed using template analysis, adopting a subtle realist stance consistent with the study's exploratory aims.

Results. Six main categories of work values emerged: personal and professional fulfillment (n = 258), economic goals (n = 191), interpersonal goals (n = 124), identity building (n = 98), well-being (n = 89), and no goals (n = 7). These categories reflect both continuity with previous research and new emphases related to Italy's current socio-economic context.

Conclusions. The study shows that the categories of work values emerging from the data align with dimensions described in existing models, while their distribution provides a situated view of how people in Italy relate to work today. The results capture both continuity and change in the current socio-economic context and offer insights for practices and policies addressing workers' evolving priorities.

Abstract 1036

MANAGING EMOTIONS, MASTERING DIVERSITY: EMOTION MANAGEMENT AS A KEY ELEMENT OF INTERCULTURAL EFFECTIVENESS IN THE WORKPLACE

Timmerman F.*, Mathijs M., Fontaine J., Schelfhout S., Derous E.

Ghent University ~ Ghent ~ Belgium

Emotional Intelligence (EI) plays a crucial role in social interactions. Research shows that the ability to manage emotions predicts the success of interactions with friends and colleagues. This suggests that emotion management may also be important in intercultural workplace interactions, which are inherently complex and emotionally charged. However, empirical evidence on the role of EI in intercultural effectiveness is limited. According to Mayer and Salovey's (1997) model, emotion management may be particularly relevant in these contexts.

This study investigated whether emotion management is associated with intercultural effectiveness in workplace interactions, and whether this relation holds beyond cognitive ability. Data were collected from 515 participants (50% men, 50% women; M age = 43, SD = 11.68, 88% employed). Participants completed the Situational Test of Emotional Management – Brief (Allen et al., 2015) to assess EI, the International Cognitive Ability Resource (Condon & Revelle 2014) to assess cognitive ability, and the Direct Intercultural Effectiveness Simulation (Schelfhout & Derous, 2023) to assess intercultural effectiveness.

A linear regression revealed that EI was significantly associated with intercultural effectiveness, $F(1, 512) = 81.50$, $p < .001$, $R2 = 13.7\%$. A subsequent multiple regression tested whether this association held when cognitive ability was included. The model remained significant, $F(2, 511) = 41.42$, $p < .001$, $R2 = 13.9\%$. EI continued to show a significant association with intercultural effectiveness, $\beta = 0.87$, $t = 8.90$, $p < .001$, whereas intelligence did not, $\beta = 0.00$, $t = 1.14$, $p = .255$.

These Findings suggest that emotion regulation in intercultural interactions is more relevant for intercultural effectiveness than the general problem-solving ability. A possible explanation is that intercultural interactions are inherently emotionally charged and require adaptive emotion regulation rather than abstract reasoning. This finding highlights the importance of integrating emotion management in organizational training to foster intercultural competence.

Abstract 876

CAREER SELF-DETERMINATION IN PRACTICE: INSIGHTS FROM AUTISTIC ADULTS' WORK EXPERIENCES

Vacca T.*, Chen C.

University of Toronto ~ Toronto ~ Canada

Introduction: Employment plays a key role in adulthood, providing opportunities for financial independence, social connection, and a sense of competence (Chen et al., 2015). For autistic adults, employment has been linked to a reduction in anxiety and depression, and improvements in social engagement and self-esteem (Raymaker et al., 2022). Despite these benefits, autistic adults face persistent employment challenges, including lower hiring rates, higher unemployment, and poor working conditions (Hedley et al., 2017). Understanding the psychological factors that support workplace success is therefore essential. Career Self-Determination Theory (CSDT) offers a promising framework, emphasizing three components of career well-being: career autonomy, career competence, and career relatedness (Chen, 2017).

Purpose: This study investigated how elements of CSDT shape the workplace experiences of autistic adults.

Method: Eight autistic adults aged 18 to 25 (Mage = 21.88) with successful employment participated in one-hour semi-structured interviews. Interviews were auto-transcribed and analyzed using NVivo 14. An interpretative phenomenological analysis (IPA) approach was employed to understand participants' lived experiences.

Results: Analysis revealed three main themes and six subthemes aligned with CSDT. Participants viewed employment as a pathway to financial independence and self-regulation. Decision-making, especially in consultation with family, guided job exploration and career transitions. Environmental factors, such as noise and lighting, impacted comfort and job performance. Despite barriers, participants demonstrated resilience and high self-efficacy, with 87.5% reporting confidence in their workplace abilities.

Conclusions: This study demonstrates how basic psychological needs manifest in real-world workplace settings among autistic adults. Findings contribute to a growing understanding of the lived experiences of this underserved population and highlight potential targets for supports and interventions.

Abstract 1035

THE RELATIONSHIP BETWEEN TEAM CREATIVE TIME PRESSURE AND INNOVATIVE PERFORMANCE UNDER THE PERSPECTIVE OF SOCIAL NETWORK

Yuan Y.[2], Wu Z.*[1]

[1]School of Economics and Management, Tsinghua University ~ Beijing ~ China, [2]Faculty of Business and Economics, The University of Hong Kong ~ Hong Kong ~ China

Although scholars have studied the relationship between creative time pressure and innovative performance from different perspectives, few studies have focused on the potential impact of team time cognition and social network. Base on the attentional focus model and social network perspective, this study examined the relationship between team creative time pressure and team innovative performance, as well as the moderating role of team network density and the mediating role of team time detachment. Data were collected from 446 team members in 108 R&D teams in China. The results showed that team time detachment mediated the relationship between team creative time pressure and team innovative performance, while team network density played a negative moderating role. That is, team creative time pressure had a positive impact on team innovative performance through team time detachment. In addition, the positive indirect effect of team creative time pressure on team innovative performance (via team time detachment) would be stronger when team network density was low than when it was high. The findings contribute to the literature by revealing team time detachment as a mediator and team network density as a negative moderator in the relationship between creative time pressure and team innovation performance.

Abstract 906

UNSTRUCTURED INTERNET BROWSING DURING BREAKS MAY SUSTAIN MALICIOUS ENVY AFTER SOCIAL COMPARISON

Yamaura K.*[1], Nishihara Y.[2], Yasuo M.[2], Shan J.[2]

[1]Ritsumeikan University ~ Shiga ~ Japan, [2]Ritsumeikan University ~ Osaka ~ Japan

INTRODUCTION Malicious envy is an inevitable negative emotion, as long as people engage in social comparison. Envy hinders individual health and negatively impacting interpersonal relationships and performance in organizations. Therefore, understanding the management of envy and its mechanism is important. This study examines how they spend their time after experiencing envy (interpersonal dialogue, AI dialogue, net-surfing, or control group) can either mitigate or intensify envy. Additionally, focusing on the etymology of envy (invidia), which means “to stare intently,” we predict that selective attention bias underlies the amplification of envy.

METHOD The participants were 25 adults. First, they responded to the scales for emotions, including envy (Pre-Time-1). They then participated in a competitive “Splatoon” game with an opponent. This match was designed to result in defeat and trigger envy toward the opponent. After the match, responses to the dot-probe task and envy were measured (Pre-Time-2). They were instructed to take a 10-minute break in an individual booth. They were randomly assigned to one of four conditions, and a final measurement was conducted (Time-3).

RESULTS Malicious envy score at Pre-Time-2 was significantly higher than at Pre-Time-1, with no significant differences between the four conditions. Analysis of co-variance was conducted: experimental condition as the independent variable, malicious envy score or bias-score of dot-probe task (Time-3) as the dependent variable, and using Pre-Time-2 each score, gender, and engagement with the experiment as covariates. The results showed that both the malicious envy score and the bias-score were significantly higher in the net-surfing condition than in the control group. However, no differences between conditions were observed for general negative emotions.

CONCLUSION Malicious envy, arising from losing the game, was intensified during the 10-minute break spent net-surfing, with selective attention toward opponents. The selective attention bias was suggested to be characteristic of malicious envy.

Abstract 866

YOU ARE NEEDED AGAIN, MY FELLOW: INTERGROUP ALLOCATION OF ILLEGITIMATE TASKS TO NATIVE AND MIGRANT PROFESSIONALS

Yeerzhati T.*[1], Söhngen C.[2], Kleszewski E.[1], Otto K.[1]

[1]Philipps-Universität Marburg ~ Marburg ~ Germany, [2]HHL Leipzig Graduate School of Management ~ Leipzig ~ Germany

Introduction

While extensive research demonstrates that individuals prefer their own groups when distributing positive stimuli such as resources or rewards, a pattern consistent with Social Identity Theory, far less is known about behaviors related to allocating negative stimuli.

Purpose

This research examined the intergroup allocation of illegitimate tasks (i.e., tasks that are either unreasonable or unnecessary and which can cause psychological or physiological harm to those carrying them out) to German and Turkish doctors, as well as the individual differences that influence these decisions.

Method and Results

Across two experimental studies using the vignette approach under free-choice (Study 1; N = 98) and forced-choice (Study 2; N = 239) conditions, results indicated that native professionals were more frequently allocated illegitimate tasks, with conscientiousness and prejudice identified as key personal factors associated with allocation preference under forced conditions.

Conclusions

The results highlight the asymmetric effects of stimulus valence on intergroup allocation, and further shed light on the complexity of ingroup favoritism, which, under conditions of negative valence, may reflect considerations about competence and reputation.

VIRTUAL REALITY MINDFULNESS INTERVENTIONS FOR EMPLOYEE WELL-BEING IN THE WORKPLACE: A SCOPING REVIEW

Sganzerla Changuini F.*[1], Santos De Carvalho C.[1], Pinto A.[1], Santos Mendes Mónico L.[1], Martínez-Córcoles M.[2]

[1]University of Coimbra ~ Coimbra ~ Portugal, [2]University of Valencia ~ Valencia ~ Spain

Mindfulness-based interventions (MBIs) promote employee well-being by reducing stress and improving emotional regulation. Virtual reality (VR) has been proven to enhance workforce wellness interventions through immersive, controlled environments. Yet, the combined use of VR and MBIs in organizational settings remains underexplored, and further research is needed to understand its full potential. Consequently, this scoping review aimed to identify evidence of how virtual reality applied to MBIs could improve employees' well-being within organizational contexts. Given this goal, this research also intended to map key concepts, research procedures, outcomes, gaps in this topic thus far, and the effectiveness of those interventions on promoting employees' well-being. Following the Joanna Briggs Institute (JBI) framework, relevant studies were identified through structured searches in four databases, PubMed (1), EBSCO (6), Web of Science (10), and Scopus (78), also through published gray literature (2), author contact (1), and independent search (4), resulting in 86 records (without duplicates). Upon full reading, 14 studies remained. Backward and forward citation tracking were also performed, albeit no further documents were selected. Tools such as Mendeley Reference Manager, Rayyan, and AI-assisted searches supported the review process. The final sample, published between 2017 and 2024, covered seven countries. All included studies used head-mounted displays as the VR intervention device, with the majority being experimental research in the healthcare sector of multimodal interventions, hence combining mindfulness components with other well-being related techniques. However, most studies lacked clear theoretical frameworks, standard outcome measures, and provided general outputs. This limited the identification of the specific effects of VR-based MBIs on employee well-being, resulting in heterogeneous findings regarding their effectiveness. Overall, this review consolidated key operational data that contributes to advancing future research.

Abstract 2514

WORK OVERLOAD AND THE PROFESSIONAL COMMITMENT OF PUBLIC SECTOR NURSES DURING THE COVID-19 PANDEMIC IN THE KINGDOM OF ESWATINI

Bagraim J.*, Nkambule N.

University of Cape Town ~ Cape Town ~ South Africa

This study investigated the effect of work overload on the professional commitment of public sector nurses during the COVID-19 pandemic in the Kingdom of Eswatini (formerly Swaziland). Professional commitment is the degree to which an individual's psychological connection to their professional identity is strong. It predicts their motivation to remain in a professional role, to demonstrate professional dedication, and to champion the profession's values. Professional commitment is often sorely tested among public sector nurses, whose work is generally characterised by poor pay, intense, variable time pressure, work overload, and emotional stress. In Africa's public health systems, these challenges are exacerbated by poor working conditions, inadequate supplies, and critical staff shortages. During the COVID-19 pandemic, which further intensified these challenges, we collected data from a random sample of professional nurses (N = 417, 81% response rate). The initial analysis of the survey data showed high levels of professional commitment, and that work overload does not predict professional commitment directly. Additional analysis indicated that perceived work-family conflict mediated the relationship between work overload and professional commitment and that the effect of work overload on professional commitment, through work-family conflict, is moderated by supervisor support. The moderating effects of demographic variables such as age, marital status, and gender are also presented. Overall, the study's findings show a nuanced understanding of the effects of work overload on nurses' professional commitment, with attendant implications for management and staff training.

Abstract 2523

BUILDING CAPACITY FOR SUSTAINABLE PROJECT MANAGEMENT: EVIDENCE FROM A TRAINING INTERVENTION IN HIGHER EDUCATION INSTITUTIONS

Bonfanti R.C.*, Cappello G.M., Ruggieri S.

University of Palermo ~ Palermo ~ Italy

As part of the SuProm Project — Sustainable PRoject Management in Balkan Higher Education Institutions (Programme: EACEA – Erasmus+, KA2 – Capacity Building in the Field of Higher Education) — a study was conducted to evaluate the effectiveness of a two-day intensive training programme for university staff, researchers, and students. The intervention aimed to promote sustainability-oriented attitudes, self-efficacy, and behaviors in the field of project management. Thirty participants (N = 30) completed questionnaires administered at four time points: pre-intervention, during the intervention, post-intervention, and at a four-week follow-up. The measures included self-report scales assessing attitudes toward sustainability, perceived organizational support, environmental self-efficacy, social norm perceptions, and behavioral intentions. Qualitative data were also collected through open-ended questions. Quantitative analyses were conducted using repeated-measures and longitudinal mixed models, and the mediation hypothesis was tested via bootstrap procedures. The results revealed significant increases in self-efficacy for sustainable design and pro-sustainability intentions from pre- to post-intervention, with partial maintenance at follow-up. Mediation analysis indicated that increases in self-efficacy mediated the relationship between the intervention and reported behaviors. Thematic analysis of open-ended responses identified recurrent organizational barriers (e.g., resource constraints and time pressures) and produced operational recommendations for improving training programme implementation. Theoretical and practical implications for occupational and sustainability psychology, study limitations (e.g., sample size and reliance on self-report measures), and directions for future research are discussed.

Abstract 2473

DECENT OR INDECENT WORK? THE CASE OF DOMESTIC WORKERS IN CHILE

Diaz Alegria C.*, Mcwha--Herman I., Calvard T.

University of Edinburgh ~ Edinburgh ~ United Kingdom

An estimated one in ten women in Chile are employed as domestic workers. By delegating the responsibilities of housekeeping and caregiving, this occupation has contributed significantly to the integration of women to the workforce. However, despite being rooted in colonial history and its importance for Chilean society, domestic workers were only granted equal labor rights in 2014 (e.g. being able to work less than 12 hours per day). These rights have been a reality for the rest of the Chilean workforce since 1924.

The integration of domestic workers into Chilean regulatory laws could be considered their first connection with Decent Work, a concept that specifies the role of decent employment and job characteristics in the satisfaction and well-being of workers. However, domestic workers remain marginalized and invisible, affecting their mental health and possibilities for social mobility. Through this study, our research aims to understand how stigmatization derived from one's job can influence the ability of a domestic worker to look for better opportunities and demand fair rights. By considering work volition, defined as the perceived freedom to make career choices despite external constraints, we examine how psychological barriers derived from social prejudice can perpetuate dynamics of invisibility and marginalization in the workplace.

This presentation will introduce initial findings of semi-structured interviews and focus groups undertaken with domestic workers in Chile, who will be contacted through their union representatives. Using a Grounded Theory approach, we develop a conceptual framework that will advance the comprehension of this phenomenon, support the construction of more comprehensive regulations that promote decent work, and encourage the development of systems that offer opportunities for the individual development and empowerment of these workers.

Abstract 2578

GENDER EQUALITY, TEAM AND LEADERSHIP EMERGENT STATES: A MULTILEVEL NOMOLOGICAL FRAMEWORK FOR COMPUTATIONAL SOCIAL MODELING

León O.*

Universidad Alberto Hurtado ~ Santiago ~ Chile

Empirical research supports that teams with better gender balance tend to exhibit higher collective intelligence, stronger team processes (e.g., cohesion, egalitarian communication), and greater innovative capacity, particularly when inclusion and interaction quality are present. Building on this core evidence, the present research develops the multilevel nomological network (MNN) that underpins a social-computational strategy for modeling how gender-equality policies and bottom-up organizational interventions shape emergent team states (e.g., affect, collective intelligence) and the dynamic emergence of positive leadership forms and blends (ecological, transformational, authentic).

The MNN integrates micro-, meso-, and macro level mechanisms of organizational emergence, whose analysis require intensive data production (e.g., through agent-based models, ABM) to be studied effectively. At the micro-level, it conceptualizes agents as socially sensitive actors whose emotional intelligence, conversational equality, and interaction frequency co-determine the emergence of trust and cohesion. At the meso-level, the framework models team processes (e.g., affect, cohesion) as nonlinear amplifiers translating inclusion and diversity into collective intelligence. At the macro-level, gender-equality interventions (e.g., stakeholder engagement, phased training, and gender-champion programs) are theorized as systemic levers that reinforce sustainable leadership emergence and organizational adaptability.

The MNN accounts for feedback dynamics in which emergent team states influence leadership configurations, which in turn reshape inclusion climates and policy effectiveness. These recursive mechanisms generate tipping points and self-organizing equilibria, explaining why moderate gains in representation can yield large effects once inclusion thresholds are reached, whereas tokenistic diversity fails to sustain long-term benefits.

By formalizing these cross-level causal pathways, the MNN is currently being used to design and implement an ABM designed to simulate the long-range impacts of gender equality on team and leadership emergence. This theory-driven, policy-relevant framework should help organizations and policymakers design scalable gender-equality strategies that foster smarter teams and sustainable leadership development,

contributing to long-term societal challenges through improved collective problem-solving and team performance.

Abstract 2574

THE WORKPLACE SPIRITUALITY MEASURE: EXTENDING THEORY WITH COMPASSIONATE LEADERSHIP

Newhouse B.*[2], O"Neill P.[1]

[1]Royal Roads University ~ Victoria, BC ~ Canada, [2]BC Public Service ~ Nelson ~ Canada

Workplace spirituality—encompassing experiences of meaning, interconnectedness, and transcendence at work—significantly contributes to employee well-being, engagement, and organizational commitment. Despite its relevance to decent work (SDG 8) and mental health (SDG 3), most existing measures originate from Asian contexts and overlook relational and leadership dimensions of spirituality at work. This gap limits understanding of how organizations can systematically cultivate spiritually enriching environments in diverse cultural settings.

This study developed and validated the Workplace Spirituality Measure (WSM), extending Petchsawang and Duchon's (2009) four-dimensional framework to better reflect North American contexts. The goal was to establish a psychometrically robust instrument addressing prior measurement limitations while exploring dimensions of workplace spirituality relevant to contemporary organizations.

A two-phase methodology was employed. Phase 1 used an inductive approach to generate and refine items grounded in workplace spirituality literature. Phase 2 incorporated qualitative peer review for content validity and validation with 218 North American participants across varied industries. Exploratory and confirmatory factor analyses, with measurement invariance testing, examined structural validity, while convergent, discriminant, and criterion-related validity were assessed via associations with job-related affective well-being, organizational commitment, and turnover intentions.

Analyses supported a 17-item, five-factor model: Meaningful Work, Mindfulness, Compassionate Leadership, Collective Compassion, and Transcendence. The WSM demonstrated strong internal consistency and criterion validity, outperforming prior measures. Two novel dimensions—Compassionate Leadership and Collective Compassion—captured relational and social aspects of workplace spirituality previously unmeasured. All subscales were significantly associated with well-being outcomes.
The WSM provides a validated tool for assessing and cultivating workplace spirituality across individual, interpersonal, and leadership dimensions. By identifying compassionate leadership as a distinct spiritual factor, this research advances SDGs 3, 8, and 16, offering practical guidance for evidence-based interventions that promote

dignity, connection, and purpose—supporting psychologically healthy, meaningful, and sustainable work environments.

Abstract 2580

RISK PERCEPTION AND PREVENTING ACCIDENTS DURING DISASTER-VOLUNTEER ACTIVITIES

Tachikake T.*[1], Ueda M.[2]

[1]The University of Osaka ~ Osaka ~ Japan, [2]Otemon Gakuin University ~ Osaka ~ Japan

Introduction: Disaster volunteer activities are crucial for recovery after large-scale disasters. However, safety measures are often insufficient compared to industrial settings, and accidents occur repeatedly. This vulnerability is attributed to constantly changing situations, fragile prevention systems, and heavy reliance on volunteers' self-responsibility.

Purpose: This study aimed to (1) investigate background factors (including human factors like excessive motivation) related to accidents and near-misses during disaster volunteer activities, and (2) clarify risk perception, attitudes, and behavioral intentions of experienced volunteers and inexperienced citizens (potential future volunteers) based on these factors. We also examined general tendencies regarding responsibility attribution for accidents.

Method: We used a two-phase approach. First, semi-structured interviews with 10 stakeholders (NPOs, social welfare councils, government, etc.) involved in disaster volunteer activities, focusing on the Great East Japan Earthquake, explored background factors. Second, based on interview factors, a large-scale internet questionnaire survey was administered to 4,000 individuals in Japan (aged 16 and over, quota sampling by generation). The survey assessed volunteer experience, willingness, attitudes toward safety measures, and attribution of responsibility.

Results: Interviews identified several factors contributing to risks, including lack of knowledge, rushing, fatigue, habituation, notably, excessive motivation, and consideration. The survey (N=4,000) revealed experienced volunteers and those willing to participate showed a significantly higher tendency to accept extending working hours to complete tasks ($p<.01$). Regarding responsibility for injury, 40.4% of all respondents attributed it to "self-responsibility," while 59.6% attributed it to the "coordinating organization."

Conclusions: Although experienced volunteers demonstrate positive safety attitudes (e.g., preparing their own equipment, $p<.01$), their willingness to extend work hours suggests potential risks associated with fatigue and excessive motivation. The finding that 59.6% hold coordinating organizations responsible, despite the autonomous nature of volunteering, indicates a clear need for organizations to consider participants' risk perceptions and attitudes to ensure safety effectively.

Abstract 2635

WORK STRESS AND JOB SATISFACTION AMONG COMPANION-ANIMAL VETERINARIANS: THE MEDIATING ROLE OF WORK VALUES AND THE MODERATING ROLE OF SELF-COMPASSION

Tsai M.*, Kuo F.N., Chen H.C.

Menghua Tsai ~ Taipei ~ Taiwan

Introduction: Companion-animal veterinarians are exposed to high job demands, which may reduce job satisfaction and increase occupational strain. Understanding how personal work values and psychological resources buffer these effects is critical for promoting practitioner well-being. Purpose: This study investigated (1) the relationship between work stress and job satisfaction, (2) the mediating role of work values, and (3) the moderating role of self-compassion in the stress–satisfaction relationship among companion-animal veterinarians. Method: A total of 300 veterinarians participated via online and paper questionnaires. Measures included work stress, work values, self-compassion, and job satisfaction. Statistical analyses involved descriptive statistics, t-tests, ANOVA, correlations, hierarchical regression, and moderated mediation tests. Results: Work stress and job satisfaction varied significantly by demographic and job characteristics, with older, experienced, and higher-income veterinarians showing lower stress and higher satisfaction. Work values also differed across age, tenure, and job roles. Mediation analyses revealed that “ability utilization” and “interpersonal satisfaction” partially mediated the effect of work stress on job satisfaction, whereas material rewards did not. Moderation analyses indicated that self-kindness, mindfulness, and common humanity buffered the negative impact of work stress on job satisfaction, particularly under lower stress levels. Other components of self-compassion did not show significant moderating effects. Conclusions: The findings highlight the importance of work values and self-compassion as mechanisms linking stress and job satisfaction among veterinarians. Enhancing personal psychological resources and aligning job roles with meaningful work values may strengthen occupational well-being. Implications for organizational support, counseling interventions, and future research on veterinary work settings are discussed.

Abstract 2622

EMPOWERING LEADERSHIP AND SUBJECTIVE CAREER SUCCESS: THE ROLES OF CAREER ADAPTABILITY AND PSYCHOLOGICAL ENTITLEMENT

Wang Z.*, Qin Z., Li Y.

Renmin University of China ~ Beijing ~ China

Introduction:
In contemporary society, where boundaryless careers have become a prevailing phenomenon, subjective career success has gained increasing importance. However, previous research on the antecedents of subjective career success has predominantly focused on individual difference variables, paying less attention to contextual factors. This gap limits a comprehensive understanding of the formation mechanism of subjective career success. As leadership represents a significant situational factor within organizations, it may substantially influence employees' subjective career success. Therefore, this study examines the impact of empowering leadership on subjective career success.

Purpose:
Drawing on conservation of resources theory, this study investigates the effect of empowering leadership on subjective career success, the mediating role of career adaptability, and the moderating role of psychological entitlement.

Method and Results:
Data were collected from 271 employees across three time points over a 12-week period, with samples drawn from various industries. SPSS and M-plus were employed for data analysis and hypothesis testing. The results indicate that empowering leadership positively influences subjective career success. Furthermore, career adaptability mediates the relationship between empowering leadership and subjective career success. Additionally, psychological entitlement negatively moderates both the relationship between empowering leadership and career adaptability and the indirect effect of empowering leadership on subjective career success through career adaptability.

Conclusions:
Theoretically, this study contributes to the subjective career success literature by delineating the mediating role of career adaptability in the relationship between empowering leadership and subjective career success, and by identifying psychological entitlement as a key boundary condition. Practically, the findings suggest that organizations should develop empowering leadership behaviors and enhance

employees' career adaptability to foster subjective career success.

Abstract 574

WHITHER JOB INSECURITY? EXPLORING THE IMPACT OF ORGANIZATIONAL COMMUNICATION AND THE MEDIATING ROLE OF ORGANIZATIONALLY PRESCRIBED PERFECTIONISM

Dhiman S.*, Naim M.F., Choubisa R.

Birla Institute of Technology and Science, Pilani Campus ~ Pilani ~ India

Job insecurity has increasingly drawn the attention of both researchers and practitioners because its negative effects extend well beyond individual stress. Managing job insecurity is an important organizational task. With many detrimental organizational outcomes such as decline in productivity, motivation, organizational commitment, job insecurity emerges as a costly variable for private sector organizations. Guided by Conservation of Resource Theory, we used a mediation framework to test how organizational communication influences perception of employees' job insecurity via organizationally prescribed perfectionism. We used Organization Communication Scale (Postmes et al., 2001), Organizationally Prescribed Perfectionism Scale (Kim et al., 2024), and Job Insecurity Index (Pienaar et al., 2014) for exploring the proposed relationship. A total of N=189 Indian private sector employees filled out the online questionnaire circulated to them via Google forms. We analyzed the collected data by validating models through Structural Equation Modeling. The findings highlight the importance of organizational communication in reducing perception of employees' job insecurity wherein organizationally prescribed perfectionism acted as a mediator. By integrating communication, perfectionism and job insecurity within the COR framework, this study contributes both to theory and managerial implications related to insecurity perception. We further discuss the importance of communication, which should be open, timely and promotes realistic performance standards that can potentially prevent insecurity among employees. We recommend that future studies should explore the interaction of individual traits such as grit and examine the cultural differences as well.

Abstract 808

EXAMINING THE INFLUENCE OF SUBORDINATE COMPETENCE, LOYALTY, AND APPRECIATION ON SUPERVISORY TRUST AND DISTRUST IN THE U.S. WORKPLACE CONTEXT

Jiang D.*[1], Fu A.W.[1], Hsiao S.[1], Hsu C.[1], Lin C.[1], Chen T.[2]

[1]Department of Psychology, National Chung-Cheng University ~ Chia-Yi ~ Taiwan, [2]Department of Criminology, National Chung-Cheng University ~ Chia-Yi ~ Taiwan

In the workplace, the close relationship between subordinates and supervisors is a critical factor in enhancing individual, team, and leadership effectiveness. A subordinate's open support for their direct supervisor (loyalty to the supervisor), affirmation of the supervisor's actions and values (appreciation of the supervisor), and the subordinate's own competencies might significantly influence whether the supervisor perceives the subordinate as trustworthy or someone to be cautiously guarded against, and which might influence the supervisor's forgiveness or social undermining behavior. This study employs a scenario method to design eight scenarios featuring vignettes with varying levels of competence, loyalty, and appreciation. Data was collected from 241 American workers through the PROLIFIC online survey platform. Analysis results indicate that the competence and loyalty of subordinates have significant effects on the level of trust the supervisor places in them ($F1, 233 = 196.57$ & 47.82, $p < .001$), showing that subordinates with high competence and high loyalty receive greater trust from supervisors. The competence, loyalty, and appreciation of subordinates all have significant effects on the supervisor's distrust and supervisor forgiveness ($F1, 233 = 3.96$ - 193.49, $p < .05$ - $.001$), indicating that subordinates with high ability, high loyalty, or high appreciation incur less distrust and are more likely to be forgiven. Meanwhile, only subordinate loyalty has a significant effect on the supervisor's social undermining behavior ($F1, 233 = 21.69$, $p < .001$), with higher loyalty correlating with reduced likelihood of such behavior by the supervisor. The results suggest that even in countries where face culture is less emphasized, subordinate loyalty and appreciation remain crucial for gaining supervisor trust and reducing distrust. These results contribute to a deeper understanding of cultural influences in management, fostering the development of innovative cross-cultural knowledge rooted in culturally meaningful concepts. Limitations and future directions are discussed.

Abstract 792

THE RELATIONSHIP AMONG ABUSIVE SUPERVISION, POSITIVE WORKPLACE GOSSIP, ONLINE WORK COMPLAINT, AND ORGANISATIONAL ATTRACTIVENESS: THE MODERATING ROLE OF OPINION-ORIENTED ANONYMOUS COMMENT

Lee L.Y.A.*[1], Ng C.T.S.[1], Chen I.[2], Lin C.H.[2]

[1]Hong Kong Metropolitan University ~ Hong Kong ~ Hong Kong, [2]National Sun Yat-sen University ~ Kaohsiung ~ Taiwan

Integrating Affective Events Theory, we examined (a) the mediating effect of online work complaint on the relationship between abusive supervision and organisational attractiveness, (b) the mediating effect of online work complaint on the relationship between positive workplace gossip and organisational attractiveness and (c) the moderating effects of opinion-oriented anonymous comments on the relationship between online work complaint and organisational attractiveness. We conducted a pre-test with 105 employees to validate all our survey items and check the consistency of the back-translation items. We then conducted a three-wave study with a two-week gap. In our three-wave study, we collected data from 401 employees across various industries in Taiwan. Our results revealed that (a) online work complaint mediates significantly the relationship between abusive supervision and organisational attractiveness, but (b) online work complaint did not mediate significantly the relationship between positive workplace gossip and organisational attractiveness. In addition, our results revealed that opinion-oriented anonymous comments did not show any significant moderating effect on the relationship between online work complaint and organisational attractiveness. Importantly, our results drew several important theoretical and managerial implications on online work complaints between (a) abusive supervision and organisational attractiveness, and (b) positive workplace gossip and organisational attractiveness. In the workplace context, online work complaints can help mitigate the worsening effect of abusive supervision on organisational effectiveness, but not positive workplace gossip. Surprisingly, there is no moderating effect, which implies that opinion-oriented anonymous comments would not mitigate the adverse effect between online work complaints and organisational attractiveness. Our study suggested that organisations or managers should pay attention to online work complaints in the workplace, as specific online work complaints can be a catalyst for employees to express relief regarding specific work behaviours.

Abstract 74

THE RELATIONSHIP AMONG PSYCHOLOGICAL CONTRACT VIOLATION, KNOWLEDGE HIDING, AND PROACTIVE BEHAVIOUR: MODERATING ROLES OF LEADER-MEMBER EXCHANGE AND PERCEIVED OVERQUALIFICATION

Ng C.T.S.*[1], Chen H.[2], Lin S.[3], Lin Y.[4], Chen I.[5], Lee Y.[5]

[1]Hong Kong Metropolitan University ~ Hong Kong ~ Hong Kong, [2]National Pingtung University of Science and Technology ~ Pingtung ~ Taiwan, [3]National Kaohsiung University of Science and Technology ~ Kaohsiung ~ Taiwan, [4]Fu Jen Catholic University ~ New Taipei City ~ Taiwan, [5]National Sun Yat-sen University ~ Kaohsiung ~ Taiwan

Integrating with Social Exchange Theory, we examined (a) the mediating effect of knowledge hiding on the relationship between psychological contract violation and proactive behaviour and (b) the moderating effects of leader-member exchange and perceived overqualification on the relationship between psychological contract violation and knowledge hiding. We conducted a pre-test with 241 employees to validate all our survey items and check the consistency of the back-translation items. We then conducted a three-wave study with a two-week gap. In our three-wave study, we collected 621 employees across different industries in Taiwan. Our results revealed that knowledge hiding mediates significantly the relationship between psychological contract violation and proactive behaviour. Our results also identified a positive relationship between psychological contract violation and knowledge hiding, and there is a negative relationship between knowledge hiding and proactive behaviour. In addition, our results revealed that a high level of leader-member exchange can strengthen the positive relationship between psychological contract violation and knowledge hiding, and a low level of perceived overqualification can also strengthen the positive relationship between psychological contract violation and knowledge hiding. Importantly, our results drew several important theoretical and managerial implications on the knowledge hiding between the relationship of psychological contract violation and proactive behaviour. In the workplace context, the interaction of psychological contract violation and high levels of leader-member exchange and low levels of perceived overqualification of employees can increase the likelihood of employees hiding their knowledge. Our study suggested that organisations or managerial practitioners should pay attention to the consistency of the psychological contract violation in the recruitment process as an essential organisational practice to prevent employees from hiding their knowledge and lowering their proactive behaviour at work.

Abstract 831

INNOVATION THROUGH TEAM MINDFULNESS: EXPLORING THE CRUCIAL ROLE OF TRUST IN A MULTILEVEL AND MULTISOURCE STUDY

Raynes N.*[1], Ramos J.[1], Pietrantoni L.[2]

[1]Universitat de Valencia ~ Valencia ~ Spain, [2]Università di Bologna ~ Bologna ~ Italy

While innovation is a key driver of organizational success, it is often contingent upon psychological and social factors that either hinder or promote innovative work behavior (IWB). This study explores the impact of team mindfulness on innovation. Drawing from prior research, it is proposed that team mindfulness fosters innovation by amplifying cognitive flexibility and problem-solving capacity. Moreover, it is hypothesized that team trustworthiness can boost this positive relationship. This study employs a two-wave design, gathering employee-reported and supervisor-reported data from 91 employees across 20 teams in 11 organizations from Spain, spanning a range of industries. A multisource and multilevel modelling approach was employed to analyze both team-level and individual-level IWB from the perspectives of employees and their managers, enabling cross-source and cross-level comparisons. Therefore, two separate analyses were conducted: one at the individual level (N = 91) and one at the team level (n = 20). The results revealed that team mindfulness positively predicted individual IWB, but only from the employee perspective. No direct effect of team mindfulness on team-level IWB was found. Additionally, team trustworthiness did not moderate but rather mediated the relationship between team mindfulness and IWB, suggesting that trust functions as a key mechanism through which mindfulness promotes innovation. These findings highlight the importance of cultivating a mindful and trustworthy team climate to foster innovative behavior. The study contributes to growing research on team-level mindfulness and offers practical insights for organizations seeking to enhance innovation performance.

Division 1: Work and Organizational Psychology Division 17: Professional Psychology Division 14: Applied Cognitive Psychology SDG 9: Industry, innovation and infrastructure

Abstract 152

TRUST OR DISTRUST? HOW SUPERVISOR TRUST INFLUENCES INFORMATION DISTORTION—THE MODERATING EFFECTS OF ALTRUISM AND NEGATIVE THINKING

Tse Y.F.*[1], Wu C.W.[2], Ng C.T.S.[1], Chen I.[3], Kao Y.[3]

[1]Hong Kong Metropolitan University ~ Hong Kong ~ Hong Kong, [2]Macao University of Tourism ~ Macao ~ Macao, [3]National Sun Yat-sen University ~ Kaohsiung ~ Taiwan

This study investigates how employees' trust in their supervisors influences information distortion in the workplace, with a focus on the moderating effects of altruism and negative thinking. While transparent communication is crucial for effective policy implementation, employees' varying levels of trust in their supervisors may hinder information accuracy, leading to operational inefficiencies. Prior research has lacked empirical evidence on how employees' psychological perceptions shape supervisor trust and subsequent information distortion. To address this gap, this study adopts an employee cognition perspective to analyze (1) the relationship between supervisor trust and information distortion, and (2) the moderating roles of altruistic tendencies and negative thinking in this dynamic.

For the research design, data was collected via a survey of 336 full-time employees. Hierarchical regression analysis was employed to test the hypotheses. The findings reveal that employees' trust in supervisors has a negative relationship with information distortion behavior. While altruism does not significantly moderate this relationship, negative thinking partially moderates the effect of supervisor trust on information distortion.

The results provide valuable insights into how cognitive and psychological factors influence information transmission in organizations. Practical implications are discussed, including strategies to enhance supervisor-employee trust and mitigate negative cognitive biases. Additionally, this study contributes to the literature by empirically examining the mechanisms of information distortion and offers directions for future research in organizational communication and trust dynamics.

01 - Division 1: Work and Organizational Psychology

BETWEEN STABILITY AND CHANGE: PSYCHOSOCIAL DYNAMICS AND THEIR INFLUENCE ON HEALTH

Wednesday 22 July 2026 from 15:30 to 17:00

(R-Arsenale)

Dina Guglielmi, Chair
Beatrice IJM Van der Heijden, Discussant

This symposium addresses how recent social, organizational, and health-related transformations are reshaping the interplay between individuals, work, and well-being across the life course. In contexts characterized by increasing uncertainty, evolving career patterns, and changing care systems, individuals are required to continuously adapt to new roles, expectations, and environments. Within this scenario, psychosocial dynamics play a crucial role in determining how people experience and manage these transitions, influencing both vulnerability and resilience.

This symposium brings together diverse perspectives, spanning both personal and professional domains, and focuses on how individual resources (such as motivation and self-efficacy), relational factors (e.g., social support), and organizational practices (e.g., Green HRM strategies) jointly shape health-related outcomes. By integrating perspectives from health and work psychology, the symposium provides a comprehensive view of how different forms of participation in work and care systems can either promote or hinder well-being.

These studies collectively explore how psychosocial resources can support adaptation in moments of change, while also highlighting how their absence may lead to disengagement, exhaustion, or unequal opportunities.

The first contribution examines the transition from pediatric to adult healthcare among emerging adults with chronic illness, focusing on psychosocial determinants of adaptation. Findings show that health-related quality of life, introjected motivation, social support, and emotional regulation self-efficacy are significantly associated with transition experiences, underscoring the importance of strengthening psychosocial resources to support continuity of care.

The second study investigates quiet quitting and its association with need for recovery and exhaustion across career stages. Results reveal distinct patterns: behavioral disengagement is more strongly linked to exhaustion in early-career workers, while emotional disengagement becomes more salient in later stages. Indirect effects through recovery needs are consistent across groups, highlighting the central role of recovery processes.

The third contribution presents longitudinal evidence on the Individual Placement and Support (IPS) model for individuals with severe mental illness. While confirming its effectiveness in promoting employment, the study identifies disparities related to diagnosis and nativity, pointing to the need for tailored, context-sensitive interventions to foster sustainable inclusion.

Finally, the fourth study explores the relationship between Green HRM practices and employee well-being. Findings indicate that sustainability-oriented HR practices reduce emotional exhaustion through increased work engagement, with stronger effects in medium and large organizations, emphasizing the role of organizational context in shaping well-being outcomes.

Abstract 4796

Transition from pediatric to adult care in chronic illness: Psychosocial determinants of adaptation in emerging adults

Farhane Medina N.Z.*, Marqués--Tejada S.[1], Espinosa De Los Monteros N.[2], Montserrat A.[2], Luque B.[1], Tabernero C.[1]

[1]Maimonides Biomedical Research Institute of Cordoba (IMIBIC) ~ Cordoba ~ Spain, [2]Reina Sofia University Hospital ~ Cordoba ~ Spain

The transition from pediatric to adult healthcare represents a critical developmental milestone for young people with chronic conditions, involving not only a transfer of medical responsibility but also significant psychological and behavioral adaptation. Despite its importance, this process is often insufficiently structured, underscoring the need to better understand the psychosocial factors that shape transition experiences.

This study aimed to examine the subjective experience of transition to adult care and its association with key psychosocial variables from an applied health psychology perspective. A quantitative, cross-sectional design was employed with a sample of 74 participants (M = 18.16 years; balanced by sex). Measures included transition experience, health-related quality of life (HRQoL), motivation for a healthy lifestyle (including introjected regulation), perceived social support, and self-efficacy for emotional regulation. Descriptive, correlational, and multiple regression analyses were conducted.

Results indicated a moderately positive overall transition experience. Transition experience was significantly associated with HRQoL, motivation for a healthy lifestyle, perceived social support, and emotional regulation self-efficacy. In the regression model, HRQoL, introjected motivation, and emotional regulation self-efficacy emerged as significant predictors of transition experience.

These findings highlight the central role of psychosocial resources in shaping how young people navigate the transition to adult care. From an applied psychology perspective, the results underscore the importance of developing structured, developmentally informed transition interventions that strengthen emotional regulation skills, support adaptive motivational processes, and enhance perceived quality of life. Integrating these components into clinical practice may improve adjustment and continuity of care during this vulnerable period.

Division 1: Work and Organizational Psychology Division 17: Professional Psychology Division 16: Counseling Psychology SDG 8: Decent work and economic Growth SDG 3: Good Health and Well-being

Abstract 2420

EXPLORING QUIET QUITTING AND RECOVERY NEEDS ACROSS CAREER STAGES: A CROSS-SECTIONAL MULTIGROUP PERSPECTIVE

Paganin G.*[1], Sciotto G.[2], Pace F.[2], Guglielmi D.[1]

[1]Department of Educational Studies- Alma Mater Studiorum, University of Bologna ~ Bologna ~ Italy, [2]Department of Economics, Business and Statistics - University of Palermo ~ Palermo ~ Italy

Quiet Quitting (QQ) has recently attracted growing research attention, aiming to clarify its definition and dimensions. Building on Social Exchange Theory and psychological contract literature, QQ has been conceptualised as a multidimensional construct encompassing behavioural and emotional components. While behavioural QQ (QQBE) reflects a strategic reduction of work effort, emotional QQ (QQEM) captures negative affective reactions when perceived effort exceeds received benefits. Despite increasing interest, evidence on QQ's consequences remains limited.

This explorative cross-sectional and multi-group study aimed to examine the relationships between QQ, Need for Recovery (N4R), and Exhaustion (EXA), and to test potential differences across career stages (≤10 vs. >10 years).

Data were collected from 4,218 employees (60.4% male; 34.9% aged ≤40; 21.4% with ≤10 years of job tenure). The anonymous Qualtrics questionnaire, distributed by HR managers, included validated international scales. Multigroup SEM analyses were conducted using Mplus.

Among the main results, differences emerged between the two career-stage groups regarding the direct effects of the two QQ dimensions on EXA. Specifically, in the group with tenure ≤10 years, QQBE showed a significant positive effect on exhaustion, while QQEM showed a negative but non-significant effect. In the group tenure >10 years, the QQBE dimension was not significant, whereas the QQEM dimension showed a significant positive association with EXA. However, the indirect effects of both QQBE and QQEM on EXA through N4R were similar and significant across groups.

Findings highlight different patterns of associations between QQBE and QQEM and EXA across career stages. These results may suggest the need for targeted interventions promoting recovery resources. However, the cross-sectional design limits causal inference, and future longitudinal studies are required to confirm these associations.

Abstract 4798

Individual Placement and Support for patients with severe mental illness in Italy: Evidence from a longitudinal cohort

Mazzetti G.*[1], Paganin G.[1], Guglielmi D.[2], Fioritti A.[2]

[1]Department of Educational Science, University of Bologna ~ Bologna ~ Italy, [2]Department of Mental Health and Substance Abuse, AUSL Romagna ~ Ravenna ~ taly

The Individual Placement and Support (IPS) model is an evidence-based intervention designed to promote competitive employment among individuals with severe mental illnesses (SMIs) and complex mental health conditions. By integrating vocational support with mental health services, IPS represents a key approach to fostering social inclusion and functional recovery. However, less is known about long-term employment trajectories and the role of individual and contextual factors in shaping outcomes.

This longitudinal study aimed to assess employment outcomes among IPS participants in Italy over a 42-month period and to examine the influence of sociodemographic and clinical characteristics. Data were drawn from a regional cohort of 1,408 individuals enrolled in IPS programs across seven Community Mental Health Centers. Information on diagnoses, work history, and employment outcomes was analyzed using descriptive and non-parametric statistical methods.

Results showed that employment outcomes varied significantly across diagnostic groups. Individuals with schizophrenia, personality disorders, and depression achieved higher job acquisition rates, whereas those with addiction disorders and milder psychiatric conditions faced greater barriers. Native participants were more likely to obtain employment compared to non-native participants, although no differences emerged in job retention once employment was secured. Additionally, job duration differed across diagnoses, with shorter employment periods observed among individuals with addiction disorders.

Findings confirm the effectiveness of IPS in supporting employment among individuals with severe mental health conditions, while highlighting persistent disparities linked to diagnosis and nativity. From a psychosocial perspective, the results underscore the importance of tailoring vocational interventions to individual needs and addressing contextual barriers to promote more equitable and sustainable employment pathways.

Abstract 4799

Green HRM and Well-being: the moderating role of organizational size

Mariani M.G.*, Lo Piccolo E., Petruzziello G.

Department of Psychology, University of Bologna ~ Bologna ~ Italy

Background. As organizations increasingly incorporate sustainability into their strategies, human resource management (HRM) practices are expected to align with these goals and foster a pro-environmental workforce. By embedding "green" approaches in recruitment, training, and performance management, HRM can influence employees' motivation and attitudes towards environmental responsibility (Cherian & Jacob, 2012; Del Brio et al., 2008). Beyond organizational performance, such practices may also affect employee well-being, potentially reducing the risk of burnout.

Aims. This study explores whether Green HRM practices impact employees' levels of emotional exhaustion. Specifically, we examine the mediating role of work engagement in the relationship between Green HRM and burnout, and test whether organizational size moderates these associations.

Methods. Data were collected through a survey of 409 Italian employees. Respondents completed scales assessing Green HRM (Dumont et al., 2017), work engagement (Schaufeli et al., 2019), and emotional exhaustion as a core dimension of burnout (Maslach et al., 1986). Hypotheses were tested using the PROCESS macro for SPSS.

Results. Findings indicate that Green HRM is negatively associated with emotional exhaustion, and this relationship is partially mediated by work engagement. In other words, sustainability-oriented HR practices appear to enhance engagement, which in turn reduces burnout. The moderating effect of organizational size further reveals that the beneficial impact of Green HRM on burnout is stronger in medium and large organizations compared to small firms.

Limits. The study's cross-sectional design prevents causal conclusions, and additional psychological mediators (e.g., green climate, environmental commitment) were not considered. Longitudinal designs are needed to clarify the directionality of effects.

Innovative aspects. To our knowledge, this is the first study to investigate how Green HRM practices may protect against burnout through work engagement, also highlighting the moderating role of organizational size.

01 - Division 1: Work and Organizational Psychology

BEYOND GENERATIONS: HOW AGE-DIVERSE FRIENDSHIPS SHAPE ORGANIZATIONS AND SOCIETY

Wednesday 22 July 2026 from 15:30 to 17:00

(O-Arsenale)

Michela Vignoli (University of Trento ~ Rovereto ~ Italy), Chair

Considering the tensions between different age groups, which entail substantial costs both for organizations and society, this symposium seeks to advance a more optimistic vision by highlighting age-diverse friendships as a promising solution able to contribute to mitigating societal tensions and fostering broader social cohesion. Age-diverse friendships, also referred to as intergenerational friendships, are defined as socioemotional-meaningful relationships between people of different ages, typically with an age difference of 10 to 15 years. Aiming to provide a comprehensive overview of how age-diverse friendships in the workplace can generate positive outcomes both for organizations and society, this symposium will present the promising preliminary findings from the Volkswagen-funded research project “Overcoming Societal Tensions in Europe: Can Age-Diverse Friendships be the Solution?”. The first presentation will be a conceptual paper that introduces a new taxonomy describing how age-diverse friendship at work can affect not only the dyad but also different-aged outgroup members, other non-involved groups, and all humanity at large. The second presentation, employing AI and topic modeling, will demonstrate how workers define their experiences of age-diverse and non-age-diverse friendships. The third presentation will focus on dyads of age-diverse workers and will demonstrate that age-diverse workplace friendships are associated with trust and bystanding not only toward the age-diverse friend but also toward the friend’s entire age group. The fourth presentation will show how high-quality contact between age-diverse friends is related to greater support for outgroups not involved in the friendship and factors that moderate this effect. Using a diary methodology, the fifth study will provide evidence for how age-diverse workplace friendship is positively associated with cognitive liberalization, which describes the process by which individuals “stop thinking in boxes” and instead engage in active, complex, and inclusive thinking. Finally, the sixth presentation will provide new insights into interventions to promote age-diverse workplace friendships.

Abstract 3123

AGE-DIVERSE FRIENDSHIPS AS SOCIAL GLUE AT WORK AND IN SOCIETY: TOWARDS A NEW TAXONOMY AND RESEARCH AGENDA

Fasbender U.*[1], Lisbeth D.[2], Gostautaite B.[3], Keller A.[4], Vignoli M.[5], Wolf T.[1]

[1]University of Hohenheim ~ Stuttgart ~ Germany, [2]Birkbeck, University of London ~ London ~ United Kingdom, [3]ISM University of Management and Economics ~ Vilnius ~ Lithuania, [4]University of Groningen ~ Groningen ~ Netherlands, [5]University of Trento ~ Rovereto ~ Italy

Introduction

Societal challenges often arise from tensions between different social groups, including age groups. With the global population and workforce aging, it is crucial to identify ways of fostering more positive intergroup relations. Friendships across age groups—defined as socioemotionally meaningful relationships between individuals with at least a 10- to 15-year age difference—offer a promising pathway. Such friendships foster learning about the other group through empathic concern and perspective-taking, leading to prosocial behaviors and innovative problem-solving across group membership and beyond.

Purpose

This presentation aims to introduce a new taxonomy of the psychological and behavioral effects of age-diverse friendships. We focus on the workplace as a central context where people of different ages regularly interact, while recognizing the broader relevance of our model for educational, community, and family contexts.

Method

Building on established theories of social categorization and identity, intergroup contact, and transfer effects, we developed a conceptual taxonomy to describe how the influence of age-diverse friendships extends beyond the dyad to different-aged outgroup members, other non-involved groups, and all humans. We also derive critical boundary conditions and outline a future research agenda, pointing to initial empirical insights.

Results

The taxonomy outlines three levels of influence: (1) member-to-group (primary transfer), (2) group-to-group (secondary transfer), and (3) liberalization (tertiary transfer). Each level reflects distinct affective and cognitive mechanisms by which a single age-diverse friendship can generate broader behavioral effects. Age distance and semantic distance are described to shape these effects.

Conclusions

Age-diverse friendships represent a powerful form of intergroup contact with the potential to reduce group-based divides and foster mutual understanding. Our taxonomy and research agenda offer a framework for advancing theory and guiding future empirical work. Practical implications highlight how organizations and communities can

support high-quality interactions that may grow into age-diverse friendships, ultimately benefiting individuals, workplaces, and society.

Abstract 3173

HOW EMPLOYEES SPEAK ABOUT AGE-DIVERSE FRIENDSHIP AT WORK

Liuberte I.*, Gouri S., Gostautaite B.

ISM University of Management and Economics ~ Vilnius ~ Lithuania

Europe has witnessed transformative social challenges including increasing lifespan, which exposes age divides and resulting tensions. Age-diverse friendships, defined as friendships between people with a ≥15-year age gap, have been identified as a bridging factor between age groups, improving outcomes for both groups in various contexts. Yet, we have limited knowledge about age-diverse friendships, particularly in the workplace, where individuals spend a significant amount of their time. What are the antecedents, mechanisms, and individual outcomes of such friendships, and what role do they play in improving the workplace environment? Current research largely assumes that friendship holds a similar meaning across all types of relationships, including age-diverse friendships. However, we propose that age-diverse friendships may possess unique qualities.

Therefore, in our research, we investigate age-diverse friendships in the workplace, the meanings that employees associate with such a friendship, and associated factors that may distinguish age-diverse friendships from more homogenous ones. We conducted an online survey that asked employees from different organizations in European countries to voice-record stories of their workplace friendships. We then use AI and topic modelling to analyze how employees construct their experiences of age-diverse and non-age-diverse friendships, and how these constructed experiences correlate with the socio-demographic characteristics of friendship and organizational environment.

At the time of the conference, we will present preliminary language analysis (Whissel affect dictionary, LIWC-22): affective, social, cognitive, and perceptual dimensions of research participant language. We will also explore the clusters and differences in the meaning that research participants attribute to age-diverse and other friendships. The findings will enable us to create a dictionary of the unique characteristics of age-diverse friendships and highlight the differences in friendships between employees of similar ages.

Abstract 3174

FROM FRIENDSHIP TO ACTION: AGE-RELATED TRUST MECHANISMS AND BYSTANDING

Grad J.*[1], Wolf T.[1], Keller A.[2], Fasbender U.[1]

[1]University of Hohenheim ~ Stuttgart ~ Germany, [2]University of Groningen ~ Groningen ~ Netherlands

Introduction

The global workforce is aging, leading to greater age-heterogeneity in organizations and higher risks of age-based discrimination. High-quality contact among age-diverse coworkers has emerged as a promising solution to reduce age-related prejudice. When employees engage in meaningful relationships with age-diverse coworkers, they learn about their colleagues' age groups, which can change how they think and behave toward members of this group (i.e., primary transfer effect).

Purpose

High-quality contact among age-diverse coworkers may encourage employees to intervene when they observe age discrimination at work (i.e., direct bystanding), making such contact an asset in age-diverse workforces. Grounded in social exchange theory, we propose that trust serves as the mechanism through which high-quality contact promotes direct bystanding. Befriended individuals do not follow norms of reciprocity but trust that the other person will step in when needed.

Methods

To test our conceptual model, we collected data from 294 age-diverse coworker dyads at two timepoints and used Actor-Partner Interdependence Modeling (APIM).

Results

We found positive associations between age-diverse workplace friendship, trust, and direct bystanding. Trust fully mediated the positive association between friendship and bystanding for older individuals, and partially for younger individuals. These findings suggest that for younger employees, forming friendships with older coworkers is sufficient to motivate them to act as direct bystanders for other older coworkers, whereas trust is a central mechanism for older employees to intervene in age-discriminatory behavior against their younger coworkers.

Conclusions

Our findings show that having an age-diverse friend results in increased levels of trust toward the befriended coworkers' entire age group rather than just the individual friend.

In ongoing data analyses, we investigate the boundary conditions of these primary transfer effects and potential age differences therein (e.g., typicality). The findings underscore the potential of age-diverse workplace friendships to act as social glue at work and potentially beyond.

Abstract 3175

CAN AGE-DIVERSE FRIENDSHIPS AT WORK ENCOURAGE SUPPORT FOR OTHER OUT-GROUPS?

Payne B.*, Lisbeth D.

Birkbeck College ~ London ~ United Kingdom

Intergroup contact can foster more positive attitudes not only toward the immediate outgroup but also toward other, unrelated outgroups—a phenomenon known as the secondary transfer effect (Pettigrew, 1998; Meleady et al., 2019). Thus, contact between age-diverse friends at work may foster greater support for the rights of other outgroups not involved in the contact, such as immigrants or people with disabilities. However, the secondary transfer effect may not occur consistently across all intergroup contact scenarios, underscoring the importance of identifying the factors that moderate its strength.

Data collection from ~250 younger–older co-worker dyads (with an age gap of ≥15 years) is on-going, with participants tested at two time points, one month apart. In this talk, we present preliminary findings from dyadic structural equation models examining key moderators of the secondary transfer effect. Specifically, we investigate whether transfer strength is moderated by: a) the perceived age difference between dyad members, where greater perceived difference — reflecting stronger outgroup salience — should enhance transfer to uninvolved outgroups; and b) perceived similarity between the co-worker's age group and target outgroups, with greater similarity facilitating stronger transfer effects.

Together, we hope to provide a better understanding of how contact in workplace contexts may offer a unique opportunity for bridging not only age divides but also wider intergroup boundaries.

Abstract 3176

TOGETHER, NOT APART: ENHANCING COGNITIVE LIBERALIZATION THROUGH AGE-DIVERSE WORKPLACE FRIENDSHIPS

Chenevert M.*[1], Lisbeth D.[2], Vignoli M.[1], Fasbender U.[3]

[1]University of Trento ~ Rovereto ~ Italy, [2]Birkbeck College ~ London ~ United Kingdom, [3]University of Hohenheim ~ Stuttgart ~ Germany

Introduction

Amidst war, economic crisis, and political unrest, social tensions fueled by oppositional identities are evident. Intergroup Contact Theory proposes that high-quality interactions with outgroup members can weaken such oppositional identities. Friendships are the strongest form of high-quality contact, with age-diverse friendships in the workplace emerging as an increasingly relevant form of intergroup contact given the significant time spent at work and the progressively aging workforce.

Purpose

We test our conceptual model, the Taxonomy of Age-Diverse Friendship Effects, which posits that high-quality intergroup contact can foster tertiary transfer known as cognitive liberalization, ultimately breaking down oppositional identities. This effect is proposed to be especially strong when the outgroup member is atypical, as greater semantic distance can challenge assumptions and promote mental expansion. Thus, this study examines whether age-diverse workplace friendships, as a form of high-quality intergroup contact, can foster cognitive liberalization, additionally investigating the role of semantic distance.

Method

A 10-week longitudinal study with data collected at 21 time points was conducted, resulting in a final sample of 171 German workers (56.2% men, 43.8% women) with an average of 4.16 (SD = 1.07) age-diverse workplace friends. Multilevel modeling was used to analyze within- and between-person effects.

Results

Age-diverse workplace friendships were positively associated with higher levels of cognitive liberalization both within and between participants. Contrary to expectations, friendships with more typical outgroup members strengthened these effects.

Conclusions

Findings provide empirical support for the role of age-diverse workplace friendships in promoting cognitive liberalization and reducing oppositional identities. However, results challenge our conceptual model's assumption that atypical outgroup members most strongly foster tertiary transfer, highlighting the need to reconsider how typicality influences intergroup contact processes and transfer effects.

Abstract 3177

UNCOVERING THE 'BLACK BOX' OF INTERVENTIONS TO FOSTER AGE-DIVERSE WORKPLACE FRIENDSHIPS: A REALIST SCOPING REVIEW

Setiono A.*[1], Keller A.[1], Gouri S.[2], Gostautaite B.[2]

[1]University of Groningen ~ Groningen ~ Netherlands, [2]ISM University of Management and Economics ~ Vilnius ~ Lithuania

Introduction

As workplaces become increasingly age-diverse, organizations face the challenge of fostering meaningful interpersonal connections across generations. Age-diverse workplace friendship, which is a form of voluntary relationships between coworkers of different age groups, can reduce age-related tensions, foster inclusion, and enhance collaboration. Yet, practical guidance on how to build and sustain such friendships remains scarce, as existing interventions are fragmented, with some targeting age-diverse interactions and others focusing more broadly on workplace relationships without addressing age dynamics.

Purpose

Using realist approach, this scoping review aims to map the existing interventions aimed at fostering age-diverse workplace friendships. Specifically, we examine the context-mechanism-outcome configurations of interventions to uncover how, why, and under what circumstances interventions succeed in supporting friendship formation and maintenance across age groups.

Method

Eligible studies include quantitative and mixed-methods interventions conducted in workplace, community, or institutional contexts, with participants aged 16 and above. Purely clinical and educational interventions are excluded unless transferable to occupational settings. The review follows RAMESES standards for realist syntheses, the Joanna Briggs Institute (JBI) guidelines, and PRISMA-ScR reporting principles. Data extraction will map intervention designs, mechanisms, and outcomes to identify recurrent CMO configurations. By collating interventions ranging from relational job crafting initiatives to cross-group friendship programs, this review shifts focus from preventing negative workplace dynamics (e.g., conflict, exclusion) to cultivating positive relational resources that benefit both employees and organizations.

Conclusion

The findings of this scoping review will advance theoretical understanding of workplace friendships, respond to calls for more intervention-based research in organizational psychology, and provide practitioners with evidence-based strategies to foster inclusion and collaboration across generations. Ultimately, this review seeks to uncover the "black

box” of how interventions can build and sustain age-diverse workplace friendships as a key organizational resource.

01 - Division 1: Work and Organizational Psychology

PROFESSIONAL DEVELOPMENT OF EARLY CAREER PSYCHOLOGISTS. AN INTERNATIONAL PERSPECTIVE

Wednesday 22 July 2026 from 15:30 to 17:00

(T-Monumentale)

Marija Davcheva (International Association of Applied Psy), Chair
Ana Kraljevic, Co-Chair

The professional development of early career psychologists is pivotal for the advancement of our science psychology and its application worldwide. Thus, understanding the factors that foster professional development and the ones that pose challenges for early career psychologists is crucial to create specific career development strategies and professional development opportunities. In fact, these factors may differ in different countries and cultures as well as at different career stages. Hence, from work and organizational psychology as well as educational psychology lens this symposium aims to explore key aspects of professional development from an international perspective, focusing on how young professionals can recognize their competencies, navigate career uncertainties, and leverage existing structures for growth. The first presentation will discuss the transition from student to professional in the African region emphasizing some practical strategies such as virtual mentorship programs and use of technology that can promote professional development. The second presentation will explore the student professional transition in Canada offering unique views of the challenges and career opportunities in this region especially involvement in international association and networking as crucial tools for professional competencies development. The third presentation will describe the transition of students to professionals and the different educational pathways in Panama, Latin America. It will provide light on some of the current challenges early career professionals face in this area and recommendations for policy and practice. The fourth presentation provides a European perspective of the topic focusing on work and organizational psychology. It will also explore the competencies that are essential for psychologists aiming to build international careers, such as adaptability, cross-cultural communication, and resilience. Additionally, it will provide a comparison on the professional development needs in the past, in the present and in the future taking into consideration emerging career paths and providing specific examples in the field of work and organizational psychology. The fifth presentation will explore the challenges and opportunities faced by postdoctorates in psychology in Spain. It reflects on the career identity of this group of early career psychologists, the specific career paths they may develop and highlights the need for personal resources that optimize their mental health.

Abstract 4017

PROFESSIONAL DEVELOPMENT FOR EMERGING PSYCHOLOGISTS IN AFRICA AND BEYOND

Namutebi J.*

Nkumba University ~ Nkumba ~ Uganda

The transition from student to professional is often a pivotal yet challenging phase for any psychologist, particularly in underrepresented regions like Africa. This presentation delves into the unique opportunities and barriers faced by early career psychologists (ECPs) from different cultures and regions on the African continent. Drawing on personal experiences and insights from various collaborations, the session highlights the importance of mentorship, advocacy, and professional training in shaping the careers of emerging psychologists. Emerging psychologists in Africa usually grapple with resource scarcity, low profession visibility, , insufficient mentorship among many other concerns. Practical strategies such as virtual mentorship programs and use of technology for building leadership skills, accessing supervision, and promoting mental health and well being are discussed. In this context, the significance of IAAP as a tool for knowledge, skill, and cross-cultural learning is examined, as well as the benefits of collaborating with non-African countries. This presentation also examines the impact of diversity and inclusivity concerning professional development by arguing that systems which appreciate specific cultural and professional realities of psychologists from every part of the world are needed. By sharing success stories, lessons learned, and advocacy strategies, the aim is to inspire action toward building a supportive global network for ECPs. Ultimately, this is a call to inspire stronger international collaboration, celebrate diversity and to prepare the next generation of psychologists in a way that makes them feel that their voices and contributions matter throughout the world.

Abstract 4018

NAVIGATING EARLY CAREER TRANSITIONS IN PSYCHOLOGY – A CANADIAN PERSPECTIVE

Kleiner T.*

York University ~ Toronto ~ United States of America

The transition from undergraduate to graduate studies in psychology presents unique challenges and opportunities for early career psychologists. In Canada, competitive admissions, financial constraints, and insufficient mentorship collectively create barriers for many students. This presentation will examine the realities of moving from an undergraduate degree to graduate-level psychology and will explore whether pursuing graduate studies is always the best option. It will also highlight pathways for professional development, emphasize the importance of mentorship, and discuss strategies for career advancement. Additionally, I will illustrate how my involvement in professional organizations, such as the IAAP, has helped me cultivate leadership skills and build global connections that foster early career growth.

Abstract 4019

FROM STUDENTS TO PROFESSIONALS: THE CARRIER EVOLUTION OF PSYCHOLOGIST IN PANAMÁ

Medianero Araúz G.*

Universidad de Panamá ~ Panama ~ Panama

Panamanian regulations state that the Licentiate Degree in Psychology is the academic degree needed to be recognized and work as a psychologist in the country. With this degree, professionals become General Psychologists and subject of responsibilities and rights (salary scale, labor protections, etc). This makes the transition from students to professionals short and abrupt and has caused the increased need to raise the hours of supervised practices during the programs and the emergence of “supervision groups” even after graduation. Although there is an increase in the enrollment to master's programs, largely driven by the industry's and labor sector's need for specialized professionals, there is still a significant group of professionals who are General Psychologists. Furthermore, Doctoral Degrees in the country are still very limited and primarily pursued by those interested in an academic career, although they are not mandatory. Currently, there is only one open Doctoral Program in the country, in Clinical Psychology, which narrows the opportunities for those seeking this postgraduate degree.

Although there are academic challenges that need to be addressed, professionals in the country are recognized for their grounded perspective and ability to understand the realities of their communities and the nation, adapting their work and interventions accordingly. Since practical hours are required to obtain the Licentiate Degree, an applied approach to various topics and challenges is incorporated from the beginning of psychological education. Furthermore, as many professors actively work in the industry (clinics, hospitals, businesses, diplomatic and national leadership roles, etc.) while teaching, they help bridge the theoretical-practical gap by integrating real-world perspectives into their classes.

Abstract 4020

PROFESSIONAL DEVELOPMENT OF EARLY CAREER PSYCHOLOGISTS: A EUROPEAN EXPERIENCE

Zangerl L.*

University of Barcelona ~ Barcelona ~ Spain

The transition from university to professional practice offers a range of opportunities for early-career psychologists, particularly those with international experience. This presentation reflects on my path through the Erasmus Mundus Joint Master's program in
Work, Organizational and Personnel Psychology (WOP-P), an international program with academic stays in cities like Barcelona and Bologna. The program's diversity provided not only a strong academic foundation but also exposure to different professional perspectives and opportunities, as well as the challenges of adapting to new
academic and cultural environments. Building on this experience, the presentation explores the professional development options available to young psychologists, focusing on my experiences in the field of Learning and Development (L&D) within international organizations. Drawing from my upcoming internship at the United Nations Office in Vienna, it will highlight how psychological principles are applied in L&D. Additionally, it will reflect on the skills that are essential for psychologists aiming to build international careers, such as adaptability, cross-cultural communication, and resilience. Finally, this presentation explores the broader opportunities and challenges that today's graduates face compared to prior generations. While emerging career paths in fields like data science, employee well-being, and digital transformation offer new possibilities, these rapid changes also demand constant professional development and flexibility. Furthermore, the frequent relocation and need to build new professional networks can pose additional stress. Consequently, mental health challenges, such as burnout and uncertainty during the early career phase, are not
uncommon. Therefore, the presentation will conclude discussing resources that can help
early-career psychologists, including the role of professional networks, training opportunities, and support provided by universities and professional associations

Abstract 4021

POST-DOCTORAL PATHWAYS IN PSYCHOLOGY IN SPAIN: CHALLENGES, NEXT STEPS, AND MENTAL HEALTH CONSIDERATIONS AFTER COMPLETING A PHD

Martín Fernández J.*

Universitat Jaime I ~ Valencia ~ Spain

Completing a PhD in Psychology in Spain is a significant academic achievement, but it marks only the beginning of a new professional journey. After finishing their doctoral studies, psychologists often face a range of challenges when transitioning from academia to the workforce. One of the primary difficulties is securing permanent, stable employment, as many doctoral candidates initially work in temporary research positions or as postdoctoral researchers. Additionally, they must navigate the competitive landscape of psychology, where opportunities in academia, clinical settings, private practice, or industry may not always align with personal aspirations or the skills developed during the doctoral program. The transition also involves redefining one's professional identity and career goals. For many, this includes deciding whether to pursue further specialization, enter into clinical practice, or take on teaching roles at universities. Some may also consider entrepreneurial ventures, such as private practice or consulting. However, the lack of clear career paths, particularly in public institutions, can create stress and uncertainty. This can be exacerbated by financial pressures, work-life balance concerns, and the need for continued professional development.

Mental health issues, such as burnout, anxiety, and imposter syndrome, are common in the post-doctoral phase due to these challenges. Graduates may experience difficulty adjusting to the demands of professional life while maintaining their well-being. As such, addressing mental health concerns should be an integral part of post-doctoral support structures.

Universities and professional organizations can help mitigate these challenges by offering career guidance, mental health resources, and fostering networks that allow recent graduates to connect with peers in their field.

PURPOSE UNDER PRESSURE: CALLING, TASK FULFILLMENT, AND RESILIENCE AMONG NONPROFIT WORKERS

Banerjee N.*, King D.

Rice University ~ Houston ~ United States of America

Nonprofit workers are frequently motivated by a deep desire to support the public good, but the specific tasks they perform each day may be straining their motivation (Olson-Buchanan et al., 2013). Given that a significant portion of the workforce is employed in this sector (Bureau of Labor Statistics, 2024), and outcomes tied to motivation—such as turnover and performance—can directly influence a nonprofit's impact, research on this population is vital. The present study addresses this need by developing and testing a moderated-mediation model that integrates vocational calling and work engagement to understand resilience and turnover at the individual level. Using survey data from a sample of over 250 full-time nonprofit employees, this research examines how a worker's perception of their daily work tasks, as framed by need fulfillment in Self-Determination Theory (Gagné & Deci, 2005), moderates the relationship between vocational calling and subsequent motivational outcomes (i.e., individual resilience and turnover intentions). Structural equation modeling will be utilized to test the proposed hypotheses and model fit. Insights gained may help us address current high levels of burnout in this important occupation.

Abstract 1264

TITLE: THE IMPACT OF AI ON EMPLOYEE WELL-BEING: A JD-R MODEL PERSPECTIVE

Gougi E.*, Berger R.

Universitat de Barcelona ~ Barcelona ~ Spain

Artificial Intelligence (AI) is transforming modern workplaces, reshaping job demands and resources and influencing employee well-being. This systematic review investigates AI's dual role as both a job resource and a job demand through the lens of the Job Demands-Resources (JD-R) model heuristically and the concept of decent work. Despite growing interest, existing research is fragmented, with a narrow focus on specific applications, limited theoretical grounding, and a lack of a holistic understanding. Moreover, few systematic reviews exist in this rapidly evolving field, and most of them study employee wellbeing as a secondary point of interest. Following the PRISMA guidelines, covering studies published between 2020-2025 across databases such as Scopus, Web of Science, and PubMed, we analyze 46 identified studies to organize the research landscape and address the existing shortcomings.

Our results showed five main categories of mediating mechanisms, with mainly motivational (N=15), followed by affective and stress related (N=9), social-cognitive (N=7), technology fit and human interaction (N=5), while only one study analyzed learning and knowledge processes. Moreover, personal resources (N=5), leadership (N=3), HRM systems and organizational support (N=3), personal demands (N=2), such as technological anxiety and organizational context (N=1) act as key moderators that shape whether AI functions as a demand or a resource.

The review provides a theory-informed mapping that clusters the mechanisms through which AI influences well-being, distinguishes between its beneficial and detrimental pathways, and highlights the contextual moderators that shape these effects. Findings offer actionable insights for managers, designers, and policymakers seeking to align AI implementation with sustainable and human-centered work design.

Abstract 1226

REFUGEES' WORKFORCE PARTICIPATION IN THE NETHERLANDS: THE ROLE OF HUMAN AND SOCIAL CAPITAL CHARACTERISTICS

Kaye N.*[1], Asfar D.[1], Oostrom J.[2], Van Den Berg R.[3], Born M.[4]

[1]Vrije Universiteit Amsterdam ~ Amsterdam ~ Netherlands, [2]Tilburg University ~ Tilburg ~ Netherlands, [3]NOA B.V. ~ Amsterdam ~ Netherlands, [4]Erasmus University Rotterdam ~ Rotterdam ~ Netherlands

Finding employment is an important aspect of the integration of refugees into their receiving society. In the Netherlands, some local authorities invite recently settled refugees to complete an online psychological assessment aimed at supporting their integration into Dutch society. By combining these data with time-lagged employment data retrieved from the Statistics Office of the Netherlands, we examined the extent to which certain individual-difference characteristics predict workforce participation among Syrian (n = 1867) and Eritrean (n = 844) refugees in the Netherlands. These characteristics were categorized as human and social capital characteristics. Workforce participation was operationalized as not only having a paid job or not, but also the longest period of time that one has stayed in a single position, and the highest hourly wage that one has earned since their arrival in the country. The results showed that several human capital characteristics (i.e., pre-migration educational level, pre-migration work experience, and local language proficiency) and one social capital characteristic (i.e., contact with natives) contributed to predicting one or more of these employment outcomes. There were some differences in the predictive validity of these characteristics between refugee groups (i.e., based on age, sex, and nationality).

Currently, a second study is being conducted to investigate the effect of neighbourhood characteristics on various integration outcomes for refugees (n = 4556) , over and above individual difference characteristics. The random manner in which many refugees in the Netherlands were housed allows for a quasi-experimental design, excluding variance from confounding factors that would ordinarily be related to personal choice of neighbourhood. Once results have been obtained in the fourth quarter of 2025, they may prove to be a valuable addition to this presentation.

Abstract 1074

PURSUING CAREER SUCCESS IN THE ERA OF BOUNDARYLESS CAREER: THE ROLE OF FUTURE WORK SELF SALIENCE

Lu C.*, Liu Q.

School of Psychological and Cognitive Sciences, Peking University ~ Beijing ~ China

Introduction - In the era of boundaryless career, employees are facing increasing uncertainties and challenges to pursue career success. Thus, it is becoming more important for individuals to develop a clear future work self and to take proactive action as well.

Purpose: Integrating the conservation of resource (COR) theory and the perspective of proactive behavior, this study is to investigate the positive effect of future work self salience on career success in boundaryless careers, as well as the mediating mechanism of proactive career behavior and the moderating effect of performance feedback.

Method - We conducted a three-wave longitudinal study, and collected multi-source data from 339 employees in a Chinese company.

Results - The results showed that a future work self salience was positively related to both employees' promotability (objective career success) and career satisfaction (subjective career success), and proactive career behavior played a significant mediating role. Furthermore, performance feedback was found to act as a significant moderating role among the above-mentioned mediating process, demonstrating a moderated mediating model. That is, in the context of sufficient performance feedback, future work self salience could promote employees' career success through taking more proactive career behaviors.

Conclusion - Our findings revealed how and when future work self salience is related to career success, which offers theoretical implications for understanding career success in the era of boundaryless career time findings also has practical implications for human resource managers and employees to achieve more effective career management and career success.

Abstract 1220

THE INFLUENCE OF WORK-LIFE BALANCE-RELATED FACTORS ON WORK ENGAGEMENT AMONG ESSENTIAL WORKERS IN JAPAN

Otake K.*

Kyoto University of Advanced Science ~ Kyoto ~ Japan

This study focuses on the influence of factors related to work-life balance (WLB) on the work engagement of essential workers in healthcare. Previous studies have shown that WLB significantly increases work engagement. However, they have adopted a variety of approaches to measuring WLB. The purpose of this study is to examine the effects of (a) the number of perceived WLB support programs in the workplace and (b) satisfaction with the ease of use of WLB support programs on work engagement among healthcare essential workers in Japan. Data were collected through an online survey of 3,000 essential workers in Japan. From these respondents, the analytic sample was limited to healthcare workers, resulting in 1,984 participants with complete data for all analysis items (valid response rate: 66.1%). The sample consisted of 818 care workers, 801 nurses, and 365 doctors. In this study, analyses were conducted separately for each occupation in order to examine differences in the effects depending on the occupation. Results of the multiple regression analyses showed that satisfaction with the ease of use of WLB support programs had a significant positive effect on work engagement across all occupations. On the other hand, the number of perceived WLB support programs in the workplace had a significant positive effect on work engagement only in the analysis of nurses. These findings suggest that, among factors related to WLB, satisfaction with ease of use of WLB programs plays a particularly important role in enhancing work engagement. In contrast, WLB support programs themselves have only a limited influence on work engagement, and this influence may vary according to occupation. The practical implication of this study is that such programs should not only be introduced but also operated effectively.

Abstract 1245

THE IMPACT OF PEER MENTORSHIP ON STUDENT OUTCOMES: A LONGITUDINAL STUDY IN AN INTERNATIONAL MASTER'S PROGRAM

Israr A., Romero Cremades M.*

University Of Valencia ~ Valencia ~ Spain

Introduction. International students face significant challenges during the transition to higher education, including acculturative stress, burnout, and adjustment difficulties. Incorporating peer mentorship into academic programs has attracted a lot of interest from around the world as a way to assist these international students. To play our part, we developed a systematic peer mentorship program to improve the cultural adaptation, satisfaction, and well-being of international master's students by offering a consistent support structure throughout their adjustment period.

Purpose. This study extends previous work done by 2024 University of Valencia WOPP Research Committee, which primarily examined the overall effectiveness of the WOP-P Peer Mentorship Program. Unlike the earlier evaluation, this follow-up study not only tests program impact but also investigates the specific mechanisms by which perceived mentoring behaviors enhance generalized self-efficacy, which in turn contributes to psychological well-being, program satisfaction, sociocultural adaptation, and reduced burnout by testing a two-wave model incorporating qualitative and quantitative methodology over a span of 6 months.

Method. Participants are first-year international students (n = 46) enrolled in the Erasmus Mundus WOP-P Master's program (2025–2026), paired with second-year mentors (n = 33) across four European universities. Data will be collected in two waves: baseline at program entry (October) and follow-up before departure to the host university (February). Validated scales were used alongside monthly reflection logs. Analyses included descriptive statistics, reliability checks, correlations, and mediation models.

Results. We hypothesize that increases in perceived mentoring behaviors between T1 and T2 will be positively associated with psychological well-being, program satisfaction, and cultural adaptation, and negatively associated with burnout. Moreover, we further expect that these effects will be significantly mediated by increases in generalized self-efficacy.

Conclusions. These key findings will offer a validated model for institutions to improve international student support, highlighting targeted mentorship as a key intervention for fostering adjustment and preventing burnout.

Abstract 1046

THE LIFE COURSE OF EXPECTATIONS ABOUT WORK: TESTING THE SUPERB MODEL OF JOB QUALITY

Ruzojcic M.*, Galic Z., Erceg N.

Department of Psychology, Faculty of Humanities and Social Sciences, University of Zagreb ~ Zagreb ~ Croatia

As people age, their relationship toward work is expected to change due to important events (e.g. childbirth, educational milestones). Studies found that the centrality of work in life generally decreases with age and that younger people value interesting work, while middle aged people value high income and security. However, most existing research measured work expectations in overly simplistic way either asking only about the general value of work or covering few most salient job aspects such as pay or intrinsic value of work.

In this research, to capture an individual relationship towards work comprehensively, we used a six-dimension heuristic model of job quality that integrates Jahoda's model of latent functions of work, Self-determination theory and Duffy and Bluestein Psychology of working theory. The SUPERB model organizes quality of work into six dimensions: Safety (economical and psychological), Upgrading (job providing opportunities for growth), Purpose (finding meaning in work), Empowerment (responsibility and autonomy), meaningful Relationships (with peers, subordinates and supervisors) and Balance (between work and life roles). We adopted a psychological contract perspective (i.e., asked participants about their expectations from employers) to investigate age-related changes in importance of various aspects of job quality in Croatia, a post-socialist Southeast European country.

We collected an online sample of 619 Croatian citizens (16 to 70 years old), who reported their beliefs about employer's obligations towards employees across the SUPERB dimensions. The results showed that, overall, age had small and mostly non-significant effects on importance of SUPERB dimensions for employees, suggesting that expectations about work remain relatively stable across the lifespan. However, we observed a small curvilinear effect of age on Purpose with expectations of work being meaningful declining between ages 20 and 35, and then gradually increasing at later ages. Additionally, age showed small positive linear effects on expectations about job being upgrading and empowering.

Abstract 1312

THE PATH FROM EMOTIONAL DEMANDS TO WORK OUTCOMES THROUGH THE LENS OF A DAILY DIARY INVESTIGATION

Stuparu G.A.*, Ion A.

University of Bucharest ~ Bucharest ~ Romania

Stress is a critical issue in organizations, research suggesting that it has even reached epidemic levels, although, it may have some benefits (Podsakoff et al., 2023), because not all stressors are alike and not everyone responds the same to a certain stressor (O'Brien & Beehr, 2019). Emotional demands are one of those stressors, with some researchers categorizing them as challenges and some as hindrances (Li et al., 2020), which is why it is important to understand the mechanisms through which they lead to different outcomes by integrating two major theoretical frameworks - Transactional Theory of Stress (Lazarus & Folkman, 1984) and Process Model of Emotion Regulation (Gross, 2015) - to propose emotion regulation as a new mechanism linking stress to job satisfaction and job performance. Furthermore, the path from appraisals to emotion regulation may be mediated by affect, and given that not all emotion regulation strategies yield the same results, more research is needed regarding their link to work-related outcomes. Thus, we investigate the serial mediation of appraisal, affect and emotion regulation in the relationship between emotional demands and work outcomes. We conducted a daily diary, in which 193 employees responded to an online questionnaire, for three days, after the workday was finished. The sample size met the guidelines recommended in the literature for data-intensive longitudinal studies, meaning 83 participants (Gabriel et al., 2019). We expect this study to help advance stress theories by integrating emotion regulation and thus, contribute to the occupational health literature, enhance the understanding of the predictors of emotion regulation, while also researching what strategies might be more adaptive in workplace contexts. From a practical standpoint, the findings may assist supervisors in fostering employees' challenge appraisals and guiding them toward more adaptive emotion regulation strategies, leading to more favorable outcomes for both organizations and individuals.

INTERACTION BETWEEN OPPORTUNITY-UTILIZING CAREER SKILLS AND CAREER INDECISION AMONG JAPANESE UNIVERSITY STUDENTS: ASSOCIATIONS WITH UNIVERSITY LIFE SATISFACTION, WELL-BEING, AND JOB-SEARCH BEHAVIOR

Yazawa M.*[1], Fukuzawa A.[1], Sugawara I.[1], Hata K.[2]

[1]Musashino University ~ Tokyo ~ Japan, [2]strobolights Inc. ~ Tokyo ~ Japan

Introduction: In Japan, mass hiring remains the dominant method of recruiting new graduates; however, currently, the job-hunting process is starting earlier and lasts longer. Previous studies indicate that students' job-search anxiety and career indecision (CI) increase with academic seniority, potentially undermining university adjustment and psychological well-being.

Purpose: This study examines the interaction between career skills (CS) for utilized circumstances, based on planned happenstance theory, and CI, and its association with university life satisfaction, well-being, and job-search behavior.

Methods: An anonymous online survey was conducted with 678 Japanese university students (aged 18–24 years; 344 men, 334 women) registered with an Internet research company. Measures included the CS scale, the CI scale, the short version of the psychological well-being scale, items on job-search behavior, one item on job-search anxiety, and one item on university life satisfaction. Correlation analyses, cluster analysis, and analysis of variance (ANOVA) were conducted to examine relationships between the variables.

Results: CS showed weak negative correlations with certain aspects of job-search behavior and anxiety, weak positive correlations with aspects of CI and university life satisfaction, and a moderate positive correlation with psychological well-being. A cluster analysis combining CS and CI identified four clusters: (1) low CI, low CS; (2) high CI, average CS; (3) high CI, low CS; and (4) low CI, high CS. The ANOVA indicated that Cluster 4 exhibited the highest job-search behavior, satisfaction, and well-being. Cluster 2 maintained satisfaction and well-being but had lower job-search activity, whereas Cluster 3 was characterized by high job-search anxiety and lower satisfaction, well-being, and job-search behavior.

Conclusions: Even with high CI, students with average CS maintained university satisfaction and well-being but were less proactive in job-search activities. Early interventions to foster CS may support university adjustment, enhance job-search engagement, and promote psychological well-being.

Abstract 629

BURNOUT IN ENGINEERING FIRMS

Cahilap D.[1], Brown J.[2], Mitchell V.*[3]

[1]Systra ANZ ~ Sydney ~ Australia, [2]Jac Brown ~ Sydney ~ Australia, [3]University of Sydney ~ Sydney ~ Australia

Burnout is surprisingly common in professional services and in this paper we highlight the issues relevant to engineering companies. Burnout arises when job demands (e.g., workload, pressure, emotional demands) exceed the job resources (e.g., support, autonomy, feedback) available to cope in line with the Job Demands-Resources Model. Using content analysis to analyze over 300 employee reviews from platforms like Glassdoor and Indeed, and companies such as; Tesla, Rictchie Engineering Company, BGC Engineering, YETI and EXeevo, several recurring themes emerge regarding burnout in engineering roles. The major themes included; excessive workloads, poor management, limited career growth, work-life balance and toxic workplace culture. These insights shed light on the multifaceted nature of burnout and highlight areas where organizations can implement changes to improve employee well-being, but show that no one model of burnout (e.g., Maslach's Three-Dimensional Model of emotional exhaustion, depersonalization, and reduced Personal Accomplishment, Conservation of Resources Theory (Hobfoll 1989), Person-Environment Fit Theory (Caplan, 1987), Learned Helplessness (Seligman 1976), Cognitive Appraisal Theory (Lazarus & Folkman, 1986), explains what happens in the engineering sector. These themes underscore the multifaceted nature of burnout in engineering roles, highlighting the need for organizational change, supportive management, and a culture that values employee well-being. To help, we detail real world examples of how engineering companies are seeking to reduce burnout by deploying strategies such as; Personal-Level Support via Company Initiatives, e.g., Google – "20% Time", Team-Level Strategies e.g.,Spotify – Squad Autonomy & Agile Practices; Organizational-Level Programs, e.g.,Basecamp – 4-Day Work Weeks; Psychological Safety & Recognition, e.g., Salesforce – Well-being Culture; Career Path and Technical Growth, e.g., Intel – Dual Ladder Career Path. The paper holds interesting findings regarding the sector specific problem and solutions to burnout in professional service firms.

Abstract 296

THE IMPACT OF ECONOMIC INEQUALITY ON ORGANIZATIONAL SUPPORT: THE MEDIATING ROLE OF MERITOCRACY

Ersoy N.C.*

Izmir University of Economics ~ izmir ~ Turkey

Economic inequality is one of the biggest problems facing people all over the world. The top 10% of earners receive 50–60% of the world's income and this pay gap is especially between the top organizational managers and other workers (Alvaredo et.al., 2018) Pay inequalities in organizations negatively affect employees' well being, job satisfaction and organizational identification (Filippi et.al, 20225). Meritocracy is the belief that success is based on abilities, skills, knowledge and performance, which can enhance fairness perceptions even in unequal settings (Cheng & Hambrick, 2005). This study aims to examine the effects of economic equality/inequality on organization support. It also aims to investigate the mediating role meritocracy in this relationship. Bimboola Paradigm is an experimental framework to simulate economic inequality and equality within organizational settings. This study utilized this manipulation. Data was collected from 180 university students and white color employees (40% females, Meanage= 38, Sdage= 3.48). Participants were randomly assigned to two experimental conditions: Economic Inequality and Economic Equality, following the Bimboola Paradigm. A mediation analysis was performed using Hayes' PROCESS macro (Model 4) to examine the indirect effects. There is a total effect of economic inequality on organizational support ($b = -0.50$, $p < .01$). Meritocracy was positively related to organizational support ($b = 0.34$, $p < .01$). When meritocracy is included as a mediator, the direct effect of economic inequality on organizational support decreases ($b = -0.30$, $p < .05$) indicating a significant partial mediation effect. These results indicate that meritocracy partially mediates the effect of economic inequality on organizational support. This research shows that the negative effect of economic inequality on employees' organizational support may be mitigated in fair and merit-based reward systems within the organizations.

Abstract 2607

THE CORPORATE SOCIAL JUSTICE INVENTORY: MEASURING INTERNAL JUSTICE CAPABILITIES FOR SUSTAINABILITY INNOVATION

O"Neill P.*[1], Reardon B.[2]

[1]Royal Roads University ~ Canada ~ Canada, [2]Senior Director of Employee Experience, Clio".

Introduction: Organizations face mounting pressure to demonstrate authentic sustainability commitments, yet recent reviews identify critical measurement gaps in leadership capabilities that enable credible action (Sajjad et al., 2024). While organizational justice research confirms that fairness perceptions mediate ESG-employee satisfaction links (Susen & Etter, 2024), comprehensive reviews reveal no validated instruments assessing internal justice capabilities that make external sustainability claims credible (Adamovic, 2023). Sustainable development requires not only external commitments but internal organizational conditions promoting employee wellbeing (SDG 3), equitable work systems (SDG 8), and community engagement capacity (SDG 11).

Purpose: This validation study develops the Corporate Social Justice Inventory (CSJI)—a brief, psychometrically sound measure operationalizing how leaders cultivate internal justice as enabling infrastructure for sustainability innovation, directly addressing SDG targets for decent work, wellbeing, and inclusive community development.

Method: Following extensive literature review and expert consultation, the CSJI underwent rigorous validation with 600 diverse North American respondents spanning technical staff to executives across multiple industries. Exploratory and confirmatory factor analyses with invariance testing established a parsimonious 12-item model comprising four correlated dimensions: Socially Just Supervision (dignifying practices building psychological safety), Fair People Management (equitable HR systems structuring opportunity), Socially Just Culture (justice-inflected climate enabling innovation), and Positive Community Impact (external stakeholder engagement widening solution spaces).

ResultsThe CSJI demonstrates high internal consistency, convergent and discriminant validity, and robust criterion validity through significant associations with job-related wellbeing (SDG 3), organizational commitment, trust, resignation intentions, and citizenship behaviors. Sample invariance confirms measurement stability across organizational levels and contexts.

Conclusion: The CSJI addresses critical measurement voids in sustainable leadership

research by specifying actionable micro-level capabilities linking internal justice to external sustainability credibility. By connecting daily leadership practices to innovation outcomes aligned with planetary boundaries, this validated instrument democratizes leadership development for sustainability transitions while providing empirical pathways toward decent work, wellbeing, and inclusive communities.

Abstract 1487

ENGAGED BUT EXPLOITED? EMPLOYEE DEDICATION AND PERCEPTIONS OF LEGITIMATE WORK DEMANDS

Sutton A.*[1], Roemer A.[2]

[1]University of Waikato ~ Hamilton ~ New Zealand, [2]Massey University ~ Palmerston North ~ New Zealand

Employee engagement is widely regarded as a positive workforce attribute, yet emerging evidence suggests it may also have unintended consequences, including increased acceptance of exploitative work practices. This paper reports two studies examining the relationship between employee engagement and the legitimisation of exploitation, with attention to gender dynamics.

In Study 1, 248 U.S. employees completed surveys measuring engagement (vigour, dedication, absorption) and their perceptions of the legitimacy of being asked to perform extra, non-compensated work. Overall, engagement was positively associated with legitimisation of exploitation, but moderation analyses revealed a gender-specific effect: for men, higher dedication predicted greater acceptance of exploitative demands, whereas for women, higher dedication did not increase legitimisation. Study 2 (N = 252) extended this inquiry using an other-report design. Participants read vignettes describing engaged or control employees and rated the legitimacy of organisational requests to those employees to perform non-compensated work. Results indicated that participants generally did not consider it more legitimate for others to be exploited, regardless of employee engagement or gender, though a small effect emerged for female participants regarding denial of extra vacation.

Collectively, these findings highlight a paradox in engagement: while highly engaged employees may personally accept additional work demands, peers do not necessarily share this view, potentially creating tensions around fairness and managerial practices. The studies underscore the importance of considering both self-perceptions and social evaluations in organisational contexts and suggest that engagement, often treated unambiguously as positive, can have complex societal and organisational implications. By revealing how engagement can intersect with perceptions of exploitative practices, this research contributes to new directions in applied psychology, informing both organisational policy and ethical management. The findings emphasise the need for interventions that foster employee well-being and equitable work practices, highlighting psychology's role in promoting sustainable, fair, and responsible workplaces.

COMPUTATIONAL PROCESS THEORIZING: LAYERS OF EXPLANATION, CAUSAL INFERENCE, AND APPLICATION EXEMPLARS

Wednesday 22 July 2026 from 17:00 to 18:30

(T-Monumentale)

Georgia Chao (University of South Florida ~ Tampa, Flo), Co-Chair
Steve Kozlowski (University of South Florida ~ Tampa, Flo), Chair and Presenter

The purpose of this symposium is to conceptually distinguish process theorizing, using computational modeling, from conventional construct theorizing, explicate the quality and depth of theoretical explanation provided by each approach, discuss implications for causal inference, and illustrate the application of computational process theorizing (CPT) with two exemplars focused on different phenomena. Although virtually every theory in organizational and work psychology endeavors to provide an explanation of the processes that are responsible for a focal phenomenon, invariably the explanation is hypothesized in terms of relationships between or among constructs. Unfortunately, construct relationships are not directly informative regarding underlying processes and, moreover, are not revealing of the deeper generative mechanisms that drive process phenomena. Construct-based theorizing, which dominates research in organizational and work psychology, is deficient in its depth of explanation and explication of causal mechanisms. To make theoretical advances in understanding processes and their dynamics, the field must embrace CPT.

The symposium presentations build upon one another to provide an in-depth understanding of CPT in relation to traditional construct theorizing. First, differences between construct and process theorizing will be discussed and the layers of theoretical explanation (LTE) will be presented to highlight the quality of explanation provided by each approach. Second, a simulated data example will be presented to illustrate concretely how CPT and data compared to construct theory and data, encompasses the LTE. Third, implications for causal inferences relevant to process vs construct theorizing will be discussed. These three integrated presentations will be followed by two CPT examples addressing different process phenomena – cognition in human-AI teams and strategic consensus in sales and operational planning – to illustrate the application of the CPT approach to theory building. The Co-Chairs will facilitate discussion with audience members and encourage more researchers to take a process perspective in research.

Abstract 3852

COMPUTATIONAL PROCESS THEORIZING AND LAYERS OF THEORETICAL EXPLANATION

Kozlowski S.*

University of South Florida ~ Tampa, Florida ~ United States of America

Organizations are complex adaptive systems, composed of entities in dynamic interaction across multiple system levels, with collective phenomena emerging across levels over time. Theorizing about such phenomena takes one of two approaches: construct or process. Most of the scientific foundation of work and organizational psychology is based on construct theorizing and quantitative research. Process theorizing is far less prevalent and, until recently, the province of qualitative research. Construct theories focus on constructs (factors) and their relationships with one another; however, they are limited in their ability to explain processes. In contrast, computational process theories (CPT) focus on the who, what, when, where, how, and why of actors (e.g., individuals, teams, and/or organizations) engaging in actions. This factor versus actor emphasis influences how researchers theorize about and study phenomena, and the extent to which a theory encompasses all the layers of theoretical explanation (LTE). LTE can account for phenomena from different perspectives. Starting at a molar layer of specificity, construct or factor theorizing examines relationships among constructs, but does not explain the process (i.e., how and why) for these relationships. This layer of explanation is where construct theory stops. At a middle layer of specificity, an actors/process layer describes action/event sequences when actors engage one another in an environment or setting. Processes, by definition, unfold and evolve over time. They cannot be adequately represented as construct point estimates, even when the data are longitudinal. Finally, moving down to a driver layer, the generative or process mechanisms are specified (i.e., rules, functions, or logic) that cause entities to act. CPT is articulated from the driver layer and instantiated in a computer simulation to run the theory. Thus, it can provide a full range of theoretical explanation across the LTE: factors, actors, and causal drivers. To advance theorizing, the field must encompass CPT.

Abstract 3853

A COMPARISON OF CONSTRUCT VERSUS PROCESS THEORY ON EXPLANATION, PREDICTION, AND CONTROL VIA A COMPUTATIONAL EXAMPLE

Grand J.[2], Kuljanin G.*[1]

[1]DePaul University ~ Chicago, Illinois ~ United States of America, [2]University of Maryland ~ College Park, Maryland ~ United States of America

To make the layers of theoretical explanation (LTE) more concrete and to highlight the depth of explanation, prediction, and control provided by computational process theory (CPT) compared to construct theory (CT), we developed an agent-based simulation (ABS) examining teams operating under autocratic versus delegative leadership. The ABS defines operational rules for processes such as team member evaluation; task assignment; team members deciding whether and how to perform tasks; team members performing tasks; and updating expertise, priorities, and social influence as performance episodes unfold. The ABS generates simulated construct and process data, which, in turn, is used to compare the quality of explanation (LTE), prediction, and control offered by CT versus CPT.

In this example, the CT employs a typical mediation model in which team member motivation serves as the explanatory mediator for the effect of leadership style on team performance (i.e., leadership style ☾ team member motivation ☾ team performance). We found the indirect effect accounted for much of the total effect, suggesting team member motivation fully mediates the relationship between leadership style and team performance. However, using our CPT, we examined a key process: evaluating team member expertise. Autocratic leaders make work decisions single handedly, including evaluating all team members. Although autocratic leaders may not make biased evaluations across team members, they do make biased evaluations about specific team members. Under delegative leadership, team members average their individually biased evaluations for a teammate. As a result, their average evaluation leads to less biased evaluation of specific team members. By considering the evaluation process in depth, the CPT provides a more complete understanding of how differences in team performance emerged from the two leadership styles. In turn, this more complete coverage of the LTE translates into better predictions of, and interventions on, team performance, which our presentation explores.

Abstract 3854

UNDERSTANDING CAUSAL EFFECTS USING COMPUTATIONAL PROCESS THEORIZING

Braun M.*

DePaul University ~ Chicago, Illinois ~ United States of America

Given that theory is designed to explain how and why a phenomenon occurs, its explanatory focus has implications for knowledge generated about relevant cause and effect relationships. Not surprisingly, significant research attention has been devoted to determining the theoretical and methodological requirements best suited for establishing construct causal effects. Discovering and describing construct causal effects using carefully designed experiments with counterfactual conditions has immense value for making policy, generating managerial recommendations, and designing organizational interventions.

Unfortunately, discovering stable construct causal relationships does not help organizational researchers understand the actual processes responsible for observed phenomena. That is, construct theories with experimental and counterfactual research designs are well equipped to determine stable causal construct relationships; however, they are unable to specify the action/event sequences (which specific actors performed which specific actions) responsible for the observed construct relations. As demonstrated in the simulated example, extremely stable and strong statistical relationships between two constructs can be caused by processes different from the measured variables. Applying recommendations based on established construct causal relationships without knowledge of underlying process mechanisms can result in unintended negative consequences, and makes diagnosing and fixing any issues extremely difficult.

Alternatively, the goal of computational process theorizing (CPT) is to encompass all three layers of theoretical explanation: discovering the rules or process mechanisms which generate observed action sequences that account for construct relationships. By focusing on the rules that generate specific action sequences, CPT aims to discover the reasoning behind how/why specific actors take specific actions at specific times and how those actions influence subsequent processes. Such knowledge allows for the creation of recommendations and interventions directly addressing the affective, behavioral, cognitive, and social actions responsible for outcomes of interest. As such, knowing the processes responsible for observed statistical relationships between constructs allows for more precise recommendations and tailored interventions.

Abstract 3855

BRIDGING STRATEGIC CONSENSUS AND SALES AND OPERATIONS PLANNING (S&OP) EFFECTIVENESS: A CPT PERSPECTIVE ON THE INFORMATION SHARING PROCESS

Bonfio D.*

Università degli Studi di Padova ~ Padua ~ Italy

Organizations are complex adaptive systems in which interdependent actors interact dynamically across levels and over time. This presentation provides an example of how computational process theorizing (CPT) deepens explanation across the layers of theoretical explanation (LTE), thus revealing how organizational phenomena emerge and evolve across different levels. In this study, we demonstrate the explanatory power of CPT and show how it can yield deeper, fine-grained causal explanations. Our focus is on the phenomenon of information sharing in S&OP executive meetings, where effective coordination depends on within-team alignment, expressed as strategic consensus. In these meetings, the Top Management Team (COO, CMO, and CFO) must reconcile distinct functional forecasting plans while pursuing different performance goals, making the S&OP process inherently conflictual. Each executive holds unique private information that must be evaluated for sharing, and if information is withheld, the overall process performance is hindered. Previous research describes how alignment appears to influence S&OP effectiveness, but findings remain at the surface level of explanation, stopping at detailing action and event sequences without uncovering the underlying mechanisms responsible for team shared information emergence. To expand this work, we develop an agent-based model (ABM) that formalizes how strategic consensus shapes the interaction rules guiding information exchange among executives.

Through repeated simulations, the ABM reveals how differences in alignment reflect in different interaction rules, producing distinct emergent patterns of information integration, plan reconciliation, and process effectiveness. By linking the factor layer (strategic consensus), the actor layer (interaction and coordination dynamics), and the driver layer (generative mechanisms of disclosure), this CPT approach provides a more fine-grained theoretical explanation. It showcases how LTE and CPT go beyond descriptive and surface-level understanding of phenomena to reveal the causal architecture underlying alignment, information sharing, and performance in complex organizational systems.

Abstract 3856

COMPUTING TEAM COGNITION: A DYNAMIC APPROACH TO KNOWLEDGE EXCHANGE FOR HUMAN-AI TEAMS

Nols T.*[1], Grand J.[2], Ulfert A.S.[1], Gevers J.[1]

[1]Eindhoven University of Technology ~ Eindhoven ~ Netherlands, [2]University of Maryland ~ College Park, Maryland ~ United States of America

Although research has emphasized teams as complex systems that must continuously react to changing contextual demands, construct-based explanations—such as input–output relationships—still dominate and struggle to capture the interaction dynamics of team adaptation. Research often lacks insight into how and why specific construct relationships exist, constraining the design of effective interventions. Consequently, we employ computational process theorizing (CPT) to uncover the generative mechanisms of focal team phenomena and highlight how the layers of theoretical explanation (LTE) provide insights for team cognition in human–AI teams.

Research has linked information-building processes, shared mental representations, and team adaptation, yet most studies only capture static end-states, offering little understanding of their temporal unfolding. Team cognition research also battles contradictory or overlapping constructs that rarely specify what, when, and how knowledge must be shared. Traditional distinctions—such as teamwork versus taskwork information or convergence versus divergence of cognition—are often static and neglect the dynamic interplay between process and outcome. This leads to suboptimal guidance for the development of AI team members whose communicative abilities (e.g., AI transparency) and collaboration outcomes are largely determined by design.

Accordingly, we propose a CPT to formalize how shared understanding emerges, stabilizes, or collapses over time as a function of knowledge types (declarative, procedural, strategic), team composition (human versus AI), and task interdependence. By simulating how knowledge sharing evolves across contingencies, we aim to identify non-linear dynamics (e.g., tipping points) that clarify when shared knowledge benefits adaptation.

This work illustrates how CPT and the LTE can complement traditional research approaches by making underlying process dynamics explicit and clarifying the mechanisms through which phenomena emerge. Situated within the domain of human–AI teaming, we further highlight its potential to inform and test the design of transparent AI agents that better align communication with team needs.

01 - Division 1: Work and Organizational Psychology

FROM ORGANIZATIONAL IMAGINATION TO TRANSFORMATIVE ACTION: TOWARDS SUSTAINABLE WORK PRACTICES

Wednesday 22 July 2026 from 17:00 to 18:30

(R-Arsenale)

Maddalena Gambirasio, Chair
Giuseppe Scaratti (Università degli Studi di Bergamo ~ Berg), Discussant

From Organizational Imagination to Transformative Action: Towards Sustainable Work Practices challenge is to enhance the relevance of psychological knowledge through generative approaches that produce collective goods and promote sustainability—environmental, economic, social, professional, and organizational. This shift requires rethinking the categories and themes of WOP, moving beyond abstract classifications towards bridging the gap between research and practice.

The symposium calls for a mobilization of knowledge aimed at activating realistic conditions for empowerment and growth in work and organizational life. This involves engaging with complexity—power dynamics, negotiation, paradoxes, and contradictions—across individual, relational, and institutional dimensions. Such work must be “good enough” (in Winnicott’s sense): not idealized, but sustainable and aware of the responsibilities of those who contribute to organizational transformation.

Finally, the proposed approach demands a complex and dynamic view of organizational realities, seen as evolving constellations of material and immaterial elements. To understand and influence such systems, researchers must adopt interpretive and critical paradigms that allow for the deconstruction and reconfiguration of assumptions and practices, in line with a renewed vision of research—rigorous, beautiful, and deeply connected to reality.

Abstract 4433

CO-CREATING WELFARE: A TRANSFORMATIVE APPROACH

Gambirasio M.*, Ruggeri G.

Università degli Studi di Bergamo ~ Bergamo ~ Italy

In a context marked by fragile welfare systems and the persistent institutional invisibility of
family caregivers, the project “Caregiver Bergamo – Supporting Those Who Provide Care”
offers an innovative model grounded in organizational imagination and transformative
mobilization. Promoted by the Health Protection Agency (ATS) of Bergamo and supported by
over 90 local actors—including public institutions, third-sector organizations, professionals,
schools, and unions—the project activated a collaborative governance laboratory for the codesign
of inclusive policies and services.
Through a participatory action research process structured in three iterative phases (listening,
co-design, and transformative restitution), the research enabled reflective and dialogical
dynamics, enhancing the experiential knowledge of caregivers. This process fostered the
emergence of hybrid competencies, identity transformation, and a renewed awareness of
caregivers as active contributors to care systems. Organizational imagination operated here as a
catalyst to rethink roles, narratives, and practices—supporting the creation of more equitable and
sustainable local welfare configurations.
The project demonstrates how co-creating policy through participatory and situated knowledge
can generate transformative alliances between institutional systems and lived family
experiences. The research enabled a process of situated learning and shared accountability,
helping to reconceptualize welfare not merely as a system of services, but as a relational and
generative space.
In line with the 2030 Agenda and the ICAP symposium’s framework, this contribution explores
the role of Work and Organizational Psychology in promoting recognition, epistemic

justice,
and social sustainability. It proposes that only through transformative practices—anchored in
participation, care ethics, and organizational imagination—can we activate new visions and
pathways for addressing complex care challenges in contemporary society.

Abstract 4434

IMAGINING THE ORGANIZATION AS A “GOOD PLACE”: TRANSFORMATIVE PRACTICES IN SOCIAL SERVICES IN EASTERN MILAN

Toscano A.*

Università degli Studi di Bergamo ~ Bergamo ~ Italy

This contribution presents an organizational supervision initiative for social workers in a consortium of municipalities in Eastern Milan, funded through the Next Generation EU programme. The project aimed to prevent burnout and was shaped by the eutopian perspective of
Martin Parker (2002), envisioning the workplace as a “good place” where people can work
meaningfully and cooperatively.
The first phase involved a network analysis that mapped institutional spaces where local actors
and social service professionals meet, along with the purposes attributed to these meetings. The
collective feedback process revealed three key critical issues: (1) the organizational structure
lacked an organic interaction with the broader local community, except for a few preselected
partners; (2) social work was characterized by an “assembly-based” mode of operation, with
frequent multi-actor meetings; (3) participants often reported unclear meeting objectives, resulting
in a sense of dispersion and time misuse.
In response, a series of consultations were introduced, inspired by critical performativity (Spicer
et al., 2009), which encouraged organizational imagination as a way to reframe consultative
meetings. These were reimagined as interdisciplinary spaces where professionals from different
backgrounds collaboratively developed tailored case-specific interventions. The cases were
reinterpreted through the lens of precarity (Butler, 2015), understood as the systemic
vulnerability to having one’s rights denied due to social, cultural, or economic conditions.
Placing citizens’ rights at the center of case discussions catalyzed a wide array of conversations
and proposals among practitioners. These were then submitted to the technical board of

the intermunicipal
planning office, which welcomed, revised, and integrated them into its strategic vision. This experience demonstrates how organizational imagination can act as a critical and generative
force in public service settings.

Abstract 4435

REVITALIZING THE FUTURE LAB: ORGANIZATIONAL IMAGINATION BETWEEN POSSIBILITIES AND CONSTRAINTS

Hersted L.*, Frimann S.

Aalborg University ~ Aalborg ~ Denmark

This contribution explores how the Future Lab method (Jungk & Müllert, 1984) can be reimagined as a space for organizational imagination and change-oriented engagement in the fields of Work and Organizational Psychology. Inspired by social constructionist perspectives, we investigate how participatory formats can support organizational members in articulating their dreams, frustrations, and alternative visions—while remaining attentive to the discursive, material, economical, societal and institutional conditions that shape what is seen as possible, desirable, or legitimate.

We propose a reframed version of the Future Lab that invites for collective imagination while also encouraging critical reflection on the organizational narratives and power structures that delimit change. Drawing on examples from collaborative change processes, we demonstrate how a creative, dialogical and reflexive approach can help navigate tensions between aspiration and constraint—without disempowering participants or reinforcing illusions of unfettered agency.

Rather than contrasting imagination with “reality,” we explore how organizations can create spaces where imagined futures are negotiated, co-constructed, and tried out in relation to prevailing norms, resource logics, and bureaucratic scripts. We argue that imagination, when ethically facilitated and socially anchored, can become a form of collective authorship that opens new trajectories for organizational change.

Our contribution invites Work and Organizational Psychology to take seriously the imaginative capacities of organizational actors—not as utopian detours, but as vital resources for

shared
inquiry and situated change.

Abstract 4436

SPIRITUALITY AT WORK AS PERSONAL AND ORGANIZATIONAL TRANSFORMATION

Barattucci M.*, Gerdel S.

University of Bergamo ~ Bergamo ~ Italy

In management literature, spirituality at work has acquired considerable interest and is now
considered a legitimate and widespread area of investigation. In the work context, it focuses on the
search for shared meaning and values, and involves a reflection on the purposes of one's actions,
capable of promoting the common and organizational good.
Spirituality at work is configured as both an individual and systemic dynamic; in fact, it proposes
multiple levels of transformation: it addresses personal change with practices of awareness,
acceptance and inner connection; but it also concerns the change of leadership models and the
development of leaders capable of integrating spiritual values into human resource management;
spirituality also concerns organizational transformations and the adoption of spiritual practices in
business systems; finally, it concerns the systemic and global connection, which intertwines global
ethical trends and sustainability issues.
This paper offers a review of theoretical models on spirituality at work and its individual and
organizational transformative dimensions, a review of emerging practices and an intervention
project in a medium-sized company based on mindfulness.
It will be illustrated how contemporary organizations are integrating spiritual activities into their
daily work: Eastern approaches provide useful interpretative frameworks to understand the
connection between spirituality and leadership, as in servant leadership models; mindfulness and
meditation protocols are proposed to reduce stress and increase awareness in the workplace;
programs based on spirituality at work and applied positive psychology generate tools

and
interventions based on acceptance, interconnection, sense of community, transcendence, shared
meanings, hope.
Organizations that recognize and integrate the spiritual dimension and values of their employees
are able to benefit from a cohesive and motivated work environment, leading to greater satisfaction,
commitment and work performance.

Abstract 4813

BROADENING THE SCOPE OF APPLIED SOCIAL PSYCHOLOGY: EPISTEMOLOGICAL, ETHICAL, AND AESTHETIC REFLECTIONS ON DEVELOPING A SCHOLARLY HANDBOOK

O"Doherty K.*

University of Guelph ~ GUelph ~ Canada

The purpose of the handbook was envisaged as broadening the scope of what might commonly be associated with the label of “applied social psychology” and to provide an overview of empirical methods and practices that might be drawn on for applied social psychological work. The content of the handbook, represented by the contributions of scholars and practitioners who wrote the individual chapters, reflects an important depth and breadth of knowledge and experience to guide applied social psychological research and practice. Beyond this, the process of developing the handbook concept, recruiting authors, accepting and reviewing submissions, and eventually compiling the final manuscript provided profound learning experiences. This process led to reinterpretation and refinement of definitions of applied social psychology, deeper understanding of the diverse traditions that applied social psychologists draw upon, and new insights about commonalities and tensions in the goals, values, and foundational assumptions that applied social psychologists bring to their work.

The reflections I share in this presentation will be organised using a theoretical foundation that distinguishes between epistemological, ethical, and aesthetic concerns. Epistemological concerns focus on the truth value or practical utility of knowledge claims and practices (Is it true? Does it work?). Ethical concerns focus on the values that are inherent in scholarly approaches and their knowledge products and may involve attention to preventing harm, justice, and moral considerations (What are the risks of this intervention? Who might be harmed? Does the research

represent the diversity of people affected by the problems being addressed?). Aesthetic concerns
focus on the kinds of vision or aspirations that guide social psychologists' purpose and objectives
when they intervene in the world (What does an ideal world look like? How does one lead a "good
life"?). Aesthetic considerations are particularly important to allow researchers/practitioners to
reflect on their own (often implicit) visions for an ideal world, and how these might differ quite
dramatically from those of the people they work with and whose lives they seek to improve.

01 - Division 1: Work and Organizational Psychology

DIGITAL WORK, TECHNOSTRESS AND NEW DIRECTIONS FOR OCCUPATIONAL WELL-BEING

Wednesday 22 July 2026 from 17:00 to 18:30

(O-Arsenale)

Alessandro De Carlo (Messina University ~ Messina ~ Italy), Chair and Discussant

The expansion of telework has profoundly reshaped occupational life, offering new opportunities but also intensifying the risks associated with technostress. This symposium examines how digital work environments influence psychological well-being, with a focus on both the risk and protective factors that contribute to workers' mental health. Contributions will explore the impact of digital overload, constant connectivity, and blurred work-life boundaries, while also highlighting the protective effects of autonomy, organizational support, and digital competence. The symposium will offer valuable insights into the development of technostress and potential strategies for its mitigation. Collectively, the presentations will outline innovative directions for psychological interventions, organizational strategies, and policies aimed at fostering healthier, more resilient digital workplaces.

Chiara La Barbiera and colleagues present a systematic review identifying psychosocial risk and protective factors in digital work. Anabela Rodrigues and colleagues offer a motivational perspective on how telework motives shape well-being and performance. Federica Arena and colleagues provide evidence on cognitive and affective vulnerabilities linked to technology addiction. Natalia Grinko and colleagues present an interdisciplinary model to strengthen mental health competencies in a conflict-affected digital context. Claudio Maggio and colleagues examine technostress as a mediating mechanism within the JD–R framework. Finally, Rubinia Celeste Bonfanti and Stefano Ruggieri analyse workplace phubbing and its consequences for burnout and team cohesion.

Abstract 4489

TELEWORK AND TECHNOSTRESS: A SYSTEMATIC REVIEW OF RISK AND PROTECTIVE FACTORS FOR WORKERS' WELL-BEING

La Barbiera C.*[1], Chambel M.J.[2], Carvalho V.S.[2], De Carlo A.[3]

[1]Magna Graecia University of Catanzaro ~ Catanzaro ~ Italy, [2]Universidade de Lisboa ~ Lisboa ~ Portugal, [3]University of Messina ~ Messina ~ Italy

Introduction: The widespread consolidation of telework in the post-pandemic period has reshaped organizational dynamics, introducing new digital demands and raising concerns about technostress. While remote work offers flexibility and autonomy, it also increases information overload, technological complexity, and blurred boundaries between work and private life, with significant implications for employees' psychological well-being.

Purpose: Grounded in the Conservation of Resources (COR) framework, this systematic review aims to identify the main psychosocial risk factors associated with technostress in telework, examine individual and organizational resources that can mitigate its impact, and explore the emerging contribution of digital psychological support tools.

Method: Following PRISMA guidelines, a systematic review was conducted between June and August 2025 across Scopus, Web of Science, and PubMed. The search included empirical, peer-reviewed studies published from 2022 to 2025, focusing on adult workers engaged in remote or hybrid work. Eligibility criteria were defined using the PICOS framework, covering population characteristics, telework-related exposures and outcomes related to well-being or technostress. After removing duplicates and screening titles, abstracts, and full texts, 14 out of 556 records met all inclusion criteria.

Results: Across the included studies, digital overload, technological complexity, work intensification, and work–life boundary blurring consistently emerged as key risk factors linked to emotional exhaustion, anxiety, reduced job satisfaction, and impaired performance. Individual resources such as digital self-efficacy, adaptability, and proactive personality acted as protective factors, while organizational resources buffered the psychological burden of digital demands. Preliminary evidence also highlights the potential of digital psychological interventions, such as online counselling and well-being platforms, in reducing emotional strain and enhancing social connection among remote workers.

Conclusions: Technostress in telework arises when digital demands exceed employees' available resources. Strengthening digital competencies, fostering supportive organizational practices, and integrating digital psychological support interventions may promote sustainable well-being in increasingly digitalized work environments.

Abstract 4490

MOTIVATIONS FOR TELEWORK, LIFE SATISFACTION, AND PERCEIVED PERFORMANCE: THE ROLE OF AUTONOMOUS AND CONTROLLED MOTIVATION

Rodrigues A.*[1], Couto R.[2], Lopes S.[2], Carvalho V.S.[2], Chambel M.J.[2]

[1]Universidade Católica Portuguesa, ~ Braga ~ Portugal, [2]Universidade de Lisboa ~ Lisbon ~ Portugal

Introduction: The rapid expansion of telework has profoundly reshaped contemporary work environments, increasing flexibility and autonomy while also intensifying digital demands, constant connectivity, and potential risks for technostress. Understanding the motivational factors underlying the choice to engage in telework is therefore essential for promoting healthier and more sustainable digital work contexts. Drawing on Self-Determination Theory (SDT), this study examines how different types of motivation for telework are associated with employees' well-being and perceived performance.

Purpose: This research explores the associations between autonomous and controlled motivations for telework and their impact on life satisfaction and perceived job performance, contributing to the identification of psychological risk and protective factors in digital work environments.

Method: A total of 265 participants took part in the study, 64.4% of whom were women, with a mean age of 37 years. Most participants held a higher education degree (89.8%). Regarding work arrangements, 42.6% worked in a hybrid format, while 22.6% worked fully remotely. Data were collected through an online survey including validated measures of telework motivation, life satisfaction, and perceived performance.

Results: Results indicated that work modality significantly influenced both perceived performance and life satisfaction, with fully remote workers reporting higher levels of both outcomes compared to hybrid workers. Correlational analyses showed that autonomous forms of motivation were positively associated with life satisfaction and perceived performance, whereas controlled motivations were negatively related to these outcomes.

Conclusions: Consistent with SDT, the findings suggest that autonomous motivation functions as a key protective factor in digital work contexts, fostering psychological well being and perceived effectiveness in telework. In contrast, controlled motivation appears to be associated with poorer adjustment and lower well-being. These results highlight the importance of autonomy-supportive organizational practices as a strategy to promote occupational well-being and to mitigate the negative effects of digital overload and technostress in telework settings.

Abstract 4491

COGNITIVE AND AFFECTIVE VULNERABILITIES IN TECHNOLOGY ADDICTION

Arena F.*[1], Lombardo C.[2], Godfrey F.[1], Accetta A.S.[1], Zuccalà F.[1], Mento C.[3]

[1]Psychiatric Unit, Polyclinic Hospital ~ Messina ~ Italy, [2]Magna Graecia University of Catanzaro ~ Catanzaro ~ Italy, [3]University of Messina ~ Messina ~ Italy

Introduction: Internet Addiction is increasingly recognised as a multifactorial phenomenon involving cognitive, emotional and temperamental dimensions, and is receiving growing attention in relation to emerging technostress processes. While previous research has examined these factors separately, fewer studies have explored them together in individuals with problematic internet use.

Purpose: This study aimed to examine cognitive and affective factors associated with mild and moderate levels of technology addiction, focusing on affective temperaments, working memory functioning, and coping strategies as potential vulnerability mechanisms relevant to technostress processes.

Method: A total of 170 participants, aged between 17 and 65, completed an online survey administered via digital platforms. Based on the severity of their addiction, 124 participants were classified as having mild dependence, while 46 were classified as having moderate dependence. The assessment protocol included measures of affective temperament, self-reported working memory function and coping strategies.

Results: Participants reported extensive daily use of social media and high levels of sleep-related difficulties. Comparative analyses revealed that individuals with moderate internet addiction experienced significantly greater impairment across all working memory dimensions. Furthermore, this group showed higher prevalence of irritable, depressive, and cyclothymic temperaments compared to those with mild addiction, as well as greater use of dysfunctional coping strategies.

Conclusions: The results highlight the important role of emotional and cognitive processes in understanding Internet Addiction, especially as they relate to emerging digital stressors. Alterations in working memory function, together with specific affective temperamental profiles, suggest that Internet Addiction should be considered within an integrated model involving emotional regulation, cognitive resources, and adaptive functioning, and not yet as merely behavioral manifestations.

Abstract 4492

UNIVERSITY-BASED APPROACH TO MENTAL HEALTH SERVICES IN THE COMMUNITY

Grinko N.*[1], Avramchuck O.[1], Rosenbaum S.[2], De Carlo A.[3]

[1]Ukrainian Catholic University ~ Lviv ~ Ukraine, [2]UNSW ~ Sidney ~ Australia, [3]University of Messina ~ Messina ~ Italy

Introduction: Since the beginning of the conflict, the Ukrainian population has been facing pressing and widespread mental health needs. A large proportion of Ukrainians recently reported stress and severe nervousness, while a substantial share of individuals affected by conflict typically experience mental health disorders. The current national system relies heavily on inpatient psychiatric hospitals, with limited community-level access points. Significant shifts are underway, including the expansion of community-based multidisciplinary mobile teams that provide care for moderate to severe mental health conditions, as well as a growing private mental health sector. These developments highlight the need for a holistic approach to strengthen Ukraine's mental health workforce.

Purpose: Our aim is to present the development of a model of interdisciplinary training in mental health that prepares future professionals to respond to the modern challenges facing Ukraine, particularly those emerging during post-war reconstruction and long-term development.

Method: This model is being developed within the Faculty of Health Sciences at the Ukrainian Catholic University, whose mission extends beyond academic training to serving the Ukrainian people. The faculty offers several degree programs and non-degree initiatives, and it provides mental health services to the university and city community. Building on recent legislative progress in Ukraine promoting interdisciplinarity in both education and community services, the proposed model will be applied to students in physical therapy, occupational therapy, psychology, and social work. The process involves identifying shared competencies, integrating learning experiences across programs, and creating opportunities for collaborative practice.

Results: Recent national advancements and the existing structure of the Faculty provide favorable conditions for implementing interdisciplinary education. Preliminary steps suggest strong feasibility and alignment with current health system reforms.

Conclusions: The next step is to translate this strategic approach into a fully implemented interdisciplinary university training model, supporting the development of a competent mental health workforce for Ukraine's recovery and future growth.

Abstract 4493

TECHNOSTRESS AS A MEDIATING MECHANISM BETWEEN DIGITAL JOB DEMANDS AND OCCUPATIONAL WELL-BEING: A JOB DEMANDS–RESOURCES APPROACH

Maggio C.*[1], Scuderi V.[2], Boccadamo M.[1], Platania S.[1]

[1]University of Catania ~ Catania ~ Italy, [2]Kingstone University ~ London ~ United Kingdom

Introduction: The increasing diffusion of digital work and teleworking has significantly transformed contemporary occupational contexts, intensifying digital job demands while simultaneously expanding opportunities for flexibility and autonomy.
Purpose: Grounded in the Job Demands–Resources (JD–R) model, the present study investigates technostress as a key psychological mechanism linking digital job demands to occupational well being outcomes in technologically mediated work environments.
Method: The study was conducted on a sample of 339 employees engaged in digital and hybrid forms of work. Digital job demands were operationalized through indicators such as information overload, constant connectivity, and techno-invasion. Technostress was modeled as a latent construct reflecting
employees' strain responses to excessive and poorly regulated digital demands. Occupational well being was assessed through both negative (emotional exhaustion) and positive (work engagement) indicators, allowing for a balanced evaluation of employee functioning.Structural equation modeling (SEM) was used to test a mediation model in which technostress mediates the relationship between digital job demands and well-being outcomes. In line with the JD–R framework, job autonomy and perceived organizational support were included as key job resources expected to buffer the negative effects of digital demands. The hypothesized model enables the simultaneous examination of risk and protective factors within a unified analytical framework.
Results: Results are expected to show that higher levels of digital job demands are associated with increased technostress, which in turn predicts higher emotional exhaustion and lower work engagement. Conversely, job autonomy and organizational support are anticipated to mitigate the detrimental effects of technostress on well-being.
Conclusions: By extending the JD–R model to digitally intensive work contexts, this study contributes to the growing literature on technostress and occupational health. From an applied perspective, the findings highlight the importance of organizational strategies aimed at regulating digital demands, strengthening job resources, and promoting sustainable well-being in digital workplaces.

Abstract 4494

BOSS PHUBBING AND EMPLOYEE BURNOUT: INTEGRATING META-ANALYTIC EVIDENCE AND EMPIRICAL FINDINGS FROM THE PUBLIC SECTOR

Bonfanti R.C.*, Ruggieri S.

University of Palermo ~ Palermo ~ Italy

Introduction: In recent years, phubbing in workplace contexts has gained increasing scholarly attention; however, research remains fragmented due to limited theoretical integration. To address this gap, a systematic review and meta-analysis of quantitative research examining phubbing within organizational contexts was undertaken. The analysis distinguishes between perceived phubbing and enacted phubbing and explores their associations with a range of organizational and psychological variables.

Method: The review included 21 studies encompassing 8,485 employees from diverse occupational sectors. The meta-analysis revealed significant associations between perceived phubbing and key organizational and psychological outcomes, including leadership dimensions, productivity, work engagement, and employee well-being. Additionally, recurrent theoretical and methodological limitations were identified, underscoring the necessity for further investigation into specific organizational contexts and the underlying mechanisms at play.

Purpose: In light of the evidence emerging from the meta-analysis and the gaps discerned in the existing literature, a cross-sectional study was undertaken to investigate the phenomenon of boss phubbing within the public sector. The study aimed to investigate the relationship between boss phubbing and burnout, as well as the moderating roles of team cohesion and team identification in this association.

Results: Based on a sample of 257 public sector employees and data collected via standardized self-report questionnaires, the study found that boss phubbing is significantly associated with higher levels of burnout. Moreover, team cohesion and team identification were found to attenuate this relationship, suggesting that these team-level characteristics may mitigate the adverse effects of perceived boss phubbing on employees' mental health.

Conclusion: By integrating meta-analytic and empirical evidence, the present study provides a more nuanced understanding of phubbing within organizational contexts, highlighting both the detrimental impact of perceived phubbing on employee well-being and the buffering effect of strong team cohesion and team identification. The study also addresses its limitations and outlines key theoretical and practical implications for management.

Abstract 4803

A life course perspective on skill certification for disadvantaged groups: alternative credentials

Favella A.*

Sapienza University of Rome ~ Rome ~ Italy

Possessing certified skills is essential in today's knowledge economies. For most, these can be acquired through the standard route i.e. a period spent in a learning environment followed by an assessment. This standard path, however, may be unsuitable for many vulnerable groups. These include individuals who have learned a job through practical experience or those who have earned a non-recognized foreign degree. Possessing skills that are not certified by a recognized credential is arguably a major source of disadvantage. To deal with this issue, interest in alternative paths to skill credentials has been rapidly gaining ground. The concrete tools and policies deployed are known as alternative credentials. Examples include processes allowing for the recognition of prior learning (RPL) which provide the certification of skills gained through practical experience, the recognition of foreign degrees, the modularisation of standard VET or adult education programmes, which allow individuals to obtain partial certification without the need to complete a full programme. Against this background, the objective of this paper is to identify and discuss the psychological and social policy implications of alternative credentials. We argue that the distributional impact of these credentials is not predetermined. Drawing on insights from life course research, we identify two key dimensions likely to shape the distributional impact of alternative credentials. First, the degree to which these alternative credentials are cumulable and can provide access to standard educational and training offers (or "stackability"). Second, the extent to which such credentials are known to and recognised as valuable by employers. Intersecting these two dimensions, we develop a typology which we illustrate with examples taken from various European countries.

Abstract 1752

UNDERSTANDING WORKPLACE INCLUSION IN AN ETHNICALLY DIVERSE PROFESSION – EXPERIENCES OF MINORITY ETHNIC DOCTORS WORKING IN THE UK HEALTH SERVICE.

Kenny E.*[1], Fernando D.[2], Duberley J.[1], Patnaik A.[1], Darko C.[1]

[1]University of Birmingham ~ Birmingham ~ United Kingdom, [2]Aston University ~ Birmingham ~ United Kingdom

Introduction

Psychological theories of workplace inclusion have been critiqued for insufficient consideration of the contextual factors shaping perceptions of inclusion (Randel, 2025). One example is the study racial inclusion in organisations where focus is mostly on the experience of minority ethnic employees who are in a numerical minority. This focus, although essential, provides a partial picture of the inclusion experience for minorities, and leaves us under-equipped to analyse inclusion in fields where minority ethnic employees are well-represented but where race-related issues remain, such as the UK medical profession (Esmail & Everington, 2025).

Purpose

To deepen understanding of workplace inclusion through examination of how minority ethnic inclusion is experienced within an ethnically diverse profession.

Method

Qualitative interviews were conducted with 33 UK-trained senior doctors from minority ethnic backgrounds working in the UK. Inductive analysis highlighted how and when the doctors experienced workplace inclusion and how their ethnicity and the ethnic composition of where they worked and trained contributed.

Results

Findings show the sense of inclusion for minority ethnic doctors developed over time was linked to an increased sense of value to the profession as they developed as independent practitioners. However ethnicity, and other aspects of identity, played a key role in how, when and with whom that sense of inclusion was experienced. In addition, the findings demonstrate how racial discrimination remains a part of the experience of minority ethnic doctors despite the diversity within the profession.

Conclusions.

We advance theory on inclusion at work by offering a deeper analysis of how it is experienced by minority ethnic employees working in a diverse profession. Our analysis shows how broader contextual factors shape the experience and perception of inclusion. With this work we make an important contribution both to psychological theory and to understanding of race-related issue in organisations within contemporary multi-

ethnic societies.

Abstract 4589

WHEN STATUS IS UP FOR GRABS: MOTIVATIONAL AND CLIMATE MECHANISMS OF WORKPLACE SELF-PROMOTION

Wang Z.*

Shanghai Jiao Tong University ~ Shanghai ~ China

Status competition is a fundamental yet often underexamined dynamic in organizational life. Although status hierarchies help coordinate roles and motivate performance, employees frequently differ in whether they perceive status positions as fixed or changeable. When status appears “up for grabs,” employees may intensify efforts to enhance their standing. However, little is known about the psychological mechanisms through which perceived status hierarchy mutability shapes competitive workplace behavior.

Drawing on social information processing theory, we propose that status hierarchy mutability serves as a salient contextual cue that activates employees’ status motive—the desire to gain respect and admiration from others. Heightened status motive, in turn, promotes self-promotion behaviors aimed at signaling instrumental value to relevant audiences. Importantly, we distinguish between supervisor-focused and peer-focused self-promotion, recognizing that status is conferred not only vertically but also horizontally within work groups. We further argue that team self-promotion climate conditions whether status-motivated employees express their motives behaviorally.

We tested this multilevel moderated mediation model using two-wave survey data from 483 employees nested within 117 work groups across 16 organizations in China. Results indicate that status hierarchy mutability positively predicts status motive, which subsequently increases both supervisor-focused and peer-focused self-promotion. However, team self-promotion climate weakens the relationship between status motive and peer-focused self-promotion, suggesting that when self-promotion is pervasive, its effectiveness as a distinct status signal diminishes.

These findings illuminate how mutable status structures energize competitive self-presentation and reshape team dynamics. By identifying both motivational and contextual mechanisms, this research offers applied insights into how organizations can manage status competition, design fair evaluation systems, and foster healthier team climates.

DIGITALIZATION AND PERCEIVED EMPLOYABILITY: EXPLORING THE MODERATING ROLES OF SOCIAL CAPITAL, AGE, AND GENDER

Bannach H.M.*[2], Tomás I.[1], Lourenço P.R.[3], González--Romá V.[1], Hernández Baeza A.M.[1]

[1]Idocal, University of Valencia ~ Valencia ~ Spain, [2]Faculty of Psychology, University of Valencia ~ Valencia ~ Spain, [3]Faculty of Psychology and Educational Sciences, Centre for Business and Economics Research (CeBER), University of Coimbra ~ Coimbra ~ Portugal

Rapid technological advancements and digitalization have driven significant economic and societal changes, reshaping workplaces and work practices. While most research on workplace digitalization has focused on organizational outcomes, its impact on employees' perceived employability remains underexplored. Previous studies suggest that digitally equipped individuals perceive themselves as more employable. It is therefore important to examine the conditions under which digitalization influences employability. Drawing on Social Capital Theory, social capital may strengthen the positive relationship between digitalization and perceived employability. Age could also moderate this relationship, as older employees often face barriers to adapting to digital tools, potentially weakening its benefits. Lastly, gender may also serve as a moderator, given evidence of persistent gender gaps in digital access, skills, and confidence.

Therefore, this study examined the relationship between the frequency of digital tool use at work and perceived employability, and the moderating roles of social capital, age, and gender.

A two-wave online survey was conducted among 360 Spanish employees (Mage=36.2, SD=10.1; 49.2% females), who completed measures of workplace digitalization, perceived employability, social capital, and demographics.

Multiple regression analyses showed that frequent digital tool use significantly predicted higher perceived employability. Among the proposed moderators, only gender showed a trend-level interaction, indicating a stronger effect of digitalization for men. Social capital had a significant main effect but no moderating role, and age was not a significant moderator.

These findings suggest that digitalization enhances employability perceptions, but not equally across individuals. The results provide both theoretical and practical implications, emphasizing the need for inclusive digital strategies to foster employability in a rapidly changing labor market.

Abstract 1380

EXPLORING THE IMPACT OF PERCEIVED FAIRNESS AT WORK ON SUBJECTIVE WELL-BEING: THE MEDIATING ROLE OF PERCEIVED JOB QUALITY

Doumat Kouja Makhoul N.*[1], Hernández Baeza A.M.[2], Zappalà S.[3], González--Romá V.[2], Tomás I.[2]

[1]University of Valencia ~ Valencia ~ Spain, [2]IDOCAL, University of Valencia ~ Valencia ~ Spain, [3]Alma Mater Studiorum - Università di Bologna ~ Bologna ~ Italy

INTRODUCTION: Promoting wellbeing at work is essential for healthy societies. Whereas both perceived job quality and fairness at work have been linked to well-being, it has been ignored that fairness can be a key determinant of perceptions of job quality. In addition, previous research has focused on hedonic and cognitive well-being, ignoring the eudaimonic aspect (e.g. personal growth at work). These are important gaps that we aim to fill in the present study.
PURPOSE: This study examines whether perceived job quality mediates the relationship between perceived fairness at work and the three dimensions of subjective well-being at work: hedonic (i.e. positive affect at work), cognitive (i.e. job satisfaction), and eudaimonic (i.e. personal growth at work).
METHOD: Data were collected from a sample of heterogeneous Spanish employees across three time points. The final sample consisted of 244 participants, comprising 52% men with an average age of 35 years and 48% women with an average age of 36 years. The research model was tested by structural equation modeling by means of Jamovi (an R based software). Indirect effects were tested by means of Bootstrap.
RESULTS: After controlling relevant job characteristics traditionally linked with high quality jobs (variety, autonomy, etc.), perceived fairness was related to perceived job quality, which partially mediates its relationship with hedonic and cognitive well-being. Contrary to expectations, fairness was not related to eudaemonic well-being.
CONCLUSIONS: Fairness is an important driver of perceptions of job quality, which, in turn, contribute to promoting important aspects of wellbeing at work. This result can help design interventions to promote wellbeing through fair treatment interventions.

Abstract 1446

THRIVING UNDER JOB DEMANDS: HOW PSYCHOLOGICAL CAPITAL SUPPORTS ENTREPRENEURS' HEALTH AND FUNCTIONING

Fernet C.*[1], Gillet N.[2], Austin S.[1], Levesque--Côté J.[1], St--Pierre J.[1]

[1]Université du Québec à Trois-Rivières ~ Trois-Rivières ~ Canada, [2]Université de Tours ~ Tours ~ France

Introduction:
Entrepreneurship is a key driver of innovation and growth, yet the psychological demands it entails, particularly job demands such as work overload, are often underestimated. Entrepreneurs frequently operate under intense pressure, which can simultaneously undermine well-being (e.g., reduced work engagement) and increase ill-being (e.g., emotional exhaustion), with significant consequences for both individual and organizational functioning.
Purpose:
This study examines how psychological capital (self-efficacy, hope, optimism, and resilience) contributes to entrepreneurs' psychological health (work engagement and emotional exhaustion) and, in turn, to job (performance and leadership) and organizational (employee relation climate) functioning. We assess its dual role: 1) as an indirect contributor to functioning by promoting work engagement and mitigating emotional in response to job demands and 2) as a moderator that buffers the indirect effect of job demands on functioning through psychological health indicators.
Method:
The sample consisted of 617 entrepreneurs who were owner-managers of small or medium-sized enterprises (SMEs): 95.3% operated small businesses (1–99 employees) and 4.7% medium-sized businesses (100–499 employees). These enterprises were active in goods production (66.9%) and service provision (33.1%). Structural equation modeling was used to test the hypothesized relationships, including moderation effects through latent interactions.
Results:
Moderation effects were more pronounced in the engagement pathway, suggesting that psychological capital primarily enhances adaptive functioning by fostering well-being (work engagement), rather than by mitigating ill-being (emotional exhaustion).
Conclusions:
Psychological capital plays a strategic role in entrepreneurial adaptation. Its differentiated effects highlight the importance of viewing it as a multifaceted resource that supports both individual and organizational outcomes. These findings refine the JD-R model and suggest practical avenues for strengthening entrepreneurs' resilience and leadership capacity in demanding contexts.

Abstract 1586

PSYCHOMETRIC PROPERTIES OF THE 13-SENSE OF COHERENCE SCALE IN A DEVELOPING COUNTRY

Mitonga--Monga J.[1], Flotman A.*[2]

[1]University of Johannesburg ~ Johannesburg ~ South Africa, [2]University of South Africa ~ Pretoria ~ South Africa

The Sense of Coherence Scale developed by Antonovsky (1993) has shown excellent psychometric properties, especially in industrialised countries. However, there is a lack of research investigating the meaning and applicability of this scale in the context of developing countries. This study aimed to investigate the psychometric properties of the 13-item Sense of Coherence Scale (SOCS) among teachers at selected high schools in the LIMETE school district in the Democratic Republic of Congo (RDC). A cross-sectional survey was conducted with a convenience sample (n =241) of teachers who completed the French Sense of Coherence Scale (SOCS). Structural equation modelling confirmed a three-factor model of SOC consisting of three dimensions: comprehensibility, manageability and meaningfulness. The three dimensions of SOCS showed acceptable internal consistency. The results indicate that the D.R. Congo Sense of Coherence Scale is a reliable and valid measure of sense of coherence in the DRC. The results provide new insights that can be used to develop strategies for employee well-being, strengthen mental resilience programmes, and guide evidence-based HR practices in the DRC school context. Schools can utilise SOC data to develop interventions that improve teachers' ability to cope with stress, maintain motivation and engage under challenging conditions, contributing to improved school performance and sustainability in resource-constrained environments.

Abstract 1449

ABSTRACT

Fritzler A.*[1], De Angelis M.[1], Navarro J.[2]

[1]University of Bologna ~ Bologna ~ Italy, [2]University of Barcelona ~ Barcelona ~ Spain

In recent years, the digitalization of work and, specifically, the successful management of a company's digital transformation have been prominent topics in work and organizational psychology. Previous literature in this area states that low individual digital transformation readiness of employees is a key obstacle to successful digital transformation. Building on this foundation, the present study examines anticipated technostress, specifically the dimensions of techno-invasion and techno-uncertainty, as potential antecedents of low individual digital transformation readiness. Since creating change readiness in employees at the initial introductory stage of a change process is crucial for successful change implementation, this study focuses on anticipatory feelings of technostress, why they arise, and how they affect individual digital transformation readiness. Therefore, this study investigates the effect of anticipated technostress and techno-invasion and techno-uncertainty as two specific dimensions of technostress on individual digital transformation readiness. A vignette experiment was conducted to examine these relationships. 42 participants were randomly exposed to vignettes that aimed at eliciting feelings of anticipatory high or low technostress before responding to items measuring individual digital transformation readiness. The data obtained did not support the hypothesized relationships between anticipated technostress (specifically techno-invasion and techno-uncertainty) and individual digital transformation readiness. Thus, technostress might not be as important regarding digital transformation as expected. Instead, future research should focus on other internal as well as external (organizational) variables that might impact individual digital transformation readiness to help managers set the stage for successful digital transformation in a company. (A second round of data collection will be implemented before the conference.)

Abstract 1491

CAREER DECISIONAL PROCRASTINATION AS A PREDICTOR OF CAREER DECISION-MAKING OUTCOMES: A LONGITUDINAL STUDY

Kashkoush S.*, Lipshits--Braziler Y., Butler R.

The Hebrew University ~ Jerusalem ~ Israel

Career decisional procrastination can hinder effective career decision-making (Levin & Lipshits-Braziler, 2022). Rather than a unitary tendency, individuals procrastinate for different reasons. To capture this, Kashkoush et al. (2025) developed the Career Decisional Procrastination Questionnaire (CDPQ), which identifies five reasons: short-term rewards (preference for immediate mood benefits from enjoyable activities), self-worth protection (fear that a wrong career decision will undermine one's self-worth), lack of psychological resources (insufficient emotional resources required for deciding), pressure thriving (belief that deciding under pressure leads to better decisions), and time management (planned delay of decision-making). This study tested the predictive validity of the CDPQ in relation to career decision-making outcomes, including career decisional difficulty and distress (Levin & Lipshits-Braziler, 2022), career decision status (Gati et al., 2003), and academic major satisfaction (Nauta, 2007).

At Time 1, 462 pre-academic preparatory students in Israel (50% woman) participated at the beginning of the year. SEM analysis showed that lack of psychological resources (β = -.29) and time management (β = -.28) negatively predicted career decision status (R^2 = .25). In addition, lack of psychological resources (β = .39) and self-worth protection (β = .30) positively predicted decisional difficulty and distress (R^2 = .31). At Time 2, 145 participants (51% woman) completed the questionnaire again at the end of the academic year. SEM analysis showed that lack of psychological resources continued to negatively predict career decision status (β = -.24, R^2 = .13), while short-term rewards negatively predicted academic major satisfaction (β = -.25, R^2 = .08).

The findings demonstrate that distinct reasons for career decisional procrastination are differentially associated with career decision-making outcomes, both concurrently and longitudinally. Identifying these reasons can inform targeted interventions to support individuals in managing procrastination and making better career decisions.

Abstract 1583

THE EFFECTS OF SYSTEM JUSTIFICATION AND AUTHORITARIANISM ON THE IMPRESSION OF BUSINESS PERSON WITH HIGH STATUS AND LOW ABILITY.

Kitamura H.*

Seisen University ~ Nagano-City ~ Japan

The Stereotype Content Model(Glick & Fiske, 2001) tends to equates status and ability of people. In this study, status and ability were separated, and stimulus persons were presented in vignettes for two types of persons: high status - low ability and low status - high ability. A thousand English Data were collected through survey company, and the results showed that an interaction effect of stimulus person and system justification was statistically significant(β=.390, p=.004). Participants with low score of system justification scale (that is liberal person) rated the stimulus person who had high status and low ability lower than the stimulus person who had low status and high ability compared with participants with high score of the scale. Furthermore we constructed a class perception scale, that means whether people perceive the social class is fixed. An interaction effect of the class perception and the stimulus person condition was also significant(β=.268, p=.001). Participants with high score in that scale evaluated the business person with low status and high ability as smarter and more likable than business person with high status and low ability. Overall, the impression of a person of low ability but high status was positive in the participants with high authoritarian tendencies. Those with lower authoritarian tendencies tended to rate lower-status and higher-ability stimulus person more highly. Cultural differences in the relationship between status and ability are also discussed.

Abstract 1511

PSYCHOMETRIC VALIDATION OF THE ORGANISATIONAL CHANGE READINESS SCALE IN THE SOUTH AFRICAN PUBLIC SECTOR

Monyai D.P.*, Mitonga--Monga J.

University of South Africa ~ Pretoria ~ South Africa

Organisational change is a constant reality, but the willingness of employees to embrace change often determines the success or failure of such initiatives. While there are several measures of readiness, few have been validated in the South African context, particularly in state-owned enterprises where the unique cultural and organisational dynamics can influence employee perceptions. The aim of this study was to validate the Readiness Toward Change Scale (RTCS) in the South African organisational context, thereby creating a reliable and contextually relevant measure of employee readiness for change. Effective organisational change management requires diagnostic tools that are psychometrically sound and culturally sensitive. By validating the RTCS, this study responds to the need for locally tested instruments that can inform change strategies and reduce resistance in South African organisations. Guided by a positivist philosophy and a quantitative research approach, the study surveyed employees of a South African state-owned enterprise (N = 373). An exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) were conducted to examine the dimensionality, validity and reliability of the RTCS. The analyses revealed four different dimensions of readiness toward change and thus confirmed the multidimensional structure of the scale. The model showed acceptable goodness of fit indices and confirmed the reliability and validity of the RTCS in the South African context. This study extends the literature on readiness toward change by validating the construct in a developing country and demonstrating the psychometric suitability of the RTCS for research. In practice, it provides managers, HR professionals and policy makers with a diagnostic tool to assess and improve employee readiness for change, enabling targeted interventions for successful organisational change.

Abstract 1407

BRIEF MINDFULNESS MEDITATION REDUCES HUMAN ERROR DURING EMERGENCY SITUATIONS

Ueda M.*[1], Nakai H.[2], Usui S.[3]

[1]Otemon Gakuin University ~ Osaka ~ Japan, [2]Graduate School of Human Sciences, Osaka University ~ Osaka ~ Japan, [3]Safety Research Institute, West Japan Railway Company ~ Osaka ~ Japan

Introduction and Purpose

Emergency situations often trigger immediate responses without careful consideration, increasing human error (Ueda et al., 2015). While long-term mindfulness meditation improves well-being (Anderson et al., 2007), no studies have examined whether brief mindfulness meditation can reduce human error during emergencies. This study experimentally investigated these effects.

Method

Thirty-six university students (26 males, 10 females; mean age = 21.92 years) were randomly assigned to mindfulness meditation or audiobook control groups. Before computer -based task, participants listened to 8-minute guided meditation or audiobook reading. They performed dual tasks: (1) a primary water pipe rotation task requiring efficient clicks to direct water flow to specific light bulbs, and (2) a secondary attention task responding to a gorilla image appearing every 10 seconds. Task difficulty was set at two levels (low/high) based on the minimum number of clicks required for completion. Tasks were conducted under control conditions or high arousal emergency simulation with warning lights, alarm sounds , wind pressure, 100-second time limit, and monetary penalty threats. Design: 2×2×2 mixed factorial with intervention group (between-subjects) and arousal condition/difficulty level (within-subjects).

Results

Analysis revealed significant mindfulness effects on multiple performance measures. Compared to the control group, participants in the mindfulness group completed the primary task using significantly fewer clicks — particularly under high-difficulty conditions ($p < .05$) — indicating greater task efficiency. For secondary tasks, they demonstrated significantly faster reaction times ($p < .01$) and fewer false alarms ($p < .05$), with trends toward lower miss rates ($p < .10$). These improvements occurred even under emergency-like conditions.

Conclusions

Brief mindfulness meditation effectively reduced human error and improved performance during complex dual-task situations under emergency conditions. The 8-minute intervention enhanced both task efficiency and attention allocation, suggesting that brief mindfulness practices can serve as practical interventions for human error

reduction in high-stress occupational environments.

Abstract 476

FROM DIGITAL STRESS TO SUSTAINABLE TEACHING: HOW OPENNESS AND ATTITUDES TOWARD TECHNOLOGY REDUCE TEACHER BURNOUT

Romero Cremades M.*, Ramos López A., González--Anta B., Orengo Castellá V., Ana Z.A.

University of Valencia ~ Valencia ~ Spain

Introduction. The digitalization of the educational landscape, accelerated by the COVID-19 pandemic and ongoing technological advances, has imposed unprecedented psychological demands on educators worldwide. While organizational factors influencing burnout are well-documented, fewer studies have addressed individual psychological resources that protect teachers' mental health and sustain educational quality in digital contexts. Purpose: Grounded in the Job Demands-Resources model and the Technology Acceptance Model, this research examines how openness to change and attitudes toward digital technology influence burnout among educators, exploring whether gender moderate these relationships. Method: A cross-sectional study involving 591 secondary school teachers in Spain was conducted. Hierarchical regression analyses were performed to evaluate how openness to change and attitudes toward digital technology related to burnout, with gender considered as potential moderator. Results: Findings revealed that both openness to change and positive attitudes toward digital technologies significantly reduced teacher burnout. Notably, gender moderated these relationships: openness to change had stronger protective effects for male teachers, while positive attitudes toward digital technologies were particularly beneficial for female teachers. Conclusions: This study highlights the importance of individual psychological factors in reducing burnout in educational settings during digital transitions, directly supporting SDGs related to Decent Work and Economic Growth, Good Health and Well-being, and Gender Equality. By fostering these psychological resources, educational organizations can tailor gender specific professional development programs to mitigate burnout, ultimately contributing to sustainable work contexts and improved teacher well-being.

Abstract 2664

THE FUTURE OF ORGANISATIONAL IDENTITY: RETHINKING THEORY AND PRACTICE FOR TURBULENT TIMES

Veldsman T.*[1], Veldsman D.[2]

[1]University of Johannesburg ~ Johannesburg ~ South Africa, [2]University of Johannesburg; Academy for Innovation in HR (AIHR) ~ Johannesburg ~ South Africa

Increasingly organisations are challenged to remain purpose-driven and coherent in an era of persistent turbulence, geopolitical instability, volatile market dynamics, and the disruptive force of generative AI. Simultaneously, employees and other stakeholders are more vocal publicly, demanding transparency, meaning, and social justice from the organisations they engage with. Amidst this disruptive complexity, Organisational Identity (OI) emerges as a critical psychological anchor. This integrative concept informs how organisations define who they are, what they stand for, and what they aspire to become.

OI has long been regarded as a foundational construct in organisational science, even described as the most meaningful concept in understanding organisations. It is uniquely positioned at the intersection of stability and change, both as a repository of organisational continuity and a compass for strategic transformation. Yet, despite its conceptual richness and a vast literature base, questions remain about its practical application and relevance in the face of accelerating disruption.

Our paper presents findings from a critically reflective and practice-informed exploration of the current state of OI theory, detailed in our book - Organisational Identity: A Critical Reflection on the Theory (2025). Drawing on contemporary literature, we examine how OI functions as a relational, integrative construct that influences culture, leadership, strategy, and employee experience. We interrogate the assumptions underpinning traditional OI thinking, and evaluate their applicability in today's volatile, uncertain, complex, and ambiguous (VUCA) world.

Our contribution's goal is twofold: to illuminate the conceptual terrain of OI through a future-centric lens, and to offer practice, actionable insights. We propose ten mega-insights that would reframe OI for applied relevance—insights that would equip psychologists, leaders, and change agents to more effectively shape, sustain, and evolve identity in organisations undergoing transformation. In doing so, we answer the critical question: How must our understanding and application of OI unfold to remain future-fit?

Abstract 153

BREAKING THE SILENCE: HOW CAREER STAGNATION DRIVES EMPLOYEE TURNOVER – THE MODERATING ROLES OF INTERACTIONAL JUSTICE AND INTERNAL LOCUS OF CONTROL

Wu C.W.*[1], Tse Y.F.[2], Ng C.T.S.[2], Chen I.[3], Yang A.L.[3]

[1]Macao University of Tourism (UTM) ~ Macao ~ Macao, [2]Hong Kong Metropolitan University ~ Hong Kong ~ Hong Kong, [3]National Sun Yat-sen University ~ Kaohsiung ~ Taiwan

This study explores corporate leadership challenges in the global pandemic era, where innovation and agile adaptability have proven critical for seizing emerging opportunities. A key factor in organizational resilience is employees' willingness to voice critical observations—enabling timely issue resolution and fostering innovation—whereas employee silence can create long-term developmental barriers. Against this backdrop, the research investigates a widespread workplace phenomenon: employees perceiving career stagnation (hierarchical career plateau) and its consequences, including turnover intentions. We examine whether silence behavior serves as an alternative response to such stagnation and how interactional justice and internal locus of control personality traits may mitigate this behavior, offering organizations actionable strategies to cultivate open communication.

Using a two-wave online survey design, data were collected from 395 experienced employees (3+ years of tenure) across diverse industries in Taiwan. The results demonstrate that silence behavior mediates the relationship between hierarchical career plateaus and turnover intentions. Moderating effects reveal that internal locus of control strengthens the role of interactional justice in attenuating the link between career plateaus and silence behavior, though neither factor independently alters this relationship.

These findings provide organizations with evidence-based insights to reduce silence, encourage proactive communication, and enhance adaptive capacity in volatile environments. By clarifying the mechanisms linking career stagnation, silence, and turnover, the study contributes to both scholarly discourse and practical interventions for fostering innovation-supportive cultures.

Abstract 805

THINK RISKS, NOT LISTS: A NEW GLOBAL FRAMEWORK FOR MANAGING PSYCHOSOCIAL RISK AT WORK

Garcia R.*

EY ~ Melbourne ~ Australia

Intro: Organisations around the world have responded to evolving challenges managing mental health at work, including varied regulations and guidance (such as ISO45003) that have resulted in increasing administrative burden, without effectively identifying real sources of harm to employees.

Purpose: This presentation introduces an evidence-based framework that defines psychosocial hazards as independent causes of psychological harm, clarifies the distinction between hazards and control failures, and provides a simplified approach for organisations to manage psychosocial risk,

Method: We synthesised peer-reviewed research, regulatory guidance, and real-world application to develop a new framework for psychosocial hazards. The framework is comprised of hazard groups that cascade to context specific triggers that connect causal pathways from work design and environment to potential harm and control selection. We present its application across the globe in three different geographic contexts (Australia, Canada, UK) to demonstrate its application worldwide.

Results: Applying the framework reduces duplication and misclassification of psychosocial hazards on risk registers, improves organisation's ability to identify causal factors, and supports organisations to monitor psychosocial risk. The approach strengthens oversight for boards and executives and takes a materiality-based approach to managing psychosocial risks.

Conclusion: This study demonstrates that a globally applicable framework for psychosocial risk manager can address the limitations of current approaches, which often conflate hazards with control failures and are increasingly challenging for organisations to manage. By defining psychosocial hazards as independent causes of psychological harm, the framework supports organisations to achieve greater clarity, consistency, and comparability in risk identification and management. This approach not only reduces duplication and misclassification on risk registers but also supports implementation of tailored controls to more effectively reduce risk.

Abstract 2015

ARCHITECTS OF CHOICE: A GROUNDED THEORY OF HOW LEADERS MAKE WISE DECISIONS UNDER PRESSURE

Sharma J.*, Sharma A.

Indian Institute of Technology Jodhpur ~ Jodhpur ~ India

Introduction: Current decision-making discourse, including rational Homo economicus and predictable irrationality, provide a plausible but unsatisfying explanation of human judgment. They perform well in the laboratory but all too often disappoint in uncertain, high-stakes situations of leadership. These explanations narrow the richness of human experience, discounting relevant contextual, ethical, and emotional factors. Therefore, we lack an holistic picture of circumstances under which wisdom leads to successful decision-making. To fill this lacuna, this study forages into Wise Decision-Making (WDM).

Aim

This project seeks to develop a data-driven, novel theory of Wise Decision-Making. We will elucidate the important components—processes, antecedents, and DMVs—involved in good judgments made by seasoned leaders who confront important responsibility and ambiguity.

Techniques

We used a grounded theory approach and a three-stage interviewing protocol to reduce demand and recall biases. We have thus far conducted 50 depth interviews with people of diverse backgrounds, such as bureaucrats, generals, surgeons, and judges. We analyzed the interview transcripts intensely, using Gioia procedure from first-order codes to final themes and a dimension of a finished theory.

Conclusion

Preliminary analysis reveals WDM to be a multi-dimensional process. Robust two-dimensional clusters have emerged from the data:

Meta-cognitive Regulation: This includes reflective deliberating ("thinking before acting") and perspective-taking ("checking viewpoints").

Moral Framing: This subsumes ethics of foresight (e.g., "thinking downstream") and value alignment (e.g., "sorting out conflicting duties"). These results show wise decision-

making to be ethics and self-control rather than mere rational choice. The new framework counters essentialist conceptions and characterizes Wise Decision-Making as an interaction of meta-cognition, ethics, and emotional regulation. This study reveals the need for a framework handling the richness of practical leadership. Data are still being gathered to reach theoretical saturation and develop a framework of wide generality and subject matter expertise.

CAREER BUILDING FROM THE PERSPECTIVE OF A VISUALLY IMPAIRED PERSON – CECÍLIA'S STORY

Beliomini L.*, Ribeiro M.A.

University of Sao Paulo ~ São Paulo ~ Brazil

Inclusion, diversity, and sustainability are frequently discussed topics in organizational discourse and the world of work, highlighting that everyone has the opportunity to work, especially those who have traditionally found the doors to work closed, including people with disabilities. Expanding career research is a demand in the field, and therefore, this study aimed to understand and understand the experiences and meanings of work for people with visual impairments in Brazil. The study was epistemologically grounded in socioconstructionism and from the perspective of Work Psychology Theory (WPT). Through semi-structured interviews, four visually impaired people—two men and two women—with at least five years of experience in the job market, were interviewed about their work experiences. Content analysis from the perspective of Work Psychology Theory (WPT) was used to obtain the results. In this research, the objective is to present the career development process of one of the participants, identified as Cecília, and to invite reflection that encompasses the psychological and sociocultural aspects of the work experiences of people commonly marginalized in the Brazilian context. The authors pointed out that accessibility difficulties, limited job opportunities in some market segments, gender issues, lack of or insufficient assistive technology resources, and attitudinal and personnel management issues hinder the career development of people with visual impairments. Through Cecília's story, you can learn about and reflect on the career development process of people with disabilities, its opportunities and limitations, and, from this, contribute to researchers and professional and career advisors in other countries' understanding of the impacts of contextual and structural dimensions on the lives of people with disabilities from the Brazilian context.

Abstract 42

THE IMPACT OF WORKER PERFORMANCE WITH INTELLECTUAL DISABILITIES ON TEAM PERFORMANCE

Fajardo--Castro L.V.*[1], Gracia E.[1], Martinez--Tur V.[1], Arbués J.[2], Estreder Y.[1]

[1]Universitat de València ~ Valencia ~ Spain, [2]Universidad de Zaragoza ~ Zaragoza ~ Spain

Inclusive employment of individuals with intellectual disabilities (ID) represents an important yet understudied area, with limited knowledge about its impact on work teams and organizations. With this in mind, our study examined whether the daily performance of workers with ID contributes to daily team performance. This hypothesis was tested using 498 daily records from 131 workers without ID across diverse industries who worked with a coworker with ID as part of their team. They reported daily on the performance of their coworkers with ID and the team as a whole during four consecutive days of work by those coworkers with ID. Using hierarchical linear growth models with Mplus 8, the results showed that within-person variance was significant, not only for daily variance in the performance of coworkers with ID (31%) but also for the daily variance in team performance (47%). Findings also supported the hypothesized relationship between the daily performance of coworkers with ID and daily team performance, with a significant parameter estimate of 0.419 ($p < .01$). Accordingly, daily changes in the performance of coworkers with ID are significantly associated with daily team performance. On the days when the performance of coworkers with disabilities is higher, the teams' performance is also higher. The study challenges common misconceptions about the capabilities of workers with ID and highlights their meaningful contributions to team effectiveness. Theoretical and practical implications of the findings are discussed.

Abstract 102

NEGOTIATING IDENTITY AND CARE: GENDERED LABOUR AND RELIGIOUS EXPECTATIONS IN CONTEMPORARY MUSLIM HOUSEHOLDS

Farista F.*

Section of Organisational Psychology, School of Management Studies University of Cape Town Feranaaz Farista

Introduction

For many Muslim women, the transition to motherhood is shaped by the complex interplay of cultural expectations, religious identities, and gendered norms. In applied psychology, understanding how these intersecting influences affect postpartum adjustment and work re-entry is critical—particularly in contexts where caregiving is framed as both a moral and religious obligation.

Purpose

This study explores how Muslim mothers in South Africa negotiate and navigate the postpartum period and return to paid work, with a focus on identity negotiation, personal strain, and adaptive strategies. The findings underscore how perceived religious obligations and cultural norms influence maternal decision-making, mental load, and experiences of support.

Method

Drawing on Holvino's (2010) intersectional framework of simultaneity, the study adopts a longitudinal qualitative design. Semi-structured interviews were conducted with 36 Muslim mothers in Cape Town and Johannesburg during maternity leave as they prepared to re-enter the workforce and after their return. Thematic analysis was used to explore how mothers make sense of their roles and responsibilities over time.

Results

Findings reveal that many mothers experienced psychological strain as they navigated competing expectations of being a "good Muslim woman" and a competent employee. However, shifts in generational norms facilitated greater partner involvement and household negotiation. Mothers described proactive coping strategies, such as outsourcing domestic tasks, flexible work arrangements, and shared parenting agreements. These adaptations were often underpinned by evolving interpretations of religious and cultural obligations.

Conclusions

Theoretically, this research advances understanding of how Muslim mothers manage

identity tensions, role conflict/overload, and systemic barriers in their return to work. It underscores the importance of culturally responsive workplace policies and partner support in reducing maternal stress and promoting gender equity. The findings also call for a critical re-examination of how religion and culture are interpreted and enacted in everyday family life.

Abstract 4936

TRAINING IDENTITY LEADERS: THE INTERACTIVE EFFECTS OF TRAIT ALTRUISM AND EMOTION REGULATION

Bialkowski A.*[1], Ashkanasy N.[1], Collins M.[2], Hartel C.[3]

[1]The University of Queensland ~ Brisbane ~ Australia, [2]Queensland University of Technology ~ Brisbane ~ Australia, [3]Monash University ~ Melbourne ~ Australia

Research tells us that leaders who cultivate a shared sense of social identity within their teams foster cohesion, collaboration, and productivity. I employed a randomised field experiment design, to examine how leader trait altruism and self-focused emotion regulation interact to influence identity leadership performance. Drawing on the 5R identity leadership framework, I randomly assigned 339 managers either to an identity leadership training group or a control group. I tasked participants with addressing a fictional workplace scenario requiring inter-departmental cooperation, and their responses were assessed for identity leadership performance. Results indicated that participants high in altruism and low in self-focused emotion regulation displayed high identity leadership performance, compared with those low in altruism and high in self-focused emotion regulation. Results showed that high self-focused emotion regulation inhibited the expression of empathy and prosocial communication necessary for effective leadership, thus limiting the positive impact of trait altruism. These findings highlight the hitherto unknown role of self-focused emotion in regulating the relationship between trait altruism and identity leadership. My research contributes to leadership theory by integrating trait-based and social identity perspectives, offering a nuanced understanding of how personality traits and emotional dynamics influence leadership outcomes. Practically, the study underscores the value of leadership training programs, such as the abridged 5R framework, which develop prosocial behaviours while mitigating the risks of emotional over-regulation.

01 - Division 1: Work and Organizational Psychology

THE JOB APPLICANT EXPERIENCE: NEW AND EMERGING ISSUES

Thursday 23 July 2026 from 08:00 to 09:30

(O-Arsenale)

Donald Truxillo (U. of Limerick ~ Limerick ~ Ireland), Chair and Presenter

Over the last 30 years, work psychology researchers have come to recognize the value of the job applicant experience in addition to assessment validity. Over this time, the field of applicant reactions and test-taker experience has flourished. For example, we know that applicant reactions can be conceptualized in terms of organizational justice and stress, and that these reactions can affect a number of important outcomes such as organizational attractiveness, job acceptance decisions, and assessment performance. We also know that the broader societal context (e.g., pandemics; McCarthy et al., 2021) can affect reactions.

However, over these 30 years, the selection landscape has changed considerably, with a move from paper assessments to online assessment and the use of a range of new assessment such as asynchronous video interviews (AVIs), gamified assessments, and AI screening. The proposed symposium will present current and ongoing research in the following areas (with primary author/presenter in parentheses):

-The relative fairness of contemporary selection methods (Donald Truxillo)
-The development and validation of the cybersecurity knowledge scale (Andreea Corbeanu)
-The importance of keeping the “human touch” in HR, including recruitment and selection (Talya Bauer)
Selection under pressure: Applicant anxiety in the era of AI and algorithmic hiring (Julie McCarthy)

Abstract 3444

AI, AVI, OR WHAT ELSE? THE RELATIVE FAIRNESS OF CONTEMPORARY SELECTION METHODS

Truxillo D.*[1], Cavallari E.[2]

[1]U. of Limerick ~ Limerick ~ Ireland, [2]University of Pavia ~ Pavia ~ Italy

Over the last 30 years, the field of applicant reactions has grown. Early on, Steiner and Gilliland (1996) established a “hierarchy” of preferred selection procedures among job applicants. Later meta-analytic reviews (e.g., Anderson et al., 2010: Hausknecht et al., 2004) confirmed this hierarchy, with more face-valid methods (e.g., work samples) being preferred over others (e.g., honesty tests.) These applicant preferences have been further shown to be relatively consistent across cultures. However, the types of assessments used have profoundly changed over the last 30 years, including methods such as gamified assessments, asynchronous video interviews, and the use of artificial intelligence. The current study will replicate the methodological approach of the original studies to include current selection procedures, assessing them using established applicant reaction outcomes of procedural and distributive fairness and organizational attractiveness.

Abstract 3445

THE DEVELOPMENT AND VALIDATION OF THE CYBERSECURITY KNOWLEDGE SCALE

Corbeanu A.*[1], Truxillo D.[1], Bauer T.[2], Brady G.[3], Jones M.[2]

[1]U. of Limerick ~ Limerick ~ Ireland, [2]Portland State University ~ Portland ~ United States of America, [3]California State University East Bay ~ Hayward ~ United States of America

Companies have unprecedented access to candidate data, which, despite the obvious benefits, brings significant concerns about privacy. One of the large gaps in the literature is the issue of “users underestimating cybersecurity threats” (Bauer et al., 2020). Despite growing awareness around data privacy and security, many users, including candidates and companies, continue to overlook or underestimate the risks posed by cyber threats during the recruitment process. This study represents the development and validation of a Cybersecurity Knowledge (CSK) Scale, designed to assess job applicants’ CSK in selection processes. In comparison to similar existing scales, this CSK scale will be specifically developed for and valid in an online hiring context. The process follows the gold-standard practices of scale development (Hinkin, 1998; Zickar, 2020), through four stages: initial item development with the input of a computer science expert, exploring the underlying structure of CSK and further item refinement, finalising and testing the scale factor structure). Content validity is tested though an iterative item generation and review process. Furthermore, the nomological network of CSK is examined to analyse evidence for convergent and discriminant validity. Theoretical and practical implications for the CSK measure are discussed.

Abstract 3446

RELATIONAL HR PRACTICES: THE PARADOX OF HIGH TECH, HIGH TOUCH

Bauer T.*

Portland State University ~ Portland ~ United States of America

As organizations increasingly adopt advanced digital HR technologies—such as AI-driven recruitment platforms, ongoing analytics, and virtual collaboration tools—a paradox has emerged: while technology promises efficiency, it can also serve to erode the relational fabric that underpins employee engagement and organizational commitment. This paper explores the concept of relational HR practices within the evolving landscape of high-tech, high-touch human resource management. Drawing on the relational perspective of HRM, I argue that technology should not replace human connection but rather augment it by enabling more personalized and empathetic workplace interactions. This talk will present a synthesis of findings from research on relational coordination (Allen & Eby, 2012), candidate reactions (McCarthy et al., 2017), and the role of digital platforms in shaping work relationships (Leonardi, 2021), to examine how organizations can design HR systems that foster trust, empathy, and collaboration. I will highlight emerging tensions—such as algorithmic decision-making versus relational judgment—and offer a framework for tech-enabled relational HRM that balances digital scalability with human-centric values. This has implications for HR leaders navigating the future of work, suggesting that sustainable people strategies must integrate relational intelligence alongside technological innovation.

Abstract 3447

SELECTION UNDER PRESSURE: APPLICANT ANXIETY IN THE ERA OF AI AND ALGORITHMIC HIRING

Mccarthy J.*

University of Toronto ~ Toronto ~ Canada

Post-pandemic uncertainty, escalating economic pressures, and the widespread adoption of technology-mediated assessment tools (e.g., AI, gamified assessments, asynchronous video interviews) have converged to intensify stress and anxiety among job applicants. These forces have reshaped selection experiences, introducing new psychological strains linked to reduced human interaction, diminished control, and algorithmic opacity. Left unaddressed, heightened applicant anxiety can lead to negative consequences including impaired performance, lower acceptance rates, and reputational risks for organizations. These developments raise pressing questions about how anxiety manifests in contemporary hiring processes, how it intersects with constructs such as fairness and control, and what organizations can do to mitigate its negative effects.

This session will advance a conceptual framework situating selection anxiety within today's socio-technological landscape, identifying key antecedents and pathways through which anxiety emerges and influences applicant reactions. Drawing on stress appraisal theory and applicant reactions models, the framework will examine both amplifying mechanisms (e.g., reduced transparency and autonomy) and potential anxiety-reducing mechanisms (e.g., increased consistency and clarity) associated with AI-based selection methods. Notably, while AI may increase uncertainty in some contexts, it also holds potential to reduce anxiety when designed to deliver clear, consistent, and bias-mitigated decision processes. By integrating these pathways, the framework seeks to clarify the role of technology as both a source of and solution to applicant anxiety, and to stimulate research on the moderators and boundary conditions that shape these effects. The presentation will outline a research agenda highlighting opportunities to refine measurement approaches, explore individual difference variables, and examine longitudinal outcomes of selection anxiety in diverse hiring contexts. By offering a comprehensive and forward-looking perspective, this session aims to provide a foundation for future research that deepens insight into the complex interplay between technology, anxiety, and fairness in personnel selection.

01 - Division 1: Work and Organizational Psychology

FROM DECENT WORK TO SUSTAINABLE LIVELIHOODS: REGENERATIVE PERSPECTIVES

Thursday 23 July 2026 from 08:00 to 09:30

(R-Arsenale)

Stuart Carr (Massey University of New Zealand/UNESCO), Chair and Presenter
Johannes KRAAK, Discussant

The ILO and UN's Decent Work Agenda was conceptualized and introduced in the 1990s, before present crises in
costs of living (reconceptualized as non-living wages), climate change, and growing inequality (of opportunity).
Research on indecent work has tended to remain separate from research on climate change, and runaway inequality,
even though the three are systemically connected. Just Transition from unsustainable to sustainable livelihoods is an
idea that encapsulated these dynamic connections. For a livelihood to be truly sustainable, it must address all three
bottom lines, people, planet and shared prosperity. This session applies the New Diplomacy of Standard-Setting, from
Humanitarian Work Psychology, in the form of Indexing. Indexes tell us how organizations, countries, cities, and
Universities, for example, are performing. They can also motivate these groups to change their behavior. Indexing of
Livelihoods, against the thee dimensions of sustainability, which underlie the SDGs as a set, has the potential to
motivate change, and advance the SDGs themselves – and especially the primary goal, eradication of poverty, in all its
forms, everywhere. This session articulates that process, under SDG 17 – Partnerships for development, in this case
towards a Sustainable Livelihoods Index.

Abstract 3934

WHY DECENT WORK IS NOT ENOUGH: THE FUNCTIONALITY OF SUSTAINABLE LIVELIHOODS

Carr S.*

Massey University of New Zealand/UNESCO Chairs Network ~ Auckland ~ New Zealand

Work and Organizational Psychology (WOP) has arguably been studying decent work and its prevailing conditions for over 60 years, but has still not really connected with the ILO's Decent Work Agenda, which was only introduced in the 1990s. Decent Work meanwhile does not take account of the motivation to work – people do not go to work to get decent work. For thousands of years, work has been done to make a sustainable livelihood. The concept of Sustainable Livelihoods was introduced in the late 1980s, with regard to aid and development in economically poorer countries, where it was intended to highlight environmental protection. Today, we know that poverty knows no borders, and that working poverty has become the norm rather than the exception. Sustainable livelihoods matter everywhere. Decent work conditions are necessary but not sufficient for their attainment. The concept is also wide enough to take in the triple bottom line, and ESG; and thus speak truth to crises that include indecent work and working poverty, climate change which is often accelerated by work practices and in turn threatens livelihoods, and the rise, and rise, of inequality within organizations and across global supply chains.

All of these factors set the scene for a need to up our applied psychology game, as researchers, educators, and practitioners. We must make more of a contribution to sustainability of livelihoods. Indexing is one way to do this. As Systems theory and thinking suggest, an index of sustainable livelihoods may offer a visible hand with just work transitions for different generations, with career counseling, with organizational and sectoral reform, and with workforce development initiatives by governments. This invited symposium, and its distinguished speakers, are each at the cutting edge of such standard-setting for the promotion of sustainable livelihoods, through Project SLATE (Sustainable Livelihoods And The Ecosystem).

Abstract 3935

THE WHEEL OF WORK: A NEW CLASSIFICATORY MODEL FOR LIVELIHOODS

Hopner V.*

Massey University of New Zealand ~ Auckland ~ New Zealand

Since 2021, the ILO has called for human-centred and sustainable responses to countermand ongoing structural changes across the world of work, including working poverty, massed precarity and the burgeoning informal sector. Answering this call, we propose the Wheel of Work, a conceptual classification framework made up of thirteen, often interchangeable and intersecting metaphorical collars (Unfree Work, Clerical Admin, Manufacturing, Skilled Trades, Service Care, Public Service, Green Work, Armed Forces, Creative Arts, Extractive Industries, Transport Services, Robotic AI, Elite Professional).These collars identify and classify, the types of work people do, and where they do it. Encompassing sectors, industries, and livelihoods (defined as types of work activities, professions, roles, occupations or jobs), the Wheel of Work complements exisiting job and occupational classification systems.

Intending to mirror the dynamic realities in the world of work today, and through geographical specificity, the Wheel of Work could more accurately reflect the types of livelihoods undertaken in different countries and/or regions of the world. As we have seen, often excluded from existing occupational, sector, and industry labour classification standards are the 58% or 2 billion of the world's working population employed in the informal economy. Informal work includes for example up to 90% of micro and small enterprises (MSEs) worldwide (ILO, 2023). Flat-structured and circular, with interchangeable and intersecting segments, the Wheel of Work includes both the formal and informal sector, and each collar is of equal importance. The thirteen collars can further be examined singly, or in tandem, in relation to human rights at work, (in)decent work, issues of social protection, and social dialogue that supports stable, fair, and sustainable labour markets. In short, it incorporates possibilities to highlight measures that protect both people and the planet

Abstract 3936

CRITERIA FOR SUSTAINABILITY OF LIVELIHOODS

Meyer I.*

University of Cape Town ~ Cape Town ~ South Africa

This presentation introduces the Sustainability of Livelihoods Index (SL-I). The SL-I indicates through numerical values the sustainability of different livelihoods derived through work. The presentation covers how the index was developed, the assessment criteria making up the index, and concludes with application examples. Theoretically, the SL-I is grounded in the Wheel of Work model, a theoretical classification of different types of work. A diverse panel of Subject Matter Experts identified the ten most common livelihood activities within each of the 13 collars in the Wheel of Work. The index represents a sustainability rating for each of the resulting N = 130 most common livelihoods. Sustainability, here, is considered along the triple bottom line of profit, people and planet: A sustainable livelihood would thus addresses economic requirements (e.g., adequate wages, working hours and conditions); (2) benefit society; and (3) the biosphere, meaning the environment, land, sea and air. The rating is based on ten criteria for each of the sustainability aspects (profit, people, planet) derived from the applicable United Nations Sustainable Development Goals. In this way, the SL-I aligns with international development policy. Per livelihood, the index generates separate scores for each sustainability aspect and an overall sustainability score. The sustainability ranking of livelihoods through different types of work which the index enables holds benefit at multiple levels. For employers, it presents a tool to assess, develop and track the sustainability of their corporate social resoponsibility efforts. It can guide national and international policymakers and civil society to identify sustainable and unustainable labour practices, advocate and develop intervention points.

At the individual level, it shifts the focus from identifying the best person-job fit to identifying types of work which best align with a person's aspirations, and thus a new way of thinking about careers and career theory.

01 - Division 1: Work and Organizational Psychology

FROM WORKPLACE TO WORLDVIEW: NAVIGATING STRESS, STEREOTYPES, AND SOCIAL NORMS IN EAST ASIA

Thursday 23 July 2026 from 08:00 to 09:30

(P -Arsenale)

Emanuele Castano, Chair and Discussant

As societies across East Asia confront demographic shifts, cultural evolution, and economic pressures, new psychological challenges are emerging at the intersection of identity, social norms, and well-being. This symposium brings together four presentations that explore how individuals experience and negotiate these shifts—whether in the workplace or in the context of intergroup and interpersonal relations. The first presentation addresses stress and work engagement among employees and business owners in Japanese SMEs, set against the backdrop of a succession crisis that threatens economic stability. The second presentation turns to gender norms in Japan, demonstrating how exposure to counterstereotypic paternal roles can reduce implicit biases associating men with work and women with home—highlighting the power of psychological interventions in reshaping entrenched beliefs. The third presentation delves into Korean lay theories of modesty, challenging the Western notion of "modesty bias" and offering a culturally grounded understanding of modesty as a behavior that enhances social connectedness and self-esteem. Finally, the fourth presentation brings us back to Japan, and focuses on “kasuhara” (customer harassment) in Japan, examining its psychological impact on employees and introducing a novel scale to assess customer-related social stress.

Together, these contributions highlight how cultural narratives, implicit beliefs, and systemic structures shape psychological experiences across both professional and personal domains. By examining stress, identity, and interpersonal dynamics in contextually rich settings, the symposium advances our understanding of applied psychology in the East Asian cultural context.

Abstract 4066

STRESS AND WORK ENGAGEMENT AMONG EMPLOYEES AND BUSINESS OWNERS IN JAPAN

Ozaki Y.*

Toyo University ~ Tokyo ~ Japan

The shortage of successors has become a significant issue for small and medium-sized enterprises (SMEs) in Japan. One reason for this is that the number of family successions has been decreasing due to the declining birthrate and the diversification of work styles. If the current situation persists, employment and GDP may face a severe decline because of the growing number of SMEs going out of business. Therefore, the aim of this presentation is to share the findings of a study focusing on Japanese SMEs, which examined the daily stress and work engagement levels of their employees and business owners, and to discuss potential solutions for improving the situation.

Abstract 4067

EVALUATING THE EFFECTIVENESS OF EXPOSURE TO COUNTERSTEREOTYPIC FATHERS ON REDUCING IMPLICIT FATHER AND MOTHER STEREOTYPES IN JAPAN

Ohtaka M.*

Toyo University ~ Tokyo ~ Japan

Previous research has shown that exposing male undergraduates to famous fathers who defy traditional gender roles can reduce implicit stereotypes about fathers and mothers. Another study focusing on ordinary fathers as counterstereotypic models found that for individuals in their 50s with strong implicit father-mother stereotypes, such exposure also helped reduce these biases. However, in other age groups, the intervention had no significant impact, possibly because of the limited influence of the intervention. A previous study showed that presenting participants with a vivid and evocative counter-stereotypic scenario of Black-positive and White-negative, along with contingency awareness between racial categories and valence, was the most effective at reducing implicit racial stereotypes. Building on this, the present study examined whether exposing participants to ordinary fathers who had taken at least three months of childcare leave, through a similarly vivid and evocative scenario with contingency awareness, could reduce the implicit association of ‘father’ with ‘work’ and ‘mother’ with ‘home.’ Japanese adults completed the Implicit Association Test (IAT) and were randomly assigned to either a counter-stereotypic or control group based on gender and age. A total of 262 respondents (132 men and 130 women in their 20s, 30s, 40s, 50s, and 60s) were included in the analysis. The results indicated that the intervention reduced implicit associations of ‘father’ with ‘work’ and ‘mother’ with ‘home’ across all gender and age groups. In addition, participants in their 60s showed stronger associations between ‘work’ and ‘father’ and between ‘home’ and ‘mother’ than those in their 20s. However, it is unclear whether a vivid and evocative scenario can reduce implicit father-mother stereotypes even without contingency awareness, highlighting the need for further investigation.

Abstract 4068

KOREAN LAY THEORY OF MODESTY: CRITICAL ANALYSIS OF THE 'MODESTY BIAS' PERSPECTIVE AND SUGGESTIONS FOR FUTURE RESEARCH

Choi H.*

Sungkyunkwan University ~ Seoul, ~ Korea, Republic of

In this presentation, we argue that the notion of 'modesty bias' conceptualized in the West does not adequately capture the psychological core of the everyday experiences of modesty in the Korean cultural context. We surveyed the lay theory of modesty among Korean adults (N = 167) and content analyzed the responses. From this, we found two higher-order conceptual categories (other/relation focus, self-focus) that include a total of seven major components pertaining to the definition of modesty (Study 1). In an independent sample of Korean adults (N = 500), we obtained evidence that the seven components driven from the lay theories reflect the Koreans' understanding of modesty (Study 2). In Study 3 (N=161), we experimentally tested the effects of a modesty behavior congruent with the lay theory (vs. a self-deprecating behavior) on social connectedness and state self-esteem. We found that, as compared to the self-deprecating behavior, the modesty behavior promoted perceptions of social connectedness and state self-esteem. We also found that the modesty behavior led to perceptions of social connectedness, which in turn led to higher levels of sate self-esteem. We discuss implications of these findings for research on modesty in social and cultural psychology.

Abstract 4069

KASUHARA: THE PSYCHOLOGY OF THE UNRULY CUSTOMER AND ITS CONSEQUENCES IN THE BUSINESS ENVIRONMENT

Kiriu M.*

Toyo University ~ Tokyo ~ Japan

Kasuhara (カスハラ) is a Japanese term derived from "kasutamā harasumento" (カスタマーハラスメント), meaning customer harassment. It refers to abusive behavior from customers toward workers, especially in retail, hospitality, and service industries. Examples include unreasonable demands, verbal abuse, or threats. As Japan traditionally values politeness and customer satisfaction, workers often endure such treatment in silence. However, growing awareness of mental health and labor rights has led to public discourse on protecting employees. Companies and governments are beginning to implement policies to address kasuhara, aiming to balance customer service expectations with worker dignity and well-being, but it remains a serious workplace issue the causes and consequences of which need to be better understood. Here I report results from a series of empirical studies, the largest of which (N = 33,133) was carried out in collaboration with Japan's largest trade union in 2024. These data highlight differences between industries in the frequency and characteristics of the phenomenon, the role of the personality of the assaillant, and the psychological cost for the victim. I will also present the newly developed "Customer-Related Social Stress Scale" to examine the negative impact of 'KASAHARA' on employees and the relationship with stress levels and work engagement for a comprehensive discussion.

UNIVERSITY STUDENTS' EMPLOYABILITY AND SCHOOL-TO-WORK TRANSITIONS: A GLOBAL PERSPECTIVE

Thursday 23 July 2026 from 09:30 to 11:00

(T-Monumentale)

Patton Garriott, Chair and Discussant

Abstract 4808

Proactive Career Behavior and Perceived Employability among Turkish Undergraduates: Test of a Social Cognitive Model

Çarkit E.*, Lent Robert W.

Psychological Counseling and Guidance Program at the Faculty of Education, Nevşehir

We will present two studies testing a social cognitive model of proactive career behavior among Turkish undergraduates. In the first study (N = 252 Turkish undergraduates), we adapted measures of proactive career behavior, self-efficacy, and outcome expectations, originally validated with workers, by framing them in the college context. Consistent with their prior use in worker samples, we found that each measure was well-represented with a higher order structure and four first order factors (career planning, skill development, career consultation, and network-building). In the second study, we used the adapted measures to test a social cognitive self-management model in predicting perceived employability in an independent sample of Turkish undergraduates (N = 499). Prior to model testing, we adapted a measure of perceived employability, finding that it produced a one-factor structure in an exploratory factor analysis with a sub-sample of Turkish undergraduates (n = 200); this structure was replicated in a confirmatory factor analysis in a second sub-sample (n = 299).

Structural path analysis results showed that engagement in proactive career behaviors was well predicted by self-efficacy, outcome expectations, career support, and proactive personality. Proactive career behavior engagement was, in turn, strongly predictive of perceived employability. We will discuss implications of our findings for future research and for practical efforts to promote the perceived employability of undergraduates.

Participation in ICAP26 for the presentation of this study was supported by TÜBİTAK under the 2224-A Grant Program for Participation in Scientific Meetings Abroad.

Abstract 4809

Graduate Employability and Early-Career Transitions in Italy

Petruzziello G.*

Junior Assistant Professor in the Department of Psychology at the University of Bologna ~ Bologna ~ Italy

The transition to the labour market is a critical developmental stage for Italian students and graduates, and it remains particularly complex. Structural factors (e.g., high youth unemployment, university curricula-industry mismatch, and shortages of employability capital) contribute to uncertain early-career pathways for many graduates. Within this context, understanding the factors that support university students' employability in the contemporary labour market and a sustainable transition stage has become a key issue for research and practice.

This contribution provides a general overview of the most pressing issues and challenges in the university-to-work transition in the Italian context. Specifically, building on empirical research conducted with Italian students and graduates, this presentation will highlight how personal resources (e.g., employability-related capitals) and contextual features (e.g., university support) influence employment potential and perceptions of employability. In light of disruptive technological changes affecting career development issues, the talk will discuss how AI-based technologies may influence job search processes and employability-related behaviours among students and graduates. Moreover, this contribution will address factors that affect expectations for a sustainable transition to work among Italian students with Specific Learning Disorders.

Overall, this contribution aims to provide an integrated perspective on employability in the Italian context and to highlight implications for research and practice in applied psychology. In particular, this presentation will provide recommendations for universities, career services, and policy initiatives to support students' career development in a rapidly evolving labour market.

Abstract 4810

Sustainable Start to Graduate Careers when Under Financial Stress: Testing the Efficacy of Career Competencies

Okay--Somerville B.*, Scholarios D., Luchinskaya D., Anderson P., Hurrell S.

Senior Lecturer in the Adam Smith Business School at the University of Glasgow ~ Glasgow ~ Scotland

This presentation examines the impact of financial stress at the time of graduation on the efficacy of career competencies for enhancing university graduates' sustainable career outcomes. Sustainable careers theory (De Vos et al., 2020) and the psychological framework of scarcity (Mullainathan & Shafir, 2013) were used in developing a conceptual model. The analyses are informed by two-wave data (at the time of graduation and one and a half years after graduation) from the 2020-cohort of graduates in the UK, i.e., 'the COVID cohort). Findings show that career competencies are significantly associated with sustainable career outcomes (H1), and that person-career fit plays a pivotal role in this relationship, particularly for life satisfaction (H2). Moreover, high financial stress at the time of graduation amplifies the positive impact of career competencies on life satisfaction (happiness) via career fit (H3).

We found no evidence of an attenuating effect of high financial stress. The findings suggest that career competencies may have a stronger compensatory role for achieving career sustainability for those who experienced financial stress, in comparison to those who did not. Our discussion focuses on the implications these findings for understanding the critical contingency role financial stress plays on individuals' experience of careers, in particular their opportunities for a sustainable start to careers. The discussion also acknowledges the contributions of this research for understanding financial stress in early careers. We conclude with consideration of practical implications, study limitations and considerations for future research. Notably, findings show individual and societal value of investment in career resources, particularly for those who may not have strong financial safety-nets.

01 - Division 1: Work and Organizational Psychology

O LEADER, WHERE ART THOU: NEW DIRECTIONS IN LEADERSHIP RESEARCH

Thursday 23 July 2026 from 09:30 to 11:00

(O-Arsenale)

Pedro Neves (Nova School of Business and Economics ~), Chair

The study of leadership has always been at the core of organizational psychology. The influence of leaders in the regular functioning of organizations is undeniable. In this symposium, we gather a collection of four presentations that advance our knowledge by examining multiple aspects of the leadership process. We not only apply different theoretical lenses to interpret leadership behaviors, by examining specific facets such as inclusive leadership, implicit leadership theories, and leader ego depletion, but we also discuss leadership in practice by looking into the implementation of a leadership training program. Relying on social information processing theory, the first presentation (Andretta & Story) will focus on inclusive leadership and examine a trickle-up model that includes perceptions of leaders, supervisors, and followers. We will follow by exploring the link between implicit leadership theories and abusive supervision (Velez), namely by examining their combined effects on employee deviant behaviors. Our third presentation (Dimas, Meneses Junior & Coelho) draws on job demands-resources theory to investigate how and under what conditions leader ego depletion influences team effectiveness. Our fourth presentation (Foster) will introduce the structure and content of a program designed to develop leadership skills for UN supervisors. These contributions will be discussed by Professor Serge da Motta Veiga, Professor at NEOMA Business School and Editor of AP:IR, who will integrate these findings and emphasize the importance of narrowing the gap between research and practice in our understanding of leadership behaviors.

Abstract 3620

INCLUSIVE LEADERSHIP AND LEADERSHIP EFFECTIVENESS: A TRICKLE-UP MODEL OF MODERATED MEDIATION WITH MULTIPLE SOURCES

Andretta D., Story J.*

Sao Paulo School of Business Administration, FGV EAESP ~ São Paulo ~ Brazil

Diversity and inclusion have become central priorities for organizations, shaping both social agendas and organizational research. In this context, leadership plays an important role in creates an environment that embraces this approach as a fundamental value. Inclusive leadership is a style characterized by valuing individual differences, fostering a sense of belonging, showing appreciation and promoting organizational diversity initiatives. While previous studies have focused largely on the outcomes of inclusive leadership for employees and organizations, less attention has been given to the effects on the leader and the mechanisms through which leadership effectiveness is perceived.

Drawing on Social Information Processing (SIP) theory, this study investigates how leaders' self-perception of inclusive leadership affects followers' and supervisors' perceptions of leadership effectiveness. We propose a trickle-up model in which followers' evaluations mediate the relationship between leaders' inclusive behaviors and supervisors' perceptions. Additionally, we examine leader anti-discrimination behaviors as a boundary condition that strengthens these relationships.

Data were collected from 45 leaders, their 45 supervisors, and 158 followers in Brazilian organizations, using validated self-report and observer-based questionnaires. Mediation and moderation analyses were conducted using SPSS PROCESS to test direct and indirect effects of leaders' inclusive self-perceptions on leadership effectiveness. Our findings indicate that leaders' inclusive self-perception conveys social cues that positively influence followers' evaluations, which in turn inform supervisors' perceptions of leadership effectiveness. High levels of anti-discriminatory behavior further enhance this relationship.

This research advances the literature by highlighting multi-level mechanisms, emphasizing leader-centered perspectives on inclusive leadership, and demonstrating how social cues within teams contribute to perceptions of effective leadership, with practical implications for fostering inclusive, fair, and high-performing organizational environments.

Abstract 3621

THE ROLE OF IMPLICIT LEADERSHIP AND FOLLOWERSHIP THEORIES IN ABUSIVE SUPERVISION PERCEPTIONS AND OUTCOMES

Velez M.J.*

ISCTE ~ Lisboa ~ Portugal

Little research attention has been devoted to employees' implicit leadership theories as an antecedent of abusive supervision perceptions. Specifically, we suggest that the prototypic dimensions are positively related to abusive supervision perceptions, contrary to the antiprototypic dimensions. Additionally, we suggest that implicit followership theories act as a moderator in the relationship between abusive supervision and deviant behaviors, since beliefs about followers' personal attributes and characteristics affect the way subordinates behave. Thus, we propose that prototypic followers are less prone to retaliate directly against abusive supervisors, however, they retaliate indirectly through turnover intentions.

Participants were 367 supervisor-subordinate dyads from different organizational settings. Bootstrapping results indicate that the prototypic dimensions are significantly related to abusive supervision perceptions and that abusive supervision is significantly related to deviant behaviors when prototypical or positive second order IFTs factor was low ($t=3.15$; $p<.05$), but not when it was high ($t=-.52$; $p>.05$). Contrary, abusive supervision is significantly related to turnover intentions when prototypical or positive second order IFTs factor was high ($t=4.22$; $p<.05$), but not when it was low ($t=-.34$; $p>.05$).

Research results indicate that employees' prior expectations and cognitive prototypes influence not only abusive supervision perceptions, but also abusive supervision outcomes. Specifically, the current study provides support for Lord and Maher's (1993) suggestions that employees use implicit leadership theories as an uncertainty reduction mechanism and compare their actual supervisor with their implicit profile to evaluate his/her behavior (Epitropaki & Martin, 2005). This research makes several contributions for theory and practice. Firstly, it expands the content domain of abusive supervision research and highlights the relevance of employees' schema to abusive supervision perceptions and consequences. Secondly, it is useful for managers to know that abusive supervision may affect employees differentially, depending on employees' prior expectations and schema.

Abstract 3622

WHEN LEADERS RUN LOW: HOW EGO DEPLETION SHAPES TEAM EFFECTIVENESS

Dimas I.*[1], Avilton Meneses Junior R.[2], Fernandes Coelho F.J.[1]

[1]Universidade de Coimbra, CeBER, Faculdade de Economia ~ Coimbra ~ Portugal, [2]Universidade de Coimbra, CeBER ~ Coimbra ~ Portugal

Introduction: Leaders face a range of challenges and significant responsibilities, including making decisions under pressure, dealing with peer conflict, and responding to external demands. These demanding responsibilities often lead to ego depletion. Given the leader'scentral role within the team, LED is likely to negatively impact team functioning and results.

Purpose: Drawing on the Job Demands-Resources (JD-R) theory, this study investigates how leaders' ego depletion influences team performance. Team potency is proposed as a mediating mechanism between leader depletion and team performance. Additionally, we examine leaders' identification with their teams as a contingency factor that shapes the impact of ego depletion on team performance.

Method: The research model was tested using data from 282 teams in public organizations, collected from two sources across three time points with a one-month interval between each. At Time 1, leaders reported their levels of ego depletion and identification with their teams; at Time 2, team members assessed team potency; and at Time 3, leaders evaluated team performance. The measurement model was tested through Confirmatory Factor Analysis in IBM AMOS 29, while the conceptual model was tested with the PROCESS macro (model 7) in IBM SPSS 29.

Results: We found that leader ego depletion was negatively related to both team potency and team performance. In addition to the direct effect on performance, an indirect negative effect through team potency was also observed. Furthermore, the results suggest that the more strongly leaders identify with their teams, the greater the impact of ego depletion on team potency.

Conclusions: These findings highlight that leader ego depletion, apart from the known negative effects on an individual's outcomes, is also detrimental for team functioning and performance.

Abstract 3623

APPLIED PSYCHOLOGY IN PRACTICE: DEVELOPING LEADERSHIP SKILLS FOR UN SECURITY SUPERVISORS

Foster L.*

North Carolina State University ~ Raleigh ~ United States of America

Applied psychology provides valuable insights for leadership development, including when individuals transition into supervisory roles for the first time. This presentation highlights how psychological science was applied in practice through a collaboration between the International Association of Applied Psychology (IAAP), the United Nations Institute for Training and Research (UNITAR), and the United Nations Department of Safety and Security (DSS).

The initiative engaged newly promoted UN security sergeants, men and women from diverse cultural backgrounds, who were assuming supervisory responsibilities in a high-stakes, multicultural environment. To support their development as leaders, IAAP delivered a workshop focused on listening and feedback.

Grounded in research, the workshop emphasized active listening and constructive feedback as essential supervisory skills. Participants explored why listening can be difficult, how to strengthen active listening, and the characteristics of effective feedback. Practical models for delivering feedback were introduced, linking the science of leadership to participants' supervisory challenges.

The training underscored how applied psychology can strengthen leadership capacity where effective communication is vital not only for organizational performance, team cohesion, and individual well-being, but also for those security supervisors interact with daily. Visitors, dignitaries, diplomats, and others ultimately benefit when supervisors are better equipped to listen, respond constructively, and lead effectively. The initiative also highlighted how psychology can be applied in contexts not traditionally associated with the discipline, such as leadership development within multilateral security operations. It showed the value of partnerships between psychology organizations and UN entities, bringing psychological science to audiences who may not otherwise have direct access.

This case illustrates the power of applied psychology to inform leadership development in demanding contexts and to bridge the gap between research and practice on a global stage.

01 - Division 1: Work and Organizational Psychology

DECENT WORK IN THE AGE OF PRECARITY

Thursday 23 July 2026 from 09:30 to 11:00

(R-Arsenale)

Maureen Kenny (Boston College ~ Chestnut Hill, MA 02467), Chair and Presenter
David Blustein, Discussant

Access to decent work has been threatened by rapid social, economic, technological and political
change and societal structures that sustain social marginalization and economic inequities and
foster a sense of anxiety and precarity. A growing body of research has focused on
understanding the structural and psychological factors that limit access to decent work with the
goal of expanding access and equity through systemic and person level intervention. This
symposium seeks to advance this research by disseminating recent and novel research from
leading scholars aligned with the lens of psychology of working. The three papers included in this
symposium examine structural barriers associated with gender, social class, nationality, and
experiences of discrimination in access to technological careers, in navigating successful
transitions from school to work, and perceptions of decent work among unemployed persons.
Taken together the three presentations deepen and broaden awareness of the structural factors that constrain access to decent work in an age of precarity and emphasize the need for structural
and policy change and for intervention that promotes individual strengths, including personal
agency, vocational identity, and career adaptability, for countering precarity and navigating societal challenges.

Abstract 4244

ENHANCING DEVELOPMENTAL AND CULTURAL UNDERSTANDINGS THROUGH PSYCHOLOGY OF WORKING (PWT)

Kenny M.*

Boston College ~ Chestnut Hill, MA ~ United States of America

As an introduction to the overall symposium, this presentation will describe the precarity that characterizes contemporary society and the workplace and describe the challenges for workers and young people who hope to access decent work and lives of fulfillment. The presentation will discuss how the psychology of working framework can guide research and practice that seeks to prepare young people and the unemployed
workers to meet these challenges. The three research presentations constituting this symposium enhance understanding of decent work, decent education, and the school-towork
transition, with implications for person level and systemic intervention for enhancing access to decent work in an age of precarity.

Abstract 4245

DOES DECENT STUDY LEAD TO DECENT WORK? FEMALE STEM STUDENTS' PERSPECTIVES

Cinamon R.G.*

Tel Aviv University ~ Tel Aviv, ~ Israel

The underrepresentation of women in STEM fields presents a moral and economic challenge, as it leads to the loss of talented minds and workers. Bridging the gender gap
in STEM education and employment is both an ethical imperative and a practical necessity.
Drawing on the Psychology of Working Theory (PWT; Duffy et al., 2016), this longitudinal mixed-methods study explores how female STEM students experience their studies and prepare for entry into the labor market. It examines how individual and contextual factors contribute to their ability to attain decent work after graduation.
The qualitative component includes semi-structured interviews with 28 Israeli female undergraduate STEM students (Mean age = 26.98; SD = 2.90), conducted six months before and after graduation, focusing on their career aspirations and job search experiences. Findings reveal that male faculty members often behave unequally toward female students, conveying direct harm and signaling to peers that such behavior is acceptable. This creates a hostile environment in which female students report feeling insecure and marginalized.
The quantitative component involved 387 participants (Mean age = 25.91; SD = 2.05). It assessed the impact of marginalization and economic constraints (measured before graduation) on occupational outcomes six months after graduation. Key individual traits examined were proactive career behavior and self-efficacy in managing work-family conflict.
Regression analysis showed that four factors significantly predicted decent work outcomes at follow-up, accounting for 25% of the variance: employment during studies (β = .21*), experiences of gender-based exclusion (β = –.15*), supportive peer relationships (β = .12), and self-efficacy in managing work-family roles (β = .22*).
Findings underscore the importance of addressing structural inequality in academic environments and enhancing individual agency to promote equitable access to decent work.

Abstract 4246

TRANSITIONING FROM EDUCATION TO DECENT WORK: EMPIRICAL INSIGHTS

Masdonati J.*

Institute of Psychology, University of Lausanne ~ Lausanne ~ Switzerland

For over a decade, the concept of decent work has gradually become pivotal to theoretical thinking and research in vocational psychology, particularly through the Psychology of Working Framework and Theory (PWT, Duffy et al., 2016). Early PWT-based literature has focused on contextual and psychosocial predictors of adults' access to decent work, then on its outcomes on careers and well-being. Adopting a developmental approach, further efforts have highlighted the characteristics of a successful school-to-work transition (STWT), seen as a critical first step towards decent work. This has led, for example, to a PWT-inspired model of the STWT (Masdonati et al., 2022) which, since its publication, has received significant, albeit fragmented, empirical support. In this paper, we provide a structured overview of this evidence, with the aim of highlighting the factors and processes that most consistently shape the transition from education to decent work. First, large-scale international surveys (e.g., OECD, 2024) offer strong evidence for the predictive power of young adults' socioeconomic status, gender, and nationality on the quality of their STWT. Second, more situated quantitative longitudinal research (e.g., Thouin et al., 2023) corroborates other associations, such as the importance of work experiences during the school years in anticipating entry into the labor market. Third, both qualitative and interventional studies (e.g., Kenny et al., 2022) point to the need to adopt an idiosyncratic and culture-sensitive perspective in understanding and supporting transition processes. Overall, our findings support the impact of contextual forces on the likelihood of successfully navigating

critical stages of a career path. They also confirm that psychosocial, identity, and educational
factors shape STWT experiences and subsequent access to decent work and meaningful careers.

Abstract 4247

PERCEPTIONS OF DECENT WORK AMONG UNEMPLOYED INDIVIDUALS IN PORTUGAL. A PERSPECTIVE FROM THE PSYCHOLOGY OF WORKING THEORY

Ferreira J.*, Paixão M.P., Rabaça J.

Faculty of Psychology and Education, CINEICC, University of Coimbra ~ Coimbra, ~ Portugal

The primary aim of this study was to investigate the predictors and outcomes of perceptions of decent work among unemployed individuals in Portugal, with a focus on policy and practice implications for facilitating the transition from unemployment to decent work. The conceptual framework guiding this research was the Psychology of Working Framework (PWF; Blustein, 2006) and the Psychology of Working Theory (PWT; Duffy et al., 2016). PWT represents an innovative approach, shifting the focus of work-related perspectives from privileged groups with access to the labor market to those facing significant challenges in the workplace (Blustein et al., 2018).
Key predictors examined included economic constraints, career adaptability, volition at work, active job search, and daily discrimination, while outcomes comprised need satisfaction and overall well-being. Data were collected from 1,013 unemployed participants, aged 18 to 67, with 628 (62%) identifying as female and 385 (38%) as male. To evaluate the instruments, the sample was randomly divided into two groups. The findings demonstrated robust psychometric properties across all instruments. Additionally, career adaptability (concern) and daily discrimination emerged as the primary predictors of perceptions of decent work for both women and men. Meeting basic needs was found to significantly impact positive and negative affect, as well as life satisfaction.
This study underscores the critical importance of developing new decent work policies in Portugal, which hold the potential to play a central role in integrating and reintegrating unemployed individuals into the labor market. Such efforts are highlighted as a social responsibility for employers and policymakers at both national and local levels.

WHEN AGE-FRIENDLY ORGANIZATIONAL CLIMATE MATTERS: A MODERATED MEDIATION MODEL OF THRIVING AT WORK, SOCIAL CAPITAL, AND OCCUPATIONAL FUTURE TIME PERSPECTIVE

Zhou Y.[1], Xu X.[1], Wang M.*[2], Tian Y.[2]

[1]The Chinese University of Hong Kong, Shenzhen ~ Shenzhen ~ China, [2]Xi'an Jiaotong Liverpool University ~ Suzhou ~ China

Introduction: The proportion of people aged over 65 is expected to double from 12% in 2015 to 22% by 2050 (United Nations, 2024), making an aging, multi-age workforce one of the greatest challenges for organizations. To respond to this demographic change, organizations are increasingly interested in creating an age-friendly climate to retain and develop multi-age employees' knowledge, skills, motivation, and effort.

Purpose: The present study aims to investigate how age-friendly organizational climate influences employees' task performance and organizational citizenship behavior toward individuals (OCBI). Drawing upon social exchange theory, we propose that age-friendly organizational climate may be perceived as valuable organizational investments, prompting employees to reciprocate with improved performance and OCBI through two mediating pathways (i.e., thriving at work and social capital). The indirect effects may be mitigated by occupational future time perspective, as employees with an open-ended perspective may rely more on future occupational opportunities and less on organizational climate.

Method: We conducted a two-wave, time-lagged survey of 396 full-time employees. The hypothesized moderated mediation model was tested using structural equation modeling.

Results: We found that age-friendly organizational climate was positively related to thriving at work and social capital, which in turn positively linked to task performance and OCBI. Occupational future time perspective mitigated the relationships between age-friendly climate and both thriving at work and social capital: the positive effects were weaker among employees with a more open-ended occupational future time perspective and were stronger among employees with a more constrained occupational future time perspective.

Conclusions: An age-friendly organizational climate can improve employees' in-role performance and increase extra-role behaviors, particularly for employees who perceive their occupational future time as more limited. These findings inform the development of age-inclusive human resource practices that benefit employees across different ages.

Abstract 298

ORGANIZING WORK SOLIDARITY IN SEARCH OF “ALTERNATIVE” APPROACHES: THE ITALIAN EXPERIENCE

Garigali I.*, Galuppo L., Piria M., Bonanomi A.

Università Cattolica del Sacro Cuore di Milano ~ Milano ~ Italy

Introduction: The contribution addresses the phenomenon of work solidarity within the Italian context, which is characterised by growing inequalities and diverse types of employment. Whilst trade unions find it challenging to offer solutions, "alternative" forms of organizations are emerging. These are driven by the desire to enhance workers’ solidarity along a continuum ranging from individual empowerment to political development and mobilisation.
Purpose: The contribution is part of a wider research project that aims to map and understand the characteristics, actions and impacts of grass-roots organisations committed to address work inequalities in Italy. The presentation will discuss the profiles of these organisations, their approaches to solidarity and their distinctive challenges.
Method: To achieve the first objective a desk analysis was carried out (via consultation of major web search engines), integrated with exploratory interviews with key informants. Afterwards, to achieve the second objective, a cluster analysis was carried out on the mapped contexts, identifying different groups of solidarity organizations.
Results: via the mapping and cluster analysis of the 37 selected cases, four different organizational profiles are identified (ie: community-based, progressive, value-based and purpose-based organizations). The findings suggest that work solidarity is a nuanced and multifaceted experience, sustained by different organizational identities and strategies. Some solidarity organization are defined by traditional approaches to representation, a precise focus on individual empowerment and more exclusionary boundaries. Other, more “counter-hegemonic” ones, are characterized by a “solidarity in difference” approach, recognizing the value of their members’ differences and integrating social with political mobilization.
Conclusions: The contribution provides a critical reflection on contemporary work solidarity and its organisation, analysing how variety and critical tensions emerge in a process of constant evolution and redefinition of the concept of 'work solidarity' itself, as evidenced by the Italian experience.

Abstract 1014

HIGH- AND LOW-IMPACT ENVIRONMENTAL MEASURES IN ORGANIZATIONS. A BOTTOM-UP TAXONOMY.

Gemmecke C.*[1], Kühner C.[2], Schäpers P.[3], Hüffmeier J.[4]

[1]TU Dortmund University ~ Dortmund ~ Germany, [2]Leipzig University ~ Leipzig ~ Germany, [3]Münster University ~ Münster ~ Germany, [4]TU Dortmund University & University of Agder ~ Dortmund & Kristiansand ~ Germany

Introduction:
Various ecological crises pose a threat to humanity, highlighting an urgent need for action. Key levers in taking action are (sustainable) companies, accounting for a considerable share of global greenhouse gas emissions (Unsworth et al., 2021). Given the progression of environmental crises, companies should adopt high-impact environmental measures to achieve a maximum environmental benefit. While the importance of high-impact measures is widely recognized, it remains unclear which specific measures have a high-impact and why such measures are not always implemented during the founding phase.

Purpose:
Entrepreneurs are a particularly interesting group to study because they have maximum freedom in decision-making during the founding phase of new companies. In this study, we investigate which high- and low-impact environmental measures entrepreneurs identify for their companies and which facilitating conditions and barriers may promote the implementation or prevent them from implementing these measures.

Method:
We conducted a two-staged qualitative Prolific survey targeting U.S. entrepreneurs (N = 102) and analyzed the data using the Gioia (2012) method. The median response time of the second survey stage was 52 minutes.

Results:
We developed a taxonomy of high- and low-impact environmental measures, including their facilitating conditions and barriers. The two most prominent high-impact measures are waste minimization strategies and transition to renewable energy. The implementation of environmental measures was, e.g., facilitated by economic advantages, sustainable boundary conditions, and an organization's pro-environmental climate. Conversely, the absence of these conditions hindered implementation. Moreover, what is a high-impact environmental measure varies across industries. However, high- and low-impact measures were implemented equally often.

Conclusions:
Consequently, entrepreneurs may not prioritize high-impact measures over low-impact measures when pondering which to implement. Our taxonomy enables scientists, entrepreneurs, and managers to identify high-impact environmental measures in organizations and to support their effective implementation by considering the facilitating conditions and identified barriers.

Abstract 947

VALIDATING SUSTAINABLE HR PRACTICES SCALE USING THE TRIPLE BOTTOM LINE FRAMEWORK: INTEGRATING PERFORMANCE ENHANCEMENT, EMPLOYEE SUPPORT, AND GREEN HR

Israr A.*, Villajos E.

University of Valencia, Faculty of Psychology and Speech Therapy ~ Valencia ~ Spain

Introduction and purpose: As business complexity increases, Sustainable Human Resource Management is now both a legal and ethical obligation for CSR. Despite its recognition, the HRM field lacks validated tools for measuring and implementing sustainable practices. While frameworks like the Triple Bottom Line (TBL) promote a balance of economic, environmental, and social factors, the absence of empirical measurements hinders practical application. This study addresses this gap by refining and validating a Sustainable HR Practices Scale based on previous studies which aligns with the TBL framework, operationalizing three key dimensions: Employee-Support (People), Performance-Enhancement (Profit), and Green HR Practices (Planet).

Methods: The research include two studies using data gathered from Spain, encompassing a cross-sector sample of 741 employees (2021) and a data cohort from social economy sector (1,589 at the end of 2022; 562 in mid-2023). The study implemented comprehensive statistical analyses, including EFA and CFA, reliability, and validity testing to ensure the scale's structural integrity. Different models were employed, tested and compared to find the best fit one.

Results: The hierarchical second-order CFA model (10 first-order factors loading onto 3 TBL-aligned bundles) confirmed structural validity (RMSEA = .06, CFI = .91) and had a good fit. Thus, the model of three bundles of practices with ten HR practices, has been confirmed and validated as an assessment tool. All psychometric results including Alpha, Omega, Rho, Split-Half and Test-retest reliability are robust. Additionally, there was consistently strong evidence for convergent, predictive, and criterion validity.

Conclusions and implications: This research offers organizations a practical tool that not only enhances academic discussions, but also provides practitioners with a validated tool to foster significant, data-driven advancements in sustainable HRM.

Abstract 161

WEAVING GREEN THREADS: EMBEDDING SUSTAINABILITY IN WORK ORGANIZATIONS

Villaluz V., Caringal--Go J.F., Teng--Calleja M.*, Catan M.G., Gutib M.V., Bagaman M.T.

Ateneo de Manila University ~ Quezon City ~ Philippines

Organizations increasingly realize the value of integrating sustainability in their strategic directions and value-creation processes. Aligning organizational norms, structures, systems and processes with the ESG (environment social and governance) framework is crucial in ensuring that leaders and employees uphold their commitment to the organization's goal of having a sustainable future. Using a multi-case study approach, this study examined recent annual sustainability reports and collected data through semi-structured interviews with sustainability leaders of seven business organizations in the Philippines, a developing country in Southeast Asia that consistently experiences environmental and socio-economic challenges. Results of the reflexive thematic analysis and cross-case comparison illustrate how external conditions (e.g. government regulations and environmental threats) and internal realities (e.g. operations and financial resources) shape how sustainability initiatives are carried out in these companies. Findings also demonstrated how sustainability is integrated in the organization's Mission and Goals that then sets direction for Leadership and Governance. At the core of the sustainability efforts are Strategic Initiatives (e.g. culture building; stakeholder engagement; institutionalizing sustainable practices and systems), that highlight concrete actions undertaken by the organizations to materialize its sustainability commitments. To evaluate the success and ensure accountability, organizations rely on Data and Metrics (e.g. key performance indicators) that orient the refinement of initiatives and guide further actions. This study contributes to applied psychology by offering a model for embedding sustainability within organizations, particularly in the context of a developing nation. The findings highlight the critical role of leadership in shaping organizational behavior and fostering a commitment to sustainability, offering practical implications for promoting environmentally and socially responsible practices in diverse organizational settings. This research underscores the application of psychological principles in understanding and driving organizational change towards a sustainable future.

Abstract 1955

WHAT FUELS SUSTAINABLE HRM IN STARTUPS? LINKING FOUNDER VALUES, SUSTAINABLE LEADERSHIP, AND HRM PRACTICES TO EMPLOYEE OUTCOMES

Zoha W.*, Garcia F.J.

University of Valencua ~ Valencia ~ Spain

Introduction: Sustainability has moved from the margins to the core of organizational strategy, extending beyond green technologies to how people are managed. Yet, while Sustainable Human Resource Management (SHRM) is well-studied in large firms, its role and drivers in startups remain underexplored. With over 150 million startups worldwide and their growing socioeconomic impact, addressing this gap is critical.
Purpose: This study investigates the relationship between founders' value-based motivation for sustainability and the adoption of SHRM policies and practices in startups. It further examines how SHRM influences workplace well-being and affective organizational commitment, and whether managerial sustainable leadership behaviors moderate these relationships.
Method: A cross-sectional survey was conducted with 91 non-founder employees across 68 global startups. Data was collected using validated scales, and organizational-level analyses tested both direct and moderating effects.
Results: Findings reveal that founder value-based motivations significantly predict the implementation of SHRM practices, which in turn positively affect workplace well-being and affective commitment. However, sustainable leadership behaviors of managers did not moderate these relationships. Among SHRM policies, Diversity & Equal Opportunities and Attraction & Retention emerged as particularly impactful.
Conclusions: Results identify the founder as a normative architect of culture, consistent with imprinting and sustainability theories grounded in ethical responsibility and social justice. Rather than profit motives, SHRM in startups is driven by deliberate, values-based leadership. This positions them as not mere risky ventures but as laboratories for people-centered sustainability, with lessons extendable to organizations of all sizes. By emphasizing the human and psychological foundations of SHRM, this study advances entrepreneurial and organizational sustainability literature. It offers practical guidance for founders and managers on how to drive SHRM, for HR professionals to design low-cost, impactful systems, and for investors to recognize people-centered sustainability as a marker of resilience

01 - Division 1: Work and Organizational Psychology

HUMAN CAPITAL SUSTAINABILITY LEADERSHIP SCALE FOR HEALTHY ORGANIZATIONS

Thursday 23 July 2026 from 11:00 to 12:30

(O-Arsenale)

Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Chair
José María Peiró, Discussant

Healthy Organizations emphasize the value of the virtuous circle of successful performance and healthy workers for healthy business. This perspective is aligned with the happy-productive worker model (Cropanzano & Wright, 2001; Peiró et al., 2019, 2021) highlighting a synergetic crucial relationship between well-being and work-related outcomes, also supporting the well-being movement (Robertson & Cooper, 2010) and the crucial role of mental health (Kelloway et al., 2023) in organizations. In a Healthy Organizations framework, new forms of leadership and management of human resources have been introduced as the Human Capital Sustainability Leadership (HCSL; Di Fabio & Peiró, 2018a). The HCSL emphasizes the promotion of healthy people as flourishing and resilient workers, fostering organizational contexts as sustainable and high-performing environments. Based on a focus on relationships and awareness, the HCSL can express itself not only as formal but also as informal leadership, and in different contexts.

The HCSL is also aligned with the Sustainability Science (Komiyama & Takeuchi, 2006; Sahle et al., 2025; Takeuchi et al., 2017), and Sustainable Development Goals of the United Nations Agenda 2030 (SDGs) using psychological lens and the framework of the psychology of sustainability and sustainable development, to promote positive organizational environments characterized by valorization of human resources, enhancing mental health and well-being.

The interest for the HCSL is progressively increasing. At the moment are available the Malaysian version (Seok, Ching, & Ismail, 2021), the Japanese version (Tani, Tsuda, Tanaka, Hashimoto, & Shirataki, 2025); the Argentinian version (Vaamonde & Peiró, 2025), and other versions are in progress in other countries.

The first contribution by Yoshiyuki Tanaka, Akira Tsuda, and Kanae Tani will highlight the value of HCSL for Japanese managers' own mental health.

The second contribution by Chua Bee Seok and Rosnah Ismail will underline the contribution of HCSL and individual differences in promoting flourishing.

The third contribution by Charles Tchagneno will offer the French-language validation of the Human Capital Sustainability Leadership Scale, continuing to open opportunities in a cross-cultural perspective.

The fourth contribution by Carpintero et al. deals with the adaptation of the Spanish version of the Scale for Spain, focusing on the appraisal of the supervisors' leadership by their employees.

As discussant, José María Peiró will offer remarks on the value of this symposium and on the results of the three presentations.

Abstract 3666

DESIRABLE LEADERSHIP STYLES FOR JAPANESE MANAGERS' OWN MENTAL HEALTH: A STUDY USING HUMAN CAPITAL SUSTAINABILITY LEADERSHIP SCALE (HCSLS-J)

Tanaka Y.*[1], Tsuda A.[2], Tani K.[3]

[1]Kyoto Tachibana University ~ Kyoto ~ Japan, [2]Teikyo University of Science ~ Tokyo ~ Japan, [3]Kurume University ~ Kurume ~ Japan

Over the past decade, the ideal leadership style demanded in Japanese working place have been shifting from Leader-centered to Follower-centered (Sasame et al., 2025). Under this changing working circumstances, compounded by issues like harassment, many leaders confused their own management behavior and struggling with interpersonal relationships with subordinates, and in worse case, their mental health is deteriorated.

In this presentation, the results examining leadership styles that are beneficial for Japanese managers' own mental health are discussed. To conduct the study, Japanese translated version of HCSLS was used, in anticipation of future comparative researches across nations where desirable leadership styles are varied. The data provided from 527 Japanese individuals, who held a position of section manager or higher, were extracted from a WEB-based screening survey conducted on 6,604 respondents.

The original four-factor structure was confirmed adequately, although Japanese specific factor structure was also emerged statistically. Concurrent validity of the HCSLS-J was also affirmed. Current level of happiness and Present life satisfaction were statistically expected by high scores of Sustainable and/or Servant leadership styles, while high Ideal happiness and low scores of Depression and Stress mindset were related with Ethical leadership style. Mindful leadership style showed somewhat low relations to those scores of mental health compared with other three styles.

These results indicated that managers could keep their own present positive mental state by providing supports contributing to the future of his/her organization and subordinates, by empowering good workplace relationships and creating a more comfortable working environment. Moreover, it was also suggested that being correct and maintaining ethical manner was necessary to pursue future own happiness without becoming depressed. These managers' satisfactory and stable mental health, based on their attempted own attitudes, will bring more comfortable working environment and higher subordinates' productivity, thereby contributing to the organization's sustainable development.

Abstract 3667

THE INTERPLAY OF HUMAN CAPITAL SUSTAINABILITY LEADERSHIP, RELATIONAL MANAGEMENT, AND THE BIG FIVE IN EXPLAINING FLOURISHING

Chua B.S.*[1], Ismail R.[2]

[1]Universiti Malaysia Sabah ~ Sabah ~ Malaysia, [2]University of Cyberjaya ~ Selangor ~ Malaysia

The pursuit of sustainable well-being has placed increasing emphasis on the role of leadership and personality in shaping individual flourishing. This study investigates the relationships between Human Capital Sustainability Leadership (HCSL), Big Five of Personality Traits Inventory, and Flourishing Scale. Grounded in positive psychology and sustainable leadership theory, the study explores whether the Big Five personality factors (extraversion, agreeableness, conscientiousness, openness, and neuroticism) mediate the relationship between HCSL and flourishing. A total of 429 participants completed validated measures of leadership, personality, and flourishing. Mediation analyses were conducted using the PROCESS macro (Model 4; Hayes, 2022). Across all models, leadership styles positively predicted flourishing. Conscientiousness emerged as a consistent positive mediator in the HCSL and mindful leadership models, with a marginal effect in the sustainable and servant leadership models. Extraversion, agreeableness, and openness were significant positive predictors of flourishing, whereas neuroticism negatively predicted flourishing, although they did not serve as mediators of the leadership–flourishing link. The integrated findings suggest that leadership fosters flourishing primarily through direct effects, with conscientiousness playing a unique mediating role. These results highlight the importance of both leadership and personality traits in understanding pathways to flourishing.

Abstract 3668

FRENCH-LANGUAGE VALIDATION OF THE HUMAN CAPITAL SUSTAINABILITY LEADERSHIP SCALE

Tchagneno C.*

Université Marie et Louis Pasteur ~ Besançon ~ France

The Human Capital Sustainability Leadership Scale (HCSLS) (Di Fabio & Peiro, 2018) captures the characteristics necessary to promote fulfilled and resilient workers and build healthy, prosperous, effective, and sustainable organizations. It is an integrative tool that incorporates new approaches to leadership, including ethical, sustainable, mindful, and servant leadership.French-speaking countries, like the others around the world, are committed to the process of sustainable development and the promotion of organizations that promote a healthy environment and ensure the fulfillment of workers without jeopardizing that of future generations. The objective of this study is to verify the psychometric properties of the French-speaking version of the LDCH scale, which is particularly relevant in this context. First, the scale was translated into French using a translation-back-translation process. The translated version was pre-tested with 10 French executives. A questionnaire containing the HCSL scale and the psychological flourishing scale was distributed online. CFA, invariance, and validity analyses of the scale were then performed.Results show that the French version of the HCSL scale has good psych ometric properties. The structure of the translated scale corresponds to that of the original scale, with good fit indices and very good internal consistency for both the four dimensions of the scale and the overall scale. It was also observed that this scale structure did not vary according to the gender of the participants, their country of origin, or their country of residence. However, for the latter criterion, some results show weaknesses that need to be explored. Thus, the HCSL scale appears to be adequate for studying the characteristics of managers necessary for promoting healthy and sustainable organizations in French-speaking countries that foster employee fulfillment and resilience.

Abstract 4925

SPANISH ADAPTATION AND VALIDATION OF THE HUMAN CAPITAL SUSTAINABILITY SCALE

Carpintero C.*[1], Soriano A.[2], Peiró J.M.[2]

[1]Europea de Madrid ~ Madrid ~ Spain, [2]Universitat de València ~ València ~ Spain

Current historical events have marked a before and after in every sphere of life: COVID-19 to the rise in political tensions, armed conflicts and a rapid increase in authoritarian leadership with a polarised political scene. Organisations, more than ever before, are starting to be interested in strengthening their human structure and entering virtuous spirals of health and profit with their workforce, ensuring the creation of safe and thriving spaces for them to become resilient and high-performing, in formal and informal leadership settings.

For this mission, the present study aims to validate and adapt the psychometric properties and the factorial structure of a tool that measures the attitudes leaders must exert to make this possible, the Human Capital Sustainability Leadership Scale (HCSLS) (Di Fabio & Peiró, 2018), to the Spanish language. This scale integrates four factorial dimensions: ethical, servant, mindful and sustainable leadership, as well as a second-order factor that was examined in a population sample consisting of approximately 200 workers from Spain.

A confirmatory factorial analysis was conducted to examine not only the validity and reliability of the instrument in the Spanish language but also to inquire into the convergent-divergent correlation of the variables of job satisfaction, job insecurity, and thriving at work with the HCSLS. The results have demonstrated strong psychometric properties, with Cronbach's alpha values ranging from .85 to .93 across the four dimensions. The dimensions showed significant positive correlations with job satisfaction and thriving, and negative correlations with job insecurity ($p < .01$). These findings support the internal consistency and construct validity of the Spanish version of the HCSL, confirming its suitability for assessing sustainable leadership styles of supervisors and middle management in organizational settings in Spain. The study of these psychometric properties in other Spanish-speaking countries is yet to be examined.

DECENT WORK AND CLIMATE CHANGE. FROM GROUND ZERO OF UNFREE WORK TO SUSTAINABLE LIVELIHOODS IN INFORMAL AND FORMAL ECONOMIES THAT PROTECT PEOPLE, PROSPERITY AND PLANET

Thursday 23 July 2026 from 11:00 to 12:00

(T-Monumentale)

Veronica HOPNER (Massey University of New Zealand ~ Auckl), Chair and Presenter
Rosalind Searle, Discussant

On the 10th of January 2024, the European Union's Copernicus Climate Change Service (C3S) confirmed that for the first time since records began, the world has experienced global temperatures which exceeded 1.5C above pre-industrial periods. Climate change is now escalating Earth's temperatures beyond the experience of modern humanity. Tackling climate change through promoting sustainable and decent work in both the formal and informal economies is now undeniably imperative. The ever-increasing extreme weather events are causing untold suffering and destruction and ongoing vulnerabilities, which are far-reaching and typically severe. Climate change is destroying people's livelihoods and creating realities of labour exploitation in informal economies, which damages our ecosystems and accelerates processes of climate change. Further escalating climate change is the world of work in the formal sector, which contributes the lion's share of the global carbon emissions. Climate Change impacts work, and the World of Work impacts climate change. This session examines the often neglected i-directional links between work and climate, in both the formal, and much larger but often overlooked, informal labour economies. We use supply chains in the fashion industries to plot climate change and show how indecent work can be reworked and made decent. Decent work and economic growth, the Agenda for Decent Work sits literally at the heart of all 17 of the 2016-30 United Nations (UN) Sustainable Development Goals (SDGs). Identifying a yawning gap in the Agenda with respect to Climate Action (SDG-13), we show how Climate Action is needed to advance the idea of decent work as ethical and functional, for people, planet, and prosperity.

Abstract 3988

UNFREE WORK AND CLIMATE CHANGE

Hopner V.*

Massey University of New Zealand ~ Auckland ~ New Zealand

It is now unequivocal that anthropogenic climate change is causing unprecedented pressures on Earth's ecosystems- air, land and water. Increasingly, there are intense weather events such as droughts, fires, floods, storms and cyclones, all of which are regularly destabilising people, communities, and inevitably, the world of work on which most still depend for their everyday livelihoods. Climate events have serious if not catastrophic impacts on people's ability to feed and house themselves and crucially on the sustainability of their livelihoods. These impacts increase vulnerability to irregular migration, labour exploitation, debt bondage, modern slavery, and human trafficking. In essence, unfree work which psychologically, physically and financially shackles millions of workers to indecent, obscene work. This unfree work which is informal and illegal often occurs in protected areas, such as forests and oceans that are crucial for climate mitigation.

As such, the world of work may be the single biggest contributor to climate change through the destabilizing of the oceans and forests, which comprise the planet's life support system, coupled with the ever-increasing greenhouse gas emissions, waste production, energy and freshwater consumption, resource extraction, and agricultural practices in the informal and formal economies. Staggeringly, it is reported that since 2016, it is 57 formal companies, which produce oil, gas, coal and cement, that are responsible for 80% of the world's carbon emissions (Watts, 2024). Humanity is locked into vicious cycles of escalating and destructive production and consumption. The world of work can no longer be separated from climate action. Indecent work is fueled by climate destruction, just as climate destruction is fueled by the world of work. Indecent work is therefore anathema to climate action, and decent work is necessary for both climate action and sustainable livelihoods. Sustainability must always be understood as equitable interconnections of people, planet and prosperity.

Abstract 3990

CLIMATE CRISIS AND WORK IN THE INFORMAL ECONOMY: A POSITIVE, SOLUTION-FOCUSED APPROACH

Saxena M.*

University of Nebraska Omaha ~ Omaha ~ United States of America

The world of work is a core contributor to the grand challenges facing the world today. On the one hand, the climate crisis is a critical area of concern that is impacted significantly by those who live and work in the informal economy, often due to exploitative and consumptive phenomena that limit choices for individuals and communities. On the other hand, this crisis tends to have a disproportionately larger adverse impact on those how live and work in the informal economy, due to limited access to resources, poverty, and means for protection.

Grounding the talk in lessons learned from artisans and indigenous knowledge schemas, this presentation will discuss a vision for a sustainable supply chain that supports living wages, worker wellbeing, and the environment. We envision an evidence-informed version of such a supply line derived from a case vignette of artisanal workers that puts the worker and the planet at the forefront. Such a supply line with key inflection or touch points that rest on the principles of living wages can be a win-win-win for people, planet, shared prosperity, including, importantly, the margins of the labour market.

Abstract 3991

LIVING WAGES AND POLYCRISIS: QUO VARDIS?

Carr S.*

Massey University of New Zealand ~ Auckland ~ New Zealand

The Decent Work Agenda calls for fair incomes for all. These imply universal living wages, especially during a cost-of-living crisis. Living wages have the further potential to help address climate action, by enabling people to afford dearer but often more environmentally friendly, sustainable goods, products and services. Nonetheless there is an inconvenient truth in this theoretical win-win – in practice, living wages in one part of a supply chain may leave less of the wage fund available to pay people working elsewhere in the same chain, e.g., in the informal economy.

People go to work not for decent work but to make a sustainable livelihood. These livelihoods are inter-connected and inter-dependent. Your livelihood is connected to mine, as mine is to yours. Our wage is connected to your wage, and we all share – and depend on - the same ecosystem for keeping all livelihoods sustainable. In research work, this focus on sustainable livelihoods shifts our gaze, from single jobs in single organizations, toward inter-organizational dynamics. Applied research then stands shoulder-to-shoulder with working groups of all denomination, and defends inter-connected human rights and social inclusion along whole supply chains.

To what end? Livelihoods become sustainable when they protect people from crises (like the cost-of-living and climate change). Historically, and pre-historically, making livelihoods sustainable has necessitated diversification of income streams. Livelihoods were made sustainable though multiple activities, because if one fell over, or under-delivered, another took over. When single jobs do not or cannot be made to pay a decent living wage, with living hours, and decent work conditions in general, diversification may become necessary. Options for diversification include for example basic income, social enterprise, and the harnessing of AI. Each of these has the potential to help deliver livings that are comparatively sustainable, for people and planet.This presentation explores their applied psychology.

BETWEEN THE GARDEN AND THE BREACH: CONVERSATIONS ON THE ROLE OF PSYCHOLOGY AND PSYCHOLOGISTS IN TIMES OF DEEP CRISIS

Thursday 23 July 2026 from 11:00 to 12:30

(R-Arsenale)

Silvia Ivaldi (University of Bergamo ~ Bergamo ~ Italy), Chair and Presenter
Kieran O'Doherty (University of Guelph ~ Guelph ~ Canada), Discussant

The main theme of this symposium is the role that applied psychology can play in addressing communitarian and organizational change through a critical stance. Discussed will be tensions of reconciling the intersubjective dimension with the global one, ethical reflexive critical stance with functionalist demands, concern for people with political and cultural mandate.

These questions run through this symposium and the conversations that will shape it, with the understanding that we are asking it at a time when several crises, of which we have been aware for decades, seem to be spiraling into epochal change. The coming decades are the time horizon that international organizations, research institutes, and think tanks estimate to be crucial, calling on us, as academics and practitioners, to take a principled stand.

This symposium offers a proposal for repositioning the psychological work of counseling and intervention in the communitarian and organizational context where remaining neutral could mean losing sight of the meaning of psychological work and missing the opportunity to realize the contributions of applied psychology to different contexts.

We feel the need for a psychology that speaks out when it acts professionally in context, about the enormous, compounding crises, for which organizations and communities bear significant responsibility. We therefore sought to lay out the basis of negotiating, designing, and evaluating organizational interventions and action research by reconnecting a critical gaze on the ideological, economic, and social dimensions with the possibility that new worlds and dislocated imaginaries may open up through emerging ourselves in the intersubjective field with stakeholders.

Abstract 4504

BETWEEN SYMBOLIC RADICALISM AND SUBTLE MANAGERIALISM: PARADOXES OF PERFORMATIVITY IN CRITICAL APPLIED PSYCHOLOGY

Hornung S.*

University of Innsbruck ~ Innsbruck ~ Austria

Discussed are paradoxes and tensions inherent in Critical Applied Psychology (CAP), which is both rooted in critical social theory and has a mission of engagement with practice. This dialectic is illustrated by combining Adorno's dictum that "there is no right life in the wrong one" with Marx's famous thesis that philosophers have "only interpreted the world in various ways; the point is to change it".

Revolutionary societal macro-emancipation, however, has been shelved as unrealistic in favor of modest versions of micro-emancipation in the workplace. This motion and associated contradictions were demonstrated by Critical Management Studies (CMS), transitioning from radical structuralism of labor process theory via poststructuralist and linguistic turn to deconstructionist and hermeneutic approaches. The extensive debate on anti-performative intent and critical performativity in CMS is reviewed with regard to implications for CAP.

Scrutinized are suggested principles of pragmatism, potentialities, affirmative stance, ethics of care, and normative grounding as well as concrete examples, such as involvement in worker recuperated enterprises, social movements, and academic activism. In the performativity-debate in CMS, different traditions accuse each other of meaningless symbolic radicalism versus selling out to subtle forms of managerialism. Similar discussions have ignited within CAP and are likely to increase as this stream gets more diverse.

While lessening the suffering of people at work is an intrinsic value that should not require justification, it may have system-stabilizing function, giving rise to the reputation of applied psychologists as handmaidens of capital and servants of power. This dialectic is expressed in Oscar Wilde's paradox that the "worst slave-owners were those who were kind to their slaves", making a monstrous system look less horrific. Of course, this sounds cynical from a humanitarian point of view, illustrating the dialectic double bind that will be reflexively deliberated here, rather than resolved.

Abstract 4505

THE EMOTIONAL PILLARS OF NEOLIBERAL OPPRESSION AND MASS SUFFERING

Degirmencioglu S.M.*

Institute of Trivial Studies ~ Frankfurt ~ Germany

Applied psychology is routinely described as a helping profession. A critical perspective reveals a troubling question: who does it actually help? Historically, psychologists have largely ignored mass suffering and emancipation, instead aligning with Comte's positivist vision and serving the status quo.

A stark example is Edward Bernays, who pioneered public relations by weaponizing psychology to "engineer consent," manipulating desires and fears to shape public behavior and fuel consumerism. This legacy persists today. Regimes and corporations exploit emotions - especially fear - to manufacture consent. Militarism and nationalism thrive on insecurity, while neoliberal capitalism weaponizes worry as a tool of control.

As one U.S. social scientist noted, the lack of universal healthcare isn't accidental; it keeps people "afraid, anxious, and worried all the time." Health, of course, is just one example. Housing is another. The absence of affordable housing and the denial of housing as a right are intended to put masses into long-term debt (i.e., mortgage) and into jobs that they cannot leave. Mortgage leads to worrying and for decades. It is not a coincidence that banks use slogans like "Seven ways to stop worrying and love your mortgage".

Mainstream psychologists have shown very little interest in how and why worry is systematically manufactured. Debt and credit have long become household terms, and they, too, have been of little interest for mainstream psychologists. Job insecurity, or precarity, has also received little attention. Today even retirement and pensions are under attack, particularly in world's richest countries. Masters of neoliberal capitalism want to make insecurity a norm across the lifespan.

Even though mainstream psychology sees emotions as its domain, it systematically avoids addressing how emotions are used to manufacture consent and particularly how they are used to create mass suffering.

Abstract 4506

RENEWING A VISION FOR APPLIED SOCIAL PSYCHOLOGY: BEYOND VARIABLES AND SOCIAL COGNITIONS

O"Doherty K.*

University of Guelph ~ GUelph ~ Canada

The field of applied social psychology is often defined as the application of theories, methods, and findings from social psychology to real world problems. This definition makes the development of solutions to real world problems highly dependent on prevailing paradigms in social psychology. In this presentation, I argue that with some notable exceptions, dominant lab based and experimental approaches to social psychology do not serve as a sound foundation for applications that might address some of the most pressing problems of our time. To a large degree, social psychological knowledge production is based on a distorted emulation of methods and epistemological principles from the natural sciences. In particular, social and psychological phenomena are typically understood through mechanistic models that neglect individual and collective human agency; knowledge production relies on positing variables without deeper ontological reflections about the nature of the phenomena being studied; research questions are typically limited to quantifying associations between variables, while failing to attend to socio-cultural meanings that shape human experiences; the analytical unit of interest in social psychological theories is predominantly the individual which neglects contextual cultural and institutional factors; knowledge claims are typically intended to be universal thus failing to understand human phenomena as situated historically, socially, and culturally. To move beyond a narrow scope of the discipline whose relevance and effectiveness is obstructed by flawed epistemological premises, I offer a pluralistic vision for applied social psychology that encompasses three distinct streams of scholarship: 1) intervention research that is based primarily on experimental design and social-cognitive approaches, 2) critical approaches that attend to unequal power relations and aim at their amelioration, and 3) participatory approaches that prioritise community well-being and engagement above epistemological goals. I provide an overview of available methodologies and practices for such an expanded vision of applied social psychology.

Abstract 4507

FROM SOCIAL STRUCTURES TO INTERSUBJECTIVE SPACES: THE CHALLENGE OF PSYCHOLOGICAL CRITIQUE IN TIMES OF CRISIS

Ivaldi S., Toscano A.*

University of Bergamo ~ Bergamo ~ Italy

The term "critique" often thrives in academic circles, but rarely among professionals—yet today's crises demand psychological engagement. Energy, war, migration, health, and economic upheavals are deeply interconnected, forming what Morin calls a polycrisis: a complex, inescapable web of challenges. The myth of psychology's neutrality is unsustainable, both theoretically and ethically. As applied psychologists, we must ask: where should we direct our knowledge and practices? Critique is not abstract; it exposes hidden crises, disrupts daily life, and reveals oppression—even when crises mask themselves as inevitabilities.

This moment forces us to confront two urgent questions: "What should we do?" and, more uncomfortably, "Which side are we on?" Consider this: a mafia boss might seek therapy, just as an executive implicated in environmental or labor crises might consult an organizational psychologist. Such encounters force critique to split: one path focuses on global injustices—judging systems harshly from a distance—while the other embraces intersubjective spaces, where reflexivity replaces judgment. Suspending judgment doesn't mean ignoring complicity, however. Research on precarious work and academia's own crises shows how we all risk perpetuating domination, even unwittingly.

The shifts are undeniable: European industry pivots to arms production, financial markets fuel militarization, welfare systems crumble, and healthcare struggles to meet escalating needs. Staying detached means forfeiting the chance to understand—and transform—these realities. To act as agents of change, psychologists must occupy the tensions between macro-critique and interpersonal reflexivity. This means building public discourse to denounce injustices and cultivating radical self-awareness in our practice.

Critique thus operates on two levels: first, by exposing systemic failures; second, by fostering reflexivity that challenges our own roles. Both require partnership—aligning with collective resistance to reshape organizations and reclaim the ethical core of our work.

Abstract 4508

BEYOND TECHNO-FUTURES: RETHINKING THE “FUTURE OF WORK” THROUGH THE CRISIS

Giusino D.*

University of Foggia ~ Foggia ~ Italy

Dominant narratives about the “future of work” overwhelmingly frame it as a technological inevitability driven by digitalisation, automation, and artificial intelligence. These framings have gained significant traction in organizational psychology and managerial discourse, often positioning psychologists as facilitators of smooth technological adaptation. Yet such accounts obscure the social, ecological, and geopolitical crises that shape contemporary work far more unevenly and unpredictably than technological trajectories. This contribution argues that the prevailing techno-centric focus narrows psychologists’ ability to engage reflexively and ethically with the world of work at a time when crises—climate breakdown, democratic erosion, economic instability, war, and intergenerational precarity—are redefining what work is and what it can be.

By disentangling “the future” from linear narratives of technological progress, the presentation invites a repositioning of applied psychology within broader societal and planetary contexts. It highlights how current future-oriented discourses reproduce exclusions by assuming that all workers and forms of labour are equally shaped by digital transformation, while large segments remain structurally marginalized or untouched by it. Moreover, it foregrounds how future-of-work rhetoric carries affective contents, revealing societal anxiety, resignation, and a shrinking political imagination.

Through this critique, the presentation aligns with the symposium’s call for a psychology capable of taking a principled, critical stance in times of deep crisis. Rather than acting as a neutral mediator of managerial agendas, psychologists can contribute by interrogating dominant imaginaries, attending to lived realities, and situating organizational interventions within complex, crisis-laden socioecological systems. A more contextual, plural, and crisis-attuned understanding of the “future of work” becomes analytically necessary and ethically imperative for the discipline’s relevance.

Abstract 2242

BALANCING THE SCALES: EXPLORING HOW WORKERS DEFINE WORK EXPLOITATION AND COPE WITH EXPLOITATIVE WORK EXPERIENCES

Oliveira S.[1], Costa S.*[1], Coyle--Shapiro J.[2]

[1]ISCTE - Instituto Universitário de Lisboa, Business Research Unit ~ Lisbon ~ Portugal, [2]Jack H. Brown College of Business and Public Administration, California State University ~ California ~ United States of America

Despite significant progress in labor protection, exploitation in the workplace may be more widespread than is generally assumed. In today's Western labor markets, shifts in working conditions have led organizations to adopt subtler forms of exploitation that serve organizational interests while undermining employees' well-being. These dynamics often involve seemingly acceptable practices, such as neglecting employee needs, fostering relative deprivation, or ongoing job insecurity, that workers may inadvertently normalize. This qualitative study explored how employees conceptualize work exploitation and the coping strategies they use to manage and recover from these experiences. Participants first took part in individual interviews addressing their perceptions about the employee-organizational relationship and their coping responses to work experiences. Two months later, a recall interview was conducted in which participants were presented with a scenario-based summary of their previously reported experiences and asked to evaluate whether each scenario represented exploitation and to define what constitutes an exploitative work relationship. Twenty-two full-time workers (68.18% women; M = 36.86 years, SD = 10.00; M = 7.95 years tenure) participated, with 20 completing the recall phase. Data were analyzed using thematic analysis, combining deductive and inductive reasoning, and organized following Gioia's methodology for data structure. Results showed that 72.73% of participants regarded their work relationships as exploitative, with 87.50% of those identifying both relational and structural dimensions of exploitation. Exploitation was perceived as more likely when individuals had limited negotiation power and lower financial stability, while perceived freedom of choice and personal responsibility attenuated the perception of exploitation. Coping strategies were mainly directed at relational rather than structural exploitation, often through emotional regulation when employees felt undervalued or ignored. These findings provide insight into employees' lived experiences of exploitation, underscoring its implications for occupational health and well-being and highlighting the need for interventions to mitigate exploitative work environments.

Abstract 804

THE LOGIC OF TOLERANCE: SYSTEMS THEORY PERSPECTIVE ON SEXUAL HARASSMENT TOLERANCE IN SERVICE INDUSTRY

Korsak M.*, Martinez L.

University of Texas at Arlington ~ Arlington, Texas ~ United States of America

Sexual harassment is a persistent and pervasive challenge for service industry employees. In the United States (US), the service industry (e.g., restaurants, bars) accounts for the highest proportion of sexual harassment lawsuits, representing 14% of total claims filed between 2005 and 2015 (Center for American Progress, 2017). Yet, when examined globally, reported rates of harassment in service contexts vary considerably, with 30–70% of restaurant employees regularly experiencing harassment (EU Parliament, 2023; Holubová & Gotthardová, 2025). These variations highlight the cultural and systemic factors shaping both the prevalence and tolerance of harassment. In the US, legislation and capitalistic policies often perpetuate a culture of tolerance, pushing many workers into compliance. For instance, servers in Europe receive base salaries that support livable wages and retain the agency to refuse service to abusive customers. In contrast, US servers typically earn minimum wage plus customer tips, with many still falling below the poverty line. Because livable wages depend heavily on tips, the service culture in the US reinforces norms such as “the customer is always right” and the expectation that service should be delivered “with a smile.” These contextual conditions leave US service staff uniquely vulnerable to harassment. In response, our proposed Logic of Tolerance model identifies factors across individual, organizational, industry, social, and legal levels that facilitate harassment incidents. The model underscores how systemic conditions—such as economic dependence on customers, cultural norms of service, and limited organizational protections—intersect to normalize and exacerbate harassment. This framework makes a novel contribution by integrating insights from social work, clinical psychology, and trauma-informed approaches into organizational and management literatures. In doing so, it represents an initial step toward addressing the structural and cultural conditions that allow sexual harassment to persist in the workplace.

MEMBER PARTICIPATION IN DAIRY COOPERATIVES: EVIDENCE FROM RURAL INDIA

Biswas S.N.*[1], Verma G.G.[2]

[1]Tribhuvan Sahkari University ~ Anand (Gujarat) ~ India, [2]Amrita Vishwa Vidyapeetham ~ Coimbatore ~ India

The study examines the direct and mediated roles of life centrality, market support, work engagement, and commitment to cooperatives in shaping participation in cooperatives that can strengthen the overall functioning of cooperatives. Dairy farmers in India form the poorer section of the rural society, owning less than two and a half acres of land and an average herd size of two animals only. Dairy cooperatives have played a central role in keeping these farmers out of poverty and destitution. Moreover, milk is a primary protein source for a large majority of the vegetarian population of India. Data from 1000 dairy farmers from 30 different dairy cooperative societies in Gujarat (India) was analysed using Structural Equation Modelling (SEM). Results suggested that life centrality of dairying significantly influences both work engagement ($\beta = .624$, $p < 0.001$) and commitment to the cooperative ($\beta = .345$, $p < 0.001$). Market support also has a positive effect on commitment ($\beta = .263$) and directly influences participation in the cooperative ($\beta = .311$, $p < 0.001$). Work engagement enhances commitment but does not directly affect participation. Participation is most strongly influenced by market support and commitment. Life centrality also showed indirect effects through work engagement and commitment. The findings indicate that life centrality and market support are critical factors influencing member participation in cooperatives. Strategies to expand membership should focus on individuals who strongly identify with the dairy business. A higher level of participation in cooperatives can improve the socio-economic conditions of dairy farmers and support sustainable rural livelihoods. The research has implications for Sustainable Development Goal (SDG) 1 (No Poverty), SDG 2 (No Hunger and Healthy Diet), and SDG 8 (Decent Work and Economic Growth).

"EXPLORING AND UNDERSTANDING THE MIGRANT WORKERS EVERYDAY EXPERIENCES OF PRECARIOUS EMPLOYMENT.

Nair S.*

Dublin Business School ~ Dublin ~ Ireland

Precarious employment increasingly defines labor markets, disproportionately affecting migrant workers. This study explores the lived experiences of precarious employment among Asian Indian migrants in the hospitality sector in Ireland and the UK. Drawing on Allan et al.'s (2021) Work Precarity Framework and framed by the Psychology of Working Theory (Duffy et al., 2016), the research examines three dimensions of precarity: precarity of work (job insecurity and workplace uncertainty), precarity at work (social rejection and discrimination), and precarity in work (poverty and unmet needs). Intersectional factors including age, gender, migration status, and education are also considered.

A purposive sample of 20–30 participants is being recruited across Dublin and London, with semi-structured interviews conducted over a three-month period. To date, 18 interviews have been completed and analysed thematically (Braun & Clarke, 2006). Emerging findings indicate widespread job insecurity, limited prospects for career progression, and heightened vulnerability tied to migration status and visa restrictions. Experiences of exclusion and stereotype-based discrimination were common, particularly among women and younger migrants, while economic precarity often intersected with pressures to remit earnings. Despite these challenges, participants described strategies of resilience, including drawing on community networks, pursuing skill development, and reframing precarious work as a stepping stone toward long-term goals.

Preliminary results highlight how structural conditions of migration interact with employer practices to exacerbate inequality in the hospitality sector. At the same time, migrant workers demonstrate agency in navigating and making meaning of precarity. These findings contribute to debates on migrant labor and inequality in European contexts and underscore the need for stronger protections ensuring equitable and secure employment conditions.

Abstract 1878

ORGANIZING WORK SOLIDARITY: DEFINITION, ENABLING MECHANISMS, AND IMPACTS. A SCOPING REVIEW.

Piria M.*, Galuppo L., Bonanomi A., Garigali I., Pistoni C.

Università Cattolica del S. Cuore ~ Milano ~ Italy

Introduction.
Amid growing labor instability, new forms of solidarity among and for workers have emerged as alternatives to trade unions. These organized forms represent an intriguing yet underexplored phenomenon within the current literature in the field of Work and Organizational Psychology (WOP).

Purpose.
This contribution seeks to frame scholarly perspectives on organizing work solidarity. It examines how solidarity is defined, the theories supporting it, its target groups, its impacts in contemporary labor contexts, and the enabling and constraining factors that shape it.

Method.
The review was conducted on Scopus, PsycINFO, and JSTOR. The process led to the inclusion of sixty-three contributions, published between 2014 and 2024, addressing conceptualizations and research on solidarity. Thematic analysis was conducted to explore emerging themes, focused on definitions of solidarity and organized solidarity, as well as enabling and hindering factors and their impacts.

Results.
The selected papers, largely sociological, identify four main approaches to defining organized work solidarity: solidarity as collective mobilization; as reciprocal and mutual help; as a "we-ness" connection; and as achievement-in-process. Targets range from traditionally unionized categories to non-standard employment. Particular attention is devoted to marginalized workers, such as those in informal and domestic labor. Enabling and constraining factors are examined across structural, organizational, relational, and individual dimensions.

Conclusions.
Workplace solidarity emerges as a heterogeneous phenomenon, simultaneously functioning as a mobilizing force, a relational practice, a process of identity formation, and a protective mechanism. It constitutes both a response to precarious employment and an innovative form of collective organization beyond unions. Its expression is strongly shaped by social, cultural, and organizational conditions, demonstrating its

dynamic and context-dependent nature. Future research should explore how solidarity can be strengthened and institutionalized, particularly in non-standard and marginalized work experiences. No recent reviews within WOP studies have systematically addressed workplace solidarity and its organizational forms.

Abstract 761

THE MEDIATING ROLE OF PSYCHOLOGICAL SAFETY IN THE RELATIONSHIP BETWEEN DECENT WORK AND OVERALL LIFE SATISFACTION: EVIDENCE FROM THE PORTUGUESE THIRD SECTOR

Lopes S.[1], Rodrigues A.*[2], Pais L.[1], Dos Santos N.R.[3]

[1]Faculdade de Psicologia e de Ciências da Educação, Universidade de Coimbra ~ Coimbra ~ Portugal, [2]Faculdade de Filosofia e Ciências Sociais, Centro de Estudos Filosóficos e Humanísticos, Universidade Católica Portuguesa ~ Braga ~ Portugal, [3]Universidade de Évora ~ Évora ~ Portugal

Introduction: Decent work is recognised as a key factor in fostering both individual and collective well-being. However, the psychological mechanisms by which decent work leads to broader life satisfaction are still not fully understood. Psychological safety, defined as a shared belief that one's work environment is safe for interpersonal risk-taking, may serve as one pathway, especially in mission-driven settings such as the third sector.

Purpose: To examine a mediation model in which psychological safety mediates the relationship between decent work and overall life satisfaction among employees of Portuguese third-sector organisations.

Method: A cross-sectional survey was conducted with 116 workers from nonprofit and social-economy organisations in Portugal. Participants completed validated measures of decent work, psychological safety, and overall life satisfaction. Data were analysed using the PROCESS macro (Model 4) with bootstrapped confidence intervals to examine mediation.

Results: The direct effect of decent work on overall life satisfaction was positive and statistically significant. The indirect impact of decent work on life satisfaction through psychological safety was also significant, indicating partial mediation. The fully standardised indirect effect showed a meaningful effect size for the mediational pathway.

Conclusions: The data support a partial mediation model whereby decent work has both a direct effect on life satisfaction and an indirect effect through psychological safety. Therefore, decent work is essential for boosting psychological safety, which subsequently enhances individuals' overall life satisfaction. Investing in decent work is crucial for third-sector organisations. Furthermore, its connection with psychological safety and employee well-being enhances its importance, as organisations with these characteristics are likely to be more sustainable.

TOXIC CULTURE AND LEADERSHIP IN ORGANIZATIONS

Thursday 23 July 2026 from 12:00 to 13:00

(T-Monumentale)

Chiara Ghislieri (University of Turin, Department of Psych), Chair and Presenter
Monica Molino (University of Turin, Department of Psych), Co-Chair

Alongside the paradigms of ‘positive’ interpretations of organisations, there is an increasing need
to consider and analyse the toxic dimensions of organisational life.This involves identifying the
sources of toxicity and recognizing and enhancing the resources that can counter these negative
dynamics(Peirò, Svicher & Di Fabio, 2023; Spagnoli et al., 2021).The growing importance of
studying these phenomena and implementing subsequent interventions is attributed to evidence of
an increasing intensification of work,characterized by significant interference of work in private life
due to new technologies and limitations on recovery opportunities.The shift in values towards a
desire for a more balanced life has also contributed to bringing attention to toxic,always-on,hypercontrolling,
and unsustainable organisational cultures.A central topic in this scenario is leadership:
the prevalence of positive approaches is now complemented by a more systematic examination of
the destructive distortions of leadership (Ghislieri, 2024),whose negative effects on well-being and
work quality are being increasingly confirmed(Molino, Cortese & Ghislieri, 2019; Dolce et al.,2020).In this symposium we bring together five different contributions that, with different but
complementary perspectives, supplement the scientific literature.
The first contribution (Dolce et al.)presents a quantitative study carried out within the French
telework observatory and focuses on the relationship between micromanagement at work and
tensions in the personal life sphere.
The second paper (Eckenschwiller & Wodociag) describes a qualitative study carried out in the
French hospital context with the aim of analysing the dynamics concerning the relationship between
leadership (positive and toxic)and the development of interprofessional collaboration practices.
The third study (Sanseverino et al.)also concerns the hospital context:we are in Italy,in this case,
and the quantitative study analyses, through a cluster analysis, the intertwining of positive
leadership and micromanagement, considering differences in turnover intention.
The fourth study (Carvalho et al.),quantitative and longitudinal, considers the relationship between
supportive organisational culture,micromanagement and work-family conflict.The last study (Caputo et al.), multilevel, concerns the healthcare context and,specifically, the

nursing population and investigates the relationship between abusive leadershipandconsensus
on LMX in relationtojobsatisfaction.

Abstract 4252

THE INTERTWIN BETWEEN LMX AND MICROMANAGEMENT: HOW DOES TURNOVER INTENTION CHANGE IN A HEALTHCARE CONTEXT?

Sanseverino D., Sacchi A., Molino M.*, Ghislieri C.

Dipartimento di Psicologia, Università degli Studi di Torino ~ Turin ~ Italy

The role of leadership in organizational culture was clearly identified by Schein (1985). Subsequent studies have observed the link between positive leadership and the sustainability of organisational life (Peirò, Svicher & Di Fabio, 2023). Over the last few years, more and more, attempts have also been made to observe also the toxic dynamic and the role of destructive leadership in association with phenomena of work invasion in personal life (Molino, Cortese & Ghislieri, 2019; Dolce et al., 2020).
While in some cases positive and destructive leadership (Ghislieri, 2024) are considered 'separate' phenomena, in the present study we focus on their intertwining (Spagnoli et al., 2021) and on the differences in turnover intention. For positive leadership, we considered the LMX model; for destructive leadership, we focused on micromanagement.
The sample consists of 1287 employees of a local health authority (70% women). LMX was surveyed through 5 items (alpha .93); micromanagement through 4 items (alpha .73); turnover intention (TI) through 3 items (alpha .84).
The data analysis, performed with SPSS, involved cluster analysis and analysis of variance.
The cluster analysis made it possible to observe the intertwining of LMX and micromanagement well, revealing subgroups characterised by different leadership experiences. The highest TI is observed in the group with high micromanagement and low LMX (19% of the sample); this is followed by the 'neglected' group (low LMX and low micromanagement; 27% of the sample); the group with high LMX and high micromanagement (27% of the sample) has a medium-low TI; finally, the lowest TI is observed in the group with high LMX and low micromanagement (27% of the sample).
This study highlights how people can experience different intertwining of positive and destructive leadership in the same organisation: these two aspects sometimes coexist, sometimes both are absent. The differences observed with respect to TI suggest the importance of jointly studying these two dimensions in order to reduce the risk of turnover, through the

promotion of a sustainable working environment.
4.

Abstract 4254

CONSENSUS ON LMX MODERATING THE EFFECTS OF ABUSIVE SUPERVISION ON NURSES' JOB SATISFACTION: A MULTILEVEL PERSPECTIVE

Caputo A.*[1], Costa P.[2], Gatti P.[3], Ferreira A.[2], Cortese C.G.[1]

[1]Psychology Department, University of Turin, Turin, Italy ~ Turin ~ Italy, [2]Business Research Unit (BRU-IUL), Iscte – Instituto Universitário de Lisboa, Lisbon, Portugal ~ Lisboa ~ Portugal, [3]Psychology Department, University of Milano-Bicocca, Milan, Italy ~ Milan ~ Italy

This study investigates how consensus on Leader-Member Exchange (LMX) within nursing teams moderates the relationship between abusive supervision and job satisfaction. Grounded in climate strength theory, we define LMX consensus as the degree of agreement among team members regarding the quality of their relationship with the leader. High LMX consensus indicates that nurses within the same unit share similar perceptions of their leader's behavior, suggesting uniform treatment. This shared perception may act as a protective factor, fostering a sense of fairness and cohesion within the team.

Using a multilevel design, we analyzed data from 130 nurse leaders and 1357 nurses. The results confirm that abusive supervision negatively affects job satisfaction at the individual level. However, LMX consensus at the team level significantly moderates this relationship. Specifically, when LMX consensus is high, the detrimental impact of abusive supervision on job satisfaction is attenuated, suggesting that a shared perception of LMX—whether positive or negative—buffers employees from the harmful effects of abusive behaviors. Conversely, when LMX consensus is low, the negative impact of abusive supervision on job satisfaction is stronger, likely due to heightened perceptions of injustice and uncertainty within the team.

These findings highlight the importance of team-level leadership dynamics in shaping individual well-being. Healthcare managers should not only focus on the quality of individual LMX relationships but also on their consistency across team members. Fostering a cohesive leadership climate may create a stronger sense of justice and team cohesion, ultimately enhancing job satisfaction and retention among nurses.

Abstract 4250

A FRENCH STUDY ON SOME FACTORS OF MICROMANAGEMENT AND THEIR EFFECTS ON WELL-BEING

Dolce V.[1], Vassallo J.[2], Sanseverino D.*[3], Vayre E.[2]

[1]Univ. Lumière Lyon 2, Societal Psychology Research Group, France ~ Lion ~ France, [2]Univ. Lumière Lyon 2, Social Psychology Pole, France ~ Lion ~ France, [3]Univ. of Turin, Department of Psychology, Italy ~ Turin ~ Italy

Introduction: Numerous studies conducted during or prior to the COVID-19 pandemic have examined the management of teleworking, but few contributions have looked at so-called 'hybrid' forms of work. This study aims to understand the issues surrounding these recent forms of work, focusing on the role of certain factors to better explore the issue of micromanagement: the intrusion of work outside working hours via technology, the existence of systems for monitoring working hours, and policies for disconnecting from work.
Methods: During the summer of 2023, the French Telework Observatory launched a national survey of French employees. As part of our study, we focused on respondents who combine teleworking with on-site work (N = 2811). The participants in this study come from different sectors of activity. Of these, 60% were women, and a quarter of the sample was under the age of 40.
Results: When the organisation of remote work was based on agreements within the team (vs. improvised or determined solely by the supervisor), participants had a higher level of positive mood and less tension in their private life. Perceived family tensions and symptoms of physical and psychological discomfort are significantly lower among people who declare that their employer implements disconnection measures than among those who declare the opposite. Regression analysis confirmed that solicitations to work outside working hours via technology, improvised organisation of remote work and the presence of perceived control over working hours are significantly associated with an increase in tension in the private sphere.
Discussion: The results warn of the risks of micromanagement and underline the importance of telework planning, through participative measures involving the team, as well as policies in favour of the right to disconnect. The cross-sectional nature of the study and the use of selfreported data are among its limitations.

IDENTITY MANAGEMENT AND WELL-BEING OF WOMEN IN THE FRENCH NAVY: A PILOT WORKPLACE STUDY

Delicourt A.*[1], Gros F.[2]

[1]Laboratoire Psychologie de la Socialisation – Développement et Travail ~ Toulouse ~ France, [2]ProgedoIR (UAR2506), CNRS Sciences humaines et sociales ~ Paris ~ France*

Women working in male-dominated organizations, such as the military, often face heightened stress (Evans & Steptoe, 2002) and identity threats (Hall et al., 2019), partly due to pervasive gender stereotypes (Heilman, 2012). These environments, often perceived as meritocratic (Doerr et al., 2021), lead women to rely on individual identity strategies rather than institutional support to fit in. This pilot study explored how such strategies relate to well-being and perceived stress at work, focusing on the French Navy.

A 12-item multidimensional scale was developed to assess four identity strategies based on the social identity theory (Tajfel & Turner, 1979; Blanz et al., 1998): assimilation, social competition, individual mobility, and comparison with a standard. This scale was administered to 87 female military personnel and showed satisfactory psychometric properties. The participants also completed a questionnaire measuring perceived stress (Cohen et al., 1983) and positive workplace well-being (Biétry & Creusier, 2013).

Assimilation—adopting masculine norms to fit in—was associated with lower well-being, including poorer relations with management ($r = -.29$, $p = .009$) and a more negative perception of the work environment ($r = –.35$, $p = .001$). Social competition and individual mobility were not significantly related to well-being or stress. However, comparison with standard—identifying with high-performing female role models—was linked to better workplace relationships, especially with supervisors ($r = .24$, $p = .03$). Individual mobility appeared more among middle managers ($F(2, 84) = 5.05$, $p = .009$, $\eta^2 = .107$), suggesting that the use of this strategy also reflects one's role and context.

These findings highlight the complexity of identity strategies in male-dominated settings. Promoting role models rather than assimilation may enhance inclusion and retention—crucial for the French Navy, where women represent only 16% of the workforce. A new data collection is currently underway to replicate and extend these results.

Abstract 869

DOES SEXUAL ORIENTATION DIVERSITY PRESENTATION IN SOCIAL MEDIA AFFECT ORGANIZATIONAL ATTRACTIVENESS AMONG JOB SEEKERS?

Oren L.*

Ariel University ~ Ariel ~ Israel

Gay, lesbian, and bisexual (LGB) individuals comprise the largest minority group among organization workers. However, studies on organizational conduct and policies regarding LGBs are very scarce.

The current quasi-experimental study examined how communication actions supporting diversity of sexual orientation in an organization's social media affect its attractiveness in the eyes of job seekers. The main objective of this research was to examine the impact of diversity-supportive cues in the hypothetical organization's social media on organizational attractiveness, person-organization fit (P-E fit), corporate social responsibility (CSR) perception, and organizational justice perception among heterosexual and LGBs job seekers. It was hypothesized that participants who review a diverse Facebook page (supporting diverse sexual orientation) will express a higher organizational attractiveness, perceived P-E fit, perceived CSR, and organizational justice compared to participants who reviewed a non-diverse page. Additionally, it was hypothesized that the relationship between the page type and organizational attractiveness will be mediated by perceived P-E fit, CSR perception, and organizational justice perception.

The study included 178 participants, half LGBs, with at least one year of work experience in an organization. Participants were asked to examine the Facebook page of one of two identical hypothetical organizations, except for one parameter - one supporting sexual orientation diversity and the other not, and then to answer several questionnaires on organizational attractiveness, P-E fit, CSR perception, and organizational justice perception.

The findings indicate that a diverse page led to higher organizational attractiveness, greater P-E fit, increased perception of corporate social responsibility, and higher organizational justice compared to the non-diverse page. In addition, LGB participants who viewed the diverse page perceived the organization as having higher CSR compared to heterosexual participants. Mediation analysis revealed full mediation, emphasizing the role of perceived fit and perceived social responsibility towards employees in organizational attractiveness.

Theoretical consequences and practical recommendations are discussed

Abstract 90

THE IMPACT OF HUMAN RESOURCE MANAGEMENT ON THE PERCEPTION OF INCLUSION AMONG FEMALE CAREER-TRACK EMPLOYEES IN JAPAN

Kitamura M.*[1], Morinaga Y.[2], Hirano M.[1], Funakoshi T.[3]

[1]Otemae University ~ Nishinomiya ~ Japan, [2]Waseda University ~ Tokyo ~ Japan, [3]Osaka University of Economics ~ Osaka ~ Japan

Traditionally, Japanese companies have not specified job duties, locations, or hours in their employment contracts. While this unique practice supported long-term employment, it also restricted employees' control over work arrangements and impeded women's career advancements (Nagase, 2024). Amid the shrinking population, Japanese companies need to encourage the participation of a diverse workforce and implement human resource management (HRM) to enhance female employees' perceptions of inclusion. This is critical for addressing issues such as the low ratio of female managers and low motivation for promotion among female employees. While previous research has clarified the impact of an inclusive climate and leadership on the perception of inclusion, the impact of HRM practices remains underexplored. This study investigated how specific HRM practices and their interactions influence female employees' perceptions of inclusion, based on the person-environment fit theory (Caplan, 1987) and the configuration approach of strategic HRM theory (Delery & Dorty, 1996). We focused on HRM practices that promote career self-management: individualized career development and self-selection-based placement. Furthermore, we focused on the degree of autonomy over work arrangements (working hours, locations, and duties), which has varied significantly across Japanese companies since the 2010s. Drawing on Shore et al.'s (2011) inclusion framework, grounded in Brewer's (1991) optimal distinctiveness theory, we defined inclusion as a state in which both belongingness and uniqueness are satisfied. We conducted a survey involving non-managerial female career-track employees (N=515). Binomial logistic regression analysis revealed a positive impact of "perceived individualized career development" and "perceived autonomy over working hours," and, contrary to expectations, a negative interaction effect between these practices. These findings suggest a complementary fit between these practices: the effectiveness of the former increases when the latter remains low. Thus, implementing at least one of these measures is necessary to enhance the perception of inclusion among female career-track employees.

Abstract 542

BEING LIKE HER: UNDERSTANDING THE SIGNIFICANCE OF ROLE MODELS IN INDIAN WOMEN'S CAREER PLANNING

Dutta A., Purang P.*

IIT Bombay ~ Mumbai ~ India

Gender equality in the workplace remains a global issue, especially in India, where only 37% of women work, below the global average of 53.4%. Indian women often face career breaks due to cultural expectations around caregiving and patrilocality, leading to non-linear career paths. These challenges make career planning complex, as their goals differ from those on linear trajectories. This mixed-method study explores how workplace social capital, particularly role models, supports women's career development. The present study used a mixed method design to understand the how social capital within workplace may help women in retaining and growing within their careers.

The first study was a qualitative study exploring the career narratives of 28 Indian women employees using a semi structured interview. The thematic analysis showed that role models emerged as an important source of inspiration for women in planning their careers. They inspire a can do attitude, offer a world of possibilities that are attainable; or changing a career path that did not have promise growth for women. Further, role models also help create a mindset of possibilities specially when women navigate transitions, especially motherhood.

Study two surveyed 200 full-time female employees, confirming the positive impact of role models on career planning through regression analysis. Thus, the findings of both the studies show that role models can contribute to career planning in women by increasing their efficacy beliefs to set career goals and navigate cultural expectations and professional roles. Role models are also important to inspire Indian women to have career ambitions that might be missing in their nurturance along with the understanding of possibility of goal achievement. Thus, more visibility to female role models will facilitate careers of larger female workforce.

Abstract 867

ACHIEVING GENDER EQUALITY IN ORGANIZATIONS: WHAT CAN WE LEARN FROM AN EARLY NATIVE AMERICAN SOCIETY?

Schein V.*

Gettysburg College ~ Gettysburg ~ United States of America

The still limited progress of women in senior management positions suggests that fresh eyes may be needed to find the path forward. The women of the League of the Haudenosaunee, an alliance of six Native American nations, held significant power and influence. Neither gender was viewed as more valuable than the other, neither gender dominated. Yet, despite this gender equality, roles were segregated. What if we took a look at the Haudenosaunee view of equality, one that speaks to a separate but equal society, as a way to generate new approaches to achieving gender equality in organizations today? Using historical sources, mainly from the 1600's and 1700's, the paper examines the influence held by the Haudenosaunee women in the economic and political arenas. As two examples, based on their control over production and distribution of food, women had the power to instigate and restrain war parties. Women leaders (clan mothers) had the power to select the clan chief and to remove him for improper behavior. Four themes emerged from the examination of the power and influence of the Haudenosaunee women. They are 1) Work of equal value; 2)Blended work and child care; 3) Interdependency and co-operation, and 4) Belonging and security. The paper considers how to incorporate aspects of these four themes into today's organizations. A key focus is on examining the way work is accomplished, especially at the senior levels, and questioning our assumptions about its design and structure. The core elements underlying the power of the Haudenosaunee women can serve as useful guides, highlighting a path toward achieving full participation of women in positions of power and influence in organizations today.

Abstract 158

DAILY WORKPLACE INCIVILITY CREATES FEAR THAT IMPAIRS MENTAL HEALTH: UNDERSTANDING WHEN JOB CRAFTING CAN ACT AS A WITHIN-PERSON MODERATOR

Junça--Silva A.*[1], Brito S.[2]

[1]*Ana Junça-Silva ~ Lisboa ~ Portugal,* [2]*Sílvio Brito ~ Tomar ~ Portugal*

The literature has indicated that employees who experience fear may feel stressed, demotivated, and unhappy, which can lead to mental health impairment. However, studies on the causes and effects of fear experiences at work are scarce. We relied on the affective events theory to test a model in which incivility experiences were hypothesized to predict decreases in mental health through fear at work. Based on the conservation of resources model, it was also hypothesized that daily job crafting behaviours would mitigate the indirect relationship between incivility experiences and mental health through fear. A daily study was conducted with 96 workers (N=96*5=480 daily measurements). The multilevel results showed that daily job crafting significantly moderated the indirect relationship between incivility experiences and mental health through fear, in such a way that the relationship was stronger for those who exhibited fewer job crafting behaviors. The results show the negative impact that daily incivility experiences can have on individuals; however, these seem to be mitigated when individuals use behavioural strategies to transform work – job crafting.

TOWARDS A CARE-CENTERED DECOLONIAL WORK PSYCHOLOGY: TRANSDISCIPLINARY INSIGHTS FROM THE MOTHERLOAD PROJECT IN SOUTH AFRICA

Jaga A.[1], Duffy C.*[1], Shen W.[2]

[1]University of Cape Town ~ Cape Town ~ South Africa, [2]York University ~ Toronto ~ Canada

Women's disproportionate responsibility for unpaid care work remains a global barrier to employment and well-being. Addressing this grand societal challenge, we explored the lived realities of 10 low-income black mothers in South Africa, a context deeply shaped by apartheid and colonial legacies of inequality. Using a decolonial feminist framing, a transdisciplinary team conducted a two-year long participatory action research project with photovoice methods, positioning mothers as co-researchers and centring their often-silenced knowledge of the tensions between earning and caring. Insights were shared and refined through iterative engagements with community members, NGOs, and government policymakers, highlighting the need for systemic responses to care.

We offer the concept, The Motherload, to capture mothers' phenomenological experiences of unpaid care burdens as entangled with historical, economic, socio-cultural, and structural conditions. This shifts understanding of unpaid care work beyond individualised framings of mental or cognitive load. Thematic analysis of workshop transcripts yielded three themes: (1) The Motherload as a socially and structurally produced burden, (2) systemic barriers to mothers' employment, and (3) stakeholder responses to reimagining care.

By grounding conceptual development in marginalised lived realities in the Global South, this study advances work psychology by positioning care as central to psychological well-being and work futures, and demonstrating the value of transdisciplinary, participatory, and decolonial methodologies. The research aligns with the sustainable development goals on gender equality, decent work, and reduced inequalities. We present pathways for informing care-responsive policies, including reframing livelihoods and workplace design around unpaid care.

Abstract 2417

RIGHTS AND WRONGS: THE EFFECT OF LABOR RIGHTS INFORMATION ON WORKPLACE DECISIONS AMONG BACKPACKERS IN AUSTRALIA.

Teufel J.*[1], Beeder M.[2]

[1]Max Planck Institute for the Study of Crime, Security and Law ~ Freiburg ~ Germany, [2]University of Southampton ~ Southampton ~ United Kingdom

INTRODUCTION

Each year, thousands of young people temporarily migrate to Australia to 'work and travel', contributing over $3.2 billion annually to the country's economy. They provide essential labor in agriculture, hospitality, and tourism, particularly in remote areas. Despite this, many face exploitative working conditions such as underpayment, long hours, and unsafe workplaces. Those with limited English skills, financial resources, or knowledge of their rights are most vulnerable to such conditions. In other migrant populations, information campaigns are a common policy approach to addressing similar issues, aiming to raise awareness and empower migrants to seek fair conditions. However, causal evidence regarding their effectiveness remains limited.

PURPOSE

This study rigorously evaluates an information campaign among 'backpackers' working in Australia, using a longitudinal randomized controlled trial. The goal is to identify how improved knowledge about workplace rights affects employment decisions over time, including quitting, staying, or reporting poor conditions.

METHOD

To test this, half of our 739 participants (the 'treatment group') received tailored information about their rights at the start of the study. One and two months later, all participants completed detailed questionnaires on working conditions, job changes, well-being, and awareness of rights. To ensure accessibility, all materials were provided in English as well as Chinese, French, and German as the main languages spoken by non-English-speaking backpackers. This allowed for a more diverse sample and inclusion of participants with limited English proficiency.

RESULTS AND CONCLUSION

Consistent with earlier research, we find that limited awareness of rights, poor English skills, and financial insecurity are linked to worse employment conditions. Our study boosted awareness of working rights - interestingly, this effect extended to the control group. Over time, increased knowledge was with slight improvements in working conditions. However, dependency on employers and structural vulnerabilities limited the overall impact, suggesting that information alone is insufficient.

SOCIAL ENTERPRISES AS INFRASTRUCTURES OF BELONGING: PERSPECTIVES FROM SOUTH AFRICA AND COLOMBIA

Veldsman N.A.*[1], Bojovic N.[2], Velez Zapata S.[2], Kraak J.[2], Meyer I.[1]

[1]University of Cape Town ~ Cape Town ~ South Africa, [2]KEDGE Business School ~ Bordeaux ~ France

Existing research on social enterprises has focused primarily on governance, finance, or social impact metrics, while much less is known about the psychosocial processes that sustain them. In particular, the cultivation of belonging and community has received limited attention, despite its importance for participation and long-term impact. This study addresses this gap by exploring how social enterprises act as community-building infrastructures that enable stakeholders to foster belonging and connection. We are conducting semi-structured interviews with founders, management, staff, clients, and volunteers at two social enterprises, one in South Africa and another in Colombia, to understand their motivations, practices, and organisational approaches to fostering community. Thematic analysis will be used to identify recurring patterns across stakeholder perspectives, clarifying mechanisms through which social enterprises strengthen community and collective engagement. By drawing on evidence from underrepresented contexts, the study seeks to challenge the Global North focus of much social enterprise research and bring forward perspectives from emerging economies. It further aims to show that the value of social enterprises extends beyond economic and social outcomes to include psychological and relational ones. In doing so, the research extends applied psychology by demonstrating that belonging is cultivated not only in workplaces and communities but also in hybrid organisational forms such as social enterprises and highlights their role in sustaining community across diverse contexts.

WHISPERS OF CHANGE: USING NARRATIVE ANALYSIS TO UNDERSTAND COMMUNITY TRANSFORMATION

Baquiano M.*[1], Teng--Calleja M.[2], Caringal--Go J.F.[2], Ramos R.E.V.[2], Manaois J.[3], Calleja J.N.[2], Perez J.[2]

[1]University of Guam ~ Mangilao ~ Guam, [2]Ateneo de Manila University ~ Quezon City ~ Philippines, [3]Mindanao State University - Iligan Institute of Technology ~ Iligan City ~ Philippines

The study examined personal stories and publicly shared narratives about community transformation among beneficiaries/partners of six non-government organizations in the Philippines. We conducted 16 focus groups and three interviews to collect data, employing an integrated approach to narrative analysis for interpretation. We identified four key themes that weave together the participants' personal and public narratives of transformation within their communities: narratives of agency and empowerment, drivers of community transformation, challenges to transformation, and narratives of transformed lives. Their stories intertwine personal, interpersonal, and social dimensions, highlighting not only their understanding of community transformation but also the identities that emerge in the change process. Using narrative analysis as the theoretical lens and analytical framework allowed for an exploration of the experiences and meaning of community transformation in the stories of community members.

Abstract 2433

INTERGENERATIONAL COMPETITION IN THE WORKPLACE: DOES IT HAPPEN?

Fülöp M.*, Molnár Z., Biro K.

Károli Gáspár University of the Reformed Church in Hungary and HUN-REN Institute of Cognitive Neuroscience and Psychology, Research Centre of Natural Sciences ~ Budapest ~ Hungary

The labour shortage is increasingly drawing attention to the older age group and its mobilization in the labour market. In both Europe and Hungary, is a growing need for workers of retirement age, as fewer and fewer young enters the labour market. In Hungary, the number of people aged 65 or over in employment has been rising steadily and dynamically since 2015 (Hungarian Central Statistical Office 2015-2022). A multigenerational work environment may have advantages and disadvantages, the interpersonal and intergroup dynamics may be constructive and destructive (Fülöp & Takács, 2013). While intergenerational cooperation in the workplace has been studied more extensively, there has not been systematic research on competition among young (below 35) and older (above 55) employees in the workplace.

The present study aimed to explore how young and older employees perceive competition among the generations in general and in their workplace and what kind of personal (constructive/destructive, fair/unfair) competitive experiences they have and how they perceive intergenerational competition in relation to cooperation among the generations in their work environment.

Altogether 40 semi-structured interviews were carried out with 20 young (below 35) and 20 older (above 55) employees. The interviews were transcribed and thematic analysis (Braun&Clarke, 2022) was applied to identify the main themes along which the participants perceive intergenerational competition in their workplace.

The results show, that intergenerational competition does occur in the workplace. Young and older employees attribute different competitive advantages to young/old depending on the particular area of comparison and competition, perceive different obstacles and unfair treatment in competition in relation to their age and gender and age & gender.

The more in-depth understanding of the competitive dynamics among different generations may contribute to a more effective management of the personal resources of employees and this may have several advantages at the individual, corporate, social, and economic levels.

Abstract 2646

IMPORTANCE OF BRANDING AND MARKETING DURING NATION'S FREEDOM STRUGGLE: A STORY OF INDIA

Mishra S.*[1], Kumar A.[1], Mishra S.[2]

[1]Manav Rachna International Institute of Research and Studies ~ Faridabad ~ India, [2]Shikshantar, A Unitech School of Learning ~ Gurgaon ~ India

The purpose of the paper is to understand how the right marketing and branding strategy can change the image of a brand, country or an individual in the eyes of all the stakeholders. This paper takes an unconventional route to understand this concept - here, Brand Identity Prism together with Analytical Psychology has been taken as the lens through which the phenomenon of India's freedom struggle has been understood. Giving clarity to what wholesome marketing campaigns can achieve, when visionaries helm a mission. The rationale behind taking a country rather than a brand to understand this concept is because most marketing theories do not cover the impact right marketing tools can have on the image of the country within and outside at a global level. This research was primarily conducted through secondary data in the form of books, articles, press clips, photographs etc. The paper establishes a stance on how symbolic branding and narrative control are central to both historical change and current nation building strategies, encouraging future research on the evolution of the country and its impact on the world. This paper offers a framework for analyzing global movements, emphasizing symbolic branding's role in social change, national identity and governance. It invites future research on India's evolving global image. The paper is based on historical context and the reality that existed then. This paper takes into consideration India's freedom struggle, not just from the historical perspective or socio-political perspective but from a marketing perspective as well, bringing light to the importance of marketing in framing a nation's identity.

Abstract 1808

THE EFFECT OF SOCIAL IDENTITY CONFLICT ON THE TENDENCY TO GREEN CONSUMPTION AND ITS MECHANISM

Wang D.*, Zhong J.

Zhejiang University ~ Hangzhou ~ China

With the advancement of science and technology, people around the world have become more and more frequent in their contacts and exchanges, and individuals can easily recognize and join various social groups, thus possessing multiple social identities at the same time, and different social identities will have a significant impact on the individual's preference for green consumption. However, when social identities provide different values and behavioral norms, individuals will face social identity conflicts, resulting in the depletion of cognitive resources and adverse effects on individuals, which will also have an impact on their inherent behavioral patterns. The present study conducted three studies based on conservation of resources theory to investigate the effect of social identity conflict on green consumption tendencies, as well as the underlying mechanisms and boundary conditions of this effect, namely the mediating role of self-concept clarity and the moderating role of social support and public self-awareness. The results of the study are as follows:

(1) Social identity conflict reduced individuals' green consumption tendency.

(2) Self-concept clarity mediated the relationship between social identity conflict and green consumption. Social identity conflict reduced individuals' self-concept clarity, which reduced green consumption tendency.

(3) Social support moderated the first half of the path of the mediating mechanism between social identity conflict and green consumption.

(4) Public self-consciousness moderated the second half of the path of the mediating mechanism between social identity conflict and green consumption.

This study enriches the evidence of relevant empirical studies on self-concept clarity in the field of consumption and the application of conservation of resources theory, and also provides some ideas for merchants to develop marketing strategies for green products.

DREAMS IN WORK AND ORGANIZATIONAL CONTEXTS: A SCOPING REVIEW

Giusino D.*[1], Akbarian Tefaghi A.[2], Di Stefano G.[3]

[1]University of Foggia ~ Foggia ~ Italy, [2]University of Bologna ~ Bologna ~ Italy, [3]University of Palermo ~ Palermo ~ Italy

Introduction: The psychological study of dreams has historically been rooted in psychoanalysis and clinical contexts since Freud's Die Traumdeutung. While extensive work has examined dreams in therapy and neuroscience, and despite a rich tradition of psychodynamic organizational analysis (e.g., Tavistock Institute of Human Relations), little attention has been given to their role in work and organizational settings. Only a handful of scattered studies address how dreams influence employees and organizations. The absence of a comprehensive synthesis limits the development of a coherent framework for integrating dreams into organizational psychology research and practice.

Purpose: This scoping review maps, evaluates, and synthesizes existing studies on dreams within organizational contexts. Its objectives are to: (1) identify the scope and state of current literature on dreams at work, (2) examine the theoretical frameworks underpinning this research, and (3) assess practical applications of dream studies for organizational life. The review encompasses both individual dream experiences and collective approaches such as social dreaming.

Method: The review follows PRISMA-P guidelines and applies a systematic search strategy across EBSCOhost, Scopus, and Web of Science. Eligible studies include peer-reviewed journal articles in English, French, or Italian, encompassing theoretical and empirical designs without restrictions on publication year. Screening and extraction are conducted independently with Rayyan software. Data are synthesized narratively, and methodological quality is critically appraised using Joanna Briggs Institute tools.

Results: Preliminary results indicate a fragmented but diverse body of research spanning clinical, organizational, and psychosocial domains. The review highlights psychoanalytic, psychodynamic, and continuity hypothesis perspectives, with practical implications for employee well-being, creativity, and reflective practices in organizations.

Conclusions: As the first comprehensive synthesis of dreams in organizational contexts, this study consolidates scattered contributions across psychodynamic and occupational psychology traditions, legitimizes an underexplored field, and provides conceptual

clarity. The findings contribute to organizational psychology by uncovering new avenues for theory, research, and practice.

Abstract 428

WORKPLACE SPIRITUALITY AS PREDICTOR OF JOB SATISFACTION AMONG HIGHER INSTITUTION TEACHERS IN INDIA

Kumar S.*[1], Kumar V.[2]

[1]Banaras Hindu University ~ Varanasi ~ India, [2]Dr. Shakuntala, Mishra National Rehabilitation University ~ Lucknow ~ India

Workplace spirituality is believed to have a positive impact on job satisfaction which leads to increased employee engagement, performance, commitment, and overall well-being. A spiritually oriented workplace fosters a sense of purpose, belongingness, and meaning in work, which in turn enhances an employee's experience and satisfaction with their job. Personal spirituality can also enhance job satisfaction, work engagement, and productivity and reduce burnout and stress. There has been a surge in factors which account for workplace performance, job satisfaction and well-being. The researchers have identified several elements which facilitate the growth and development of an organization. Workplace spirituality has emerged to be a crucial index for job satisfaction and overall well-being of an individual. The present investigation attempts to explore the role of workplace spirituality in predicting job satisfaction of teachers in private colleges of management and technology education in India, because private institutions of these two domains are perceived to be more pressurized due competition and therefore need coherence among employees. The sample size of the current study is one hundred and fifty (N = 150) teachers of private colleges (management and technology) located in and around Lucknow and Varanasi cities of India. During the data collection Minnesota Satisfaction Questionnaire was used to measure job satisfaction while workplace spirituality was measured by utilizing Human Spirituality Scale and Organizational Spiritual Values Scale was used to measure organizational spirituality. The results indicate that workplace spirituality is a significant predictor of job satisfaction. Results revealed strong positive relationship between job satisfaction and both organizational spirituality ($r = .611$, $p < .001$) and personal spirituality (.709, <.001). Regression analysis further emphasized that these two factors, i.e., personal spirituality and oganizational spirituality ($r = 0.268$, $p < 0.001$), account for 42.8% variance in job satisfaction ($R2 = .428$, $p < .001$). This underscores the importance of spirituality at organizational as well as personal levels in enhancing job satisfaction.

Abstract 387

MORE THAN WORDS ON A WALL: TESTING HOW PURPOSE-DRIVEN MISSION CONSISTENCY AFFECTS MEANING AT WORK

Skhirtladze E.*[1], Selvam R.[1], Romeo Delgado M.[1], Rey C.[2]

[1]University of Barcelona ~ Barcelona ~ Spain, [2]International University of Catalonia ~ Barcelona ~ Spain

Introduction: In the context of growing global interest in purpose-driven organizations, this research aims to contribute to the applied psychology of work by clarifying how and when purpose-driven mission fosters meaningful work. It addresses a gap in understanding the behavioral pathways and contextual factors, more specifically, by exploring prosocial behavior as a potential mechanism through which purpose–mission consistency translates into meaningful work, and organizational trust as a potential moderator.

Purpose: This research examines how purpose-driven mission consistency, defined as the alignment between a stated purpose, motivation, and daily practices, shapes employees' perceptions of meaningful work. Rather than treating purpose as a static statement, it is conceptualized as a dynamic, lived organizational principle a "why" that actively informs the "what" (mission) and the "how" (daily practices) of organizational life.

Method: A cross-sectional survey was conducted with 658 employees from various organizations in Spain. Data were analyzed using SPSS and Hayes' PROCESS macro. The analysis included Confirmatory Factor Analysis (CFA) and moderated mediation modeling to test the hypothesized relationships.

Results: Purpose-driven mission consistency significantly influenced meaningful work perceptions. Prosocial behavior partially mediated this relationship, indicating that consistent purpose fosters meaning partly through its influence on pro-socially oriented employee actions. However, organizational trust did not significantly moderate these pathways.

Conclusion: This research contributes to understanding how organizations can foster meaningful work. When purpose is operationalized not as rhetoric but as a lived organizational reality, it can promote both meaningful work experiences and prosocial behavior. In doing so, organizations not only strengthen internal outcomes, such as engagement and well-being, but also advance broader societal objectives particularly those aligned with the United Nations Sustainable Development Goals, such as

promoting good health and well-being (SDG 3) and ensuring decent work and economic growth (SDG 8).

MANSPLAINING AND MORE: DEVELOPMENT AND CROSS-CULTURAL VALIDATION OF THE WORKPLACE GENDER COMPETENCE QUESTIONING SCALE (WGCQS)

Chenevert M.E.*[1], Valenzuela Catarí G.[8], Da Silva Guimarães M.*[2], Mészarosová J.[3], Obertautsch H.[4], Papadopoulou P.[6], Terragni G.[7], Tutinelli V.[5], Vignoli M.[1]

[1]University of Trento ~ Rovereto ~ Italy, [2]University of Valencia ~ Valencia ~ Spain, [3]Palacký University Olomouc ~ Olomouc ~ Czech Republic, [4]University of Vienna ~ Vienna ~ Austria, [5]University of Zurich ~ Zurich ~ Switzerland, [6]Aristotle University of Thessaloniki ~ Thessaloniki ~ Greece, [7]University of Turin ~ Turin ~ Italy, [8]University of Seville ~ Seville ~ Spain

Introduction

The infamous “mansplaining” is just one form of gender competence questioning (GCQ)—which refers to subtle communication behaviors that signal doubt about a woman’s competence, rooted in gender stereotypes. While mansplaining, or unsolicited condescending explanations, is widely recognized, it is only one of three empirically established GCQ behaviors, alongside voice non-recognition and intrusive interruptions.

Purpose

Despite their cultural salience, GCQ behaviors have received limited empirical attention. No existing scale captures all three GCQ types, and prior research has largely relied on self-labeling, limiting analytical precision. Thus, this research project aimed to (1) develop and validate a comprehensive scale to measure GCQ in the workplace, (2) position GCQ within a broader nomological network of workplace and individual factors, and (3) extend the scale’s validation to six additional countries.

Method

Our research project consisted of four studies. Study 1 involved two rounds of qualitative data collection and analysis for item development. Study 2 used parallel analysis and exploratory factor analysis to examine the scale’s factor structure. Study 3 confirmed the structure using a series of confirmatory factor analyses (CFA), and Study 4 assessed convergent, discriminant, criterion and nomological network validity and tested measurement invariance across the seven countries.

Results

The final Workplace Gender Competence Questioning Scale (WGCQS) consists of 11 items across two factors. CFA results across all countries indicated good model fit, and strict measurement invariance was established. The scale showed strong convergent validity and acceptable discriminant validity. Furthermore, GCQ was meaningfully situated within a broader network of person- and work-related variables in each country.

Conclusion

The WGCQS offers a reliable tool validated in seven languages for measuring GCQ in the workplace. Its development provides a foundation for deeper theoretical and empirical investigations into subtle forms of gender discrimination and their implications

for women’s workplace experiences and outcomes.

Abstract 784

GENDER, DOMINANCE, AND NETWORK SIZE: HOW SOCIAL MEDIA SIGNALS SHAPE ENTREPRENEURIAL FUNDING

Schweitzer V.[2], Gerpott F.H.*[1], Rivkin W.[3], Stollberger J.[4], Perez--Luno A.[3]

[1]WHU - Otto Beisheim School of Management ~ Duesseldorf ~ Germany, [2]Universität Konstanz ~ Konstanz ~ Germany, [3]Trinity College Dublin ~ Dublin ~ Ireland, [4]Durham University Business School ~ Durham ~ United Kingdom

Introduction: Despite growing numbers of female entrepreneurs, gender disparities in venture capital funding persist. Social media offers entrepreneurs opportunities to signal legitimacy, yet an ongoing debate suggests that such signals may be evaluated differently depending on gender.

Purpose: Drawing on signaling theory and role congruity theory, we examine how male and female entrepreneurs' dominance displays and network size on social media jointly shape investors' funding decisions. Specifically, we develop nuanced arguments about how digital signals are interpreted in the context of gender stereotypes, thereby rewarding female founders who combine high dominance expression with a large network on social media.

Method: We used archival data from 634 U.S.-based tech startups that raised Series A–D funding in 2021, which we combined with founders' communication on X (formerly Twitter) using a natural language processing model to assess dominance displays. We are planning to complement the field data with a 2 (gender: female vs. male) x 2 (dominance: high vs. low) x 2 (network size: high vs. low) experiment, including investment professionals who will be asked to allocate funding to systematically varied founder profiles.

Results: Our archival data study shows that female founders secure less funding than male founders when their network size is small, but this gap reverses when women combine large networks with high dominance displays. Male founders, in contrast, are penalized for dominance when their network size is large. Findings from the experimental study will further substantiate and extend these insights.

Conclusions: Our research contributes to understanding when dominance displays may help female founders overcome gender-based disadvantages in funding contexts, while potentially backfiring for male founders. The findings advance our understanding of signaling theory in the context of entrepreneurship and gender stereotypes, offering actionable insights for founders navigating investor evaluations and for investors aiming

to overcome bias.

Abstract 228

MORE THAN A WORK-FAMILY DEMANDS AND RESOURCES PROBLEM: THE PERSISTENT GENDER GAP IN WORK-LIFE BALANCE

Hakem Zadeh F.*, Chowhan J., Kalynychenko I.

York University ~ Toronto ~ Canada

Introduction: Work-life balance (WLB) is a pillar of gender equality, as it emerges from interdependent roles, affects both work and home domains, and is significantly associated with job satisfaction, commitment, performance, and intention to leave, which can shape wage disparities.

Purpose: This study examines whether WLB is unequally distributed between females and males and if a resource/demand perspective across work and family domains can explain the potential disparity.

Method: Data from 2,963 participants in the nationwide Statistics Canada General Social Survey (24-64 years old, employed, and living with a partner) was analyzed using Stata. Structural equation modelling was used to test how work and family resources and demands affect WLB, mediated by Work Interference with Personal Life (WIPL) and Personal Life Interference with Work (PLIW).

Results: The partial mediation model significantly outperformed the full mediation model (LR chi2=201.57, $p<0.001$). WIPL and PLIW significantly reduce WLB (β=-0.865***, -0.207***). Work domain demands (work intensity, job insecurity, and conflict at work) are positively associated with WIPL and PLIW and negatively associated with WLB. Work domain resources, including autonomy, task significance, and employment benefits, are positively associated with WLB (β= 0.151**, 0.289***, 0.306**). Telework is positively associated with WIPL and PLIW and does not offer any benefits in WLB. In the family domain, having young children is positively associated with WIPL and PLIW while negatively associated with WLB. Family rewards (satisfaction with the amount and quality of family time) appear to be the strongest protective factor (β= WIPL -0.476 ***, PLIW –0.325 ***, WLB 0.591 ***). The sex-based female disparities persist (β= WIPL 0.237*, PLIW 0.420***, WLB -0.332**) even after considering the work and family resources/demands perspective.

Conclusions: Association between WIPL, PLIW, and WLB is asymmetric. WLB gap cannot be fully explained by the current resource/demand perspective, suggesting the need for theoretical expansion.

Abstract 1002

COSTS AND CONSEQUENCES OF GENDERED LEISURE AMONG INDIAN WORKING WOMEN: THE ROLE OF CULTURE AND CONTEXT

George A.J.[1], Sadasivan A.*[2]

[1]Indian Institute of Management Ranchi, Jharkhand, India ~ Ranchi ~ India, [2]Birla Institute of Technology, Mesra, Ranchi, Jharkhand, India ~ Ranchi ~ India

Introduction: Leisure, defined as having sufficient time to engage in enjoyable activities of one's choice, is a universal necessity for well-being and related outcomes. However, gender often influences both the availability and quality of leisure. In the Indian context, working women typically shoulder household responsibilities in addition to workplace duties, leaving them burdened with both paid and unpaid labour, and with very little leisure time. While leisure has been extensively studied in the West, empirical research remains scarce on the leisure experiences of Indian working women, despite its direct and indirect implications for productivity, health, and well-being.

Purpose: This study sought to address the questions: What challenges do women face in engaging in leisure? and how does leisure contribute to women's well-being and contentment? It aimed to investigate the gendered leisure experiences of Indian working women.

Method: Qualitative research design was adopted with mixed purposeful sampling – combining chain and intensity sampling – to recruit 44 working women from South Indian states. Data were collected through in-depth interviews, which were recorded, translated where necessary, and transcribed for analysis.

Results: Reflexive thematic analysis revealed three major themes related to women's leisure engagement: (1) Constraints, (2) Consequences, and (3) Changes. The findings highlight the diverse leisure experiences of participants and indicate potential strategies for enhancing the leisure of working women.

Conclusions: The study provides insights to inform multiple stakeholders – including working women and their families, managers, organisations, policymakers, and women's empowerment advocates – about the significance of gendered leisure. It further emphasises the need to adopt strategies that ensure women's leisure satiation, thereby promoting a range of personal and societal benefits.

Abstract 774

OVERCOMING "MASCULINE – CODED" ORGANISATIONAL CULTURES AND PERSISTENT GENDERED SUB-STRUCTURES: EXPERIENCES OF WOMEN INDEPENDENT DIRECTORS IN INDIA

Singh R.*, Purang P.

Indian Institute of Technology ~ Mumbai ~ India

Context: Globally while representation of women in the workplace has increased, it reduces to a trickle by the time they reach senior leadership in organizations - a phenomenon which has negative consequences both for women and a nation's financial and social health. While extant literature has examined the challenges disrupting women's career progression this paper explores how Women Independent Directors (WID), have navigated male-oriented organisational cultures, unfriendly HR policies presented in the garb of "merit-based" policies and gendered substructures to shape their career trajectories.

Study: A qualitative study using semi-structured interviews was conducted with 25 WID and 6 Male Independent Directors in India. The data collected was analysed using thematic analysis. The resultant analysis showed the presence of organizational bias impacting psychological safety, belongingness, and motivation in the women in the workforce. It demonstrated how systemic workplace practices and HR policies perpetuate opportunity, resource and income inequalities.

Apart from bringing out the systemic barriers that women face, the study showed organisational factors like visibility at work, mentorship, taking initiative and exercising of voice by the women, as enabling factors. The study revealed that the type of organisation like government, public or private sector along with its associated manpower intake policies appear to have a bearing on the longevity of the woman's employment and subsequently overcoming the systemic barriers and reaching the top echelons of management.

Implications of the findings: The findings highlight the need for HR Policies/ Service Rules to offer mentorship, training and enabling networks to help women grow in their professions. It highlights that organisations need to rally behind the women if the income, opportunity and resource inequalities need to be bridged.

01 - Division 1: Work and Organizational Psychology

ADVANCING RESEARCH ON CALLING AND MEANINGFUL WORK: PATHWAYS AND BOUNDARIES

Thursday 23 July 2026 from 14:00 to 15:30

(R-Arsenale)

Anna Dalla Rosa (University of Padova ~ Padova ~ Italy), Chair and Discussant

The pursuit of calling and meaningful work has gained increasing scholarly and practical attention. Researchers are asking: What does it mean to experience work as a calling, how does it develop, and under what conditions does it backfire? These questions remain pressing, yet important challenges persist. Advancing the field requires valid measures across cultures, deeper understanding of developmental pathways, and knowledge of their pitfalls. Addressing these challenges through five complementary studies, this symposium aligns with the congress theme of offering new directions in applied psychology and innovative approaches to the study of calling and meaningful work in diverse global settings.

The first presentation introduces the adaptation and validation of the Unified Multidimensional Calling Scale for Türkiye exploring the methodological foundation needed for reliable, cross-cultural assessment of calling. The second reports on the LIVE Project, the largest-ever longitudinal study of vocational exploration in North America, tracking students and faculty to analyse developmental pathways and institutional practices that shape calling and meaning. The third presents results from iWORK, a smartphone-based intervention experimentally testing whether calling can be cultivated by enhancing work and life meaning, using character strengths, and engaging in job crafting through daily micro-activities. The fourth examines a dual pathway model of meaningful work in Türkiye, showing how systemic constraints and resources shape professionals' experiences amid turbulence. The symposium closes with a critical perspective: using cross-national data from 13 countries and a person-centered approach, the final study investigates cultural conditions under which calling may lead to workaholism and organizational exploitation.

Together, these contributions move beyond positive correlates, tracing a narrative from measuring and cultivating calling to the contextual conditions that shape it. Integrating psychometric, longitudinal, and experimental approaches, the symposium highlights both the promise and pitfalls of calling and meaningful work.

Abstract 3835

PSYCHOMETRIC PROPERTIES OF THE TURKISH VERSION OF THE UNIFIED MULTIDIMENSIONAL CALLING SCALE: RELIABILITY AND VALIDITY

Erhan T.*[2], Vianello M.[3], Yastioglu S.[1], Akçakanat T.[2], Uzunbacak H.H.[2]

[1]Burdur Mehmet Akif Ersoy University ~ Burdur ~ Turkey, [2]Süleyman Demirel University ~ Isparta ~ Turkey, [3]University of Padova ~ Padova ~ Italy

This study aimed to contribute to the literature on validated calling scales in Türkiye by adapting and validating the Unified Multidimensional Calling Scale (UMCS; Vianello et al., 2018). The UMCS is a comprehensive instrument capturing both internal drives for self-fulfillment—such as passion, pervasiveness, purposefulness, and identity—and external influences shaping a sense of calling, including transcendent summons, prosocial orientation, and sacrifice. The adaptation process involved translation and back-translation to ensure linguistic equivalence. To assess linguistic validity, 39 academicians responded to both Turkish and English versions of the UMCS with a 14-day interval. Item-level correlation analyses demonstrated moderate to high significant associations ($r = .383–.855$, $p < .05$), supporting linguistic validity. Construct validity and reliability were then examined with a larger sample of academicians ($N = 464$). Exploratory factor analysis supported the expected seven-factor structure (total variance explained = 78.90%), while confirmatory factor analysis indicated satisfactory model fit ($\chi^2/df = 3.563$; CFI = .926; TLI = .914; RMSEA = .074; factor loadings = .646–.945). Internal consistency coefficients showed high reliability across subdimensions ($\alpha = .835–.939$). Concurrent validity was supported through significant correlations with the Brief Calling Scale ($r = .730$, $p < .001$). Convergent validity was demonstrated via positive associations with work engagement ($r = .714$, $p < .001$), and discriminant validity was established through negative relationships with disengagement ($r = –.699$, $p < .001$), turnover intention ($r = –.371$, $p < .001$), and exhaustion ($r = –.367$, $p < .001$). Overall, findings provide strong evidence that the Turkish UMCS is a valid and reliable instrument with sound psychometric properties to assess the seven-dimensional construct of calling within the Turkish cultural context. This study was supported by the Scientific and Technological Research Council of Türkiye (TÜBİTAK 2219 – International Postdoctoral Research Fellowship Program for Turkish Citizens).

Abstract 3836

THE LIVE (LONGITUDINAL INVESTIGATION OF VOCATIONAL EXPLORATION) PROJECT: VISION, SCOPE, EARLY RESULTS

Dik B.*[1], Duffy R.[2], Daniels D.[3], Inselman K.[4]

[1]Colorado State University (USA) and Optentia Research Unit, North-West University (South Africa) ~ Fort Collins ~ United States of America, [2]University of Florida ~ Gainesville ~ United States of America, [3]Wheaton College ~ Wheaton ~ United States of America, [4]Colorado State University ~ Fort Collins ~ United States of America

In 2025, the Council of Independent Colleges (USA) launched the LIVE (Longitudinal Investigation of Vocational Exploration) Project. This major study, funded by Lilly Endowment Inc., will follow two cohorts of students as well as faculty members from 39 universities in the U.S. and Canada that are members of NetVUE (Network for Vocation in Undergraduate Education). This is expected to be the largest-ever longitudinal study focusing on outcomes related to calling, vocation, and purpose in career decision-making and planning. The project aims to track first-year students annually over their four years of university education, and fourth-year students as they graduate and pursue further education or employment opportunities in emerging adulthood. A central goal for the project is to shed light on best practices in fostering a deepening sense of calling, vocation, and purpose, particularly among undergraduate students at NetVUE member institutions, as they progress through their university years and embark on adult life. While the project is still in its early stages, this initial report will provide insight into the difference that programming in vocational exploration and discernment is making—both for students and for academic institutions. This workshop will present highlights from the initial wave of this research effort—with results from both faculty and student participants—and will invite attendees to consider the implications of the data for individual, counseling, and educational policy applications.

Abstract 3837

IWORK: A SMARTPHONE-BASED INTERVENTION TO CULTIVATE CALLING AT WORK

Pasto A.*, Dalla Rosa A.

University of Padova ~ Padova ~ Italy

People seek more from their work, especially a sense of meaning and purpose (d'Aniello, 2022), yet practical tools to translate meaning into a sustained sense of calling are scarce; and, theoretically, we still lack causal evidence on how a sense of calling develops and which ingredients drive it. iWORK was built to address this gap: A smartphone app that helps people clarify, strengthen and enact a sense of calling in everyday work by engaging in three evidence-based pathways: (a) identifying and using signature character strengths at work, (b) enhancing meaningful life and meaningful work, and (c) practicing job crafting. The app translates these mechanisms into brief, daily micro-activities, reflections and behavioral gestures that fit into daily life, with adaptive prompts and progress feedback to sustain engagement.

By December 2025, we will complete an optimization trial using a factorial design to test all combinations of iWORK components. A sample of 278 will be collected to detect a small-to-moderate effect size (d = 0.30) with 80% power at α = .05. Participants will engage in the program for three weeks, with outcomes on calling and related constructs assessed at baseline, post-intervention, and 3-month follow-up. From January to June 2026, we will conduct a two-arm randomized controlled trial (N = 278) to evaluate the effectiveness of the optimized intervention against a control condition.

Results will be presented at the 2026 International Congress of Applied Psychology in Florence.

If effective, iWORK will advance theory by identifying which components are most useful for developing a sense of calling; clarifying the temporal ordering among strengths use, meaning (life and work), job crafting and calling, providing causal evidence that calling can be intentionally cultivated. Practically, it will provide concrete support to develop calling, packaged as a low-cost app with actionable implementation guidance for organizations and career services.

Abstract 3838

MEANINGFUL WORK AMIDST UNCERTAINTY: THE CASE OF TÜRKIYE

Karabati S.*

Bilgi University ~ Istanbul ~ Turkey

The pursuit of meaningful work has emerged as a pivotal concern for workers navigating an era of rapid technological change, economic instability, and sociopolitical turbulence. While meaningful work is consistently associated with positive outcomes such as engagement and well-being, its realization remains uneven, particularly among those facing systemic constraints. This study examines how white-collar professionals in Türkiye experience meaningful work, a context marked by weak education–employment linkages, limited perceptions of meritocracy, and rising political and economic uncertainties. Utilizing survey data from white-collar employees aged 18–59, the study tests a dual pathway model. The threat pathway proposes that technostress increases competence need frustration, undermines the experience of meaningful work, and thereby fuels hopelessness. The motivational pathway posits that job-related psychological resources strengthen autonomy need satisfaction, enhancing both meaningful work and meaning in life. Findings are expected to inform policymakers and organizational leaders seeking to support professionals' pursuit of meaningful work amidst profound existential, economic, and technological disruptions.

Abstract 3839

CULTURAL TIGHTNESS AND RELATIONAL MOBILITY IN PREDICTING THE "DARK" PROFILES OF CALLING: A CONFIRMATORY LATENT PROFILE ANALYSIS

Takagi R.*[1], Dalla Rosa A.[1], Balazs A.[2], Akbari M.[3], Miranda Amorim S.[4], Eftekhari S.[3], Bergner S.[5], Borinca I.[6], Fris D.[7], Gerdel S.[8], Harangozó J.J.[2], Kim S.[9], Maierhofer S.[5], Park J.[10], Porto J.B.[11], Yakideh K.[3], Vianello M.[1]

[1]University of Padova ~ Padova ~ Italy, [2]Eötvös Loránd University ~ Budapest ~ Hungary, [3]University of Guilan ~ Rasht ~ Iran, Islamic Republic of, [4]Universidade Federal de Minas Gerais ~ Belo Horizonte ~ Brazil, [5]University of Graz ~ Graz ~ Austria, [6]University of Groningen ~ Groningen ~ Netherlands, [7]Open University ~ Heerlen ~ Netherlands, [8]University of Bergamo ~ Bergamo ~ Italy, [9]Yonsei University ~ Seoul ~ Korea, Republic of, [10]Duksung Women's University ~ Seoul ~ Korea, Republic of, [11]porto.juliana@gmail.com ~ Brasilia ~ Brazil

Empirical evidence on the positive relation between work as a calling and well-being is well-established. However, this predominantly positive view may be incomplete, as findings on the so-called "dark side" of calling—the prediction that calling leads to negative work outcomes under specific conditions—remains inconclusive. Existing research has primarily relied on nomothetic approaches, which may overlook the adverse effects that manifest only in a subset of individuals. This limitation is further compounded by the dominance of WEIRD samples, which restricts cross-cultural generalisability.

This study aims to identify how distinct profiles of workers with a sense of calling, characterised by high moral duty and/or destiny beliefs, are associated with detrimental outcomes such as workaholism and organisational exploitation across diverse cultural contexts. Using latent profile analysis, we will apply a person-centred approach to a sample of workers from 13 countries. The study will examine how cultural dimensions, specifically cultural tightness (the degree of social norms and intolerance for deviant behaviour) and relational mobility (the freedom to form and dissolve social ties), interact with calling and its potential dark side. We hypothesise that individuals in profiles characterised by high calling combined with high duty and/or destiny beliefs will experience higher levels of workaholism and organisational exploitation. Additionally, we expect that higher cultural tightness and lower relational mobility will predict membership in these profiles.

At the time of the conference, data collection will have been completed, and we will present the results of our analysis. This research advances the understanding of the boundary conditions under which calling's dark side may emerge and underscores its relevance to cultural context. Findings will offer practical implications for organisations and evidence-based HR practices, providing insights into how cultural norms may shape the negative consequences of work as a calling.

ADVANCES IN PSYCHOLOGY OF WORKING THEORY

Thursday 23 July 2026 from 14:00 to 15:30

(O-Arsenale)

Ryan Duffy (University of Florida ~ Gainesville ~ Un), Chair
Kelsey Autin (University of Wisconsin-Milwaukee ~ Milw), Co-Chair
David Blustein (Boston College ~ Boston ~ United States), Discussant

Psychology of Working Theory has emerged as a major framework within work psychology over the last 10 years. The theory is unique in its focus on structural and psychological constructs that shape access to decent work. In the current symposium, a series of presentations will document recent extensions of the theory to unique populations, incorporating new predictor and outcome variables, and broadening its application to policy.

Abstract 3845

DECENT AGRICULTURE

Mcilveen P.*

University of Southern Queensland ~ Toowoomba ~ Australia

The psychology of working theory (Duffy et al., 2016) posits contextual factors as crucial determinants of decent work and wellbeing. Place attachment refers to the emotional bond individuals form with geographic locations, encompassing feelings of belonging, comfort, and identity. Place identity is a subdimension of place attached. It reflects how physical settings and symbolic meanings become integrated into one's self-concept. Place is especially salient in agricultural contexts, where land is not only a workplace but also a source of cultural, familial, and personal meaning. Emerging psychological research reveals place identity's associations with intent to reside and work in regional communities (McIlveen et al., 2022), suggesting psychological attachments may outweigh economic factors in career choices. Rural communities offer supportive cultures that shape career expectations (McIlveen & McDonald, 2019), though limited services and isolation deter some, while others value open space and community life. Healthcare and education professionals, for example, cite place attachment and identity as reasons for residing and working in rural communities, despite resource limitations (Beccaria et al., 2021; Cosgrave, 2020; McCredie et al., 2025). The vocational psychology of agriculture (McIlveen & McDonald, 2019; McIlveen et al., 2025) contextualises global initiatives like the UN Sustainable Development Goals (2015), linking meaningful work in food and clothing production to decent work and wellbeing (Blustein et al., 2016). This symposium presentation converges tenets of the psychology of working theory with the psychology of agriculture to offer a research and development agenda. The presentation addresses how psychology of working theory may conceptually and empirically integrate psychological experience of place attachment and identity—both under-theorised but salient factors in career development, rural careers, and agriculture.

Abstract 3848

INTEGRATING RADICAL HEALING INTO THE PSYCHOLOGY OF WORKING THEORY: A SOCIAL JUSTICE FRAMEWORK FOR ADDRESSING RACISM IN THE EVOLVING WORLD OF WOR

Erby W.*

Boston College ~ Boston ~ United States of America

Racism has plagued the United States since before its founding and remains deeply embedded in society. Although the Civil Rights Act of 1964 made discrimination illegal and blatant racism became less socially acceptable, covert forms—like colorblind racism and microaggressions—took over. While overt racism had become less prominent, Trump's second term reversed prior progress, normalizing overt racism through executive orders and white supremacist rhetoric that reinforce racial hierarchies. What was once condemned is increasingly normalized, accepted, and rationalized.

Work is a fundamental part of life and essential to well-being, yet it remains a major arena where racism persists (Blustein, 2006, 2008; Fouad & Byars-Winston, 2004; Helms & Cook, 1999). Research shows that Black employees regularly experience racial microaggressions, harming both well-being and job satisfaction (Erby & Blustein, 2025; Decuir-Gunby & Gunby, 2016; Holder et al., 2015; Pitcan et al., 2018). Additionally, the current administration has moved to dismantle the DEI initiatives that followed the 2020 racial reckoning and corporations are falling in line. This regression highlights the urgent need for vocational psychologists to support clients of color in navigating increasing workplace challenges and uncertainties.

Historically, vocational psychology has often overlooked the work experiences of marginalized groups (Blustein, 2008; Helms & Cook, 1999). However, social justice-focused psychologists have increasingly integrated issues of racism and marginalization into theory, research, and practice (Blustein, 2008; Duffy et al., 2016). The Psychology of Working Theory (PWT) emphasizes the impact of marginalization on career development and well-being. Yet, there are still further opportunities to develop interventions that are therapeutically responsive to the racial and cultural needs of clients of color.This presentation will explore the ways in which the Psychology of Radical Healing (PRH) offers a unique framework that can be integrated into PWT to provide career counseling that addresses these rapidly evolving challenges.

Abstract 3849

PREDICTORS AND OUTCOMES OF DECENT WORK AMONG ECONOMICALLY DISADVANTAGED EMPLOYED WOMEN IN TÜRKIYE: A PSYCHOLOGY OF WORKING THEORY PERSPECTIVE

Buyukgoze--Kavas A.*, Atay M.R.

**Ondokuz Mayis University ~ Körfez, Ondokuz Mayis ~ Turkey*

Psychology of Working Theory (PWT; Duffy et al., 2016) has emerged as a vocational framework that explains how contextual barriers shape access to work opportunities, particularly among individuals from economically disadvantaged and marginalized within society. In this study, PWT is utilized to examine the predictors and outcomes of decent work among disadvantaged women, who experience structural barriers in the labor market due to gender-based inequalities and limited socio-economic resources. The sample of the study consisted of 477 employed women in Türkiye. Data were collected using the Economic Constraints Scale, Lifetime Experiences of Marginalization Scale, Decent Work Scale, Work Needs Satisfaction Scale, Job Satisfaction Scale, Work and Meaning Inventory, Short Critical Consciousness Scale, and a demographic information form. Structural Equation Modeling (SEM) and bootstrapping methods were applied.

The findings revealed that economic constraints and marginalization significantly hinder access to decent work. These contextual barriers also negatively predicted work needs satisfaction, job satisfaction, and meaningful work. In contrast, decent work positively predicted work needs satisfaction, job satisfaction, and meaningful work. Mediation analyses showed that decent work and work needs satisfaction mediated the effects of economic constraints and marginalization on work outcomes. However, the moderating role of critical consciousness in the relationship between contextual barriers and access to decent work was not significant. These results emphasize the importance of decent work as a key mechanism for enhancing psychological well-being and promoting social inclusion in the labor market. The findings highlight the need for policies that reduce structural inequalities faced by women and support fair, safe, and meaningful employment opportunities. Recommendations are offered for researchers, policymakers, and practitioners aiming to strengthen social justice practices in working life.

Abstract 3850

LATENT PROFILE ANALYSIS OF ECONOMIC CONSTRAINTS AND PSYCHOLOGY OF WORKING THEORY MODERATORS: IMPLICATIONS FOR WORK AND LIFE WELL-BEING

Ahn J.[1], Lee H.*[2]

[1]Hankuk University of Foreign Studies ~ Seoul ~ Korea, Republic of, [2]Konkuk University ~ Seoul ~ Korea, Republic of

Economic constraints serve as a significant career barrier that limits individuals' career exploration and preparation. The Psychology of Working Theory (PWT; Duffy et al., 2016) proposes that contextual constraints negatively impact decent work attainment, while suggesting proactive personality, social support, and critical consciousness as potential moderators. However, empirical findings regarding these moderators have been inconsistent across studies. This study employed latent profile analysis (LPA) to examine how combinations of economic constraints and PWT moderators relate to work and life well-being outcomes.

Data were collected from 392 Korean full-time workers (mean age = 39.4 years, 62.5% female) through an online survey. Economic constraints, proactivity in career tasks, social network resources, critical agency, and critical action were used as classification indicators. Work and life well-being were assessed through decent work, withdrawal intention, job satisfaction, and life satisfaction.

LPA revealed five distinct profiles: (1) Adaptive with Stability (23.5%): low economic constraints with high psychological resources but low critical action; (2) Average (50%): moderate levels across all indicators; (3) Disempowered with Constraints (10.7%): high economic constraints with minimal psychological and social resources; (4) Resistant with Constraints (7.9%): highest economic constraints combined with high critical action; and (5) Transformative with Stability (7.9%): lowest economic constraints with highest levels of all moderators.

The Transformative with Stability group demonstrated the most favorable outcomes across all well-being indicators. Notably, among groups experiencing economic constraints, the Resistant with Constraints group showed higher withdrawal intention than other profiles. The Disempowered with Constraints group exhibited the poorest outcomes across all indicators. These findings suggest that when addressing economic constraints in career counseling, interventions should particularly focus on enhancing career-specific proactivity, social network resources, and facilitating critical action rather than solely cognitive awareness. Practical implications for career interventions targeting economically constrained populations are discussed.

01 - Division 1: Work and Organizational Psychology

“TECHNOLOGY AT WORK: CHALLENGES AND POTENTIALITIES OF ROBOTIZATION IN THE WORKPLACE”

Thursday 23 July 2026 from 14:00 to 15:30

(T-Monumentale)

Amelia Manuti (Department of Education, Psychology, Com), Chair and Presenter

The impact of robotization in the workplace is a complex and evolving subject. As technology advances, robots and automation tools are playing an increasingly significant role in many industries. This transition brings both challenges and opportunities, reshaping how businesses operate, and how workers interact with technology.

On the one side, many fear that robots will replace human workers, especially in manual labor or repetitive tasks. Industries like manufacturing, logistics, and customer service are particularly susceptible to this shift. Workers whose jobs are automated may face difficulties transitioning to new roles without retraining or reskilling opportunities.

Workers need to learn how to work alongside robots and operate new technologies. For many, this requires significant investment in education and training programs, which may not always be readily available.

On the other hand, robots can significantly boost productivity and reduce human error, as automation can optimize workflows, reduce downtime, and help companies achieve higher throughput.

Yet, while robotization may eliminate certain jobs, it also creates new opportunities in areas like robotics maintenance, programming, and design. In fact, industries such as tech, AI, and automation are rapidly growing.

Additionally, humans may take on roles that require creative, emotional, and strategic decision-making—areas where robots currently cannot compete.

Furthermore, robots can collaborate with humans in new ways, using artificial intelligence to optimize processes or even develop novel solutions that a human alone might not have imagined.

The future of robotization in the workplace will likely involve a balance between automation and human involvement. Instead of replacing human workers entirely, robots could complement human work by handling repetitive or dangerous tasks, while humans focus on more complex, innovative roles. The key will be ensuring that the workforce is prepared for this shift through proper training, ethical guidelines, and policies that address both the economic and social implications of increased automation.

Abstract 4476

ROBOTIZATION AND HUMAN RESOURCE MANAGEMENT: MAPPING THE RESEARCH DISCOURSE THROUGH A BIBLIOMETRIC-SYSTEMATIC LITERATURE REVIEW

Gemmano G., Manuti A.*, Giancaspro M.L.

University of Bari "Aldo Moro" Pegaso University ~ Bari ~ Italy

The increasing integration of robotization and automation in the workplace is profoundly transforming the way organizations manage their workforce. As robotics, smart technologies, and artificial intelligence (AI) become more prevalent across industries, Human Resource Management (HRM) faces new challenges and opportunities. While some research has examined these dynamics, the literature remains fragmented, lacking a comprehensive overview of the field's
evolution, key themes, and theoretical advancements.

This study aims to systematically map the evolving research discourse on HRM and robotization, identifying key research areas, intellectual structures, and emerging trends. By doing so, we provide a structured synthesis of the existing knowledge base and highlight potential avenues for future research.

To achieve this, we employ the Bibliometric-Systematic Literature Review (B-SLR) methodology, which combines bibliometric analysis techniques with systematic review best practices (e.g., PRISMA). A search query on Scopus was designed using robotization-related and HRM-related keywords, retrieving 2840 articles, which were refined through the B-SLR structured selection process, leading to a final dataset of 281 studies. Using Bibliometrix (R) and VOSviewer, we performed co-citation analysis, bibliographic coupling, and keyword co-occurrence mapping.

The results indicate a growing research interest in recent years, with the USA, Germany, and China as leading contributors. The thematic evolution analysis shows a shift from automated task performance to trust in AI, with recent emphasis on sustainability and decision-making in human-machine interactions. The cluster analysis on keyword co-occurrence networks identified three main groups: a) Automation productivity; b) HRM for Industry 4.0; c) Trust in AI.

Our findings highlight the growing importance of HRM practices in dealing with robotization advancements, emphasizing the need to theoretically understand and practically support both organizational strategies and employee perceptions for effective human-machine collaboration. By integrating bibliometric insights with a systematic review, this study maps key intellectual structures and emerging trends in HRM and robotization, providing insights for researchers andpractitionerspreparing forthefutureofworkinanautomatedera.

Abstract 4477

AUTOMATION AND WORK CHARACTERISTICS: A COMPARISON BETWEEN USERS AND NON-USERS

Molinaro D.*[1], Buono C.[2], Spagnoli P.[1]

[1]University of Campani "L. Vanvitelli" ~ Italy ~ Italy, [2]Unimercatorum ~ Italia ~ Italy

The rapid spread of physical and cognitive automation has transformed the work environment and employee experience. In this context, scholars have called for a deeper understanding of how work characteristics vary with the implementation of automation.

Based on Hackman and Oldham's Job Characteristics model and its extension by Morgeson and Humphrey, this study examines differences in job characteristics between users and non-users of automation.

As part of the RECHARGE project, data were collected from a sample of 428 employees at a single time point.

Results of the Multivariate Analysis of Variance (MANOVA) showed that automation users report a higher level of task variety, information processing, job complexity, problem-solving and skill variety. Conversely, non-users experience a higher level of physical demands compared to automation users. This suggests that automation may reduce physical effort. On the other hand, work tasks could be more cognitively demanding for automation users.

Interestingly, automation users report higher levels of adaptability, a personal factor that may be essential in fostering openness to current technological changes in the workplace.

Although the cross-sectional study's design, these findings provide insights into the complex relationship between automation and work characteristics, highlighting the importance for organizations and managers to foster openness to automation and account for changes in cognitive demands when implementing them

Abstract 4478

COGNITIVE AND PHYSICAL AUTOMATION: POSITIVE AND NEGATIVE EFFECTS ON HUMAN RESOURCES AND ORGANIZATIONAL IMPROVEMENTS – A QUALITATIVE STUDY

Barbieri B.*, De Simone S., Mondo M., Bellini D.

University of Cagliari ~ Cagliari ~ Italy

The integration of physical and cognitive automation has influenced individuals and organizations, yielding both positive and negative effects. On one hand, automations have enhanced operational efficiently, streamlined workflows, and improved data management. On the other hand, it has introduced challenges, including workforce resistance, technical barriers, and potential impacts on organization. While the existing body of literature explores these dynamics, the factors that drive its successful implementation and acceptance, as well as those that hinder it—sometimes generating resistance among users—remain insufficiently understood. This study aims to address these gaps in the literature. To investigate these phenomena, five in-depth interviews, each lasting approximately one hour, were conducted with human resource managers and an innovation manager. The objective was to examine the impact of physical and cognitive automation on individuals and organizations. Key obstacles identified include fear of control and unclear o poorly communicated uses of automated systems, unclear use or poorly communicated use of information, resistance from older employees and technical staff, system bugs, and limited utilization of system functionalities of automated tools. Such factors often slow down the adoption of automation technologies and contribute to employee apprehension. Conversely, positive drivers for acceptance were the reduction of paperwork, greater ease in managing complex data, and potential for automation alleviate repetitive and time-consuming tasks. Automation also facilitates standardization and improve productivity which were cited as the primary motivation for its implementation by the interviewed managers. However, concern about the long-term effects of automation remains unclear. While it can enhance productivity, it is unclear whether the reliance on automated system might stifle creativity and critical thinking among employees.

Abstract 4479

WORKING WITH ROBOTS, JOB AUTONOMY, AND EUDAIMONIC WELLBEING AT WORK: A MODERATED MEDIATION MODEL

Roma V.G.*, Schweizer T., Peiró J.M.

University of Valencia ~ Valencia ~ Spain

The number of robots implemented in organizations is increasing on a steady basis. This is changing the nature of jobs. Therefore, it is paramount to investigate how working with robots is influencing work characteristics. This research will provide knowledge that can be used to strengthen the functional consequences of working with robots and mitigate the dysfunctional ones. In the present study, we investigated the relationship between the Frequency of Interaction with Robots while working (FIR) and job autonomy (a key work characteristics). Moreover, we investigated: 1. whether this relationship is moderated by attitudes towards robots, and 2. the indirect “effect” of FIR on eudaimonic wellbeing (personal growth at work) through job autonomy, and work engagement/emotional exhaustion. The sample study was composed of 299 employees from a manufacturing company. The results obtained showed a positive relationship between FIR and job autonomy. Moreover, FIR showed a positive indirect “effect” on personal growth at work via job autonomy and work engagement. This indirect “effect” and the FIR-job autonomy relationship were moderated by attitudes toward robots, so that the relations became stronger when attitudes toward robots increased. Our study shows some ways in which the implementation of robots is changing the nature of jobs and how these changes are affecting employee wellbeing.

Abstract 4480

TRAINING WORKERS FOR HUMAN-ROBOT COLLABORATION: A MULTI-STUDY INVESTIGATION

Salcedo Gil R.*[1], Mol N.[2], Le Blanc P.[1], Rispens S.[1], Van Gool P.[1], Kleingeld A.[1]

[1]Eindhoven University of Technology ~ Eindhoven ~ Netherlands, [2]Delft University of Technology ~ Delft ~ Netherlands

As Human-Robot Collaboration (HRC) becomes more prevalent across industries, training employees to collaborate with robots is increasingly acknowledged as critical for successful integration (Charalambous et al., 2015). In fact, inadequate employee preparation has been linked to increased anxiety and resistance (Arslan et al., 2021). As shortages, aging populations, and rising production demands drive increased integration of robots alongside employees on shared tasks, employees face significant challenges, including increased job uncertainty, stress, and a lack of confidence in interacting with robots. Addressing these challenges and developing interventions to increase employees' confidence in their ability to collaborate with robots is essential.

This study investigates how training can facilitate employee transition to working with robots. Building from Social Cognitive Theory, we developed and tested an online training intervention. We conducted two different studies to test the effectiveness of the training intervention on robot use self-efficacy and collaborative performance during a physical task with a robot. The first study examined how an online training intervention affects participants' self-efficacy, attitudes toward robots, and robot acceptance. A total of 66 people were recruited via Prolific. Results revealed a significant increase in all three dependent variables, indicating that the online training effectively enhanced participants' confidence in their ability to work with robots. In the second study, we extend these findings through a laboratory study where participants physically collaborate with an industrial robot in a controlled setting. We assess whether completing the online training intervention prior to the hands-on collaboration improves task performance compared to participants without training.

This study contributes to the existing literature on Human-robot collaboration and employee adaptation to advanced technologies by offering insights into how to prepare employees for collaborating with robots.

Abstract 1244

A MULTILEVEL INVESTIGATION OF THE RELATIONSHIP BETWEEN DAILY EXISTENTIAL LABOR AND WORK ENGAGEMENT: WORK CENTRALITY AS A CROSS-LEVEL MODERATOR

Cetin M.*, Seljeseth I., Peláez Zuberbuhler J., Svendsen M.

Department of Leadership and Organization, Kristiania University of Applied Sciences ~ Oslo ~ Norway

With the growing recognition of meaningfulness at work as a key driver of employee well-being and organizational outcomes, organizations increasingly attempt to foster meaningful work. When such efforts feel inauthentic or clash with employees' own sense of meaningfulness, employees may engage in existential labor (EL), that is, the regulation of meaningfulness at work. EL can take the form of deep existential labor (DEL), where employees try to alter their internal experience, or surface existential labor (SEL), where they outwardly conform while maintaining internal inconsistency. Despite its relevance, research on EL is scarce, particularly regarding within-person dynamics linking EL to day-level outcomes, and the potential moderators of this relationship. Built on job demands and resources theory (JD-R) and based on nested data collected from 247 respondents over 4 to 5 consecutive days (1,207 day-level responses nested within individuals), this study investigates the relationship between day-level EL and daily work engagement (WE). The study also examines the cross-level moderating effect of work centrality (WC) on this relationship. Multilevel analyses were conducted using hierarchical linear modeling (HLM 8), allowing both intercepts and slopes to vary across individuals. The results show that both daily DEL and SEL are negatively related to daily WE. Additionally, WC has a cross-level buffering effect, which attenuates the negative relationship between DEL and daily WE. These findings highlight the day-level outcomes of existential labor and identify work centrality as a person-level resource that mitigates its impact, advancing the understanding of how the management of meaningfulness unfolds in daily work life.

FEAR OF DEATH, PERSONAL VALUES, AND ACHIEVEMENT MOTIVATION: AGE AND GENDER DIFFERENCES IN ADULTS, ARMENIA 2024

Ghaltakhchyan S.*

Public Administration Academy of the Republic of Armenia, Chair of Psychology ~ Yerevan ~ Armenia

Fear of death is a central theme in existential psychology, yet its interaction with personal values and achievement motivation is not fully understood in applied contexts. The present study explored how death anxiety relates to value orientation and motivational patterns across age and gender groups.

The research was carried out in Yerevan, Armenia in 2024. The sample included 120 Armenian adults of two age groups (20–30 and 40–50 years) of 30 persons, balanced by gender and professional background. Four standardized measures were administered: the Death Anxiety Scale (DAS), Fear of Personal Death Scale (FPDS), Rokeach Value Survey, and Rean's Achievement Motivation Test. Data were analyzed by age, gender, and motivational type.

Results revealed that younger participants (20–30) reported significantly higher death anxiety than the older group (40–50). The older group (40–50) showed stronger fear of personal death (due to mortality salience).

In the groups with higher fear of personal death (40-50), the achievement motivation of women was still high. On the contrary, men with higher fear of personal death had significantly low achievement motivation.

Women consistently scored higher on both DAS and FPDS measures compared to men. Importantly, value orientation moderated these patterns: individuals with family- and security-related values demonstrated stronger death anxiety, whereas those prioritizing independence, creativity, and self-actualization values reported lower fear levels. Achievement motivation was also linked to existential concerns: participants oriented toward fear of failure exhibited heightened death anxiety and gravitated toward security values, while success-oriented individuals showed lower fear of death and a preference for growth-oriented values.

These findings suggest that existential fears are closely tied to both value priorities and motivational style. Applied implications include the potential of value reorientation and motivational training as protective factors against maladaptive death anxiety in educational, organizational, and therapeutic settings.

Abstract 2422

THE RECONFIGURATION OF MEANINGFUL WORK IN INTERGENERATIONAL WORK CONTEXTS: A QUALITATIVE COMPARISON ACROSS ORGANIZATIONAL ROLES

Morabito M.A.*, Gazzaroli D., Gozzoli C.

Catholic University of the Sacred Heart, Department of Psychology ~ Milano ~ Italy

Introduction: In the wake of profound geopolitical, social, and environmental changes, the structural and procedural dimensions of work are rapidly transforming, requiring organizations to continuously adapt. On the social side, the relationship between individuals, work, and organizations also appears to be shifting: work is often experienced as less central to personal identity than in the past. While this phenomenon is commonly attributed to younger professionals, evidence suggests that it also concerns more senior employees with high levels of responsibility and expertise.

Purpose: This study investigates, on one hand, the dynamics that currently shape how individuals construct meaningful work, considering both the organizational role they occupy and their generational background; on the other hand, how organizations contribute to this construction of meaningfulness.

Method: A qualitative–interpretative design was employed. Forty professionals from ten organizations participated, representing four organizational roles: CEOs, top managers, middle managers, and junior employees. These roles were selected to encompass the different generations. Data was collected through semi-structured interviews and focus groups, and analyzed using Reflexive Thematic Analysis, supported by NVivo software.

Results: Three transversal themes emerged as central to meaningful work across all groups: (1) perceiving the value of one's work contribution within the organizational context, (2) receiving recognition, and (3) experiencing flexibility. Alongside these elements, role- and generation-specific differences were observed regarding the impact of technology on work and relationships, management's awareness of emerging organizational challenges, and motivational drivers.

Conclusions: The reconfiguration of meaningful work includes both cross-cutting and role-specific elements. Organizations need to strengthen social and relational dimensions alongside technical ones to sustain meaningful work, with implications for leadership development, HR practices, and organizational sustainability.

Abstract 1486

AUTHENTICITY AT WORK: LINKING VALUES CONSISTENCY, WELL-BEING, AND PERSON–ORGANISATION FIT

Sutton A.*

University of Waikato ~ Hamilton ~ New Zealand

Work and home contexts are often guided by different expectations and value priorities, creating tensions that may undermine well-being and workplace engagement. Authenticity, the extent to which people feel able to act in line with their true selves, has been theorised as a buffer in such contexts, yet empirical evidence linking authenticity, values, and organisational outcomes remains limited. This paper reports three studies that investigate how values consistency and authenticity shape well-being and person–organisation (P–O) fit, and the extent to which authenticity can be enhanced as an intervention target.

In Study 1 (N = 79), participants completed matched surveys in both work and home contexts. Results showed that values inconsistencies between contexts, though generally modest, predicted lower authenticity at work, which in turn was associated with higher stress and lower well-being. Study 2.1 (N = 285) examined predictors of key organisational outcomes. Across four outcomes (job satisfaction, commitment, belonging, and turnover intentions) state authenticity and self-report P–O fit were consistently the strongest predictors, while trait authenticity and visual P-O fit measures were weaker. Finally, Study 2.2 (N = 180) tested causality through an experimental recall task. Participants who recalled an authentic work episode subsequently reported higher state authenticity and greater P–O fit compared to those recalling inauthentic episodes.

Together, these studies demonstrate that authenticity is both a personal resource and a potential organisational lever, enhancing well-being while promoting commitment and retention. By showing that authenticity can be experimentally influenced, the findings suggest practical pathways for developing more values-aligned and humane workplaces. This contributes to applied psychology by identifying authenticity as a driver of sustainable work practices, organisational resilience, and employee flourishing, and points to new directions in applied psychology focused on authenticity as a foundation for trust, responsibility, and well-being in contemporary work.

Abstract 2237

REDEFINING WORKPLACE FLOURISHING: A GROUNDED THEORY EXPLORATION OF EMPLOYEES' PERCEPTION AND LIVED EXPERIENCES

Verma R.*[1], Srinivasan S.[2], Mukhopadhyay S.[1]

[1]Indian Institute of Technology Kharagpur ~ Kharagpur ~ India, [2]Indian Institute of Technology Madras ~ Chennai ~ India

The inescapable desire to flourish, representing the pursuit of the best possible life, has captivated scholars throughout history. The workplace, a significant avenue for fulfilling this desire, paradoxically remains marked by widespread employee exhaustion and gloominess, despite substantial investments in the area. This disconnect underscores a gap between theoretical understandings and employees' lived experiences of flourishing. Furthermore, existing workplace flourishing conceptualizations, largely adapted from life-domain research conducted in a Western context, often lack cultural sensitivity and work-specific nuances, limiting their relevance and applicability. To address these gaps, this study employs a grounded theory approach, interviewing 31 employees across diverse industries and occupations to explore their perceptions and experiences of workplace flourishing. While previous research primarily defines flourishing as a state of emotional, psychological, and social well-being, our findings reveal it as a dynamic, ongoing process of achieving optimization through the fulfillment of interconnected values at any given moment. We present a theoretical model that unravels the gearbox system consisting of the present self, personally expressive work, personal projects, and the agentic self that drives flourishing at the workplace. This model also emphasizes the critical role of a supportive workplace environment in fostering and sustaining flourishing while acknowledging the influence of uncontrollable situational factors. Additionally, it captures the evolving nature of flourishing, shaped by changing individual values and goals over time. This study contributes to the advancement of workplace flourishing theory by providing a culturally nuanced and work-specific perspective, offering valuable insights into organizational practices and direction for future research.

01 - Division 1: Work and Organizational Psychology

TOWARDS A SUSTAINABLE FUTURE: EMPLOYABILITY AND ENTREPRENEURSHIP FOR ACADEMIC SUCCESS AND CAREER DEVELOPMENT IN UNIVERSITY STUDENTS

Thursday 23 July 2026 from 15:30 to 17:00

(R-Arsenale)

Emanuela Ingusci (University of Salento ~ Lecce ~ Italy), Chair

The growing attention to the crucial role of soft skills in students' academic and personal success, combined with the need to enhance the quality and employability of graduates, highlights the urgency for educational institutions to rethink orientation strategies and promote sustainable resources among university students. This is particularly relevant in an increasingly dynamic job market, where career choices demand high levels of autonomy, adaptability, and risk management. The current labor market, marked by unpredictable challenges and rapid transformations, underscores the need to strengthen the factors that improve individuals' ability to engage with professional contexts, while also prioritizing the promotion of well-being. Recent literature on orientation and education has focused on key constructs that predict well-being and success, not only in educational and training pathways but also in the career choices made. Among these, the construct of employability stands out, encompassing essential skills to navigate professional scenarios in constant flux. A specific aspect of this ability relates to the development of entrepreneurial skills, which are increasingly vital for thriving in an evolving occupational landscape.

This discussion aligns closely with the United Nations 2030 Agenda for Sustainable Development, particularly Goals 4 (Quality Education) and 8 (Decent Work and Economic Growth). The emphasis on fostering skills that enhance employability and entrepreneurship directly contributes to providing inclusive, equitable, and quality education while promoting lifelong learning opportunities for all. Simultaneously, by equipping students with the tools to navigate uncertain labor markets, educational institutions play a crucial role in ensuring sustainable economic growth and creating opportunities for decent work, especially for young people. This broader framework underscores the importance of systemic change in higher education, encouraging practices that not only meet immediate labor market demands but also address global challenges such as inequality, unemployment, and the need for innovation.

Abstract 3236

UNDERSTANDING PERCEIVED EMPLOYABILITY AMONG UNIVERSITY STUDENTS: THE ROLE OF CHATGPT PERCEPTIONS, ACADEMIC ENGAGEMENT, AND JOB SEARCH SELF-EFFICACY

Ortiz--Bonnin S.*, Blahopoulou J.

Universitat de les Illes Balears ~ Palma de Maiorca ~ Spain

In higher education, the use of artificial intelligence (AI) tools such as ChatGPT has generated growing interest in their impact on learning and academic performance. Based on the Job Demands-Resources (JDR) model of work engagement proposed by Bakker and Leiter (2010),this study examines a model linking the perceived ease of use of ChatGPT to job search self-efficacy, academic engagement, and students' perceived academic performance, while recognizing that proficiency in using AI tools represents a critical job demand for the future.

Using a cross-sectional design, we analyzed data from 393 university students to assess the role of ChatGPT's ease of use in job search self-efficacy and engagement. The findings reveal that a higher perception of ChatGPT's ease of use is associated with increased job search self-efficacy, which enhances academic engagement and ultimately contributes to a higher perceived academic performance.

These results highlight the mediating role of self-efficacy and academic engagement in the relationship between AI ease of use and perceived academic performance. The findings have important practical implications for the integration of AI tools in higher education. Implementing training programs that help students become familiar with AI tools can boost their confidence in future employability, enrich their educational experiences, and better equip them to face upcoming career challenges.

Abstract 3232

DEVELOPING RESOURCE-BASED EMPLOYABILITY DURING THE UNIVERSITY-TO-WORK TRANSITION. A QUASI-EXPERIMENTAL LONGITUDINAL STUDY ON ITALIAN MASTER STUDENTS AND RECENT GRADUATES

Lo Presti A.*[1], Ingusci E.[2], De Carlo E.[2], Sciotto G.[3], Signore F.[4], De Rosa A.[1], Moavero C.[3], Landolfi A.[1], Pace F.[3]

[1]University of Campania "Luigi Vanvitelli" ~ Caserta ~ Italy, [2]University of Salento ~ Italy, [3]University of Palermo ~ Italy, [4]Universitas Mercatorum

In today's labor market, marked by uncertainty and constant change, employability is a crucial resource for navigating career transitions. The shift from education to employment, as well as transitions across different career stages, requires not only technical and specialized skills but also the ability to adapt to new opportunities and challenges. In this context, developing employability skills plays a key role in fostering successful and sustainable career paths. Building on the resource-based model of employability by Lo Presti and Pluviano (2016), we designed and implemented a training and career counseling intervention for groups of master students and recent graduates from three universities from Southern Italy: Caserta, Lecce, and Palermo. The intervention, consisting of six sessions delivered in both in-person and remote formats, aimed to enhance awareness about one's own human capital and promote a positive attitude towards professional development, one's own social capital and the ability to network with significant others, one's own career identity and the ability to self-manage one's own career and, finally, one's own awareness about environmental constraints and opportunities and the ability to deal with them. The intervention combined structured training sessions with personalized career counseling, equipping participants with practical tools and strategies to effectively navigate the transition from education to employment. To evaluate the impact of this intervention, we conducted a three-wave longitudinal study using a quasi-experimental design. Data were collected at three time points: pre-intervention, post-intervention, and three months after the intervention. A repeated measures ANOVA was performed to analyze the data, comparing the intervention groups with a control group to assess changes over time.

Abstract 3231

ENHANCING EMPLOYABILITY THROUGH GENERIC SKILLS: TEACHERS' CONCEPTIONS, PRACTICES, AND PEDAGOGICAL TRAINING IN HIGHER EDUCATION

Tuononen T.*[1], Hyytinen H.[2], Kleemola K.[1], Hailikari T.[3], Toom A.[1]

[1]Centre for University Teaching and Learning (HYPE), Faculty of Educational Sciences, University of Helsinki ~ Helsinki ~ Finland, [2]School of Educational Sciences and Psychology, University of Eastern Finland ~Finland, [3]Unit for Research and Development of Higher Education Pedagogy (HEPeda), Häme University of Applied Sciences ~ Finland

University teachers play a crucial role in enhancing students' employability by developing their generic skills, such as critical thinking, problem-solving,
collaboration, and communication. Including these skills in course objectives is essential for students to recognize their importance. However, evidence suggests that teachers vary in how they perceive their role in ensuring students learn these skills. Additionally, integrating these skills into discipline-specific teaching requires pedagogical skills. This study examined the conceptions of teaching generic skills and pedagogical practices among university teachers and how these were related to their pedagogical training. A total of 286 teachers participated in the study by completing an electronic questionnaire. The data were analyzed using linear regression and analyses of variance (ANOVA). As a result, we identified three types of conceptions: non-integrative, integrative, and participatory. Non-integrative conceptions were negatively related to all pedagogical practices, while participatory conceptions were positively related to practices such as sharing experiences and combining theory with practice. Integrative conceptions did not relate to pedagogical practices. The results also indicate that pedagogical training significantly influences teachers; conceptions and practices. For instance, teachers without pedagogical training were more likely to hold non-integrative conceptions, meaning they did not see their role in teaching generic skills. Conversely, teachers with more pedagogical training employed a more diverse range of teaching practices. The findings from this study indicate a need for teachers to enhance their awareness of conceptions related to teaching generic skills and highlight the importance of pedagogical training. Such training supports teachers work and their well-being and enhances students'
employability by equipping teachers with the skills to effectively incorporate generic skills into their teaching.

Abstract 3234

POLISH ADAPTATION AND VALIDATION OF THE MULTIDIMENSIONAL EMPLOYABILITY MEASURE: A PSYCHOMETRIC INVESTIGATION

Mamcarz P.*[1], Lo Presti A.[2]

[1]John Paul II Catholic University of Lublin ~ Lublin ~ Poland, [2]University of Campania "Luigi Vanvitelli" ~ Caserta ~ Italy

This study presents the adaptation and validation of the Multidimensional Employability Measure (based on Lo Presti & Pluviano's model) for use in the Polish context. The adaptation process followed a rigorous methodology including translation, back-translation, and expert panel review to ensure linguistic and cultural equivalence. Through two comprehensive studies, we examined the psychometric properties and construct validity of the Polish version. Study 1 (N=540) focused on the adaptation process, including translation and back-translation procedures, followed by confirmatory factor analysis which verified the four- dimension structure (human capital/professional development, social capital/networking, career identity/self-management, and environmental monitoring). The analysis demonstrated good model fit and internal consistency. Study 2 (N=400) established construct validity by examining relationships with theoretically related measures including Perceived Employability, PsyCap (Psychological Capital), subjective and objective career success indicators, and employability culture. Results showed significant correlations in expected directions, supporting both convergent and criterion validity of the adapted measure. The findings confirm that the Polish version maintains the psychometric integrity of the original instrument while demonstrating cultural appropriateness. This validated tool provides researchers and practitioners with a reliable instrument for assessing employability in Polish organizational contexts.

Abstract 3233

EMPLOYABILITY SKILLS AND LABOR MARKET EXPECTATIONS: A QUALITATIVE STUDY ON STUDENTS AND STAKEHOLDERS' PERSPECTIVES

Moavero C.*, Sciotto G., Cusimano G., Pace F.

University of Palermo ~ Palermo ~ Italy

The employability of graduates represents a strategic priority for higher education institutions. Ensuring an effective transition from university to the workforce requires not only solid academic preparation but also an alignment between the skills developed during academic programs and the actual needs of the labor market. However, this alignment is not always guaranteed, and the mismatch between university education and stakeholder expectations can influence graduates' professional opportunities.

Data has been collected through interviews from university students and various labor market experts (e.g., recruiters, headhunters, career advisors, HR professionals) on the skills considered most relevant for professional placement, hypothesizing possible divergences between students' perceptions and the needs of the labor market. This study adopts a qualitative approach to explore how students and stakeholders perceive employability, with particular focus on the skills deemed essential for professional success and their integration into educational pathways. The data analysis aims to identify points of convergence and differences in the perceptions of the two groups, exploring key dimensions of employability such as human and social capital, knowledge of the labor market, opportunities, and obstacles.

The findings provide valuable insights for designing training programs more aligned with labor market dynamics and for fostering more effective collaboration between universities and the productive sector. Furthermore, this research may contribute to the development of educational strategies aimed at promoting a more informed and prepared entry into the workforce, encouraging a model of university education capable of addressing emerging employment challenges.

01 - Division 1: Work and Organizational Psychology

FROM PRODUCTIVITY TO PROTECTION: RETHINKING WORK AND ORGANIZATIONAL PSYCHOLOGY IN CLIMATE EMERGENCIES

Thursday 23 July 2026 from 15:30 to 17:00

(O-Arsenale)

Hugo Sandall (Brazilian Society of Work and Organizati), Chair and Presenter
Pedro Neves (Nova School of Business and Economics ~), Co-Chair

This session explores how Work and Organizational Psychology can contribute to disaster preparedness, response, and recovery by reframing performance management, leadership, and human resource management practices as protective and developmental tools. Drawing from cases in Brazil, Puerto Rico, and Spain, the presentations showcase frameworks, reviews, and applied research that integrate behavioral self-management, volunteer leadership, human resource management strategies, co-designed community interventions, and organizational practices. Together, they highlight innovative ways to sustain decent work, restore well-being, and build resilience in contexts of climate emergencies and other disruptive events. The session also features the SBPOT open-access initiative after Brazil's 2024 floods, demonstrating the potential of collective scientific action for equitable global access to evidence-based practices. By connecting situated experiences from Latin America and Southern Europe, this session advances a Global South–rooted and decolonial perspective that directly challenges the hegemony of Northern frameworks in organizational psychology. The Brazilian contributions emphasize behavioral performance management and competencies for volunteer leadership under resource constraints; Puerto Rico's case shows how human resource management and organizational practices shaped recovery across consecutive disasters; European interior regions bring forward co-designed, technology-supported interventions to restore well-being in vulnerable mountain and semi-rural communities—contexts often marginalized in global debates. Complementing these, a systematic review from Brazil maps human resource management practices in disaster contexts across the literature. Together, these contributions emphasize precarious, resource-limited, and community-centered responses, revealing how context-sensitive knowledge from the Global South and non-hegemonic European regions enriches international debates and unsettle universalizing assumptions in organizational psychology.

Abstract 4184

PROFESSIONAL PERFORMANCE MANAGEMENT IN POST-CRISIS RECOVERY: A BEHAVIORAL SELF-MANAGEMENT FRAMEWORK FOR WORKERS AND ORGANIZATIONS

Sandall H.*[2], Dias Costa T.[1]

[1]Universidade do Pará ~ Belém ~ Brazil, [2]Brazilian Society of Work and Organizational Psychology (SBPOT) and Universidade Federal Fluminense (UFF) ~ Brasília ~ Brazil

Extreme events and disasters caused by climate change increasingly disrupt organizations and workers worldwide. Beyond environmental and economic losses, such crises alter working conditions, threatening professional performance and mental health. Despite their relevance, few interventions in Work and Organizational Psychology address the sustained impact of crises on occupational routines and recovery processes. This presentation proposes a practical, behavior-based framework for managing professional performance during post-crisis recovery. Performance is understood as the set of behaviors that, supported by resources and context, produce organizational results. Crises dismantle these conditions and create abrupt constraints such as damaged infrastructure, disrupted routines, shortages of resources, and heightened psychological strain. To respond to these challenges, we introduce a self-management diagram designed to help workers and managers identify key behaviors, recognize contextual changes, assess consequences, and specify antecedents required for effective performance. This structured reflection enables individuals and organizations to adopt adaptive responses, prioritize feasible actions, and negotiate support essential for recovery. Illustrative examples from manufacturing and service contexts show how the model can be applied to sustain essential tasks, adapt routines, and maintain engagement despite severe constraints. By combining individual self-management strategies with organizational practices, the framework promotes resilience, strengthens adaptive capacity, and safeguards well-being while supporting continuity of operations. Ultimately, professional performance management in post-crisis contexts should be viewed not only as a way to restore productivity but also as a protective and developmental process that contributes to professional growth and collective resilience. This contribution highlights the crucial role of Work and Organizational Psychology in preparing, supporting, and restoring workers and organizations facing emergencies, disasters, and catastrophes.

Abstract 4186

RE-ACTION: DIAGNOSE, COMMUNICATE, SHARE, AND CO-DESIGN INTERVENTIONS: THE CASE OF RESTORING EMOTIONAL WELL-BEING USING COMMUNITY RESOURCES WITH IT AND AI

Pérez--Nebra A.*[1], Oliván--Blázquez B.[1], Faurie I.[2], Delicourt A.[2]

[1]Universidad de Zaragoza ~ Zaragoza ~ Spain, [2]Universite Toulouse-Jean Jaures ~ Toulouse ~ France

This project aims to identify and intervene in key aspects to improve the emotional well-being of people living in mountain and semi-mountain territories on the semi-rural communities in the Pyrenees. This project is structured into three phases: 1) Diagnose; 2) Share and Communicate; 3) Co-design and Intervene. In the first phase, the project aims to diagnose and identify the needs of citizens, key stakeholders, and managers to enhance emotional well-being, considering age groups, gender, gender roles, occupational roles, and situations of vulnerability. In the second phase, the project seeks to communicate and share the diagnoses of the main identified needs to establish response plans, generate ideas, and co-design solutions collaboratively. This will be done with expert groups composed of citizens, key community stakeholders, managers, and researchers. Finally, in the third phase, the project will address a previously identified need: the recovery of psychological well-being, which may have been affected by disasters, temporary isolation, stressful life events, etc. Co-creation and intervention design will be carried out to improve emotional well-being, leveraging community resources (physical, social, cultural, etc.). These resources and health assets will be identified, and a technological resource (website or app) supported by AI will be developed to personalize these resources based on age, gender, roles, preferences, vulnerability status, and place of residence. This technological resource will help to find a fit community resource and increase motivation by sending reminders or personalized messages. Finally, the tool will be piloted, implemented, and evaluated for usability, satisfaction, effectiveness, and implementation.

Abstract 4187

PSYCHOLOGICAL, ORGANIZATIONAL, AND HUMAN RESOURCE MANAGEMENT PRACTICES IMPACT OF CONSECUTIVE NATURAL DISASTERS IN PUERTO RICO

Galarza L.*

University of Puerto Rico ~ San Juan ~ Puerto Rico

This presentation discusses research and applied projects designed to examine the organizational, performance management, and human resource management practices utilized in Puerto Rico after various consecutive and diverse natural disasters (hurricanes, floods, earthquakes and the pandemic). The purpose of the qualitative studies conducted was to examine the individual and organizational impact of consecutive natural disasters and pandemic in Puerto Rico. The focus of the qualitative study was to examine the human resource management and organizational initiatives and practices implemented in Puerto Rico after various natural disasters and emergencies (e.g. hurricanes, earthquakes, among others) to assist workers in their recovery & return to work, and for worker retention amidst the disasters. For the qualitative component individual interviews were conducted with supervisors of employees in organizations in Puerto Rico. For the quantitative study, electronic questionnaires were administered to persons in Puerto Rico who had been affected by consecutive natural disasters and the pandemic. Consecutive natural disasters had an impact on individual and organizational variables. At the organizational level the human resource management, performance management, and organizational post-disaster response affected post-disaster worker retention and return to work. At the individual level, the disaster impacted psychological wellbeing variables. The application of work and organizational psychology knowledge and human resource management practices adapted to the specific response to the various steps of consecutive natural disasters can impact worker's and individual's wellbeing, organizational worker retention, the worker's post-disaster return to work, and the organizational ability to return to pre-disaster regular operations.

Abstract 4189

INTRODUCING THE ALLIANCE FOR ORGANIZATIONAL PSYCHOLOGY (AOP)

Hiemstra A.*

Erasmus University Rotterdam ~ Rotterdam ~ Netherlands

This invited symposium is an initiative of the Alliance for Organizational Psychology (AOP), a federation of leading societies in Work, Organizational, and Industrial Psychology that aims to expand the contribution of our field to society by improving both the quality of work life and the effectiveness of individuals and organizations. AOP promotes collaboration and effective communication among its member associations while advancing science-based practice and supporting the development of policies that protect worker well-being and foster organizational productivity worldwide. Its goals include connecting academics and practitioners across regions, maintaining continuous dialogue with international policy makers such as the ILO and the United Nations, and fostering global research and practice collaborations to address critical workplace challenges. To strengthen dissemination and exchange, AOP has also established initiatives such as an online video repository capturing the perspectives of global leaders on pressing organizational and societal issues. Member organizations include IAAP Division 1 (Work and Organizational Psychology), EAWOP (European Association of Work and Organizational Psychology), SIOP (Society for Industrial and Organizational Psychology, USA), CSIOP (Canadian Society for Industrial and Organizational Psychology), the APS College of Organisational Psychologists (Australia), and SBPOT (Brazilian Society of Work and Organizational Psychology). Through this international alliance, AOP serves as a platform to amplify diverse perspectives, strengthen collective action, and mobilize scientific knowledge to advance decent work, resilience, and sustainable organizational practices in a rapidly changing world.

Abstract 4185

HUMAN RESOURCE MANAGEMENT PRACTICES IN THE CONTEXT OF EMERGENCIES AND NATURAL DISASTERS: A SCOPING REVIEW

Greghi Sticca M.*[1], Carlotto M.S.[2], Raya Amazarray M.[3]

[1]Universidade de São Paulo ~ Ribeirão Preto ~ Brazil, [2]Universidade de Brasília ~ Brasília ~ Brazil, [3]Universidade Federal de Ciências da Saúde de Porto Alegre ~ Porto Alegre ~ Brazil

In recent years, the issue of disasters and emergencies, whether natural (earthquakes, tornadoes, floods, extreme climatic and hydrological events, etc.) or technological (hazardous materials, urban fires, nuclear accidents, etc.), has garnered increasing attention due to the multiple challenges they face, including consequences for individuals and communities. In this context, it is crucial that organizations, particularly those directly involved in disaster responses, ensure the optimal functioning of their teams by adopting efficient resource management and, above all, by providing support to their own workers. The goal of this presentation is to illustrate findings of a literature review about the human resource management practices that can support organizations operating in contexts of emergencies and disasters, as well as the workers operating on the frontline, with the aim of promoting protective factors for their health and psychological well-being. A scoping review was conducted using the protocol PRISMA-ScR using the terms ”human resources” AND “natural disasters”. A total of 19 studies were identified and categorized into: recruitment practices, training and development, performance monitoring, and mental health and well-being. Organizational strategies, such as psychoeducational training in the workplace and development of professional action protocols, play a critical role in the mental health of the workers. The results will serve as guidelines to implement specific policies and intervention protocols, through the incorporation of human resource policies in organizations and services involved in disaster response.

Abstract 4188

COMPETENCIES FOR VOLUNTEER LEADERS IN CLIMATE EMERGENCY CONTEXTS: A STUDY ON FUNCTIONAL LEADERSHIP IN BRAZIL

Dias Costa T.[1], Ferreira Dias G.C.[1], Sandall H.*[2]

[1]Universidade Federal do Pará ~ Belém ~ Brazil, [2]Brazilian Society of Work and Organizational Psychology (SBPOT) and Universidade Federal Fluminense (UFF) ~ Brasília ~ Brazil

Volunteer work has been essential in supporting people impacted by climate disasters. In contexts like these, functional leadership can become the foundation of an effective and safer work environment. The objective of this text was to identify the competencies required for volunteer leaders in climate emergency contexts through a literature review and interviews. The behaviors described will be applied to train volunteer leaders in climate disaster contexts in Brazil. A set of 20 competencies was identified. The first behavior was goal management, described as the ability to develop and distribute goals among team members, offering support and encouragement to achieve them. The second was providing feedback. Effective feedback emphasizes positive performance while offering constructive guidance for improvement. Feedback should focus on behaviors, be timely, and highlight contributions to team success. The third was described as Consequential Listening. Leaders should acknowledge and incorporate team members' ideas, fostering engagement and motivation. Recognizing contributions publicly strengthens team cohesion. The data also outlines three categories of crisis management. During Establishing a Crisis Management Structure, Leaders must follow protocols, gather reliable information, make decisions despite uncertainties, and respond swiftly to demands. The Interaction with Partners and Institutions appeared like essential for resource allocation and effective communication. At least, Engaging with the Public demands for the Leader to provide clear, accurate, and empathetic communication to manage public expectations and reduce panic. Practical recommendations also were included like Identifying and utilizing reliable information sources, establishing clear communication channels and protocols, recognizing team members' efforts to maintain morale and adapting strategies based on evolving situations. The process of identifying competencies and developing training actions for leaders will be detailed in the work.

01 - Division 1: Work and Organizational Psychology

FROM ACCEPTANCE TO ADAPTATION: DIGITAL TRANSFORMATION IN WORK AND HEALTH

Thursday 23 July 2026 from 15:30 to 17:00

(T-Monumentale)

Giulia Paganin (Deparment of Educational Science ~ Bolog), Chair and Presenter
Jennifer Apolinário-Hagen, Discussant

This symposium explores the psychological implications of digital transformation in healthcare and work contexts, adopting a person-centered lens to examine how individuals and professionals accept, adapt to, and are impacted by emerging technologies. As digital tools—such as AI systems and digital therapeutics—become increasingly integrated into professional practice and daily routines, it is crucial to understand not only the technological
innovations themselves, but also the human processes that facilitate or hinder their effective
use. This symposium addresses this gap by presenting four distinct yet complementary contributions that investigate digital transitions across different domains and populations.
The first presentation examines the acceptance of digital therapeutics (DiGA) among health
professionals in Germany, combining qualitative, quantitative, and experimental methods to
identify determinants of adoption and information preferences. This research sheds light on
communication strategies and policy implications for the dissemination and successful integration of digital healt
The second presentation focuses on the development of an AI-powered virtual assistant for
chronic patients, designed to deliver psychological support and enhance personalized care.
The project integrates natural language processing and patient-centered design to bridge the
gap between digital innovation and holistic healthcare needs.h solutions.
The third contribution adopts a person-centered approach (Latent Profile Analysis) to explore
workers' acceptance of Artificial Intelligence in an Italian company. By identifying psychological and organizational profiles, the study highlights individual differences in technology-related anxiety, engagement, and perceived job insecurity.
Finally, the fourth study uses a longitudinal person-centered methodology (Latent Transition
Analysis) to trace digital adaptation profiles and their transitions over time, linking them to recovery, work-life conflict, and digital competence. The findings illuminate how technology use patterns influence well-being and sustainable work-life integration.
Together, these contributions provide a multi-method, interdisciplinary exploration of the psychological processes underpinning digital innovation, emphasizing the need for inclusive,
tailored, and ethically grounded approaches.Thesymposiumcontributesnovelinsightsinto howindividualsinteractwithtechnologyincontextsofhealthandwork,aligningclosely withtheCongress'sfocusonmental health,sustainability,and digitalization.

Abstract 4376

AI-POWERED MULTIPLATFORM VIRTUAL ASSISTANT FOR CHRONIC DISEASE PATIENTS: ENHANCING PERSONALIZED CARE AND PSYCHOLOGICAL SUPPORT

Farhane Medina N.Z.*, Rubio S., Castillo--Mayén R., Villaécija J., Luque B.

Maimonides Biomedical Research Institute of Cordoba (IMIBIC) ~ Cordoba ~ Spain

Introduction: The emergence of artificial intelligence (AI) has triggered a methodological revolution across all domains. In the context of healthcare, it represents a valuable opportunity to promote the personalization of care, an essential factor in improving treatment adherence and the prognosis of several medical conditions. This technological advancement is extremely relevant to patients suffering from chronic illnesses, who often require ongoing medical attention and complex disease management over time.
It is important to note that chronic conditions are frequently associated with a high comorbidity of mental health problems, including symptoms of depression, anxiety, psychological distress, and reduced quality of life. It is imperative to acknowledge the significance of these psychological components, which frequently remain underrecognized and undertreated. Their direct influence on treatment adherence and overall health outcomes is a relevant factor that must be considered. Consequently, there is an increasing necessity to incorporate psychological interventions as a fundamental element of comprehensive care for chronic patients.
Objective:
To respond to this need, the development of machine learning systems- particularly natural language processing models- is proposed, with the goal of supporting both medical and psychological care. A multiplatform (app and web) application will be developed as the user interface for this AI system, enabling patients to interact easily and safely with a virtual assistant trained to provide personalized guidance, reminders, symptom monitoring, and continuous psychological and emotional support. The design of all the functions is intended to complement and reinforce in-person care, serving as a digital companion without replacing the essential human contact or direct clinical supervision.
Keywords: Artificial intelligence; Chronic disease; Healthcare; Psychological interventions; Virtual assistant.

Abstract 4377

UNDERSTANDING AI ACCEPTANCE THROUGH A PERSON-CENTERED LENS: A LATENT PROFILE ANALYSIS

Paganin G.*[1], Laudadio A.[2], Galanti T.[3], Cortini M.[3], Guglielmi D.[1]

[1]Department of Education Sciences "Giovanni Maria Bertin", University of Bologna, ~ Bologna ~ Italy, [2]TIM Academy & Development, TIM S.p.A., Rome, Italy ~ Rome ~ Italy, [3]Department of Psychology, University "G. d'Annunzio" of Chieti–Pescara, Italy ~ Chieti–Pescara ~ Italy

Introduction: Artificial Intelligence (AI) is a transformative technology with increasing impact across social and economic domains. Understanding the factors that influence its adoption is essential for both research and practice. The most widely used model in this field is the Technology Acceptance Model (TAM; Davis, 1989), which identifies perceived usefulness (PU) and perceived ease of use (PEOU) as predictors of behavioral intention to use (INT).
Objectives: To date, the literature has predominantly focused on variable centered approaches, often neglecting individual differences. This study adopts a person-centered approach to identify unobserved subgroups of workers and to explore the role of personal and organizational resources in AI acceptance processes.
Method: A total of 653 employees from an Italian company participated in the study (73% male; 52.3% aged between 51–60), completing an online survey. Latent Profile Analysis (LPA) was used to identify profiles based on individual innovativeness, openness to change, digital skills, organizational support for innovation, and training opportunities. These profiles were then compared on TAM dimensions (PU, PEOU, INT), as well as on technology anxiety, job insecurity, and work engagement.
Results: Four distinct profiles emerged: the Uninspired (n=213), the Misunderstood Innovators (n=70), the Change Champions (n=360), and the Disillusioned (n=66). Change Champions reported the highest levels of AI acceptance and work engagement, along with the lowest levels of technology anxiety and job insecurity. Conversely, the Disillusioned exhibited the most negative scores across all indicators.
Conclusions: The findings provide new insights into the role of personal and organizational resources in AI acceptance processes, offering practical implications for fostering more informed and positive attitudes toward the use of artificial intelligence. The cross-sectional design prevents causal inferences. Additionally, the relatively high average age of the sample may have influenced

the results, limiting their generalizability to younger populations.

Abstract 4378

DIGITAL ADAPTATION PROFILES AND LONGITUDINAL TRANSITIONS: THEIR IMPACT ON RECOVERY AND WORK-LIFE INTERFACE

Sanseverino D.*

Department of Psychology, Università degli Studi di Torino ~ Torino ~ Italy

Introduction: Constant connectivity and after-hours work demands are central challenges of digital transformations, impacting recovery and work-life conflict (WLC; Cho et al., 2020). Conversely, digital competencies may help reduce work-life spillover (Christensen & Treas, 2024). Understanding the interplay of technological demands and resources in the work-life interface is essential for sustainable digitalization (Trenerry et al., 2021).
Purpose: This study aims to: (1) identify digital adaptation profiles based on after-hours technology-assisted job demands (off-TAJD), digital competencies (DC), and leisure-time technology engagement (LTE); (2) examine transitions between profiles over time; and (3) assess predictors and outcomes in terms of recovery and work-life conflict.
Method: A two-wave longitudinal study (3-month interval) was conducted involving 144 workers from the general population (52% women, Mage = 41.62) using an online self-report questionnaire. Latent transition analysis was performed in Mplus. Relationships were analyzed using multinomial logistic regression and path analysis.
Results: Four profiles emerged: (1) Balanced – moderate off-TAJD, average DC/LTE; (2) Integrated – low off-TAJD, high DC/LTE; (3) Disengaged – low off TAJD/DC, moderate LTE; (4) Overloaded – high on all three indicators. Lower detachment and higher WLC at Time 1 predicted a higher likelihood of transitioning from Integrated to Balanced, while high control increased it. Staying in the Integrated profile predicted higher detachment at Time 2, whereas remaining Overloaded predicted increased work-life conflict and lower detachment. Transitions from Balanced to Disengaged and from Integrated to Balanced/Disengaged predicted lower WLC. Mastery was lower in transitions from Overloaded to Balanced and higher in those from Disengaged to Integrated.
Conclusion: The person-centered longitudinal approach and the integration of technological resources rarely studied concerning organisational well-being offer a granular view of digital exposure trajectories and their effects on the work-life interface.

Abstract 1894

WORK ALIENATION IN ACADEMIA: INSIGHTS FROM RELATIONAL MODELS THEORY

Balim S.*[1], Cesur S.[2]

[1]Bursa Technical University, Psychology Department ~ Bursa ~ Turkey, [2]Istanbul University, Psychology Department ~ Istanbul ~ Turkey

The aim of this study is to examine work alienation in academic life through Fiske's (1991) Relational Models Theory (RMT). RMT conceptualizes four basic relational models—communal sharing, authority ranking, equality matching, and market pricing—which are expected to shape how academics perceive and experience alienation. To address this issue, semi-structured interviews were conducted with 15 academics from different regions of Turkey, representing diverse disciplines and titles, each with at least four years of experience. Interviews lasted 45–90 minutes and were analyzed using thematic analysis supported by a closed coding approach. Findings showed that alienation was most strongly associated with the market pricing model. Academics reported difficulties in receiving fair returns for their efforts, increasing pressure of academic performance standards, the commodification of academic labor, and the erosion of meritocracy. Experiences linked to equality matching included unequal access to resources, limited participation in decision-making, and gender inequality. In relation to authority ranking, participants highlighted the misuse of hierarchical power and corruption of authority. Finally, in the context of communal sharing, academics emphasized the importance of unity within departments, institutions, and among the academic community noting its decline as a source of alienation. Overall, the results suggest that market pricing is the dominant dimension shaping alienation in academia. Strengthening fairness and proportionality in academic relations may help reduce alienation. This study contributes by demonstrating the usefulness of RMT for understanding alienation in academic settings and by providing insights into the particular challenges faced in Turkish higher education.

Abstract 2245

IDENTITY (A)SYMMETRY IN DUAL ROLES: HOW HYBRID ENTREPRENEURS ALLOCATE EFFORT AND PERFORM ACROSS VENTURE AND WAGE WORK

Asante E.A.[2], Chen T.*[1]

[1]Lingnan University ~ Hong Kong ~ Hong Kong, [2]Nottingham University Business School China ~ Ningbo ~ China

Hybrid entrepreneurship—simultaneously running a venture while holding wage employment—is a fast-growing, underexamined work form with profound implications for motivation, performance, and human resource strategy. This paper extends role identity theory to a dual-role hybrid entrepreneurial context and integrates a self-regulation lens to explain when dual identities enable versus impair performance. We theorize that identity (a)symmetry—the relative prominence of entrepreneurial and wage work identities—shapes self-regulatory effort allocation across roles, with downstream consequences for performance in both roles. Under identity asymmetry (one identity more prominent), hybrids prioritize effort toward the corresponding role and perform better in that role. Under identity symmetry, however, equally high prominence in both identities may impair regulation, yielding insufficient effort and underperformance in both domains compared with equally low prominence.

We test our model using three-wave, multi-source data from 327 hybrid entrepreneurs in Ghana, linking self-reports of identity and effort with partner-rated entrepreneurial performance and supervisor-rated wage work performance. Polynomial regression and response surface analyses support our hypotheses: effort increases along the identity-asymmetry line toward the more prominent identity; both entrepreneurial and wage work effort are lower when both identities are highly prominent than when both are low; and entrepreneurial (wage work) effort mediates the effects of identity (a)symmetry on entrepreneurial (wage work) performance, with cross-domain trade-offs. These findings reveal identity-driven resource allocation as a core mechanism for dual-role functioning.

This work advances theory by: (1) extending role identity theory to dual-role hybrid entrepreneurial contexts, showing configurations—not single identities—drive behavior; (2) specifying identity (a)symmetry as a self-regulatory mechanism allocating finite effort; and (3) revealing counterintuitive impairment under high identity prominence in both entrepreneurial and employment roles. Practically, these insights enable sustainable dual-role performance without assuming “more identity is better,” which is particularly salient for emerging economies where hybrid work sustains livelihoods.

Abstract 942

IDENTITY PROCESSES IN FREELANCE CAREERS: THE MEDIATING ROLE OF OCCUPATIONAL IDENTITY AND THE MODERATING ROLE OF CALLING

Jung Y.*, Takeuchi N.

Waseda University ~ Tokyo ~ Japan

Introduction: Participation in non-traditional work, including freelance and platform-based arrangements, is expanding globally (World Bank, 2023). Japan, despite enduring long-term employment traditions (Jung et al., 2023), has likewise experienced rapid growth in freelance work—defined as "charging fees for services and are independent of their clients in employment terms" (Fraser & Gold, 2001, p. 682)—fueled by side job deregulation, work-style reforms, and digitalization (Freelance White Paper, 2023). While freelancing affords autonomy and independence, it also generates "identity challenges" rooted in role ambiguity and the absence of organizational affiliation, which complicate the development of occupational identity (Caza et al., 2022). Yet, evidence on how occupational identity shapes freelancers' career remains limited (Stoyanova et al., 2025), and theorizing on calling as a buffer outside traditional employment is underdeveloped (Lysova et al., 2019).

Purpose & Method: Guided by career construction theory (Savickas, 2013), we examine (1) whether occupational identity achievement mediates the relationship between identity challenges and career outcomes, and (2) whether calling moderates this mechanism. A three-wave longitudinal survey of 1,177 Japanese freelancers measured identity challenges and calling at Time 1, occupational identity achievement at Time 2, and subjective career success and career growth at Time 3. We tested a moderated mediation model using path analysis in Mplus.

Results & Conclusions: Identity challenges significantly reduce occupational identity achievement, which in turn, mediates their negative effects on subjective career success and career growth. Perceived calling attenuated this indirect pathway, yielding a significant moderated mediation effect such that the adverse conditional indirect effects were weaker at higher level of calling. These findings expand career construction theory to non-traditional employment contexts by demonstrating that identity processes remain consequential outside organizations. The findings identify calling as a psychological resource that sustains career development under precarious conditions, informing interventions that cultivate identity clarity and purpose among freelancers.

Abstract 4107

SAFETY PERCEPTION, AGE, AND JOB DEMANDS: IMPACT ON WORK ABILITY IN OLDER WORKERS

Bacci G.*, Viotti S., Guidetti G., Sottimano I., Converso D.

University of Turin, Department of Psychology ~ Turin ~ Italy

This study explores the interplay between perceived safety, age, and job demands in shaping work ability among older workers. This topic is of increasing relevance given the ageing workforce. Utilising the Job Demands-Resources (JDR) model, the study investigates the moderating effect of cognitive and physical job demands on the relationship between safety perception and work ability. The research is grounded in survey data collected from 340 employees at a manufacturing facility in Northern Italy.

The findings of the study reveal a significant three-way interaction between perceived safety, age, and cognitive demands. Specifically, older workers with lower cognitive demands were more dependent on high safety perceptions to sustain work ability, while cognitive demands played a more crucial role for those with average or above-average cognitive abilities. Conversely, physical demands exhibited a consistently detrimental effect on work ability, irrespective of perceived safety or age.

These results underscore the multifaceted nature of factors influencing work ability in older employees, emphasising the necessity for customised interventions that address safety perceptions, cognitive abilities, and job demands. Consequently, the enhancement
of safety culture, the implementation of ergonomic modifications, and the provision of cognitive support within the workplace can assist in the mitigation of age-related declines in work ability.

This study makes a valuable contribution to the understanding of the challenges faced by older workers and offers insights into the design of inclusive occupational health policies. Future research should further investigate the intersection of individual and environmental factors in shaping work outcomes.

Abstract 639

APPLYING CAREER SUSTAINABILITY ECOSYSTEMS THEORY TO NEURODIVERGENT INDIVIDUALS – A SYSTEMATIC REVIEW

Kugler M.*, Aichroth L.S.

European University for Innovation and Perspective ~ Backnang ~ Germany

Introduction: The recently introduced sustainable career ecosystem theory (SCET) integrates sustainable career theory and career ecosystem theory, highlighting the interplay of person, context, and time in shaping sustainable careers. At the same time, the growing number of neurodivergent individuals in the workforce has been acknowledged, yet little is known about their career sustainability.

Purpose: This study addresses the need, raised in a current special issue on SCET, to systematically explore neurodiversity in the context of career sustainability. To date, no comprehensive mapping of existing evidence exists. Our systematic literature review aims to synthesize empirical research and theoretical propositions, thereby providing a foundation for a future research agenda. The study has been pre-registered and approved by the authors' institutional ethics board.

Method: Following PRISMA guidelines, a systematic search was conducted in SCOPUS. We combined terms for neurodivergent diagnoses with variables drawn from the SCET framework (e.g., career counseling, career crafting, career success). To capture contemporary conceptualizations of neurodivergence, we included articles published between 2020 and 2025. Reporting bias and certainty assessment were unremarkable.

Results: Preliminary findings indicate that some SCET elements, such as individual-level outcomes, have been linked to neurodivergence in scattered studies or highlighted in recent scoping reviews. However, more detailed analyses are lacking. For instance, the role of career crafting in shaping perceived career sustainability among neurodivergent individuals remains underexplored. Moreover, the predominance of US-based research limits the transferability of findings and underscores the need for cross-cultural investigations.

Conclusion: In conclusion, integrating neurodivergence into the SCET framework offers significant potential to advance the field. Given SCET's emphasis on context, future research should particularly account for cultural and national backgrounds when examining sustainable careers of neurodivergent individuals.

Abstract 232

"EVERYTHING WE SEE HIDES ANOTHER THING": ENHANCING RETURN TO WORK AFTER MATERNITY LEAVE THROUGH VISUAL METAPHOR-BASED INTERVENTION

Rapisarda S.*, Dal Corso L.

Department of Philosophy, Sociology, Education and Applied Psychology, University of Padua ~ Padua ~ Italy

Introduction: Return to work (RTW) after maternity leave is a challenging experience for working mothers (WMs). Organizations can support WMs to improve this experience. A valuable tool for eliciting the intrinsic meanings of RTW is visual metaphors (VMs), which provide easier access to even the most complex life experiences.
Purpose: In line with the J-DR theory, we propose a psychological intervention that utilizes VMs combined with cognitive and mindfulness techniques to promote personal resources (e.g., psychological flexibility, parental self-efficacy), address personal demands (e.g., irrational beliefs at work, rigid maternal beliefs), and manage anxiety, work-related stress, and its consequences (e.g., parental and job burnout).
Method: Visual-Meta4Moms@Work consists of a series of VMs produced using AI, which refer to possible types of structure and meaning, as well as the semiotic dimensions of expression, conceptualization, and communication. A first group of WMs evaluated the VMs in terms of appreciation, deviation from expectations, complexity, and communicative ability. A second group of WMs will be enrolled in an intervention that involves the use of Visual-Meta4Moms@Work to elicit the meanings of RTW, along with a series of sessions focused on psychoeducation and experiential exercises, including measures of biofeedback.
Results: Visual-Meta4Moms@Work consists of ten meaning categories (e.g., challenge and destination, fight, hostile place) and over 300 VMs. Following the WMs' evaluations, the most appreciated and communicative VMs were selected, which were less complex and deviated less from expectations compared to the meaning category.
Conclusions: This contribution is part of a broader research project aimed at designing an organizational intervention to enhance RTW after maternity leave, including using VMs and AI. Images facilitate the emergence of meaning from complex experiences, allowing the researcher/consultant to facilitate their re-elaboration and promote the development of new awareness. Visual-Meta4Moms@Work can be beneficial in organizations for designing primary and secondary psychological interventions.

Abstract 406

WHY CONFLICT AFFECTS CAREERS - WORK-FAMILY CONFLICT, CAREER SELF-EFFICACY AND THE ROLE OF PURPOSE AND GROWTH AT WORK

Rubinstein N.L.C.*[1], Soriano A.[2], Villajos E.[2]

[1]Universitat de València ~ València ~ Spain, [2]IDOCAL, Universitat de València ~ València ~ Spain

Along with a large increase in the prevalence of Work-Family Conflict and Family-Work Conflict as a consequence of societal developments, research has outlined possible negative consequences of this development. Adding to these potential dangers, this study investigates the hypothesised negative effect of Work-Family Conflict and Family-Work Conflict on Career Self-Efficacy, which would be detrimental to individual careers. Two mediators, which are sub-dimensions of Eudaimonic Well-Being, are introduced to explain the relationship: Purpose in Career and Personal Growth at Work. To test the model, self-report questionnaires of the mentioned concepts were administered to a sample of Spanish employees (N = 327) at two time points, three months apart. Results were analysed using structural equation modelling in Jamovi, revealing Family-Work Conflict as a direct negative predictor of Career Self-Efficacy and Work-Family Conflict as an indirect negative predictor via Purpose in Career and Personal Growth at Work. With this research, the study contributes not only to the awareness of the negative consequences of Work-Family and Family-Work Conflict, but it also highlights the importance of Career Self-Efficacy and brings forth possible explanatory mechanisms for the outlined effects. In doing so, it responds to the growing societal need to protect employee well-being and career self-efficacy in the face of blurred work-life boundaries and changing career realities.

AI READINESS AND HUMAN-AI COLLABORATION ON EMPLOYEE COLLABORATIVE CLIMATE: EVIDENCE FROM THAILAND

Peemanee J.*[1], Boonlua S.[1], Weerarathna R.[2]

[1]Mahasarakham Business School, Mahasarakham University ~ Maha Sarakham ~ Thailand, [2]3SLIIT Business School, Sri Lanka Institute of Information Technology ~ Colombo ~ Sri Lanka

Introduction:
The rapid advancement of artificial intelligence (AI) has fundamentally transformed the modern workplace, particularly in the area of human resource management. As AI systems become increasingly integrated into organizational operations, understanding how employees perceive and collaborate with AI is essential to fostering a productive and inclusive working environment.
Purpose:
This study aimed to investigate the influence of AI readiness—comprising perceived usefulness, ease of interaction, trust in AI, and threat acceptance—on the employee collaborative climate in organizations. Additionally, it examined the mediating role of human-AI collaboration in the relationship between AI readiness and collaborative climate, with Thailand serving as the contextual setting.
Method:
A quantitative approach was employed using survey data collected from 400 Thai employees across various sectors. The research instrument was a structured questionnaire measured on a five-point Likert scale. The instrument demonstrated strong internal consistency (Cronbach's $\alpha > 0.80$). Data were analyzed using multiple regression and mediation analysis.
Results:
Findings revealed that all dimensions of AI readiness positively and significantly influenced both human-AI collaboration and employee collaborative climate ($p < .001$). Human-AI collaboration also had a significant positive impact on collaborative climate and acted as a partial mediator in the model. The indirect effect of AI readiness on collaborative climate through human-AI collaboration was statistically significant ($\beta = .693$, CI [.582, .812]), supporting the proposed mediation framework.
Conclusions:
This research highlights the importance of employees' psychological and behavioral readiness in adapting to AI-integrated environments. The results suggest that organizations should not only invest in AI infrastructure but also foster a climate that supports human-AI cooperation. Enhancing employee readiness and trust toward AI can play a crucial role in sustaining collaboration and performance in AI-driven workplaces.

Abstract 952

RESILIENCE AND BIOMARKERS OF STRESS IN CROSS CULTURAL ADAPTATION: A LONGITUDINAL COMPARATIVE STUDY OF CHINESE RETURNEES AND FOREIGN EXPATS IN CHINA

English A.*

Wenzhou-Kean University ~ Wenzhou ~ China

Grounded in the biopsychosocial model and the Job Demands–Resources framework, this longitudinal study explored how physiological stress and psychological resources jointly shape cross-cultural adaptation among returnees and foreign talents in China. A total of 357 professionals, including both Chinese returnees and foreign experts, participated in this study by completing self-reported measures and providing hair samples for cortisol analysis. Six months later, 246 of these participants completed follow-up measures. The surveys administered assessed resilience, perceived talent status, coping strategies, and effort-reward imbalance. Results revealed distinct yet convergent adaptation patterns: returnees reported greater use of active coping, while foreign talents perceived higher talent recognition. Despite these differences, both groups reported comparable levels of resilience, physiological stress, and ERI. A moderated mediation analysis showed that elevated baseline cortisol predicted lower ERI at time 2, and individuals with low levels of resilience reported an increase in effort-reward imbalance. For highly resilient participants, ERI remained consistently low regardless of cortisol, reflecting a ceiling effect of psychological protection. Although perceived talent status independently reduced ERI, it did not significantly mediate the cortisol–ERI association. These findings support a dual-pathway model in which psychological resilience and physiological arousal operate as complementary, compensatory systems. As long as one pathway is engaged, individuals maintain a balanced effort–reward ratio and occupational well-being. This perspective challenges deficit-based views of cortisol and underscores the need to integrate both psychological and physiological resources in global talent management.

Abstract 963

IT TAKES A VILLAGE: ENHANCING REALISM IN HIGH STAKES ASSESSMENTS THROUGH THE INCLUSION OF COMMUNITY VOICES

Costa P.*[1], Geiger T.[2], Tummarello M.[2], Drcar S.[1], Gardner T.[1], Gardner A.[1]

[1]SurgWise ~ Denver ~ United States of America, [2]Association for American Medical Colleges ~ Washington DC ~ United States of America

Introduction
Integrating community members into the development of high-stakes assessments can ensure relevance, equity, and trust. Their insights can help align assessments with real-world needs, reduce bias, and foster shared ownership of assessment decision outcomes.
Purpose
We explored outcomes related to the incorporation of real-world patients into the development of a national high-stakes assessment used for the selection of future healthcare professionals.

Methods
Real world patients were invited to participate in a critical incident study involving the collection of situations in which they encountered medical students demonstrating ineffective or effective professionalism behaviors. Situational judgment tests (SJTs) created from these collected vignettes were compared to SJTs developed from traditional subject matter experts (SMEs; medical school faculty and staff) in terms of professionalism domains represented, number of initial item responses created, scoring survival rates, and item response effectiveness patterns.

Results
Sixty situational judgment test scenario sets were analyzed, with 25% of these developed from critical incidents provided by patient SMEs. Fisher Exact Tests revealed no differences in the type of critical incidents submitted based on SME type (patient versus medical school faculty/staff), as determined by competency domain represented. Additionally, no significant interactions emerged between SME type and competency domain for the number of initial items created, item effectiveness patterns, or item survival rates, suggesting that critical incidents provided by patients perform similarly to traditional SMEs in terms of opportunities to create an array of relevant response items and their ability to survive through independent scoring analysis .

Discussion
Involving relevant community members in the development of high-stakes selection

tools yields outcomes comparable to traditional expert-driven methods. These results suggest that inclusive design does not compromise rigor, and can instead enhance relevance, variety of content, transparency , and public trust in the selection process.

Abstract 1099

THE TRICKLE-DOWN EFFECT OF COURAGEOUS LEADERSHIP: SCALE DEVELOPMENT, SUBORDINATE COURAGE, AND BOUNDARY CONDITIONS

Lin S., Huang S.*

National Kaohsiung University of Science and Technology ~ Kaohsiung ~ Taiwan

Courageous leadership has been increasingly recognized as an essential resource for organizations, yet empirical research remains limited, especially in everyday managerial contexts. This study is conducted in two parts to address both conceptual and empirical gaps.

The first part of the research focuses on developing and validating a scale to assess leaders' courageous behavior. Drawing on social learning theory and the Job Demands–Resources model, courageous leadership is conceptualized as leaders' willingness to assume responsibility, speak up under pressure, and inspire others despite risks. Through qualitative interviews and content analysis, scale items were generated and refined, followed by exploratory and confirmatory factor analyses. The results provide a reliable and valid measure that captures the multidimensional nature of leaders' courageous behavior, offering a foundation for further empirical investigations.

The second part of the study examines the trickle-down effect of leaders' courageous behavior on employees. Subordinate courage is proposed as a mediating mechanism through which leaders' courage influences innovative work behavior. To capture boundary conditions, interpersonal trust is hypothesized to moderate the relationship between leaders' courageous behavior and subordinates' courage, while psychological safety (team climate) is expected to strengthen the pathway from leader courage to subordinate outcomes. Data are collected from employees across diverse industries in Taiwan and analyzed using structural equation modeling and moderated mediation techniques.

This study contributes to leadership and organizational behavior research in two ways. Theoretically, it clarifies the construct of courageous leadership and empirically tests its trickle-down effect in a Chinese cultural context. Practically, it highlights the importance of cultivating courageous leadership, building trustful leader–follower relationships, and fostering psychologically safe climates to enhance employee courage and innovation.

Courageous Leadership, Courage, Interpersonal trust, Psychological Safety, Innovative Work Behavior

Abstract 2248

INVESTIGATING THE IMPACT OF GRATITUDE INTERVENTIONS ON SOCIAL RESPONSIBILITY BEHAVIORS ACROSS DOMAINS

Babu N.*

Loughborough University ~ Loughborough ~ United Kingdom

Introduction and purpose: Provisional research has shown that gratitude interventions can engender positive outcomes in the workplace (Locklear et al., 2021; Sawyer et al., 2022). However, existing research has neglected a focus on prosocial (i.e., social responsibility) behaviours, which gratitude is predicted to facilitate through upward reciprocity, as well as methodologically not accounting for the effectiveness of different types of gratitude interventions. As per broaden and build theory (Fredrickson, 2001), a work-specific and general gratitude intervention are predicted to broaden one's perspective and build resources, to facilitate social responsibility behaviours in individuals, in comparison to an active control group. It is predicted that the gratitude interventions will have domain-specific effects (e.g., work vs personal).

Methods: Participants were randomly assigned to one of three conditions: general gratitude, work-specific gratitude, and an active control condition (total N = 210). Participants provided baseline measures in week 1, then engaged in the intervention for a period of four weeks, and subsequently responded to a variety of prosocial outcome measures in week 6.

Results:
There was a significant difference between intervention conditions [F (2, 105.71) = 4.90, p = 0.009]: the general (M = 3.71) and work-specific (M = 3.72) conditions were not significantly different from one another, but both the general (p = 0.012) and work-specific (p = 0.015) groups had significantly higher gratitude scores in comparison to the control group (M = 3.13). Participants in the general gratitude condition had significantly lower environmental behaviour (B = -0.181, p = 0.048) versus the control group, and the work-specific condition had lower scores on work-related corporate volunteering than the general gratitude condition (B = -0.328, p = 0.064).

Conclusion: The current study provides evidence of causality as well as contributing to absent research on the effects of gratitude within and through the workplace, on social good.

Abstract 157

WORKING SIDE BY SIDE: HOW TELEWORK AND HUMAN-ANIMAL INTERACTIONS FOSTER WORK ENGAGEMENT AND LIFE HARMONY

Junça--Silva A.*[1], Rueff Lopes R.[2]

[1]Ana Junça-Silva ~ ISCTE - Instituto Universitario de Lisboa ~ Portugal, [2]ESADE ~ Barcelona ~ Spain

For employees with companion animals, telework offers the opportunity to remain close to them, fostering frequent interactions with them. However, research on the impact of work arrangements (flexible versus non-flexible) on well-being indicators remains limited. Grounded in Social Exchange Theory, a conceptual model was developed to explain how and under what circumstances work arrangements influence work engagement and life harmony. It was hypothesized that telework facilitates human-animal interactions, which, in turn, positively influence work engagement and life harmony. Additionally, it was proposed that attitudes toward telework moderate this indirect relationship. To test this model, 238 employees participated in a three-wave study. The findings supported the hypotheses, demonstrating that telework (versus on-site work) positively influences work engagement and life harmony through human-animal interactions. This relationship was moderated by employees' attitudes toward telework, with stronger effects observed among those with positive attitudes (versus negative attitudes). This study highlights the positive impact telework can have for individuals with companion animals, enabling them to work in proximity to their companion animals and alleviating potential concerns about their well-being.

REMOTE AND HYBRID WORK: CONNECTING INDIVIDUAL EXPERIENCES AND TEAM DYNAMICS

Thursday 23 July 2026 from 17:00 to 18:30

(R-Arsenale)

Salvatore Zappalà (University of Bologna ~ Bologna ~ Italy), Chair and Presenter
Ferdinando Toscano (University of Campania "Luigi Vanvitelli), Co-Chair
Núria Tordera (University of Valencia ~ Valencia ~ Spai), Discussant

The expansion of remote and hybrid work has reshaped the modern workplace, raising new theoretical and practical questions for scholars and practitioners. Flexible arrangements promise autonomy, work–life balance, and agility, yet they also bring challenges for motivation, leadership, collaboration, and collective performance. This symposium gathers five contributions that address these issues at both the individual and team level.

The first two papers examine individual processes. The opening study develops and validates a Telework Motivations Scale grounded in Self-Determination Theory, showing that autonomous motivations are linked to higher well-being, balance, and performance in comparison to controlled motivations. This study extends motivational constructs to telework context, and offers an instrument to guide evidence-based policy design The second paper focuses on managers, highlighting the overlooked strains of hybrid leadership. Findings from Danish corporations show that while managers value flexibility, they also face coordination burdens, reduced informal contact, and increased responsibility for negotiating hybrid arrangements, with implications for their own well-being.

The next three papers address team processes. A scoping review of hybrid team research, guided by the Input–Mediator–Output framework, identifies key organizational, behavioral, and cognitive factors that shape collaboration and outcomes such as productivity and commitment, while underscoring gaps in the study of conflict and cooperation. The following empirical study, using the Telework Quality Model, shows how different profiles of hybrid workers experience team identification, knowledge sharing, and efficiency differently, emphasizing that organizational conditions strongly influence outcomes. The final contribution explores leadership in hybrid settings, demonstrating that improvements in leaders' competencies foster greater employee autonomy, social support, and positive affect.

Together, these papers highlight how motivations, leadership, and organizational design determine whether hybrid work fosters thriving individuals and effective teams—or instead generates disconnection and inefficiency.

Abstract 3698

MOTIVATIONS FOR TELEWORK: A PSYCHOMETRIC VALIDATION STUDY BASED ON SELF-DETERMINATION THEORY

Couto R., Lopes S.*, Carvalho V.S., Chambel M.J.

CICPSI, Universidade de Lisboa ~ Lisbon ~ Portugal

Introduction: Telework has become a central aspect of modern work life, raising questions about how employees' motivations shape their experiences and outcomes. Self-Determination Theory (SDT) provides a valuable framework for examining the quality of motivation in this context.
Purpose: This study aimed to create and validate a way to measure teleworkers' motivations, including autonomous and controlled regulatory processes, thereby broadening the use of SDT in flexible work setups.
Method: Data were collected from 454 employees in Portugal engaged in full or partial telework. The development of the Telework Motivations Scale involved exploratory and confirmatory factor analyses to identify underlying structures. The resulting instrument measured five forms of motivation: autonomous (integrated, intrinsic) and controlled (external social, external material, introjected). Reliability and validity analyses were conducted to assess psychometric adequacy.
Results: The scale demonstrated strong reliability and validity indicators, confirming its robustness. Autonomous motivations were positively associated with life satisfaction, work–family balance, and job performance. In contrast, controlled motivations correlated with less favorable personal and professional outcomes.
Conclusions: The validated Telework Motivations Scale offers a reliable tool for understanding motivational profiles in telework settings. The findings underscore the importance of fostering autonomous motivation to enhance employee well-being and performance. The scale provides organizations practical insights to design evidence-based telework policies and interventions. Further research should examine the measure across cultural and occupational contexts to strengthen its generalizability.

Abstract 3699

HYBRID WORK'S EFFECT ON MANAGEMENT AND MANAGERS' WELL-BEING: AN EXPLORATORY STUDY

Ipsen C.*[1], Manca C.[2]

[1]TECHNICAL UNIVERSITY OF DENMARK ~ Copenhagen ~ Denmark, [2]University of Bologna ~ Bologna ~ Italy

Hybrid work has become a central trend in contemporary labor markets (Eurofound, 2021). While research has largely focused on employee outcomes, far less is known about how line and middle managers experience leading hybrid teams, the organizational factors influencing these experiences, and their consequences. Prior studies suggest that hybrid work intensifies managerial effort and reduces perceived task quality, but the underlying mechanisms remain underexplored.

This study investigates managers' daily experiences of hybrid work and its implications for productivity and well-being. Data were collected from approximately 30 managers across six large knowledge-intensive corporations in Denmark. Participants engaged in a series of workplace Fishbone workshops designed to facilitate collective reflection on the benefits and strains of hybrid leadership.

Findings show that managers experience some of the same advantages as employees, including increased focused time and recognition that hybrid arrangements improve employee satisfaction. At the same time, managers face distinctive challenges. Their work has become increasingly centered on coordination, leaving less time for critical tasks. They report difficulties maintaining oversight of employees' activities and well-being, a loss of community and informal interactions, and an ongoing burden of negotiating hybrid arrangements. These factors generate strain and, in some cases, boredom, despite the broader enthusiasm surrounding flexible work.

The study contributes to ongoing debates on hybrid work by foregrounding the managerial perspective. It highlights the dual role of managers as both facilitators and sufferers of hybrid transitions. The insights provide practical guidance for organizations, emphasizing the need to support managers through clearer structures, enhanced communication practices, and shared responsibility for hybrid arrangements. By addressing these factors, organizations can cultivate healthier workplaces and ensure that managers remain engaged and effective in the evolving world of hybrid work.

Abstract 3701

TEAMING IN HYBRID WORK: A SCOPING REVIEW

Zappalà S.*[1], Donati S.[1], Toscano F.[2]

[1]University of Bologna ~ Bologna ~ Italy, [2]University of Campania "Luigi Vanvitelli" ~ Caserta ~ Italy

Introduction. With the acceleration of hybrid work in the post-pandemic era, organizations are facing new challenges in managing team processes. Hybrid teams, in which different combinations of members alternate between in-person and remote work, integrate physical and virtual interactions, exposing themselves to subgroup risks, low cohesion, reduced information sharing, and team commitment. The Input-Mediator-Output (IMO) framework, widely used in the study of traditional and virtual teams, has been little used to investigate group processes in hybrid teams.

Objectives. Referring to the model of Kozlowski and Bell (2019) and using the IMO framework, a scoping review was conducted that analyzed the literature on five team processes (collaboration, conflict, cooperation, coordination, interactions) in hybrid contexts. The aim was to identify which input factors influence team processes and the effects of these processes on individual and group outcomes in hybrid teams.

Method. The PRISMA-ScopinReview guidelines were followed. The keywords used in Scopus and Web of Science identified 1,022 articles published between 2009 and 2024; 111 studies were deemed relevant, and 19 empirical articles were ultimately selected for full-text analysis.

Results. Three main categories of input factors emerged: organizational (e.g., physical location, spatial design, task interdependence), behavioral (e.g., informal interactions, leader behavior, common ground), and cognitive (e.g., shared identity, collaboration readiness). The identified outputs include productivity, organizational commitment, and performance.

Limitations. The scoping review was based on a limited number of studies (n=19). Most of the reviewed research focuses on communication and collaboration processes in hybrid teams, while a lack of work on conflict and cooperation processes was highlighted.

Innovative Aspects. The study presents a systematic review that lists the input and outcome factors of six group processes in hybrid teams, applying an IMO approach.

Abstract 3702

BRIDGING THE GAP: CAN TEAMWORK THRIVE IN A HYBRID WORLD?

Miglioretti M.*[1], Donati S.[2], Gragnano A.[1], Zappalà S.[2], Margheritti S.[1]

[1]University of Milano-Bicocca ~ Milano ~ Italy, [2]University of Bologna ~ Bologna ~ Italy

Hybrid work, defined as any combination of working time spent within the organization and in other settings (typically at home), has now become a common practice in many organizations. However, its implications at the team level remain poorly understood.

Drawing on the Telework Quality Model (QoT Model)—which identifies four key resources, namely agile remote workstations, agile offices, flexible time, and enabling management— and adopting a person centred approach, this study aims to investigate whether specific hybrid work configurations may facilitate or hinder perception of team functioning and performance.

A total of 719 employees from four different organizations (three private and one public; age: 38% between 46 and 55 years; 54.1% women) participated in the study. Latent Profile Analysis (LPA) was used to identify distinct groups of employees characterized by different hybrid work configurations. ANOVA was then conducted to examine differences across the identified profiles in terms of team identification, team knowledge sharing, team hybrid mode satisfaction, team collective self-efficacy, and team efficiency.

The Latent Profile Analysis identified four profiles: (1) High-Quality Agile Work (39.4%); (2) All Good but Struggling at Home (41.4%); (3) Better Alone than in the Office (12.8%); and (4) Low-Quality Agile Work (6%). The four profiles of hybrid work reveal significant differences with respect to team identification (F:29,65; p<,001); team knowledge sharing (F:13,03; p<,001); team collective self-efficacy (F:28,69; p<,001), team hybrid mode satisfaction (F:37,45; p<,001), and team efficiency (F:15,59; p<,001).

Our findings indicate that quality of hybrid work is closely related to perception of good team processes, while satisfaction with hybrid work may reflect both high-quality practices and organizational challenges.

Abstract 3703

FROM LEADERSHIP TO WELL-BEING IN HYBRID WORK: THE EFFECTS OF EVOLVING LEADERSHIP COMPETENCIES ON WORKERS' OUTCOMES

Tordera N., Rodríguez I.*, Peiró J.M., Villajos E., Lorente L.

IDOCAL, University of Valencia ~ Valencia ~ Spain

Objective. Hybrid and remote work arrangements have become more common in recent years. Those work arrangements have presented both bright and dark sides, posing diverse challenges for leaders who must now manage a more dispersed workforce through digital communication. Physical distance and the need to adapt leadership digitally require leaders to update their competencies and skills in this context, contributing to a committed, productive, and healthy workforce. Improvement of digitalized leadership competences for hybrid and remote work management might be a key to that purpose. Departing from the Leadership Competences for Telework model, in the present research, we analyze how improvements in leaders' competences for telework are related to improvements in the quality of working life of followers.

Methods. The study included data from 432 hybrid and remote workers, 52,2% male and 47.8% female, aged 19 to 68 years (M = 35.4, SD = 9.3). A longitudinal design was used, with repeated measures collected at two different time points (T1 and T2) separated by two to four months using an online survey. SPSS 29 was used for data analysis.

Results. Results show that positive changes in leadership competencies for telework between T1 and T2 were positively related to changes in employees' perceptions of autonomy and social support, as well as positive affect.

Conclusion. The findings suggest that when leaders enhance their competencies for managing telework, their team members experience a better teleworking experience, characterized by greater support, increased autonomy, and positive affect. Therefore, strengthening leaders' skills and competencies is essential to enhancing employees' quality of working life in telework settings.

(UN)EMPLOYMENT STATUS CHANGES AS CAREER SHOCK OR CAREER DECISION: THE INTERPLAY OF PERSONAL AND CONTEXTUAL DRIVERS FOR DEVELOPMENTS IN WELL-BEING

Thursday 23 July 2026 from 17:00 to 18:30

(O-Arsenale)

Claudia Bernhard-Oettel (Stockholm University ~ Stockholm ~ Swed), Chair and Presenter

This symposium brings together five presentations from Belgium, Germany, the UK, Sweden and Norway. All contributions focus on employment and job changes and highlight the importance of such transitions for the development of identity and career, job satisfaction and well-being, individual economic resources and balance in non-work life. Using various theoretical points of departure, samples and methods, all presentations make theoretical and practical contributions towards a better understanding of what changes in job and employment status across the life span mean for the development of satisfying sustainable careers. Additionally, each presentation reveals how important the point of reference is for individuals who often compare idiosyncratically and as couples how their current situation is an improvement to a previous state or needs changes towards an envisioned state. These within-individual or dyadic perspectives of change are captured in qualitative narratives, statistical analyses and theoretical conceptualizations.

Paper 1 from Belgium studies the group of economically inactive using the LISS data. The study takes personal preferences and contextual changes into account to investigate what different career choices and developments mean for well-being.

Paper 2 from Germany investigates how past career shocks (job loss, short-time work) associate with economic stress and well-being, thereby exploring the role of posttraumatic growth.

Paper 3 from the UK investigate transitions from entrepreneurship to employment to understand how changes in autonomy and security relate to changes in job satisfaction.

Paper 4 from Sweden is a qualitative study with temporary agency workers that explores how workers can use agency in this specific employment context to create sustainable careers, momentarily or intheirfuture.Paper 5 from Norway takes a conceptual stance on career transitions into retirement and argues that individual changes in subjective well-being can be understood and predicted more accurately if pathways of both partners in romantic couples are considered.

Abstract 4275

GHOSTS FROM THE PAST: ON THE IMPACT OF CAREER SHOCKS ON ECONOMIC STRESS AND THE ROLE OF POSTTRAUMATIC GROWTH

Klug K.*

University of Bremen ~ Bremen ~ Germany

Introduction: For many workers, the pandemic led to career shocks in terms of employment disruptions (job loss, short-time work), which may induce economic stress (i.e., job insecurity, financial stress). Yet it is unclear how exactly career shocks affect economic stress and well-being beyond immediate reactions. We argue that such long-term effects also depend on how people have coped with the experience.
Purpose: Based on stress theories and life course perspectives, this study investigates relationships between past career shocks, current experiences of economic stress and well-being. We explore the role of posttraumatic growth as a potential moderator in these relationships.
Methods: We conduct a longitudinal study with five measurements, about six weeks apart, among a diverse sample of employees from different sectors. Respondents retrospectively report career shocks during the pandemic, posttraumatic growth at the beginning of the survey, as well as current job insecurity, financial stress and well-being at each time point. The data collection will be completed in autumn 2025 with an expected N = 160. Multilevel models will be calculated to test our hypotheses.
Results: We expect past career shocks to predict current economic stress. We also expect economic stress to relate to lower well-being, in terms of differences between persons and changes within persons. Posttraumatic growth may moderate a) effects of past career shocks, such that people with more posttraumatic growth perceive less economic stress after the shock, and b) effects of economic stress on well-being, such that people with more posttraumatic growth react less strongly to economic stress.
Conclusion: The study will contribute to the understanding of longer term outcomes of career shocks, as well as economic stress in the context of the life course. It will also highlight individual differences in how people cope with critical life events such as career shocks.
Keywords: Career shocks; economic stressors;well-being;posttraumaticgrowth

Abstract 4276

FROM ENTREPRENEUR TO EMPLOYEE: THE COMPETING EFFECTS OF CHANGES IN AUTONOMY AND JOB SECURITY FOR INDIVIDUAL WELL-BEING

Doden W.*

King's Business School, King's College London ~ London ~ United Kingdom

Introduction. While many studies have explored transitions into entrepreneurship, far less is known about the reverse pathway—from entrepreneurship to wage employment. This is surprising given the high failure rates of entrepreneurial ventures and the fact that most former entrepreneurs ultimately return to paid employment. Whereas prior research has focused largely on the structural costs of this transition (e.g., hiring stigma, wage penalties), we examine how individuals adapt to paid employment, focusing on changes in job characteristics, which in turn influence work-related well-being.
Purpose. Drawing on prospect theory, we propose that individuals evaluate their work characteristics in paid employment relative to their prior entrepreneurial experience. Specifically, the loss of autonomy and the gain in job security—two hallmark features of entrepreneurial versus employed work—may have competing effects on overall job satisfaction.
Methods. We tested our hypotheses using 20 years of panel data from the Household, Income and Labour Dynamics in Australia (HILDA) survey.
Results. Using within-person fixed effects models, our findings reveal a clear trade-off: former entrepreneurs experience a significant drop in autonomy and satisfaction with autonomy, alongside a substantial and sustained increase in job security and satisfaction with job security after transitioning to paid employment. Crucially, the positive effect of increased job security outweighs the negative effect of reduced autonomy, resulting in an overall increase in job satisfaction.
Conclusion. We extend career transition research by introducing a reference-point perspective showing that changes in job characteristics during transitions are evaluated not only in absolute terms but also through subjective comparisons to prior roles. In doing so, we challenge the prevalent assumption that returning to paid employment represents a "career failure" and instead demonstrate that this transition can offer a fulfilling and stabilizing path—an insight with important implications for organizations hesitant to hire former entrepreneurs.

Abstract 4277

NARRATIVES AMONG TEMPORARY AGENCY WORKERS: WEAVING INDIVIDUAL AGENCY AND CONTEXTUAL CONDITIONS FOR SUSTAINABLE CAREER DEVELOPMENT

Bernhard--Oettel C.*

Stockholm University ~ Stockholm ~ Sweden

Introduction. Temporary agency work (TAW) means performing work in a client organization for a limited time. Workers thus continuously switch to different assignments, which often are similar in nature so that workers can quickly learn and perform well on the job. This constitutes a context with specific conditions for individual career development, but there is limited research focusing on individual possibilities – or hinders – to create meaningful and sustainable careers in TAW.
Purpose. Therefore, this qualitative study explores whether and in what way temporary agency workers can use individual agency to influence their personal development and person-environment fit in meaningful ways to increase career sustainability, momentarily or over time.
Methods. We conducted semi-structured theme-focused interviews with 22 temporary agency workers. All interview material was transcribed verbatime. By means of narrative analysis, five typical narratives were identified: (a) TAW as secure flexibility, (b) TAW as side gig, (c) TAW as stepping stone, (d) Return to work as TAW, and (e) TAW as dead-end.
Results. The five narratives offer different perspectives on development and meaningfulness. TAW is seen as an investment in future career sustainability, an investment into regaining sustainability, an indirect investment in a future sustainable career, or as a sustainable or unsustainable situation in itself. In each narrative, individualized career development required agency, which was experienced as restricted due to the employment contract (e.g., work tasks and responsibilities defined in contract) and the TAW policy of the client organization (buffer vs. recruitment strategy). Career development was mainly shaped by changing assignments or – in an envisioned future - being directly employed by the client organization.
Conclusions. The five different narratives elicit how temporary agency workers can become (or are hindered from) being agentic to create meaning around TAW and their careers. In addition, occupationalidentity playsavitalroletodefineasustainable person-environment fit.

Abstract 4278

HAPPILY EVER AFTER: THE SELF- AND DYADIC-REGULATION MODEL OF RETIREE SUBJECTIVE WELL-BEING IN ROMANTIC COUPLES

Unger D.*

Department of Psychology, UiT The Arctic University of Norway ~ Tromsø ~ Norway

Introduction. Improving retirees' subjective well-being is crucial, and yet we know little about how retiree subjective well-being develops over time. The existing research has also largely neglected the dynamic role of significant others in shaping retiree adjustment outcomes, which is an important omission because social relationships become more important with age as romantic partners take a particularly central role in the lives of retiring/retired individuals.
Purpose and Methods. Drawing on action regulation and transactive goal dynamics theories, this conceptual article addresses these concerns by developing the self- and dyadic-regulation pathways to retiree subjective well-being.
Expected Results and Conclusions. The self-regulation pathway conceptualizes retirement planning as an iterative action process that involves setting retirement-related goals and generating, deciding on, and executing plans to pursue those goals. We propose that retirement planning leads to higher levels of retiree subjective well-being via the attainment of resources and that retiree subjective well-being has a reversed positive effect on retirement planning. Assuming that Partner A is a retiring/retired individual and Partner B their partner, we conceptualize the dyadic-regulation pathway to retiree subjective well being, whereby Partner B's action process is interlinked with Partner A's retirement planning process and Partner A's attainment of resources. These links between both partners should be weakened by Partner A's power and strengthened by couple-level intimacy. Couple-level intimacy and retiree subjective well-being are posited as reciprocally and positively related. Together, both pathways suggest that retirement planning is a dynamic and iterative process in which the retiring/retired individuals and their partners jointly engage, ultimately leading to better retirement adjustment.

LEARNING FROM ERRORS, REFLECTION, AND CONTEXT: INSIGHTS FROM APPLIED PSYCHOLOGY ACROSS WORK, SPORT, AND ENTREPRENEURSHIP

Thursday 23 July 2026 from 17:00 to 18:30

(B- Spadolini)

Michael Frese (Leuphana University of Lüneburg & Asia S), Chair and Discussant

Errors and reflection are central to human learning and adaptation, yet their interpretation and management differ across contexts. This symposium examines how individuals and organizations learn from mistakes, reflect constructively, and adapt under uncertainty across domains—elite sport, organizational behavior, and entrepreneurship.

Together, the papers highlight applied psychology's contribution to understanding and improving learning from error and reflection in diverse environments.

Cathy Van Dyck explores elite equestrian eventing, revealing how high-performing horse–rider teams treat competitions as learning exercises, using flexible mental models and growth-oriented mindsets that cultivate self-efficacy—parallels that extend to leadership and team learning at work. Kaili Yu investigates how newcomers form reflection habits during onboarding, distinguishing productive, task-oriented reflection from maladaptive rumination. Jomel Wei Xuan Ng presents cross-cultural evidence from entrepreneurial teams in five Asian countries, showing that national culture shapes how rumination and detachment mediate the relationship between errors and knowledge sharing. Gary Latham revisits goal-setting theory, integrating field and lab evidence to propose seven principles that preserve motivation while preventing unethical behavior.

Finally, Janina Peschmann examines entrepreneurship training across WEIRD and non-WEIRD contexts, demonstrating how contextualized training design enhances learning and business success.

Together, these papers offer a holistic perspective on learning from error—ranging from individual cognition to team dynamics and institutional practice—illustrating how reflection and adaptation can drive ethical, sustainable, and high-performing organizations worldwide.

Abstract 4360

ETHICAL GOAL SETTING: PRESERVING MOTIVATION WITHOUT MISCONDUCT

Latham G.P.*

University of Toronto ~ Toronto ~ Canada

Goal-setting theory remains one of organizational psychology's most empirically supported frameworks for enhancing performance. Yet recent criticism suggests that ambitious goals may sometimes promote unethical behavior. This presentation synthesizes findings from laboratory and field research to identify seven evidence-based
principles that prevent ethical lapses while maintaining high motivation and performance.
The principles emphasize linking goals to values and prosocial motives, using learning goals in uncertain contexts, fostering self-regulation and feedback loops, and emphasizing accountability and transparency. Together, they show that unethical behavior can be mitigated through goal design rather than avoidance of goals.
Drawing from over four decades of research, this presentation reaffirms goal setting as a cornerstone of ethical and effective performance management and provides
clear guidance for practitioners to design motivational systems that inspire excellence without compromising integrity.

Abstract 4362

CROSS-CULTURAL DIFFERENCES IN KNOWLEDGE SHARING IN THE AFTERMATH OF AN ERROR EXPERIENCE: AN ASIA-CENTRIC STUDY ON ENTREPRENEURIAL TEAMS

Wei Xuan Ng J.*

Zhejiang International Business School, Zhejiang University ~ Haining, Zhejiang Province, ~ China

Entrepreneurs frequently encounter errors amid the uncertainty and complexity of venture creation. How these errors
shape team learning depends on individuals' cognitive and cultural contexts. This multi-country study investigates
how error occurrence affects knowledge sharing and how rumination, problem-solving pondering, and emotional
detachment mediate this process across cultures.
Using repeated weekly sampling, the study collected 3,019 observations from 634 individuals in 238 entrepreneurial
teams across China, India, Indonesia, Japan, and Singapore. Multilevel analyses reveal culture-specific
mechanisms: in India, error-related rumination suppressed knowledge sharing; in Japan, it enhanced sharing
through reflective problem-solving; and in China and Singapore, emotional detachment facilitated positive knowledge
exchange.
These findings provide the first comparative insight into how cultural norms shape the emotional and cognitive
consequences of error in entrepreneurial teams. The results expand error management theory beyond Western
contexts and offer practical implications for designing culturally sensitive entrepreneurship education and team
learning interventions

Abstract 4363

BETWEEN THE EARS: TRAINING FOR ADAPTABILITY AND A GROWTH MINDSET

Van Dyck C.*

VU Amsterdam, Amsterdam, The Netherlands ~ Amsterdam ~ Netherlands

Eventing, an Olympic equestrian sport combining dressage, cross-country, and show jumping, provides a unique lens to study learning
under uncertainty. Based on extensive fieldwork including 187 systematic observations and 25 interviews with riders at national
through Olympic levels, this research identifies how expert riders use competition as structured practice rather than as opportunities
solely to win. They construct detailed pre-event plans including contingencies for varying course conditions, while fostering the horse's
confidence and trust.
Findings highlight the coexistence of flexible and stable mindsets among elite performers. Top riders demonstrate growth-oriented
thinking that allows adaptive responses to unexpected challenges, grounded by a stable performance foundation. Importantly,
riders hold a strong growth mindset toward their horses, viewing errors as valuable learning opportunities to enhance mutual confidence.
This study illustrates how learning from mistakes, reflective planning, and mindset regulation underpin excellence in high-risk environments.
The findings have strong implications for applied psychology, suggesting parallels for leadership and team learning in
organizational contexts, where growth mindsets and constructive error cultures enhance adaptive performance

Abstract 4361

ENTREPRENEURSHIP TRAINING DESIGN AND IMPACT ACROSS CONTEXTS: TRANSGRESSING THE W.E.I.R.D.

Peschmann J.*

Leuphana University of Lüneburg ~ Lüneburg, Niedersachsen, ~ Germany

Entrepreneurship training programs are central to global efforts promoting employment and
income generation. However, most evidence on their effectiveness comes from WEIRD
(Western, Educated, Industrialized, Rich, Democratic) contexts, raising concerns about their
transferability to low- and middle-income settings.
Drawing on over eight years of field experience and data from more than 6,000 participants in
seven countries, this presentation explores how cultural, social, and infrastructural contexts
shape training design and impact. The analysis demonstrates that interventions tailored to
participants' literacy levels, cultural norms, and economic constraints produce stronger outcomes
entrepreneurial self-efficacy, opportunity recognition, and business growth.
Findings underscore the importance of contextualizing psychological interventions: effective
education must integrate action-oriented learning, reflection, and local relevance. By
bridging applied psychology with development practice, this research advances theory and
offers actionable insights for scaling entrepreneurship training globally

CULTIVATING SELF-REFLEXIVE PRACTICE: DUO-ETHNOGRAPHIC INSIGHTS ABOUT TEACHING REFLEXIVITY IN A PHD CONSULTING PSYCHOLOGY PROGRAM

Barnard A.*, Flotman A.

UNISA ~ Pretoria ~ South Africa

Introduction

Reflexivity is a metacognitive process of engaging critically with the self and it is recognized as essential for improving professional practice and sustaining a scientifically robust discipline. In consulting psychology, the psychologist is regarded as the primary instrument of consulting and the aim is to bring about insight and change in the organization, through the use of self. The importance of reflexivity in the psychology profession is widely recognized, yet there is limited empirical evidence describing its challenges and value.

Purpose

The study aims to explore lessons learnt about teaching reflexivity by interrogating the experiences of two lecturers facilitating a year-long reflexive practice course with PhD students in consulting psychology.

Method

The study followed an autoethnographic approach, applying the critical and dialogical process of duo-ethnography. Having taught a reflexive practice course since 2018, the researchers generated data through critical self- and collaborative reflection about their teaching experience with consulting psychology doctorate students. The 10-month course includes identity awareness workshops, self-reflective essays, narrative group reflections, coaching workshops and peer coaching, as well as metaphoric self-presentation. The researchers' interconnected, iterative data collection and analysis process entailed: i) the generation and sharing of individual self-reflective narratives; ii) entering into critical dialogue about shared reflections to develop new insights and meaning about teaching reflexive practice; iii) co-constructing themes through a thematic analysis of the narratives generated in i) and ii).

Results

Preliminary themes describe reflexivity as: i) a window to epistemological growth, ii) a vehicle for authentic self-expression and connection, iii) inspiring self-authorization in research and practice, iv) a process of resilience building.

Conclusions

Acknowledging the subjectivism of the duo-ethnographic method, the study provides a critical phenomenological grounding for cultivating reflexive practice. Reflexivity facilitates conscious identity work and develops self-efficacy in becoming a consulting psychologist. The duo-ethnographic methodology highlights a unique triple hermeneutic epistemology to teaching reflexivity.

Abstract 1761

INVESTIGATING SUBTYPES OF CAREER INDECISION: A REGISTERED SYSTEMATIC LITERATURE REVIEW OF CAREER INDECISION TYPOLOGIES

Boudry L.*[1], Udayar S.[1], Parmentier M.[2], Fedrigo L.[1], Levin N.[1]

[1]University of Lausanne ~ Lausanne ~ Switzerland, [2]University of Liège ~ Liège ~ Belgium

Introduction. Indecision is one of the most common problems addressed in career counseling and a central construct in vocational psychology. Rather than a single issue, indecision represents a broad category of difficulties in choosing, committing, or pursuing a career path. To date, numerous studies have attempted to classify individuals into subtypes of indecision using cluster analysis. However, past studies often resulted in inconsistent findings, presenting limited diagnostic utility.

Purpose. This registered systematic literature review sought to synthesize clustering studies of career indecision to describe the populations studied, the measures used, and the recurring subtypes emerging in clustering studies on indecision.

Method. Following the PRISMA framework, we systematically searched multiple databases for indecision clustering papers. Eligible publications were coded for their metadata, sample characteristics, constructs, measures, analytic approach, and cluster solutions. Then, a panel of experts evaluated the identified subtypes across studies and assessed the degree of overlap between them.

Results. Most studies focused on high school and university students, with working populations and non-Western samples underrepresented. Indicators predominantly included indecision measures (e.g., CDP, CDS), but also measures of anxiety, self-esteem, and locus of control. Methodologically, early work favored hierarchical and k-means clustering, while recent studies increasingly utilized latent class/profile analyses. Across studies, 2-7 subtypes were reported, including four recurring subtypes characterized by low information, chronic, internal conflicts, and external conflicts.

Conclusion. Across studies and cultural contexts, four consistent subtypes of career indecision emerge despite methodological differences. These include low information (limited knowledge of self or career options), chronic (persistent indecision across time and situations), internal conflicts (struggles linked to ambivalence, values, or identity), and external conflicts (barriers stemming from family, social, or contextual pressures). Identifying these stable subtypes enhances the conceptual clarity of career indecision and provides a stronger basis for advancing theory, assessment, and tailored counseling interventions.

Abstract 1452

TOWARDS CAREER SUSTAINABILITY: A STUDY OF GLOBAL WORKERS

Tao J.*, Simosi M.

Royal Holloway, University of London ~ London ~ United Kingdom

Introduction: The rising complexity of modern careers has, in recent decades, fuelled a significant growth in scholarly interest in sustainable careers. Sustainability of careers is particularly relevant for global workers, for whom the transition from working in their home country to working abroad often constitutes a major turning point in their lives.
Purpose: This paper examines the career sustainability of Chinese global workers employed abroad. We use De Vos et al.'s (2020) three key dimensions to analyse sustainable careers: person, context, and time. We also build on the Job Demands-Resources framework to disentangle the challenges and opportunities across both working life and private life that may shape career sustainability.
Method: The study draws on semi-structured interviews with a heterogeneous sample of thirty Chinese global workers currently working abroad.
Results: We examined how the interactions between the key indicators of a sustainable career (i.e., health, happiness, and productivity) change over time. The narratives of global workers highlight distinctions between short-term and long-term career sustainability. Furthermore, recovery from depletion is often perceived as a personal rather than a professional endeavour.
Conclusions: This study addresses a gap in the literature by shedding light on the underexplored area of global workers and career sustainability.

Abstract 2367

THE ROLE OF FUTURE-DIRECTED UNCERTAINTY FOR WORK MOTIVATION AND VOLITION AMONG YOUNG ADULTS: QUANTITATIVE ANALYSIS AND INTERVENTION RECOMMENDATIONS

Yilmaz E.*, Zimber A.

University of Applied Management Studies ~ Mannheim ~ Germany

The motivation and commitment to work of younger generations are crucial for ensuring companies' future workforce and productivity. In this context, understanding the dynamics underlying young employees' goal-directed processes is important. Motivation and volition are fundamental psychological constructs that explain how individuals initiate, sustain, and regulate goal-directed behaviors. Uncertainty can affect individuals' actions toward their goals and their ways of directing them, highlighting motivation and volition. Although previous research shows that uncertainty can weaken these processes, recent studies have indicated that uncertainty can be turned into a positive force through self-regulation. Considering these findings, this study adopts an interdisciplinary approach focusing on motivational, volitional, personality psychology, drawing on Heckhausen's Expectancy-Value Theory, the Rubicon Model, and Kuhl's Personality Systems Interaction Theory (PSI) to address the complex challenges young adults face in their work-related decision-making processes in uncertain environments. The study will follow a two-stage empirical research design with participants aged 18-30. The first stage will use qualitative methods with uncertainty scenarios to explore participants' goal-directing and self-regulation strategies. Responses will be analyzed via qualitative content analysis, focusing on cognitive and emotional processes. The second stage will use a quantitative survey design incorporating the Action Control Scale (ACS) to examine personality effects on motivation and volition. Finally, the results will be integrated within the Rubicon Model framework to develop a motivational intervention program for strengthening goal commitment under uncertainty. The program's effectiveness will be evaluated with a pre/post-test design, assessing changes in participants' motivational and volitional responses. This research aims to contribute to theory and practice by identifying key factors shaping motivation and volition in uncertain environments, by promoting sustainable work motivation and well-being through self-regulation. Initial results will be presented at the conference.

Abstract 321

NAVIGATING THE GLOBALIZED CAREER PARADOX: CULTURAL IDENTITY, MARGINALIZATION, AND VOCATIONAL RESILIENCE IN THREE STUDENT POPULATIONS

Zhou Y.*[1], Meng L.[2]

[1]Yiheng Zhou ~ Iowa City ~ United States of America, [2]University of Iowa ~ Iowa City ~ United States of America

The rapid internationalization of higher education exposes students to career barriers that vary by both societal structure and culture. Built on the Psychology of Working Theory (PWT), this cross-national study examined how economic constraints and marginalization shape the perception of future decent work through two psychological resources—work volition (agency) and career adaptability (resilience)—and how these pathways are moderated by cultural identity (American vs. Chinese nationality), societal system (United States vs. China), and prior work experience.

Method. 845 participants were retained for data analysis. We used parallel English and Chinese surveys to reduce language bias. Based on PWT, we apply a full-factorial path model-- an advance over traditional pairwise group comparisons -- to test latent means, variances, paths, and covariances across three moderators (cultural identity, societal system, and prior work experience).

Results. Part of paths were supported among all participants: economic constraints and marginalization all significant predicts work volition and work volition are significantly related with career adaptability. Cultural identity significantly moderated key pathways: marginalization more strongly suppressed volition among Chinese students ($p = .022$), while adaptability ($p < .001$) and volition ($p = .038$) more powerfully predicted decent work; American students reported higher work volition ($p < .001$) but lower career adaptability ($p < .001$) and lower perceptions of future decent work ($p < .001$). Regarding the societal system, living in US society is associated with higher positive effect of adaptability on decent work than in China ($p < .001$). The third moderator, wok experience, was found to enhance volition ($p = .040$) and adaptability ($p = .001$) across the three groups.

These paradoxical patterns from this study extend PWT by positioning cultural identity as a pivotal moderator and by illustrating a dialectical process in which structural disadvantage can catalyze vocational resilience. Implication and future research direction will be discussed.

Abstract 4026

THRIVING IN THE AGE OF AI：HOW GROWTH MINDSET REDUCES JOB REPLACEMENT ANXIETY AND DRIVES PERFORMANCE

Song L.J.*

Leeds University Business School, University of Leeds ~ Leeds ~ United Kingdom

The rapid pace of AI integration and digital transformation in the workplace has given rise to significant concerns about job displacement, with many employees fearing that their roles may become obsolete. This study explores how a growth mindset, the belief in the ability to develop one's skills and intelligence, can buffer against these anxieties and positively influence employee performance. Drawing on data from 622 participants, our research examines a serial mediation model where growth mindset promotes greater engagement in learning activities, which in turn reduces job replacement anxiety and enhances job performance. The results highlight that employees who score higher on growth mindset are more likely to embrace active learning in the workplace, mitigating fears related to job displacement and fostering improved performance outcomes. These findings have important implications for organizations navigating the challenges of digital transformation, suggesting that cultivating a growth mindset among employees can be a strategic approach to reduce anxiety and support sustained performance in the face of technological change.

Abstract 1613

MAPPING THE NETWORK OF CAREER INSECURITY, BURNOUT, AND MOTIVATION IN UNIVERSITY STUDENTS

Cangialosi N.*[1], Velasco V.[2], Bassano N.[3], Brugnera A.[4], Cena L.[5], Daccò S.[6], Profeta P.[7], Trotti E.[8], Delle Fave A.[1]

[1]Università degli Studi di Milano ~ Milano ~ Italy, [2]Università degli Studi di Milano-Bicocca ~ Milano ~ Italy, [3]Politecnico delle Arti di Bergamo ~ Bergamo ~ Italy, [4]Università degli Studi di Bergamo ~ Bergamo ~ Italy, [5]Università degli Studi di Brescia ~ Brescia ~ Italy, [6]Humanitas University ~ Milano ~ Italy, [7]Università Bocconi ~ Milano ~ Italy, [8]Università degli Studi dell'Insubria ~ Varese ~ Italy

Career uncertainty is a major stressor for university students, with implications for psychological wellbeing beyond academic life. While prior research has linked career insecurity to burnout, less is known about the role of individual motivational orientations in these experiences. This study uses psychological network analysis to examine the pattern of associations among career insecurity, burnout, and motivation offering perspective on how these constructs interconnect. A cross-sectional design was used to collect data from 2,111 Italian university students, within the framework of the PRO-BEN funding program of the Italian Ministry of University and Research. Career insecurity was measured with the Career Insecurity Scale (Spurk et al., 2016), burnout with the Maslach Burnout Inventory–Student Survey (MBI-SS; Schaufeli et al., 1996), and motivation with the University Student Motivation and Satisfaction Questionnaire, version 2 (TUSMSQ-2; Afzal et al., 2010). Network analysis was used to identify direct associations and central nodes within the network.

Results showed that career insecurity was directly associated with higher burnout cynicism and lower feelings of efficacy. Rejection-avoidance and social pressure-related motivations emerged as the most central nodes, linking career insecurity with burnout. Self-exploration and social-enjoyment motivations also contributed to the overall network structure, suggesting that broader motivational orientations are meaningfully associated with the clustering of insecurity and burnout. Theoretically, rejection-avoidance and social pressure-related motivations capture students' sensitivity to evaluation and performance demands, which are particularly salient under conditions of career uncertainty.

These findings highlight the importance of considering motivational orientations when examining student burnout in the context of career insecurity providing a nuanced map of how insecurity, burnout, and motivation interrelate. Furthermore, the results offer insights for targeted interventions aimed at reducing the psychological costs of career uncertainty among university students.

THE RELATIONSHIP BETWEEN ANXIETY AND CAREER THOUGHTS: RESEARCH FINDINGS AND IMPLICATIONS

Hayden S.*

Wake Forest University ~ Winston-Salem, NC ~ United States of America

Career thoughts consist of both cognitive and affective aspects (Peterson et al., 2024), and when negative in nature, are associated with poor career outcomes such as career indecision (Bullock-Yowell et al., 2011), less self and options knowledge (Osborn et al., 2020), and decision-making difficulties (Hayden & Osborn, 2020). Negative career thoughts have been correlated with forms of anxiety, such as worry (Hayden & Osborn, 2020) and career tension (Finklea & Osborn, 2019). Anxiety has been shown to impair a person's cognitive abilities (MacLeod & Mathews, 2012; McNally, 2019) and cause a negative cognitive bias (Hallion & Ruscio, 2011; Yiend et al., 2015). Anxiety has also been frequently associated with career indecision (Daniels et al., 2011; Park et al., 2017). Despite indications of a connection between anxiety and career thoughts, the connection between forms of anxiety, negative career thoughts, and a a key component of Cognitive Information Processing career theory, information processing skills, has not been studied.

This study of 181 participants at a large university career center that serves community members explored the connection between forms of anxiety (i.e., state, trait, overall), negative career thoughts, and CIP skills using the Career Thoughts Inventory (CTI) and the State-Trait Anxiety Inventory (STAI). Correlational research, including regression analyses, was performed to examine this connection. Results indicated a relationship between anxiety, negative career thoughts and information processing skills. Particularly, trait and overall anxiety were found to be most associated with negative career thoughts and CIP skills. Implications of these findings in career practice, research, and theory will be presented.

Abstract 3297

INTEGRATING ADVANCEMENTS FROM ARTIFICIAL INTELLIGENCE INTO HEALTHCARE SELECTION: LESSONS LEARNED ALONG THE WAY

Carpenter J.*

HireVue ~ Cleveland ~ United States of America

Artificial Intelligence (AI) is transforming healthcare recruitment and selection by enhancing speed, precision, and scalability. Hiring bodies—such as hospitals, clinics, and staffing agencies—are increasingly leveraging AI to address workforce shortages and improve hiring outcomes.

Examples include Automated Resume Screening, in which AI systems rapidly scan thousands of resumes to identify candidates who meet specific job criteria. This approach can reduce manual sorting and helps eliminate bias-prone processes, ensuring faster and more objective shortlisting. AI tools can also provide intelligence candidate matching, by analyzing candidate profiles across dimensions like skills, experience, and location to surface matches that may be overlooked by traditional methods. These systems generate real-time recommendations tailored to specific roles, potentially improving fit and retention. Another increasingly common approach is to use AI to forecast candidate success based on historical hiring data, clinical performance metrics, and behavioral indicators to help hiring bodies make data-informed decisions about long-term potential and cultural fit. Further, AI can automate typically onerous administrative tasks through automated and personalized outreach and engagement, streamlining the recruitment journey. This solution can be especially useful in high-volume hiring environments where timely engagement is critical.

Despite these advantages, AI is not a standalone solution. This talk will provide a sample of ways in which AI solutions have been applied to various healthcare settings, and some of the unexpected and unintended consequences that can occur when relevant stakeholders - such as applied psychologists - are left out of the process.

COGNITIVE INFORMATION PROCESSING CAREER THEORY: ENHANCING AGENCY AND WELLBEING

Hayden S.*

Wake Forest University ~ Winston-Salem, NC ~ United States of America

The interconnected aspects of career development and mental health posits career as a central feature of human functioning. The Indivisible Self Model of Wellness (Myers & Sweeney, 2008) views career and work as interrelated domains of Wellness. A perceived lack of control within career and work exacerbates existing challenges in several domains of people's lives. Focusing on enhancing agency within the realm of career and work is imperative within counseling and psychological practice.

Cognitive Information Processing (CIP; Sampson et al., 2023) accounts for the complexity of career concerns and diminished volition by enhancing agency in career decision making and problem solving which can remedy career uncertainty. CIP theory's emphasis on promoting agency makes for an ideal match for the current moment of increased anxiety and uncertainty resulting from the rapid advancement of artificial intelligence and sociopolitical factors impacting career and work. CIP's focus on empowerment through developing decision making, problem solving, and information processing skills has been shown to positively impact career thinking and improve mental health (Osborn et al., 2016). CIP provides a structure through the Pyramid of Information Processing and the CASVE cycle to effectively navigate present and future career concerns. The current state of work, threats to agency within career development, associated research supporting this approach, and specific CIP-based assessments (e.g., Career Thoughts Inventory) and interventions (e.g., cognitive restructuring) designed to enhance agency will be discussed.

OBSERVING INJUSTICE AND EMPLOYEE OUTCOMES: A META-ANALYTIC INVESTIGATION OF MEDIATING MECHANISMS

Cai Y.[1], Su Y.[1], Ji J.*[1], Xu X.[1], Liu X.[1], Chen X.[2], Zhang W.[1], Li K.[1]

[1]The Chinese University of Hong Kong, Shenzhen ~ Shenzhen ~ China, [2]Macao University of Tourism ~ Macao ~ China

Observers pervasively witness organizational justice. Although prior research, including meta-analyses, has examined observer responses to injustice, existing work has neither differentiated across distinct facets of observed injustice nor compared the relative strength of competing mediating mechanisms. This meta-analysis investigates the effects of observed injustice in the workplace by addressing four key questions: (a) how observed injustice shapes observer responses, including emotional (i.e., anger, empathy, guilt, positive affect), cognitive (i.e., moral perception and moral judgment), relational (i.e., exchange quality with organizations and coworkers), psychological strain (i.e., burnout), behavioral (i.e., citizenship and deviance behaviors), and employee outcomes (i.e., attitudes, performance, and well-being); (b) whether the effects vary across different facets of observed injustice—overall, distributive, interpersonal, and procedural injustice; (c) which competing mechanisms underlie observer responses and outcomes, with a focus on helping victims, punishing perpetrators, task performance, and withdrawal behaviors; and (d) how cultural dimensions (e.g., individualism–collectivism, power distance) moderate the prominence of these mechanisms. We first identify six prominent mechanisms: anger, exchange quality, empathy, guilt, negative affect, and justice perception. Synthesizing evidence from 222 unique samples (N = 96,408 participants), we compare the relative strength of these mechanisms. Our findings show that when all six mechanisms are considered simultaneously, exchange quality, anger, and justice perception consistently predict observer behaviors. Specifically, observed injustice primarily influences helping and punishing behaviors through anger, task performance via exchange quality and negative affect, and withdrawal behaviors through exchange quality and anger. Theoretical and managerial implications are discussed.

THE STEPPING STONE EFFECT: A SURVIVAL ANALYSIS OF “PUSH” VS. “JUMP” FACTORS IN KOREAN NEWCOMER TURNOVER (KLIPS)

Im J.*

Sungkyunkwan University Department of Applied Data Science ~ Seoul ~ Korea, Republic of

Grounded in Social Exchange and Conservation of Resources theories, this study proposes a Stepping Stone Hypothesis for newcomers (<5 years’ tenure). We argue that voluntary turnover reflects both “Push” factors—low pay and long hours indicating perceived inequity and resource depletion—and a “Jump” factor, on-the-job wage growth that, while resource-enhancing, may signal market value rather than relational commitment in early employment exchanges. Using Korean Labor & Income Panel Study (KLIPS) data (4,529 persons; 13,074 observations), turnover was defined as job-sequence change. We employed a dual-approach design: (1) prediction via a 5-fold StratifiedGroupKFold Logit model assessing PR-AUC, and (2) explanation via a Cox proportional hazards model (cluster-robust by person ID, controlling for gender, education, union, and occupation categories). Results supported the Stepping Stone Hypothesis: on-the-job wage growth (the 'Jump' factor) significantly increased turnover hazard (coef = +0.350, p = 0.024), alongside the 'Push' effects of current wage level (−1.017, p < 0.001) and work hours (+0.101, p = 0.002). Predictive accuracy was limited yet non-trivial (mean PR-AUC = 0.120 vs. baseline = 0.086). (When full occupational controls were added, the prediction model failed to converge.) Psychologically, the findings reveal a dual mechanism—resource depletion prompting escape and resource activation fostering opportunity seeking. Within early transactional employment relationships, raises can enhance employability perceptions rather than relational attachment, posing a paradox for HR: rewards may both retain and release. These insights call for applied psychology to integrate exchange-based and motivational resource frameworks when explaining turnover dynamics.

Abstract 703

HOW ATHLETES MAKE SENSE OF AND MANAGE COMPLEX CAREER TRANSITIONS: ELITE ATHLETES' JOURNEY FROM SPORT TO LIFE AFTER SPORT

Mewis L.*[1], Hendrikx K.[1], Van Ruysseveldt J.[1], Grosemans I.[2]

[1]Open Universiteit ~ Heerlen ~ Netherlands, [2]KU Leuven ~ Leuven ~ Belgium

In today's dynamic work environment, career transitions are often complex, yet research provides limited processual insight into how individuals interpret these complex career transitions and how their evolving interpretations are associated with career self-management (CSM) behaviors. Existing studies often adopt a macro-level perspective, focusing on predetermined predictors and outcomes of career success, while overlooking the lived experiences and micro-processes through which individuals make sense of transitions and enact CSM behaviors.

Elite athletes provide a compelling case for studying complex career transitions. Moving into life after sport entails simultaneously crossing multiple boundaries, for example, from structure to ambiguity and from sport networks to professional networks. This study investigates how elite athletes make sense of their career transitions and how these interpretations are associated with different patterns of CSM behaviors. We use the Conservation of Resources theory to understand these dynamics, and adopt a sensemaking lens to capture the micro-level perspectives of noticing what is happening, interpreting its meaning, and taking action, with these processes being continuously shaped by the surrounding context.

Through semi-structured interviews with recently retired and soon-to-be-retired athletes, this study makes three contributions to career transition literature. First, it adds a micro-level and processual perspective, seeking to understand the experience of the career transition and the associated CSM behaviors. Second, it extends CSM to complex career transitions and responds to calls for attention to non-standard workers. Third, by integrating context, the study focuses on how people interpret and navigate transitions in ways that reflect their personal and environmental context. Taken together, the findings deepen our understanding of complex career transitions in elite sport while offering implications for other complex transitions beyond sport.

EXPATRIATES IN TRANSITION: THE ROLE OF ORGANISATIONAL AND FAMILY-LEVEL SUPPORT IN REMOTE WORK

Vegh J.*[1], Claes M.[2], Jenkins J.[3]

[1]Eötvös Loránd University (ELTE) ~ Budapest ~ Hungary, [2]WU Vienna University of Economics and Business ~ Vienna ~ Austria, [3]Expert Humans ~ Singapore ~ Singapore

This study explores expatriates' perceptions of the support they receive during crises as they transition to remote work, focusing on the factors that assist them in adapting and performing effectively in such conditions. Applying an inductive approach, 20 semi-structured interviews were conducted with expatriates across eleven countries. Reflexive thematic analysis was used to examine their experiences of organisational and social support during the transition.

Findings identify four crucial factors that contribute to a successful transition and should be actively reinforced by organisations: (1) awareness of the tension between belonging and isolation, as well as uncertainty, (2) feeling supported by both the organisation and one's social network, (3) maintaining a positive approach to challenges, and (4) informal "JAVA/coffee" connections that foster interpersonal engagement and belonging. These insights suggest that structured support mechanisms, particularly at the family level, are essential for helping expatriates navigate remote work transitions during crises.

The study extends the literature on perceived organisational support, which has traditionally focused on employees, by highlighting the importance of considering support at the family level in addition to the individual. This research provides practical guidance for HR and global mobility professionals seeking to implement effective support strategies, reinforcing awareness of the identified factors and fostering resilience among expatriates.

Overall, the study offers a novel perspective on expatriate support during crisis-induced remote work, emphasising both organisational and social dimensions of adaptation and well-being.

Abstract 1338

ADJUSTING TO WORK: YOUTH APPRENTICES PERSPECTIVES ABOUT STAYING OR LEAVING

Woodend J.*[1], Arthur N.[2], Archer B.[3]

[1]University of Victoria ~ Victoria ~ Canada, [2]University of South Australia ~ Adelaide ~ Australia, [3]James Cook University ~ Cairns ~ Australia

Introduction: Youth, ages 18-21, are often entering the workforce for the first time as they explore their interests and skills and learn about expectations in the workplace. During apprenticeships, youth are still considered learners while supervised in the workplace. Youth apprentices' perspectives on their workplace experiences, particularly their reasons for staying or leaving, offer valuable insights into early career development at this stage of exploration. The Theory of Work Adjustment (TWA) provides a useful framework for interpreting these experiences, emphasizing the dynamic fit between the apprentices and their work environments. TWA considers both how well the individual apprentice's abilities and values align with workplace demands (e.g., technical skills) and how well the workplace supports the individual's needs through reinforcers (e.g., pay, meaningfulness).

Purpose: Both the workforce demands and apprentices' needs are essential for understanding how long apprentices are willing to stay employed and pursue career pathways in industry. Applying TWA to youth apprentices' experiences may help apprentices, career development practitioners, educators, and employers better understand how to foster environments that meet young workers' expectations, reduce attrition risk, and support more sustainable employment.

Method: This qualitative, thematic analysis study investigated the experiences of youth in the construction industry, an industry sector facing labour shortages and barriers for retaining young workers. Based on interviews with 17 apprentices in their first year of employment, the results emphasized the importance of socialization to the workplace.

Results: There were three main concerns of youth (1) providing decent work conditions, (2) scaffolding learning experiences, and (3) supervisor/mentor relationships. The results suggest that the values of youth apprentices underpin their intensions to stay or leave and the factors that are influencing their decisions in the first year of employment.

Conclusion: Recommendations address the importance of adjusting workplace cultures to meet the needs of youth, while youth are adjusting to work.

Abstract 219

EVALUATORS' SEXISM, CANDIDATES' ATTRACTIVENESS AND GENDER, GENDER-CONGRUENCE OF OCCUPATIONS, AND SELECTION DECISIONS

Mat E.[1], Göncü--Köse A.*[2]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Çankaya University ~ Ankara ~ Turkey

Employee selection decisions are crucial for organizations. Nevertheless, research indicates potential biases in selection processes. We explored how candidates' physical attractiveness, gender, and the gender-role congruence of occupations influence personnel selection decisions, including candidates' employability level, offered wage ranges, and expectations for candidates' performance and job motivation. Additionally, the impact of evaluators' sexism tendencies, and moderating effects of candidates' gender, gender-role congruence of the occupations, and attractiveness on the association between evaluators' benevolent and hostile sexism and the outcome variables were examined using a semi-experiemental design. The data were collected from 651 participants online. A 2 (candidates' gender: female – male) × 2 (candidates' physical attractiveness: low – high) × 2 (candidates' occupations' gender congruence: low – high) mixed factor quasi-experimental design was utilized. Findings revealed that attractive candidates and candidates with gender-role-congruent occupations were in a more advantageous position in personnel selection decisions compared to unattractive candidates and candidates with gender-role-incongruent occupations in Türkiye. The moderating effects of gender-role-congruence of the occupation on the relationship between evaluators' benevolent and hostile sexism and personnel selection decisions were significant. Moreover, candidates' physical attractiveness moderated the relationship between evaluators' benevolent sexism levels and selection decisions. Results were discussed by highlighting the study's contribution to theory and practice as well as suggestions for future research.

LEADERSHIP AND WELLBEING

Friday 24 July 2026 from 08:00 to 09:30

(O-Arsenale)

Kevin Kelloway (Saint Mary's University ~ Halifax Nova S), Chair and Presenter

Leadership is a critical topic in organizations and a predictor of almost every outcome of interest in occupational health psychology (Kelloway & Barling, 2010; Mullen et al., 2024). Although most of the research has focused on leaders as a causal factor in employee wellbeing, there are also data pointing to the need to consider leaders' own health (e.g.,as a determinant of leaders' wellbeing and leadership style). The papers in the symposium reflect both concerns and span a diverse array of methodologies.Hildebrand uses a daily diary study to examine the effects of leaders and employees mindsets in relation to anticipated workload, leader behavior, and, ultimately, employee health. Using longitudinal data, Wong examines leaders' green behaviors as a predictor of employee wellbeing in the context of climate change. Biricik Gulseren presents a multi-study set that develops a measure of inconsistent leadership and then examines the effects of inconsistent leadership on employee wellbeing. Day draws on both qualitative and quantitative data to examine the influences on leaders' own health and argues that efforts to create healthier workplace need to include leaders' health as a focus. Finally, Kelloway examines the topic of moral distress in the workplace. Drawing on three-wave longitudinal data, he first develops a scale of moral distress that is not context dependent and demonstrates measurement equivalence over time. Longitudinal data support a model suggesting that moral distress is a function of abusive supervision and results in employee anxiety.This collection of papers offer multiple perspectives on the topic of leadership and health and draws on a range of methodologies to offer new insights into the complex relationships between leadership and health.

Abstract 3373

STRESSED OUT OR HYPED UP? THE ROLE OF LEADER AND EMPLOYEE STRESS MINDSETS FOR EMPLOYEE WELL-BEING

Hildrenbrand K.*

University of Sheffield ~ Sheffield ~ United Kingdom

Objective: High workload represents the main cause of stress-related absence from work in the UK. Yet, research also shows that workload does not always have such negative consequences and that the effect of anticipated workload depends on individuals' stress mindsets, which encompass individuals' beliefs as to whether stress is harmful or beneficial for health and productivity. Although the benefits of the stress-is-enhancing mindset for individual well-being over the stress-is-diminishing mindset have been established, we do not yet know how leaders' stress mindsets impact their behaviours and their employees' well-being. This is of particular importance as it needs to be ensured that the established and very effective stress mindset interventions, when line managers are trained, do not result in adverse consequences for their staff.

Drawing on the transactional theory of stress, we propose that the relationships between leaders' workload anticipation in the morning, leader behavior during the working day and employee well-being in the evening depend on leader and follower stress mindsets.

Methods: We conducted a daily diary study with leader-follower dyads (one daily measurement point for leaders, two daily measurement points for followers) over ten consecutive working days to test our hypotheses. Data has been analyzed via multilevel modelling in MPlus.

Results: The data analysis is ongoing and we will report on the findings when presenting.

Conclusions: This study will contribute to a better understanding of the role of stress mindsets for leader behaviors and employee well-being. The results of this study might be harnessed for organizational interventions.

Abstract 3374

LEADERSHIP AND EMPLOYEE WELLBEING IN THE CONTEXT OF ENVIRONMENTAL SUSTAINABILITY IN THE WORKPLACE: A SELF-DETERMINATION THEORY LENS

Wong J.*

University of Canterbury ~ Christchurch ~ New Zealand

Climate change is one of most prominent threats to society and our existing way of living. Organizations are recognizing their role in contributing to and addressing the climate crisis. Past research has demonstrated that workplaces factors (e.g., climate, leadership, team dynamics) can encourage and shape employee green behaviours. However, less is known about the influence of these factors on employee wellbeing related to climate concerns.

This study explores whether leader's environmentally sustainable behaviours can predict employee green wellbeing. Building on our prior research, we conceptualize the leader's green behaviours to include: engaging of employee green attitudes (fostering awareness and understanding of the importance of climate change issues); encouraging employee green behaviors (training, recognizing, reinforcing sustainable behaviours at work); and advocating for employee green participation (facilitating employee influence on organizational decisions, and voice to organizational decision-makers).

The current study is a quantitative, longitudinal survey project conducted in collaboration with a European job recruitment platform. Basing our hypotheses on Self Determination Theory, we will be examining if leader's environmentally sustainable behaviours can predict employee's sense green self-efficacy over time, and whether this relationship is mediated by employee's sense of needs satisfaction in the workplace. This study has implications for broadening our understanding of the impact that workplace leaders can have on environmental sustainability issues, from beyond influencing employee behaviours and performance to also supporting their psychological wellbeing.

Abstract 3375

INCONSISTENT LEADERSHIP: MEASUREMENT AND CONSEQUENCES

Biricik Gulseren D.*

York University ~ Toronto Ontario ~ Canada

Although much is known about what effective leaders do, we know less about what happens when they behave inconsistently. In this program of research, we examined inconsistent leadership—the experience of receiving conflicting or unpredictable signals from the same leader over time. Across three studies, we explored how this form of inconsistency shapes employee sense-making and organizational outcomes.

The first two studies focused on scale development and validation. In Study 1, we generated a pool of items based on interviews, prior theory, and critical incident technique. Exploratory factor analysis (EFA) supported a unidimensional structure for the inconsistent leadership construct. In Study 2, we conducted a confirmatory factor analysis (CFA) in an independent sample and demonstrated the scale's discriminant validity from related leadership styles (e.g., abusive, laissez-faire, transformational), as well as its predictive validity for psychological strain and decision-making ambiguity.

Study 3 is a three-wave longitudinal field study designed to assess the consequences of inconsistent leadership using a sense-making and sense-giving lens. Data collection is complete, and we will analyze the results before the time of the presentation. We expect to show inconsistent leadership's unique effects on employees' work engagement and burnout via heightened levels of rumination. We also hypothesize that these effects will be lessened under clear organizational communication.

Together, these studies contribute to applied psychology by deepening our understanding of how inconsistent leadership signals are experienced by followers and why they matter. The project moves beyond idealized leadership styles and considers real-world complexity, helping to inform interventions for more stable and supportive leadership in dynamic work environments.

Abstract 3376

I'M ALRIGHT... NOBODY WORRY ABOUT ME'HOW VALUES AND WORKPLACE NORMS SHAPE LEADERS' SELF-CARE BEHAVIOURS AND WELLBEING

Day A.*

Saint Mary's University ~ Halifax NS ~ Canada

Although leader wellbeing is increasingly recognized as being essential to organizational health, much research and workplace initiatives tend to focus on employee health (e.g., Arnold & Connelly, 2013), overlooking the unique stressors and wellbeing needs of those in leadership roles. Leaders are often expected to maintain composure, project strength, and provide support—while receiving little support themselves. These expectations can create a sense that their own wellbeing is secondary to that of their teams, a perception reinforced by organizational norms (e.g., "tough it out" cultures), internalized values, and gendered expectations for emotional regulation and invulnerability (cf., Offermann & Foley, 2020). Therefore, leader self-care among may be a function of both personal discipline and knowledge, as well as complex identity dynamics, perceived role obligations, and the subtle (or sometimes explicit) signals they receive from their organizations.

To address these issues, we explore how organizational norms and individual values influence leaders' self-care behaviours and wellbeing. Qualitative interviews with leaders from diverse sectors examine common barriers to self-care, including norms, pressures to model positivity, and personal leadership values and beliefs (e.g., 'my team comes first'; 'I don't want to burden others'). These insights inform a quantitative study of 150 leaders across industries (via Prolific), examining the relationships among self-care behaviours, values, workplace norms, gender, and wellbeing.

This work advances recent calls to reframe leader health not as an individual trait but as a systemic outcome, embedded in relational and contextual dynamics (e.g., Kaluza et al., 2021). Interventions aiming to foster psychologically healthy workplaces must include leaders as a focus— not only as supporters of others' self-care and wellbeing, but also as individuals with legitimate and often overlooked health needs

Abstract 3378

MORAL DISTRESS IN THE WORKPLACE

Kelloway K.*

Saint Mary's University ~ Halifax NS ~ Canada

Moral injury and moral distress are well established constructs in the military (moral injury) and healthcare (moral distress or stress) literatures – generically both result from feeling forced to do something that violates one's sense of what is right. Markham and Kelloway (in press) argued that the notion of moral distress is more broadly applicable in moral violations can occur in a wide range of occupations. In a three wave longitudinal study I operationalize this suggestion. First, I develop a 9-item measure based on Nash et al's (2013) scale of moral injurious events at work (MIEWS) and test for measurement equivalence across time. The scale comprises three dimensions (self-transgressions, other transgressions and betrayal) and demonstrates criterion-related validity. Second, longitudinal data are used to test a model suggesting that moral injury is an outcome of abusive supervision and a predictor of anxiety. Evidence for both the stress generation and the "traditional" model of stress is obtained. Finally, I discuss the need for further research on moral distress in the workplace and make the case that it is a primary outcome of leadership.

ALLIANCE FOR ORGANIZATIONAL PSYCHOLOGY: MEANING IN WORK AND LIFE? MULTI-COUNTRY, MULTI-METHODS ADDRESSING DECENT WORK AND WELL-BEING

Friday 24 July 2026 from 08:00 to 09:30

(T-Monumentale)

Sharon Glazer (Rutgers University-New Brunswick, USA ~), Chair and Presenter
Li-Jun Ji (Li-Jun Ji ~ Kingston ~ Canada), Discussant

Abstract 4964

MEANINGFULNESS IN LIFE AND WORK-RELATED ANXIETY AMONGST MOTHERS CARING FOR A CRITICALLY ILL CHILD

Glazer S.*

Rutgers University ~ New Brunswick ~ USA

Little to no research has examined implications of perceptions of financial vulnerability among parents caring for a child with chronic congenital heart disease (CHD). These parents face enormous financial obligations associated with hefty healthcare costs and can result in a great deal of emotional strain, as evident in decreased interaction with family, lower well-being, and greater work-family conflict. One study thus far has shown that financial vulnerability due to healthcare costs adversely affects parents' well-being differently for dual-earner households compared to single-earner households (where the mother is primary caretaker and father works). Drawing on Conservation of Resources Theory, the current study examines whether meaningfulness in life (MIL) serves as a cognitive resource that prevents experiencing financial vulnerability and anxiety amongst working mothers in dual-earner households (n = 178). Findings show that despite increasing financial vulnerability, anxiety is consistently lower for mothers with high (vs. low) MIL, suggesting that MIL has a direct connection to both stressor and strain, but that it does not necessarily protect one from experiencing anxiety as financial strain increases. In other words, financial vulnerability positively relates with anxiety regardless of level of MIL. However, working mothers with high MIL consistently report less anxiety across all levels of financial vulnerability. Thus, MIL influences anxiety but does not alter the strength of the financial vulnerability-anxiety relationship. This finding is discussed theoretically and practically in terms of stress prevention theory.

Abstract 4965

MEANING IN WORK AS A CALLING FOR CAREGIVERS OF ALZHEIMER'S PATIENTS: A QUALITATIVE STUDY

Dryjanska L.*

Uniwersytet Kardynala Stefana Wyszynskiego ~ Warsaw ~ Poland

This presentation will discuss meaning in life through challenging yet rewarding work of facilitators of conversation groups for families of persons diagnosed with Alzheimer's disease in Italy. Drawing from guided interviews with facilitators across three different regions in Italy, the research featured is a part of a larger project conducted in several European countries and Israel. The facilitators who work for non-profit organizations have elaborated on the ethical issues that they face, how they navigate ethical dilemmas, and how in spite of numerous challenges they found meaning in their work. The overarching themes in how participants understood meaning in life related to conceptualizing work as a calling, finding meaning in alleviation of suffering through their work, and building and finding a sense of community through their work. The presentation will highlight the relevance of findings to several United Nations Sustainable Development Goals, as well as the need for transdisciplinary approach in research and advocacy.

Abstract 4966

DOES CULTURE MATTER? MEANINGFUL WORK, DECENT WORK, AND WELL-BEING ACROSS FOUR COUNTRIES

Fisher S.L.*[1], Cedeño V.*[2], Tresidder A., Van Fossen Jenna A., Hoole C., Boucher Erica R.

[1]Münster University of Applied Sciences ~ Münster ~Germany, [2]Universidad de La Sabana ~ Chía ~ Colombia

Research on both decent work (DW) and meaningful work (MFW) and their impact on individual need satisfaction and well-being, has often been conducted within a single country. However, cultural differences play an important part in people's values, expectations and perceptions of work, and cross-cultural work on the antecedents and outcomes of decent work and meaningful work is needed (Blustein et al., 2023). This paper focuses on measurement issues inherent in assessing MFW and DW across cultures. It is part of a larger project examining how DW and MFW affect the well-being of employees through the satisfaction of basic psychological needs at work and at home across four countries: the United States, Germany, Colombia, and South Africa.

01 - Division 1: Work and Organizational Psychology

AN INVESTMENT IN KNOWLEDGE PAYS THE BEST INTEREST! NEW RESEARCH INSIGHTS ON WORKPLACE LEARNING AND KNOWLEDGE SHARING IN ORGANIZATIONS

Friday 24 July 2026 from 08:00 to 09:30

(R-Arsenale)

Alessandro Lo Presti (Università degli studi della Campania “L), Chair and Presenter
Ulrike Fasbender (University of Hohenheim ~ Stuttgart, ~ G), Co-Chair

Workplace learning and knowledge sharing are crucial to organizational success as they enable the acquisition and transfer of critical skills, experiences, and insights, fostering innovation, collaboration, and productivity. As organizations grapple with rapid technological advancements, globalization, and the rise of remote work, the ability to effectively acquire, share, and apply knowledge has become even more crucial.

Despite its importance, there are still gaps in our understanding of knowledge sharing and workplace learning. What organizational factors more significantly promote or hinder knowledge sharing and workplace learning? How does knowledge sharing impact individual and organizational outcomes? How can we leverage technology and other resources to facilitate workplace learning in diverse work environments? This symposium brings together five cutting-edge presentations that address these critical questions, offering fresh perspectives and insights into the dynamics of knowledge sharing and workplace learning.

Grosemans and Vangrieken investigate, through a four-wave longitudinal study with Belgian employees, the relationship between informal learning and well-being at work by proposing a reinforcing feedback loop.

Decius and colleagues focus, using a mixed-methods approach with apprentices and dual students in Germany, on informal learning among apprentices by examining how opportunities and support influence their knowledge acquisition through self-based and social-based learning.

Mamcarz and colleagues investigate, through a three-wave longitudinal study on Polish civil servants, the mediating roles of professional self-efficacy, fitness to learn, and workplace loneliness between workplace temporal comparison and knowledge sharing.

Van Ruysseveldt explores, through a longitudinal study on Dutch workers, how organizational change impacts workplace learning, particularly through knowledge sharing and feedback-seeking behaviors.

Finally, Lo Presti and colleagues examine, using a three-wave longitudinal study with Italian employees, the role of organizational factors such as inclusion practices, employability culture, and intergenerational climate in promoting knowledge sharing and resource-based employability.

Abstract 4258

AGE-BASED TEMPORAL COMPARISON AND KNOWLEDGE TRANSFER IN PUBLIC ADMINISTRATION: THE MEDIATING ROLES OF PROFESSIONAL SELF-EFFICACY, FITNESS TO LEARN, AND WORKPLACE LONELINESS

Mamcarz P.*

Katolicki Uniwersytet Lubelski Jana Pawla II ~ Lublin ~ Poland

Building on Fasbender and Gerpott's (2022) temporal social comparison model of knowledge transfer between younger and older employees, this study advances our understanding of intergenerational knowledge transfer in public administration by testing and extending this theoretical framework. While the original model focuses on age-specific motives and emotions, our extended model introduces additional mediating mechanisms: professional self-efficacy, fitness to learn, and workplace loneliness. The public administration sector represents an ideal context for studying these knowledge transfer dynamics due to continuous changes in laws and regulations that require constant learning and adaptation.

Our model positions workplace temporal comparisons—encompassing perceptions of career opportunities, compensation, and workplace treatment—as the primary antecedent affecting both knowledge obtaining and providing behaviors. Using a three-wave longitudinal design over a 9-month period, we will collect data from Polish public administration employees (T1: N=543; T2: N=364; T3: N=298). We hypothesize that workplace temporal comparisons will significantly influence knowledge transfer through all three mediating mechanisms. We expect professional self-efficacy and fitness to learn to show positive mediating effects, while workplace loneliness will demonstrate negative indirect effects. Additionally, we anticipate that a strong employability culture will buffer the negative effects of unfavorable temporal comparisons.

This study extends Fasbender and Gerpott's temporal social comparison theory by incorporating additional psychological mechanisms in knowledge transfer processes and will offer practical implications for managing intergenerational knowledge exchange in public administration organizations. The longitudinal design will provide robust evidence for the temporal ordering of our proposed relationships and help establish causality within this knowledge-intensive sector.

Abstract 4259

WORKPLACE LEARNING IN TIMES OF ORGANIZATIONAL CHANGE FROM THE PERSPECTIVE OF THE ADAPTATION-ACTIVATION MODEL: LESSONS LEARNED

Van Ruysseveldt J.*

Open Universiteit ~ Heerlen, Limburg, ~ Netherlands

In this study, we examined the conditions under which organizational change (e.g., digitalization, restructuring) characterized by high event strength (e.g., novelty, disruptiveness) fosters workplace learning. Guided by the Adaptation-Activation Model, we aimed to gain a deeper understanding of the processes underlying workplace learning during ongoing organizational changes.

Hypotheses. First, we hypothesized that organizational change with high event strength promotes workplace learning by encouraging employees to engage in adaptive behaviors, particularly knowledge sharing and feedback seeking. Second, we proposed that the adaptive demands associated with such change events enhance knowledge sharing and feedback seeking. For instance, employees experiencing increased learning demands are more likely to develop new competencies in response. Third, we suggested that this adaptation process (organizational change → adaptive demands → knowledge sharing and feedback seeking → workplace learning) is amplified by the presence of strong adaptive resources. These include ample learning opportunities, instrumental support from supervisors and colleagues, and a workplace climate characterized by psychological safety.

To test these hypotheses, we conducted a moderated mediation analysis using the PROCESS tool on a longitudinal dataset representative of the Dutch working population (N = 682). All variables were measured using validated and widely used questionnaires.

Results.Theanalysesconfirmedourhypotheses.First,organizationalchangecharacterizedbyhigheventstrengthpositivelyinfluencedknowledgesharingandfeedbackseekingsixweekslater,which,inturn,facilitatedworkplacelearning.Second,suchorganizationalchangepromotedknowledgesharingandfeedbackseekingbyincreasingcriticaldevelopmentaladaptivedemands,suchaslearningdemandsandcognitiveload.Finally,thismediationalprocesswasmoderatedbykeysocialjobresources.Specifically,theeffectoflearningdemandsonknowledgesharingwasstrengthenedinapsychologicallysafeclimate,inthepresenceofengagedleadership,andwheninstrumentalsupportandlearningopportunitiesfromcolleagueswereabundant.

Abstract 4260

ORGANIZATIONAL PREDICTORS OF KNOWLEDGE SHARING AND ITS IMPACT ON EMPLOYABILITY

Lo Presti A.*

Università degli studi della Campania "Luigi Vanvitelli" ~ Caserta ~ Italy

As employees' talents and competencies have become crucial invisible assets to guarantee companies' competitive advantage, knowledge sharing is acquiring increasing importance as a mechanism that may facilitate the transmission and widespread circulation of knowledge between employees. This is crucial also considering that European companies are nowadays experiencing, among their workforce, the simultaneous presence of different generations of employees, as well as the progressive retirement of Baby Boomers, who traditionally represented the organizational core workforce. In this scenario, it is compelling to identify which organizational factors may facilitate knowledge sharing among employees, and which effect they may have on their employability, seen as a resource for both individuals' career potential and organizational performance.

Drawing on Witherspoon et al. (2013) framework of organizational predictors of knowledge sharing, intertwined with the resource-based model of employability by Lo Presti and Pluviano (2016), we examine if organizational inclusion practices, workplace intergenerational climate, and employability climate predicted knowledge sharing, finally impacting on resource-based employability.

To achieve our aims, we set up a three-wave longitudinal study carried out on Italian employees. Data are analyzed through structural equation modelling.

Abstract 4257

GROWING TOGETHER: THE ROLE OF OPPORTUNITIES AND SUPPORT IN APPRENTICES' INFORMAL WORKPLACE LEARNING

Decius J., Lorber A.*

University of Bremen ~ Bremen ~ Germany

In this study, we examine how the within-person variability of situational factors influences apprentices' informal learning, using the CAM-OS model as a conceptual framework. The CAM-OS model posits that the situational readiness factors of opportunity and support play a crucial role in shaping informal learning processes. Our mixed-methods approach combines a quantitative diary study and qualitative interviews to provide a comprehensive understanding of these dynamics. Participants included 127 apprentices and dual students from a medium-sized manufacturing company in Germany, who provided data over 837 daily records, supplemented by interviews with trainers and apprentices. Our findings confirm that learning opportunities, job control, and role clarity positively relate to self-based informal learning. Learning opportunities also positively relate to social-based informal learning, while job control and role clarity do not. Peer and supervisor support were not significantly related to self-based informal learning, but peer support was strongly associated with social-based informal learning. The interviews further highlighted apprentices' preferences for clear objectives combined with autonomy, as well as their strong reliance on peer interactions for knowledge exchange and reassurance. Notably, while trainers initiate learning through task assignments, their direct involvement in subsequent informal learning processes appears to be limited.

The study extends the CAM-OS model by differentiating between self-based and social-based informal learning, revealing that structural work characteristics primarily support self-based learning, whereas relational characteristics like peer support foster social-based learning. These insights suggest that apprentices' informal learning is highly dependent on a balance between autonomy and guidance. The qualitative findings also highlight the importance of accessible learning resources, role clarity, and defined goals, which help apprentices structure their learning experiences effectively. To support apprentices' informal learning, organizations should focus on designing a work environment rich in learning opportunities, clearly defining roles and expectations, and leveraging peer support through collaborative tasks and mentoring programs.

01 - Division 1: Work and Organizational Psychology

HIGH RELIABILITY ORGANIZATIONS AND SAFETY MANAGEMENT.

Friday 24 July 2026 from 08:00 to 09:30

(P -Arsenale)

Francisco Javier Gracia (IDOCAL. University of Valencia. ~ Valenc), Chair and Presenter

High Reliability Organizations (HROs) are “organizations in which errors can have catastrophic consequences but which consistently seem to avoid such errors” (Roberts et al., 2005, p. 216), despite operating in environments where accidents might be expected due to risk factors and complexity (Perrow, 1984). High Reliability Theory emerged as a response to Normal Accidents Theory (Perrow, 1984), introduced by a group of researchers from the University of California, Berkeley, exactly 40 years ago (e.g., Rochlin, 1986). Surprisingly, HRO theory has remained on the periphery of mainstream organizational theory, even though organizations operating in less hazardous conditions could learn valuable lessons from HROs on improving safety performance and ensuring long-term reliability (Weick et al., 1999). This symposium provides a timely opportunity to reflect on four decades of HRO research, examining what we have learned and identifying key challenges for the future.

HROs are pioneers in safety management, demonstrating a sustained ability to prevent accidents and catastrophic failures in highly complex and high-risk environments. How do they achieve this level of reliability? What can organizations in high-risk industries learn from them to enhance safety performance? Moreover, what insights can organizations in lower-risk sectors gain from HROs to maintain reliable operations and sustain nearly error-free performance over extended periods? This symposium brings together five contributions that explore different perspectives on HROs and safety management

Abstract 4409

MAPPING VARIABLES ASSOCIATED WITH SAFETY PERFORMANCE: A META-ANALYSIS OF OCCUPATIONAL SAFETY RESEARCH (2000–2025)

Oh S.*[1], Gracia F.J.[1], Kwangsu M.[2], Martínez--Córcoles M.[1], Silla I.[1]

[1]Research Institute of Personnel Psychology, Organizational Development, and Quality of Working Life (IDOCAL), University of Valencia. ~ Valencia ~ Spain, [2]Faculty of Psychology, Chung Ang University. ~ Seoul ~ South Korea

Safety performance is one of the strongest predictors of occupational accidents and injuries and constitutes a central mechanism through which organizations achieve safe operations. After the influential synthesis by Christian et al. (2009), numerous additional variables have been investigated in relation to safety performance. Simultaneously, the conceptualization of safety performance has expanded beyond safety compliance and safety participation to encompass additional behavioral dimensions. These developments present the needs of a timely opportunity to integrate past and recent research. This study will conduct a meta-analysis of empirical studies examining variables associated with safety performance. Studies published between 2000 and 2025 will be retrieved from Web of Science, Scopus, and PsycINFO and screened according to PRISMA guidelines. The identified variables will be categorized according to their relationship with safety performance, and overall effect sizes will be estimated through random-effects meta-analysis. Given the methodological variability across studies, including differences in occupational contexts, measurement approaches, and study designs, a random-effects model will be applied to provide more generalizable estimates of the relationships between safety performance and associated variables. This study will contribute to the theoretical understanding of safety performance by providing an updated synthesis of its nomological network and clarifying the relative strength of relationships between safety performance and associated variables. From a practical perspective, the findings may help organizations identify the factors most strongly linked to safety performance and support the development of evidence-based safety interventions and management practices.

Abstract 4410

PLANNED SAFETY CULTURE CHANGES IN NUCLEAR POWER PLANTS: INSIGHTS AND IMPLICATIONS

Schöbel M.*

University of Basel ~ Basel ~ Switzerland

The concept of safety culture emerged following the analysis of the 1986 Chernobyl nuclear disaster. Since then, various frameworks have been developed to define an ideal safety culture, outlining key attributes—such as organizational values and norms—across different levels and domains. These conceptual models serve as the foundation for assessment and evaluation standards, which are applied, for instance, in peer reviews and safety incident analyses. Additionally, they inform the planning and implementation of cultural change initiatives within nuclear power plants (NPPs) to enhance cultural maturity and prevent the recurrence of safety-related events.

This presentation critically examines the empirical and theoretical foundations of planned safety culture changes in NPPs. Despite the recognized importance of safety culture, research on its structured and intentional development within the nuclear industry remains limited. The presentation analyzes various cultural change initiatives in NPPs using evidence-based change models, with a particular focus on changes driven by incident and deviation analyses, peer-review processes, and self-assessment programs. These initiatives are evaluated based on their underlying safety culture models, applied change strategies, and intended outcomes, with the aim of identifying key facilitating and inhibiting factors. Based on these findings, the presentation provides recommendations for more effectively leveraging the safety culture concept to enhance the safety and reliability of nuclear power plants in the future.

Abstract 4412

DEVELOPMENT OF HRO ASSESSMENT TOOLS FOR KOREAN ORGANIZATIONS

Kwangsu M.*[1], Lee J.[2], Lee H.[2], Oh S.*[3]

[1]Chung-Ang University ~ Seoul, Republic of Korea ~ Korea, Republic of, [2]SafetyON Solution ~ Anyang, Republic of Korea ~ Korea, Republic of, [3]Research Institute of Personnel Psychology, Organizational Development, and Quality of Working Life (IDOCAL), University of Valencia. ~ Valencia ~ Spain

Major industrial accidents are a serious social problem in South Korea. Despite various efforts by companies and the government, the rate of industrial accidents and fatalities has not decreased. Therefore, this study developed a tool to diagnose and evaluate the level of high reliability organizations for safety management. Based on previous studies (e.g., Weick, & Sutcliffe, 2011; Mezentseva, et al., 2023), we developed a Korean version of the five characteristics of high trust organizations (Preoccupation with error, Reluctance to simplify, Sensitivity to operations, Commitment to resilience, Deference to expertise) and additional variables (vulnerability, organization, etc.) and validated the content validity among experts and safety managers. We then conducted a survey of employees in various companies to examine the construct validity through factor analysis and reliability analysis. The construct validity was examined through factor analysis and correlation analysis. In future studies, it is necessary to continue to validate the usefulness of this tool by comparing more companies and plants or departments.

Abstract 4413

MEASURING ANESTHESIA SENSE-MAKING IN THE OPERATING ROOM DURING CRISIS SITUATIONS: A PILOT STUDY

Renaud V.*[1], Blanié A.[2], Benhamou D.[2]

[1]ATRISC CIO ~ Aix en Provence, France ~ France, [2]UC Berkeley CCRM ~ Aix en Provence, France ~ France

In 1999 the Institute of Medicine (IOM) released a report titled “To Err Is Human,” in which medical error was cited as the eighth leading cause of death in the United States (more than motor vehicle accidents, breast cancer, or AIDS), responsible for as many as 98,000 deaths annually [1]. The healthcare community was starting to become aware of the significance of organizational and human factors. In France, the Ministry of Health conducted a national survey on ‘serious unwanted events related to healthcare delivery’ in 2004 and 2009. It was found that in hospitals, 60% of such events could be connected to poor teamwork, especially ‘insufficient supervision,’ ‘insufficient communication,’ and ‘lack of quality culture’ [2].

Since then, many studies have examined the non-technical skills of caregivers [3]–[6] and have shown that poor communication and supervision were general precursors of unwanted events as in the French studies. These skills are especially crucial in ill-defined and rapidly evolving situations and when stakes are high. This is the case when a patient in the operating room starts desaturating, with no apparent reason, and when the first remediation actions show no improvement. The anesthesiologist, surgeon, and nurses must then share their perceptions of the situation, come up with interpretations, select the most plausible and take action before it is too late. In other words, the staff must address the questions “what is going on?” and “what should we do about it?”, i.e. engage in sense-making processes.

Effective sense-making processes are the cornerstone of high reliability organizations [7]. The aim of this study was to validate a measure of sense-making in anesthesia in the operating room through the video analysis of high-fidelity simulation training exercises conducted at the LabForSIMS simulation center of Paris-Saclay Medical school between 2017 to June 2021.

We review the reliability and validity of themeasureanddiscusstheoreticalandmanagerialimplicationsforhigherreliabilityintrainingforreal-lifeoperations.

PERSPECTIVES FROM DIFFERENT CAREER STAGES: UNDERSTANDING THE CHALLENGES AND OPPORTUNITIES IN CONTEMPORARY INTERVENTIONS, NONWORK DOMAINS, AND WORK TRANSITIONS ACROSS CONTEXTS

Friday 24 July 2026 from 09:30 to 11:00

(P -Arsenale)

Rita Chiesa (University of Bologna ~ Bologna ~ Italy), Chair and Discussant
Audrey Antonio (University of Bologna ~ Bologna ~ Italy), Co-Chair

This symposium expands the existing knowledge on contemporary careers by applying psychological perspectives on how people manage challenges and changes in different contexts and career stages. Five studies are presented in this symposium, with each study investigating certain constraints and/or opportunities that individuals experience in their career transitions, work-nonwork interface, and professional development. Using different methodologies, all studies of this symposium employ a comparative approach in addressing their research questions that examine similarities and differences in individuals' experiences between age groups, countries, cultures, or work sectors. Providing insights into the mechanisms at play in the interventions and processes that individuals undergo in their unique career contexts, this symposium offers implications on the sustainable growth of individuals and organizations in a global environment.

The first two studies of the symposium focus on the early career stage. Antonio et al. (Italy) explore the career uncertainty of young people through a qualitative study conducted in Italy and Norway. Whereas van Nieuwerburgh et al. (Ireland) use a randomized control trial to assess the effectiveness of an AI-powered coaching platform on the individual outcomes of early-career professionals from three continents (i.e., Asia, Europe, North America).

The succeeding three studies of the symposium consider the mid-career and late career stages. Matos et al. (Portugal) engage in a mixed-methods study to investigate the impact of leadership interventions on decent work in military and academic organizations. While Šimunić & Sinovčić (Croatia) examine in their quantitative study the work-family conflict and coping strategies observed in early, middle, and older adulthood. Finally, Sonnenschein & Wiik (Norway) probe in their qualitative research the changes in the work and nonwork identities of newly retired employees in Denmark and Norway.

To conclude the symposium, the discussant, Rita Chiesa (Italy), will synthesize the collective insights gained regarding the modern career context.

Abstract 3274

EXPLORING YOUNG PEOPLE'S CAREER UNCERTAINTY: A QUALITATIVE STUDY IN ITALY AND NORWAY

Antonio A.*[1], Sonnenschein K.[2], Chiesa R.[1]

[1]University of Bologna ~ Bologna ~ Italy, [2]BI Norwegian Business School ~ Trondheim ~ Norway

Though uncertainty has been regarded as a fundamental experience in individual careers, the rapid changes in the labor market have augmented the instability that people encounter in their professional development, especially considering the growth of non-standard career paths. Given the high degrees of uncertainty brought forth by different environmental factors such as the rise of the gig economy and technological advancements, we focused our study on young people, who are susceptible to the trends of the modern work environment. As they face high risks of unemployment, temporary jobs, and skill-inadequate employment during the early phases of their career development, the aim of our study was to explore the meanings, sources, and resources that young people attribute to their career uncertainty. In extension of the existing knowledge that previous research has reported about the topic, our study accounted for the conceptualization of career uncertainty that is relevant to the early career stage in two different country contexts. To achieve our research objective, we employed a qualitative research design in which data was collected through online focus groups among young people in Italy and Norway (N = 53). The qualitative data was analyzed using thematic analysis. The results of our study expound on the temporal elements, labor market characteristics, and psychosocial resources that emerged in young people's discussions of career uncertainty. Furthermore, certain similarities and differences are noted in the experiences and coping strategies of Italian and Norwegian participants. In view of the contextual support that young people can receive from institutions and societies as they establish themselves in the workforce, our study offers theoretical and practical implications on how early career uncertainty can be managed amidst the changing labor market.

Abstract 3281

EVALUATING AI-POWERED COACHING INTERVENTIONS FOR EARLY-CAREER PROFESSIONAL DEVELOPMENT: A MULTI-COUNTRY RANDOMIZED CONTROLLED TRIAL

Van Niewerburgh C.[1], Klapow M.*[2], Vigna K.R.[3]

[1]RCSI Centre for Positive Health Sciences ~ Dublin ~ Ireland, [2]Oxford University ~ Oxford ~ United Kingdom, [3]University of Bologna ~ Bologna ~ Italy

Traditional human coaching remains inaccessible to most early-career professionals due to scalability and cost constraints, while recent evidence suggests AI coaching platforms can deliver meaningful developmental outcomes, yet rigorous experimental validation remains limited. This randomized controlled trial will evaluate the effectiveness of an AI-powered coaching platform on workplace performance, well-being, and career development outcomes among early-career professionals across three regions: Europe (n=300), United States (n=300), and India (n=300). Participants will be randomly assigned to either: (1) AI coaching intervention group receiving 12 weeks of personalized coaching via the Sherlock AI platform, or (2) waitlist control group. The AI coaching system integrates behavioral science frameworks with large language models, providing psychological safety-focused dialogue, adaptive inquiry, and personalized developmental pathways. Primary outcomes include work engagement (Utrecht Work Engagement Scale), psychological well-being, PERMA+4, and self-reported career development confidence measured at baseline, 4 weeks, 8 weeks, 12 weeks, and 3-month follow-up. Secondary outcomes encompass 360-degree feedback on communication effectiveness, emotional regulation, and leadership behaviors; organizational commitment; turnover intention; and platform engagement metrics including coaching session frequency and duration. Based on preliminary pilot data showing 92% coaching effectiveness ratings and significant engagement (13,700+ minutes across 900 users), we hypothesize significant improvements in primary outcomes for the intervention group, with potential cultural variations in response patterns. This study will provide the first large-scale experimental evidence for AI coaching effectiveness across diverse cultural contexts, informing evidence-based implementation of scalable developmental interventions for the global workforce.

Abstract 3282

FROM RESEARCH TO ACTION: LEADERSHIP INTERVENTIONS TO ENHANCE DECENT WORK

Matos H.*[1], Teixeira J.[1], Pais L.[1], De Sousa B.[1], Dos Santos N.R.[2]

[1]University of Coimbra ~ Coimbra ~ Portugal, [2]University of Évora ~ Évora ~ Portugal

Decent Work (DW) is an aspirational concept introduced in 1999 by the International Labour Organization (ILO) and is currently part of the 8th Sustainable Development Goal of the United Nations 2030 Agenda. It is a fundamental pillar for sustainable organizational performance, contributing to employee well-being, motivation, and productivity, and, in highly structured environments such as the military and academia, can be differentiated. This study examines the relationship between leadership influence on employees' perceptions and DW. Leadership plays a crucial role in fostering conditions that support DW. Three key leadership approaches are explored: Empowering Leadership, which enhances employee autonomy; Responsible Leadership, which aligns organizational activities with the broader ecosystem; and Ethical Leadership, which ensures consistency between actions, values, and moral principles of the organization and society. This study aims to study the impact on DW through interventions designed for leadership development. The research was conducted in two distinct contexts: the Portuguese Air Force and one of the oldest universities in Portugal, Coimbra University. Both have hierarchical structures and specific challenges that make leadership analysis particularly relevant. Participants include leaders and teams from both organizations based on voluntary participation. Several instruments measuring DW and leadership practices were applied through a three-wave mixed-methods study within a participatory intervention approach. The results will be presented and discussed, highlighting the impact of leadership interventions on DW perception and offering practical insights for fostering positive organizational change.

Abstract 3285

WORK-FAMILY CONFLICT AND COPING STRATEGIES IN DIFFERENT AGE GROUPS

Šimunic A.*, Sinovcic G.

University of Zadar ~ Zadar ~ Croatia

The aim of this research was to examine the differences in work-to-family and family-to-work conflict and coping strategies between different age groups and the relationship between these conflicts and the dominant style of coping with stress. The research questionnaire included questions on age, education, partner and child status, work experience and the division of labor in the household, the Endler and Parker Coping with Stressful Situations Questionnaire (CISS) and the Work-Family Conflict Scale (Netemeyer et al., 1996). A total of 334 participants, working and residing in the Republic of Croatia, between the ages of 19 and 63 completed the online questionnaire. According to Matthews et al. (2010) study, the participants were divided into 3 age groups: early adulthood (18 to 28; n=101), middle adulthood (29 to 44; n=126) and older adulthood (45 and older; n=107). There was no difference in work-to-family conflict between different age groups, but there was a significant difference in family-to-work conflict when controlling for child status, with the youngest group reporting greater conflict than the older groups. Avoidance coping was found to be more common in the youngest group, while no age group difference was found for emotion-focused coping and problem-focused coping. Moreover, a greater tendency towards emotion-focused coping (which was also more common for women than men) was related to a higher level of both directions of work-family conflict. Problem-focused coping was related to lower family-to-work conflict only in the oldest group, while a higher level of the same conflict was related to avoidance coping in the youngest group. The results of this research call for the need to encourage strategies of problem-focused coping, especially in younger adults, and to take into account different life circumstances and stages in developing resources to deal with the stress of juggling work and different life roles.

Abstract 3343

THE IDENTITY FORMATION OF RETIRED EMPLOYEES IN THEIR TRANSITION PHASE FROM WORK TO RETIREMENT

Sonnenschein K.*[1], Wiik R.[2]

[1]BI Norwegian Business School ~ Trondheim ~ Norway, [2]BI Norwegian Business School ~ Stavanger ~ Norway

The purpose of this study is to investigate the possible changes in work and non work identities (e.g. role identity and core identity), among newly retired employees in their transition from work to retirement. This transition is now seen as a process that involves several stages, including exiting the workforce, re-entering it, re-exiting, and exploring new life roles (Bordia et al., 2020). The loss or alteration of one's work identity as a consequence of retirement may significantly affect individuals and shape their involvement in post-retirement jobs. Individuals, particularly those strongly integrated into their work roles, routines, and professional connections, may undergo a profound loss of work identity upon retiring (Sullivan and Al Ariss, 2019). There is a scarcity of research on the types of identity work they engage in as retirees, and the evolving nature of the retirement transition itself. Furthermore, there is a lack of research on the identity challenges faced by blue collar workers. The current study thus aims to include both blue- and white-collar employees among the respondents (Bordia et al., 2020). The methodology has a phenomenological approach as it explores the work identities of 40 respondents (20 recently retired blue collar and 20 recently retired white collar employees). Twenty (10 blue collars and 10 blue collars) will be recruited in Denmark and 20 (10 blue collars and 10 white collars) will be recruited in Norway. Narrative interview techniques will be applied, and the data will be analysed using methods suited to our empirical data. The research will add to the body of knowledge regarding the identity progression of recently retired blue- and white-collar employees. The study will lead to recommendations and insights to inform future designs for interventions such as policies, more inclusive human resources practices towards seniors.

01 - Division 1: Work and Organizational Psychology

HEALTH AND ENTREPRENEURSHIP

Friday 24 July 2026 from 09:30 to 11:00

(R-Arsenale)

Barbara Barbieri (University of Cagliari ~ Cagliari ~ Ital), Chair
Michela Loi (University of Cagliari ~ Cagliari ~ Ital), Co-Chair

This symposium is centered on analyzing the emerging link between entrepreneurship and health, which recent research has highlighted as an essential topic requiring in-depth investigation (Shepherd & Patzelt, 2017).

Entrepreneurship is a relatively new and growing field of research (Wiklund et al., 2019). Scholars have examined its dynamics and implications by emphasizing its economic aspects. However, its broad definition as a transformative process that changes—sometimes radically and structurally—social and institutional contexts through the agentic power of entrepreneurs (McMullen et al., 2021) emphasizes that other implications, beyond economic ones, are fundamental to address (Wiklund et al., 2019). For instance, the link between entrepreneurship and democracy/politics exemplifies how entrepreneurship dynamics and implications can affect our society (Audretsch, 2021; Farè et al., 2023).

By relying on Shepherd and Patzelt (2017), we refer to health as both physical health —"the physiological and physical status of the body"—and mental health—"the state of mind, including basic intellectual functions." Throughout the five contributions, this symposium aims to focus on health by considering two different streams of research: entrepreneurial well-being and the psychological impact of entrepreneurship education.

First, we discuss the link between entrepreneurship and well-being (Stephan et al., 2023), highlighting how team dynamics in the early stages of the entrepreneurial process could impact team performance and members' well-being. Second, we address the impact of teaching entrepreneurship to dropout targets (e.g., Jennings, 2014; Jennings Mayo-Wilson et al., 2020), showing how this could leverage or hamper individual changes at both the psychological and economic levels.

Taken together, the contributions highlight new potential streams of research that could have relevant implications for applied psychology, contributing to this year's debate conference centered on discussing new directions for applied psychology.

Abstract 3327

EXPLORING THE LINK BETWEEN TEAM ENTREPRENEURIAL PASSION AND WELL-BEING IN ENTREPRENEURIAL TEAM

Maryami S.*[1], Pattnaik S.[2], Opizzi M.[3]

[1]Norwegian University of Science and Technology ~ Trondheim ~ Norway, [2]Nord University Business School ~ Bodø ~ Norway, [3]University of Cagliari ~ Cagliari ~ Italy

Introduction

Well-being is recognized as vital for physical and psychological health, and it is particularly true in the entrepreneurship domain. Defined as the experience of satisfaction, positive affect, and psychological functioning during venture creation and management, it directly influences productivity and success. While it is well-established that positive emotions and passion influence well-being, how this relationship manifests in a team context remains underexplored. Especially when team members shared intense positive feelings for a collective team identity - i.e., Team Entrepreneurial Passion (TEP). Drawing on Self-Determination Theory, this study explores how TEP satisfies psychological needs for autonomy, competence, and relatedness.

Research Purpose

The model examines the relationships between TEP in three domains (inventing, founding, and developing) and two key outcomes: subjective well-being and team performance. It also explores how team performance mediates the connection between TEP and subjective well-being, providing insights into how entrepreneurial teams' passions influence both individual and collective outcomes.

Methods

Using cross-sectional survey data from European entrepreneurial teams, we will apply partial least squares modeling to analyze relationships between TEP domains and well-being.

Results

We expect to find that TEP could positively affect individual team members' well-being. Specifically, TEP may foster stronger psychological fulfillment, enhancing team dynamics and creating a supportive environment that contributes to individual well-being.

Conclusion

Our research highlights the importance of fostering TEP to enhance well-being in entrepreneurial teams. By focusing on individual well-being, this study provides practical insights for building healthier and more effective entrepreneurial ecosystems. This work advances the literature on entrepreneurship and well-being, addressing critical gaps in understanding team dynamics and their broader implications for health in entrepreneurship. Moreover, by focusing on TEP and its role in fostering well-being, we bridge the gap between team dynamics, shared emotions, and individual health,

contributing to the broader discourse on entrepreneurship, psychology, and health.

Abstract 3334

EMPOWERING EMPLOYEES IN SMALL BUSINESSES: THE ROLE OF ENTREPRENEURIAL LEADERSHIP

Manuti A.*[1], Gemmano G.[1], Giancaspro M.L.[2]

[1]University of Bari ~ Bari ~ Italy, [2]Pegaso University ~ Naples ~ Italy

Entrepreneurship is a key driver of economic growth and innovation, but its impact extends beyond business performance to workplace relationships and employee experiences. Entrepreneurs are not only strategic decision-makers but, especially in small businesses, they are also leaders of their employees, shaping the social and psychological dynamics of the workplace. While prior research has largely focused on the economic aspects of entrepreneurship, less attention has been given to how entrepreneurs, through their leadership, foster employee empowerment and well-being. This study examines how entrepreneurial leadership (LMX) in small businesses contributes to psychological empowerment, which in turn enhances work engagement and organizational commitment. Entrepreneurs who cultivate a leadership approach characterized by trust, support, and mutual influence can create conditions that enhance employees' psychological empowerment. As a consequence, employees perceive greater competence, autonomy, meaning, and impact in their work, reinforcing their dedication to work and commitment to the business. Thus, we hypothesize that entrepreneurs' LMX has both direct and indirect effects on employees' work engagement and organizational commitment, through the mediation of psychological empowerment.

To test this model, we collected survey data from 219 employees (55% female; Mage = 34.60; SD = 12.12) working in small and micro enterprises, ensuring that respondents referred to their entrepreneur as their direct leader. Participants completed measures assessing LMX, Psychological Empowerment, Work Engagement, and Organizational Commitment. Structural Equation Modeling results confirmed that LMX is positively related to work engagement and organizational commitment, both directly and indirectly through psychological empowerment. These findings have theoretical and practical implications for the role of entrepreneurial leadership in small businesses. By developing supportive relationships with employees, entrepreneurs can create an empowering work environment that enhances employee engagement and organizational attachment. This perspective extends LMX theory to entrepreneurship and offers practical insights into the importance of entrepreneur-employee relationships in small businesses.

Abstract 3336

THE ROLE OF COURAGE IN ENTREPRENEURSHIP: EXPLORING ITS MANIFESTATIONS, CHALLENGES, AND FACILITATORS

Russo A.*[1], Zammiti A.[2], Ramaci T.[2], Santisi G.[2]

[1]University of Bologna ~ Bologna ~ Italy, [2]University of Catania ~ Catania ~ Italy

Introduction

Courage emphasizes the pursuit of a goal despite risk or fear. In recent years, this dimension has also been studied in relation to the work environment. In the specific context of entrepreneurship, courage has been classified as one of the most important qualities of successful entrepreneurs. Entrepreneurship is a path characterized by uncertainties and risks, where courage plays a fundamental role in the entrepreneurial process. However, few studies have explored courage in the specific entrepreneurial context. It is therefore necessary to capture entrepreneurs' subjective experiences related to courage, exploring definitions, emotional dynamics, and organizational factors that either facilitate or hinder acts of courage at work.

Methodology

The study used semi-structured interviews for qualitative data collection conducted with a small and homogeneous sample of Italian entrepreneurs. The chosen approach allowed for an in-depth exploration of the lived experience of courage at work, emphasizing the relationship between obstacles and facilitating factors.

Preliminary Results

The interviews highlighted the complexity of the experience of courage at work and how it manifests in daily work practices. Participants reported that courage is not an innate trait but rather the ability to persevere and act with determination in the face of difficulties, taking responsibility and risks, driven by the willingness to overcome obstacles and confidence in their own abilities. Key resources that facilitate courage emerged, as well as factors that hinder its expression.

Conclusions

This research contributes to understanding the way to acting courageously at work from the perspective of entrepreneurs. The findings suggest that in accounts of workplace courage, courageous behavior is not merely an individual response to professional challenges, but a collective phenomenon influenced by organizational and social contexts. This study lays the groundwork for developing new assessment tools for courage and designing training interventions aimed at strengthening this dimension.

01 - Division 1: Work and Organizational Psychology

NEW DEVELOPMENTS IN EMPLOYEE COMMITMENT RESEARCH: METHODOLOGICAL, CULTURAL, AND MULTILEVEL PERSPECTIVES

Friday 24 July 2026 from 09:30 to 11:00

(T-Monumentale)

Christian Vandenberghe (HEC Montreal ~ Montreal ~ Canada), Chair

This symposium highlights recent advances in employee commitment research, integrating methodological innovations, cross-cultural insights, and multilevel analyses. Commitment remains central to organizational psychology due to its links with retention, performance, and well-being. Yet contemporary workplaces—with diverse teams, global operations, and evolving professional roles—require updated approaches to conceptualizing, measuring, and examining employee commitment. The presentations collectively explore novel antecedents, mechanisms, and outcomes of employee commitment at individual, professional, team, and cultural levels. The symposium is timely and highly relevant for ICAP because employee commitment continues to shape critical organizational outcomes, yet traditional approaches often overlook cultural, temporal, and team-level complexities.

Presentations:

• Meyer, Stanley, and Espinoza present an AI-assisted comprehensive meta-analysis of the organizational commitment literature. Their work demonstrates how artificial intelligence can efficiently screen, extract, and categorize data from decades of primary studies, enabling large-scale integration of findings across cultures, constructs, and outcomes.

• Wasti offers a cross-cultural perspective on commitment, synthesizing emerging cultural constructs from recent cross-cultural research—including the dimensions of selfhood, responsibilism, tightness–looseness, and relational mobility—that go beyond traditional taxonomies developed by Hofstede, Schwartz, or the GLOBE project. This work provides the basis for a more nuanced understanding of how cultural contexts shape the formation, expression, and impact of employee commitment.

• Lapointe and Nikolova focus on commitment to the profession, an under-researched form of commitment. Using longitudinal data, they reveal dynamic, reciprocal relationships between occupational future time perspective, goal-supportive supervision, and professional commitment, highlighting how individuals' perceptions of career opportunities and support influence their professional dedication.

• Montani and Vandenberghe investigate team-level social dominance orientation, demonstrating how collective dominance tendencies undermine team goal commitment and, in turn, reduce innovation in ethnically diverse teams. This study highlights team goal commitment as a critical mechanism that may link team-level characteristics to performance outcomes in the context of diversity.

Abstract 3648

TOWARD AN AI-ASSISTED COMPREHENSIVE META-ANALYSIS OF THE ORGANIZATIONAL COMMITMENT LITERATURE

Meyer John P.*[1], Stanley D.[2], Espinoza J.[1], Saeidmehr A.[3]

[1]Western University ~ London ~ Canada, [2]University of Guelph ~ Guelph ~ Canada, [3]Zenbase AI ~ Calgary ~ Canada

Organizational commitment has long been a central construct in the I/O psychology, organizational behaviour, and management literatures due to its links to important outcomes, including retention, performance, and well-being. It has also been incorporated into other theories (e.g., leadership, justice, and HRM) as a proximal outcome and/or mediator of more distal outcomes. Over the last decade, interest and research on organizational commitment has expanded rapidly to countries outside of North America where interest originated.

The last comprehensive meta-analysis of commitment research was conducted over 20 years ago; subsequent analyses have been limited in scope due to the size of the literature. Consequently, more recent meta-analytic reviews tend to address isolated correlates and are scattered across disciplines, making integration of findings difficult.

Recent developments in artificial intelligence (AI) now make it possible to deal with the extensive and ever expanding commitment literature. Indeed, AI can screen studies for relevance and extract the data required for analysis with high reliability and accuracy. Once extracted into a common database, AI can aid in categorizing variables based on label and measure to isolate core constructs. Importantly, this database can be shared among researchers, and data from new studies can be added to update previous analyses and address new research questions.

In this presentation, we will provide an overview of this AI-assisted approach to conducting meta-analyses using organizational commitment as the focal variable. For example, we will illustrate how data extracted from studies conducted across countries/cultures can be combined with other country-level data to identify and explain differences in the nature and strength of commitment. We will also demonstrate how key antecedent and outcome variables can be included in the analyses, and how changes in commitment, and its correlations with other variables, can be tracked over time using more than 40 years of commitment research.

Abstract 3649

ADVANCING CROSS-CULTURAL PERSPECTIVES ON ORGANIZATIONAL COMMITMENT

Wasti A.*

Sabanci University ~ Istanbul ~ Turkey

It has been more than a decade since the most comprehensive meta-analytic investigations of organizational commitment and culture were published (Jackson et al., 2013; Meyer et al., 2012). These studies drew on Hofstede's (2001), Schwartz's (1992), and GLOBE's (House et al., 2004) cultural taxonomies and documented the moderating role of individualism–collectivism and power distance with respect to strengthening the predictive power of normative commitment.

Since then, cross-cultural organizational research has advanced considerably. For instance, several studies have sought to update or improve Hofstede's original cultural indices (Komisarof & Akaliyski, 2025). Recent work has also examined the nature of collectivism. Vignoles et al. (2016) identified a seven-dimensional model of selfhood (distinct ways of being independent-interdependent) in 33 nations. Similarly, Talhelm (Talhelm et al., under review) introduced the construct of responsibilism emphasizing duties and roles in close relationships but relatively weaker ties in distant ones. Given the centrality of collectivism in shaping workplace bonds, such refinements hold significant promise for advancing commitment research.

Beyond collectivism, other cultural constructs have also been developed and have potential relevance for organizational commitment. For instance, Gelfand et al.'s (2011) concept of cultural tightness–looseness captures the strength of social norms. Another promising construct is relational mobility, which refers to the degree to which individuals in a given society can initiate new relationships or terminate existing ones. In a 39-country study, Thomson et al. (2018) showed that while the United States ranked high and Japan low in relational mobility, the construct only partially overlaps with individualism–collectivism. For example, Germany scored low, whereas Brazil scored high on relational mobility, despite their differing individualism–collectivism profiles.

The aim of this presentation is to synthesize these emerging strands of cross-cultural research in order to advance our understanding of organizational commitment across cultures.

Abstract 3650

EMBRACING THE FUTURE, COMMITTING TO THE PROFESSION? HOW OCCUPATIONAL FUTURE TIME PERSPECTIVE AND GOAL-SUPPORTIVE SUPERVISION SHAPE COMMITMENT TO THE PROFESSION

Lapointe E.*[1], Nikolova I.[2]

[1]BI Norwegian Business School ~ Oslo ~ Norway, [2]School of Business and Economics, Maastricht University ~ Maastricht ~ Netherlands

Commitment to the profession, defined as a volitional psychological bond reflecting dedication to, and responsibility for, one's profession is an important, yet under-researched form of commitment. Building on conservation of resources theory and temporal construal theory, we examine occupational future time perspective (OFTP), referring to employees' perception of the time and opportunities remaining in their career, and goal-supportive supervision, referring to employees' perception that their supervisor actively empowers them and stimulates their motivation to pursue their professional development goals, as predictors of commitment to the profession. More specifically, we expect OFTP and goal-supportive supervision to have positive effects on commitment to the profession. To robustly test these ideas, we collected survey data from 628 employees working in the Netherlands, occupying various professions and working in different industries.

Relying on a three-wave repeated measures random-intercept cross-lagged panel model (RI-CLPM), we tested within-person effects over time, while accounting for stable between-person differences. Results provide support for the effect of OFTP on commitment to the profession at the within-person level and showed evidence for a reversed causation effect. Specifically, at the within-person level, there was a positive relationship between OFTP and commitment to the profession (β =.20, SE = .09, p =.021), and a reversed effect from commitment to the profession to OFTP (β =.38, SE = .17, p =.028), suggesting a recursive within-person process. While we did not find support for the expected within-person effect of goal-supportive supervision on commitment to the profession at any of the time points, we did find a significant reversed effect from commitment to the profession to goal-supportive supervision (β = .31, SE = .14, p = .027). Detailed findings, as well as their implications for commitment research, will be discussed in the symposium.

Abstract 3651

MOVING TO THE NEXT LEVEL: WHEN DOES TEAM SOCIAL DOMINANCE ORIENTATION AFFECTS TEAM GOAL COMMITMENT AND INNOVATION?

Montani F.*[1], Vandenberghe C.[2]

[1]University of Montreal ~ Montreal ~ Canada, [2]HEC Montreal ~ Montreal ~ Canada

Prior research has scarcely examined the role of social dominance orientation (SDO) at the team level in organizational settings and has often overlooked its potential downsides. This omission is notable because SDO is fundamentally a group phenomenon, making it essential to understand how collective dominance tendencies shape team functioning, particularly team members' commitment to team goals, and ultimately team outcomes.

This study addresses this gap by examining SDO as a team-level construct and identifying the conditions under which it may hinder innovation, as well as the mechanisms driving these effects. Grounded in social identity theory, we propose that team goal commitment serves as a mediator and ethnic diversity as a moderator in the relationships between the two dimensions of team SDO—Dominance (SDO-D) and Anti-egalitarianism (SDO-E)—and team innovation. Specifically, we argue that at high levels of ethnic diversity, SDO-D and SDO-E undermine members' commitment to team goals, thereby reducing team innovation.

To test these hypotheses, we conducted a three-wave, multilevel study of 82 teams (616 employees and their supervisors) across public government departments. As expected, ethnic diversity moderated the indirect effects of team SDO-D and SDO-E on innovation via team goal commitment. When ethnic diversity was high, SDO-D and SDO-E negatively affected goal commitment, which, in turn, impaired innovation. These negative effects were mitigated when ethnic diversity was low. Overall, this research highlights the critical role of team goal commitment in explaining how social dominance tendencies impair innovation in diverse teams.

01 - Division 1: Work and Organizational Psychology

SUSTAINABLE DEVELOPMENT: CONTRIBUTIONS FROM APPLIED PSYCHOLOGY

Friday 24 July 2026 from 09:30 to 11:00

(O-Arsenale)

Walter Reichman (International Association of Applied Psy), Chair and Presenter
Vicente Martinez-Tur, Discussant

This symposium will describe the contributions of applied psychology to the science of sustainability. Sustainability is the focus of scientific attention in this 21st century since we came to understand that unless we take action the world as we know it will cease to exist. We are already experiencing environmental devastation and the recognition of our situation led to the need to preserve what we now have and to the science of sustainability. The symposium will consist of four presentations by applied scientists and a discussion.
The first presentation will describe sustainability among indigenous people and how it became part of the culture of the community and enhanced the dignity of the individual.She offers lessons for our future from indigenous cultures where the informal economy among artisanal workers has been sustained for centuries and contributes to the sense of wellbeing among them.
The second presentation describes how applied psychology collaborated with other sciences to develop the science of sustainability and sustainable development .They describe their research on the psychological dimensions and behavioral requirements in decision making related to environmental,economic and equity factors as they are related to sustainable development
The third presentation discusses the United Nation's Sustainable Development Goals and calls for the linkage of two of the Goals,8 and 13.Goal eight refers to decent work and economic growth and 13 to the environment. The authors point out that you cannot have one without the other.They show that it is possible to develop an economy of decent work and a clean environment by describing the city of Katowici,Poland that went from the sixth most polluted city in Europe to a. clean air city and a great economy.You can have both decent work and a clean environment.The fourthpresentationdescribestheresearchondevelopingthecompetenciesneededfor sustainabilityandmakingitapartoftheculture.They describe the validation of the Climate KIC Professional Competency Framework for System Innovation.This instrumentrevealed heneededcompetenciesofacceleratingtransitionspromotinginnovationanddrivingentreprene urshipalongwiththesubcompetenciesundereach.

Abstract 3994

SUSTAINABLE WORK :LESSONS FROM INDIGENOUS CULTURES

Saxena M.*

University of Nebraska ~ Omaha ~ United States of America

This paper discusses a unique conceptualization of work that was found to rest on ancient cultural skills of indigenous people that was found to be “sustainable.” In this presentation, I describe the concept of sustainable work, grounded in its cultural context.

As the modern world of work grapples with the many difficulties that are a part of working in today’s time, there is a need to explore other forms of working that are more sustainable in nature. An alternate approach comes from work in the informal economy of indigenous people. Indigenous approaches to work and life are in harmony with nature , considering nature and the environment not a tool for exploitation and consumption but to revere and live in tandem with. In researching the work-experiences of informal workers in rural and remote parts of India, a unique conceptualization of work was discovered, that was truly psychologically sustainable. Sustainable work is work that gives more than it takes to the community, environment, and nature. It is defined as work” which provides inherent meaningfulness, a sense of purpose, innate dignity, identity aligned with cultural values, that instils contentment and hope. It is free from the depleting aspects of modern-day work that lead to fatigue ,irritability, job burnout, and poor physical and mental health.

Sustainable work was unique in that it rested on cultural skills that was involved with creative traditional occupations. These skills were learned through informal methods (e.g., observing, practice, behavior modeling). These cultural skills are intergenerational that existed in the family / community for generations in an unbroken chain of intergenerational cultural continuity. The cultural continuity was a key component in driving decent work and overcoming the deficits of poverty. This paper presents lessons learned from an indigenous Indian culture that has implications for work in our time.

Abstract 3995

THE PSYCHOLOGY OF SUSTAINABILITY AND SUSTAINABLE DEVELOPMENT FOR THE 21ST CENTURY

Di Fabio A.*

University of Florence ~ Florence ~ Italy

This presentation will describe applied psychology's role in the Science of Sustainability whose aim is to preserve the planet and to assure the health and well-being of human beings. The presenter will describe her work in developing a new research and intervention area within the domain of Sustainability Science ,the Psychology of Sustainability and Sustainable Development (PSSD).

At the core of the PSSD is to study in depth internal psychological processes involved in decision-making and behaviors related to sustainability and sustainable development within individual(s), within environment(s), between/among individuals, between/among environments, between/among individuals and environments, and between/among living beings and the natural world/universe, ranging from the past to the present, and into the future .The PSSD also focused on promoting the environment, economy and equity and avoiding exploiting, depleting, and altering through seeking opportunities, challenges and new solutions. The importance of early building strengths, for each person and the system/s, for person/people and environment/s, in the world and in different cultural contexts, recognizing the usefulness of tailored interventions for special needs and critical situations.

The aim of the PSSD is to contribute to establishing a culture of sustainability and sustainable development according to the sustainable development goals (SDGs) of the UN's Agenda 2030 using psychological lens. The Sustainable Development Goals Psychological Inventory was developed to explore critical dimensions that could promote the realization of the 17 SDGs contribute to the preservation of the environment promoting sustainable practices for the benefit of future generations. The inventory can monitor the effects of implementing the 17 SDGs on the environment, climate change, decent work, sustainable livelihoods, physical and mental, work opportunities and the process of bringing about change. This monitoring will contribute to the development of the culture of sustainability.

Abstract 3996

CLIMATE ACTION THROUGH SUSTAINABLE LIVELIHOODS

Reichman W.*

OrgVitality ~ Larchmont, New York ~ United States of America

This presentation calls attention to the world's concern for the first eight of the 17 United Nation's 17 Sustainable Development Goals (SDGs), often to the detriment of the other nine, Chief among them, is SDG 13, Climate Action. Climate action is integral to the achievement of the other goals and especially to those related to work psychology as described in SDG 8 - Decent work and Economic Growth. Decent Work and Climate Action are rarely linked in research or in practice. The uncoupling Is absurd. How people work, what work produces, how much is produced, where it goes after it is consumed, impacts the ecosystem. Work affects climate. Likewise, climate change impacts how we work, what can be produced, how much gets made, and where it goes after it is consumed. Climate affects work. Climate and work are dynamically thereby interconnected, in a systems dynamic of Escalation.

One potential circuit-breaker is civic - pivoting a whole city from coal production into clean energy and high-tech occupations, as part of a just transition from carbon-dependent to carbon-free municipal economy. This pathway was chosen by the Polish city council of Katowice. Facing unemployment and pollution from over 50 mines, the city was Europe's sixth most polluted city in 2018 when its council replaced the coal mines with diverse and cleaner businesses. In order to enable a just transition, coal miners were offered free vocational courses to prepare them for work in clean energy production. Economically, Katowice has become one of Poland's top industrial, commercial and financial hubs. Crucially, the unemployment rate is only 1.5%, and wages generally are among Poland's highest. Thus, there has been Decent Work, Economic Growth, and a healthy environment.

Abstract 3997

FRAMEWORK OF PROFESSIONAL TRANSFERABLE COMPETENCIES FOR SUSTAINABLE DEVELOPMENT

Peiró J.M.*

University of Valencia ~ Valencia ~ Spain

To develop a culture of sustainability it will be necessary to promote the competencies necessary to develop and maintain it. Promoting and managing individual and collective actions toward sustainable development requires adequate human capital, professionals, policymakers, and other change leaders. With this in mind, our work is grounded in the field of system innovation. System innovation is the result of a transformation process in which actors navigate transitions, develop visions, and adapt them through searching and learning. This means that the appropriate competencies have to be available. This presentation will identify and provide a framework for the competencies people should master to contribute meaningfully to this cultural transformation. Specifically, it it will describe the validation process of the Climate-KIC Professional Competence Framework for system innovation. Climate-KIC is a European knowledge and innovation community, working towards a prosperous, inclusive, climate-resilient society based on a circular, zero-carbon economy.

To identify the key competencies for system innovation, we first identified the three main components: accelerating transitions, promoting innovation, and driving entrepreneurship. Through a wide search and careful study of the relevant literature, the core competencies for each of the aforementioned components were identified and structured in blocks. All of them were mapped, describing the core transferable competencies for each Green Economy transition and the skills/competencies identified were reviewed to examine to what degree they matched the competencies included.

To provide a more definite focus on system innovation, an integrated competence framework was developed which included five blocks of competencies, with four competencies in each block and four performance and four performance indicators for each competency. The description of the research and its outcome will present a unique process for developing individuals who will promote the culture and science of sustainability.

01 - Division 1: Work and Organizational Psychology

FRESH PERSPECTIVES ON WORKPLACE VIOLENCE & ITS PREVENTION

Friday 24 July 2026 from 11:00 to 12:00

(R-Arsenale)

Rosalind Searle (Rosalind Searle ~ Glasgow ~ United King), Chair and Presenter

This symposium explores workplace violence and abuse, which costs organizations around $1.97 trillion. Taking a fresh perspective, we consider the complexities of workplace aggression and sexual harassment and abuse, identifying evidence-based perspectives to advance detection, deterrence and amelioration of multi-level consequences.
First, Fida et al's focuses on Workplace Aggression, considers the gap between academic evidence and prevention conceptualisation and operationalisation in policy. Adopting a multi-actor and multi-level approach, they show how prevention is often vague, using compliance measures or generic training, rather than differentiated interventions that align with primary, secondary, and tertiary levels. They outline a different means to prevention.

Second, Brough and colleagues examine Workplace sexual harassment, which adversely impacts victims, observers, organisations, and society. They explore prevention focusing on workplace risks. Drawing from a Australian mixed methods project, cultivating safe workplace conditions resistant to sexual harassment, and the evaluation of key workplace interventions they transformed risk contexts supporting safer ways of working.

Next Bowen considers trauma-informed leadership, and the IRIS Model framework, identifying four critical domains in which integration is required to break cycles of harm: Intrapersonal (internal emotional regulation); Relational (interpersonal trust); Institutional (organisational structures); and Systemic (broader societal factors). By considering leaders we consider a group central for restructuring environments allowing people to bring their whole selves, connect authentically, and contribute meaningfully to collective transformation.

Finally, Searle and Garippa explore reporting of sexual harassment and abuse. They identify how reporting itself can add further and new levels for trust violation. They consider how to enhance regulation through a trauma-informed approach, and identify upstream areas to help reduce these incidents, enhance its early detection, and ameliorate further escalations. They offer an evidence-based approach identifying the different stakeholders and stages where change is required.

Our discussant Dr. Stone will conclude this symposium.

Abstract 3118

CULTIVATING SYSTEMIC SAFETY TO PREVENT WORKPLACE SEXUAL HARASSMENT

Brough P.*, Tuckey M., Davis A., Way K., Li Y., Moulds S., Moulding N., Mundkur A.

Paula Brough ~ Brisbane ~ Australia

Abstract (max 300 words)

Workplace sexual harassment is a serious global problem with significant adverse effects for victims, observers, organisations, and society. Despite its high prevalence, affecting approxiametly 20% of workers annually, workplace sexual harassment is preventable. In the work context, the greatest risks lie within workplaces rather than with workers per se; employees with the propensity to harass others are less likely to do so in certain work environments. This project tackles the challenge of cultivating safe workplace conditions resistant to sexual harassment through our focus on the risk contexts in which sexual harassment occurs in daily working life. Risk contexts reflect "systemic errors" in organisational functions that manifest in an elevated risk of harm; in this case, increased risk of sexual harassment. This paper reviews progress in workplace sexual harassment research and practice, including an evaluation of key workplace interventions that transform the risk contexts and support safer ways of working. The paper also summarises results to date from a large Australian mixed methods research project, designed to pioneer a new way of understanding and addressing workplace sexual harassment and to underpin a transformative shift towards organisational cultures of prevention rather than reaction. By extending knowledge of the risk contexts for workplace sexual harassment – what they are, how they are defined, and how they combine to increase risk – this project generates an evidence-based framework for understanding sexual harassment as a systemic issue. Hence an issue which can be addressed via a systematic organisational approach. The project demonstrates how we can transform the risk contexts for workplace sexual harassment and create systemic safety for all workers.

Abstract 3120

JOURNEY TO REPORTING: FURTHER SPACES FOR TRUST BREACH, OR A MEANS TO REPAIR

Searle R.*, Garippa L.

Searle, Rosalind ~ glasgow ~ United Kingdom

Abstract (max 300 words)Reporting sexual harassment and abuse can add further traumas to the individuals reporting. Staff in institutions receiving such reports often lack training to help them support those reporting. Drawing from a study of reporting harm, this session considers how and where reporting can be improved through the adoption of trauma-informed approach (Hope, et al., 2013). This approach is designed to enhance witnesses' experiences and reduce further shocks and surprises, specifically support witnesses' needs to restore their agency and control and create the means to rebuild their trust. We build from witnesses' insights into reporting using a trust framework to outline how and where reporting processes can be changed. We use multi-level trust theory (Gelfand and Fulmer, 2012) to identify where competence- and affect-based trust (Leegood, et al., 2022) can be positioned and utilised. This trauma-informed trust-framing can improve witnesses' emotion regulation that can enhance their event recall; It is designed to reduce epistemic injustices (Fricker, 2007) through specifically raising awareness of how to avoid testimonial and hermeneutic injustices and thus support better recovery through the means to retain and rebuild relational trust, and reduce witness identity-damage; and diminish risk of Institutional trust damage that will retain confidence in the systems and outcomes from reporting. This session will outline an more integrated prevention approach that can addresses simultaneously individual, relational, and systemic level trauma responses.

01 - Division 1: Work and Organizational Psychology

QUALITY OF WORKING LIFE AND STRESS IN ACADEMIA: A COMPARISON OF TOOLS AND EXPERIENCES

Friday 24 July 2026 from 11:00 to 12:30

(P -Arsenale)

Alessandra Falco (University of Padova ~ Padova ~ Italy), Chair
Barbara Barbieri (University of Cagliari ~ Cagliari ~ Ital), Discussant

Evolving social and economic pressures are reshaping universities, intensifying workloads through new technologies, internationalization, funding challenges, and administrative demands, which negatively affect academic staff's well-being and increase their psychophysical strain. Despite high workloads, meaningful work and job autonomy can protect academics, fostering energy and resilience through teaching and research activities. Similarly, key resources for technical and administrative staff include support from supervisors and colleagues, job autonomy, and organisational justice. Although the literature has highlighted several risk and protective factors affecting academic staff, further exploration is needed to better understand the relationship between psychosocial risk factors and the quality of academic life.

Building on the reflections of a QoL@Work group of the Italian Association of Psychologists, this symposium aims to contribute to understanding the factors influencing academic staff well-being by comparing methodologies and research experiences in different European academic contexts. The first contribution by Arcucci introduces a new tool designed to objectively assess the risk of work-related stress (W-RS) in academia, addressing both Italian legal requirements and the growing need for objective measures of W-RS risk. The second contribution by Bacci describes an empirical study based on data collected through five biennial surveys targeting the same population of researchers and professors within a large public STEM university in northern Italy. The empirical study by Papa investigates potential role-based differences – among researchers, associate professors and full professors - within an Italian university regarding job demands, resources, and job outcomes. In a fourth contribution Mol conducted a multilevel, multinational study on the contextual antecedents of mental health among researchers. Finally, the study by Elfering extends the reflection beyond academics to technical and administrative staff with the aim of investigating the antecedents and consequences of procrastination among scientific workers in a university faculty in Switzerland.

Abstract 3328

ENHANCING WELL-BEING IN ACADEMIA: DEVELOPING A TOOL TO ASSESS WORK-RELATED STRESS RISK AMONG ACADEMICS IN A MULTI-METHOD PERSPECTIVE

Arcucci E.*

University of Padova ~ Padova ~ Italy

Introduction. In a constantly changing economic and social environment, university employees are often faced with significant organizational changes, like internationalization and an increase in the number of students. These changes can have a negative impact on their psychosocial well-being and lead to an increase in work-related stress (W-RS). The Job Demands-Resources (JD-R) theory is applicable to different work environments and provides a valuable framework for examining job demands and job resources - risks and protective factors, respectively - associated with well-being and W-RS in academia.

Purpose. In response to both legal requirements (Italian Legislative Decree 81/2008) and the growing need for objective measures of W-RS, we introduce a new tool designed to objectively assess W-RS risk in academia. Based on a review of the literature and existing instruments, the tool - developed by psychologists from the Italian Association of Psychology (Quality of life at work) - examines context-specific risk and protective factors, as well as potential outcomes of W-RS (i.e., sentinel events) among academics.

Methods. In line with national guidelines and the European Agency for Safety and Health at Work (EU-OSHA), the tool includes three core areas designed to assess: (a) sentinel events as potential organizational indicators W-RS (e.g., formal complaints to the Head of Department, number of visits to university clinical and psychological services); (b) job content factors, which pertain to intrinsic job characteristics, including qualitative and quantitative workload, working conditions and equipment; (c) job context factors, encompassing organizational culture, interpersonal relationships, and roles in organization.

Discussion. After initial applications and validation across homogeneous groups of workers (e.g., assistant, associate, and full professors), the tool will provide a theoretically grounded instrument for a multi-method assessment of W-RS in academia (e.g., combined with self-report questionnaires). This approach has potentially significant implications for multi-level, evidence-based interventions aimed at promoting health and well-being in academia.

Abstract 3331

QUALITY OF LIFE AT WORK AMONG STEM ACADEMIC PROFESSORS. A DIACHRONIC ANALYSIS

Bacci G.*, Molinengo G., Converso D., Loera B.

University of Torino ~ Torino ~ Italy

Introduction. In recent decades, academia has undergone profound changes, reshaping the roles and expectations of university staff. Professors and researchers must now excel in teaching, research, funding, patenting outcomes, knowledge transfer, and institutional duties. While dynamic and stimulating, modern academic environments are increasingly demanding, impacting well-being and work-life balance and challenges intensified by COVID-19.

Despite growing interest in academic quality of life, most research remains cross-sectional, relying on general occupational health theories and measurement tools not specifically suited to academia, failing to capture its unique complexities.

Purpose. This study underscores the value of assessing academic quality of life through the repeated use of standardized tools, specifically tailored to the academic context.

Method. Data were collected through five biennial surveys (2017–2025) targeting the same population of researchers and professors within a large public STEM university in northern Italy. Path models analyzed protective and risk factors affecting psychological health. Additionally, latent class analysis identified distinct subgroups based on work engagement and health outcomes, including emotional exhaustion, cynicism, and behavioral stress.

Results. Over time, workload, rewards, and identification with the university emerged as key organizational factors influencing professors' well-being. The relational dimension of work, particularly interactions with administrative staff and students, played a dual role: while serving as a resource for well-being, it also contributed to stress and burnout. The academic workforce is not homogeneous but consists of natural subgroups with varying levels of resilience and psychological health patterns.

Conclusions. Systematic monitoring of professors' work-life quality is crucial for identifying distress and risk factors requiring targeted interventions. Effective monitoring relies on valid theoretical models and tailored assessment tools. This study is the first in Italy to apply this approach to a STEM faculty, offering a potential best-practice model to better assess quality of life in academia and inform the development of appropriate policies.

Abstract 3333

A MULTILEVEL MULTICOUNTRY INVESTIGATION OF THE CONTEXTUAL ANTECEDENTS OF RESEARCHER MENTAL HEALTH

Mol S.T.*

Amsterdam Business School, University of Amsterdam ~ Amsterdam ~ Netherlands

Introduction. In light of the 'mental health crisis in academia,' the EU-Funded Cost action (CA19117) Researcher Mental Health Observatory Consortium (ReMO) established the Survey Special Interest group in January 2022 with the ambition to conduct the largest ever benchmark on mental health in (European) academia.
Purpose. The specific objectives of the Sustainable Working Conditions in Academia (STAIRCASE) Survey that they developed were to i) examine the state of researcher mental health across institutions and countries, ii) examine what institutions are doing regarding mental health, and iii) examine how that which countries and institutions are doing is related to researcher mental health.
Based on a literature review, the following hypotheses were formulated:
Hypothesis 1: There is significant variance in mental health (symptoms of depression, anxiety stress (DASS), burnout, work engagement, and well-being at the individual, institutional, and country levels.
Hypothesis 2: Demands and resources manifest at individual, institutional, and country levels. Demands have a negative effect on indicators of mental health, whereas resources have a positive effect.
Example demands at respectively the individual, institutional, and country levels are illegitimate tasks, student-staff ratio, and corruption, and example resources at these respective levels are time until the end of the contract, aggregated frequency of appraisal interviews, and employment protection.
Methods. Data collection ran from September 2023 until August 2024 and yielded 3101 complete responses, with 30 countries having more than 25 responses, and data analysis is currently underway.
Results. The main findings about the hypotheses and lessons learned in running a multicounty-multilevel survey of this scope will be presented.
Conclusion. The STAIRCASE survey is one of the largest multinational surveys of research mental health conducted to date. Theoretical, practical, and policy implications will be discussed, and the audience will be invited and informed as to how to gain access to the open-source dataset.

Abstract 3335

PROCRASTINATION IN LECTURERS AND SCIENTISTS – FINDINGS ON POTENTIAL ANTECEDENTS AND CONSEQUENCES AT A SWISS UNIVERSITY

Elfering A.*

University of Bern ~ Bern ~ Switzerland

Background. The current questionnaire study explores antecendents and consequences of procrastination in academic employees of a university faculty in Switzerland. A model of procrastination as mediator is tested with qualitative overload as a predictor of procrastination and procrastination as a predictor of emotional exhaustion.

Method. All employees of the Faculty of Human Sciences (academic, technical, administrative, and service: N=507) were invited to participate in the survey via the institutional email distribution list. After data cleaning, the sample consisted of 36% (N=182) of the target group. Qualitative overload, procrastination, and emotional exhaustion were assessed by validated questionnaires. The mediation model was tested by use of the process model of Hayes.

Results. Procrastination was higher in PhD students compared to post-docs, lecturers, and professors. Procrastination was lower in tenured staff and was higher in scientists with current mental health problems or a recent history of mental health problems. Procrastination was higher in those with sleep problems and was related to less fruit consumption. There was no sex difference in procrastination. Qualitative work overload, procrastination, and emotional exhaustion were positively related. showed a significant indirect path (qualitative work overload -> procrastination -> emotional exhaustion, B = 0.047 SE = 0.015 CI 95% = 0.020 - 0.080). The significant indirect path remained significant when current of recent mental health problems were controlled in the mediation model (B = 0.036 SE = 0.014 CI 95% = 0.012 - 0.067).

Conclusion. Scientific work is complex and many scientists report qualitative work overload. Procrastination as a nonadaptive work style may be a consequence that increases the risk of emotional exhaustion as core of professional burnout. The current study points to workplace ergonomics, health behaviors, and health promotion recommendations, that are related to procrastination and might help to reduce procrastination in higher education staff.

ARTIFICIAL INTELLIGENCE AT WORK: FRIEND OR FOE?

Friday 24 July 2026 from 11:00 to 12:30

(O-Arsenale)

Vicente González-Romá (University of Valencia; ~ Valencia ~ S), Chair
Pascale Le Blanc (Eindhoven University of Technology ~ Ei), Co-Chair
Gudela Grote, Discussant

Artificial intelligence (AI) is changing the nature of work at a high speed (Bankins et al., 2024; Bick et al.
2024). AI is expected to affect 60% of jobs in advanced economies and 40% of jobs globally in the next two
years (Reuters, 2024). Considering its capabilities, its relative ease of use and accessibility, besides its
growing application in organizations, there is broad agreement in that AI is changing people's work
(Bankins et al., 2024; Parent-Rocheleau & Parker, 2022; Pereira et al., 2023).
What is less clear is how and what work aspects are affected. Previous research on some AI-based
developments (i.e., Algorithm Management) suggests that AI might have functional and dysfunctional
consequences (Ma et al., 2024; see Parent-Rocheleau & Parker, 2022). Due to the novelty of the subject,
there is a shortage of empirical studies addressing these issues, and consequently, a scarcity of evidencebased knowledge.
To address this problem, the four studies comprised of this symposium will analyze some of the influences
that AI has on several important work aspects. First, Arriagada and colleagues examine the influence of
Generative AI (GenAI) use at work on the five work characteristics considered in the SMART model (Parker
& Knight, 2023) and its indirect effect on work meaningfulness. The preliminary results obtained suggest
both functional and dysfunctional influences. Second, Vahlkamp & González-Romá's study investigates
whether GenAI use at work is a resource for work engagement. They examine the indirect effect of GenAI
use on work engagement via employee work ability. Third, Kirchner and Jensen investigate the influence of
AI on managerial work.Theirfindingsbased on interviews with managers suggest both opportunitiesand
challenges. Fourth, Maton et al., in two empirical studies, analyze how human explanations improve AI
augmented decision-making performance.Theyproposethatbiasesbasedonintuitiveandautomatic
thinkingleadtoover-relianceorunjustified rejection of AI advice,andthatdeliberateandreflectivethinking
supports appropriate reliance.Finally,GudelaGrotewilldiscussthestudies'findingsandcontributions.

Abstract 4042

GENERATIVE AI'S INFLUENCE ON JOB CHARACTERISTICS AND MEANINGFULNESS: THE MODERATING ROLE OF EMPLOYEE ATTITUDES

Arriagada M.*, González--Romá V., Ariño--Mateo E.

University of Valencia ~ Valencia ~ Spain

Background: This study examines the influence of Generative Artificial Intelligence (GenAI) use at work on various job characteristics, employing Parker and Knight's (2023) SMART model. Generative AI (an advanced type of artificial intelligence that creates original content by analyzing extensive datasets) has the potential to reshape workplace practices and change jobs. Given its transformative potential, it is crucial to understand the influence of generative AI on job characteristics and their subsequent impact on key psychological states such as work meaningfulness. Specifically, this study investigates GenAI's influences on perceived skill variety, autonomy, job feedback, social support, and role overload, and examines the indirect impact of GenAI use on perceived work meaningfulness through these job characteristics. Additionally, the study examines how individual attitudes toward GenAI moderate these relationships

Method: Date were collected at three time points separated by 1.5 months from a sample composed of Spanish employees working in various sectors. Moderated mediation analysis was implemented to estimate the examined relationships.

Results: Preliminary results based on the first wave of data indicate significant positive relationships between GenAI use and all the job characteristics considered (skill variety, autonomy, job feedback, social support, and role overload). Furthermore, preliminary findings suggest a positive indirect effect of GenAI use on job meaningfulness through the first four work characteristics, and a negative indirect effect via role overload. Moreover, attitudes toward GenAI significantly moderated the relationships between GenAI use and skill variety, autonomy, and social support, and the corresponding indirect effects. The involved positive relationships were higher as attitudes toward GenAI increase.

Conclusion: The use of GenAI at work represents a double-edged sword, generating both positive and negative indirect effects on job meaningfulness through different job characteristics. Organizations must carefully manage GenAI implementation to prevent negative consequences via increased role overload.

Abstract 4044

THE IMPACT OF ARTIFICIAL INTELLIGENCE ON MANAGERIAL WORK AND WELL-BEING

Kirchner K.*, Kjeldmand J.J.

Technical University of Denmark ~ Ballerup ~ Denmark

Recent advancements in Artificial Intelligence have sparked discussion of its impact on work processes and, thus, future work roles when organizations navigate the transformations to AI-supported businesses.
While current research focuses particularly on the AI impact on employees, there is limited understanding of its influence on managerial work, particularly regarding managers' tasks, roles, and well-being when their tasks are supported or automated by AI.
On the one hand, administrative and repetitive tasks can be delegated to algorithmic solutions, enhancing efficiency and freeing time for managers to focus on strategic decision-making and interacting with their employees.
On the other hand, algorithms can surpass managers by effectively integrating big amounts of data into decision-making processes, potentially challenging the relevance of traditional managerial tasks.
What are the broader implications of AI integration for managerial experience, including well-being considerations, role ambiguity, and professional identity?
Based on literature and interviews with managers in Danish organizations that have integrated AI into decision-making, this presentation will explore the influence of AI on managers.
We find that the integration of AI into managerial work possesses both opportunities and challenges. Managers tend to view AI positively when it improves decision quality but may experience stress if they perceive AI as a threat.
Future research should investigate these aspects further to ensure that AI integration not only supports organizational goals but also the well-being and professional development of managers.

Abstract 4045

BEYOND EXPLAINABLE AI: HOW HUMAN EXPLANATIONS IMPROVE (AI) AUGMENTED DECISION-MAKING PERFORMANCE. A MULTI-LEVEL FIELD AND EXPERIMENTAL STUDY

Maton K.*, Van De Calseyde P., Le Blanc P., Ulfert A.S.

Eindhoven University of Technology ~ Eindhoven ~ Netherlands

) Organizations increasingly use Artificial Intelligence-Driven Decision-Support Systems (AI-DSS) to augment employee decision-making and enhance decision-making performance. However, optimal employee reliance on AI-DSS remains a challenge, as employees often either over-rely on system recommendations or reject them due to intuitive aversion. Existing research focuses on AI explainability to improve employee reliance. However, the best performing algorithms are based on complex, opaque models, and opting for more transparent but less sophisticated models can reduce decision-making accuracy. This makes AI explainability less appealing in high-stakes organizational environments, and highlights the need for alternative interventions to promote appropriate employee reliance.

This research focuses on human cognitive engagement in augmented decision making. Building on dual-process theories, we propose that biases stem from Type 1 (intuitive and automatic) thinking, leading to over-reliance or unjustified rejection of AI-DSS advice. In contrast, Type 2 thinking (deliberate and reflective) supports appropriate reliance. Type 2 thinking can be activated by: (1) increasing information accessibility (as in AI explainability) and (2) prompting deliberate reflection. We propose that human explainability, wherein employees articulate their reasoning for adjusting AI-DSS outputs, fosters metacognitive engagement. Thus, employees are stimulated to critically evaluate their adjustments and calibrate their reliance, ultimately improving decision-making performance.

We conducted two studies in the context of demand forecasting. In a field study, we analysed thousands of decisions from 60 demand planners over three years, examining within-person (whether employees perform better in months where they provide more explanations) and between-person (whether employees who explain more perform better) effects. The second study experimentally manipulates explanation conditions, comparing AI explainability, human explainability and their combination in fostering appropriate employee reliance. Data is currently being collected and analysed, and results will be presented at the symposium.

Abstract 4043

IS GENERATIVE AI AT WORK A RESOURCE FOR WORK ENGAGEMENT?

INTERGENERATIONAL TRANSMISSIONS, ORGANIZATIONAL DYNAMICS, AND SYSTEMIC FRAGILITY

Friday 24 July 2026 from 11:00 to 12:30

(T-Monumentale)

Gabriele Giorgi (Università Europea di Roma ~ Roma ~ Ita), Chair
Cristina Giovanelli (Università Europea di Roma ~ Roma ~ Ita), Co-Chair
Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Discussant

In an organizational context that increasingly reflects the tension between individual identities, organizational pressures, and socio-economic instability, this symposium aims to investigate how these multiple forces contribute to shaping workers' well-being, values, and professional experience across diverse cultural and organizational contexts. Specific attention will be given to the role of sustainability, both social and organizational, as a guiding framework for promoting equitable, inclusive, and health-oriented workplaces. This symposium brings together 4 international contributes from Italy, Serbia and Spain.
The first contribution investigates the Serbian teaching profession, illustrating how shifting socio-political crises and job insecurity erode professional dignity and intensify burnout risk.
The second paper, based on data from Italian real estate companies, analyzes how workload and digital connectivity affect work–family conflict and organizational sustainability through the Job Demand–Control–Support Model.
The third contribution focuses on migrant workers in Italy, addressing how intergenerational transmissions of work values interact with power relations and perceived justice in multicultural organizations.
Finally, the fourth study explores workplace experiences of transgender and LGB+ employees in Spain, highlighting how the interaction of gender identity and sexual orientation shapes visibility, discrimination, and well-being at work.
Together, these contributions lighten the systemic fragilities and strengths that emerge where cultural, intergenerational, and organizational forces intersect. The symposium proposes an integrative framework linking micro-level identity processes with macro-level and socio-economic pressures in an era of global instability and challenges. Additionally, this symposium aligns with the United Nations' Sustainable Development Goals (SDGs 3, 5, 8, and 10), advocating for inclusive and sustainable workplaces that promote dignity, belonging, and equity.

Abstract 4167

EXPLORING THE INTERSECTIONALITY OF GENDER IDENTITY AND SEXUAL ORIENTATION IN WORK EXPERIENCES OF TRANSGENDER PEOPLE IN SPAIN

Ortiz--Salado R.[1], Corlett S.*[2], Arenas A.[1], Di Marco D.[1]

[1]Universidad de Sevilla ~ Sevilla ~ Spain, [2]University of Valladolid ~ Valladolid ~ Spain

Despite the legislative progress in terms of employment protection for LGBT+ people in Spain, transgender people continue to face unequal treatment in access and during their professional career paths compared to their cisgender counterparts. Less is known about what is the role of sexual orientation in work experiences of transgender individuals. This qualitative study focuses on exploring the intersection of gender identity and sexual orientation in the career paths of transgender people in the Spanish workplace. The participants were two transgender non binary, four trans women and seven trans men. Regarding their sexual orientation,participants were seven bisexuals, two heterosexuals, two homosexuals, one queer and one indeterminated sexuality. Through 13 semi-structured interviews, three main themes were identified: (1) decision to make identity (in)visible, (2) structural and interpersonal discrimination and its impact on the individual and (3) informal and formal support and its influence on individual well-being at work. In the first main theme, the interactive role of trans identity and sexual orientation was observed when managing both identity dimensions, especially when it came to revealing two socially stigmatized identities. Moving on to the second theme, the consequences of revealing trans identity and, in some cases, a non-heterosexual identity, did not reveal unique forms of oppression resulting from the intersection. In this regard, various forms of discrimination motivated by trans identity were exposed. Finally,the third theme highlighthed the importance of the role of organizational support in the visibility and well-being of trans people regardless of their sexual orientation. This study underscores the need to implement organisational policies that establish the starting point for the integration and creation of an inclusive organisational culture for transgender employees.

Abstract 4168

CRACKS IN THE WELLBEING OF THE TEACHING PROFESSION: THE COLLAPSE OF A SINGLE RAILWAY STATION CANOPY AS A REFLECTION OF SYSTEMIC FRAGILITY

Petrovic I.*, Vukelic M., Cizmic S.

University of Belgrade ~ Belgrade ~ Serbia

Teachers have long been recognized as a professional group at high risk of burnout. Through the lens of three “snapshots” of teachers from Serbia, we explore the role of contextual factors in shaping teacher wellbeing and burnout.

The first snapshot, taken in 2010—ten quiet years after the so-called October Revolution—revealed that teachers perceived their profession as hardworking, energetic, reliable, sincere, honest, and intelligent, as assessed by an adapted version of the Jennifer Aaker Brand Personality Scale. On a higher-order level, teaching was characterized by uniqueness, modernity, and excitement. Teachers were moderately satisfied with their jobs; although salaries were perceived as low, they were rarely cited as a reason to leave the profession.

The second snapshot, from 2023, followed a tragic school shooting in which ten people were killed. Preventive measures introduced afterward imposed additional responsibilities and emotional demands on teachers. Using the Burnout Assessment Tool (BAT), we identified low to moderate levels of burnout across the sample.

The third snapshot, from 2025, captured the so-called Students’ Uprising—a period of widespread public protests triggered by the collapse of a newly refurbished train-station canopy in Novi Sad that killed sixteen people. This political turmoil further reduced teachers’ job autonomy, increased administrative workload, and heightened job insecurity—particularly among those employed on temporary contracts who participated in protests. Job insecurity was significantly associated with burnout, while perceived organizational support served as a protective factor. However, political polarization within schools deepened divisions among teachers.

These three moments illustrate how shifting social and political contexts continuously shape the wellbeing of teachers. We argue that the decades-long cascade of systemic collapse—symbolized by the fall of a single railway-station canopy—reflects a broader disintegration of dignity and wellbeing within the teaching profession and raises questions about career sustainability

Abstract 4169

POWER, BELONGING, AND WORK VALUES: INTERGENERATIONAL TRANSMISSION AND ORGANIZATIONAL DYNAMICS AMONG ITALIAN MIGRANT WORKERS

Ruggieri S.*, Bonfanti R.C.

Università degli studi di Palermo ~ Palermo ~ Italy

Workplaces represent crucial arenas in which individuals not only perform tasks but also negotiate meanings, identities, and personal, cultural, and organisational values. Within multicultural organisations, these processes often unfold amid power asymmetries and subtle exclusionary dynamics affecting ethnic minorities. This study examines how the transmission and negotiation of work values intersect with experiences of negative acts and power relations among first- and second-generation migrant workers in Italy. Drawing on theories of work socialisation and organisational justice, the study conceptualises the workplace as a site of secondary socialisation where values inherited within the family context (such as morality, religion, loyalty, or respect for hierarchy) may conflict with organisational norms typical of cultures different from one's own (e.g., Italian culture), which tend to emphasise autonomy, self-expression, and meritocracy. Such discrepancies can create fertile ground for misunderstanding, marginalisation, or microaggressions within the workplace, particularly when the values of minority groups are unacknowledged or delegitimised. In light of these premises, an exploratory mixed-methods study is presented. The quantitative phase employs standardised measures of work values, perceived organisational justice, and exposure to negative acts in a sample of migrant and non-migrant employees from the Italian service sector. The qualitative phase includes semi-structured interviews designed to capture intergenerational narratives of work value transmission and personal experiences of microaggressions in the workplace. Preliminary findings suggest that greater perceived discrepancies between personal and organisational values are associated with higher exposure to negative acts and a lower sense of belonging. However, second-generation migrants appear to exhibit more flexible and integrative value orientations, which buffer the impact of power asymmetries. The study underscores the importance of recognising diverse systems of work values within organisations as a strategy to mitigate power imbalances and to promote inclusive and equitable workplaces.

Abstract 4170

THE IMPORTANCE OF WORK–FAMILY BALANCE: AN EMPIRICAL ANALYSIS OF WORK-RELATED STRESS

Giovanelli C.*, Spoliti V., Alessio F., Giorgi G.

Università Europea di Roma ~ Roma ~ Italy

In a rapidly evolving and digitized professional environment, understanding how individuals balance work and family life has become crucial for promoting psychological well-being and organizational sustainability. This study aims to investigate the relationships among perceived workload, digital connectivity, and work–family conflict within the theoretical frameworks of the Job Demand–Control–Support Model (Karasek & Theorell, 1990) and the Work–Family Conflict Model (Greenhaus & Beutell, 1985) in the real estate companies.

A total of 146 employees from the Italian branch of Engel & Völkers, a global real estate company, participated in the study. Data were collected via an online survey including the Stress Questionnaire (Giorgi et al., 2015) and the Work–Family Conflict Scale (Netemeyer et al., 1996). The survey was conducted in 2025 with voluntary and anonymous participation. Statistical analyses (ANOVA, correlation, and mediation models) were performed using Jamovi 2.6.13 version.

Results revealed that perceived workload was the strongest predictor of work–family conflict ($\beta = 0.7453$, $p < .001$), while digital connectivity did not significantly mediate this relationship. Contrary to expectations, neither gender nor parental status influenced the perception of work–family conflict, suggesting a possible cultural shift in role distribution. However, significant differences emerged by age and job role: employees aged 31–40 reported the highest workload and administrative staff perceived higher work pressure than real estate agents. Interestingly, digital engagement increased with age, reflecting the growing digital competence of older professionals.

These findings emphasize the central role of workload in generating inter-role conflict and highlight the limited compensatory function of digital connectivity. Promoting a supportive organizational culture and realistic workload management emerges as essential to sustain employee well-being and work–life balance in contemporary workplaces.

WORK WELLBEING & LEADERSHIP IN TURBULENT TIMES

Friday 24 July 2026 from 12:00 to 13:00

(R-Arsenale)

Paula Brough (Griffith University ~ Brisbane, Queensla), Chair and Discussant

How to prevent, treat, and manage occupational stress and maintain employee wellbeing effectively are longestablished
problems that are increasingly expensive to organisations. This symposium discusses the increased
recognition of effective leadership for the prevention and management of occupational stress and the maintenance of
healthy and thriving workers. This symposium draws on our applied organisational psychology expertise from three
countries and consists of five presentations describing our evidence-based programs. The presenters consist of both
academic researchers and practitioners in this field.
Paper 1 presents results of a study assessing the sustainable implementation of a new Artificial Intelligence system for
healthcare workers. The assessment includes pre and post measures of key job characteristics, including technostress,
to ensure minimal negative impacts for these workers' psychosocial safety and wellbeing. Paper 2 discusses the results
of a systematic review assessing the impacts of psychological flexibility upon work-related wellbeing. The review highlights the need for a more nuanced, workplace-specific understanding of psychological flexibility, and its impacts
fro both leaders' and employees' wellbeing.Paper 3 discusses emerging leadership models in this era of volatility,
uncertainty, complexity, and ambiguity (VUCA) and the clear need for in-person training focused on social learning
principles.The paper provides examples of practical leader development models, techniques and practices designed to
develop collective leadership in order to enhance employee wellbeing.Paper 4 discusses how assessing wellbeing for
high-risk of stress workers is focused on not an absence of stress, but rather assisting these employees to 'work with'
the presence of perpetuating and external stressors beyond their control.The paper discusses how recent turbulence
experienced by many of our workplaces, is an opportunity to positively shift the focus towards 'new ways to work',
creating engaged and resilient teams and hybrid workforces.Finally, Paper 5 discusses how the 'visibility paradox' in
hybrid workplaces is a new significant challenge for both workers and managers.The paper describes how
technological surveillance systems generate employee performance data which is under-utilised by increasing anxious
leaders.

Abstract 4353

DEVELOPING COLLECTIVE LEADERSHIP IN TURBULENT TIMES

Webster V.*

Griffith University ~ Brisbane, Queensland, ~ Australia

Traditional leadership models no longer suffice in today's VUCA world—characterised by volatility, uncertainty, complexity, and ambiguity. In these turbulent times, the ability to adapt, innovate, and collaborate isn't just beneficial—it's essential to embrace disruptive opportunities. Driven by the acceleration of connectivity and cognitive technology, including AI and robotics, almost every job is being reinvented, causing leaders to reconsider how they design roles, organise work (clarify the boundaries between humans and machines) and grow their businesses for future sustainability. When executive leaders share responsibility and empower their teams through collective
leadership, they unlock a reservoir of resilience and innovation that no single individual can achieve alone. The strength of collective leadership lies in its ability to transform complexity into opportunity. In the face of all types of turbulence, it's a shared vision and collaborative spirit that will steer executive and senior leadership teams toward sustainable success. We must move beyond a focus on developing leadership skills and competencies. Developing executives and managers to lead in turbulent times requires
social learning to provide them the opportunity to change their mindset or worldview. In-person social learning allows for a more holistic understanding and approach to challenges through open dialogue with peers, enabling mutual learning as participants leverage their personal experiences and those of their peers within their specific cultural and political context. Taking a collaborative, in-person approach to leader and leadership development responds to the critique that leadership practitioners have focused on behavioural outcomes over cognitive and affective/motivational outcomes, skill acquisition and competencies over leadership maturation, and individual over collective outcomes. Practical leader development models, techniques and practices that are designed to develop collective leadership will be shared.

Abstract 4354

CONSIDERATIONS FOR ESTABLISHING THRIVING WORK WELLBEING AND LEADERSHIP INTERVENTIONS

Muller W.*

Griffith University ~ Brisbane, Queensland, ~ Australia

The transactional Stress and Coping Model describes stress as an individual decision based on one's cognitive appraisal, where demands are perceived to be stressful according to the subjective negative appraisal of the person experiencing it. This framework has greatly influenced organisational psychological perspectives for the explanation of stress and wellbeing in the workplace, emphasising appraisal, engagement, and resilience for how individuals and teams feel, behave, and react at work. Arguably though, traditional views of stress as a linear process aimed at 'eliminating' singular threats do not generally represent workplace environments. Nor does the notion that workplaces focus on specific stressors or strain effects. For many leaders and teams, wellbeing is not perceived to be the absence of stress, but rather, accepting how to 'work with' the presence of perpetuating and external stressors beyond
their control, regardless of their individual or collective cognitive appraisal/s.
Workplace turbulence impacts labour shortages, work demands and expectations, both disrupts and reforms how work is conducted. When unaddressed, concerns related to communication, micromanagement, fairness, work life balance and the impact on relationships at home are reported. Three contributions are offered from a practical perspective: understanding occupational versus organisational stress, implementation of
the tripartite model, focus on human needs. Turbulence, then, is an opportunity to positively shift the focus towards 'new ways to work', creating engaged and resilient teams and hybrid workforces. It is imperative that wellbeing interventions evolve to align with the realities of how stress is truly experienced and the manifestations for individuals at work and home.

Abstract 1469

UNDERSTANDING AI ADOPTION IN THE JOB SEARCH: PERCEPTIONS, EMOTIONS, AND BEHAVIOURAL INTENTIONS AMONG EARLY-CAREER INDIVIDUALS

Bansal S.*, Petruzziello G.

University of Bologna ~ Cesena ~ Italy

Introduction
Job search is considered an essential activity that individuals engage in at various stages of their careers. Artificial Intelligence (AI) is revolutionising this landscape, yet very little is known about the motivations driving early-career individuals to adopt AI tools in their job search process.

Purpose
Therefore, this study aimed to investigate how perceptions and emotions influence behavioural intentions to use AI-based job search tools. Drawing on the Theory of Reasoned Action, the Technology Acceptance Model, and the Career Self-Management framework, we tested a moderated serial mediation model. Specifically, we examined whether Perceived Ease of Use (PEOU) predicts Behavioural Intention (BI) through Perceived Usefulness (PU) and Positive Attitude (PA), and whether Job Search Self-Efficacy (JSSE) moderates this indirect relationship.

Method
For the purpose of this study, the data were obtained from a sample of 179 university students and recent graduates in Italy, who were invited to complete an online questionnaire with the psychometric scales measuring the core variables.

Results
The results supported proposed serial mediation (PEOU → PU → PA → BI), highlighting the importance of combining cognitive and emotional variables in the adoption of AI in the Job search process. However, JSSE did not significantly moderate the indirect relationship, suggesting that although job search self-efficacy is essential to motivate job search behaviours, it might not shape early-career individuals' decisions to adopt AI tools for job seeking.

Conclusions
The findings from this research extend the existing models by showing that cognitive, emotional, and motivational factors might help in shaping job seekers' intentions to use technology. They also suggest some practical ways to improve AI-based job search tools, making them more user-friendly while catering to job seekers' emotional and psychological needs.

Abstract 2596

AI ADOPTION IN HIGH-STAKES PUBLIC SECTOR ENVIRONMENTS: PRESERVING HUMAN DIGNITY AND AGENCY

Devita--Cochrane C.*[1], Smith B.[2]

[1]Booz Allen ~ McLean, Virginia ~ United States of America, [2]Booz Allen ~ Stuttgart ~ Germany

Introduction:
Artificial intelligence (AI) is transforming high-stakes public institutions such as defense, intelligence, healthcare, and public utilities. While these technologies can improve speed and consistency, they also risk eroding human agency, accountability, and dignity. Applied psychology provides essential tools for designing AI adoption processes that enhance, rather than diminish, human judgment and responsibility.
Purpose:
This presentation introduces a graded adoption framework grounded in behavioral science and sociotechnical systems theory. The framework emphasizes three interdependent pillars: transparency, employee voice, and continuous learning, to support ethical and psychologically sustainable AI integration and efficient adoption.
Method:
The model advances through five structured stages, each producing observable organizational deliverables:
(1) Use-case cards to identify purpose, clarify problem framing, classify risk, provide paths for reversibility, and define oversight level for each application
(2) Transparency pilots that build trust through visible disclosure of algorithm logic, data sources, access and performance limits, accompanied by internal registries and algorithm fact sheets
(3) Structured dissent mechanisms for employee voice integration (e.g., “challenge-the-model” sessions and continuous access to communication pathways during iterative development and implementation) to promote psychologically safe, critical engagement
(4) Defined human-in-the-loop roles with micro-credentialed upskilling pathways
(5) Post-deployment learning reviews to integrate operational insights into model refinement and workforce development.
Results:
Preliminary findings from public sector pilots show improved employee engagement, confidence in overriding algorithmic recommendations, improved adoption of AI tools, and calibrated trust in AI-assisted systems.
Conclusions:
By aligning behavioral science, ethical climate, and organizational learning, this staged framework demonstrates how applied psychologists can help public institutions adopt AI responsibly. The approach provides measurable pathways to preserve dignity, foster

trust, and ensure that automation amplifies, rather than replaces, human expertise.

Abstract 4603

MENTALIZING THE DIGITAL SELF: NEUROCOGNITIVE MECHANISMS BEHIND PERSONAL BRANDING, EMOTIONAL RESONANCE, AND AUDIENCE RESPONSE ON LINKEDIN.

Haro Leon I.E.*

Institute of Psychiatry, Psychology & Neuroscience (IoPPN), King's College London ~ London ~ United Kingdom

Digital platforms such as LinkedIn have transformed how organizational leaders present themselves and engage with professional networks. Despite the increasing frequency of emotionally charged content in these environments, the cognitive and emotional processes that affect leaders' responses remain poorly understood. This research proposal aims to investigate how mentalization, the capacity to understand one's own and others' mental states, and emotion regulation interact with cognitive load and digital engagement when leaders face compassionate empathy versus personal distress content online. Leadership tenure and seniority will be examined as key moderating variables. A mixed-methods, within-subjects experimental design will be implemented with a sample of 60 to 100 leaders and managers active on LinkedIn. Participants will view validated LinkedIn-style posts differing in affective tone, with responses measured through established psychometric instruments (MentS, DERS/ERQ, NASA-TLX, PANAS, IRI) and open-ended qualitative questions. Quantitative analysis will test mediation and moderation effects, while thematic analysis will explore leaders' subjective experiences. It is hypothesized that compassionate empathy content will promote higher engagement and lower cognitive load, especially among leaders with greater experience. Findings are expected to advance the theoretical understanding of digital leadership, inform the design of psychologically safer digital environments, and support interventions to enhance executive well-being in the digital age.

Division 1: Work and Organizational Psychology Division 4: Environmental Psychology SDG 9: Industry, innovation and infrastructure SDG 3: Good Health and Well-being

Abstract 2287

SOCIAL WELL-BEING AND PSYCHOLOGICAL SAFETY IN GENAI-AUGMENTED ORGANIZATIONS

Norkin S.L., Kirchner K.*

Technical University of Denmark ~ Ballerup ~ Denmark

GenAI-augmented organizations, those integrating Generative AI into daily work, see GenAI as a new type of employee embedded within their social structures. GenAI conducts work tasks, adjusts roles and functions, and learns how to improve. As GenAI adoption rapidly increases, we must understand how it impacts social relationships and, consequently, social well-being and psychological safety in the workplace.

This study, based on 29 qualitative interviews with managers from knowledge-intensive, GenAI-augmented organizations, seeks to answer: In what ways does GenAI influence social relationships within these organizations?

The thematic analysis indicates that GenAI alters the patterns of social relationships, both positively and negatively. When employees preferentially ask for advice from GenAI, they reach out to their more experienced colleagues less often. Moreover, it appears that interacting with GenAI leads to deeper working in silos, which hinders the development of social relationships across organizations. In addition, our findings also indicate changes in communication when there are fewer status meetings, and the agendas of the conducted meetings encompass more discussion related to more complex problems than before. Furthermore, the use of GenAI may lead to new forms of collaboration, shaping new social relationships and deepening existing ones.

We conclude that the use of GenAI appears to have a profound impact on how social relationships are shaped and nurtured in GenAI-augmented organizations. Given that social interactions underpin the foundation for social well-being, psychological safety, and company culture, the influence of GenAI extends to these critical organizational outcomes. The findings underscore the need for established guidelines on the use of GenAI regarding ethics and responsibility. Moreover, managers have a special responsibility to shape social well-being in GenAI-augmented organizations, as they establish and deepen social relationships as part of the organizational HR and workforce development strategy.

Abstract 2372

IT IDENTITY WORK AND COGNITIVE DISSONANCE: TOWARDS A MODEL FOR ADAPTING TO TECHNOLOGICAL CHANGES IN ACADEMIA

Tolken R.*, Carrim N., Maree D.

University of Pretoria ~ Pretoria ~ South Africa

Introduction

This study highlights how people perceive and react to technological change by introducing a model that investigates the connection between IT identity work and cognitive dissonance.

Purpose

Was to find out how South African academics cope with growing demands on their use of technology in their work and in their daily lives.

Method

A qualitative methodology was used where 30 South African academics were interviewed using in-depth interviews using purposive sampling. Grounded theory was used to explaining the results of the study and to develop the model.

Results

A model was developed for the intensity of IT identity work, depicting three different intensity levels – low, moderate and high. The process of engaging in these different levels of intensity is not unidirectional from low through moderate to high. Instead, the direction of change in intensity varies with the ebb and flow of cognitive dissonance experienced, increasing when the individual confronts new technological challenges and subsiding when they are mastered. Low intensity signifies IT identity formation in childhood through schooling and at home. Moderate intensity signifies quick changes needed to adapt one's current IT identity, for example, learning how to use a new computer programme. High intensity signifies cognitive dissonance experiences due to forced changes in the environment, for example the COVID-19 pandemic as well as getting use to the imminent 4th industrial revolution and use of AI in our daily lives.

Conclusion

The focus of this study was on the IT identity work academics engage in upon experiencing cognitive dissonance when forced to use unfamiliar technology in their daily work activities. The overarching research purpose was to establish a model on the identity work academics engaged in as well as the intensity of their identity work.

Abstract 2693

DIGITAL WORK AND WELLBEING IN HEALTHCARE: EXPLORING ORGANISATIONAL SUPPORT AND TECHNOSTRESS THROUGH A MIXED-METHOD APPROACH

Pernice A.*[1], Kowalski T.[2], Angeli F.[2]

[1]LUISS Guido Carli University ~ Rome ~ Italy, [2]University of York ~ York ~ United Kingdom

Introduction:
The digital transformation of healthcare systems has become a strategic driver for improving efficiency and quality of care. However, it also introduces new psychosocial risks. Healthcare professionals, such as physicians, nurses, and administrative staff, are increasingly required to manage complex digital tools, high information flow, and continuous technological adaptation. These challenges can generate technostress, impacting well-being, work engagement, and performance.

Purpose:
This study investigates the relationship between technostress, perceived organisational support, and occupational stress among healthcare professionals in Italy. It examines how organisational and individual factors interact to shape digital well-being, while also exploring differences and configurations across professional clusters (physicians, nurses, and administrative staff) to capture diverse experiences and support needs.

Method:
A mixed-method approach was adopted, combining quantitative and qualitative data. Structured questionnaires were administered to a sample of 94 healthcare professionals from various disciplines and organisational roles, measuring levels of occupational stress, organisational support, and technology-related challenges. Additionally, semi-structured interviews provided in-depth insights into professionals' experiences, perceptions of digital change, and coping strategies. The integration of both data types enabled the identification of patterns and differences across professional groups.

Results:
Preliminary findings reveal that insufficient organisational support and digital complexity exacerbate occupational stress, while teamwork, open communication, and supportive leadership act as protective factors. Cluster analyses highlight notable differences: physicians report stress linked to information overload and system integration challenges; nurses experience tension from balancing clinical and digital tasks; and administrative staff show difficulties in adaptation and digital training.

Conclusions:
The study emphasises the need to embed digital well-being and psychosocial support strategies within organisational digitalisation processes. Promoting digital competence, supportive leadership, and participatory change management can reduce technostress and foster professional resilience. These findings contribute to building sustainable and human-centred digital innovation in healthcare.

Abstract 1222

WHEN ACCESS IS NOT ENOUGH: THE ROLE OF WORKPLACE FOMO IN THE USE OF FLEXIBLE WORK ARRANGEMENTS

Ariño--Mateo E.*, Villajos E., Soriano A.

University of Valencia ~ Valencia ~ Spain

Flexible work arrangements, such as teleworking, are increasingly being offered by organizations, yet availability does not necessarily translate into employee utilization. Understanding the factors that influence their effective and actual use has, therefore, become essential. This study examines the relationship between employees' availability to flexplace and their subsequent use of it, controlling for baseline use. Specifically, we test whether the two facets of workplace Fear of Missing Out (wFoMO), informational and relational, moderate this relation. Using a three-wave, time-lagged design with 99 employees (employees' availability to flexplace measured at T1, wFoMO at T2, and use of flexplace at T3), we estimated a structural equation model. Consistent with our hypothesis, the informational dimension of wFoMO significantly weakened the positive association between employees' access to flexible work and their subsequent use. Worries about missing important updates or knowledge made employees less likely to turn flexible work access into actual use. The relational dimension was not significant. These findings highlight the importance of psychological factors in shaping the effectiveness of organizational flexibility policies and suggest strategies to support employees in leveraging available work options. We discuss implications on proactive flexibility practice, emphasizing the need for information-management routines (e.g., reliable asynchronous updates) to mitigate informational wFOMO and enable employees to take advantage of flexible work options.

Abstract 398

NAVIGATING THE NEW NORMAL: HOW TRANSFORMATIONAL LEADERSHIP AND BOUNDARY CONTROL INFLUENCE DAILY WORK-HOME SPILLOVER VIA RESOURCE- AND DEMAND-BASED PATHWAYS

Grau I.*, Berger R.

Universitat de Barcelona ~ Barcelona ~ Spain

The growing blur between work and home boundaries—exacerbated by digitalization, remote work, and constant connectivity—makes daily employee well-being a pressing concern for organizations and society. Responding to calls from the International Labour Organization (ILO) and the European Agency for Safety and Health at Work (EU-OSHA) to improve psychosocial risk management, this study addresses a critical gap by moving beyond static, cross-sectional research and investigating the dynamic, everyday interplay between work and home domains. Specifically, we examined how transformational leadership (TFL) and boundary control—as stable organizational and personal resources—shape daily experiences of job autonomy and job demands, and how these, in turn, mediate both positive and negative work-home spillover.

Using the Work-Home Resources (W-HR) model, we conducted a two-week daily diary study among 88 full-time employees in Spain (N=844 observations). Multilevel path analysis showed that personal boundary control—rather than TFL—was a robust predictor of both greater daily autonomy and lower job demands. These, in turn, were associated with reduced negative, and for job demands, increased positive work-home spillover. The influence of TFL on these daily processes was limited, emphasizing the central role of employees' personal agency in managing boundaries, particularly in flexible, post-pandemic work settings.

Our findings provide timely, evidence-based recommendations for organizations seeking to foster sustainable work-life integration and enhance employee well-being, including actionable strategies to strengthen boundary control and redesign work demands. By highlighting the importance of boundary management alongside supportive leadership, this research supports progress toward the United Nations' Sustainable Development Goals (SDGs)—specifically SDG 3 (Good Health and Well-being) and SDG 8 (Decent Work and Economic Growth). Implications for policy and organizational practice are discussed.

Abstract 227

TO TRUST AND FEEL TRUSTED? THE ROLE OF FREQUENCY AND QUALITY OF INTERACTIONS FOR TRUST DEVELOPMENT AMONGST TELEWORKERS

Kaltiainen J.*

Finnish Institute of Occupational Health ~ Helsinki ~ Finland

Introduction
In the evolving nature of work, hybrid work and telework are among the most prominent phenomena, allowing employees to work entirely or partially outside their employer's physical location while communicating and operating through information technology. While hybrid work and teleworking arrangements are arguably more prevalent than ever, many have raised concerns that the physical separation amongst employees compromises workplace trust. Despite these concerns, research evidence indicating that telework negatively impacts workplace trust is limited.

Purpose
We hypothesize that telework may both diminish and promote trust via two pathways. Telework may diminish trust through less face-to-face interactions which subsequently may lead to less positive perceptions of co-workers' behaviors (friendliness and performance as team members) and subsequently to less trust amongst co-workers. Conversely, teleworking may promote trust via more electronic interaction which may lead to more positive perceptions of co-workers' behaviors.

Methods
We used two-wave data from two Finnish organizations, with 1203 participants who worked remotely. We employed structural equation modeling to analyze latent changes between November-December 2023 and May-June 2024.

Results
Increased telework was associated with decreased face-to-face interactions but not with changes in electronic interactions. Face-to-face and some of the electronic interactions were associated with increased perceptions of co-workers' friendliness and team proficiency, which in turn were associated with increased trust towards co-workers and felt trust from co-workers. Indirect effects of increased telework on decreased trust via reduced face-to-face interaction were significant, while those via electronic interactions were not.

Conclusions
Our study illuminates why telework may diminish trust and felt trust amongst co-

workers. Telework may reduce trust due to less face-to-face interaction, emphasizing the importance of maintaining such interactions. Electronic interactions, while helpful, may not fully compensate for the loss of face-to-face interactions. The findings contribute to understanding hybrid work and trust dynamics.

Abstract 832

FACILITATING AND HINDERING EFFECTS OF TELEWORK: THE ROLE OF PSYCHOSOCIAL CONDITIONS, JOB CONTENTS AND WORKING MODALITIES .

Massoudi K.*[2], Giauque D.[1], Pacht S.[1], Duc N.[1]

[1]IDHEAP (Swiss Graduate School of Public Administration) ~ Lausanne ~ Switzerland, [2]Institute of Psychology, University of Lausanne ~ Lausanne ~ Switzerland

Telework has become a common working modality in most OECD countries (Chênevert et al., 2023), implemented by many organizations to respond to employees' needs, while realizing cost reductions and maintaining high performance. However, the literature on the consequences of telework, both for employees and organizations, offers unclear or equivocal results (see Charalampous et al., 2019). Some studies highlight positive outcomes in terms of increased productivity, greater autonomy, or lower emotional exhaustion and turnover intentions, whereas others indicate negative outcomes such as greater professional isolation, less organizational commitment, or more work-life conflicts. Moreover, studies also suggest that the direction and the magnitude of these effects may depend on the intensity of telework, and the characteristics of a specific job.

This study draws on the Job Demands-Resources model (Bakker et al., 2014) to investigate employee's perceived working conditions and well-being under different working modalities (fully on site, hybrid or fully remote). Data was collected through a questionnaire completed by a semi-representative sample (N = 1'683; 52% F) of employees in a Swiss University. Preliminary results highlight a general positive perception of hybrid telework (2 days per week), mainly because it facilitates task performance and work-life balance without jeopardising relations with peers or supervisors. However, respondents with managerial duties perceive telework as hindering their supervision tasks and undermining their team's cohesion. Furthermore, tenured academics reported higher levels of engagement and satisfaction, while experiencing difficulties to detach from work and maintain work-life balance. Finally, Partial Least Squares Structural Equation Modelling (Becker et al., 2023) will be conducted to test the moderating effect of different working arrangements on the relation between working conditions and well-being outcomes.

The application of our results for optimizing telework will be discussed, namely in terms of boundary management strategies for specific employees, or adapted management practices to supervise remote workers.

Abstract 826

THE INTERPLAY OF TECHNOSTRESS, WORK-FAMILY CONFLICT, AND RESILIENCE IN PREDICTING LIFE SATISFACTION, STRESS, AND ANXIETY IN HYBRID WORK

Olckers C.*, Koekemoer E.

University of Pretoria ~ Pretoria ~ South Africa

Introduction: While hybrid work environments offer increased flexibility, they often blur the lines between personal and family life. Without clear support systems in place, these environments can heighten stress and anxiety, leading to reduced life satisfaction—especially when employees become overly dependent on digital tools, face constant connectivity, and encounter unclear expectations.

Purpose: Against the backdrop of the Job Demands and Resources Model, Conservation of Resource Theory and Work-Home Resource Theory, this study explores the effect of technostress on employee well-being – specifically life satisfaction, anxiety and stress – in a hybrid work environment. Additionally, the research investigates how work-family conflict mediates the relationship and how psychological resilience moderates it.

Method: The study employed a quantitative, cross-sectional survey design using convenience and snowball sampling methods. It involved 480 South African employees working under hybrid arrangements, and relationships among the constructs were examined using structural equation modelling.

Results: The findings confirm that technostress is significantly related to increased work-family conflict, anxiety, and stress, suggesting that although hybrid work offers flexibility and opportunities, it also introduces strain due to blurred boundaries and role overload. Notably, work-family conflict emerged as a partial mediator, explaining how technostress contributes to higher levels of anxiety and stress. Additionally, work-family conflict fully mediates the relationship between technostress and life satisfaction. This highlights the crucial role of work-family dynamics in influencing psychological outcomes in hybrid work environments. Furthermore, utilising resilience as a personal resource may help mitigate the effects of technostress on work-family conflict.

Conclusion: This research enhances our understanding of how technostress affects employee well-being and provides evidence that addressing work-family conflict is essential for reducing anxiety and stress while improving life satisfaction. Organisations can foster healthier, more sustainable, and more productive work environments by intentionally designing hybrid work arrangements that balance job demands with sufficient resources.

Abstract 163

NAVIGATING THE NEW TERRAIN: HUMAN RESOURCES MANAGERS AND EMPLOYEES' SENSEMAKING IN HYBRID WORK

Teng--Calleja M.*, Caringal--Go J.F., Mactal M.T., Lim S., Dizon M.N.

Ateneo de Manila University ~ Quezon City ~ Philippines

This study utilized a sensemaking lens in understanding the experiences of HR managers and employees as they adopt hybrid work arrangements. We gathered data through semi-structured interviews among eight HR managers and qualitative surveys with 92 employees from varying industries to examine external cues employees and HR managers took notice and made meaning of, as well as the actions taken by HR in facilitating transition to evolving work arrangements. HR's sensemaking highlighted the importance of responsiveness to employees while sustaining stability throughout the change. Results demonstrate how employees noticed HR's presence and support or its absence, however, their sensemaking points to an understanding that HR is also navigating challenges during the transition and a recognition of HR's efforts to take care of employees while helping sustain business operations. Findings may provide helpful guideposts to HR practitioners (e.g. adapting a systems perspective and taking an employee-focused and balanced approach) that are still in the process of transitioning to or resolving challenges related to institutionalizing hybrid work arrangements.

Abstract 846

PERCEIVED NORMS, EMOTION REGULATION ABILITY, AND FACEWORK IN FEEDBACK: A THREE-COUNTRY STUDY

Lee J.*

Jenny C. Lee ~ New Brunswick ~ United States of America

Introduction:
Feedback exchanges in professional contexts often misfire when expectations around norms and
emotional regulation are misaligned. Cultural tightness-looseness (CTL) shapes expectations for norm
clarity and enforcement, while emotion regulation ability (ERA) influences how individuals respond
under face threat. Together, these constructs offer a person-environment framework for understanding
variability in facework responses to feedback.
Purpose:
The study examined how perceived CTL and ERA were associated with facework responses to face-
threatening feedback among professionals in the United States, India, and Canada.
Method:
Participants were 491 professionals (USA, n = 206; India, n = 152; Canada, n = 133) recruited via
CloudResearch and snowball sampling. Using a vignette-based survey, participants were randomly
assigned to a high- or low-face-threat feedback scenario and completed measures of perceived CTL,
ERA, and facework responses, as well as two manipulation checks. The study focused on integrating,
obliging, and avoiding strategies; dominating was examined for completeness. Country was controlled
in hierarchical regression analyses.
Results:
Exploratory analyses showed country accounted for significant variance in CTL, ERA, integrating,
obliging, and avoiding, but not dominating. After controlling for country, greater perceived tightness
was positively associated with integrating, obliging, avoiding, and dominating. Higher ERA was

negatively associated with obliging, avoiding, and dominating, but not integrating. Moderation of ERA
on the CTL-facework relationship was not supported. However, ERA and CTL showed independent
associations with facework responses. Within-country analyses were fairly consistent with pan-cultural
analyses.
Conclusions:
The findings of this study clarify how perceived normative context and individual regulatory capacity
each contribute uniquely to facework responses to face-threatening feedback. Results advance theory
linking CTL and ERA to interpersonal communication and have practical implications for feedback
training and leader development. Overall, responses to face-threatening feedback were associated with
an individual's regulatory capacity and their perceptions of normative expectations in the environment.
Keywords: cultural tightness-looseness; emotion regulation ability; facework; feedback; pan-cultural

Abstract 537

THE ROLE OF PERSONALITY TRAITS IN SHAPING EMPLOYEE EXPERIENCES

Löfstrand P.*, Vinberg S.

Mid Sweden University ~ Ostersund ~ Sweden

This study investigates how personality traits and psychosocial work environment factors relate to employees' preferences for different office configurations. While prior research has examined these domains separately, this study integrates them to explore their combined influence on office solution preferences. Using the Big Five Inventory and psychosocial work environment measures, the study addresses three research questions. First, results indicate that employees most commonly prefer cellular offices, with open-plan offices being the least favored. Interestingly, employees currently working in a specific office type often prefer to remain in that environment, suggesting a role for psychological inertia and perceived security in established routines. Second, personality traits, particularly Extraversion, significantly influenced office preferences. Individuals with lower Extraversion scores, characterized by lower Sociability and Energy Level, preferred cellular offices, while those with higher Extraversion preferred activity-based working environments. This aligns with earlier findings suggesting that extraverted individuals thrive in dynamic, open settings. Third, significant associations were found between personality, psychosocial work environment factors, and office preferences. Higher Extraversion correlated with satisfactory vertical trust, job demands, and emotional demands, possibly reflecting increased workplace engagement. Agreeableness was positively associated with trust, while facets such as Compassion and Responsibility correlated with a preference for cellular offices and an aversion to activity-based workplaces. Negative Emotionality was linked to higher job demands and lower perceived trust, suggesting heightened sensitivity to stressful work environments. Open-Mindedness showed no significant associations. These findings highlight the importance of considering both individual personality profiles and psychosocial workplace factors when designing or transitioning office environments. Tailoring workspaces to individual needs may enhance employee satisfaction, well-being, and productivity. Therefore applied psychology knowledge based on research committed at different forms of hybdrid work is of importance for securing better psychoscial work environments.

THE UTILIZATION OF MUSIC'S PSYCHOLOGICAL EFFECTS IN HUMAN LIFE

Friday 24 July 2026 from 14:00 to 15:30

(R-Arsenale)

Kyung-Hyun Suh, Chair
Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Discussant

This symposium investigates the psychological impact of music from an applied psychology perspective, focusing on its real-world utilization in various human environments. Presentations will address how environmental music shapes consumer and employee behavior, how cultural traditions like Chinese folk songs foster emotional connection, and how music contributes to therapeutic processes such as emotional regulation and trauma recovery. Furthermore, the role of psychometric tools in measuring music enjoyment and engagement will be discussed. By integrating cultural, clinical, and organizational contexts, this session highlights music's value as a practical tool in applied psychological interventions and research.

Abstract 4957

THE UTILIZATION OF THE PSYCHOLOGICAL EFFECTS OF ENVIRONMENTAL MUSIC IN THE SETTING OF COMMERCIAL AREA OR WORKING PLACE

Wu G.*

School of Music, Xianda College of Economics and Humanities, Shanghai International Studies University ~ Shanghai ~China

Given that cognitive performance critically underpins work efficiency and safety in commercial settings and workplaces, environmental music-an auditory intervention currently underutilized in these scenarios-exerts measurable regulatory effects on physiological activity and behavioral responses. This study targets two scenario-specific psycho-behavioral challenges rooted in suboptimal cognitive and emotional states: low consumer engagement/transaction willingness in commercial settings (exemplified by Shanghai SOGO) and reduced cognitive efficiency/elevated stress in FinTech workplaces, aiming to quantify how environmental music optimization enhances these key outcomes. Methodologically, the study integrates psychology-informed tools, building on the neurophysiological framework from the University of Oxford's 2023 study Ambient Music and Cognitive Performance: A Neurophysiological Perspective (e.g., Smith et al., 2023): 1) Neurophysiological measures (electroencephalography [EEG] to capture cognitive-related brain wave activity, heart rate variability [HRV] to assess stress responses)—consistent with the EEG/HRV measurement protocols validated in Smith et al. (2023)—to test and refine scenario-specific music parameters (60–80 BPM, ≤45 dB); 2) Personality and music use assessments (the Big Five Inventory, Behavioral Activation System [BAS]/Behavioral Inhibition System [BIS] scales, Use of Music Inventory [UMI]) to adjust music for individual differences (e.g., low-arousal tracks for introverted participants); and 3) Operational metrics (FinTech task completion speed/error rates, SOGO customer dwell time/average transaction value) to evaluate real-world impact. Preliminary results suggest that optimized environmental music may contribute to improved cognitive efficiency and reduced stress among FinTech employees, while also potentially enhancing consumer engagement and transaction willingness at Shanghai SOGO. This work aims to offer modest advancements to music psychology application in real contexts, providing tentative evidence-based strategies for linking auditory stimuli to better cognitive functioning and consumption-related behaviors.

Abstract 4958

THE PSYCHOLOGICAL APPLICATION OF CHINESE FOLK SONGS

Wang J.*

School of Music Education, Zhejiang Conservatory of Music ~ Hangzhou City ~ China

As a vital genre of national folk music, Chinese folk songs carry rich cultural meaning and collective memory. Beyond their artistic value, they possess inherent psychological functions due to their melodic structure and lyrical imagery, offering a culturally grounded approach to emotion regulation and stress intervention. These songs evoke emotional resonance, allowing for tailored emotional alignment. For those experiencing anxiety or mental tension, soft and flowing melodies—such as the Jiangnan folk song Jasmine Flower (Mo Li Hua) and the Suzhou Pingtan piece Slow, Slow Tune (Sheng Sheng Man)—can help regulate autonomic nervous system activity and reduce cortisol, a hormone involved in the stress response. Natural imagery in the lyrics helps shift attention from stressors and promotes psychological relaxation. For those suffering from emotional repression, expressive songs such as the Northern Shaanxi tune Little Peach Blossom (Xiao Tao Hong) or the modern adaptation Farewell to You (Bie Jun Tan) support the release of negative emotions like sadness and loneliness, helping prevent emotional rumination. In practice, Chinese folk songs are now used in counseling and university-based emotional education. For example, upbeat songs such as Joyful When the Sun Rises (Tai Yang Chu Lai Xi Yang Yang) are integrated into courses on "Music and Emotion Regulation" to enhance dopamine production—a neurotransmitter associated with pleasure and motivation—and stimulate positive mood. Psychologists and psychotherapists also use folk songs aligned with clients' emotional states to support cognitive reappraisal and emotional catharsis. This presentation explores the psychological mechanisms and practical applications of Chinese folk songs, emphasizing their therapeutic potential as culturally embedded tools for emotional well-being.

Abstract 4959

THE HEALING POWER OF MUSIC: RECENT ADVANCES IN THERAPEUTIC APPLICATIONS

Zhang Q.*

School of Music, Xianda College of Economics and Humanities, Shanghai International Studies University ~ Shanghai ~ China

The connection between music and human emotions, culture, and healing practices has been recognized since ancient times. The application of music in therapy has made significant strides, driven by the development of disciplines such as counseling psychology and neuroscience. This study explores recent advancements in music therapy, analyzing healing mechanisms and practical innovations from multiple perspectives. From a neurobiological standpoint, the rhythmic, melodic, and harmonic elements of music can activate neural circuits associated with emotion, memory, and motivation. This provides a scientific basis for interventions targeting anxiety, depression, trauma recovery, and cognitive impairments. Moreover, music demonstrates unique value in emotional regulation, effectively helping individuals process negative emotions and enhance emotional stability. With ongoing advancements in science and technology, new measurement tools have been developed to quantify individuals' enjoyment, engagement, and therapeutic responses to music. These innovations have improved the scientific soundness and effectiveness of music-based interventions in educational, clinical, and community settings. Meanwhile, the study also ponits out the current challenge: the need to strike a balance between the structural validity of measurement frameworks, cultural inclusivity, and diversity of musical forms. Achieving this balance ensures that music therapy not only maintains empirical foundation but also meets the humanistic needs of diverse populations. As the field continues to develop, music therapy must further integrate interdisciplinary research findings and refine its intervention models to fully utilize its healing potential in promoting mental and emotional well-being and supporting effective emotional regulation.

Abstract 4960

THE UTILIZATION OF MEASUREMENT TOOLS FOR MUSIC ENJOYMENT

Suh K.*

Department of Counseling Psychology, Sahmyook University ~ Seoul ~ South Korea

Throughout history, humans have engaged with music in a wide variety of contexts—for emotional expression, social bonding, ritualistic practices, and personal enjoyment. Music has long been considered an essential component of education, taught from elementary to higher levels, and recognized as a formal academic discipline. Concurrently, research has explored the psychological and therapeutic benefits of music, particularly its impact on mental health and well-being. As the educational and clinical applications of music continue to grow, measuring how individuals engage with music—both in terms of usage and enjoyment—has become increasingly important for researchers, educators, and clinicians alike. While a number of instruments have been developed to measure music listening, there remains a notable lack of validated tools that capture the enjoyment of singing or playing musical instruments. Moreover, many existing tools designed to measure music listening present limitations in terms of factor structure stability and construct validity. In response to this gap, my colleague and I developed and validated new scales that measures not only the enjoyment of listening to music but also the pleasures derived from singing and instrumental performance. The scale was constructed with a focus on establishing a satisfactory factor structure and offers practical utility in educational and clinical settings. However, we also acknowledge a critical limitation: emphasizing structural stability may inadvertently narrow the range of musical activities captured by the scale. This may exclude certain forms of music engagement that are equally meaningful. Consequently, researchers in music psychology, as well as professionals in music education and therapy, should thoughtfully consider the scope and purpose of their assessments and select measurement tools that align with the specific goals of their work.

DECENT WORK: CURRENT CHALLENGES

Friday 24 July 2026 from 14:00 to 15:30

(O-Arsenale)

Leonor Pais (University of Coimbra ~ Coimbra ~ Portug), Chair and Presenter
Nuno Rebelo Dos Santos (University of Évora ~ Évora ~ Portugal), Co-Chair

Decent work has become a conceptual anchor to work, organizational, and personnel psychology as long as the
current times challenge traditional workplace settings, job characteristics, and employment relationships. Since the
International Labour Organization mission was established for the first time in 1919, the work landscape has changed
hugely. Considering the permanent novelties that emerge worldwide in the labor field, although the concept was
created in response to safety emergencies exacerbated during the I and II World Wars, it maintains its relevance or
even becomes more relevant due to the multi-emergencies we live in. This symposium describes and discusses some
of the major emergencies that challenge and reinforce the importance of discussions around decent work concept in
the labor field. We also intend to bring some practical implications in terms of policy design and practices related to
the topics under discussion. First, we start with the self-employment issue. The fast-changing business context has
made organizations fear financial sustainability. Porto and Zagheto present the decent work discussions around this
problem. Then, we move to the turbulence around artificial intelligence and its implications for the world of work.
Rebelo et al. discuss the problem specifically in the field of academia but also present some implications for the work
in general. After this, Berger et al. bring to light the outbreaking technology that made it possible to work remotely
and the implications of this to the decent work concept. After that discussion, Matos et al. report the impact of decent
work on interventions aimed at leadership development. Theyusetheframeworksofempowering,ethical,andresponsibleleadershipinhighlystructuredcontextsofmilitaryandacademicorganizations.Finally,Semedoetal.systematizetheexistingknowledgeongender-
basedviolenceatwork,animportanttopicthatthreatensthedecentworkstandardsandchallengespolicymakersandhumanresourcemanagerstotackletheissue,whichisexacerbatedduetomigrationandsocialpolarization.Allthediscussionshavethebackgroundofthemultipleemergencies weliveinandthesustainabledevelopmentgoalsthatclaimglobalandlocalaction.

Abstract 4036

THE REALITY OF DECENT WORK FOR SELF-EMPLOYED WORKERS IN LATIN AMERICA

Porto J.B.*, Zagheto J.Â.V.

University of Brasília ~ Brasília ~ Brazil

) Decent work involves high-quality employment that prioritizes freedom, equity, security, and human dignity. The International Labour Organization (ILO) notes that informality is a major challenge for quality employment in Latin America, with 48% of workers in informal contracts and 37% in Brazil. Though informal work lacks formal contracts, it remains a crucial source of employment for many. How can we ensure decent work for these individuals, and what are their perceptions of their employment? The primary objective of this presentation is to characterize the perceptions of decent work among workers without formal employment contracts through qualitative and quantitative studies. The first study involved a qualitative content analysis of 30 interviews with informal and self-employed workers. The results revealed multiple groups with diverse needs and challenges. The second study was conducted with 9,594 psychologists participating in a national survey, of whom 6,456 worked without a formal contract. The Decent Work Questionnaire was adapted for this category of work, and confirmatory factor analysis (CFA) demonstrated good fit indicators for the seven-factor model, each with three items ($\chi 2$ = 4936 (df = 168); TLI = 0.95; CFI = 0.96; RMSEA = 0.05). The findings indicate that decent work is perceived positively in the dimensions of fundamental principles and values at work, fulfilling and productive work, and health and safety. Conversely, the dimensions of social protection and meaningful remuneration for the exercise of citizenship were poorly evaluated, reflecting similarities with other workers. However, when asked which aspects they value most about work, the meaning of work ranked highest and social protection the lowest. These results underscore the challenges in defining public policies that promote decent work while addressing the demands of such heterogeneous groups.

Abstract 4038

DECENT WORK UNDER REMOTE CONDITIONS: WORK-LIFE FLOW (WLF) AND EMPLOYEE WELLBEING

Berger R.*, Grau I., Czakert P.

University of Barcelona, Spain ~ Barcelona ~ Spain

During COVID-19 remote work was introduced and nowadays it is often present. Under remote working conditions decent work as proposed by the International Labor Organization allows the analysis of working demands and resources, specifically related to work and nonwork which we define as work-life flow (WLF) (representing the dimension “working time and workload”) and to employee wellbeing (EWB) (representing the dimension “Health and safety”). This panorama is relatively new and requires more insight. The aim of this systematic review is to offer results on WLF and EWB representing the two mentioned decent work dimensions under remote working conditions. Using PRISMA we identified 27 studies on the relationship between WLF and EWB and on possible protective and risk factors under the lense of decent work in a
pre- and pandemic remote working context from home. This review is based on two organizational theories: the Human System Audit and the IGLO Model, and on four theories explaining wellbeing and work-life interference: Job Demand-Resource Model, Role Theory, Work-family spillover, and Boundary Theory. We classify protective (resources) and risk factors (demands) from all organizational levels that influence WLB and EWB. Inclusion criteria were articles published between 2020-2021.
Findings concern the integration of roles, a frequent reported stressor which increases work-nonwork interference reducing WLF and EWB. This stressor can be coped with decent resources at organizational level such as autonomy, schedule control/flexibility and individual resources such as boundary management. Facilitating employees’ boundary management and perform roles more efficiently, has a positive impact on EWB and improves the WLF. Results also show that for improving the WLF and EWB research on psychosocial processes in organizations at leader and group level resources
is needed. Main limitation was the subjectiveness of measures as data was self-reported
with data collection based on individuals’ perceptions rather than on behaviors.

Abstract 4039

FROM RESEARCH TO ACTION: LEADERSHIP INTERVENTIONS TO ENHANCE DECENT WORK

Matos H.*[1], Teixeira J.[1], Pais L.[1], De Sousa B.[1], Dos Santos N.R.[2]

[1]University of Coimbra ~ Coimbra ~ Portugal, [2]University of Évora, Portugal ~ Évora ~ Portugal

Decent Work (DW) is an aspirational concept introduced in 1999 by the International Labour Organization (ILO) and is currently part of the 8th Sustainable Development Goal of the United Nations 2030 Agenda. It is a fundamental pillar for sustainable organizational performance, contributing to employee well-being, motivation, and productivity and, in highly structured environments such as the military and academia, can be differentiating. This study examines the relationship between leadership influence on employees' perceptions and DW. Leadership plays a crucial role in fostering conditions that support DW. Three key leadership approaches are explored: Empowering Leadership, which enhances employee autonomy; Responsible Leadership,
which aligns organizational activities with the broader ecosystem; and Ethical Leadership, which ensures consistency between actions, values, and moral principles of the organization and society. This study aims to study the impact on DW through interventions designed for leadership development. The research was conducted in two distinct contexts: the Portuguese Air Force and one of the oldest universities in Portugal, Coimbra University. Both have hierarchical structures and specific challenges that make leadership analysis particularly relevant. Participants include leaders and teams from both organizations based on volunteered participation. Through a three-wave mixed methods study within a participatory intervention approach, several instruments measuring DW and leadership practices were applied. The results will be presented and discussed, highlighting the impact of leadership interventions on DW perception and offering practical insights for fostering positive organizational change.

EVIDENCE TO SUPPORT THE DEVELOPMENT OF A NEW MODEL OF GENERAL COMPETENCIES

Arribas--Aguila D.*[1], Castaño--Collado G.[2]

[1]Hogrefe TEA Ediciones ~ Madrid ~ Spain, [2]Complutense University of Madrid (UCM) ~ Madrid ~ Spain

Introduction

Competency models are lists that specify sets of behaviours necessary for effective job performance (Campion et al., 2020). Despite their widespread use, they have been strongly criticised, mainly for the lack of consensus regarding their development methodology (Goldman and Scott, 2016) and weak empirical support (Furnham, 2018; Arribas-Aguila et al., 2024). Consequently, a gap persists between models developed internally by organisations and those in the academic literature. Addressing this gap requires models that meet organisational needs while remaining generic enough to capture overlap across leading competency frameworks (Campion et al., 2020; Shippmann et al., 2000).

Purpose

Develop a new model of cross-occupational competencies that are considered important for job performance, integrating empirical data from two sources of evidence.

Method

Two studies were conducted: a panel of 168 HR subject-matter experts and a survey of a representative Spanish sample of 676 employees. Both rated the importance of the competencies in the taxonomy developed by Arribas-Aguila et al. (2024) for the successful performance of tasks in four occupational groups consistent with the Spanish National Classification of Occupations (CNO-11): 1) directors and managers; 2) professionals (scientific and intellectual); 3) technicians and associate professionals; and 4) accounting, administrative, and other employees.

Results

A factor-analytic approach was used to extract 21 competencies judged by both experts and employees to be important across all four occupational groups. Using a criterion-based approach, different combinations of competencies from the taxonomy that were important for each specific occupational group were added to these cross-occupational competencies, which together form a new model of general competencies.

Conclusions

The proposed model is consistent with the literature in the field of I/O Psychology and includes competencies rated as highly important for job performance while remaining general and applicable across multiple occupational groups.

THE RELEVANT SOFT SKILLS FOR EMPLOYABILITY: A SYSTEMATIC REVIEW IN THE EUROPEAN CONTEXT

Bigoni A., Benedetti A., Ince A., Crepaldi M.*, Greco A.

University of Bergamo ~ Bergamo ~ Italy

Background: Soft skills, defined as interpersonal and situational competencies, are increasingly recognized as crucial for employability in the labour market. Recent studies have highlighted that soft skills such as effective communication, problem-solving, time management, and teamwork are essential for professionals. This project aims to identify the most relevant soft skills for employability in the European labor market and to provide an overview of the transversal competencies more required by employers.
Methods: A systematic literature review was conducted using Scopus and PsycINFO, following the PRISMA guidelines. Studies published between 2008 and 2024 were included. Data were extracted and analyzed to identify key soft skills more requested by employers in the European labour market context.
Results: The search identified 21 relevant studies describing different soft skills from different point of view: graduated students, HR and employers. The results indicate that the most relevant soft skills for employability include communication, creativity, teamwork, resilience and interpersonal skills.
Conclusions: This systematic review highlights the importance of soft skills for employability in the European labor market and the need to integrate these competencies into educational curricula and professional training programs. Future research should further explore the effectiveness of development training for the soft skills improvement.

Abstract 685

YOU CRAFT AND THEN DO I, BUT WHY? ZOOMING INTO THE TRANSMISSION OF JOB CRAFTING MOTIVATION BETWEEN COWORKERS

Bolschakow X.*[1], Kleszewski E.[2], Rigotti T.[1]

[1]Johannes Gutenberg University ~ Mainz ~ Germany, [2]Philipps – University ~ Marburg ~ Germany

Introduction: Employees initiating changes to their job demands and resources in the form of job crafting has been widely studied, with meta-analyses linking this behavior to performance and well-being. Recent literature shifts the focus from the crafting individual to the broader social context surrounding this proactive behavior, studying crafting as a collaborative team effort or reactions of coworkers after observing an employee crafting their job. Employing such a social lens, researchers have also investigated whether engagement in job crafting is transmitted from one coworker to another, reporting a positive link between job crafting in employee dyads. Even though these studies have argued that such a transmission occurs because of crossover and/or vicarious learning processes, these underlying processes have not yet been investigated in detail.

Purpose: Focusing on such transmission processes of job crafting between coworker dyads from a motivational perspective, we aim to explore the transmission of job crafting motivation as an underlying mechanism. We draw on the model of proactive motivation, which posits the three motivational states of reason-to, energized-to and can-do as drivers of proactive behaviors. In the context of coworker dyads, we examine whether the energized-to and the can-do motivational states are transmitted between dyads of coworkers in a weekly diary study.

Method: We recruited employees who then invited one coworker to participate together with them. Both dyad members filled out weekly questionnaires across five workweeks. The motivational state of energized-to was operationalized using vigor and the can-do state was assessed using self-efficacy.

Results: Data collection just ended. Preliminary correlational analyses indicate hypothesized relationships between coworkers. Results of multilevel modelling will be presented at the conference.

Conclusions: This study aims to empirically test underlying motivational transmission between colleagues, shedding light onto how job crafters pass their motivation to craft their job on to their close coworkers.

Abstract 670

THE ASSOCIATIONS BETWEEN TEACHERS' JOB CRAFTING AND WORK WELL-BEING: A CROSS-LAGGED PANEL NETWORK ANALYSIS

Li X.*[1], Gong M.[2], Zhang Y.[1]

[1]Zhejiang Normal University ~ Jinhua ~ China, [2]Lanxi Shuguang School ~ Lanxi ~ China

Introduction. Teachers' workplace well-being (WWB) is essential for both personal satisfaction and educational outcomes. Job crafting has been shown to enhance workplace well-being. However, existing studies insufficiently explore the causal relationship between job crafting and workplace well-being, relying mainly on cross-sectional designs and providing few targeted interventions at the dimensional and item-specific level. Purpose. This study aims to 1) examine the causal relationship between teachers' job crafting and workplace well-being and 2) provide targets for the development of intervention programs through Cross-Lagged Panel Network Analysis (CLPN). Method. Data were gathered with questionnaires from 818 teachers in Zhejiang Province, China. The longitudinal tracking method was used in this study. Results. Results indicated a notable decline in both job crafting and work well-being over time. CLPN analysis demonstrated that the item "I always find a way to fill my work" (WWB-4) exerted the highest predictive influence on other items, underscoring its pivotal role in enhancing workplace well-being. Conclusions. The findings align with Self-Determination Theory, indicating that job crafting via task, relational, and cognitive crafting satisfies teachers' basic psychological needs and improves their well-being. This study highlights the importance of fostering job crafting behaviors to improve teachers' work experiences and offers practical implications for schools to support teachers' professional development.

Abstract 162

FROM STAGE TO STRATEGY: A PHENOMENOLOGICAL STUDY ON HOW THEATER EXPERIENCE SHAPES ORGANIZATIONAL LEADERSHIP

Dela Cruz J.*, Teng--Calleja M.

Ateneo de Manila University ~ Quezon City ~ Philippines

Leaders need to develop competences that will allow them to face emerging challenges amid uncertainties and complexities. To address this, organizations look into the arts, in particular theater skills, as a means to form leaders. This study investigated how organizational leadership is honed by active involvement in theater. Interpretative Phenomenological Analysis was used in examining data gathered through semi-structured interviews with 12 participants who are managers/executives from various industries and sectors that had previous involvement in theater. Results show that theater shapes intrapersonal (self- awareness, confidence, creativity and resourcefulness), interpersonal (empathy, trust that empowers, and manages people) and collective competence (shared vision and values, collaboration). Experiences shared by the participants illustrate how they considerably use competences learned from active theater involvement (i.e. working in theater productions, mentoring they received, and the theater environment that they were part of) in their current leadership role. The study presented the ability of theater to form leaders and develop leadership. Although not all prospective employees have joined a theater organization while in the university, leadership development programs at work that enhance competencies such as creativity, quick adaptation to different situations, effective presentation of ideas, empathy, and collaboration with different types of people among others can be implemented by organizations with the use of theatre exercises and activities. It is also essential to consider the importance of having a community of mentors to immediately address development needs of employees and leaders. This may mean embedding a culture of mentorship where leaders are able to provide immediate feedback and guidance, yet allow for autonomy and freedom. Findings of this study contributes knowledge on theater's ability to hone leadership and provides practical insights on how theater competences may be used in developing leaders that will prepare organizations to face and thrive in an ever-changing global landscape.

Abstract 1069

CREATING BETTER OPPORTUNITIES THROUGH A GROWTH-MINDSET-OF-OPPORTUNITY INTERVENTION

O"Keefe P.*, Horberg E.J.

University of Exeter ~ Exeter ~ United Kingdom

Many new graduates struggle to cultivate gainful opportunities and make progress toward their long-term career goals after university. Drawing from the “mindsets of opportunity” framework (O’Keefe et al., 2023), we investigate whether a novel intervention that fosters a growth mindset of opportunity—the belief that opportunities in life are changeable, not fixed—can help new graduates thrive.

In a randomized controlled field experiment, we recruited 224 new university graduates in the South West of England. Around their time of graduation, participants were randomly assigned to complete a 30-minute online module designed to inculcate the belief that opportunities in life are not fixed, but can be cultivated (growth-mindset-of-opportunity intervention) or that addressed sources of life satisfaction (active control condition). Ten months post-treatment, participants completed follow-up assessments of their current job position, career goal progress, and mindsets.

The intervention showed several direct benefits to participants’ mindset and career progress. Critically, participants in the intervention conditioned had adopted a significantly stronger growth mindset of opportunity, relative to the control condition. Moreover, they reported significantly greater progress toward their long-term career goals since graduation, which was mediated by their stronger growth mindset.

The intervention also had several significant indirect effects—via a stronger growth mindset of opportunity—on the quality of graduates’ current job (51.9% were employed full-time). Specifically, the intervention indirectly led to participants having jobs that (a) offered greater upward mobility in their organization, (b) provided greater job satisfaction and (c) were perceived as more relevant to their long-term career goals.

These effects generalized across degrees, gender, socioeconomic status, and ethnicity. Taken together, our findings demonstrate how adaptive beliefs about the malleability of opportunity, and a brief growth-mindset-of-opportunity intervention, can help new graduates thrive, create better opportunities toward a more equitable future.

Abstract 1512

HOW HYBRID WORK ARRANGEMENTS AND AUTONOMY SHAPE JOB SATISFACTION, WORK–LIFE BALANCE, AND PERFORMANCE

Kirienko A.*[1], Giurge L.[1], Briguglio M.[2]

[1]London School of Economics ~ London ~ United Kingdom, [2]University of Malta ~ Msida ~ Malta

Introduction. Hybrid work has proliferated, yet evidence on its effects is mixed, partly because “hybrid” lumps together distinct schedules and ignores autonomy over scheduling.

Purpose. We test how specific hybrid splits—3 office/2 home (3–2) vs 4 office/1 home (4–1)—and who chooses the days (employee vs manager) shape job satisfaction, work–life balance, and performance.

Method. Study 1 re-analyses survey data from Malta Business Bureau employees (n=285; 2020) to relate proportion of WFH to outcomes. Study 2 is a pre-registered online vignette experiment (n=1,003) randomly assigning five conditions: 5–0, 3–2 (employee-chosen), 3–2 (manager-chosen), 4–1 (employee-chosen), 4–1 (manager-chosen). Outcomes use established 3-item scales for job satisfaction, work–life balance, and performance; OLS/ANOVA and margins tests assess main and interaction effects.

Results. Study 1: higher WFH share correlates positively with work–life balance and performance ($p<.01$) and modestly with job satisfaction. Study 2: both hybrid splits beat 5–0 on all outcomes; 4–1 outperforms 3–2 for job satisfaction and work–life balance ($p<.001$). Autonomy raises job satisfaction and work–life balance; for performance, autonomy interacts with schedule: 3–2 with employee choice performs best, whereas 4–1 with manager choice outperforms 3–2 when autonomy is absent.

Conclusions. Not all hybrid is equal. A structured 4–1 model can optimize satisfaction and balance, especially where autonomy is limited, while granting choice can unlock performance in more flexible (3–2) setups. Organizations should tune both split and autonomy to role/team needs.

Abstract 2621

HYBRID WORK AND MULTIPLE FACETS OF WORK PERFORMANCE: A DIARY STUDY OF WITHIN-PERSON DYNAMICS AND THE MODERATING ROLES OF SELF-REGULATION AND JOB INVOLVEMENT

Ohly S.*[1], Kern M.[2]

[1]University of Kassel ~ Kassel ~ Germany, [2]University of Bochum ~ Bochum ~ Germany

Previous research suggests a performance benefit when working remotely, compared to working in the office. Based on Beal et al.'s episodic performance model, we argue that not all remote work is conducive to performance, as distractions and additional demands might interfere. Moreover, the lack of coworkers' presence may lead to a lack of a task attentional pull towards organizational citizenship behaviors (OCB). This within-person test of the effects of work location on three facets of performance (task; OCB-I and OCB-O) in a sample of 154 individuals providing 704 daily reports revealed negative effects of working remotely. Self-regulation and job involvement moderated the negative effects in the case of OCB, albeit not in the way we expected. Individuals high on trait self-regulation (job involvement) show higher OCB-I (OCB-O) when working in the office, but their performance suffers when working remotely. We explain these findings with reference to interferences in the office. Our study implies that cognitive processes leading to performance need to be considered, and that hybrid work arrangements need to be carefully designed to facilitate performance.

Abstract 1733

MULTIDISCIPLINARY COLLABORATION FOR LEADERSHIP DEVELOPMENT THROUGH WEB AND APP-BASED TRAINING

Tordera N.*[1], Rodríguez I.[1], Moro M.[2], Pérez--Aixendri M.[3]

[1]IDOCAL. Universitat de València ~ Valencia ~ Spain, [2]Universitat Jaume I ~ Castelló de la Plana ~ Spain, [3]Department of computer science. Universitat de València ~ Valencia ~ Spain

The integration of applied psychology with other disciplines enables the addressing of complex problems, such as education and health. This is the case of training leaders for and in the context of growing digitalization, virtual tools, and hybrid workplaces. A multidisciplinary approach allows for the integration of knowledge about the science of training with effective leadership for performance and well-being, as well as the development of digital tools. With this aim, our research team has developed a self-guided web and app-based training program for leaders in telework. We aim to describe multidisciplinary collaboration in the development of the e-learning platform and software, and to analyze the impact of the training on the learning experience.

We departed from problem-focused research, combining organizational and occupational health psychology, computer engineering, and multimedia training through a process of need analysis, requirements identification, design, implementation, and evaluation. A total of 126 leaders completed the program. Participants evaluated their satisfaction with the web- and app-based training, as well as their perceptions of their ability to transfer the learning. Data was collected through the app and survey.

The results show high levels of satisfaction among participants with the learning process and the use of various methods and tools (X=5.16 = 5.16, range 1-6), especially with the structure of the training, the materials, and the fit with the media. Similar levels of satisfaction were found for leaders with different levels of remote work (hybrid or completely remote) or tenure. The higher levels of satisfaction were experienced in the modules related to reducing affinity distance. The perceived ability to transfer the learning was related to levels of satisfaction. Our research suggests that multidisciplinary collaboration has a significant impact on the success of online leadership training. Suggestions for improving the interaction between the various tools employed are considered.

Abstract 1301

THE INFLUENCE OF REMOTE TIME-MANAGEMENT SKILLS ON TELEWORKER WELLBEING: A LONGITUDINAL STUDY.

Najeeb S.*[1], González--Romá V.[1], Lousã E.[2]

[1]Universitat de València ~ València ~ Spain, [2]University of Maia ~ Maia ~ Portugal

Digitalization, automation, and artificial intelligence are taking a stride in contemporary times and have maintained the legacy of remote work. It is increasingly becoming important for founders of start-ups and companies to retain and capitalize on their remote talent to survive. One way to do so is to foster employees' well-being. This study added a unique perspective to the existing body of remote work literature by testing a mediation model involving teleworkers' Remote Time-Management Skills (predictor, RTMS), the technostress facet of Techno-invasion (TI), and well-being (WB). A longitudinal study with three time points was implemented, and a sample of teleworkers (T1=206, T2=148, and T3=103) was recruited to test the study hypotheses. Stability effects for techno-invasion and well-being were controlled for. The indirect effect (RMTS ☾ TI ☾ WB) was not statistically significant. However, Remote Time Management Skills at T1 predicted change in Techno-Invasion between time 1 and time 2, and change in well-being between time 2 and time 3. These results highlight the importance of Remote Time Management Skills to reduce the levels of experienced stress and well-being of teleworkers. Organizations should foster these skills to improve the quality of working life of these employees.

Abstract 2244

WHEN THE GRAPEVINE DRAINS THE VINE: HOW WORKPLACE GOSSIP PREVALENCE RIPPLES INTO EXHAUSTION AND WITHDRAWAL—AND HOW DETACHMENT HELPS RECOVER

Wang L.[1], Chen T.*[1], Xie J.[3], Zhang Q.[4], Liang Y.[2]

[1]Lingnan University ~ Hong Kong ~ Hong Kong, [2]Jinan University ~ Guangzhou ~ China, [3]Guangdong University of Foreign Studies ~ Guangzhou ~ China, [4]Shenzhen University ~ Shenzhen ~ China

Workplace gossip is ubiquitous, yet research largely centers on the sender–receiver–target triad—actors directly involved in gossip—overlooking observers who overhear it and are affected by it. We examine perceived workplace gossip prevalence—employees' sense that evaluative talk about absent colleagues is frequent—as an ambient social stressor with organization-wide implications. Integrating the Transactional Theory of Stress and Coping with the Stressor-Detachment Model, we argue that frequent exposure to gossip signals a climate of continuous social evaluation, triggering insecurity and hypervigilance that deplete psychological resources and heighten emotional exhaustion. Exhaustion, in turn, promotes work withdrawal behaviors (e.g., absenteeism, tardiness, early leaving) as coping responses to an adverse social context. We further propose that psychological detachment from work during nonwork hours buffers this strain pathway by disrupting ruminative carryover and restoring self-regulatory capacity.

We conducted a three-wave survey of employees (N = 347; 43.8% men; 85.9% aged 21–40; 64.6% with a college degree or higher; 22.8% managers). Results showed that: (1) gossip prevalence was positively related to emotional exhaustion; (2) emotional exhaustion was positively related to work withdrawal; (3) there was a significant indirect effect of gossip prevalence on withdrawal via exhaustion; and (4) psychological detachment attenuated the relationship between gossip prevalence and exhaustion, yielding a weaker indirect effect of gossip prevalence on work withdrawal via exhaustion at higher levels of detachment.

This paper advances three contributions: (1) it shifts the focus from gossip actors to observers, capturing a prevalent but underexamined exposure; (2) it specifies emotional exhaustion as the mediating mechanism linking gossip prevalence to withdrawal; and (3) it identifies psychological detachment as a practical buffer. We outline actionable interventions—team communication norms, leader modeling, and micro-interventions to foster detachment—to curb ambient social stress, protect well-being, and sustain engagement, thereby shaping healthier workplaces.

Abstract 2679

INVESTIGATING WORKPLACE BULLYING: THE IMPACT OF DARK LEADERSHIP AND ORGANIZATIONAL CULTURE

Czibor A.*, Paulovicsné Petes R.

University of Pécs ~ Pécs ~ Hungary

Introduction: The dark triad personality traits, which include subclinical narcissism, subclinical psychopathy, and Machiavellianism, have been linked to various negative workplace outcomes, such as bullying. Leaders play a crucial role in shaping organizational culture through their behavior, communication, and decision-making. Their personality traits - especially their dark traits - can give rise to dangerous organizational norms and behaviors. The relationship between leaders' (dark) personality traits, organizational culture, and employees' bullying experiences is still underexplored.

Purpose: This research aims to examine the interrelationships among leaders' perceived dark leadership traits, organizational culture, and workplace mobbing.

Method: The study sample comprised 301 employees from Hungary (M = 35.06, SD = 11.66, 78% women). Participants completed the Short Dark Triad Questionnaire (SD3-HU) to characterize their immediate leader and then completed two measures reflecting on their workplace experiences: the Denison Organizational Culture Survey (DOCS) and the Negative Acts Questionnaire-Revised (NAQ-R), which assesses workplace bullying.

Results: The findings revealed that all three dark traits (and especially psychopathy) perceived in the leader's personality were significantly associated with experiencing bullying insults. Regarding organizational culture, the Agreement dimension (part of the Consistency scale) of DOCS emerged as the strongest predictor of bullying. SEM analyses indicate that leaders' dark traits, mediated by specific organizational culture dimensions, are associated with workplace bullying.

Discussion and Practical Implications: The results highlight that, in bullying prevention, it may be necessary to monitor leaders' dark traits and organizational culture characteristics, as these may serve as risk factors. This research also shows how leadership traits can foster a culture that is conducive to abusive behaviors.

Abstract 2413

LAUGH IT OFF? HOW HUMOR PROTECTS HOME LIFE FROM DAILY ILLEGITIMATE WORK TASKS

Du D.*[1], Koçak Ö.[2]

[1]Ningbo University ~ Ningbo ~ China, [2]Istanbul Medipol University ~ Istanbul ~ Turkey

Introduction – As a common phenomenon in organizational settings, illegitimate tasks are widely recognized for their detrimental effects on employees. However, most of the existing studies have focused on work-related and well-being related outcomes, overlooking how illegitimate tasks are linked to outcomes in the family domain.
Purpose – Drawing on the work-home resources model, we propose that illegitimate tasks experienced during the workday trigger rumination in the evening, resulting in decreased home performance. Moreover, we hypothesize that humor acts as a key resource and buffers the relationship between illegitimate tasks and rumination.
Method – We collected 373 daily observations from 87 employees at work in the afternoon and at home in the evening per day for 5 consecutive workdays.
Results – We found that daily illegitimate tasks were positively associated with evening rumination and further negatively related to home performance. Humor buffered the negative work-to-home process from daily illegitimate tasks to home performance via rumination by mitigating the positive relationship between daily illegitimate tasks and evening rumination.
Conclusions – Building on the work-home resources model, we found that daily illegitimate tasks decrease home performance through evening rumination. Humor, as a key resource, can buffer the negative work-to-home process associated with illegitimate tasks. Our study reveals the cross-domain effects of illegitimate tasks on a daily basis and highlights the importance of enacting humor skills in protecting employees from this negative effect.

Abstract 1411

UNDERSTANDING ORGANIZATIONAL AND INDIVIDUAL FACTORS CONTRIBUTING TO OVERWORK CULTURE IN SOUTH AFRICAN WORKPLACES

Ronnie L.*[1], Du Plessis M.[2], Dayal A.[1]

[1]University of Cape Town ~ Cape Town ~ South Africa, [2]University of the Western Cape ~ Bellville ~ South Africa

Introduction: South Africa reports the fourth-highest rate of employees working over 50 hours weekly globally (18.1%), with workers averaging 2,209 hours annually. This overwork culture significantly impacts employee well-being, contributing to the country's lowest World Happiness Index score of 4.72.

Purpose: This study aimed to identify organizational factors and individual behaviors that contribute to overwork culture in South African organizations, examining the interplay between personal characteristics, managerial practices, and organizational structures.

Method: A mixed-methods approach was employed using explanatory sequential design. Phase one involved an online survey (n=100) incorporating Andreassen and Pallesen's overwork climate scale. Phase two comprised semi-structured interviews with 13 participants selected through purposive sampling. Data analysis utilized thematic coding and hermeneutic phenomenological interpretation.

Results: Three key factor categories emerged: personal factors (perfectionism, guilt, high conscientiousness, inability to set boundaries), organizational factors (poor people management skills, inadequate team structures, unrealistic deadlines, lack of appreciation), and industry factors (client demands, gender dynamics, generational differences). Findings revealed that 79% of respondents worked beyond contractual hours, with 97% experiencing job-related stress. Participants demonstrated workaholic characteristics with high work involvement but low work enjoyment, consistent with Spence and Robbins' workaholic triad model. Female participants reported additional pressure to prove themselves in male-dominated environments, while millennial managers experienced dual stressors as both subordinates and team leaders.

Conclusions: Overwork culture results from complex interactions between individual personality traits and organizational demands rather than isolated factors. Organizations promoting work-life balance through awareness campaigns alone fail to address systemic issues. Recommendations include implementing structural changes such as meeting-free periods, mandatory time-off policies, improved manager training, and

establishing healthy client boundaries to create sustainable work environments.

Abstract 2563

RECIPROCAL RELATIONSHIPS BETWEEN STRAIN AND JOB CHARACTERISTICS: EVIDENCE FROM BIVARIATE LATENT GROWTH CURVE MODELS

Tritschler N.D.K.H.*[1], Semmer N.[1], Igic I.[2], Kälin W.[1], Meier L.[3], Elfering A.[1]

[1]University of Bern ~ Bern ~ Switzerland, [2]Military Academy (MILAC), ETH Zürich ~ Zürich ~ Switzerland, [3]University of Neuchâtel ~ Neuchâtel ~ Switzerland

While extensive research has examined how working conditions influence employee strain, the reverse relationship—how strain affects working conditions— remains underexplored. To explain these reversed effects, possible underlying mechanisms include perceptual (shifts in the appraisal), stressor-creation (shifts in behaviour), drift, and the refuge hypothesis (shifts in structure). To narrow this gap, this study investigates reciprocal relationships between strain and job stressors, as well as job resources.

Bivariate latent growth curve analysis was conducted on a sample of N = 2001 Swiss workers from the Job-Stress-Index. Participants' exhaustion and several working conditions, including task-related uncertainty, social stressors with supervisors and colleagues, supportive supervisor behaviours, and job autonomy, were assessed using questionnaires in 2014, 2015, and 2016.

Except for task-related uncertainty, exhaustion and job stressors rose across the 3 years, while job resources declined. Consistent with a bidirectional relationship, a stronger rise in exhaustion corresponded with a steeper increase in job stressors, and a greater drop in job resources. Furthermore, higher initial levels of exhaustion were associated with higher initial job stressors and lower job resources. Contrary to a drift or a chronically impaired appraisal of strained individuals, higher levels of exhaustion predicted an attenuated increase in social stressors with supervisors, and fewer declines in supportive supervisor behaviour, potentially indicating a refuge mechanism or attentive supervisors unwilling to burden already strained employees. Meanwhile, higher initial levels of social stressors with colleagues and supervisors predicted lower increases in exhaustion, while higher initial job resources predicted a stronger rise.

Taken together, the results indicate a reciprocal co-development between strain and job characteristics, while the changes in growth associated with initial levels of the other constructs may suggest habituation, adaptation, or potential ceiling effects. The findings emphasise the need for future studies on reversed effects.

Abstract 2256

INTERNAL COMMUNICATION PRACTICES AND UNIVERSITY LECTURERS' EXPERIENCES OF FEAR OF MISSING OUT (FOMO) AND BURNOUT: A CONCEPTUAL FRAMEWORK

Xu Z.*[1], Kamaruzaman N.A.[2]

[1]Universiti Putra Malaysia ~ Kuala Lumpur ~ Malaysia, [2]Universiti Putra Malaysia (UPM) ~ Kuala Lumpur ~ Malaysia

Within the digital transformation of higher education, internal communication has become both a structural demand and a psychological force. For lecturers in Malaysia, constant connectivity and message saturation amplify FoMO and emotional exhaustion, positioning internal communication as a critical determinant of occupational well-being in increasingly digitalised academic settings. This study presents a conceptually driven framework grounded in a review of prior research and supported by preliminary empirical insights. Following an interpretivist paradigm, it brings the Job Demands–Resources (JD-R) model and Coping Theory as sensitising devices for comprehending internal communication as functioning as a job demand and job resource. A pilot interview was conducted with a full-time lecturer at Universiti Putra Malaysia to refine the interview protocol and validate the contextual applicability of key constructions. The broader study involves semi-structured interviews with 10–15 lecturers, conducted with reflexive thematic analysis. Preliminary findings suggest that lecturers experience communication overload as both a structural demand and a self-imposed emotional strain, underscoring the double-sided functioning of digital connectedness in academic life. Conceptually, the framework advances understanding of how FoMO operates as a psychological link between institutional communication practices and lecturer burnout. Methodologically, it illustrates the way in which sensitising theories could be mobilized in qualitative research in order to retain openness while being theoretically rigorous. Practically, it allows for higher education settings that aim to rethink communicative structures that maintain staff well-being in preference to draining it.

WELL-BEING AND MENTAL HEALTH IN ACADEMIA WORLDWIDE

Friday 24 July 2026 from 15:30 to 17:00

(O-Arsenale)

Amalia Pérez-Nebra (Universidade de Zaragoza ~ Zaragoza), Chair

Important issues arise when considering academia. Worldwide, the higher education context has undergone significant
transformations in the last decades, which include precarious contracts and pay, intense competition, and overwhelming
administrative burdens. It contributes to mental health problems within a system that is unhealthy for many of us,
professors and students. Even psychology has not been excluded from this context of worsening mental health. This
symposium will discuss the well-being in academia in different countries and continents, including non-WEIRD
countries. Dr. Sticca analyzes the role of Brazilian postgraduate programs' organizational structure in the mental health
and productivity of doctoral students. She also provides information about the impact of the structure of postgraduate
programs on the well-being and productivity of minority groups. Dr. Oliveira-Silva explores how institutional factors,
rather than individual responsibility, can address the mental health challenges faced by women in academia. Gender
bias, discrimination, and work-life balance pressures—exacerbated by the COVID-19 pandemic—have led to high rates
of mental health issues among female faculty, yet institutional support remains insufficient. Through a comparative
analysis of policies and initiatives in Brazil, Australia, Canada, and the UK, the study examines efforts to promote well
being. Combining quantitative and qualitative research, it aims to generate evidence-based strategies to mitigate
systemic inequalities and inform gender equity initiatives locally and globally in academia. Dr. Orhan examines the
impact of the publish-or-perish culture on authorship inequality and researcher well-being in academia, particularly in
industrial and organizational psychology. A six-decade analysis of authorship trends reveals that elite scholars and
institutions dominate high-impact journals, creating barriers for researchers from less prestigious backgrounds. The
presentantion conducted by Dr.Velascowilloutlineamulticentercross-sectionalstudytoidentifydifferentstudentprofilesbasedonwell-beinglevels,lifestyleconditions,andcontextualfactors.Earlyidentificationofdistresssymptoms willfacilitatetheimplementationoftimelyinterventionsfromahealth-promotionperspective.Thestudy'sfindingswillserveasguidelinesfordevelopingspecificpolicies andinterventionprotocolsthatactivelysupportstudentwell-beingandtheoverallhealthoftheuniversitycommunity.ThepresentationconductedbyDr.Pérez-NebraandDr.Mourãodescribestheaxisofinternationalizationanddifferencesbetween GlobalNorthandGlobalSouth,describingthreemainimpactaxes:(1)qualityofresearchertraining,

Abstract 4032

THE GLOBAL RACE FOR PRESTIGE AND ITS TOLL ON RESEARCHERS: THE IMPACT OF UNREALISTIC PUBLICATION EXPECTATIONS ON THE WELL-BEING OF ACADEMICS

Orhan M.A.*

Nyenrode Business University ~ Nyenrode ~ Netherlands

The publish-or-perish culture has intensified global competition in academia, shaping career trajectories, institutional rankings, and access to research funding. However, behind this pressure to publish in top-tier journals lies a deeper crisis; the crisis of authorship inequality, and rising dominance of elite scholars. These trends have a huge negative impact as they are instrumental in the erosion of researcher well-being. In this presentation, I will present findings from a six-decade analysis of authorship trends in management and organization studies, highlighting how structural inequalities shape knowledge production. This presentation will especially focus on the field of industrial and organizational psychology. The research demonstrates that a small group of elite institutions and scholars dominate high-impact journals, creating significant barriers for researchers from less prestigious backgrounds. Editorial gatekeeping, preferential citation
practices, and institutional biases reinforce this dominance, making top-tier publishing

increasingly inaccessible. While diversity and inclusion initiatives are often promoted as solutions, they paradoxically benefit the scientific elite, as high-status scholars continue to control research agendas and publication standards. Beyond the systemic inequalities,
this culture of prestige-driven publishing takes a severe toll on the mental health and job satisfaction of researchers. The pressure to publish frequently and in elite outlets contributes to burnout, job insecurity, and an erosion of intrinsic motivation for scholarly work. Academics, especially early-career researchers, often feel trapped in a cycle where
success is defined not by intellectual contributions but by meeting rigid, metric-driven expectations. I will conclude by discussing possible reforms, including greater transparency in peer review, a shift away from journal prestige as the primary measure of
academic success, and policies that prioritize quality over quantity in research evaluation.

Abstract 4033

UNIVERSITY STUDENTS' PROFILES TO IDENTIFY RISK AND PROTECTIVE FACTORS OF WELL-BEING

Velasco V.*[9], Guerini J.[9], Delle Fave A.[2], Brugnera A.[3], Trotti E.[4], Cena L.[5], Profeta P.[6], Bassano N.[7], Daccò S.[8], Dell"Aversana G.[1]

[1]1Università degli Studi di Milano-Bicocca; 2Università degli Studi di Milano ~ Milano ~ Italy, [2]Università degli Studi di Milano; ~ Milano ~ Italy, [3]Università degli Studi di Bergamo ~ Bergamo ~ Italy, [4]Università dell'Insubria ~ Varese ~ Italy, [5]Università degli Studi Di Brescia ~ Brescia ~ Italy, [6]Bocconi University ~ milano ~ Italy, [7]Politecnico delle Arti - Conservatorio G. Donizetti di Bergamo ~ Bergamo ~ Italy, [8]Humanitas University ~ Milano ~ Italy, [9]Università degli Studi Bicocca ~ Milano ~ Italy

In recent years, malaise has been spreading among university students. Campus drop outs, feelings of uncertainty and worry about academic deadlines, lack of social support, and inequalities are frequent manifestations of this situation. To better understand these phenomena, most studies and interventions are primarily focused on addressing individual vulnerabilities. Psychological support interventions have been implemented in universities, and different individual resources and difficulties have been investigated. Less attention was paid to relational and contextual factors, even though the health promotion approach emphasizes the interconnectedness between individuals and their environments, and calls for organizational changes (WHO, 1986). The goal of this presentation is to illustrate the structure and findings of a multicenter cross-sectional study
with a large sample of Italian university students. The study is included in the broader project 'University for psychological well-being: from prevention to psychological support' developed following the Health Promoting University approach (ACHA, 2025; Suárez-Reyes et al., 2019). It involves 8 Universities in Italy and is funded by the Ministry
of University and Research (Proben project).The study is focused on the investigation of individual, relational and organizational risk and protective factors in students' well being, taking into account factors related to both students' personal lives and university experiences. A person-centered approach will be used to identify students' profiles, based
on individual well-being levels and lifestyle conditions, as well as contextual risk and protective factors. The early identification of distress and malaise symptoms will allow for implementing early interventions to address them from a health-promotion perspective. The results will serve as guidelines to implement specific policies and intervention protocols based on the Health Promoting University approach, through the incorporation of health in the university culture, processes and policies, and through the promotion of an organizational and learning environment supporting health and well being among students and the whole academic community.

Abstract 4034

SUSTAINABLE INTERNATIONALIZATION: REFLECTIONS ON RESEARCHERS' WELL-BEING AND PERFORMANCE

Pérez--Nebra A.*[1], Mourão L.[2]

[1]University of Zaragoza ~ Zaragoza ~ Spain, [2]Rio de Janeiro State University ~ Rio de Janeiro ~ Brazil

The need for internationalization in all fields of science is undeniable, and numerous articles have been written on this topic. This presentation discusses repercussions that are less seen on research agendas. The so-called "international" literature on internationalization has an important bias regarding where it speaks and who receives it:
literature from large centers, European-US, speaks to other large centers. In other words, universities that receive international students with a different funding pattern and a completely different process of scientific development when compared to developing countries. The discussion on the internationalization of science is not new. Still, it has gained speed with globalization. While countries with highly qualified human capital benefit from globalization, this phenomenon has been a curse for the developing continents. We decided to discuss the internationalization model based on three main impact axes: (1) quality of researcher training, (2) researcher mobility, and (3) student mobility. Despite these critical discussions, there is a consensus that the internationalization of psychological science is relevant. Therefore, there is no need to question whether internationalization is, in fact, essential. Taking the advancement of psychological science and the well-being of those who promote it as equally important parameters, we must return to each of the three dilemmas presented. The first axis, training, has fundamentally taken place in the national territory since the chances of support for training outside the country are slim and/or depend on individual resources. The second axis is mobility, i.e., when this teacher gets a job as a university lecturer and
continues their training, they must move to continue their training, which is not always possible. Finally, student mobility is more common in European-US literature on internationalization. Still, it is rare in non-central countries due to the low number of scholarships available, language difficulties, and other issues.

COST ACTION LEVERAGE: A EUROPEAN NETWORK TO LEVERAGE THE MULTI-AGE WORKFORCE

Friday 24 July 2026 from 15:30 to 17:00

(R-Arsenale)

Marija Davcheva (umivale activa ~ Valencia ~ Spain), Chair and Discussant

COST Action program is a unique opportunity and the European Commission's oldest funding program that promotes the creation of scientist-practitioner networks in a given topic area and both drive scientific excellence and societal impact.
This symposium provides a detailed overview on the COST Action LeverAge A European network to leverage the multi-age workforce as the first Action led by WOP/HRM scholars in at least the last decade. The aim of the network is to advance, share, and promote knowledge and implementation of evidence-based practices to fully leverage the multi-age workforce and enhance the well-being, productivity and prosperity of individuals, organizations, and societies.
Composed of four presentations and a discussion, this symposium will provide practical recommendations on how to manage a scientist practitioner network which can be generalized beyond the WOP field and can be applicable to any applied psychology field.
The first presentation will focus on the practical implications for coordination of a COST program, while the second presentation will focus on the leadership of a cost action working group Successful Aging at Work. The third presentation will offer an overview of previous successful short term scientific mission within this cost action network broadcasting their impact on research progress, networking, and interdisciplinary cooperation. The fourth presentation will discuss practical implications for scientific communication taking into account different stakeholders in order to bridge the scientific practitioner gap in the field of work, aging, and retirement. Finally, a WOP practitioner discussant will provide an overview of the benefits and lessons learnt for an international scientist practitioner collaboration.This symposium makes great contributions to ICAP as it explores practical examples of the different aspects of LeverAge offering a unique view of how to manage and promote a scientist practitioner network on a highly relevant WOP topic

Abstract 4197

THE COST ACTION PROGRAM: WHAT IT ENTAILS AND SOME PRACTICAL RECOMMENDATIONS ON COORDINATING A COST ACTION

Marcus J.*

College of Administrative Sciences and Economics, Koç University ~ Koç ~ Turkey

Running for over 50 years, the COST Action program is the European Commission's oldest funding program. Unlike most grants, the focus of the COST Action grant is to create scientist-practitioner networks in a given topic area and both drive scientific excellence and societal impact. Yet, despite its clear utility for maximizing scientific impact and bridging the science-practice gap, COST Actions are sorely lacking in the fields of work and organizational psychology and human resource management (WOP/HRM). Case in point, COST Action LeverAge is the first Action led by WOP/HRM scholars in at least the last decade. Therefore, my aim in this presentation is to drum interest in and build knowledge of the COST Action program. I discuss how COST Actions are structured and the types of activities that are funded. I will provide examples and lessons that draw from my experience as the coordinator (i.e., "Action Chair") of COST Action LeverAge, including how we have organized and grown the Action network from a small pool of initial co-proposers to 200+ scientists and practitioners from over 50 countries and myriad disciplines.

Abstract 4198

COORDINATING A COST ACTION WORKING GROUP: SOME INSIGHTS

Truxillo D.*

Kemmy Business School, University of Limerick ~ Limerick ~ Ireland

One of the essential parts of COST Actions is the development of “working groups” (WGs) focused on a stream of research questions. The LeverAge COST Action on aging and work has five such working groups: Organizational Practices; Successful Aging at Work; Integration of Age-Diverse Workers/Knowledge Transfer; Aging and Technology; and Career Development/Retirement. In this presentation, I discuss how COST leadership got these working groups organized and “up-and-running” through annual in-person meetings and bi-monthly online meetings. Specifically, I will provide examples and lessons based on my experience as WG leader of the Successful Aging at Work working group, including how we organized the group and used it to promote research collaborations among network members.

Abstract 4199

COST ACTION LEVERAGE: A CATALYST FOR SHORT-TERM SCIENTIFIC MISSIONS AND RESEARCH COLLABORATION

Sotiroska Ivanoska K.*

Institute of Psychology, Faculty of Philosophy, Ss. Cyril and Methodius University ~ Skopje ~ North Macedonia, Republic of

COST Action LeverAge is a European-wide collaborative network that brings together experts from diverse fields and sectors to study the various psychological and organizational aspects of work and aging. Short-Term Scientific Missions (STSMs) are crucial in fostering collaboration, knowledge exchange, and skill development among researchers across Europe and beyond. These grants allow researchers to engage in hands-on experience, share expertise, and strengthen partnerships within the LeverAge network. By facilitating international mobility, STSMs contribute to the advancement of research on work and aging, enabling deeper insights and innovative solutions. Through these missions, researchers not only expand their scientific horizons but also build lasting professional relationships that enhance interdisciplinary cooperation in the field. As part of this initiative, previous successful STSMs will be presented, showcasing their impact on research progress, networking, and interdisciplinary cooperation within the LeverAge network.

Abstract 4200

SCIENCE COMMUNICATION AND DISSEMINATION: RECOMMENDATIONS FROM COST ACTION LEVERAGE

Sousa I.C.*[1], Balytska M.*[2]

[1]Iscte - Instituto Universitário de Lisboa, CIES-Iscte ~ Lisbon ~ Portugal, [2]Taras Shevchenko National University of Kyiv ~ Kyiv ~ Ukraine

Science communication and dissemination are key requirements in today's research environment and are among the main goals of COST Actions. In the LeverAge COST Action, we aim to build the world's largest network of scientists and practitioners in Work, Organizational, and Personnel Psychology (WOP) and Human Resource Management (HRM), alongside other stakeholders, to co-create solutions for leveraging the multi-age workforce.

Effectively communicating research on work, aging and retirement to diverse audiences is essential. The primary stakeholders of this Action include workers, HR practitioners, consultants, managers, employers and employers' associations, unions, professional associations, and policymakers at local, regional, national, and European levels. Additionally, the scientific community is a crucial audience for disseminating research on work, aging, and retirement.

In this presentation, I will outline the science communication strategy of the LeverAge COST Action, focusing on the most effective channels for each audience, their impact, and the challenges involved. I will also share examples of successful communication initiatives and provide recommendations for researchers and scientific institutions seeking to engage diverse audiences.

Artificial Intelligence at Work 2

Friday 24 July 2026 from 15:30 to 17:00

(T-Monumentale)

Abstract 4027

WHEN HIDING HURTS: HOW STEALTH USE OF GENERATIVE AI RESOURCES IMPAIRS TASK PERFORMANCE

Li P.*

Leeds University Business School, University of Leeds ~ Leeds ~ United Kingdom

The rapid proliferation of Generative Artificial Intelligence (Gen AI) has created an intriguing paradox in organizations: while employees increasingly recognize Gen AI's potential to enhance productivity and innovation, many use these tools covertly. Drawing on dual-process theory, we introduce and validate the concept of Stealth Use of Generative AI Resources (SUGAR)—employees' hidden use of Gen AI tools within professional settings. Through rigorous scale development across multiple samples in the UK and China, we establish SUGAR as distinct from related constructs including AI usage and attitudes. Analysis of multi-wave data from 207 employees reveals that SUGAR undermines task performance by disrupting employees' natural learning processes and triggering feelings of professional inadequacy. Specifically, while general AI usage positively relates to performance, concealing such usage reduces reflective learning opportunities and increases impostor feelings, ultimately reducing performance. Our findings advance organizational theory by revealing how AI concealment creates unique cognitive demands that cannot be overcome by motivational factors, while also demonstrating how employees' well intentioned efforts to leverage AI capabilities through covert use may ultimately impair their performance. This research initiates important theoretical conversations about the unintended consequences of undisclosed AI usage in organizations and provides practical insights for developing more nuanced approaches to AI governance that balance productivity with transparency.

Note: This study is collaborated with colleagues from China, New Zealand and Netherlands.

Abstract 1848

THE GOOD, THE UGLY, THE FAIR: INVESTIGATING CANDIDATES' FAIRNESS PERCEPTIONS OF AI-SUPPORTED SELECTION TOOLS — A SYSTEMATIC REVIEW

Orso V.*, Cortiana S., Pluchino P., Gamberini L.

Università degli Studi di Padova ~ Padova ~ Italy

Background. Artificial Intelligence (AI) is increasingly incorporated into organizational practices, including recrtuitment processes. The integration of AI tools can significantly streamline personnel selection by increasing efficiency and scalability, and potentially reducing the likelihood of biases. However, how applicants receive AI tools in selection process remain a key concern. Fairness perceptions influence applicants' attitudes, including organizational attractiveness, job pursuit intentions, and the likelihood of recommending the employer. Understanding how AI-based tools affect fairness perceptions is crucial for both research and practice.

Aim. The present study systematically reviews the literature on applicants' fairness and justice perceptions in AI-supported selection, with the aim of identifying critical issues, and conditions facilitating the acceptance of such technologies.

Method. Following the PRISMA protocol, five academic databases (Scopus, Google Scholar, PsycInfo, IEEE, and ACM Digital Library) were searched for articles published between 2018 and 2024. From an initial set of 4,324 records, 28 peer-reviewed studies were selected based on criteria of relevance, methodological rigor, and focus on the applicant's perspective. The selected studies were analyzed and categorized by AI tool type: Algorithmic Decisison Making (ADM), CV screening, AI-assisted interviews, and procedural explanations.

Results. The exclusive reliance on ADM or algorithmic screening reduces perceived fairness. Applicants often complain a lack of transparency, diminished opportunity to perform, and reduced interpersonal treatment. AI-based video interviews are generally evaluated as less fair than traditional methods due to lower social presence, limited two-way communication, and decreased sense of control. Conversely, hybrid approaches, where AI supports but does not replace human decision-making that increase transparency (e.g., providing explanations) are associated with more favorable perceptions, especially in terms of consistency and accuracy.

Discussion. Delegating critical hiring decisions entirely to AI undermines applicants' fairness perceptions, which may negatively affect organizational reputation. Human involvement and explainability emerge as key factors in enhancing acceptance.

Abstract 1644

THE IMPACT OF AI-ASSISTED DECISION SUPPORT ON OPERATOR PERFORMANCE AND ACCEPTANCE IN AEROSPACE MANUFACTURING PLANNING

Fraboni F., Morandini S., Pietrantoni L.*

University of Bologna ~ Bologna ~ Italy

Introduction. The integration of artificial intelligence in complex industrial systems presents significant challenges for human-AI collaboration, particularly in safety-critical domains like aerospace manufacturing. As AI systems become increasingly autonomous in decision-making processes, understanding how to effectively design human-AI interaction becomes crucial for optimizing performance. The aerospace industry, facing unprecedented pressure from growing air traffic demands and production backlogs, represents an ideal context for examining these human factors challenges.

Purpose: This study aimed to investigate user perspectives on AI-based decision support systems in aerospace manufacturing planning and scheduling tasks. Specifically, the research examined how different levels of AI assistance, from manual baseline conditions to local and global interactive support. influence operator performance, workload, and acceptance in real-world industrial settings.

Method: Nine expert planners and schedulers participated in a within-subjects experimental design study. Participants completed workforce allocation tasks under three conditions: manual scheduling (baseline), local interactive AI support, and global interactive AI support. Each participant performed two scenarios per condition (six total), with one simple and one difficult allocation task. Performance metrics, perceived cognitive demand (NASA-TLX), efficiency measures, and sentiment were collected. Testing occurred in participants' actual work environment to ensure ecological validity.

Results: The findings revealed complex patterns in human-AI interaction effectiveness. While no significant differences emerged in perceived performance across conditions, cognitive demand showed notable variations, with global AI support demonstrating slightly higher demands than local support. Efficiency measures indicated that manual scheduling required the most time (approx 2000 seconds), while both AI-supported conditions showed improved time efficiency (local: ~800 seconds, global: ~600 seconds).

Conclusions: The study demonstrates that AI integration in aerospace manufacturing requires careful consideration of human factors beyond pure performance metrics. While AI assistance improved task efficiency, the relationship between automation level and operator acceptance is non-linear.

Abstract 2394

CONVERGENT OR DIVERGENT? A MULTILEVEL APPROACH TO TEAM PROACTIVITY EMERGENCE

Bonfio D.*[1], Furlan A.[1], Guizzo A.[2]

[1]Università degli Studi diPadova ~ Padova ~ Italy, [2]Fondazione Bruno Kessler ~ Trento ~ Italy

Introduction

This study challenges the dominant assumption that proactive behavior within teams emerges through a convergent process characterized by increasing behavioral similarity. Conversely, we argue that convergence fails to capture the complexity of how team proactivity unfolds over time and across contexts. Grounded in multilevel theory, we propose that team proactivity follows a divergent, compilational pattern, emerging from contextually embedded and interaction-driven dynamics among team members.

Purpose

This research advances a configural and process-oriented understanding of team proactivity. Drawing on critiques of compositional emergence models, we conceptualize team proactivity as a dynamic configuration of individual behaviors that vary over time, rather than as a uniform and isomorphic team trait. Divergence thus reflects the differentiation of roles, motivations, and interaction patterns that evolve through interpersonal collaboration.

Method

We conducted two complementary studies. Study 1 examined field data from 267 employees nested within 45 work teams across 13 manufacturing firms, analyzing rWG and ICC values of Proactive Idea Implementation to assess whether team tenure predicts within-team dispersion in proactivity. Study 2 employed an agent-based model to simulate the emergence of team proactivity under varying team configurations, within-team heterogeneity in personality traits (dominant/submissive) and skills, and to identify micro-level mechanisms generating within-team individual proactivity divergence.

Results

Results from Study 1 indicate that greater team tenure is associated with increased within-team dispersion in proactivity, suggesting that repeated interaction may foster divergence rather than convergence in proactive behavior. Study 2's simulations confirm this empirical pattern, revealing that heterogeneity in individual attributes can produce multiple, equifinal pathways to team proactivity.

Conclusions

Integrating field and computational evidence, we show that team proactivity emerges as an evolving, relational, and context-sensitive phenomenon. A configural, process-oriented perspective offers a more nuanced understanding of how heterogeneous forms of proactive behavior emerge and evolve over time, deepening theoretical insight and

informing more adaptive practices in managing team-level emergence.

TEMPORAL DYNAMICS OF STRESS AND WORKLOAD IN FIREFIGHTERS: AN INTENSIVE LONGITUDINAL STUDY OF SLEEP, HRV AND SELF-REPORTED MEASURES

Arenas A.*[1], Sanclemente F.J.[2], Torrado M.[1], Di Marco D.[1], Escobar--RodrÍguez G.[3], MartÍnez--NÚÑez A.[4]

[1]Universidad de Sevilla ~ Sevilla ~ Spain, [2]Universidad de Málaga ~ Málaga ~ Spain, [3]Instituto de Biomedicina de Sevilla (IBIS) ~ Sevilla ~ Spain, [4]Servicio de Prevención, Extinción de Incendios y Salvamento / Ayuntamiento de Sevilla ~ Sevilla ~ Spain

Introduction

Firefighting entails acute operational demands layered onto rotating 24-h shifts, with implications for stress biology, sleep, and psychological health. Evidence integrating wearable physiology with psychosocial indicators in real service conditions remains scarce.

Purpose

To characterize short-term (within-shift) changes in physiological stress and sleep alongside dispositional, work condition, and health-related self-reports in a municipal firefighter service, and to describe variability by station and shift.

Method

We analysed data from 145 firefighters (97% men; mean age = 46.9 ± 9.0 years) working 24-h rotating shifts across four stations and five shifts. Measures included: salivary alpha-amylase and cortisol collected pre- and post-shift; Fitbit-derived heart-rate variability (HRV; RMSSD and LF/HF) and deep non-REM sleep; and validated self-reports (e.g., perceived stress, burnout, emotion regulation, resilience, etc.). Operational workload was indexed by types of interventions and frequency.

Results

Across the duty, alpha-amylase decreased while cortisol increased; both biomarkers showed marked variability across stations and shifts. Self-reports indicated low–moderate stress and low burnout, alongside high resilience. Wearable HRV and deep-sleep metrics were feasible to collect and varied by station/shift. During the observation window, 85 interventions were recorded. A predictive model proposes a dual-path mechanism linking emotional demands and station conditions with firefighters' health outcomes. Suboptimal station conditions are posited to increase acute fatigue, undermining recovery between shifts and—through this energetic pathway—contributing to higher burnout and lower well-being. Thus, the model distinguishes a cognitive-affective route (stress → burnout/well-being) from a physiological-energetic route (fatigue → recovery → burnout/well-being).

Conclusions

Station/shift variability suggests organizational and scheduling levers may shape sleep

and autonomic recovery. Integrating wearables with multi-level self-reports is feasible and informative for targeted fatigue- and stress-mitigation strategies. Interventions should combine emotion-regulation and supervisory support (to buffer stress) with environmental and scheduling improvements (to reduce fatigue and protect recovery).

Abstract 62

POSITIVE DEVIANCE: ANALYSIS FROM A TIME-LAPSE STUDY OF AVIATION MAINTENANCE DECISION MAKING

Bannister--Tyrrell T.*

University of Newcastle ~ Newcastle ~ Australia

Introduction: Deviance from approved procedures poses a risk to organisational performance and potentially to individual or collective safety. Understanding attitudes to deviant behaviour provides scope to define the difference between wilful violations and positive deviations. Such a definition, however, cannot mitigate the risk that a process deviation poses, nor its potential for unintended outcomes.

Whilst this study focuses on aviation maintenance processes, it is proffered that similar research could be applied to other highly regulated, high consequence industries where procedural deviance, process workarounds, and organisational norms are common, or indeed accepted, or where due attention is not applied to the capture, codification, and control of positive deviance behaviours.

Purpose: Initial data collection was undertaken as a PhD research project in 2017. A comparison and contrast activity was undertaken in 2025 following collection of further data. The aim of the follow-on study was to ascertain if attitudes identified in the initial study remained extant. In the period 2017-25 the aviation regulatory framework changed from technical compliance to system safety, the aircraft platform aged thereby requiring additional maintenance effort, the operational environment changed, and turnover of maintenance personnel remained high.

Method: Both studies utilised the Maintenance Innovation Survey (MIS). The MIS comprises 60 statements where responses are codified using an anchored 6-point Likert scale from Strongly disagree to Strongly agree.

Results: The comparative analysis is expected to confirm that positive deviance behaviours remain extant and uncontrolled (final analysis to be completed by July 2025).

Conclusion: No pathway should exist that allows deviant decision-making to prosper over logically conceived compliance requirements in highly regulated, high consequence industries. Defining the impact of individual behaviours and understanding attitudes towards compliance is essential to mitigating the risk of positive deviance by well-intentioned individuals. It is this presenters position that positive deviance requires a capture, codify, and control response.

Abstract 1384

NOT ALL WORKERS SEE RISK ALIKE: LEADERSHIP AND ROLE-BASED PERCEPTIONS OF RISK TRAINING

Cedeño Bustos J.V.*, Molano Castañeda K., Paredes Peña M.A., Pinilla Castro S.A., Durandeau Gottopo J.

Universidad de la Sabana ~ Chía, Cundinamarca ~ Colombia

Introduction
Knowledge workers are increasingly exposed to psychosocial and digital risks, requiring targeted prevention strategies. Secondary-level interventions, such as risk training, play a key role in building resilience and competencies in diverse occupational groups (LaMontagne et al., 2007; Nielsen & Noblet, 2018).

Purpose
This study analyzes how workers in leadership and non-leadership roles evaluate risk training and compares knowledge workers with front-line workers, while exploring associations with safety motivation and innovative work behavior.

Method
The sample included 670 participants from three large Colombian organizations in the service, production, and construction sectors. In the service and production organizations, the focus was on knowledge workers (n = 481), comparing leaders (n = 143) and non-leaders (n = 338). In the construction company, the analysis centered on occupational roles, contrasting knowledge workers (n = 93) with front-line workers (n = 96). Training was evaluated with the Feedback Instrument for Rescue forces Education (FIRE; Thielsch & Hadzihalilovic, 2020), which measures trainers' behavior, structure, group dynamics, overextension, competence acquisition, and transfer. Additional measures included Personal Motivation for Safety Climate (Williamson et al., 1997) and Innovative Work Behavior (De Jong & Den Hartog, 2010).

Results
Leaders reported more favorable perceptions of training structure and competence acquisition than non-leaders. Across sectors, knowledge workers evaluated training more positively than front-line workers. Significant positive correlations were also observed between FIRE dimensions, safety motivation, and innovative behavior.

Conclusions
Perceptions of risk training vary by role and occupational profile. Knowledge workers consistently rated training more positively than front-line workers, and leaders evaluated

it more favorably than non-leaders. These findings are indicative of the importance of advacing tailored programs to these distinct groups to enhance competence development, safety engagement, and innovation.

Abstract 8

REDUCING VIOLENCE THROUGH ROUTINE RISK ASSESSMENT

Ilarda E.*[1], Mcilveen P.[1], Senz A.[2]

[1]University of Southern Queensland ~ Toowoomba ~ Australia, [2]Western Health ~ Footscray ~ Australia

Workplace violence is a serious problem worldwide, with recent Australian data showing a significant increase in workers' compensation claims. The highest rates are found in the healthcare and social assistance industry, with workers frequently exposed to abuse, assault, and threats. The incidence of violence increases significantly in emergency departments (EDs). The challenge of workplace violence is the physical and psychological impact, which can include profound and long-lasting consequences. This PhD research presentation involves data from three publications. Two qualitative studies; including interviews and focus groups of workers who have used the Bröset Violence Checklist (BVC), a well-known and validated risk assessment tool in routine practice at the hospital ED study site for several years. Clinical staff identified what they considered most important in an ED violence risk assessment instrument, as well as benefits and recommendations for improvement. Subsequently, in the third study, nurses collected information over an 8-week period on 14 risk factors, totaling more than 5000 observations on over 1750 patients. Risks were then crossmatched with security incidents and analysed to determine predictive validity. The result of this study was the development of an ED-specific violence risk assessment instrument named the Aggression and Violence Risk Evaluation Tool (AVERT). This tool was developed to improve risk mitigation in this setting and play an integral role in enhancing patient and staff safety. Such a tool, when matched with interventions, can make a significant difference to the reactive culture often associated with EDs and prepare the workforce to anticipate risk and take practical precautions to prevent adverse injury and impact.

Abstract 2094

ORGANIZATIONAL PSYCHOLOGICAL SAFETY CLIMATE AS A SHIELD AGAINST EXPERIENCING SEXUAL HARASSMENT AT WORK

Toker--Gültas Y.*[1], Ok A.B.[2], Sümer H.C.[3], Demircioglu Z.I.[1], Göncü--Köse A.[4]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Ankara University ~ Ankara ~ Turkey, [3]Özyegin University ~ Istanbul ~ Turkey, [4]Çankaya University ~ Ankara ~ Turkey

Research on workplace sexual harassment (WSH) has predominantly examined organizational psychological safety climate as a factor facilitating formal reporting to organizational authorities. However, limited attention has been paid to its role, along with peer support, in shaping WSH experiences based on anonymous reports. The present study, supported by The Scientific and Technological Research Council of Türkiye (TÜBİTAK – Project No: 124K975), aimed to empirically investigate the influence of organizational psychological safety climate and peer support on four forms of WSH previously identified in the Turkish context: insinuation of interest, sexual hostility, physical sexual harassment, and quid pro quo. Data were collected from 1,005 women employees across six geographical regions of Türkiye, ensuring heterogeneity in individual characteristics, workplace demographics, and attitudinal variables. Four hierarchical regression analyses were conducted, one for each form of WSH, controlling for age, organizational tenure, managerial status, and organizational gender ratio as control variables and organizational psychological safety climate (a composite of the Decent Work Scale-Physically and Interpersonally Safe Working Conditions factor, Organizational Ethical Climate Scale, and Psychological Safety scale) and peer support as predictors. The two predictors added from 4% to 10% of variance in explaining WSH with small effect sizes (Betas from -.11 to -.26) indicating that women employees perceiving higher organizational psychological safety climate and peer support experience less WSH. Perceived safety climate most strongly protected against physical sexual harassment. In addition, moderation analyses indicated that the shielding effect of organizational psychological safety climate on sexual hostility and quid-pro-quo was more pronounced for women working in more male-dominated environments. Our findings highlight the importance of fostering psychologically safe organizational climates and peer support systems in reducing WSH, particularly in contexts characterized by gender imbalance.

Abstract 1628

MAPPING CHANGE THROUGH NETWORKS: A CASE STUDY OF ORGANISATIONAL NETWORK ANALYSIS IN A CORPORATE TRANSFORMATION

Clifford I.*, Harrington G.

Novartis ~ Dublin ~ Ireland

Organisational Network Analysis (ONA) offers psychology-informed tools to understand how people, information, and resources flow within workplaces. This paper presents a case study of ONA deployment in a large corporate context, drawing on systems theory, social network theory and dynamic network analysis to model relationships among individuals, teams, and knowledge resources. Using both statistical measures and visualisations, we map communication and socio-technical networks to reveal structural patterns and team dynamics that shape organisational effectiveness.

The analysis identifies network silos, key influencers, and collaboration clusters, and links these features to actionable outcomes, including strategies to strengthen employee engagement and support culture change. We compare two complementary approaches to ONA: Active ONA (employee surveys capturing nuanced relational data) and Passive ONA (digital interaction traces that infer connectivity). For each, we outline methodological considerations, ethical trade-offs, and practical limitations relevant to applied psychologists and organisational practitioners.

We further detail core network metrics—such as tie frequency, central tendency, dispersion, and related measures of connectivity and subgraph structure—and demonstrate how these indicators, paired with accessible visualisations, surface meaningful patterns for decision-making. Together, the case insights and methodological synthesis illustrate how ONA can inform evidence-based interventions that improve coordination, reduce friction, and enhance organisational learning. The paper concludes with guidance on integrating ONA into organisations, emphasising the importance of validity, transparency, and the responsible use of employee data.

Abstract 1804

ENHANCING PSYCHOLOGISTS' ROLE IN INTERPROFESSIONAL PRACTICE: A MODEL FOR PRIMARY HEALTHCARE IMPLEMENTATION.

Perri F., Ohtsuka K.*

Victoria University ~ Melbourne ~ Australia

Background:
Psychologists are integral to addressing complex health conditions, yet their capacity to work interprofessionally in primary healthcare remains underutilised in Australia. Despite global evidence supporting interprofessional practice (IPP), barriers such as professional silos, funding constraints, and logistical challenges limit psychologists' engagement. This paper reports the development of an evidence-informed model to enhance the uptake of IPP in primary healthcare clinics.

Objectives:
This paper aims to:
Identify barriers preventing psychologists from working interprofessionally in primary healthcare settings.
Present evidence-based strategies and a practice model to overcome these barriers.
Demonstrate how psychologists can leverage this model to improve collaborative care delivery.

Methods:
A three-phase qualitative study was conducted. Phase 1 involved interviews with 20 health professionals from diverse primary care settings to identify barriers. Phase 2 applied the CDC's Social-Ecological Framework to categorise barriers and explore solutions, including a case study on cost and technology. Phase 3 integrated these findings with Kotter's Change Model and design-thinking principles to develop a practical implementation framework.

Results:
Nine key barriers were identified, including cost, limited understanding of IPP, and logistical challenges. Solutions emphasised multi-level interventions, such as professional education, improved communication systems, and technology-supported coordination. The resulting model provides a step-by-step guide for clinics to embed IPP, adaptable to diverse settings.

Conclusion and Implications:
Psychologists can play a pivotal role in advancing IPP by adopting structured change

frameworks and design-driven solutions. The proposed model provides clinics with a roadmap to foster collaboration, reduce fragmentation of care, and enhance outcomes for clients with chronic and complex needs. This research contributes both theoretically, by integrating socio-ecological and change management approaches, and practically, by offering psychologists and their colleagues a viable pathway to implement IPP in everyday practice.

Abstract 706

RE-CONCEPTUALIZING EMPLOYEE RESPONSES TO ORGANIZATIONAL CHANGE

Vakola M.*[1], Tasoulis K.[2]

[1]Athens University of Economics and Business ~ Athens ~ Greece, [2]American College of Greece ~ Athens ~ Greece

Researchers widely agree that employees make or break organizational change initiatives. Traditional approaches have focused on the valence of recipients' reactions (positive or negative). However, a growing body of research emphasizes the more complex nature of these responses, incorporating another important dimension—activation level, i.e., whether the responses are passive or active. In addition, the endurance of employees' reactions represents another crucial and informative characteristic: one may possess a positive attitude towards a particular change today, but this attitude may not endure over time, thereby limiting sustained benefits.

The present study advances the understanding of responses to organizational change by extending beyond traditional valence-only models. To examine this, we conducted a two-wave qualitative study based on interviews with technology employees of an international betting company headquartered in Switzerland, which had recently undergone multiple acquisitions alongside significant structural and cultural changes. In total, we conducted 31 interviews across two waves and analyzed the data using configurational analysis.

Our findings revealed two key challenges. First, responses to change are not always immediately observable, as they often become entangled with the demands of daily functioning and the fear of being negatively assessed if performance delivery is deemed inadequate. Consequently, we found employees who continued to perform their tasks exceptionally well while simultaneously expressing disbelief, lack of support, or ambivalence toward the change. This raises the question of how resistance to change manifests itself in subtle rather than overt ways. Second, despite the change initiative being implemented simultaneously across the organization and accompanied by uniform communication and events, it exerted varying effects on employees and managers. These variations were explained not by the change itself but by factors such as an individual's position in formal or informal networks, the nature of their work, interpersonal relationships, and personality characteristics.

Abstract 113

REIMAGINING THE HR BUSINESS PARTNER MODEL: A PSYCHOLOGICALLY-INFORMED FRAMEWORK FOR STRATEGIC IMPACT

Veldsman D.*[1], Van Der Merwe M.[2]

[1]University of Johannesburg ~ Johannesburg ~ South Africa, [2]The Academy to Innovate HR ~ Rotterdam ~ Netherlands

The role of Human Resources (HR) is undergoing profound transformation. Amid technological disruption, economic volatility, and rising employee expectations, HR is expected to evolve from a support function into a strategic enabler of organizational adaptability and performance. At the center of this shift lies the HR Business Partner (HRBP) model—originally introduced to align HR with business strategy, streamline operations, and elevate professional expertise. Yet, despite its widespread adoption, many organizations continue to experience an execution gap between the model's promise and its actual impact.

This session introduces the 5SL HR Effectiveness Framework, developed through a multi-year study of over 1,200 organizations. The framework identifies six interdependent pillars—Strategy, Structure, Skills, Systems of Work, Stakeholders, and Leadership & Culture—as essential to enabling effective HRBP performance. Grounded in applied psychology and systems thinking, it serves as both a diagnostic and developmental tool for assessing and enhancing HR's strategic contribution.

Findings reveal that while 71% of HR leaders report confidence in their strategic alignment, only 56% feel they can demonstrate measurable impact. Barriers include legacy structures, digital skills gaps, and inadequate work systems that fail to translate strategy into action. Notably, smaller HR teams often outperform larger ones due to enhanced agility and clearer role clarity.

The session will explore the psychological, relational, and systemic conditions that shape HRBP effectiveness. Participants will gain practical insights into building digital capabilities, reducing structural complexity, and cultivating leadership that fosters alignment and trust.
By embracing a holistic, behaviourally-informed approach to HR design, this session empowers practitioners to reimagine the HRBP model—not just as a structural blueprint, but as a dynamic enabler of sustained strategic impact

01 - Division 1: Work and Organizational Psychology

TRANSDISCIPLINARY PSYCHOLOGICAL APPROACHES TO SKILLS, TRUST AND SOCIAL INCLUSION IN TIMES OF POLYCRISIS

Friday 24 July 2026 from 17:00 to 18:30

(O-Arsenale)

Concetta Fonzo, Chair and Presenter
Sandra D'Agostino, Discussant

TOPIC: Transdisciplinary Approaches: Collaborate across areas of psychology and disciplines to address complex global challenges
In the context of accelerating and interconnected global challenges, often conceptualised as a “polycrisis”, applied psychology is called to develop new transdisciplinary approaches capable of addressing complexity while promoting inclusion, trust and sustainable development. This symposium responds to this call by integrating organisational, educational, policy and behavioural perspectives to explore how skills, agency and trust can act as key levers for social inclusion. Adopting a multi-level framework, the contributions offer complementary insights. At the organisational level, one paper examines the psychological foundations of systems change in the non-profit sector, highlighting hope, agency and relational trust as critical resources enabling collective action and long-term transformation. At the intersection of psychology and social policy, a second contribution investigates alternative credentials as innovative tools for recognising skills beyond formal education, discussing their implications for equity and life-course opportunities among disadvantaged groups. Expanding the analysis to global and societal challenges, a third contribution applies a polycrisis lens to forced displacement, exploring how educational systems and transnational initiatives can foster inclusion, recognition of prior learning and multicultural integration, particularly across Europe and Africa. At the meso level of vocational education and training, another study presents the development and validation of a soft skills self-assessment tool, addressing the role of interpersonal competences in building trust, collaboration and quality assurance processes. Finally, an interdisciplinary contribution examines how environmental narratives shape consumer behaviour, demonstrating how psychological and cultural factors influence decision-making in sustainability transitions. By bridging theory, empirical research and practice across diverse domains, the symposium advances an innovative and transdisciplinary understanding of applied psychology’s role in responding to polycrisis. It highlights how fostering skills, trust and agency can support more inclusive, resilient and sustainable societies.

Abstract 4802

Hope, Agency and the Psychology of Systems Change in the non-for-profit sector

Norris L.*, Maksimtseva R.*, Crooks A.

Curiosity Society ~ London ~ United Kingdom

Efforts to address complex social challenges increasingly emphasise the need for systems change. Yet while much attention is given to structural reform, funding strategies, or policy influence, less focus is placed on the psychological dimensions of change within the organisations and communities attempting to drive it. This presentation explores how concepts from applied psychology - particularly hope, agency, and relational trust- can support organisations working to change complex social systems.

Drawing on practice-based work with major UK funders including Comic Relief, Nationwide Foundation, and Resonance, we reflect on how organisations seeking to influence systems must also engage in processes of internal change. This includes shifts in mindset, power relationships, and ways of working with partners and communities. Systems change is not only technical or strategic; it is also psychological. It requires individuals and institutions to reconsider assumptions, tolerate uncertainty, and develop new forms of collaboration.

Our approach combines applied psychological insight with participatory and creative practice. Through facilitated learning partnerships, collective reflection, and creative methods drawn from community arts, we create spaces where organisations can explore complexity together, build relationships across sectors, and imagine more hopeful futures. These relational spaces are critical for sustaining motivation and agency in long-term social change work.

A central proposition of the presentation is that hope is not simply an outcome of successful systems change, but a resource that enables change to occur. Building hope within and between organisations helps create the conditions for collective action, trust, and sustained commitment to change.

By sharing examples from real-world practice, the session will explore how human-centred and creative approaches can support organisations to change themselves while working to change the systems around them.

Abstract 4805

Construction and Pilot Validation of a Soft Skills Self-Assessment Scale for Peer Review in VET

Evangelista L.*[1], Boerchi D.[2]

[1]INAPP ~ Rome ~ Italy, [2]University Cattolica del Sacro Cuore ~ Milan ~ Italy

Peer review in vocational education and training requires not only technical competences but also soft skills that support collaboration, trust, feedback and shared decision making. This study describes the construction and pilot validation of a self-assessment scale designed to measure the soft skills needed to participate effectively in quality peer review processes. Starting from a competency framework previously defined for peer review roles, we developed behaviour-based items referring to everyday actions, written to reduce ambiguity and allow self-evaluation also for people without direct peer review experience. The initial pool included 8 items for each of 10 dimensions. The pilot study involved 75 participants with different levels of familiarity with self-assessment and quality processes. Item analysis and content review were combined to select a parsimonious final version.

The final instrument includes 50 items rated on a 5-point Likert scale, with 10 subscales of 5 items each: adaptability, active listening, attention to detail, collaboration, clear communication, facilitation, critical thinking, problem solving, resilience and time management. Correlations between the 8-item and 5-item versions were always above .90, indicating strong continuity. Internal consistency coefficients ranged from .74 to .89. Compared with the original 8-item version, the 5-item version showed psychometric properties that were, on average, slightly better and more homogeneous across subscales. The scale was designed to support profile reading by role and to identify strengths and areas for development in peer review teams.

The results support the current 5-item version as a practical and conceptually coherent tool for formative and organizational use. Further studies on larger samples are needed to confirm the structure and extend validity evidence.

Abstract 4952

From Quality Standards to Evaluator Competences: A Competence Mapping Framework for Evaluation in Education

Fonzo C.*

INAPP ~ Rome ~ Italy

Evaluation plays a central role in promoting learning and teaching improvement as well as organizational enhancement across education systems. Although frameworks define the standards and dimensions to be assessed, less attention has been devoted to the competences required by evaluators to perform their role effectively. Evaluation is not solely a technical activity; it involves professional judgement, critical thinking, communication, collaboration and the ability to interpret complex organisational contexts. This paper presents a competence mapping framework designed to identify and operationalise the competences underpinning educational evaluation processes. Starting from sixteen Quality Areas commonly employed in evaluation frameworks, the study develops a systematic association between quality dimensions and evaluator competences. The resulting framework organises competences into four domains: contextual knowledge of education systems, evaluation-specific competences, methodological-evaluative competences, and transversal competences. The mapping process reveals considerable variation in competence requirements across Quality Areas. While methodological and procedural competences are consistently represented, other dimensions associated with effective evaluator performance — such as communication, collaboration, adaptability and contextual understanding — appear less systematically embedded. The analysis also identifies competence gaps linked to emerging challenges, particularly digital transformation and sustainability, which are becoming increasingly relevant within educational organisations. By making explicit the relationship between quality standards and competence requirements, the framework contributes to the professionalisation of evaluators and provides a conceptual basis for the design of training programmes, competence assessment tools and professional development pathways. More broadly, the study advances the understanding of educational evaluation as a competence-based professional activity, highlighting the importance of both technical and transversal competences in supporting evidence-informed quality improvement processes.

PARTNERSHIPS FOR THE GOALS: GLOBAL COLLABORATION IN WORK AND ORGANIZATIONAL PSYCHOLOGY FOR THE SDGS

Friday 24 July 2026 from 17:00 to 18:30

(R-Arsenale)

Jenna McChesney (Meredith College ~ Raleigh ~ United Sta), Chair and Presenter

The United Nations Sustainable Development Goals (SDGs) outline a shared vision for a healthier, fairer, and more sustainable world, and Work and Organizational Psychology (WOP) offers critical contributions to this agenda, particularly in advancing SDG 3 (Good Health and Well-Being), SDG 8 (Decent Work and Economic Growth), and SDG 10 (Reduced Inequalities). This symposium will bring together scholars and representatives from some of the leading WOP associations, including Division 1 of the International Association of Applied Psychology (IAAP), the European Association of Work and Organizational Psychology (EAWOP), and the Society for Industrial and Organizational Psychology (SIOP), to explore how partnerships across the field can be leveraged to contribute to the 2030 agenda and beyond.

The session will begin with the session's chair, Dr. Jenna McChesney, providing a brief overview of how WOP can contribute to he SDGs, the different professional organizations represented in the session, and an introduction to our speakers. Presenters include: Dr. Ishbel McWha-Hermann (EAWOP) on informing policy around decent work; Dr. Zonke Zungu (SIOP-UN) and Dr. Mahima Saxena (SIOP-UN) on lessons from research-based policy mandates; Dr. Vicente Martínez-Tur (IAAP Division 1 President) on how IAAP advances the SDGs and how IAAP and SIOP support each other through joint efforts, including showcasing IAAP initiatives such as 'This Works in My Place' at SIOP conferences; and Dr. Morrie Mullins (SIOP-UN) on embedding global lessons into WOP education and training.

As we approach 2030, the milestone year for the SDGs and the next ICAP, the session will conclude with a forward-looking discussion of how IAAP, EAWOP, SIOP, and other WOP associations can continue to partner, adapt, and expand psychology's role in contributing to the UN SDGs and shaping global priorities beyond 2030.

Abstract 3660

EAWOP IMPACT INCUBATOR - USING WOP TO INFORM POLICY

Mcwha--Herman I.*

University of Edinburgh ~ Edinburgh ~ United Kingdom

The SIOP-UN team works across two broad areas: working with SIOP members to promote an understanding of (and engagement with) the work of the United Nations, and collaborating on projects with various UN departments to raise awareness of the tools available through work and organisational psychology. Strengthening both aspects of this work means collaborating with other professional associations. IAAP, SIOP and EAWOP work together closely on a range of topics (e.g.,through The Alliance for Organisational Psychology) and work together on promoting one another's work. Advancing Decent Work is a key workstream within the European Association of Work and Organisational Psychology's impact incubator (EAWOP-ii). Established in 2020, EAWOP-ii is designed to engage, inform, and influence policymakers and policymaking across Europe through sharing evidence and insights that are generated from Work and Organisational psychology research and practice. This commitment to translating psychological research for policymakers has forged partnerships such as with City of Edinburgh Council, and Living Wage Scotland. Through this work EAWOP-ii has created numerous research-based animations, briefing papers, and a serious game, on the topic of decent work. We have also hosted events with policymakers and had the opportunity to present this work at the International Labour Organisation in Geneva. This presentation will share how the SIOP-UN team and EAWOP-ii have collaborated on this work around decent work. I have been both the Decent Work lead for EAWOP-ii as well as a SIOP-UN committee member. I will provide an overview of the Decent Work stream at EAWOP-ii and share insights about how to communicate psychology research for policymaker audiences. I will also share lessons learned about engaging with policymakers and offer ideas for how to enhance collaboration between professional associations.

Abstract 3661

PSYCHOLOGY AS A TOOL FOR ADVANCING UNITED NATIONS SUSTAINABLE DEVELOPMENT GOALS: PERSPECTIVES FROM COMMUNITY ORGANISATIONS IN THE GLOBAL SOUTH

Zungu Z.*

University of Cape Town ~ Cape Town ~ South Africa

Community organisations in South Africa play a critical role in driving the United Nations Sustainable Development Goals (SDGs), yet their experiences and insights seem to be overlooked in current literature. SIOP-UN committee member, Dr Zonke Zungu, will share the findings of a research project that investigates the factors that shape employee health and well-being in community organisations. It will centre the role of community organisations, particularly in under-resourced community organisations, while foregrounding the challenges, gaps and recommendations for empowering employees on the margins. Overall, this presentation contends that advancing SDGs must be driven by human-centred principles, starting by caring for those on the frontlines of leading these goals, which will ultimately create a ripple effect. It will argue that community organisations are a microcosm of the larger society, shaping not only the well-being of employees, but also families, communities and the planet. Drawing from the findings and the multiple perspectives in the field of Work Psychology, this session will demonstrate how this field can serve as a tool for advancing the SDGs.

Abstract 3662

POLICY AND THE INFORMAL ECONOMY - HOW I-O RESEARCH CAN SUPPORT THE UN SUSTAINABLE DEVELOPMENT GOALS ON DECENT WORK, HEALTH & WELL-BEING, AND INCLUSIVE DEVELOPMENT

Saxena M.*

University of Nebraska Omaha ~ Omaha ~ United States of America

SIOP-UN committee member, based on her research in decent work and well-being, Dr. Mahima Saxena, will discuss how decent work policy mandates can benefit from grassroots research based on the lived experiences of those in non-traditional work and occupations. Dr. Saxena will discuss how policies that center the experiences of those they hope to support, can be more effective for local communities and the SDGs. Grounding the presentation in research that began with SIOP's very first grant for humanitarian work psychology a decade ago, the critical role of research in capturing lived experiences and worker realities will be examined. General recommendations from this research stream and ways forward will be discussed to ultimately promote inclusive sustainable development centered on decent work and wellbeing that leaves no one behind.

Abstract 3663

THIS WORKS IN MY PLACE

Martinez--Tur V.*

University of Valencia ~ Valencia ~ Spain

Dr. Vicente Martínez-Tur will highlight the collaboration between the International Association of Applied Psychology (IAAP) Division 1 and the Society for Industrial and Organizational Psychology (SIOP) in advancing the United Nations Sustainable Development Goals (SDGs). He will share how the two organizations support each other, particularly through their respective congresses, to strengthen the connection between work and organizational psychology and the global development agenda.

As a key example, Dr. Martínez-Tur will present IAAP's "This Works in My Place!" initiative, which collected regionally grounded strategies from Latin American and African experts on addressing SDGs such as no poverty SDG 1, good health and well-being SDG 3, gender equality SDG 5, decent work SDG 8, and innovation SDG 9. This project, also featured at SIOP, illustrates the importance of context-sensitive approaches in promoting sustainable and inclusive development.

The presentation will emphasize how collaboration between professional societies enhances global impact and supports the integration of psychological science into efforts to achieve the SDGs.

Abstract 3664

TRAINING THE NEXT GENERATION OF WOP RESEARCHERS AND PRACTITIONERS INTERESTED IN THE UN SDGS

Mullins M.*

Xavier University ~ Cincinnati ~ United States of America

The surest way to both sustain and extend the work done by WOP as relates to the sustainable development goals (SDGs) is to train new generations of scholars and practitioners on the criticality of the goals. The Society for Industrial and Organizational Psychology (SIOP) has supported such training through its publications, its conference programming, its committee structure, and its mission, for over a decade. Even before being granted special consultative status with ECOSOC, SIOP's quarterly member publication, The Industrial-Organizational Psychologist (TIP), regularly included the work of Professor Stuart Carr and others on humanitarian topics. In 2015, TIP published an article offering guidance to WOP graduate programs on the process of becoming signatories to the United Nations Global Compact. The article included resources based on the experience of the program at Purdue University in becoming the first U.S. psychology graduate program to join the Global Compact. In another TIP article that same year, Ashley Hoffman offered insights on the incorporation of humanitarian work psychology into both graduate and undergraduate psychology classes. Efforts to support engagement with the Global Compact, and to highlight the relevance of the SDGs, are on-going, and find a ready audience in graduate students.

This presentation will focus on efforts made to broaden awareness of the SDGs and their relevance to WOP among student populations, and to support the integration of SDGs into both graduate and undergraduate psychology training. In addition to sharing key milestones and learning points related to SIOP's support of these efforts, we will describe facets of the SIOP United Nations committee that target enhanced student engagement. We will also offer a recent example of an undergraduate course focused on humanitarian work psychology and the SDGs, and lessons learned from that course's design and implementation.

Abstract 2447

FROM AMBIGUITY TO CONFIDENCE: VALIDATING AN ORGANISATIONAL PSYCHOLOGY ENTRUSTABLE PROFESSIONAL ACTIVITIES ASSESSMENT FRAMEWORK

Hess N.*[1], Harrison E.[2], Pritchard E.[3], Zadow A.[4], Auton J.[4]

[1]Macquarie University ~ Sydney ~ Australia, [2]University of Queensland ~ Brisbane ~ Australia, [3]University of Western Australia ~ Perth ~ Australia, [4]Adelaide University ~ Adelaide ~ Australia

Introduction: Assessment of psychology trainees is the cornerstone of developing a skilled psychologist workforce. However, assessment of psychology trainees during practicum placements continues to have reported issues of assessment bias and leniency. To overcome these reported assessment issues, medical and allied health professions have adopted Entrustable Professional Activities (EPA) frameworks. EPAs are the specific tasks of the profession that need to be assessed for safe and effective professional practice.

Purpose: To develop and validate an EPA framework for assessing organisational psychology trainees during placements.

Method: A mixed-methods iterative process led by an Australian national expert group was used to identify and refine the EPAs. Seventeen focus groups were conducted with 68 participants: graduates (n = 27), placement supervisors (n = 27), and academic staff (n = 14). Focus group transcripts were thematically analysed to refine the EPAs for the validation survey. A validation survey with 78 placement assessors evaluated each EPA using seven rubric items to determine the content validity, and one qualitative item, which was thematically analysed.

Results: Focus group themes identified revisions to the initial 12 EPAs for language, specificity, and additional task requirements. One EPA was removed, and three additional EPAs were added, yielding 14 EPAs for validation. The survey content validity outcomes resulted in further revisions, with two EPAs being combined and the removal of one EPA that did not meet the required content validity criteria. The final framework comprised 12 attributes, six met the criteria as EPA descriptors, and six were identified as professional attributes required to achieve the EPAs and were reconceptualised in this way for the final proposed assessment framework.

Conclusions: As an initial attempt to define an EPA framework for organisational psychology trainees during placements, this project may serve to inform the design of

EPA frameworks for the other professional psychology training programs.

Abstract 2202

FROM REFLECTING TO GROWTH: APPLYING PERFORMAPA TO CATALYZE PROFESSIONAL PERFORMANCE

Sandall H.*[1], Mourão L.[2]

[1]Brazilian Society of Work and Organizational Psychology (SBPOT) and Universidade Federal Fluminense (UFF) ~ Brasília ~ Brazil, [2]Universidade do Estado do Rio de Janeiro (UERJ) and Universidade Salgado de Oliveira (UNIVERSO) ~ Rio de Janeiro ~ Brazil

This session introduces the Performap, an inventive and practice-oriented tool designed to guide the mapping of professional performance and support self-directed development. Structured as a visual diagram, it enables workers to identify, organize, and prioritize performance behaviors, as well as to plan targeted interventions that align contextual demands with personal career aspirations. Grounded in functional analysis of contingencies and enriched by design thinking principles, the tool combines behavioral science with creative problem-solving to place workers at the center of their own developmental processes. The session will describe the potential of this approach by presenting results from a series of workshops conducted with six groups of leaders and non-leaders who applied the Performap to map their performance and design initiatives for career development. In follow-up interviews conducted six months later, participants reported substantial outcomes, including greater clarity in career direction, improved negotiation of organizational support, and more consistent pursuit of professional performance catalysts. These findings highlight how organizational and work psychologists can act as facilitators of self-management, supporting individuals in connecting their performance behaviors to broader organizational goals while maintaining a focus on sustainability and well-being. By integrating design thinking with behavioral analysis, the diagram becomes more than an assessment device: it is a developmental resource that supports workers in managing their performance, negotiating resources, and sustaining growth across contexts. One limitation concerns the diagram's current format, which can restrict portability and compromise the privacy of annotations; for this reason, we recommend adopting a planner-based version that enhances usability and protects confidentiality. Ultimately, the Performap exemplifies how Work and Organizational Psychology can deliver applied and inventive tools that foster autonomy, adaptive capacity, and professional development as an ongoing, co-created process between workers and organizations.

PATHS TOWARD WELL-BEING: AN ACTION-RESEARCH FOR PROMOTING QUALITY OF LIFE IN A MULTIDIMENSIONAL PERSPECTIVE

Scalas L.F.*[1], Cuccu S.[1], Pedditzi M.L.[1], Fadda D.[1], Guarnera M.[2], Zarbo R.[2], Magnano P.[2], Buccheri S.L.[2], Lodi E.[3], Perrella L.[3], Patrizi P.[3]

[1]University of Cagliari ~ Cagliari ~ Italy, [2]University of Enna "Kore" ~ Enna ~ Italy, [3]University of Sassari ~ Sassari ~ Italy

In these first decades of the 21st century, interest in the topic of human well-being, as a complex and multidimensional construct, has grown exponentially both in terms of scientific interest and professional psychological practices. Psychological well-being has a significant impact on quality of life and its most important domains. In this scenario, the PRIN project to be presented was carried out in collaboration between three Italian universities (Cagliari, Enna, Sassari) and aimed to: 1) conduct a systematic review of the literature on training for the promotion of subjective well-being in school, university, and workplace, which included 32 studies published between 2009 and 2024. The review confirmed the relevance of structured, evidence-based interventions to promote well-being across different contexts, emphasising the importance of considering individual and environmental factors to maximise their effectiveness; 2) developing and testing of training programmes aimed at improving relevant well-being dimensions highlighted by the first Italian validation study (Scalas et al., 2023a, 2023b) of the Well-being Profile scale (WB-Pro Marsh et al., 2020): optimism, competence, self-esteem, engagement, meaning, positive emotions. The experimentation took place in three different domains of people's lives (school, university, workplace), with the participation of around 300 people: 100 high-school students, 100 university students, and 100 workers. The programme, divided into six sessions, included a pre-post assessment to verify the effectiveness of the intervention through the administration of the WB-Pro scale.

This contribution will present the main phases of the research programme, the techniques and tools used, and the results obtained in terms of enhancing the dimensions of well-being promoted in the training.

Watts L.*, Martín--Raugh M., Martinez L., Tran E.

University of Texas at Arlington ~ Arlington ~ United States of America

Training programs aimed at facilitating ethical and responsible research (ER2) are a central mechanism for improving researchers' familiarity with rules, policies, and professional norms, as well as for cultivating more complex competencies such as ethical reasoning and decision-making. Although computer-based programs (e.g., CITI) are widely used, their efficacy in strengthening ethical reasoning is limited compared to face-to-face formats. This research sought to close that gap by developing and rigorously testing innovative hybrid training approaches that integrate the interactivity and engagement of in-person instruction with the scalability of computer-based delivery.

The interventions focused on early-career researchers, who practiced responding to animated video- and text-based ethical dilemmas relevant to the social sciences (e.g., data management, study conduct, professional and business practices). Embedded, real-time expert feedback was designed to enhance reasoning and decision-making in ethically complex situations. A randomized study compared the relative effectiveness of situational judgment test (SJT)-based training with more traditional critical incident-based approaches, providing the first empirical comparison of these methods for ER2 training.

This work contributes to understanding how ethical decision-making can be taught in scalable, digital environments and applied across diverse research contexts. It also advances knowledge of video- and SJT-based training methods, which show strong promise but remain underexamined in the ethics domain.

Abstract 340

THE IMPACT OF SOCIAL MEDIA ON GENERATION Z'S WORKPLACE COMMUNICATION: THE MEDIATING ROLE OF ANXIETY AND THE MODERATING ROLE OF LEADER SOCIAL SUPPORT

Fontes A.*

ISCTE ~ LISBON ~ Portugal

In an increasingly digital professional context, the rise of social media has been transforming the way individuals communicate and interact in the workplace, especially Generation Z. The growing reliance on social media raises concerns about its effects on interpersonal communication and social anxiety, potentially compromising the communication effectiveness of younger workers. Furthermore, studies indicate that social support may play a moderating role in mitigating the negative effects of anxiety, fostering a healthier and more productive work environment.

This study aims to analyze (1) how the use of social media influences Generation Z's communication in professional settings, (2) the impact of anxiety on this process, (3) whether workplace social support moderates the relationship between anxiety and communication, and (4) whether anxiety explains the link between social media use and communication styles.

The research involved a sample of 181 participants, aged between 17 and 27, and revealed that intensive use of social media is associated with less effective workplace communication. Additionally, it was found that anxiety mediates the relationship between social media use and communication, such that increased digital engagement heightens anxiety, which in turn impairs communication. The study also found that this effect is significantly moderated by the social support provided in the professional environment, particularly by supervisors.

The results highlight the need for organizations to adopt strategies that promote balanced digital habits and foster a workplace culture based on social support. Understanding these dynamics will enable companies to implement practices that minimize the negative impacts of anxiety and enhance Generation Z's communication effectiveness in the workplace.

INFORMATION AND COMMUNICATION TECHNOLOGY (ICT) USE AT WORK, JOB INSECURITY, AND WORK MEANINGFULNESS: A MODERATED MEDIATION MODEL IN EUROPEAN COUNTRIES

Ariño--Mateo E.*, González--Romá V.

University of Valencia ~ Valencia ~ Spain

Drawing on the Conservation of Resources theory, this study investigates how information and communication technology (ICT) use at work relates to employees' perceptions of work meaningfulness, focusing on the mediating role of job insecurity and the moderating role of organizational participation. Data was collected from the seventh European Working Conditions Survey (Eurofound), across 37 European countries and 71,451 employees and analyzed using multilevel modelling. Results showed a dual pattern: ICT use was negatively related to job insecurity, which in turn was negatively related to meaningfulness, yielding a positive indirect effect of ICT on meaningfulness via job insecurity. At the same time, ICT showed a negative direct association with meaningfulness. Organizational Participation showed a moderating effect on the relationship between ICT use and Job Insecurity, indicating that higher levels of Organizational Participation strengthen the negative relationship between ICT use and Job Insecurity. These findings highlight ICT skills and participatory practices as key protective resources that reduce job insecurity and sustain work meaningfulness in the context of digital transformation.

Abstract 2176

AI, COLOURISM, BLACK WOMEN & CARE: THE IMPACT OF STEREOTYPES IN IMAGE-GENERATING ALGORITHMS

Doudy--Michez O.*, Pohl S., Faleu L.

Université libre de Bruxelles ~ Bruxelles ~ Belgium

Colourism is a positive bias towards people with lighter skin, which manifests itself at the intra- and/or inter-ethnic level (Doudy-Michez, Pohl and Moerenhout, 2024). In Belgium and France, this research is the first to evaluate AI-generated images in relation to colourism among black women according to their hierarchical level in the care sector. Black women are overrepresented in care professions, particularly in subordinate positions (Gatugu, 2017). Among Black women, ethnic group and gender stereotypes, as well as the type of profession, influence the perception of skills (Cuddy, et al., 2008). Generative AI algorithms reproduce the biases affecting people who are discriminated against in the real socio-professional world (Lacroux & Lacroux, 2021).

In the design of this study, 50 prompts were submitted to three AIs: Copilot, Sora (ChatGPT) and Gemini. The prompts included three skin colour types: light mixed race, dark mixed race and black, and the hierarchical level of the position (care assistant, nurse and paediatrician).

Analysis of the images shows that AI fails to take into account colourism affecting dark-skinned mixed-race black women and that there are differences in skin colour depending on hierarchical level. The generated photos show that they have the same skin colour as dark-skinned black women. Our research demonstrates that generative AI must include colourism in order to represent the existing professional realities in the care sector.

Abstract 1456

ACCEPTANCE OF WORK ALLOCATION TO INTELLIGENT ROBOTS IN MONETARY AND MORAL CONTEXTS: BASED ON INDEPENDENT AND COLLABORATIVE WORK

Jiang D.*

School of Psychology, Shenzhen University ~ Shenzhen ~ China

With the advancement of artificial intelligence, intelligent robots are increasingly integrated into the workforce, raising critical questions about how tasks should be allocated between humans and robots. According to mind perception theory, robots are attributed with moderate agency but low experience, leading to disparities in the types of tasks they can effectively undertake. These differences shape judgments of responsibility and influence task allocation. Despite their lower perceived agency and experience, robots' computational and storage advantages highlight the emerging trend of human-robot teams. Moreover, collaboration extends beyond individuals to group forms (human-human, human-robot, robot-robot), raising questions about collective mind and its implications for responsibility and task allocation.

This research employs four behavioral experiments. Studies 1 (N = 100) and 2 (N = 100) use contextual decision-making tasks to test whether individuals accept work allocations to humans or robots under monetary and moral scenarios. Studies 3 (N = 100) and 4 (N = 100) further examine whether collaborative teams influence acceptance of work allocation, comparing human-human, human-robot, and robot-robot teams within the same contexts.

The results show: (1) in both monetary and moral tasks, loss-related work is more readily allocated to robots, while benefit-related work is assigned to humans; (2) The differentiated mind of humans and robots lead to differences in the responsibilities they can assume, ultimately resulting in the allocation of tasks with distinct gain-loss works; (3) collaborative teams exhibit a collective mind; and (4) collective mind declines progressively from human-human to human-robot to robot-robot teams, with corresponding reductions in accepted monetary and moral responsibilities.

Grounded in mind perception theory, this study clarifies the psychological mechanisms driving acceptance of task allocation across entity types and teams, offering insights for the rational integration of intelligent robots into the division of labor.

Abstract 2466

MIRROR, MIRROR, ON THE WALL: WHO DELIVERS FEEDBACK BEST OF ALL?

Gardner A.*[1], Michalsen K.[1], Carlson C.[1], Czaja A.[1], Kiger M.[1], Bilyeu C.[2], Lockspeiser T.[1]

[1]University of Colorado School of Medicine ~ Aurora ~ United States of America, [2]University of Manitoba ~ Thompson ~ Canada

Introduction

We investigate the accuracy of feedback delivery scores provided by artificial intelligence (AI) powered avatars in comparison to feedback delivery ratings created by supervisors and peer observers.

Methods

Supervisors attended a two-hour professional development workshop focused on enhancing feedback delivery skills. After a 20-minute lecture, participants took turns in groups of four providing feedback to the avatar while the remaining participants observed. After each scenario, all participants and the avatar independently rated the feedback delivery skills using the DOCS-FBS feedback delivery scale (1-3 scale; 1=not done;3=successfully done). Scenario complexity was calculated with a 9-item 1-4 scale (4=most complex). Paired-samples t-tests with post-hoc Tukey tests were used to examine differences between groups.

Results

Twenty-four supervisors with an average of 10(± 5) years in practice participated across six groups. A total of 120 feedback evaluations were collected across 24 unique avatar interactions. Scenario complexity ratings ranged from 1.89 to 3.11, with an average scenario complexity rating of 2.50 (±0.46). Across each of the four scenarios, no differences emerged between self and avatar feedback delivery ratings. For the two scenarios with above average complexity ratings, however, peer ratings were higher than both self ratings (scenario 3: 2.91±0.08 vs 2.47±0.42,$p<0.05$); scenario 4: 2.97±0.03 vs 2.80±0.16,$p<0.01$) and avatar ratings (scenario 4: 2.74±0.22 vs 2.97±0.03,$p<0.05$). No differences emerged between self and peer ratings or avatar and peer ratings for either of the below-average complexity scenarios.

Discussion

Feedback delivery ratings produced by self, peers, and the avatar platform itself were similar the majority (75%) of the time. With higher complexity, however, we found peers

provided higher feedback delivery ratings than self or avatars. Our study supports the value of using AI-powered avatars to simulate the feedback delivery process and offers supervisors an opportunity to rehearse and refine their feedback skills in a safe, convenient, repeatable setting.

Abstract 687

GETTING SOCIAL IN LEADERSHIP: AN INVESTIGATION INTO HOW ENTERPRISE SOCIAL MEDIA AFFECTS LEADERSHIP IN SERVICE ORGANISATIONS

Yang W.Y.*, Budjanovcanin A.

King's College London ~ London ~ United Kingdom

The adoption of enterprise social media (ESM) – web-based platforms that facilitate communication within organisations – has grown rapidly in recent years, particularly in service organisations where leaders and followers often rely on ESM for daily operations. A defining characteristic of effective leadership is the ability to influence followers, yet with the growing use of ESM in leadership, it is often assumed that such practices will be as effective on these digital platforms as they are in person. However, whether leadership processes, such as leaders' use of influence tactics, translate effectively into these settings, and how ESM affordances may shape such processes, remains empirically unclear.

This study therefore investigates leadership in which ESM is used as a primary mode of communication between leaders and their followers in the service sector, in two key ways. First, we explored how transformational and transactional leadership affect their respective influence tactics – consultation and collaboration – which in turn mediate followers' perceptions of leader effectiveness and their extra effort. Second, we examine how the ESM affordance of interdependence, defined as the extent to which ESM enables leaders to foster mutual reliance and coordination and facilitates followers to build on one another's input to complete tasks, moderates this relationship.

Regression analyses of 228 employees across three time points in UK service organisations indicate that transformational leadership positively influences follower extra effort (but not perceived leadership effectiveness) via consultation influence tactics, with this indirect effect strengthening as leaders leverage greater interdependence affordance. In contrast, transactional leadership positively affects perceived leader effectiveness (but not follower effort) via the collaboration tactics, with the indirect effect weakening and eventually disappearing as interdependence affordance increases. This study offers insights about how ESM and its affordance may shape leadership and outcomes, highlighting both their benefits and potential overuse.

Abstract 809

WORKPLACE BULLYING IN CHINESE CULTURE: CONTENT AND BULLIES

Chen T.*[1], Jiang D.[2], Hsiao S.[2], Chuang C.[2], Lin C.[2]

[1]Department of Criminology, National Chung-Cheng University ~ Chia-Yi ~ Taiwan, [2]Department of Psychology, National Chung-Cheng University ~ Chia-Yi ~ Taiwan

Recent studies have shown that workplace bullying consistently impacts workers' physiological and psychological well-being, as well as organizational effectiveness. Although researchers have described various workplace bullying behaviors and developed corresponding measures, workplace bullying behaviors may be influenced by social cultures, resulting in different manifestations. In particular, compared to Western organizations, Enterprises influenced by the Chinese culture may place greater emphasis on guanxi, face, and social orders, which may be exploited to facilitate certain forms of workplace bullying. Additionally, bullies are not only superiors or colleagues; subordinates may also engage in bullying behaviors toward their supervisors. As a result, this study employs critical incident techniques, collecting critical incidents from 83 workers in various organizations in Taiwan, which yielded 825 reported incidents. After excluding unclear or irrelevant incidents, 636 valid incidents remained. Through a lexical classification and concept generation process, nine categories emerged: illegal workplace behaviors (26%), social undermining (23%), emotional outbursts (14%), verbal abuse (12%), harassment (7%), physical violence (7%), oppression behaviors based on social order (6%), information manipulation (3%), and scapegoating (3%). Among these categories, bullies may originate from superiors, colleagues, and subordinates; however, illegal workplace behaviors are more often committed by superiors, scapegoating and information manipulation more by colleagues, and social undermining by subordinates. This preliminary exploratory study indicates that the cultural context in which workers operate may give rise to culturally specific forms of workplace bullying that require particular attention. Furthermore, the study highlights that managers and supervisors can also be subjected to bullying from subordinates, emphasizing the need for organizational understanding and support. Ultimately, the findings will inform the development of measures for workplace bullying tailored to Chinese cultural contexts, facilitating the exploration of the underlying mechanisms of bullying behaviors and the development of effective coping strategies for various forms of bullying.

Abstract 1579

THE POLICY-PRACTICE GAP IN WORKPLACE WELL-BEING: INSIGHTS FROM EUROPEAN OCCUPATIONAL PSYCHOLOGY PRACTITIONERS

Martín J.*[1], Frida R.[2], Csukonyi C.[3], Dias L.[4], Sušanj Z.[5], Jungmann F.[6]

[1]Universitat Jaume I ~ Castellón de la Plana ~ Spain, [2]Aston University ~ Birmingham ~ United Kingdom, [3]University of Debrecen ~ Debrecen ~ Hungary, [4]Pact for Mental Health in the Workplace ~ Lisboa ~ Portugal, [5]University of Rijeka ~ Rijeka ~ Croatia, [6]SARIA Group ~ Dresden ~ Germany

Across Europe, stress and burnout are growing challenges, and despite existing legal frameworks, there is a notable gap between well-being policies and their practical implementation. This fosters a "box-ticking" culture where compliance is prioritised over genuine commitment. This multi-country qualitative study, led by the European Federation of Psychologists' Associations (EFPA), explores best practices, implementation challenges, the role of policies, and the intersection with Equality, Diversity, and Inclusion (EDI) initiatives through interviews with occupational psychology practitioners in eight European countries.

The findings indicate that a successful approach must be proactive and systemic, not reactive. Key elements include psychosocial risk assessment, leadership training, mental health literacy, and the integration of EDI initiatives, which are intrinsically linked to improved mental health outcomes. However, implementation faces systemic challenges, such as the underutilisation and misunderstanding of the occupational psychologist's role, a lack of integration among key stakeholders, and sectoral disparities, with public organisations and small enterprises lagging behind larger corporations.

The conclusions highlight the need for a cultural shift. It is recommended to elevate the professional status of occupational psychologists, update legislative frameworks to focus more on well-being promotion rather than just risk prevention, and foster interdisciplinary collaboration to ensure holistic and sustainable initiatives.

Abstract 1328

SEPARATING THE WHEAT FROM THE CHAFF: THE RELATIVE IMPORTANCE OF CHALLENGE AND HINDRANCE JOB DEMANDS FOR BURNOUT AND WORK ENGAGEMENT

Dopico Casal C.*, Hernández A., Montes C.

Psychosocial Risks at Work Laboratory, Department of Social Psychology, Basic Psychology, and Methodology, University of Santiago de Compostela ~ Santiago de Compostela ~ Spain

Introduction: In psychosocial risk assessments, the relevance of job demands is often attributed to their frequency of exposure. However, frequency does not necessarily reflect impact: prevalent stressors may contribute little, whereas less common ones can be decisive. Within the challenge–hindrance stress framework, little is known about the weight of each specific stressor in predicting occupational health.

Purpose: To examine the relative importance of challenge and hindrance demands in predicting burnout and work engagement.

Method: A multi-occupational sample of 822 (68.5% women) employees completed an online survey that assessed 37 job demands extracted from the scientific literature. Burnout and engagement were measured using the BAT-12 and the UWES-3, respectively.

Results: Twenty-five demands were experienced as hindrances (rBAT=.13 – .51, p< .001; rUWES=.01 – -.33, p< .001 – ns), and four as challenges (rBAT=.08 – .21, p< .001 – p=.02; rUWES=.08 – .20, p< .001 – p=.03). Eight stressors showed inconsistent associations with outcomes and were not classified as demands. Cognitive demands (98.8%) and variability of work task (98.7%) were the most frequently reported demands; both were challenges. Relative importance analyses indicated that hindrance and challenge demands explained 97.0% and 3.0% of the variance in burnout (R2=.52, 95%CI [.49 – .59]), respectively, with life-work conflict as the most important predictor (RW=12.4, 95%CI [7.9 – 16.1]). For engagement, while hindrance demands explained 81.1% and challenge stressors 18.9% of the variance (R2=.34, 95%CI [.31 – .42]), job responsibility (a challenge demand) showed the highest relative weight (RW=10.9, 95%CI [5.4 – 16.3]).

Conclusions: Although nearly all employees were exposed to cognitive demands and variability of work task, these stressors played a marginal role in predicting burnout or engagement. When considering health outcomes, it is more important to differentiate the nature and relative weight of job demands than their prevalence.

Abstract 1323

THE CHANGING NATURE OF WORK-RELATED STRESSORS: A SYSTEMATIC REVIEW OF CHALLENGE AND HINDRANCE JOB DEMANDS

Dopico Casal C.*, Hernández A., Montes C.

Psychosocial Risks at Work Laboratory, Department of Social Psychology, Basic Psychology, and Methodology, University of Santiago de Compostela ~ Santiago de Compostela ~ Spain

Introduction: Not all job demands are equally detrimental. Hindrance stressors involve undesirable constraints that interfere with an individual's ability to achieve valued goals, while challenge demands can foster positive emotions and attitudes that contribute to beneficial outcomes. Nevertheless, the nature of some demands remains unclear: the same demand may be experienced as a challenge or a hindrance depending on the context.

Purpose: Clarify which job demands are categorized as challenges and/or hindrances, their effects on workers' well-being, and the contextual conditions that shape their impact.

Method: A thorough search of PsycINFO, MEDLINE, Web of Science, and Scopus was conducted to identify peer-reviewed articles in English or Spanish, following the PRISMA statement. Reference lists of previous reviews and meta-analyses were also screened. Eligibility criteria required quantitative or mixed-methods studies evaluating the effects of a job demand classified as a hindrance or a challenge on burnout and/or engagement.

Results: From 1,233 records retrieved, 129 publications (135 studies) were included, covering 91 job demands and 113,235 employees (54.5% women). Hindrance demands (49.5%), mostly organizational politics and administrative hassles, were associated with higher burnout, anxiety, and turnover intentions, along with lower engagement and job satisfaction. Challenge demands (38.3%), most often cognitive and problem-solving demands, were linked to higher burnout, engagement, job satisfaction, and performance. Time pressure and workload were the most studied ambiguous demands (18.6%), showing mixed effects characteristic of both types, related to higher burnout and presenteeism, and greater or lower engagement and self-efficacy. Social support and leadership emerged as key mediators/moderators of their impact on burnout and engagement.

Conclusions: This research contributes to identifying which job demands are experienced as challenges, hindrances, or both. These findings underscore the

importance of considering organizational factors to better understand the changing nature of work-related stressors and to guide contingent workplace practices aimed at managing psychosocial hazards.

Abstract 150

THE ROLE OF JOB STRESSORS AND STRAIN FOR CONTENT MODERATORS: A MIXED-METHODS STUDY

Jamdagni I.*, Green D., Semmler C.

University of Adelaide ~ Adelaide ~ Australia

Content moderators are front-line workers keeping digital spaces safe by filtering and removing harmful and unpleasant content. There is empirical evidence that the psychological demands in this role are can lead to distress. However, there is limited understanding of the mechanisms of this relationship. One possibility can be the nature of the role rather than the content which leads to this distress. Thus, here we aim to investigate the role of occupational stress, on content moderators. Through a survey, key occupational stressors and strains were measured with content moderators, using subscales of the Occupational Stress Inventory-Revised and open-ended questions. The results showed that content moderators scored significantly higher on all subscales ($p < .001$) except for Role Boundary and Responsibility. Significantly higher scores on Role Overload were reported by participants ($t(112) = 3.38$, $p < 0.001$) which overlapped considerably with the qualitative findings. Additionally, expanding on the significantly higher scores of psychological strain ($T = 4572$, $p < .001$), qualitative results of exposure to distressing content, user aggression, ethical dilemmas in decision-making which reflected the nuances involved in content moderation. These findings indicate significant organisational and individual factors associated with stress in the role of content moderation. Additionally, occupational stress-strain cannot be adequately measured using present scales as they do not capture the nuances of this complex job. Finally, future research should not only focus on poor mental health outcomes for content moderators but also explore occupational stressor-strain relationships.

Abstract 314

HEALTHY ORGANIZATIONS IN THE EDUCATIONAL FIELD: A CASE STUDY BASED ON THE HERO MODEL

Mirica A.R.*, Cruz--Ortiz V., Salanova M.

Universitat Jaume I ~ Castellón ~ Spain

Mental health at work has become a strategic priority due to the rising organizational costs and the economic impact of disorders such as depression and anxiety, which generate annual productivity losses nearing one trillion dollars (WHO, 2022; Nielsen et al., 2023). This highlights the need to address psychosocial risks through a positive perspective (Salanova & Llorens, 2025). The objectives of this study were: (1) to conduct a diagnostic assessment of psychosocial factors, and (2) to design a multilevel intervention (Nielsen et al., 2017) tailored to identified needs. The methodology combined quantitative methods (a survey of 73 employees) and qualitative methods (10 interviews and 4 focus groups).

The assessment identified critical areas compared to an external normative sample: low feedback (M = 2.40; p = .000), high quantitative (M = 4.32; p = .000) and emotional overload (M = 4.83; p = .000), and high role ambiguity (M = 2.30; p = .000). Leadership also emerged as a key driver of well-being, distress, and organizational outcomes in both predictive models and qualitative analysis.

Based on these findings, three interventions were implemented following the IGLO model (Nielsen et al., 2017; Salanova & Llorens, 2024): (1) a leader-coach program with group and individual sessions; (2) appreciative survey feedback for departmental representatives to foster participatory reflection; and (3) the DESA program (Development of Healthy Teams), using a quasi-experimental design with an intervention and a waiting list control group.

We are currently analyzing the effects of these positive psychology interventions on indicators of well-being (e.g., work engagement, horizontal/vertical trust) and distress (burnout). Preliminary results indicate improvements in social support climate, leadership perception, and organizational commitment.

These findings reinforce the HERO model as a valuable framework for promoting healthy organizations. Positive psychological interventions are effective strategies to enhance well-being and prevent occupational distress, supporting more sustainable organizational management.

NEW DIRECTIONS IN TOXIC LEADERSHIP: MECHANISMS AND CONSEQUENCES ACROSS ORGANIZATIONAL CONTEXTS

Saturday 25 July 2026 from 08:00 to 09:30

(O-Arsenale)

Lara Pico (Nova School of Business and Economics ~), Chair and Presenter
Pedro Neves (Nova School of Business and Economics ~), Discussant

Organizations are increasingly confronted with destructive leadership behaviors that systematically undermine employee well-being, organizational effectiveness, and ethical climates. This symposium presents five complementary studies from three different countries (Canada, Germany, and Portugal) that advance our understanding of how various forms of problematic leadership create uncertainty, stress, and dysfunction across organizational contexts. Using multiple theoretical frameworks (e.g., Uncertainty Reduction Theory, Affective Events Theory, Cognitive-Affective-Behavioral-Trait) and diverse methodological approaches—experimental designs, longitudinal studies, critical incident techniques, and multi-source assessments—the set of presentations provides robust empirical evidence for the mechanisms through which leaders inadvertently or deliberately create dysfunctional workplace dynamics. The symposium discusses inconsistent and exploitative leadership behaviors and highlights important leader-follower perceptual discrepancies, showing that reluctant leaders may remain unaware of their destructive behaviors, while followers readily identify these patterns and associate them with passive and inconsistent leadership. Additionally, research on paradoxical leadership situations reveals anxiety as a predominant leader emotion, with systematic differences in emotional experiences between leaders and followers during challenging scenarios. Collectively, these studies offer context-specific insights for organizational interventions. For remote work environments, organizations should prioritize strengthening organizational identification and monitoring exploitative behaviors. In military and hierarchical settings, implementing systems to detect and address leadership reluctance before destructive patterns emerge is crucial. Across all contexts, leadership development programs should incorporate emotional regulation training and establish multi-source feedback mechanisms to bridge leader-follower perceptual gaps. This symposium makes a timely contribution to leadership research by integrating multiple perspectives on destructive dynamics within a unified theoretical framework. By examining leadership challenges across traditional, remote, and military contexts, these studies provide both comprehensive theoretical insights and immediately applicable solutions for organizations navigating increasingly complex leadership demands in the contemporary workplace.

Abstract 3610

HOW INCONSISTENT LEADERSHIP PROMOTES UNETHICAL PRO-ORGANIZATIONAL BEHAVIORS AND COWORKER UNDERMINING

Pico L.*, Neves P.

Nova School of Business and Economics ~ Lisbon ~ Portugal

Inconsistent leadership refers to a pattern where a leader's actions, decisions, and interactions with employees shift unpredictably, making it difficult for employees to understand their leader's expectations. This inconsistency fosters an environment of ambiguity, prompting behaviors that deviate from the organization's core values. Drawing on Uncertainty Reduction Theory, we propose that employees, when faced with inconsistent leadership, resort to deviant behaviors such as unethical pro-organizational behaviors and coworker undermining to gain advantage in such a competitive environment and reduce the uncertainty stemming from that environment. We also propose that this relationship occurs because employees adopt competitive and aggressive behaviors, characteristic of masculinity contest cultures. To empirically test these relationships, we conducted a time-lagged study across three waves, gathering data from 300 employees across various organizations. Our findings highlight that inconsistent leadership indeed promotes both unethical actions intended to benefit the organization and behaviors that undermine colleagues to maintain or enhance their status. Additionally, we identify perceptions of masculinity contest cultures as a key mediator in these relationships. Our study not only deepens the understanding of how inconsistent leadership fosters deviant behaviors in the workplace but also offers actionable insights for organizations aiming to reduce these negative outcomes. Specifically, we show that inconsistent leadership, by exposing employees to unpredictability, induces a climate of hypercompetition that drives individuals to engage in self-preserving behaviors misaligned with organizational ethics. Our research further extends the theoretical discourse on the nomological network of inconsistent leadership, offering a nuanced view of how uncertainty disrupts ethical climates and interpersonal relationships within organizations.

Abstract 3611

LEADING FROM HOME: THE INFLUENCE OF EXPLOITATIVE LEADERSHIP ON JOB SATISFACTION, EMPLOYEE´S PERCEIVED STRESS, LEADER-MEMBER-EXCHANGE AND ORGANIZATIONAL IDENTIFICATION

Vilser M.*[1], Holzapfel M.[2], Wein L.[1], Schmid E.[1], Hauser A.[2], Böhm M.[3]

[1]University of the Bundeswehr Munich ~ Munich ~ Germany, [2]Munich Business School ~ Munich ~ Germany, [3]University of Applied Sciences Landshut ~ Landshut ~ Germany

Introduction: In recent years, the prevalence of working from home and digital collaboration has increased significantly. However, the role of managers and especially it´s potentially negative aspects, has not yet been sufficiently investigated. Purpose: Our study addresses this research gap and focuses on the concept of exploitative leadership (i.e., a destructive leadership style, that represents self-serving and manipulative leadership behaviour that can happen in a seemingly friendly manner towards the employee). Specifically, we examine how exploitative leadership behavior affects employees perceived stress, job satisfaction and organizational identification in remote work settings. Further, we want to explore if the quality of the relationship between the leader and the employee (i.e., the Leader-Member-Exchange), is affecting this relationship. Method: Using a comprehensive online questionnaire, data were collected from a sample of 1,922 Internet-using, German employees. The study employed multiple regression analysis, mediation analysis and moderated mediation analysis. Results: Initial results indicate that exploitative leadership correlates positively with stress and negatively with job satisfaction. Furthermore, organizational identification appears to mediate this relationship. Leader-Member-Exchange shows no moderating effect. Conclusion: These findings have important implications for leadership development in remote work settings. Specifically, it seems important that companies implement measurements to strengthen the organizational identification.

Abstract 3612

THE IMPACT OF INCONSISTENT LEADERSHIP ON EMPLOYEE ATTITUDES AND PERCEPTIONS

Biricik Gulseren D.*

York University ~ Toronto ~ Canada

Introduction: Inconsistent leadership, defined as variability in a leader's actions, decisions, and behaviours, is associated with negative employee outcomes. Most prior research relies on cross-sectional surveys, which limits causal conclusions about these effects.

Purpose: This study aims to experimentally examine how inconsistent leader behaviours influence employee reactions and attitudes compared to unethical and passive leadership styles.

Method: A between-subjects design will be used with 200 participants recruited via Prolific. Participants will read vignettes describing leaders exhibiting unethical, passive, or inconsistent behaviours. Outcomes measured will include confusion, frustration, moral distress, trust, and perceived leadership effectiveness. Data will be analyzed using ANOVA and mediation analyses to assess differences across conditions.

Results: We expect inconsistent leadership to generate higher confusion, frustration, and moral distress, as well as lower trust and perceived leadership effectiveness, compared to other leadership styles.

Conclusions: Findings will enhance understanding of the detrimental consequences of inconsistent leadership and inform interventions aimed at reducing its negative impact in organizational contexts.

Abstract 3613

DOES LEADERSHIP RELUCTANCE BREED TOXICITY? LEADER–FOLLOWER DISCREPANCIES IN PERCEIVED DESTRUCTIVE LEADERSHIP BEHAVIOURS

Suurd Ralph C.*, Bartolozzi B., Glover I.

The Royal Military College of Canada ~ Kingston ~ Canada

Introduction: Although leadership roles are often framed as opportunities for personal growth and achievement, not all individuals aspire to lead—and some accept such roles reluctantly. Reluctant leaders may experience heightened stress and diminished well-being, which could manifest in destructive or toxic leadership behaviours.

Purpose: The present research examined the construct of reluctance to lead (RTL) among naval and officer cadets at the Royal Military College of Canada (RMC), where occupying a leadership position is mandatory.

Method & Results: In Study 1, 77 naval and officer cadets holding a leadership role completed measures of their own RTL, leadership self-efficacy, and leadership behaviours. Results indicated that, even when they were employed in a position they had not sought out, most cadet leaders did not endorse being reluctant to lead. RTL was also not significantly related to leadership self-efficacy or to self-reported leadership behaviours. In Study 2, a group of 52 naval and officer cadets in follower roles rated their cadet leaders' reluctance and destructive leadership behaviours. Followers' perceptions of their leaders' reluctance were positively associated with three forms of destructive leadership, including passive management by exception, laissez-faire, and inconsistent leadership.

Conclusions: Together, these findings suggest that individuals may be hesitant to acknowledge their own leadership reluctance, especially when holding a leadership role. In contrast, cadet followers perceived reluctance in their leaders, and that reluctance was associated with their evaluations of the leaders' destructive leadership including passive, laissez-faire, and inconsistent leadership behaviours. These studies raise important questions about how socially desirable responding may mask leadership reluctance, emphasizing the need for future research using multi-source or longitudinal designs to better capture its relationship with destructive leadership behaviour.

Abstract 3614

THE AFFECTIVE CORE OF LEADERSHIP: EMOTIONAL DYNAMICS IN PARADOXICAL LEADERSHIP SITUATIONS

Büchner H.*[1], Ritter M.[1], Dehne J.[2], Kauffeld S.[1]

[1]Technical University of Braunschweig ~ Braunschweig ~ Germany, [2]German Computer Society ~ Berlin ~ Germany

Introduction & Purpose: The interplay between paradoxical leadership, emotions, and regulatory strategies remains underexplored. This study examines paradoxical leadership situations and associated discrete emotions at both the individual and dyadic levels. Guided by Affective Events Theory (Weiss & Cropanzano, 1996) and the Cognitive-Affective-Behavioral-Trait (CAB-T) framework (Shao, 2024), the study emphasizes discrete emotions, their contextual triggers, and emotion regulation strategies beyond broad positive/negative affect measures. Paradoxical leadership—balancing contradictory yet interdependent demands - has been studied primarily in terms of cognition, while emotional processes remain understudied. This research addresses that gap by analyzing emotions across phases of paradoxical leadership situations and resolving strategies as well as highlighting followers' emotions and perceptions.

Method: Semi-structured interviews were conducted with 15 leaders and 15 matched followers, using the Critical Incident Technique to explore paradoxical leadership situations. Data were analyzed through deductive-inductive content analysis, allowing for category expansion to strengthen the study's theoretical contribution.

Results: Preliminary findings highlight anxiety as the predominant leader-emotion. Compared with labeled "easy" paradoxical situations, anxiety peaks later, intensifies over a longer period of time and reaches higher levels in "difficult" situations. In addition a broader range of emotions characterize difficult paradoxical situations. Resolving mechanisms include optimism, perspective-taking, and emotion-regulation-strategies. Followers primarily reported joy when leadership was perceived as effective. When leadership was ineffective, followers reported anxiety, anger, and sadness. Notably, followers rarely recognized leader emotions.

Contributions: The findings advance understanding of emotional processes in paradoxical leadership by incorporating both leader and follower perspectives. They highlight factors shaping the success or failure of paradox management, guide future research directions, and provide practical insights for supporting leaders and followers in such contexts.

01 - Division 1: Work and Organizational Psychology

PERSPECTIVES IN ADDRESSING THE NEEDS OF VULNERABLE POPULATIONS

Saturday 25 July 2026 from 08:00 to 09:30

(R-Arsenale)

Ines Martínez-Corts (Universidad de Sevilla ~ Sevilla ~ Spain), Chair and Presenter
Carolina Moliner (Universidad de Valencia ~ Valencia ~ Spa), Co-Chair

With a focus on vulnerable individuals, along the five studies we examine how working conditions (demands, resources, support, etc.) impact the psychological well-being and professional development of people in vulnerable situations, whether due to disability, intellectual disability (ID), precarious work, limited work capacity, or challenging conditions in
the long-term care (LTC) sector. Each study aims to understand how psychosocial and organizational factors affect these vulnerable groups, with the goal of identifying strategies and
resources that can improve their well-being, employability, and job satisfaction.
More concrently, by applying the Job Demands-Resources model, the researcb by De Carlo
provides empirical evidence on how acceptance of disability contributes to the psychological
well-being of individuals with disabilities, both employed and unemployed. The study by van
Ruitenbeek, highlights the role of workplace acceptance and support in fostering the cognitive
and work behavior development of individuals with limited work capacity (LWC), emphasizing its impact on employability and growth over time. The research by Cuinen explores whether
precarious work can be a stepping stone or a stumbling block to more stable employment, examining the experiences of workers in domestic cleaning in Flanders through the lens of Conservation of Resources Theory. The study by Martinez-Corts examines the psychosocial and
organizational factors impacting the well-being of long-term care workers in Europe, highlighting how job demands, resources, and vulnerabilities—especially among women and
migrant workers—affect stress, burnout, and job satisfaction. Finally, the study by Moliner on
inclusive leadership underscores its importance in promoting the autonomy of employees with
ID. Inclusive leadership not only enhances autonomy but also shapes positive attitudes toward
hiring individuals with similar profiles, creating a more diverse and inclusive work environment.
This emphasis on leadership can be extended to other work contexts, such as LTC and precarious work, where leadership can mitigate negative working conditions and improve job
satisfaction.
The integration of these studies emphasizes the need for inclusive leadership and supportive
work environments to foster the well-being and professional growthofvulnerable workers.By
focusingonautonomy,workplacesupport,andacceptance,organizationscancreateconditions

thatreduceburnout,improvejobsatisfaction,andpromotediversehiringpractices.Ultimately, thesefindingscallforcomprehensivestrategiestoimproveworkingconditionsandinclusivity acrossdifferentsectors,ensuringthatvulnerableindividualscanreachtheirfullpotentialin the workforce.

Abstract 4060

ACCEPTANCE OF DISABILITY AS A PROTECTIVE FACTOR FOR EMOTIONAL EXHAUSTION: AN EMPIRICAL STUDY ON EMPLOYED AND UNEMPLOYED PERSONS WITH DISABILITIES

De Carlo E.*[1], Ingusci E.[2], Signore F.[2]

[1]Department of Human and Social Sciences, University of Salento ~ Lecce ~ Italy, [2]University of Salento, Lecce, italy

A diagnosis of disability represents a significant event in an individual's life, as it brings with it a series of challenges and adjustments in both personal and professional areas. Acceptance of disability plays a key role in the process of adaptation, indirectly promoting the psychological well-being of persons with disabilities. Acceptance of disability (hypothesized as a resource) in the work context may promote the reduction of emotional exhaustion (a sub-dimension of burnout), thus significantly influencing the achievement of well-being. Based on these assumptions and according to the Job Demands-Resources the study involved 102 employed and unemployed persons with disabilities. This research sought to contribute to an understanding of the dynamics between acceptance of disability and psychological well-being also in the work context. The analysis of key variables led to highlighting the importance of promoting acceptance as a crucial factor in reducing the emotional exhaustion of people with disabilities, which inevitably has several practical implications

Abstract 4061

WORKPLACE LEARNING AND DEVELOPMENT OF PEOPLE WITH LIMITED WORK CAPACITY

Van Ruitenbeek G.*

Maastricht University ~ Maastricht ~ Netherlands

Workplace learning and development is crucial for sustained employability, especially for people with limited work capacity (LWC). We explored the development in cognitive functioning and work behaviour of people with LWC and to which extent this is moderated by workplace acceptance and support.
In total, 182 people with LWC and 172 workplace mentors provided data on dimensions of cognitive functioning and work behaviour on three timepoints over 4 months. Furthermore, people with LWC provided data on workplace acceptance and support.
Results showed significant development over time for both, self- and observer-rated cognitive functioning, such as planning and organising, learning and memory, problem solving, and for self-rated adaptability and concentration. Development over time emerged for the self-rated work pace, a work behaviour dimension. Moreover, the growth curves on selfrated variables such as learning and memory, work accuracy, social behaviour and work pace were moderated by workplace acceptance and support.
This study provides initial insight into growth patterns of cognitive functioning and work behaviour of people with LWC and illustrates the relevance of a supportive climate for development.

Abstract 4062

STEPPING STONES OR STUMBLING BLOCKS? OPPORTUNITIES AND CHALLENGES IN DOMESTIC CLEANING WORK

Cuinen S.*, Proost K., El Khawli E., Mewis L.

Open Universiteit ~ Heerlen, ~ Netherlands

Precarious work often carries a rather negative connotation, being associated with unstable, insecure and unhealthy employment (Allan et al., 2021), However, it is frequently framed in policy discourse as a stepping stone to labour market inclusion, offering non-workers initial access to employment and, potentially, pathways to more stable job opportunities (de Graaf-Zijl et al., 2011). This idea of precarious work as a stepping stone also underpins the recent surge in policies and programs focused on activation of non-workers (Rubery et al., 2018). However, recent research has shown that precarious work can also cause individuals to fall into cycles of unemployment and precarious work or lead to discouragement from jobsearching altogether (Aldrich & Callanan, 2011).

In this study, we explore whether, and if so, how precarious work can serve as a stepping stone. Through interviews with individuals in precarious work, we want to gain insight into their experiences and identify factors that render precarious work a stepping stone or a stumbling block. We approach these questions from Conservation of Resources Theory (Hobföll, 1989, 2011): we assume that individuals with sufficient personal resources are better equipped to navigate precarious job conditions and use their resources to secure less precarious employment. Conversely, those with fewer resources may struggle to escape such conditions.

We select a work context that has distinct precarious characteristics in Flanders (the Dutch-speaking part of Belgium), namely domestic cleaning work. Domestic cleaning work is rather unstable and insecure as it is characterized by a volatile demand for labour and unhealthy because of the physically demanding tasks.

Abstract 4063

WELL-BEING, AND WORKPLACE CONDITIONS IN LONG-TERM CARE: A WEEKLY STUDY ACROSS EUROPE

Martínez--Corts I.*, Kuradchik V., Martínez--Corts I., Medina F.

Universidad de Sevilla ~ Sevilla ~ Spain

The European long-term care (LTC) sector faces significant challenges, including staff shortages, precarious working conditions, and low professional recognition. Many LTC workers belong to vulnerable groups, such as women, migrant workers, or individuals lacking legal protection. These factors negatively impact their mental health, leading to stress, burnout, and reduced job satisfaction. This study explores psychosocial and organizational determinants of well-being in LTC workers, aiming to inform policies that foster inclusion and improve working conditions.

A four-week longitudinal study was conducted in six EU Member States: Spain, France, Italy, Poland, Germany, and Sweden. Participants from the LTC sector provided data on working conditions, job demands, available resources, and well-being indicators. The study examined how these factors evolved over time and influenced each other.

Findings reveal critical job demands that heighten stress and protective resources that enhance well-being. Vulnerable workers, particularly migrants and women, experience heightened risks due to job instability and limited support. Identified key resources—such as social support, fair wages, and job security—mitigate stress and foster resilience.These insights provide an empirical foundation for targeted interventions.

Organizational psychologists can design workplace support systems to enhance well-being and retention, while policymakers can implement strategies to improve job security, fair labor conditions, and legal protections for LTC workers. Strengthening these measures is crucial to fostering an inclusive and sustainable workforce in LTC.

Abstract 4064

THE ROLE OF INCLUSIVE LEADERSHIP IN SHAPING ATTITUDES TOWARD THE HIRING OF INDIVIDUALS WITH INTELLECTUAL DISABILITIES: THE MEDIATING EFFECT OF AUTONOMY

Moliner C.*, Plavsic A., Estreder Y., Martinez--Tur V., Fajardo--Castro L.V.

Department of Social Psychology, University of Valencia & IDOCAL ~ Valencia ~ Spain

Workplace inclusion is increasingly recognized as both an ethical imperative and a driver of organizational effectiveness and innovation (Shore et al., 2018). However, individuals with intellectual disabilities (ID) remain among the most marginalized, facing barriers in hiring, advancement, and integration (Bonaccio et al., 2020; Fajardo-Castro et al., 2024). In this study we focus the attencion on inclusive leadership characterized by valuing, respecting, and leveraging diversity within organizations. Inclusive leaders promote equity, encourange active participation, and the creation of an environment where all individuals feel safe, heard, and valued thus promoting a fair treatment and contributing to more equitable workplaces.

Our research investigates whether the autonomy of workers with intellectual disabilities (ID) in the workplace mediates the relationship between inclusive leadership and the attitudes of coworkers without ID toward hiring individuals with ID. We collected data from 26 teams, each including at least one worker with an intellectual disability (ID). A total of 130 coworkers without ID provided insights into team dynamics and leadership practices. Using a time-lagged design,inclusive leadership was measured at T1, while the autonomy of workers with ID and hiring attitudes were assessed five working days later (T2)

The results supported the full mediation role of autonomy. Inclusive leadership was positively related to the autonomy of workers with ID. Autonomy, in turn, was associated with positive attitudes of coworkers without ID toward hiring individuals with ID. The results suggest that inclusive leadership with a strong sense of justice,

improves positive attitudes toward hiring individuals with ID in organizations, enhances their autonomy, and contributes to a more inclusive and supportive organizational culture.These findings highlight the importance of fostering inclusive environments to improve the quality of life and opportunities for people with intellectual disabilities in both organizational contexts.

01 - Division 1: Work and Organizational Psychology

WORK PLACE COACHING: EXPLORING EFFECTIVE FACTORS, MECHANISMS AND COACHING FORMATS

Saturday 25 July 2026 from 09:30 to 11:00

(R-Arsenale)

Conny Antoni (Trier University ~ Trier ~ Germany), Chair and Discussant

This symposium discusses the factors and mechanisms through which workplace coaching is effective and the situational, technological, and temporal factors that influence its efficacy. Workplace coaching describes customised activities that are based on a collaborative, reflective, and goal-focused relationship between a professional coach (without formal supervisory authority) and one or more coachees to facilitate a range of positive work outcomes. Several meta-analyses have demonstrated the overall effectiveness of workplace coaching in reaching coaching goals and enhancing work performance. Nevertheless, the field continues to require rigorous theoretical underpinnings and research designs to facilitate a more profound comprehension of the factors that influence its efficacy, the mechanisms through which coaching is effective, the demographic characteristics of those who benefit from it, and the temporal parameters within which it is most effective. The studies presented in this symposium contribute to close this research gap.

Mühlberger and colleagues analyze in four empirical studies how the coachee's self-regulation and self-access facilitate coaching success and how coaches can foster coachees' self-development. Tatar and Antoni investigate the general and differential mediation effect of occupational self-efficacy in two coaching modalities, coaching by coaches (N = 60) and self-coaching (N = 32), by using moderated longitudinal multi-level mediation analysis. Gil Bozer and Silja Kotte explore in their qualitative study how organizational context shapes the workplace coaches' adaptation to an artificial intelligence (AI)-Coaching platform and challenges the core mechanisms of their practice. Nicky Terblanche compares in his two-wave experimental study (N = 592), how generative AI chatbots based on different coaching models influence goal attainment, working alliance, and client perceptions of the coaching experience. The discussant reflects the theoretical and methodological approaches of the presented studies, and their implications for theory development, research methods and ethical standards for AI-coaching.

Abstract 3585

THE SELF IN WORKPLACE COACHING: HOW THE COACH'S RELATIONSHIP BEHAVIOR FOSTERS COACHEES' SELF-REGULATION AND SELF-ACCESS

Jonas E.*[1], Zerle G.[1], Behrendt P.[2], Mühlberger C.[1]

[1]University of Salzburg ~ Salzburg ~ Austria, [2]Freiburg Institut ~ Freiburg ~ Germany

Introduction: The coachees' self-development, particularly self-regulation and self-access, is central to coaching. Through a strong relationship, the coach plays a vital role in supporting the coachee's self. However, it remains unclear how exactly the self is activated through the coach behaviors within the coaching relationship.
Purpose: Using Personality Systems Interactions theory, we investigated how the coachee's self-regulation and self-access facilitate coaching success and how coaches can foster coachees' self-development.
Method: In two studies, we investigated whether the coachee's self-development can predict coaching success. Study 1 (N = 37) employed a longitudinal design with a 5-month coaching program for caregivers in management positions. In Study 2, we matched self-reported data of 298 coachees with self-reported data of their 75 respective coaches. In two additional studies, we investigated the impact of coach behavior on success. We hypothesize that three relationship-oriented coach behaviors are important for coaching success: Providing structured guidance, providing personalized support, and activating the coachee's resources. In Study 3 (N = 108), we used video ratings to analyze coach behavior and assessed goal attainment after one month. In Study 4 (N = 1,217), we asked coachees about their goal attainment, coaching satisfaction, and need satisfaction based on past coachings.
Results: In Study 1, the coachees' self-regulation and self-access increased from before to after coaching. Self-regulation further predicted goal attainment. In Study 2, a strong coaching relationship reported by the coaches positively related to the coachees' self-regulation and self-awareness, an aspect of self-access, further predicting goal attainment, satisfaction, and need fulfillment. In Studies 3 and 4, the coach's resource activation had the strongest positive effect on coaching success. Self-regulation and self-access mediated this effect.
Conclusion: The client's self-development significantly contributes to coaching success. Coaches should focus on fostering self-regulation and self-access by building a strong relationship and activating the coachee's resources.

Abstract 3586

GENERAL AND DIFFERENTIAL MEDIATION EFFECTS OF OCCUPATIONAL SELF-EFFICACY IN SELF-COACHING AND COACHING BY COACHES ON STRESS AND WELL-BEING

Tatar A.*, Antoni C.

Trier University ~ Trier ~ Germany

Workplace coaching is known to reduce stress and improve well-being. A significant factor that has been demonstrated to be efficacious in the reduction of stress in other areas of research is self-efficacy, which is a key concept in social learning theory. Coaching can enhance individuals' occupational self-efficacy. As occupational self-efficacy is related to stress and can be enhanced by coaching, we regard occupational self-efficacy as a promising mediating mechanism in coaching for reducing stress and increasing wellbeing. As coaches are costly, accessible and cost-effective alternative coaching formats, such as self-coaching, are advocated. However, whether these coaching formats can support the sources of occupational self-efficacy (mastery experience, social modeling, social persuasion and physical and emotional states) can be doubted. While mastery experience and emotional states might be triggered in self-coaching, social modeling and social persuasion both require another person, i.e. a coach. Therefore, we assume stronger mediation effects for coaching by coaches than for self-coaching.

The present study employs a longitudinal design, conducted over five measurement points, to assess the effectiveness of manualized stress coaching in self-coaching and coaching by coaches modalities on coachees' perception of stress and well-being. Furthermore, we investigated the general and differential mediation effect of occupational self-efficacy by using moderated longitudinal multi-level mediation analysis. In both coaching by coaches (N = 60) and self-coaching (N = 32), coachees completed online questionnaires before and after each session. The results show that the stress coaching intervention reduced coachees perception of stress and improved their well-being. Occupational self-efficacy partially mediates the impact of the intervention on stress and well-being in coaching by coaches, but not in self-coaching. These results indicate that self-coaching could rather supplement than substitute coaching by coaches. Theoretical and practical implications for different coaching formats are being discussed.

Abstract 3588

COMPARING GROW, SOLUTION-FOCUSED, AND CBT COACHING CHATBOTS: A SELF-DETERMINATION AND TRANSFORMATIVE LEARNING PERSPECTIVE

Terblanche N.*

Stellbosch University Business School ~ Stellenbosch ~ South Africa

Artificial intelligence (AI) coaching chatbots are increasingly used to support personal and professional development, yet little is known about how different coaching models translate into AI-mediated practice. This study compares three established coaching approaches: GROW, Solution Focused (SF), and Cognitive Behavioral Therapy (CBT) as implemented in generative AI chatbots. Drawing on Self-Determination Theory (SDT) and Transformative Learning Theory (TLT), we examine how these approaches influence three outcomes central to coaching: goal attainment, working alliance (bond, goal, task), and client perceptions of the coaching experience. In a two-wave experimental study (N = 592), participants were randomly assigned to engage with one of the three coaching chatbots over two sessions. Contrary to expectations derived from human coaching literature, the CBT-based chatbot outperformed both GROW and SF chatbots across most measures, suggesting that AI-mediated coaching may activate different psychological processes than human coaching. These findings extend coaching theory by exploring how established models function in AI contexts and highlight implications for coaching practice, training, and the integration of AI into organizational and developmental settings. The study also raises critical questions about the unique contribution of human coaches in an era of increasingly capable AI coaching tools.

01 - Division 1: Work and Organizational Psychology

FROM CAMPUS TO CAREER: PSYCHOLOGICAL RESOURCES AND VALUES FOR SUSTAINABLE AND PROACTIVE EMPLOYABILITY

Saturday 25 July 2026 from 09:30 to 11:00

(M-Lorenese)

Greta Mazzetti (University of Bologna ~ Bologna ~ Italy), Chair
Vicente González-Romá (University of Valencia ~ Valencia ~ Spa), Discussant

This symposium brings together five international research teams to explore how psychological resources, values, and emotional processes foster sustainable and proactive employability during the transition from higher education to work. Drawing on frameworks such as the Job Demands–Resources model, the Career Sustainability Framework, and Proactive Motivation Theory, the contributions collectively illustrate how values, self-regulation, and affective mechanisms shape adaptive and meaningful career trajectories.

The opening paper (Panari et al.) examines how intrinsic and extrinsic work values influence perceived employability through protean career orientation, emphasizing the importance of value-driven self-management. The second study (Floris et al.) adopts a longitudinal approach to show how career resources such as self-exploration and clarity predict sustainable academic success. The third paper (Milani et al.) highlights the motivational power of positive affect in envisioning Future Work Selves and its role in enhancing career proactivity. The fourth contribution (Gerritsen et al.) presents a scalable intervention promoting proactive career behaviors during the school-to-work transition. Finally, the closing paper (Signore et al.) investigates how soft skills and psychological capital contribute to sustainable employability and readiness for decent work.

Together, these studies offer a comprehensive and integrative view of psychological mechanisms underpinning sustainable and self-directed career development. The symposium highlights implications for career education, guidance, and policy, emphasizing interventions that cultivate values alignment, emotional engagement, and soft skills to support lifelong employability and well-being.

Abstract 3907

DYNAMIC INTERCONNECTIONS BETWEEN UNIVERSITY STUDENTS' CAREER RESOURCES AND SUSTAINABLE ACADEMIC SUCCESS: A LATENT CHANGE SCORE MODEL

Floris M.*[2], Hirschberger S.[1], Kauffeld S.[1], Mazzetti G.[2], Guglielmi D.[2]

[1]Technical University of Braunschweig ~ Braunschweig ~ Germany, [2]University of Bologna, Department of Education Studies ~ Bologna ~ Italy

Introduction.
In line with the Career Sustainability Framework, higher education represents a crucial learning environment where individuals begin to shape their future career trajectories. From this perspective, academic success can be considered an early indicator of sustainable career success, encompassing dimensions of productivity (e.g., number of exams), happiness (e.g., satisfaction), and health (e.g., psychological well-being). Although previous research has highlighted the importance of career self-management in promoting sustainable careers, the specific role of career resources in fostering sustainable outcomes during university years remains underexplored.
Purpose.
This study examined the extent to which three key career resources (i.e., career clarity, self-exploration, and career exploration) predict changes in academic performance (i.e., GPA), well-being, and satisfaction over the course of one academic year. Furthermore, we investigated the interdependence among changes in these outcome variables.
Method.
A sample of 846 university students (53.4% female; M = 20.5, SD = 2.11) completed an online questionnaire at two time points, one year apart. A Latent Change Score Model was employed to estimate the effects of Time 1 (T1) career resources on changes in outcomes between T1 and T2.
Results.
All three career resources positively predicted at least one indicator of sustainable academic success. Specifically, self-exploration at T1 predicted increases in the number of exams completed, well-being, and satisfaction, whereas career clarity predicted increases in satisfaction. Conversely, career exploration negatively predicted the number of exams completed, suggesting that extensive engagement in exploration activities may temporarily redirect students' efforts away from academic performance.
Conclusions.
These findings underscore the importance of fostering students' career resources as a means of promoting sustainable academic and career development. Interventions aimed at enhancing self-exploration and career clarity could strengthen students' well-being, satisfaction, and academic engagement, thereby laying the foundations for

sustainable career growth from the earliest stages of higher education.

Abstract 3908

HOW POSITIVE AFFECT IN IMAGINING FUTURE WORK SELVES DRIVES CAREER PROACTIVITY

Milani G.*[1], Cortellazzo L.[1], Bonesso S.[1], Strauss K.[2]

[1]Venice School of Management, Ca' Foscari University ~ Venice ~ Italy, [2]ESSEC Business School ~ Cergy-Pontoise (Paris Area) ~ France

Introduction.
Future Work Selves (FWSs; Strauss et al., 2012), cognitive representations of one's hopes and aspirations related to work, have been widely recognized as motivators of proactive career behaviors. To explain this relationship, previous research has predominantly focused on the extent to which FWSs are clear and easy to imagine (i.e., salient), while largely overlooking the affective dimension involved in envisioning FWSs.
Purpose.
The purpose of this study is to investigate the previously neglected role of affect associated with FWSs and to examine its motivational potential, as well as the factors that influence the level of affect individuals experience. This is critical for developing a more comprehensive understanding of the mechanisms that enhance proactive behaviors. We argue that, beyond the role of salience, the affective dimension motivates proactive career behaviors by energizing individuals and sustaining motivation toward future-oriented goals.
Method.
To substantiate our hypotheses, we conducted two studies. Study1 relied on a three wave-survey with a sample of graduate students (N = 220) who were asked to write about their FWSs. We gathered data on personality (T1), FWS salience and FWS positive affect (T2), and proactive behaviors (T3). Study2 is an experiment conducted on a sample of employees, that is expected to confirm preliminary text analyses identifying which characteristics of the narratives predicted higher levels of FWS affect.
Results.
Study1 showed that, after controlling for FWS salience, higher levels of positive affect in envisioning the FWS were significantly associated with proactive career behaviors. Expected results from Study2 are that experienced affect is positively influenced by process-oriented narratives while the acknowledgment of over-optimism negatively influences the relationship.
Conclusions.
This study advances the literature on FWS by identifying positive affect as an additional mechanism driving proactive career behavior and by uncovering narrative dimensions that enhance the positive affect associated with FWSs.

Abstract 3909

SHAPING SUSTAINABLE CAREERS: STIMULATING PROACTIVE CAREER BEHAVIOR DURING THE SCHOOL-TO-WORK TRANSITION

Gerritsen S.*[1], Pak K.[2], Darouei M.[4], Van Der Heijden B.I.[3], Akkermans J.[4]

[1]University of Applied Sciences Rotterdam, Rotterdam Business School ~ Rotterdam ~ Netherlands, [2]Tilburg University, School of Social and Behavioral Sciences, Human Resource Studies ~ Tilburg ~ Netherlands, [3]Radboud University, Institute for Management Research ~ Nijmegen ~ Netherlands, [4]Vrije Universiteit Amsterdam, School of Business and Economics, Department of Management and Organization ~ Amsterdam ~ Netherlands

Introduction

Navigating the school-to-work transition (STWT) is a formative stage in shaping sustainable careers. Proactive career behaviors are critical during this phase, fostering sustainable careers marked by happiness, health, and productivity (Akkermans et al., 2024; De Vos et al., 2020). However, it remains uncertain whether such behaviors can be effectively trained through scalable interventions.

Drawing on proactive motivation theory (Parker et al., 2010), we examined whether a supervision-embedded, three-session intervention could enhance proactive career behaviors and indicators of sustainable careers during the STWT.

Method

We conducted a quasi-experimental, mixed-methods study comparing an intervention group (N = 72) with a control group (N = 84). Three sessions, spaced three weeks apart, were integrated into existing supervision meetings. Analyses used repeated-measures GLM and hierarchical regressions controlling for T0.

Qualitative data from student focus groups (n = 76), a supervisor survey (n = 14), a six-month supervisor focus group (n = 5), and six-month student interviews (n = 2) contextualized the quantitative findings.

Results

Quantitative results showed a significant increase in network building, with marginal effects for skill development and career consultation. Unexpectedly, increases in proactive behaviors correlated with lower job satisfaction, higher stress, and reduced employability perceptions, suggesting short-term trade-offs rather than immediate benefits. Qualitative findings clarified these patterns: students valued reflection, peer dialogue, and future planning, but faced competing demands during graduation that limited behavioral enactment.

Conclusions

Overall, the study demonstrates that proactive behaviors can be stimulated during the STWT but develop unevenly across sub-domains. Action-oriented behaviors (e.g., networking) adapt more quickly than reflective or planning behaviors. Embedding interventions in existing supervision proved feasible and realistic, though timing and

sustained reinforcement are essential for lasting impact. These insights inform both theory and practice on how to design scalable, context-sensitive interventions that lay the groundwork for sustainable career development.

Abstract 3910

ARE UNIVERSITY STUDENTS READY TO WORK? THE ROLE OF SOFT SKILLS AND PSYCHOLOGICAL CAPITAL IN BUILDING SUSTAINABLE EMPLOYABILITY

Signore F.*[1], De Carlo E.[2], Semeraro G.C.[2], Ingusci E.[2]

[1]Universitas Mercatorum ~ Rome ~ Italy, [2]University of Salento, Department of History, Society and Human Studies ~ Lecce ~ Italy

Introduction

The transition from university to work requires students to develop both transversal competencies and psychological resources that sustain employability and well-being over time. In a rapidly evolving labor market, soft skills such as communication, adaptability, and teamwork are increasingly recognized as essential personal assets that promote motivation and proactive career engagement. Understanding their role in fostering sustainable employability can guide educational policies and interventions aimed at preparing students for meaningful, human-centered careers.

Purpose

This study examined how soft skills predict employability, psychological capital, and adaptive behaviors among Italian university students. It also explored potential differences between students from STEM and non-STEM disciplines, aiming to identify whether disciplinary background moderates these associations.

Methods

Grounded in the Job Demands–Resources (JD–R) model and Positive Organizational Psychology frameworks, a structural equation model (SEM) was tested on a balanced sample of 501 Italian university students. The model assessed relationships between self-reported soft skills, employability, psychological capital, and proactive career behaviors. Multi-group analyses compared STEM and non-STEM students to detect possible differences in the strength of these relationships.

Results

Soft skills significantly predicted employability, psychological capital, and proactive behaviors in both groups. The association between soft skills and psychological capital was slightly stronger among non-STEM students, while the link between soft skills and employability was robust and consistent across disciplines. Multi-group comparisons revealed no significant overall differences between the two models, indicating a similar structural pattern across fields of study.

Conclusions

Findings highlight the pivotal role of soft skills as sustainable personal resources that

enhance employability and psychological well-being across academic disciplines. Universities should implement evidence-based programs to cultivate students' soft skills and psychological capital, strengthening their readiness for sustainable and adaptive career paths.

Abstract 3906

THE RELATIONSHIP BETWEEN WORK VALUES AND EMPLOYABILITY: THE ROLE OF PROTEAN CAREER ORIENTATION IN UNIVERSITY STUDENTS

Panari C.*[2], Bonini A.[2], Caricati L.[3], Tonelli M.[1], De Caro M.[2]

[1]IFOA – Institute for Training of Business Operators ~ Reggio Emilia ~ Italy, [2]University of Parma, Department of Economics and Management ~ Parma ~ Italy, [3]University of Parma, Department of Humanistic Studies ~ Parma ~ Italy

Introduction.
Research on university students showed that protean career orientation, focused on the sense of responsibility in managing their career based on personal values, is becoming increasingly important to one's career development in the dynamic business environment, and is strictly related to employability. Meanwhile, employability has a central role in the evaluation of new career opportunities that fit with one's values and goals. In this sense, the study of the system of work values plays an important role in understanding how people pursue their work goals.

Purpose.
This study aims to examine the mediating role of protean career orientation between intrinsic and extrinsic work values and perceived employability in graduate students.

Method.
A self-report online questionnaire was sent to a sample of 120 university students (57.4% female; Mean Age = 22.7, SD = 2.54). We tested our hypotheses using the PROCESS macro. To be specific, Model 4 was performed to test the mediating role of a protean career between each work value (three intrinsic values and three extrinsic values) and perceived employability. The six mediational analyses were performed separately.

Results.
The results showed that the influence of intrinsic work values on perceived employability was mediated by protean career orientation. Self-achievement, risk, and freedom had an impact on protean career orientation that, in turn, influenced students' perception of employability – even if the mediation was not total. On the contrary, extrinsic work values, such as approval from others and facilitating work conditions in terms of location and informal context, lead people to underestimate both their own skills and, as well, opportunities within the labour market.

Conclusions.
These results highlight the role of protean career orientation as a mechanism linking

personal values to employability. Interventions fostering self-directedness, clarity of values, and proactive goal setting could strengthen students' adaptive career behaviors and readiness for sustainable employability.

01 - Division 1: Work and Organizational Psychology

TRUST: THE CEMENT THAT HOLDS THE WORLD TOGETHER IS ERODING

Saturday 25 July 2026 from 09:30 to 11:00

(O-Arsenale)

Walter Reichman (OrgVitality ~ Larchmont, New York, ~ Uni), Chair
Annamaria Di Fabio, Discussant

Trust is the cement that holds people, organizations, communities, countries and the nations of the world together. Multilateralism was the name given to the cement created after World War II which gave rise to the United Nations and regional organizations to maintain peace and improve our social and economic lives. Multilateralism is now being supplanted by a return to nationalism ,individuality, competition for resources and threats of conflict. This symposium is designed to describe the intricacies of establishing trust, its fragility and the difficulty of resurrecting it when it ends. There will be four presenters and a discussant who are recognized experts in their area of research and advocacy.
Jeffrey Saltzman is CEO of a leading management consulting firm who has consulted with organizations around the world in methods of building trust and engagement within their organizations.
Richard Plenty and Terri Morrissey have worked for over 20 years on assignments that support international collaboration. They received the Presidential Citation from the American Psychological Association for their activities.
Raymond Saner has been a researcher and consultant to the United Nations for several decades and has fostered the acceptance and implementation of the UN's Sustainable Development Goals (SDGs) in Europe, Asia and Africa.

The first presentation by Raymond Saner will examine the UN's 17 Sustainable Development Goals (SDG), only17%of them having been achieved. He will point to the necessity of collaboration among governments, private sector and civil society if the goals are to be achieved.
The second presentation by Richard Plenty will describe ways of dealing with complex global challenges using his four-step model of Reflect, Strategize, Explore, and Act to develop trust and transformational relationships.
The third presentation by Jeff Saltzman will focus on how to build trust within organizations using businesses as an example. He will describe how trust promotes organizational success and participant satisfaction, and how it can be resurrected when eroded.
The fourth presentation by Her Excellency Bint Hamad Hessa from Qatar will focus on research and clinical applications of a culturally-rooted measure of wellbeing: the Al-hayat Al-tayiba Wellbeing instrument. Well-being could be a crucial and promising ingredient in building trust.
The discussant is Annamaria Di Fabio, Professor of Work and Organizational Psychology as well as Psychology of Sustainability and Sustainable Development (PS&SD) at the University of Florence. She founded the PS&SD research and intervention area officially in 2016 as Section editor in the Journal Sustainability Science (Editor in chief Kazuhiko Takeuchi).

Abstract 4122

TRUST, PRINCIPLES, AND THE SUCCESSFUL IMPLIMENTATION OF THE 2030 UN AGENDA

Saner R.*

Centre for Socio-Eco-Nomic Development ~ Geneva ~ Switzerland

The 2030 Agenda for Sustainable Development outlines an ambitious global roadmap. Its successful implementation depends on two critical elements: sustained trust among stakeholders and strict adherence to core principles—multi-stakeholder engagement and integrated sustainability.
Trust is built when governments, the private sector, and civil society collaborate transparently and inclusively. Governments provide the legal and institutional frameworks; businesses contribute innovation and financial resources; civil society organizations ensure accountability and protect marginalized voices. Authentic participation from all sectors can increase the Agenda's legitimacy and momentum.
Equally, the 2030 Agenda integrates three dimensions of sustainability: economic growth, social inclusion, and environmental protection. Addressing these dimensions simultaneously is not optional but essential. Prioritizing one dimension over the others undermines resilience, exacerbates inequalities, and depletes natural resources.
Experience from business and NGO diplomacy demonstrates that sustainable partnerships are built on trust, openness, and respect for shared values. Where exclusion, short-termism, or disregard for sustainability occur, trust erodes quickly—leading to fragmentation, inefficiency, and ultimately failure to meet development goals. Non-compliance with the Agenda's principles would severely compromise implementation efforts. It would diminish institutional credibility, weaken public support, and jeopardize long-term development outcomes.
Therefore, restoring and maintaining trust through respect for multistakeholder engagement and the three dimensions of sustainability is not merely advisable—it is imperative. The 2030 Agenda must be implemented through collective responsibility, with full recognition that without trust, sustainable development cannot be achieved.
Saner, R, Yiu,L., (2022) « Leveraging Business Diplomacy: The Role of Multinational Enterprises Supporting the United Nations' SDGs, chapter 10, in The Role of Multinational Enterprises Supporting the United Nations', edited by John McIntryre, Silvester Ivanaj and Vera Ivanaj, Edward Elgard, 2022)

Abstract 4121

INTERNATIONAL COLLABORATION WORKING: A MODEL FOR BUILDING TRUST

Plenty R.*

Thisis ~ Kingston Upon Thames ~ United Kingdom

This presentation describes a model of trust developed from many years' experience of working internationally on organisation and leadership development in the energy, aviation and climate change areas as well as from the facilitation of the Global Psychology Alliance (GPA) since its inception in 2019.
The model builds on the Richmor Framework for dealing with uncertainty, a four step approach consisting of Reflect, Strategise, Explore and Act. This model was first articulated in the book 'Uncertainty Rules?' written by Richard Plenty and Terri Morrissey in 2019. He applies this to the development of trust and transformative, rather than transactional, relationships. Examples will be given of how this approach has been used in the Alliance's work on climate change and other complex global challenges.

Abstract 4120

BUILDING TRUST IN ORGANIZATIONS

Saltzman J.*

OrgVitality ~ Pleasantville New York ~ United States of America

Trust is won in a slow accretion of behaviors and values over time but can be lost in an instant. Once lost, trust is extremely difficult to regain. This holds true for any kind of organization.

There are myriad defini-ons of trust, depending on discipline and circumstance. A defini-on of trust that works for the employer/employee rela-onship will be presented, covering integrity, the belief that a person or organiza-on is fair and just; dependability, the belief that a person or organiza-on will do what they say; and confidence, the belief that a person or organiza-on has the ability to do what they say they will do. Addi-onally, the personality characteris-cs of leaders who can build trust will be discussed.

Generally, this presentation will focus on the world of work and on the organizations that employ people. The presentation will examine the conditions and culture within an organization that can bring about a trusting environment, those actions and values that will destroy trust, and what an organization must do to begin to regain trust once lost.

There are many negative consequences to being in a low-trust environment and those consequences will be spelled out with supporting data. Alternatively, the benefits of working in a hightrust environment will also be examined.

Finally, methods that can be used to measure trust and to build a trust index, that can be tracked over time, in an organization will be presented and which are best for differing situations.

Abstract 4950

BUILDING AND MEASURING TRUST THROUGH AL-HAYAT AL-TAYIBA SCALE FOR GLOBAL WELLBEING

Al Thani H.e. Dr. Hessa Bint Hamad Bin Khalifa*

Chairperson and Founder, The Center for Wellbeing- Qatar

Wellbeing is a central concept in global mental health, reflected in the United Nations 2030
Agenda for Sustainable Development and increasingly recognized as essential for informing
policy, programming, and clinical practice. Despite advances in wellbeing research, existing
assessment tools have been developed within Western contexts and do not adequately capture
culturally-specific understandings of human flourishing for Middle Eastern populations. This
presentation introduces the Al-Hayat Al-Tayiba Wellbeing Framework and the development
of the Al-Hayat Al-Tayiba Wellbeing Instrument (HTI), a culturally-grounded measure that
assesses holistic wellbeing within Middle Eastern contexts. Drawing on extensive scholarly
research conducted in Qatar, the framework conceptualizes wellbeing through five
interconnected pillars: Spiritual, Emotional, Intellectual, Physical, and Social Wellbeing.
Together, these dimensions provide a comprehensive model of human flourishing while
maintaining relevance across diverse cultural settings. Using a sample of 400 undergraduate
students from Qatar University, the study conducted extensive statistical analyses to establish
the reliability and validity of the instrument. Results provide strong initial evidence
supporting the HTI as a psychometrically sound and culturally-relevant measure of wellbeing.
These findings address an important gap in culturally rooted wellbeing assessment and
contribute to ongoing efforts to develop more inclusive approaches to measuring and
promoting wellbeing globally. Implications for research, clinical practice, and cross-cultural
applications will be discussed, along with directions for future studies in other cultural
contexts.

PSYCHOLOGY AND GLOBAL ACTION FRAMEWORKS COMPETENCIES, ETHICS AND RESPONSIBILITY IN A WORLD IN CRISIS

Saturday 25 July 2026 from 11:00 to 12:30

(R-Arsenale)

Luis Carrizo, Chair

Abstract 4894

Psychology, Multilateralism, and International Action Frameworks

Neves P.*

President Elect, International Association of Applied Psychology ~ Portugal ~ Portugal

Inspired by recent IAAP discussions on global responsibility, interdisciplinarity, and the social relevance of applied psychology, the presentation may emphasize the importance of international cooperation, professional networks, and partnerships with global organizations in addressing complex, interconnected challenges. It may also reflect on how applied psychology can strengthen its impact by aligning research, training, and professional practice with global policy agendas, while remaining sensitive to cultural diversity and local contexts.

Abstract 4895

International Professional Competencies as a Global Reference for Training and Practice

Iliescu D.*

President, Psychology Competencies International Project ~ Romania ~ Romania

This presentation will focus on the International Declaration of Core Competencies in Professional Psychology as a global benchmark for quality, relevance, and ethical responsibility in professional training and practice. It will explore how competency-based frameworks support international mobility, comparability of qualifications, and social accountability, while remaining sensitive to cultural diversity. The presentation will also address current challenges in implementing competency-based education across different higher education systems worldwide.

Abstract 4896

Psychology, History and Global Responsibility. Lessons for Contemporary Global Challenges.

Hayes N.*

IUPsyS, Executive Committee member. Former President, British Psychologial Society ~ United Kingdom ~ United Kingdom

Drawing on a historical perspective, this presentation will examine how psychology has evolved in response to major social, political, and ethical challenges, and how global frameworks have increasingly shaped the discipline's identity and responsibilities. By situating contemporary debates within a broader historical trajectory, the presentation will offer insights into how psychology can learn from its past to better navigate current global demands related to ethics, human rights, and social transformation.

Abstract 4897

TRAINING PSYCHOLOGISTS IN THE 21ST CENTURY: A UNIVERSITY EXPERIENCE ALIGNED WITH INTERNATIONAL FRAMEWORKS

Carrizo L.*

Dean, Faculty of Psychology, Universidad CLAEH ~ Uruguay ~ Uruguay

This presentation will showcase the experience of the newly established bachelor's degree in psychology at the Faculty of Psychology of Universidad CLAEH. The program has been explicitly designed in alignment with the International Declaration of Core Competencies in Professional Psychology and the Sustainable Development Goals, integrating ethical responsibility, social relevance, and interdisciplinary approaches into its curriculum. It also highlights the direct alignment of its curriculum with UNESCO's Recommendation on Education for Peace, Human Rights and Sustainable Development.

The presentation will highlight how global frameworks are translated into concrete curricular decisions, learning outcomes, competency development, and professional identity formation.

01 - Division 1: Work and Organizational Psychology

PROMOTING GENDER EQUALITY IN THE WORKPLACE AND BEYOND: HAVE WE GOTTEN ANYWHERE YET?

Saturday 25 July 2026 from 11:00 to 12:30

(O-Arsenale)

Kristina Potočnik (University of Edinburgh Business School), Chair and Presenter
Fanny Cheung, Discussant

This symposium critically examines contemporary challenges and progress in workplace gender equality through four interconnected perspectives. The selected presentations collectively explore how gendered power dynamics manifest across diverse organizational contexts and life stages, revealing persistent barriers for some gender groups despite formal equality policies in place.

González-Morales critiques recent calls for "more masculine" workplace cultures and proposes transforming toxic power cultures into "brave relational cultures" that redefine masculinity as one that is brave and advocates for marginalized groups. Her proposed framework advances our understanding of workplace power dynamics by showing how psychological safety and belonging can be fostered by promoting noble aspects of masculinity while at the same time addressing systemic inequalities.

Kowalski and Suter explore 12-hour shifts in the UK national healthcare sector and show how flexible work policies, when implemented without genuine employee input, can disproportionately impact women. Their findings suggest that persistent "double shifts" amplify workplace inequalities, threatening both employee wellbeing and the sustainability of workforce in female-dominated sectors.Unger et al.’s presentation discusses the results of a systematic review of 45 years of multidisciplinary research of unemployment effects on children’s education and career outcomes. Their research demonstrates how parental unemployment affects children's educational and career trajectories differently based on gender, with maternal unemployment showing stronger detrimental effects than paternal unemployment on children's future employment prospects.Potočnik examines menopause transition at work and discusses how this complex, individualized transition may affect job performance, retention, and occupational wellbeing.Among other findings, this presentation explores how the use of flexible work arrangements can help manage menopause symptoms but potentially compromise retirement affordability.She advocates for context-sensitive approaches to support employees transitioning menopause rather than standardized policies that may inadvertently create new inequities.Together, these presentations illuminate the multifaceted nature of gender equality challenges across different life domains and career stages.They emphasizethatmeaningfulprogressrequiresaddressingbothsystemicpowerstructuresandindividual lived experiences through evidencebasedcontextsensitiveapproachesthatrecognizetheintersectionalityofgenderwithothera spectsofidentityandexperience.

Abstract 3982

TRANSFORMING TOXIC POWER CULTURES INTO BRAVE RELATIONAL CULTURES

González Morales M.G.*

Claremont Graduate University ~ Claremont ~ United States of America

In 2025, US corporate culture is at a crossroads, particularly in the technology sector, as political shifts and executive orders reshaped workplace policies and DEI initiatives in early 2025. While some industry leaders, including Meta's CEO Mark Zuckerberg, advocated for a return to "more masculine" workplace cultures, this presentation argues that such calls misinterpret both the nature of gender roles and the requirements for modern organizational innovation. Instead of reverting to traditional power dynamics, I propose a transformation toward "brave relational cultures" that redefine masculinity and organizational effectiveness.

The technology sector exemplifies these tensions, with men holding 65% of jobs and 89% of executive positions, while women continue to exit the industry at higher rates. Instead of perceiving inclusive environments as "emasculated" cultures, I argue that true organizational effectiveness is achieved by fostering spaces where diverse perspectives can be engaged. The author presents the concept of brave relational cultures, where masculinity, rather than being toxic, is brave in amplifying marginalized voices, challenging harmful norms, and creating psychological safety for innovation.

Drawing on feminist management scholarship and critical intersectional feminist perspectives, the paper presents a theoretical framework for understanding workplace power dynamics and toxic phenomena such as victimization, imposter syndrome, code-switching, and emotional labor. These issues are framed as symptoms of a broken system requiring transformation through relational practices and Positive Organizational Scholarship. The proposed framework aims to foster psychological safety, innovation, work engagement, well-being, and belonging in organizations by elevating noble aspects of masculinity while addressing systemic power and oppression.

Abstract 3983

FLEXIBLE WORKING, BUT ON WHOSE TERMS? IMPORTANCE OF EMPLOYEE CHOICE AND PERCEIVED CONTROL

Kowalski T.*, Suter J.

University of York, School for Business and Society ~ York ~ United Kingdom

The national health care system in the UK (NHS) is renowned for the financial and resource pressures that it continues to be under. High volumes of vacancies exist across NHS departments, which can have knock-on effects for the quality of patient care. To help address these workforce shortages, various flexible working policies have been introduced across NHS Trusts. One example of this is the introduction of 12-hour shifts, however, evidence is mixed as to the potential impact of these on employee wellbeing and performance. Underpinned by Job Demands-Resources model, the aim of this study was to explore the impact of moving to 12-hour shifts on employee wellbeing for staff working in a large mental health NHS Trust.

Semi structured interviews were held with mental health ward staff across four different levels of job role (n=35 at T1), with follow up interviews conducted 6-9 months later (n=35 at T2). Two thirds of the sample were women, which shares parallels with the gender distribution of the wider NHS.

Although a 'consultation' had been held between staff and senior managers regarding the move to 12-hour shifts, there was a sense of distrust in management and concerns over how transparent or genuine this process was. Irrespective of respondents' perceptions of this change, the fact that many had misgivings about the consultation process itself had a significant impact on employee wellbeing, with many respondents citing that they felt they had little control over the proposed change to working patterns.

The move to 12-hour shifts, for female workers in particular, may have far reaching consequences due to the 'double shift' that still seems to permeate in current times and how this might impact non-work commitments. Our research also has implications relating to the sustainability of the NHS workforce.

Abstract 3984

SCARRED OR SPARED? A REVIEW OF MICRO- AND MACRO-LEVEL UNEMPLOYMENT'S GENDERED EFFECTS ON CHILDREN'S EDUCATION AND CAREERS

Zografia Bika B.[1], Debus M.E.[2], Hopp C.[3], Klehe U.C.[4], Unger D.*[5]

[1]2Norwich Business School, University of East Anglia ~ Norwich ~ United Kingdom, [2]3Institute of Work and Organizational Psychology ~ Neuchâtel ~ Switzerland, [3]4Institute of Psychology, RWTH Aachen ~ Aachen ~ Germany, [4]5Department of Psychology, University of Giessen ~ Giessen ~ Germany, [5]1Department of Psychology, UiT The Arctic University of Norway ~ Tromsø ~ Norway

Unemployment has profound implications for individuals and societies. The impact of micro- (i.e., parental) and macro-level (i.e., local, regional, or national) unemployment on children's education and career outcomes is particularly relevant, as detrimental effects may perpetuate a vicious cycle, with unemployment causing more unemployment. Furthermore, the role of gender is not sufficiently elucidated in this context. This systematic review summarizes studies conducted from 1979 to 2024 worldwide across economics, sociology, psychology, education sciences, and public health, adopting an integrative, multidisciplinary approach. Furthermore, we coded gender effects (i.e., maternal vs. paternal unemployment; education and career outcomes measured in girls and boys).

Key findings reveal that micro-level unemployment adversely affects children's education and career outcomes, whereas macro-level unemployment appears to have both beneficial and detrimental effects. In terms of gendered effects, we found a beneficial effect of macro-level unemployment on the participation in post-compulsory schooling, particularly in boys. Further, the detrimental effect of maternal unemployment on children's adult unemployment seems stronger than paternal micro-level unemployment.

Our results underscore the importance of probing homology (i.e., whether macro- and micro-level effects go in the same direction) when assessing unemployment's impact on children's education and careers, as this study shows that effects on the micro- and macro-level are not necessarily the same. Furthermore, our review highlights that the gender of the parent and child can be an important boundary condition in this context.

Future research should focus on investigating mediating mechanisms of these gendered effects. Additionally, we need more research on the topic from countries that are not Western, educated, industrialized, rich, and democratic (WEIRD). We provide recommendations for parental and professional caregivers, teachers and principals, as well as decision-makers in politics and organizations.

Abstract 3985

IT IS MORE THAN THE HOT FLUSHES AND MOOD SWINGS: MANAGING MENOPAUSE TRANSITION IN THE WORKPLACE

Potočnik K.*

University of Edinburgh Business School ~ Edinburgh ~ United Kingdom

Menopause is a workplace issue, which affects women and other gender groups, including non-binary, transgender, and gender non-conforming. Menopause or a point in time when the menstruation has completely ceased for 12 months, is often considered as part of ageing process, but not everyone experiences natural menopause. Hot flushes, followed by fatigue, night sweats and insomnia are some of the most common symptoms that can last for a number of years; however, the experience of menopause is highly complex and individualized.

Most of the existing research on menopause at work is cross-sectional and has predominantly found the experience of menopause to be linked with negative outcomes, such as higher burnout, poorer perceived job performance, and higher intention to quit. Considering these results, as well as raising awareness of menopause and how it may affect individuals, it has become increasingly important to explore how employees can best be supported as they navigate through this complex and individualized transition.

This presentation draws from the mixed-methods research program on menopause at work using different samples of cis-women to discuss diverse menopause symptoms and their effects on job performance, retention, and occupational wellbeing. Drawing from selection, optimization, and compensation (SOC) model, it explores the role of individual agentic behaviors to manage menopause symptoms at work. Following the conservation of resources (COR) theory, it also addresses the role of workplace resources, such as social support from line managers and colleagues that was observed as useful in helping employees navigate this complex transition.

The presentation concludes with a discussion of flexible work arrangements and how the use of this type of workplace support can be a double-edged sword. Whereas the use of such arrangements can be helpful for managing symptoms, at the same time, it may have unintended consequences on late careers and pension provision.

02 - Division 2: Psychological Assessment and Evaluation

HARMONIZING TRADITION AND INNOVATION: CULTURAL COMPETENCE IN ASEAN PSICHOLOGY

Wednesday 22 July 2026 from 08:00 to 09:30

(C- Spadolini)

Maria Luisa Guinto (University of the Philippines, Diliman ~), Chair and Presenter

The ASEAN Regional Union of Psychological Societies (ARUPS) is characterized by rich cultural diversity, with each member country possessing unique traditions, languages, and worldviews. As applied psychology continues to expand across the region, cultural competence becomes essential in ensuring the effectiveness of psychological practices. This symposium convenes scholars and practitioners from the Philippines, Indonesia, Malaysia, and Singapore to discuss the role of cultural competence in various domains of applied psychology, including clinical, counseling, organizational, educational, and sport psychology. The symposium will explore the conceptualization of cultural competence in ASEAN, highlighting how local values and indigenous knowledge systems shape psychological practice. Presenters will share research findings, case studies, and good practices that uphold culturally responsive psychological assessment, intervention, and training approaches. Topics will include integrating traditional practices with modern psychological interventions, navigating through collectivist versus individualist orientations to well-being, and managing the challenges of cross-cultural competency in a globalizing world. The Philippines will highlight the application of indigenous psychological concepts in sport psychology, including inner self, shared identity, communal resilience, and spirituality, in the context of performance enhancement and mental health support services. Malaysia will discuss multiculturalism and interethnic relations, particularly in the context of psychological research and its practical applications. Indonesia will feature the integration of keroncong music in psychotherapy. Singapore will address multicultural competence in psychological assessment and practice in a highly diverse, urbanized setting. This symposium aims to affirm collaboration across borders among psychologists, promote culturally inclusive psychological practices, and encourage the development of culturally competent policies in the fields of mental health, education, and the workplace. Through this exchange of knowledge and experiences, the team aspires to enhance psychological services that are both effective and respectful of the diverse cultural fabric of ASEAN.

Abstract 4446

RECLAIMING CULTURAL ROOTS: INTEGRATING INDIGENOUS PSYCHOLOGY INTO SPORT PSYCHOLOGY

Guinto M.L.*

College of Human Kinetics, Department of Sports Science, ~ Philippines ~ Philippines

As a specialized field within applied psychology, sport psychology has largely been shaped by WEIRD (Western, Educated, Industrialized, Rich, and Democratic) paradigms. These dominant frameworks often prioritize individualism, performance metrics, and cognitive-behavioral models that may not fully resonate with the lived experiences of athletes in non-WEIRD settings. In the Philippines, fostering both high performance and athlete well-being requires incorporating culturally framed relational, communal, and spiritual values. This presentation demonstrates how Indigenous Filipino psychological concepts can enrich and inform sport psychology practice, making it more context-specific and culturally grounded for Filipino athletes, coaches, teams, and communities. Employing qualitative methodologies—such as narrative inquiry, case study analysis, and program evaluation—the study draws from decades of sport psychology consultations, performance enhancement interventions, participatory research, and community-based initiatives. Findings reveal how core indigenous constructs—such as loob (relational inner self), kapwa (shared identity), bayanihan (communal unity), and pananampalataya (faith/spirituality) —are meaningfully integrated into both elite sport and communities in crisis. By embedding Indigenous Filipino psychology into sport psychology, this work offers a pathway to reclaim cultural roots, challenge one-size-fits-all approaches, and promote psychological practices that value relationality, spirituality, and collective strength. This work contributes to the global discourse on new directions in applied psychology, especially in culturally diverse and historically underrepresented regions such as those in the ASEAN.

Abstract 4448

INTEGRATION OF KERONCONG MUSIC IN PSYCHOTHERAPY: OPPORTUNITIES AND CHALLENGES FOR CULTURALLY BASED MENTAL HEALTH INTERVENTIONS IN INDONESIA

Ningdyah A.*, Pratiwi W.P., Noviekayati I., Saragih S.

Faculty of Psychology, Universitas 17 Agustus 1945 ~ Indonesia ~ Indonesia

Mental health has become an increasingly urgent global concern, along with the rising prevalence of psychological disorders such as anxiety, chronic stress, and depression. Various therapeutic approaches have been developed to address these issues, including cognitive-behavioral therapy, humanistic psychotherapy, and integrative approaches. Music therapy—an alternative approach to psychotherapy that utilizes musical elements to enhance psychological well-being—has rapidly developed and is recognized for its effectiveness in reducing stress, alleviating anxiety, and improving mood. However, most of these interventions are still based on Western values and paradigms, often less contextual when applied in non-Western societies, including Indonesia. Music therapy used in Indonesia mainly adopts popular Western instrumental music and has not yet utilized the richness of local traditional music. In the context of Indonesian culture, keroncong music has its own distinct characteristics, marked by a slow tempo, gentle harmony, and poetic lyrics. This music is often associated with a peaceful, reflective, and melancholic atmosphere. As a cultural heritage, keroncong not only serves as entertainment but also as a medium for emotional expression and the meaning of life. With these characteristics, keroncong has the potential to be integrated into psychotherapy practices as a form of culturally based mental health intervention. Studies exploring the integration of keroncong into psychotherapy practices have not been widely conducted in Indonesia. Therefore, this research aims to understand how keroncong can be used in psychotherapy, including the opportunities it offers and the challenges faced in its implementation. This research emphasizes a qualitative approach to explore the meanings, perceptions, and direct experiences of practitioners and clients, and to provide a conceptual and practical foundation for the development of culturally relevant therapeutic interventions.

Abstract 4449

BRIDGING WORLDS: ADAPTING PSYCHOTHERAPY TO SINGAPORE'S MULTICULTURAL REALITIES

Neo H.L.M.*

National University Hospital, Singapore ~ Singapore ~ Singapore

Singapore's multicultural society, defined by intersecting ethnic, linguistic, and religious traditions, offers a dynamic context for advancing culturally competent psychological assessment. As a densely urbanized and globally connected city-state, Singapore is shaped by the lived experiences of Chinese, Malay, Indian, and migrant communities. Psychological assessment must therefore address the diverse ways individuals interpret and express psychological distress. Rapid socio-economic development, educational shifts, and digital exposure have contributed to changing generational perspectives on mental health, increasing the demand for tools that are both linguistically accessible and culturally meaningful. This presentation examines culturally competent practices in psychological assessment in Singapore, with a focus on adapting and validating instruments for use across diverse linguistic and cultural groups. Examples include the local validation of the Center for Epidemiologic Studies Depression Scale (CES-D) among Chinese, Malay, and Indian populations, revealing differential symptom expression and varying prevalence rates of depression across ethnicities. The cross-cultural application of cognitive assessments, such as the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and the Montreal Cognitive Assessment (MoCA), highlights the need to move beyond direct translation toward cultural adaptation that ensures semantic, conceptual, and criterion equivalence. Recent work adapting tools like the EQ-5D-Y for Singaporean youth demonstrates the value of involving expert panels and cognitive debriefing interviews to ensure language and concepts are locally relevant and developmentally appropriate. The presentation will outline best practices derived from local and international guidelines for cultural adaptation, including co-production with users, expert consultation, and rigorous content validation. The discussion will also address ethical imperatives, including fairness, inclusivity, and reducing diagnostic bias. Singapore's experiences offer valuable insights for ASEAN member states aiming to harmonize psychological measurement with local norms, advancing culturally competent practice across the region.

Abstract 4450

BEYOND TRANSLATION: CULTURAL ADAPTATION OF PSYCHOLOGICAL ASSESSMENTS

Toh A.*

Singapore Psychological Society ~ Singapore ~ Singapore

Singapore's multicultural society, defined by intersecting ethnic, linguistic, and religious traditions, offers a dynamic context for advancing culturally competent psychological assessment. As a densely urbanized and globally connected city-state, Singapore is shaped by the lived experiences of Chinese, Malay, Indian, and migrant communities. Psychological assessment must therefore address the diverse ways individuals interpret and express psychological distress. Rapid socio-economic development, educational shifts, and digital exposure have contributed to changing generational perspectives on mental health, increasing the demand for tools that are both linguistically accessible and culturally meaningful. This presentation examines culturally competent practices in psychological assessment in Singapore, with a focus on adapting and validating instruments for use across diverse linguistic and cultural groups. Examples include the local validation of the Center for Epidemiologic Studies Depression Scale (CES-D) among Chinese, Malay, and Indian populations, revealing differential symptom expression and varying prevalence rates of depression across ethnicities. The cross-cultural application of cognitive assessments, such as the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and the Montreal Cognitive Assessment (MoCA), highlights the need to move beyond direct translation toward cultural adaptation that ensures semantic, conceptual, and criterion equivalence. Recent work adapting tools like the EQ-5D-Y for Singaporean youth demonstrates the value of involving expert panels and cognitive debriefing interviews to ensure language and concepts are locally relevant and developmentally appropriate. The presentation will outline best practices derived from local and international guidelines for cultural adaptation, including co-production with users, expert consultation, and rigorous content validation. The discussion will also address ethical imperatives, including fairness, inclusivity, and reducing diagnostic bias. Singapore's experiences offer valuable insights for ASEAN member states aiming to harmonize psychological measurement with local norms, advancing culturally competent practice across the region.

02 - Division 2: Psychological Assessment and Evaluation

INVESTIGATING THE EARLY DEVELOPMENT OF EXECUTIVE FUNCTIONS: A DEBATE ABOUT DIFFERENT APPROACHES

Wednesday 22 July 2026 from 09:30 to 11:00

(C- Spadolini)

Sabrina Panesi (University of Genoa ~ Genova ~ Italy), Chair and Presenter
Gaia Scerif, Discussant

The development of Executive Functions (EFs) in the first years of life is foundational to later-life success. For this
reason, assessing EFs in young children is fundamental and several approaches are currently used.
This symposium aims to create a debate about different approaches concerning the assessment of EFs in the first years
of life. Specifically, different direct measurements of EFs are explored.
Berni and colleagues present a novel scale designed to assess EFs and self-regulation in children aged 18 to 36 months,
encompassing both typical and atypical developmental trajectories. The study explores the scale's structure and its
correlations with various aspects of daily functioning.
Bandettini and colleagues examine the structure of EFs in 208 preschoolers using a large test battery composed of three
working memory, three updating, three shifting and nine inhibition tasks. CFAs show that the best-fitting model comprises two correlated factors (factor 1: inhibition measures; factor 2: working memory, shifting, and updating
measures).
Downes presents research that explores performance on a scaffolded tool (Preschool Executive Task Assessment;
PETA), developed following an ecological approach. Results show some links between performance on the PETA task
and behavioral functioning, environmental factors, academic ability.
Panesi and colleagues examine an updating task for preschoolers, the Magic House task, comparing analog and digital
versions, also exploring the role of Working Memory (WM) capacity. 127 preschoolers completed both versions of the
Magic House task and two WM capacity tasks. Results show higher performance in the analog version of the Magic
House task.
Gaia Scerif leads the discussion.

Abstract 4452

THE EMERGENCE OF EXECUTIVE FUNCTIONS: A NEW SCALE FOR ASSESSING PRECURSORS IN EARLY CHILDHOOD

Berni M.*

University of Florence ~ Florence ~ Italy

Many studies highlight how executive function precursors begin to emerge in the second
half of the first year of life, with rapid development during the first three years, and predictive associations with future behaviors (Hendry et al., 2016; Mulder et al., 2014). However, tools for the early assessment of these processes, particularly in clinical settings, remain limited.
In this study, we introduce a scale for the direct assessment of executive functions and self-regulation, designed for children between 18 and 36 months of age, both with typical
and atypical development. The tool consists of 14 stimulus situations and a free-play session, accompanied by an integrated quantitative and qualitative coding system, as well
as an observer-completed questionnaire.
Data collected from a sample of typically developing children will be presented, analyzing the structure of the scale and highlighting correlations with various aspects of daily functioning.

Abstract 4454

THE EXPLORATION OF EVERYDAY EXECUTIVE FUNCTION SKILLS IN EARLY CHILDHOOD USING A SCAFFOLDED TOOL

Downes M.*

University College Dublin ~ Dublin ~ Ireland

Executive function (EF) is an umbrella term that describes an intricate group of cognitive processes that operate in an integrated way to regulate behaviours, organise mental processes, shift between tasks flexibly, and solve problems. EF subdomains such as working memory, cognitive flexibility and inhibitory control become increasingly complex and integrated during development and are influenced by internal and external factors. The development of scaffolded tools that tap executive function in the classroom
could support teachers to promote learning in the classroom. The current research explores performance on the Preschool Executive Task Assessment (PETA), designed to
more easily translate feedback into the classroom. Links to behavioural functioning, environmental factors and academic ability will also be discussed. The PETA is a multistep,
table-top task designed for 3-6 year olds that requires structured scaffolding for the child and aims to reflect a novel task which children at this stage of development often face at home or at school. The practical implications of using tools such as the PETA in order to promote early learning skills will be discussed. Qualitative feedback on task design from teachers will be considered. Finally, we will discuss the challenges of the current development of similar tasks for the earlier toddler stage

Abstract 4455

ASSESSING THE EXECUTIVE FUNCTION “UPDATING” IN PRESCHOOLERS WITH THE MAGIC HOUSE TASK: ANALOG VERSUS DIGITAL VERSIONS AND THE ROLE OF WORKING MEMORY CAPACITY

Panesi S.*

University of Genoa ~ Genova ~ Italy

In the digital age, the integration of both analog and digital tools to study the development of Executive Function (EF), particularly the “updating” component, in preschoolers is crucial. Few studies have focused on updating tasks for young children, and even fewer have compared analog and digital versions of these tasks. Additionally, the developmental growth of Working Memory (WM) capacity is likely to significantly impact performance in updating tasks. This study examined an updating task for preschoolers, the Magic House task, comparing analog and digital versions to identify potential differences. It also explored how changes in WM capacity influenced performance in both versions. A total of 127 children aged 4 to 6 years participated in the study. They completed both analog and digital versions of the Magic House task and two WM capacity tasks (Mr. Cucumber and BWS) in balanced order. Results revealed significant differences in performance between analog and digital versions, with analog version yielding higher average scores, regardless of task order. Furthermore, children with lower WM capacity struggled more to achieve threshold scores, particularly in the digital version.

These findings suggest that preschoolers find the analog version of the Magic House task easier than the digital version. The study also highlights qualitative differences in the cognitive processes required for each version, emphasizing the need to consider WM

capacity when designing and implementing digital updating tasks for young children.

Abstract 4453

INVESTIGATING THE LATENT STRUCTURE OF EFS IN PRESCHOOLERS USING A LARGE TEST BATTERY

Bandettini A., Traverso L.*

University of Genoa ~ Genova ~ Italy

Executive Functions (EF) are higher-level cognitive processes critical for achieving goaloriented
behaviors. Research in adults has identified three distinct yet interconnected EF components: inhibition, shifting, and updating (Miyake et al., 2000). While these components are well-defined in adults, their organization during early development, particularly in preschool-aged children, remains unclear. The multicomponent nature of EF and the relationships among its components continue to be subjects of debate. This study investigates the structure of EF in a sample of 208 preschool children (age range: 4;2 - 6;4) using Confirmatory Factor Analysis (CFA). Children completed a large test batttery composed by 18 tasks assessing EF and Working Memory (WM). The results support a two-factor model, distinguishing inhibition as a separate factor, while WM, updating, and shifting are combined into a single factor.

02 - Division 2: Psychological Assessment and Evaluation

INSIGHTS AND IMPACTS FOR APPLIED PSYCHOLOGISTS USING TESTS, IN PARTICULAR WITH THE UPDATED EFPA TEST REVIEW MODEL

Wednesday 22 July 2026 from 11:00 to 12:30

(C- Spadolini)

Mark Schittekatte (Ghent University ~ Ghent ~ Belgium), Chair and Presenter

The aim of the EFPA Board of Assessment (BoA) was to develop and improve assessment practice in Europe. It was one of the oldest and largest working groups of the European Federation of Psychological Associations (EFPA).
The panel will share insights and impacts of the work of the BoA, in particular on using the updated Test Review Model, published in the summer of 2025.
Covering 37 countries, EFPA has a reach to impact test use practice for almost half the practicing Psychologists in the world. How far have we come, and what should we focus on further? To this end, the BoA panel will discuss:

- Using the (updated, version 5.0) European Test Review Model (https://www.efpa.eu/consultation-model-review-description-and-evaluation-psychological-and-educational-tests), for official and unofficial review processes
- Test user standards with Euro Test certification processes for meeting expected competence
- Online and mobile assessment, particularly drawing on the European survey of test attitudes
- Digitization, AI, and other technological advances
- Lobbying government and institutions across respective countries

ARTIFICIAL INTELLIGENCE IN PSYCHOLOGICAL ASSESSMENT: RISKS, NOVEL OPPORTUNITIES, AND EMERGING SOLUTIONS ACROSS APPLIED CONTEXTS

Wednesday 22 July 2026 from 12:30 to 14:00

(C- Spadolini)

Antonia Hogrefe (Hogrefe Publishing Group ~ Göttingen ~ G), Chair and Presenter

Artificial intelligence (AI) has rapidly entered the field of psychological assessment, reshaping long-standing practices in both applied and clinical contexts. While offering unprecedented opportunities, AI also poses significant challenges for the validity and integrity of established assessment methods. This symposium brings together five diverse contributions that illustrate the dual role of AI: as both a threat to traditional assessments and a driver of innovative solutions. The first presentation addresses one example of the most pressing risks—AI-assisted faking in personality assessment. Generative AI can produce highly convincing response patterns, raising serious concerns for fairness and validity in personnel selection, but also pointing to new design strategies for prevention. A second contribution highlights how AI can reduce human subjectivity in neuropsychological testing by introducing fully automated scoring of the Rey Complex Figure Test, with promising implications for early detection of cognitive impairment. The third presentation explores AI as an effective and valid alternative to human expert ratings in situational assessments, comparing self-report, expert, and AI-based ratings of open responses. The fourth contribution critically examines whether AI can simulate normative data, using ChatGPT to generate norms for a verbal reasoning task—providing early evidence of both potential and current limitations. Finally, the MAPA project demonstrates how AI-powered natural language processing can be used to assess psychopathology, offering validated digital tools for OCD and anxiety that integrate seamlessly into clinical practice. Together, these perspectives show that AI represents a “next-level challenge” for psychological assessment—undermining validity in some contexts, while offering novel and paradigm-shifting pathways to overcome existing limitations. By addressing both risks and opportunities, this symposium invites applied psychologists to critically reflect on how AI can be integrated responsibly, ensuring assessments remain scientifically rigorous, fair, and clinically useful.

Abstract 3705

FAKING IN PERSONALITY ASSESSMENT IN THE AGE OF GENERATIVE ARTIFICIAL INTELLIGENCE: RISKS, DETECTION, AND PREVENTION STRATEGIES

Schwarz A., Hogrefe A.*

Hogrefe Publishing Group ~ Göttingen ~ Germany

Personality assessments are widely used in applied psychology, particularly in personnel selection, where they help predict workplace behavior. Their validity, however, critically depends on honest responding. Faking—intentionally distorting responses to create a favorable impression—has been a long-standing challenge. With the rise of generative artificial intelligence (AI), this challenge has reached a new level: applicants now have access to powerful tools capable of producing highly tailored, convincing responses that mimic desirable personality profiles. What was once a matter of individual strategy and test-taking skill has become a qualitatively different challenge that raises fundamental questions about the integrity of assessment results. This presentation examines how AI is transforming faking in personality assessment, the limitations of current prevention and detection methods, and possible strategies to safeguard validity. We synthesize findings from recent empirical studies comparing AI-generated responses with human faking attempts, review the effectiveness of traditional detection tools, and explore emerging approaches such as behavioral data analysis, test design adaptations, and preventive interventions. Evidence suggests that AI can, under certain conditions, outperform human fakers by producing highly socially desirable profiles aligned with job requirements. Traditional detection methods often fail to reliably identify such responses. At the same time, test formats such as forced-choice and situational judgment tests show greater resistance. Preventive strategies—including warnings, proctored testing, and technical safeguards—offer practical ways to reduce faking. Importantly, AI use may not always be a threat: in some contexts, the ability to leverage AI tools could itself represent a job-relevant skill. Generative AI therefore presents both risks and opportunities for applied psychology. Safeguarding the integrity of personality assessment requires a shift from purely detection-focused approaches toward prevention and innovative test design. Ongoing research and collaboration are crucial to ensure assessments remain valid, fair, and practically useful in the age of AI.

Abstract 3706

REDEFINING NEUROPSYCHOLOGICAL TESTING: FULLY AUTOMATED RCFT SCORING

Puig Navarro Y.*[1], Rincón Zamorano M.[2], Martínez--Tomás R.[2]

[1]Hogrefe TEA Ediciones ~ Madrid ~ Spain, [2]Escuela Técnica Superior de Ingeniería Informática (UNED) ~ Madrid ~ Spain

Mild Cognitive Impairment (MCI) is a prevalent condition among older adults and can progress to dementia if not detected early. Neuropsychological tests, such as the Rey Complex Figure Test (RCFT), are widely used for early detection by evaluating visuospatial construction, memory, and executive functions. However, traditional manual scoring is time-consuming and subject to inter-rater variability. Recent advances in artificial intelligence (AI) and computer vision provide new opportunities for automated and objective evaluation. This study proposes and evaluates a fully automated system for scoring RCFT drawings, aiming to enhance diagnostic precision, reduce subjectivity, and facilitate large-scale cognitive screening. A dataset of RCFT drawings was digitized and analyzed using a combination of computer vision techniques and machine learning models. The system was designed to identify core structural elements, quantify accuracy and organizational strategies, and compute standardized scores aligned with test norms. Preliminary analyses suggest that the automated approach can approximate human ratings and highlight organizational strategies in the drawings. While performance varies across specific scoring domains, the system shows potential to reduce rater subjectivity and evaluation time. Early results also indicate that novel digital features, such as drawing complexity or error patterns, may provide complementary insights, although further validation with larger datasets is needed. Fully automated RCFT scoring offers a reliable, efficient, and scalable alternative to manual evaluation. By combining standardized assessment with novel digital biomarkers, this approach has the potential to support earlier and more accurate detection of MCI and related neurocognitive disorders, while streamlining both clinical and research applications.

Abstract 3707

A MULTI-METHOD COMPARISON OF SELF-REPORT, EXPERT, AND AI RATINGS OF BEHAVIOR IN STANDARDIZED STATE ASSESSMENTS

Freudenstein J.*

Hogrefe Publishing Group ~ Göttingen ~ Germany

Standardized State Assessments, a method of assessing psychological states in hypothetical situations, have recently been shown to be highly reliable and to have convergent validity with other self-report measures. These assessments require respondents to indicate their behavior in hypothetical situations in an open-response format and to rate their own behavior on a set of construct-specific self-report items. This study examines (a) how self-report ratings in Standardized State Assessments converge with human subject matter expert ratings of the same behaviors and (b) whether natural language processing capabilities of GPT can provide an economically attractive alternative to human ratings. Results showed that GPT provided highly reliable ratings of open-ended responses with small to moderate correlations with self-report ratings of the same open-ended response and with self-report trait measures. These results are discussed in relation to subject matter expert ratings as well as their relevance for future assessments.

Abstract 3708

CAN AI ESTIMATES NORMS? SIMULATED NORMS FOR A VERBAL REASONING TASK

Ciancaleoni M.*

Hogrefe Editore ~ Florence ~ Italy

AI is a very powerful tool that is widely used in many aspects of daily life. In recent years, several studies have investigated the potential application of AI in psychology (e.g., Dillon et al., 2023). However, there is still no evidence to suggest that AI can simulate test-taker responses to questionnaires (Harding, 2024). This study aimed to provide a preliminary evaluation of ChatGPT-based norms for a verbal reasoning task in children aged 5 and 10, examining both the overall sample and age-specific subgroups. The Naming Opposites subtest of the Intelligence and Development Scales – 2 (Grob & Hagmann-von Arx, 2018) was administered to a sample of 450 children and ChatGPT (GPT-4 Omni) was used to replicate the test score distribution. The items of the scale were provided to ChatGPT and, iteratively, the item parameters, mean and standard deviation, were disclosed to the model. The results showed that AI cannot estimate the mean and standard deviation of the sample without knowing the item parameters. When the item parameters were added, the mean estimations improved, but the standard deviation estimates remained inconsistent with the real data. These patterns were consistent across the age-specific subgroups, except for the youngest and oldest children, for whom ChatGPT encountered greater challenges due to floor and ceiling effects. Furthermore, even when item parameters were provided, ChatGPT did not always improve the accuracy of its estimations. Further research is needed (e.g. using Item Response Theory parameters) to better understand ChatGPT's ability to estimate standard deviations and reduce the number of item parameters required to produce mean estimates that match real data. Currently, ChatGPT is unable to provide suitable norms, despite showing some awareness of typical verbal reasoning abilities in children aged 5 to 10, but it does not adequately account for variability among children of the same age.

Abstract 3710

GIVING VOICE TO PSYCHOPATHOLOGY: MAPA, AN AI-POWERED DIGITAL ASSESSMENT TOOL FOR OCD AND ANXIETY

De Francisco Carvalho L.*

University of São Francisco ~ São Francisco ~ Brazil

The integration of artificial intelligence (AI) into psychological assessment is transforming clinical practice, offering scalable solutions that complement traditional methods. This presentation introduces the Measure for Artificial Intelligence-based Psychopathology Assessment (MAPA), a platform of digital assessment tools designed to analyze natural language with high contextual accuracy. MAPA operates through a mobile interface accessible on standard smartphones and is structured around a semi-structured interview format, where patient speech is recorded, transcribed, and analyzed by transformer-based language models (TLMs). The system then generates structured clinical reports mapping disorder-specific symptomatology to support clinicians. MAPA represents a growing suite of tools, of which two modules are currently available: MAPA-OCD, developed for obsessive-compulsive disorder, and MAPA-ANX, developed for pathological anxiety. Tool development followed a multidisciplinary process, combining AI engineering expertise with clinical specialization in psychopathology to ensure both technological robustness and clinical validity. Validation was performed with two clinical cohorts: 30 adults diagnosed with OCD for MAPA-OCD, and 38 adults with anxiety disorders for MAPA-ANX. Participants provided extended speech samples, and AI-generated reports were benchmarked against traditional clinician-administered assessments. Results demonstrated strong stability across repeated analyses, high agreement with clinician ratings, and compelling evidence of external validity, supporting the reliability of MAPA in detecting disorder-specific symptoms. Three major contributions emerge: first, evidence that TLMs can accurately parse complex clinical narratives across distinct psychopathologies; second, demonstration of the feasibility of remote digital screening via accessible mobile technology; and third, the potential to enhance clinical efficiency by providing clinicians with structured, AI-supported reports. Together, MAPA-OCD and MAPA-ANX illustrate the promise of MAPA as an innovative framework for integrating AI into clinical practice. Future directions include refining algorithms for cultural and linguistic variability, expanding validation with diverse populations, and exploring adaptive, real-time feedback during assessments.

02 - Division 2: Psychological Assessment and Evaluation

FROM IQ TO DEVELOPMENTAL PROFILES: INTERNATIONAL PERSPECTIVES ON MULTIDIMENSIONAL ASSESSMENT IN CHILDREN AND ADOLESCENTS WITH THE IDS-2

Wednesday 22 July 2026 from 14:00 to 15:30

(C- Spadolini)

Antonia Hogrefe (Hogrefe Publishing Group ~ Göttingen ~ G), Chair and Presenter

This symposium highlights recent international research on the Intelligence and Development Scales – 2 (IDS-2), a multidimensional tool for assessing children's and adolescents' cognitive and developmental functioning. The symposium addresses the scientific and practical relevance of advancing assessment practices in school, clinical, and cross-cultural contexts from pure reliance on IQ measures to multidimensional approaches. The symposium presents a breadth of perspectives: from understanding the requirements and opportunities of valid international test adaptations to innovative approaches for profiling strengths and challenges, linking cognitive abilities with emotion regulation, and developing new clinically sensitive indices of intelligence. Together, these contributions emphasize how the IDS-2 can provide evidence-based, culturally valid, and clinically useful insights that move beyond reliance on global IQ scores alone. The first contribution examines the rigorous international adaptation of the IDS-2. It highlights the balance between cross-national comparability and local cultural validity, showing how coordinated processes and collaboration with domain experts ensure robust test adaptations across languages and contexts. A second presentation provides evidence of factorial, convergent, and differential validity across six countries, demonstrating that the added value of combining cognitive and developmental measures is both valid and generalizable. In the third contribution incremental value of developmental profiles is being investigated through latent profile analyses, illustrating how multidimensional assessment refines educational decision-making. Building on this, another study examines how intelligence and executive functions predict emotion regulation strategies, highlighting the role of the cognitive profile in understanding youth mental health. Finally, the symposium presents the proposal of two new indices (Central Ability Index, Balanced Intelligence Quotient) to strengthen the theoretical and clinical sensitivity of IDS-2 intelligence measurement. In sum, the symposium showcases how the IDS-2 can advance psychological assessment by integrating methodological rigor, cultural adaptation, multidimensional profiling, and clinical innovation, thereby enhancing both scientific knowledge and practical application.

Abstract 3714

MAKING ASSESSMENTS WORK ACROSS CULTURAL CONTEXTS: COORDINATED INTERNATIONAL ADAPTATIONS OF THE IDS-2

Hogrefe A.*

Hogrefe Publishing Group ~ Göttingen ~ Germany

Adapting a comprehensive psychological assessment tool such as the Intelligence and Development Scales – 2 (IDS-2) to diverse cultural contexts requires a careful balance between ensuring cross-national comparability and achieving local validity for each language version. This contribution outlines the rigorous procedures underlying the international adaptations of the IDS-2, highlighting methodological standards as well as collaborative practices. We will present how central coordination of test adaptations ensures consistency in the test materials and the psychometric quality while allowing necessary modifications of the test material to account for cultural and linguistic specificities. Given the comprehensive nature of the IDS-2 we can demonstrate how the involvement of local experts from the developmental domains assessed (e.g., psychomotor skills, social-emotional development, scholastic abilities) is essential for developing culturally appropriate test materials. At the same time, adapting intelligence measures across cultures requires a focus on high comparability to enable factorial stability across language versions for generalizable interpretations of results. We also illustrate how standardization data can be used not only to establish reliable local norms but also to support secondary analyses and research. This approach fosters further research into an internationally adapted instrument and enables both continuous refinement of the measure and basic research on the assessed constructs. Applying this dual approach—combining rigorous quality assurance with openness to empirical scrutiny—to the international adaptations of the IDS-2 ensures that the IDS-2 remain both scientifically robust and practically useful across language versions. In sum, we present how the adaptation of the IDS-2 exemplifies best practice in cross-cultural test development by integrating methodological precision, interdisciplinary expertise, and international collaboration. These efforts enhance the clinical and educational utility of assessments like the IDS-2 and ensure their ongoing alignment with the latest scientific knowledge and practical needs.

Abstract 3715

GENERALIZABLE VALIDITY OF THE INTELLIGENCE AND DEVELOPMENT SCALES 2ND EDITION (IDS-2) ACROSS DIVERSE CLINICAL APPLICATIONS AND CULTURAL CONTEXTS

Grob A.*[1], Hogrefe A.[2]

[1]University of Basel ~ Basel ~ Switzerland, [2]Hogrefe Publishing Group ~ Göttingen ~ Germany

The Intelligence and Development scales - 2 (IDS-2) provide a comprehensive diagnostic assessment with 30 subtests covering six domains: two cognitive domains (Intelligence and Executive Functions) and four developmental domains (Psychomotor Skills, Social-Emotional Skills, Scholastic Skills, and Motivation and Attitude). The IDS-2 offers detailed insights into children's and adolescents' strengths and developmental needs, enabling psychologists to identify specific areas requiring support to help individuals reach their full potential. The IDS-2 can be applied in diverse contexts, including the identification and diagnosis of intellectual disabilities and learning disorders, the evaluating of cognitive and motor skills, and understanding emotional resources and weaknesses. Currently, the IDS-2 has been adapted or is being adapted across multiple countries with a combined sample size of approximately 15.000 children and adolescents aged 5;0 to 19;11 years in the U.S., United Kingdom, Brazil, Denmark, Finland, France, Germany/Austria/Switzerland, Italy, Portugal, the Netherlands, Norway, Poland, Sweden, and Spain. This presentation will provide an overview of the factorial, convergent (e.g. WISC, WPPSI, RIAS; SON-R, SPM, TEA, BRIEF, M-ABC, SDQ), and differential validity (e.g. high/low intelligence, learning disability, reading/writing disability, dyslexia, ADHD, DCD, ASD) across the available language versions. We conclude that (1) the IDS-2 clearly meet the expected validity standards, and that the (2) validity evidence is comparable across cultural contexts.

Abstract 3716

MOVING BEYOND IQ: ADVANCING MULTIDIMENSIONAL ASSESSMENT OF COGNITIVE AND DEVELOPMENTAL PROFILES

Hasselhorn K., Freudenstein J.*

Hogrefe Publishing Group ~ Göttingen ~ Germany

To address diverse learning needs, school psychologists require assessments that go beyond a single intelligence score. Focusing exclusively on IQ may obscure other critical developmental aspects (e.g., Alzahrani et al., 2019; Best et al., 2011). Integrating both cognitive and developmental measures within a single tool allows for a more comprehensive understanding of a child's strengths and challenges. This presentation first presents the validity of the cognitive assessment integrated in the Intelligence and Development Scales – 2 (IDS-2; Grob & Hagmann-von Arx, 2018) by comparing it with the Wechsler Intelligence Scale for Children (WISC-IV/V; Wechsler, 2003/2014) across multiple language versions. To investigate the added value of developmental measures alongside cognitive ability, we conducted latent profile analyses on a large international sample assessed with the IDS-2 (N = 8,446; from Germany, Italy, Netherlands, United Kingdom, U.S., Sweden, in 2018–2025). In this study we identify distinct subgroups with unique constellations of cognitive and developmental characteristics that extend beyond general intelligence. Findings are expected to replicate aligned profiles previously reported (e.g., Grieder & Grob, 2020), but also to reveal subgroups with specific strengths and weaknesses. Such profiles offer practical insights for tailoring support, moving beyond static IQ cutoffs that risk misrepresenting the needs of gifted as well as underperforming learners. By highlighting the incremental validity of developmental profiles, this study underscores the value of multidimensional assessments for nuanced student profiling and evidence-based decision-making in school psychology.

Abstract 3717

LINKING COGNITIVE ABILITIES AND EMOTION REGULATION: THE ADDED VALUE OF MULTIDIMENSIONAL ASSESSMENT IN YOUTH MENTAL HEALTH

Hasselhorn K., Freudenstein J., Hogrefe A.*

Hogrefe Publishing Group ~ Göttingen ~ Germany

Emotion regulation is crucial for psychological well-being, particularly in children and adolescents. The use of ineffective regulation strategies has been identified as an early indicator of mental health problems, including depression and anxiety (e.g., Joormann & D'Avanzato, 2010). Cognitive processes such as intelligence and executive functions have also been linked to effective emotion regulation (e.g., Bridgett et al., 2013). This study examines the effects of intelligence and executive functions on both cognitive and behavioral emotion regulation strategies using path analysis. Data will be drawn from a subset of the U.S. standardization sample (N = 166) who completed both the Intelligence and Developmental Scales -2 (IDS-2; Grob & Hagmann-von Arx, 2028; U.S. adaptation in preparation) and the new Emotion Regulation Strategies Questionnaire (FEEL-KJ-2; Grob et al., 2025), which assesses both cognitive and behavioral strategies. Based on previous findings (Te Brinke et al., 2021), we hypothesize positive effects of intelligence and executive functions on cognitive strategies, and negative effects on behavioral strategies. These results will highlight the value of multidimensional, evidence-based assessments of cognitive factors for understanding the origins of emotional regulation difficulties in children and adolescents and for informing targeted interventions to improve mental health.

Abstract 3718

ENHANCING THE POTENTIAL OF IDS-2: PROPOSAL FOR TWO NEW CLINICALLY SENSITIVE INDICES OF INTELLECTUAL ABILITY

Toffalini E.*, Cornoldi C.

University of Padua ~ Padua ~ Italy

The Intelligence and Development Scales-2 (IDS-2) represent a valuable tool for assessing intellectual functioning in children and adolescents. In this presentation, we will argue that the typical use of its intelligence battery can be enriched by introducing two new indices. First, because short-term memory is split into separate domains, and together with memory and speed constitute four of the seven areas used to compute the global IQ score, the current structure risks overemphasizing neuropsychological efficiency while underrepresenting central reasoning abilities, which are more directly relevant to the g factor. Second, unlike Wechsler scales, the IDS-2 does not provide an equivalent of the General Ability Index (GAI), an alternative proxy of g particularly valuable in neurodevelopmental conditions, where working memory and processing speed are not only weaker but also less strongly related to general ability, as shown by recent literature. To address these issues, we propose the development of two new indices for the IDS-2. The first is a Central Ability Index (CAI), designed to capture core abstract reasoning abilities (both verbal and nonverbal) while excluding memory and processing speed. This index would provide a more central estimate of g and help avoid underestimation of intellectual potential in children with uneven cognitive profiles, such as those with specific learning disorders or ADHD. The second is a Balanced Intelligence Quotient (BIQ), designed to provide a theoretically more balanced representation of intellectual ability in line with hierarchical models of intelligence. To this end, we examine the incremental value of supplementing the global IQ score with two additional reasoning subtests, thereby reducing the disproportionate influence of memory and processing speed. Together, these new indices could enhance the IDS-2's clinical utility and theoretical validity, offering complementary perspectives on the assessment of intellectual ability.

ASSESSING CRITICAL THINKING THROUGH PERFORMANCE-BASED ASSESSMENTS IN HIGHER EDUCATION: A SYSTEMATIC-NARRATIVE REVIEW

Hyytinen H.*[1], Tuononen T.[2], Jämsä M.[1], Kleemola K.[2]

[1]University of Eastern Finland ~ Joensuu ~ Finland, [2]University of Helsinki ~ Helsinki ~ Finland

Critical thinking is widely recognized as a key objective of higher education, encompassing a complex interplay of cognitive skills, knowledge, and dispositions. However, assessing critical thinking in authentic educational contexts remains a challenge. This presentation introduces findings from a systematic-narrative review that examined how performance-based assessments are used to evaluate critical thinking in higher education. Performance-based assessments aim to elicit authentic responses by placing students in real-world-like situations that require critical thinking. The review focused on peer-reviewed empirical studies published between 2013 and 2023, identified through searches in EBSCOhost, Scopus, and the Social Science Database. A total of 28 studies were included. The review process followed four phases: identification, screening, data extraction, and synthesis. The first three phases adhered to the PRISMA protocol, while the final phase involved qualitative content analysis. Findings showed that most studies employed open-ended performance tasks, with selected-response formats being less common. There was no consistent theoretical framework across the studies. Critical thinking was typically defined as a skill or a set of skills, though a few studies acknowledged the role of dispositions. Evaluation and inference were the most frequently assessed skills, while dispositions were not explicitly targeted in any of the assessments. The results revealed a misalignment between how critical thinking is defined and how it is assessed through performance-based methods. This raises important questions about the validity and comprehensiveness of current assessment practices. The presentation will discuss implications for future research and higher education, highlighting the need for more integrated frameworks that encompass both skills and dispositions in the assessment of critical thinking.

IMPLEMENTING A GROUP-BASED CAREER GUIDANCE INTERVENTION IN SOUTH AFRICAN HIGH SCHOOLS: A SOCIAL JUSTICE IMPERATIVE

Naidoo T., Jäckel--Visser M.*

Stellenbosch University ~ Stellenbosch ~ South Africa

Introduction
Three decades after the end of apartheid in 1994, the youth unemployment rate in South Africa is alarmingly high at 45%. Notwithstanding the central role that career guidance and counselling plays in high school education, there are major disparities in the provision of career guidance services at high school level with the majority of schools not having dedicated personnel, services and resources for this vital function.

Purpose:
Using a community based participatory action research approach with post-graduate students working at 10 partner schools, we describe an intervention to develop, implement and evaluate a group-based career guidance intervention. Due to Covid-19 restrictions, adaptations were made to shift to developing self-directed resources for students and teachers.

Method:
A combination of quantitative and qualitative methods was used to implement the intervention with the students. Formative evaluation methodology was then used with the teachers and students to garner feedback that was helped to improve the intervention and the resources.

Results:
Findings from 2021 and 2022 indicated an overwhelming positive impact of the self-directed manual intervention. This emphasized the importance of promoting career preparedness and the facilitation of self-exploration among adolescents.

Conclusions.
Inspite of the positive findings of the impact of the intervention, significant challenges persist in the South African educational system including the inadequate time allocation in the Life Orientation curriculum to career guidance and counselling and the limited access that students have to adequate physical and digital resources as a result of socio-economic limitations. The study emphasized the importance of direct one-on-one personal discussion and the role of competent counsellors to engage with students' queries about career questions and subject choices and their personal contexts. This

research directs systemic attention to the urgent need for comprehensive and appropriate career counselling services and resources and emphasizes this as a significant social justice concern.

Abstract 2112

POST-PANDEMIC ASSESSMENT OF CHILDREN'S COGNITIVE PERFORMANCE

Parcon A.M.*

University of the Philippines ~ Diliman ~ Philippines

This study assessed the baseline IQ scores of 317 children from Philippine' public and private schools, ages 4-7 years old, through individually administering the WPPSI-IV. Among the subtests, the children scored highest in the Processing Speed tests (Bug Search and Cancellation tests), followed by Working Memory (Picture Memory), Visual-Spatial (Block Design), and Matrix Reasoning, The children, however, scored lowest in subtests that measure verbal knowledge and comprehension (Information and Similarities). Nevertheless, looking at their Full Scale IQ scores, only .95% reached Superior, 4.1% reached High Average IQ, and 40.1% Average IQ. The rest rendered low scores with 22.4% falling within Low Average IQ, 21.8% Borderline IQ, and 5.0% Extremely Low IQ. Significant differences among the subtests were also observed, particularly between the nonverbal and verbal tests. To give context to the scores in Verbal tests (Information and Similarities), the team did a qualitatively study on the responses of the children, by systematically taking note and coding their wrong answers in these subtests. The thematic analysis revealed the gaps in educational system and the value of culture, context, and daily conversations and experiences in the way the children understood and responded to verbal questions. These studies showed the possible concerns and potential problems on how the Philippine educational system teaches concepts to children. Further, this study discussed some recommendations in order to help children to have a more meaningful learning and integration of knowledge and concepts..

PSYCHOMETRIC PROPERTIES OF THE NOC OUTCOMES COPING AND SELF-ESTEEM IN TURKISH ADULTS WITH MENTAL ILLNESS

Aşkan T.*[1], Özkan B.[2], Kamis G.Z.[1], Ugurlu M.[2]

[1]Ankara Bilkent City Hospital ~ Ankara ~ Turkey, [2]Ankara Yildirim Beyazit University ~ Ankara ~ Turkey

Abstract

Introduction

In mental health services, implementing and evaluating interventions that enhance coping and self-esteem are essential, as these factors play a critical role in promoting individuals' recovery. A Turkish adaptation of the Nursing Outcomes Classification (NOC) outcomes "Coping" (1302) and "Self-Esteem" (1205) has not yet been identified in the literature.

Purpose

This study was conducted to examine the validity and reliability of the Turkish translations of the NOC outcomes "Coping" and "Self-Esteem".

Method

This methodological study was conducted with a sample of 145 individuals who visited a psychiatric outpatient clinic. The validity of the outcomes was assessed using content, convergent, and construct validity methods, while reliability was evaluated by calculating Cronbach's alpha and McDonald's omega reliability coefficients and intraclass correlation coefficients. The data for the study were collected between December 2023 and July 2024 using the Information Form, NOC outcomes "Coping", "Self-Esteem", Coping Strategies Brief Form, Rosenberg Self-Esteem Scale, and Trait Anger and Anger Expression Styles Scale. The data were analysed using IBM SPSS 28.0 and Mplus 8.3 software.

Results

The NOC outcome "Coping" consists of 19 indicators and a single dimension, demonstrating excellent inter-rater reliability, good internal consistency, criterion validity, and discriminant validity. The NOC outcome "Self-Esteem" comprises 19 indicators and 3 sub-dimensions, demonstrating excellent inter-rater reliability, adequate internal consistency, criterion validity, and discriminant validity.

Conclusions

In conclusion, NOC outcomes "Coping" (1302) and "Self-Esteem" (1205) were determined to be valid and reliable instruments for use with individuals diagnosed with mental illness. The results of this study will enable the evaluation of mental health care through an international nursing classification system. Therefore, the study is expected to contribute to the body of nursing knowledge, the dissemination of an internationally standardized language, and the improvement of the quality of care.

Abstract 1109

CROSS-CULTURAL ADAPTATION AND VALIDATION OF THE PERCEIVED STRESS QUESTIONNAIRE IN THE ECUADORIAN POPULATION

Hernández--Martínez M.A., Cadena--Povea H.*, Bastidas--Amador G.

Universidad Técnica del Norte ~ Ibarra ~ Ecuador

Objective: To linguistically and culturally adapt the Perceived Stress Questionnaire (PSQ) by Levenstein to the Ecuadorian context and to validate its psychometric properties in an adult population. Method: The process followed five phases: translation and back-translation, expert review, two pilot tests (N = 600), exploratory factor analysis (395 participants), confirmatory factor analysis (391 participants), and sex-based invariance analysis. A non-clinical sample was selected to ensure that results represent the normative range of perceived stress in the general population. Reliability was assessed using Cronbach's alpha and McDonald's omega, while convergent and discriminant validity were examined through correlation analyses. Results: The general version was optimized to 23 items across three factors, explaining 49.8% of the variance, while the specific version comprised 21 items in four factors with a distinct structure, accounting for 54.97% of the variance. Both versions demonstrated excellent internal consistency (α y ω > 0,90) and satisfactory fit indices in the CFA ($\chi^2/gl \approx 2,2$; CFI ≈ 0,92; RMSEA ≈ 0,056). Construct validity was confirmed, and metric and scalar invariance by sex supported their use in group comparisons. Conclusions: The Ecuadorian adaptation of the PSQ is a valid and reliable instrument for assessing perceived stress in adults. The specific version is suitable for detecting acute stress and monitoring short-term interventions, while the general version is appropriate for longitudinal studies. These findings reinforce evidence of cross-cultural validity and provide a foundation for developing national norms and mental health promotion programs.

Abstract 1013

PSYCHOLOGICAL RESILIENCE IN THE ERA OF INDUSTRY 5.0: DEVELOPMENT AND PRELIMINARY EVALUATION OF THE CHANGE ADAPTATION RESILIENCE EVALUATION QUESTIONNAIRE FOR INDUSTRY 5.0

Bassi G.*[1], Valente A.[2], Tassoni S.[2], Salcuni S.[2]

[1]Dipartimento di Psicologia dello Sviluppo e della Socializzazione, Università degli Studi di Padova; Human-inspired Technologies Research Centre, Università degli Studi di Padova ~ Padova ~ Italy, [2]Dipartimento di Psicologia dello Sviluppo e della Socializzazione, Università degli Studi di Padova ~ Padova ~ Italy

Introduction: Within the evolving paradigm of Industry 5.0, resilience is increasingly recognized as a strategic resource for promoting well-being and adaptability in high-tech manufacturing settings. However, existing assessment tools often lack the contextual sensitivity and fail to account for the specific demands of human-technology interaction. Purpose: This study introduces the Change Adaptation Resilience Evaluation Questionnaire for Industry 5.0 (CARE-QI 5.0), a novel multidimensional instrument designed to evaluate both individual and contextual dimensions of resilience among operators engaged in technologically advanced environments. Method: Using a sequential mixed-methods approach, the questionnaire was developed in four phases: literature review, expert content validation, focus groups and pilot administration in two Italian high-tech companies. The resulting instrument encompasses 88 items distributed across a global resilience score and two overarching domains: individual (i.e., change management and adaptation, self-efficacy, cognitive flexibility, and coping strategies) and contextual (i.e., perceived social support and organizational resilience) resilience, organized into 18 subscales. Results: A total of 64 operators (M = 46.11 years, SD = 10.71) took part in the study. Preliminary psychometric analyses indicated good internal consistency across most subscales (α = from 0.76 to 0.94). Key correlational findings ($r \geq .30$, $p < .05$) highlighted the importance of support from significant others, colleagues, and the organization, as well as individual resources such as interpersonal self-efficacy and problem-oriented coping. Several additional subdimensions, particularly those related to skill-based resilience, cognitive flexibility, and change management and adaptation, also showed substantial relational density. Conversely, technology readiness, usage frequency, and job tenure appeared more peripheral within the network. Conclusions: CARE-QI 5.0 provides a theory-based, context-sensitive tool for enhancing both individual and organizational resilience and well-being, identifying strengths and vulnerabilities, and tailoring support accordingly in advanced manufacturing.

Abstract 902

ENHANCING THE CLINICAL UTILITY OF THE DIFFICULTIES IN EMOTION REGULATION SCALE (DERS): USING EXPLORATORY GRAPHICAL ANALYSIS TO REFACTOR THE DERS

Gardner F.*, Moore Z.

Touro University ~ New York City ~ United States of America

The Difficulties in Emotion Regulation Scale (DERS) evaluates the transdiagnostic construct of emotion dysregulation and its connection to various psychopathologies. However, researchers have questioned the validity of the original six-factor structure. This research examines the latent variables implicated in the DERS using Exploratory Graphical Analysis among 428 university students in the northeastern United States (ages 18-30). EGA is a psychometric approach that evaluates constructs through visually represented graphical networks. These networks provide an understanding of the interconnection among items through nodes and edges. Clusters of nodes signify distinct variables/communities, while the edges between nodes indicate the predicted statistical associations between variables. The total sample was divided in half, and an EGA was run on half of the sample; the resulting factor structure was then confirmed using the other half of the sample. EGA results suggest the DERS is better explained as five interrelated latent variables. Based on the stability analysis, 10 DERS items were eliminated when using a 0.7 factor loading cutoff. Confirmatory factor analysis was run on the remaining 26 items on the second sample, which reaffirmed a 4-factor model as a good fit for the data (CFI=.911; RMSEA=.071; p<.001). Due to a significant interaction between communities in the EGA, a higher-order confirmatory factor analysis was run. Results showed an adequate fit (CFI=.89; TLI=.88; p<.001). As the original CFA produced a better fit than the higher-order CFA, four interrelated but independent factors may be a better conceptualization of difficulties in emotion regulation than one overarching factor with four subscales. Revising the DERS using EGA facilitates a comprehensive understanding of the scale's construct validity, highlighting the shared variance among factors. The implementation of a DERS-Revised version, characterized by four interrelated factors (Emotional Awareness, Helplessness, Self-Deprecation, Difficulties with Executive Function), enhances assessment strategies and promotes interventions to address emotion regulation difficulties.

Abstract 998

INTRA-INDIVIDUAL VARIABILITY AND CHARACTERISTICS OF FRONTAL CEREBRAL BLOOD FLOW DURING PERSONALITY SELF-RATINGS

Matsuda K.*[1], Sato E.[2]

[1]Tohoku-Bunkyo university ~ Yamagata ~ Japan, [2]Tokyo-Fuji university ~ Tokyo ~ Japan

The purpose of this experiment was to examine the relationship between prefrontal cerebral blood flow and questionnaire responses during personality self-rating. Participants were 61 university students experimented between May and December 2023. Frontal cerebral blood flow was measured with nIR-HEG under six conditions: three computer-based self-rating tasks, two questionnaire-based tasks, and one eyes-closed baseline. Personality trait scores were obtained using the Big Five, BIS/BAS, and POMS2, and correlation coefficients were calculated between these scores and frontal cerebral blood flow under each condition. To investigate changes in blood flow during personality self-rating, the means and standard deviations of cerebral activity were computed for each participant across conditions. The nIR-HEG index was calculated as the ratio of oxyhaemoglobin (mol / micro L) to deoxyhaemoglobin (mol / micro L), measured with near-infrared and red visible light. The displayed measurement value was 200 times this ratio, producing a unitless nIR-HEG index (Serra-Sala et al., 2012). To explore inter-individual variability in blood flow, cluster analysis was conducted using Ward's method with case-wise standardisation and Euclidean distance. Four clusters were identified, suggesting that individual differences in frontal cerebral blood flow during self-rating could be classified into four distinct patterns. The ANOVA was then performed to examine the relationship between these clusters and personality questionnaire scores. Significant differences were found in Big Five scores for F ($F(3,55) = 3.34$, $p < .05$) and Att ($F(3,55) = 4.11$, $p < .05$). No significant difference was observed for BIS ($F(3,55) = 2.13$, n.s.), but BAS scores differed significantly ($F(3,55) = 3.25$, $p < .05$). Overall, the findings suggest that personality can be classified according to intra-individual differences in self-rating, and that certain personality traits may influence the degree of curiosities for performance.

VALIDATION OF PODSAKOFF'S ORGANIZATIONAL CITIZENSHIP BEHAVIOUR SCALE IN A DEVELOPING COUNTRY

Mitonga--Monga J.*

University of Johannesburg ~ Johannesburg ~ South Africa

Background: Organisational citizenship behaviour (OCB), also known as extra-role behaviour, plays an important role in increasing the effectiveness of organisations. The Organisational Citizenship Behaviour Scale (OCBS) developed by Podsakoff, MacKenzie, Moorman and Fetter (1990) have demonstrated high reliability and validity in Western contexts. However, the applicability and relevance of the scale in a Central African culture have only been explored to a limited extent. Purpose: This study's purpose was to validate the OCBS in a sample of permanent employees (N = 839) working in the transport sector in the Democratic Republic of Congo (DRC). Methods: Psychometric analyses, including a confirmatory factor analysis, were conducted to examine the structure of the scale. Results: Results support the five-dimensional model of OCB. In addition, the sub-dimensions of the OCBS showed high internal consistency. Furthermore, the second-order measurement models showed good model fit, whereas a competing first-order model did not adequately fit the data. Conclusion: The findings provide robust evidence for the reliability and validity of the scale in the context of the Democratic Republic of Congo, supporting its use in similar developing countries and culturally diverse settings

Abstract 229

MEASURING MATHEMATICAL REASONING: A SYSTEMATIC REVIEW OF ASSESSMENT TOOLS AND VALIDITY CONSIDERATIONS

Moncalieri G.*, Tagliabue S.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Introduction

Mathematical reasoning is a fundamental competence in mathematics education (Khardita et al., 2023). Although there is a lack of consensus on a unique definition of mathematical reasoning (Jeannotte & Kieran, 2017), several measurement tools have nonetheless been proposed, from traditional standardized tests to adaptive digital platforms and AI-enhanced systems (Mustafa, 2024). However, no comprehensive review has systematically examined how mathematical reasoning is defined and assessed, especially regarding validity and fairness (Zumbo, 2009).

Purpose

This systematic review aims to identify, categorize, and critically evaluate tools used to assess mathematical reasoning in educational settings.

Method

Following PRISMA guidelines, a systematic search will be conducted in Scopus, PsycINFO and ERIC to find peer-reviewed studies. Included studies will focus on tools explicitly designed to assess mathematical reasoning at all educational levels. Tools will be categorized by features such as instrument type (e.g., paper-based, computer-based, AI-enhanced), development method (manual, AI-assisted) and task characteristics (e.g. multi-step problems, visual-spatial tasks). Evaluation will follow Zumbo's framework of validity (2009), which treats validity as an integrated concept including reliability and fairness.

Results

The review is expected to reveal a wide range of tools, reflecting differing definitions and characteristics. Variation is also expected in the quality of validity evidence. Findings may highlight gaps in equitable and meaningful score interpretation across diverse populations.

Conclusions

This review will provide a timely synthesis of current definitions and assessments of mathematical reasoning, emphasizing validity and fairness. The findings will guide development of psychometrically sound and equitable tools, supporting ethical educational practices.

Abstract 745

LISTENING TO SILENCE: UNWANTED LONELINESS AND ITS PSYCHOSOCIAL DETERMINANTS IN OLDER ADULTS IN A RURAL AREA OF SOUTHERN SPAIN

Robles--Bello M.A.*, Valencia--Naranjo N.

University of Jaén ~ Jaén ~ Spain

Background: Unwanted loneliness is a growing public health concern among older adults, with documented negative effects on mental and physical health. Despite its relevance, little evidence exists regarding its prevalence and associated factors in rural southern Spain. This project, funded by the Provincial Council of Jaén (Spain) through Resolution No. 295 of August 19, 2025, investigates unwanted loneliness in older adults, focusing on risk and protective factors through an in-depth analysis in the province of Jaén. Objectives: This study aimed to evaluate the prevalence of unwanted loneliness among individuals aged 60 and over in Jaén and to identify sociodemographic, family, and psychosocial risk and protective factors. Methods: An analytical, cross-sectional, observational study was conducted with approximately 429 older adults recruited from community and residential centers in urban and rural areas of Jaén. Loneliness was assessed using the De Jong-Gierveld Loneliness Scale, while complementary instruments measured depression, resilience, and perceived social support. Sociodemographic and mobility data were also collected. Statistical analyses included descriptive statistics, Spearman correlations, regression models, and non-parametric tests. Results: A high prevalence of moderate and severe unwanted loneliness was found, particularly among single, widowed, or those living without a partner. Protective factors included having children, greater social support, and resilience. Depressive symptoms were a significant risk factor. Loneliness was also associated with limited mobility, poor physical or mental health, financial difficulties, and loss of loved ones. Social and environmental factors, such as living alone, geographic isolation, lack of transportation, or weak support networks, further increased risk. Conclusions: The study revealed a high prevalence of unwanted loneliness among older adults in rural southern Spain, particularly linked to living without a partner, widowhood, and poor health. Findings underscore the urgent need for targeted interventions to strengthen protective resources, reduce risks, and design community and health strategies adapted to older adults.

GENDER EQUALITY, DIVERSITY AND SOCIAL INCLUSION: VALIDATION AND DEVELOPMENT OF INSTRUMENT FOR HIGHER EDUCATION

Roxas M.*

Philippine Normal University ~ Manila ~ Philippines

Gender Equality, Diversity and Social Inclusion (GEDSI) are critical in achieving the Sustainable Development Goals number 4 (Quality Education), number 5 (Gender Equality) and number 10 (Reduced Inequalities) , impacting various aspects of society, organizations, and individual well-being. While GEDSI issues are still a pressing issue worldwide, this study aims to design an instrument for the GEDSI situationer tool for students, administrative staff and faculty members. This instrument underwent a thorough validation and development process utilizing a mixed-method design. First, the item is designed through Focus Group Interviews (FGIs) on GEDSI in a prominent state university in the Philippines. Through Exploratory Factor Analysis (EFA)- using survey responses from 374 students and PLS-SEM for 40 faculty and 51 administrative staff, the study found that the data met all four fit statistics cutoffs outlined in the literature Cronbach alpha 0.9 excellent in most of the factors except for factor 1 of the Student Tool, which has a score of 0.78 acceptable , item loadings, average variance extracted (AVE) and composite reliability results. The validated GEDSI Situationer Tool proved to be a reliable technique for assessing gender related issues in the institution. This would help make evidenced-based decisions and develop solutions to create a more inclusive and equitable environment.

Abstract 997

INDIVIDUAL DIFFERENCES IN FRONTAL CEREBRAL BLOOD FLOW DURING PERSONALITY SELF-RATINGS AND VARIATIONS ACROSS RATING CONDITIONS

Sato E.*[1], Matsuda K.[2]

[1]Tokyo Fuji University ~ Tokyo ~ Japan, [2]Tohoku Bunkyo University ~ Yamagata ~ Japan

The purpose of this experiment was to measure changes in cerebral blood flow in the prefrontal cortex during personality self-rating and to examine intra-individual variability during self-rating and the characteristics of cerebral blood flow by conditions.

The participants were 61 university students (29 men and 31 women, missing value1) and was conducted in May-December2023. Participants were performed Big Five inventory before we used NIRS-based Hemoencephalography to measure frontal cerebral blood flow under six self-rating conditions: three PC conditions, two questionnaire conditions, and one eyes-closed condition as an individual baseline. For each participant, the Means and SD of all intervals were standardized within each individual, with a mean of 100 and a standard deviation of 15 for each condition.

We calculated the Means and SD to compare frontal cerebral blood flow for each experimental participant and the six conditions. The ANOVA results showed that there was a significant difference between participants($F(60,363)=134.9, p<.01$), so it was revealed that there were individual differences in frontal cerebral blood flow during self-rating. When examining the Means for each condition of the participants, it was shown that all participants had different baseline values for frontal cerebral blood flow, and that each task condition fluctuated based on this value. As there was a significant difference for conditions($F(5,363)=6.84, p<.01$), it suggested that participants were able to discriminate between the self-rating tasks. When comparing the Means across task conditions, the Means cerebral blood flow was higher in the questionnaire condition than in the PC condition, it suggested that questionnaires using paper and pen enable greater concentration self-rating than PC rating. These results supported previous research (Sato & Matsuda, 2019), it showed that self-rating tasks result in individual differences in frontal cerebral blood flow and that there are differences depending on the rating tasks.

Abstract 223

FITTING PSYCHOLOGICAL DEVELOPMENT CURVES SEPARATELY FOR MALES AND FEMALES USING POLYNOMIAL EQUATIONS

Shimizu H.*[1], Tanaka S.[2], Shimizu S.[3], Matsuoka T.[2], Zen Y.[4], Adachi E.[2], Goma H.[5]

[1]Kobe Gakuin University ~ Kobe ~ Japan, [2]Kyoto International Social Welfare Exchange Center ~ Kyoto ~ Japan, [3]Osaka Tokiwakai University ~ Osaka ~ Japan, [4]Nara University of Education ~ Nara ~ Japan, [5]Himeji University ~ Himeji ~ Japan

This study attempted to represent psychological development curves separately for males and females using polynomial equations. We utilized standardized data from the 2020 edition of the Kyoto Scale of Psychological Development (KSPD) to specify these equations. The participants included 1281 males and 1355 females ranging in age from 0 to 20 years. This age range was chosen because, after the age of 20, there is little to no increase in KSPD scores. Using the least squares method, polynomial equations from the first to the sixth degree were calculated, with age (in days) as the x-axis and scores as the y-axis. As a result, for both males and females, no differences were observed in the coefficient of determination for second-degree or higher equations, with the highest average agreement rate found in third-degree equations (males 96.0%, females 95.7%). The cubic equation for males was y= 4.272・10－1x－4.592・10－5x2+ 1.586・10－9x3+1.293 (R2=.986), and the cubic equation for females was y= 4.284・10－1x－4.623・10－5x2+ 1.437・10－9x3+3.932 (R2=.985). We determined that the third-degree equation provided the best fit for both males and females and calculated the maximal value. The maximal value was calculated because it is estimated to correspond to the peak of development. The maximal value for males was x = 7818.5, y = 1292.3, while for females, it was x = 6770.9, y = 1231.2. In other words, males were estimated to reach their developmental peak at 7818.5 days (256.9 months: 21.4 years) with a score of 1292.3, while females were estimated to reach their peak at 6770.9 days (222.5months: 18.5 years) with a score of 1231.2. These results may suggest slight differences in the developmental timing between males and females.

Abstract 367

DEVELOPMENT AND VALIDATION OF THE POSITIVE EGOGRAM SCALE

Tokuyoshi Y.*

Coaching Psychology Center ~ Tokyo ~ ??

Introduction

Egograms, derived from Eric Berne's Transactional Analysis (TA), represent distinct ego states within an individual's personality. John M. Dusay, influenced by TA principles, developed a personality diagnostic tool based on this framework, which has since been applied across various domains. In recent years, Positive Psychology has emerged as a key applied discipline, contributing to the study of well-being. As part of this development, an egogram scale incorporating a positive perspective was designed to further support research and applications related to well-being. This scale was named the Positive Egogram, with the hypothesis that it would be associated with the positive dimensions of the Big Five personality traits.

Method

This study developed the Positive Egogram, consisting of 15 items representing five ego states: Critical Parent, Nurturing Parent, Adult, Free Child, and Adapted Child. A total of 2,987 participants (mean age = 46, SD = 15) completed an internet-based questionnaire. The data were analyzed using confirmatory factor analysis (CFA).

Results

The CFA supported a five-factor structure, showing a good fit to the data (CFI = .956, TLI = .943, RMSEA = .058, 90% CI = [.055, .062]). Cronbach's alpha coefficients ranged from .71 to .84, indicating satisfactory internal consistency. Mokken Scale Analysis also confirmed the reliability of the scale (Ht ≥ .49). The Positive Egogram showed significant positive correlations with the Big Five traits of Conscientiousness, Agreeableness, and Openness.

Discussion

The Positive Egogram demonstrated significant correlations with the Big Five traits of Agreeableness, Conscientiousness, and Openness, supporting the hypothesis that it reflects positive personality characteristics. Given its theoretical basis in TA, the scale shows construct validity. Future research should further investigate its association with well-being indicators and interpersonal relationship measures.

An overview of the selection methods used for selecting military pilots for the Royal Netherlands Air and Space Force

Kapitein M.V.*

Selectiepsycholoog, Koninklijke Luchtmacht ~ Utrecht ~ The Netherlands

A successful air operation starts with the quality of the selected candidates for pilot training. Selection methods are therefore of essential importance: without rigorous and valid selection procedures, it is not possible to develop highly competent pilots.
Military pilot selection traditionally emphasizes cognitive competencies, such as spatial orientation, memory, and reaction time. However, as the demands of modern military operations evolve, interpersonal competencies—such as teamwork, communication, and emotional regulation—are gaining increased recognition as essential attributes for mission success. These competencies are typically assessed through structured interviews, behavioral exercises, and personality questionnaires.
This presentation provides an in-depth overview of the selection procedures used by the Royal Netherlands Air Force, with a specific focus on the psychological dimensions assessed during the interview phase.

ETHICS, EQUITY, AND EXPERIENCE: EXPLORING PRACTITIONER PERCEPTIONS OF TECHNOLOGY-BASED ASSESSMENTS

Adams S.*, Bidi A., Khunkhube K., Sandy S.

Stellenbosch University ~ Stellenbosch ~ South Africa

The integration of technology into psychological assessment is transforming professional practice, offering opportunities for more adaptive, efficient, and personalised assessment experiences. However, their use also raises challenges, including concerns about fairness, algorithmic bias, data security, and equitable access. While research has often emphasised the technical and psychometric properties of Technology Based Assessments (TBAs), limited attention has been given to how practitioners themselves experience and evaluate these tools. This study addresses this gap by exploring practitioners' perceptions of the opportunities and challenges associated with TBAs in South Africa, a context marked by both rapid technological change and socio-cultural diversity.

Semi-structured interviews were conducted with 10 psychometrists, industrial psychologists, and research psychologists experienced in the use of TBAs. Thematic analysis revealed four overarching themes: (1) the advancement of technology in assessment, (2) the assessment experience for both practitioners and test-takers, (3) opportunities and challenges in the use of TBAs, and (4) ethical considerations and professional development. These themes illustrate both the potential of TBAs to improve efficiency and accessibility, as well as concerns regarding fairness, practitioner preparedness, and ethical use.

Findings highlight the importance of contextual validation to ensure cultural and socio-economic relevance. They also underscore the value of continuous professional development, equipping practitioners with the knowledge and skills to integrate TBAs responsibly. By capturing practitioner-driven insights, this study contributes to international debates on the future of psychological assessment and emphasizes the critical role of ethics, contextual sensitivity, and professional readiness in the sustainable adoption of technology-based assessments.

Abstract 1821

TPT-2: A NEW QUESTIONNAIRE FOR ASSESSING PERSONALITY IN THE WORKPLACE

Arribas--Aguila D.*

Hogrefe TEA Ediciones ~ Madrid ~ Spain

Introduction

The TPT questionnaire (Corral et al., 2002) is one of the most widely used questionnaires among occupational and organisational psychology practitioners in Spain (Muñiz et al., 2020). It is a self-report measure comprising 160 items assessing 15 personality dimensions relevant to workplace behaviour, as well as a social desirability scale. Although five new editions of the technical manual have been published to date, a review and update are recommended (International Test Commission, 2013; EFPA, 2025). This recommendation reflects a concern raised years ago regarding the psychometric properties of some scales (Arribas-Aguila, 2011). It also extends to the instrument's structure and suitability for today's workplace.

Purpose

To address this need, information about the different stages of the revision process of the original questionnaire will be presented, focusing on a pilot study used to define the standardisation version of the new TPT-2.

Method and results

Based on a subject-matter expert (SME) study and psychometric analyses with a very large sample (N = 51,482), three new scales (Honesty/Integrity, Professionalism, and Leadership) were added and 182 new items were developed. Together with 76 items retained from the original version, this yielded an experimental form with 258 items that was administered to a sample of 1,391 individuals in personnel selection contexts. Using these data, we conduct item analyses and evaluated scales unidimensionality and reliability, which led to the standardisation version of the questionnaire consisting of 170 items.

Conclusions

Using empirical and real-world data in the initial stages of questionnaire development and validation enables evidence-based decisions about item retention and scale structure, directly improving the resulting psychological measure.

Abstract 1727

ADAPTING AND VALIDATING THE CAREER RELATED TEACHER SUPPORT SCALE (CRTSS) FOR FRENCH- SPEAKING BELGIAN SECONDARY SCHOOL PUPILS

De Felice N., Canzittu D., Carosin E.*

Université de Mons ~ Mons ~ Belgium

Pupils' perceptions of career related support provided by teachers are a key element of their own career and school orientation decision making process (Wong et al., 2021). Yet, this construct remains underexplored in the French-speaking context, due to a lack of validated French psychometric tools. The purpose of this study is to adapt and validate the French version a scale (Wong et al., 2023 ; Parola et al., 2025) in order to assess a professional development program that trains teachers in career guidance and accompanies pupils in developing career-related skills. Following established guidelines for scale adaptation and validation (Boateng et al., 2018), the instrument underwent translation and independent back-translation, peer review by experts in vocational guidance and educational sciences, and iterative adaptation to the French-speaking Belgian cultural context. The main challenges for this scale's adaptation involved balancing translation fidelity with functional needs, context and cultural adaptations. The study sample consists of approximately 1000 pupils (first, second and third year secondary school) from 10 schools in French-speaking Belgium . Internal consistency, reliability, and construct validity will be examined using standard psychometric procedures. The questionnaire will be administered twice (October 2025, pre-training and April 2026, post-training). The first data collection will allow for exploratory structure analysis and reliability analysis . The second data collection will allow for confirmatory analysis. Expected outcomes include replication of the original multidimensional structure with satisfactory reliability. Although data collection is ongoing, the findings will be presented in forthcoming scientific communication.

THE FILIPINO RECEIVED SOCIAL SUPPORT SCALE: PRELIMINARY SCALE DEVELOPMENT AND VALIDATION

Guilaran J.*, Robles A.M., Alingasa--Aguirre A.P., Mamauag B.V.

University of the Philippines Visayas ~ Miagao ~ Philippines

Social support is one of the most reliable predictors of positive psychological outcomes. However, the salutary effects of social support are embedded in a social-cultural context. In spite of this, current scales that measure social support were based on WEIRD contexts. In addition, the literature presents three facets of social support: received social support, perceived social support, and social embeddedness. Of these facets, received social support is arguably the most useful in intervention, but is also the least studied. To address these gaps, the current study aimed to develop and validate a received social support scale that is grounded in the Filipino social and cultural experience. Forty-one items were created based on Guilaran et al.'s (2025) Filipino received social support dimensions. Confirmatory factor analysis (CFA) on 243 Filipino adults resulted in a 22-item scale (α=.945). Convergent validity was tested through the Lubben Social Network Scales, Questionnaire on the Frequency of and Satisfaction with Social Support, and the Berlin Social Support Scales, all with acceptable validity coefficients. Theoretical and practical implications are discussed.

DIAGNOSTIC PERFORMANCE AND OPTIMIZATION STRATEGIES FOR A DIGITAL SERIOUS GAME IN MILD COGNITIVE IMPAIRMENT SCREENING

Jeon B.*[1], Noh C.H.[2], Noh S.R.[1], Shim Y.[1], Cho S.B.[2], Cho S.[1]

[1]Chungnam National University ~ Daejeon ~ Korea, Republic of, [2]Pusan National University ~ Pusan ~ Korea, Republic of

Mild Cognitive Impairment (MCI) is a transitional stage between normal aging and dementia, where early detection is crucial. Neuropsychological test batteries, including the Consortium to Establish a Registry for Alzheimer's Disease (CERAD), are widely used but require lengthy administration and involve trained professionals. Digital screening tools with serious game elements may provide an efficient alternative by simulating daily-life scenarios. This study evaluated the diagnostic performance of a digital serious game and proposed strategies for its optimization. Seventy-eight older adults (58 healthy controls, 20 MCI) completed the CERAD-K2 and the digital tool. The serious game consisted of five tasks reflecting daily life: recalling sale items, solving puzzles, crossing malfunctioning traffic lights, a prize (go/no-go) game, and route-finding. Diagnostic performance was evaluated using Random Forest classification (accuracy, sensitivity, specificity), and discrimination was assessed with Receiver Operating Characteristic (ROC) analysis with Area Under the Curve (AUC). Task contribution was examined by removing components, and usability was measured using the NASA Task Load Index (NASA-TLX). The digital tool showed an accuracy of 82.1%, sensitivity of 71.4%, and specificity of 84.4%. Compared with CERAD-K2 (sensitivity 87.9%, specificity 66.7%), the digital tool demonstrated higher specificity but lower sensitivity. Removing the puzzle task improved sensitivity to 76.9% while maintaining specificity at 84.6%. ROC analysis indicated excellent discrimination (AUC=1.0). NASA-TLX results indicated a moderate workload, supporting feasibility. Compared to conventional neuropsychological batteries, the digital tool demonstrated higher specificity but relatively lower sensitivity, limiting its use as a screener. Future optimization should focus on removing tasks that negatively affect sensitivity and emphasizing those with higher feature importance. Specifically, we plan to (i) analyze misclassification patterns by comparing false negatives and true positives, (ii) remove low-importance features with retraining to assess performance changes, and (iii) refine UI/UX to reduce workload and improve clarity, followed by validation in an expanded sample.

AUTOMATED OSCE SCORING USING ARTIFICIAL INTELLIGENCE

Lan Y.*[1], Wang Y.[2], Chen W.[3]

[1]National Dong Hwa University ~ Hualien ~ Taiwan, [2]National Kaohsiung Normal University ~ Kaohsiung ~ Taiwan, [3]Tzu Chi University ~ Hualien ~ Taiwan

Objective structured clinical examinations (OSCEs) have been gradually used in professional psychology to assess clinical competence and facilitate clinical training courses. However, the scoring of OSCE, especially the standardized patient (SP) station, usually uses psychologists with OSCE rater training to evaluate student performance, which requires substantial time and considerable costs. Artificial intelligence, combined with machine learning techniques, has been used in several psychotherapy studies to automatically evaluate the content of client-psychologist interactions and has demonstrated a certain degree of credibility. This study aimed to utilize Google Gemini 2.5 Flash with the support vector machine (SVM), a frequently used machine learning model, to automate the evaluation of student performance on SP stations of the Intake OSCE. A total of 30 students' performances on a 20-minute SP station were included in this study. The SVM model achieved a Precision of 83.3% and an Accuracy of 73.3%. However, the F1 score and Recall were 55.6% and 41.7%, respectively. These findings support the potential of using artificial intelligence and machine learning techniques for automated OSCE scoring in professional psychology.

Abstract 1110

PSYCHOMETRIC VALIDATION OF THE CANCER LONELINESS SCALE IN COLOMBIAN CANCER PATIENTS

Parra A.*, Sanchéz R.

Universidad Nacional de Colombia ~ Bogotá ~ Colombia

Introduction. Loneliness is a negative subjective experience linked to adverse physical and psychological outcomes. In oncology, it may act as a psychosocial risk factor affecting quality of life, coping, and survival. The Cancer Loneliness Scale (CLS) is the only instrument specifically developed to assess cancer-related loneliness, but it has not been validated in Spanish-speaking populations.

Purpose. This study aimed to validate the CLS in Colombian cancer patients to provide a reliable tool for assessing loneliness in this context.

Method. A prospective validation study was conducted with 500 adult patients diagnosed with breast, prostate, cervical, gastrointestinal, or hematological cancers at the National Cancer Institute in Colombia. Psychometric properties were assessed using Classical Test Theory (internal consistency, test–retest reliability, construct, concurrent, divergent, and discriminant validity) and Item Response Theory (Rasch model).

Results. The CLS demonstrated a unidimensional structure (CFA: $\chi^2/df = 1.924$; CFI = 0.984; TLI = 0.977; RMSEA = 0.061). Internal consistency was high ($\alpha = 0.88$; $\omega = 0.91$; GLB = 0.84). Test–retest reliability was strong (Lin's coefficient = 0.92; $p < 0.001$). The CLS correlated positively with the UCLA Loneliness Scale ($\rho = 0.75$; $p < 0.001$) and negatively with the FACIT-G and its domains ($\rho = –0.40$ to $–0.55$; $p < 0.001$). No significant correlation was found with the Charlson Comorbidity Index. Rasch analysis confirmed unidimensionality, appropriate item fit (MNSQ 0.78–1.19), and reliability for items (0.98) and persons (0.70). The Wright map indicated that the scale more effectively captured moderate-to-high levels of loneliness, with limited sensitivity at very low levels and overlap between some items.

Conclusions. The Colombian version of the CLS showed robust psychometric properties, supporting its validity and reliability for measuring loneliness in cancer patients. Its use may facilitate the identification of psychosocial risk and inform interventions that contribute to improved health outcomes and reduced inequalities in oncology care.

Abstract 1108

CROSS-CULTURAL ADAPTATION OF THE CANCER LONELINESS SCALE IN COLOMBIAN CANCER PATIENTS

Parra A.*, Sanchéz R.

Universidad Nacional de Colombia ~ Bogotá ~ Colombia

Introduction. Loneliness is a subjective and distressing experience associated with adverse physical and mental health outcomes. In oncology, loneliness has been identified as a psychosocial risk factor that negatively influences quality of life, coping, and survival. However, there are no culturally adapted and validated instruments in Spanish to assess cancer-related loneliness.

Purpose. This study aimed to translate and cross-culturally adapt the Cancer Loneliness Scale (CLS) for use among Colombian cancer patients.

Method. Authorization for the use of the instrument was obtained from the original authors. The process followed the European Organisation for Research and Treatment of Cancer (EORTC) translation guidelines to ensure semantic, cultural, and conceptual equivalence. The procedure included forward translation by two independent translators, reconciliation, back translation, expert committee review, and a pilot test with 20 Colombian cancer patients receiving care at the Instituto Nacional de Cancerología. Participants evaluated clarity, comprehensibility, and acceptability of items.

Results. Minor discrepancies emerged during translation, particularly regarding the adverb how often. After consensus, the phrase “qué tan a menudo” was selected as the most accurate option. The reconciled version preserved semantic equivalence with the original. In the pilot test, patients found the items clear and non-offensive, with only minor suggestions that did not warrant changes. As a result, a culturally adapted Spanish version of the CLS was obtained without modifications after pilot testing.

Conclusions. The Spanish version of the Cancer Loneliness Scale is linguistically and culturally appropriate for Colombian cancer patients. This adaptation provides the foundation for subsequent psychometric validation, supporting the measurement of cancer-related loneliness in Spanish-speaking populations.

Abstract 1736

NEW APPROACHES TO NORM CONSTRUCTION: TESTS WITH SEQUENTIAL TASK DEPENDENCY

Puig Navarro Y.*

Hogrefe TEA Ediciones ~ Madrid ~ Spain

Introduction
The Rey Complex Figure Test (RCFT) is widely used to assess visuoconstructive ability and visual memory. It includes three sequential tasks, Copy (C), Immediate Recall (IR), and Delayed Recall (DR), where performance on earlier tasks can substantially influence later ones or, at least, should be considered to gain a more complete and global understanding and to draw more grounded conclusions. Considering this dependency is essential when constructing normative data.

Purpose
This study proposes are to obtain normative data for a sample of 2,503 individuals aged 6 to 80 years on the three RCFT tasks, using models that account for the sequential dependency among them.

Method
Path analysis provides a comprehensive and detailed view of the relationships among multiple variables, particularly when these relationships are complex, recursive, and interdependent, as in the case of the RCFT tasks. Once the sequential dependency model is established, the differences between expected and observed scores are normed, allowing for a more precise adjustment of performance relative to task interdependence.

Results
Analyses revealed patterns consistent with the sequential nature of RCFT tasks. A strong correlation was observed between performance on the C task and subsequent IR and DR tasks, as well as between IR and DR performance. Path analysis models confirmed that performance on earlier tasks significantly influences visual memory ability in later tasks.

Conclusions
Path analysis provides additional relevant information and more accurately captures variations in performance due to the sequential dependency of RCFT tasks. Moreover, the norming of differences between expected and obtained scores provided additional

value, offering a refined view of individual performance that goes beyond traditional normative approaches.

Abstract 1797

INHIBITION DEFICITS AND ADHD SYMPTOMS IN CHILDREN WITH DEVELOPMENTAL COORDINATION DISORDER

Carreiro L.R.*, Blascovi--Assis S.M., Gotuzo Seabra A., Teixeira M.C.

Mackenzie Presbyterian University ~ São Paulo ~ Brazil

Introduction: Developmental Coordination Disorder (DCD) is characterized by motor skill delays or difficulties in coordination that interfere with daily activities. DCD affects 5–6% of school-aged children, with higher prevalence in boys. It frequently co-occurs with Attention-Deficit/Hyperactivity Disorder (ADHD), with comorbidity rates of approximately 50%. Purpose: Examine correlations between ADHD symptoms, attentional and executive abilities, and DCD indicators in children evaluated within an interdisciplinary protocol for inattention and hyperactivity. Method: Fifty-four children aged 6–15 years (M = 9.9; SD = 2.9) were assessed using the BPA for attention, the Five Digits Test for executive functioning, and the WASI for intelligence. ADHD symptoms were measured with a DSM-5–based inventory, and the Developmental Coordination Disorder Questionnaire (DCDQ) was applied to identify DCD. Data were analyzed using Spearman correlation tests in Jamovi. Results: Significant negative correlations were found between DCD symptoms and Inhibition (ρ = –0.495; p = 0.019), indicating that greater motor difficulties were associated with poorer inhibitory control. A significant negative correlation also emerged between DCD and total ADHD symptoms (ρ = –0.326; p = 0.020), suggesting that more severe motor problems were linked to higher ADHD symptomatology. Positive but non-significant trends were observed with BPA-General (ρ = 0.279; p = 0.071) and BPA-Alternating Attention (ρ = 0.271; p = 0.079). No significant associations were detected with total IQ (ρ = 0.142; p = 0.319) or cognitive flexibility (ρ = –0.258; p = 0.247). Conclusions: Findings highlight that DCD symptoms are associated with deficits in inhibitory control and greater ADHD severity, reinforcing the overlap between motor and self-regulation difficulties. Motor deficits may selectively affect executive functions, particularly inhibition, and potentially extend to attentional processes. These results underscore the importance of integrated motor and cognitive assessments and interventions addressing the co-occurrence of DCD and ADHD in clinical and educational contexts.

Abstract 1703

UNIVERSAL SCHOOL-BASED MENTAL HEALTH SCREENING IN THE PHILIPPINES: INITIAL REPORT ON THE CHILD AND ADOLESCENT RISK SCREENER

Callueng C.[1], Valladolid V.[2], Roxas M.*[3]

[1]Rowan Univeristy ~ New Jersey ~ United States of America, [2]De La Salle University ~ Manila ~ Philippines, [3]Philippine Normal University ~ Manila ~ Philippines

Support for students with mental health and academic problems remains to be one major concern of the Philippine educational system, particularly in the public schools. While the Philippine Mental Health Law stipulates that the state shall: “ensure integration of the mental health into the educational system”, and make available “timely, affordable and high quality and culturally-appropriate mental health care”, no guidelines and programs have yet been developed by the educational system to properly screen and identify students who may be at-risk of mental health problems. Universal screening is recognized as one basic component of a comprehensive and effective school mental health program. This reports the development of the Child and Adolescent Risk Screener (CARS), a pioneer universal mental health screening for K-12 grade students in the Philippine public schools. A chronicle of the test development process of the CARS employing an exploratory mixed-methods approach will be shared : the rationale and conceptualization of the CARS, content domain and factor structure, comprehensive psychometric properties, and social validity. Development of CARS was supported by the Unilab Foundation-Philippines.

Abstract 1754

THE PREDICTIVE ROLE OF INHIBITORY CONTROL IN EARLY CHILDHOOD: A SYSTEMATIC REVIEW OF THE LITERATURE

Müller Vieira B.C., Traverso L.*

University of Genoa, Department of Education Sciences (DiSFor) ~ Genoa ~ Italy

Over the past decades, a large number of studies have been conducted on inhibition, in which the term has been used to refer to various aspects of child functioning, ranging from behavioral inhibition to cognitive inhibition. The present systematic review aims to investigate the role of different inhibitory processes in predicting inhibition itself as well as other developmental domains.

Specifically, the review, conducted in accordance with PRISMA guidelines (Page et al., 2021), considers multiple conceptualizations of inhibition assessed during the first five years of life in relation to children's development across multiple domains. A database search using predefined keyword strings, conducted in PsycINFO, PsycArticles, Psychology & Behavioral Sciences Collection, and PubMed, initially identified 5,843 reports. After the removal of duplicates, 3,741 studies were retained for screening.

The eligibility criteria were: (1) empirical longitudinal studies published in English; (2) participants within the age range of interest; (3) typically developing children; and (4) inclusion of at least one measure of inhibition used to predict inhibition itself or outcomes in other domains. To date, 85.35% of the full texts have been screened, resulting in the inclusion of 487 records. Analyses of the full texts are currently underway, and the findings will be presented at the congress. The results will provide an analysis of the different conceptualizations of inhibition and its predictive role across developmental outcomes.

Abstract 4953

DEVELOPMENT AND THE PSYCHOMETRIC PROPERTIES OF CREATIVE SCIENTIFIC ABILITY TEST FOR PRIMARY SCHOOL STUDENTS

Ayas M. Bahadir*

Department of Special Education Gifted Education Division, Anadolu University

One of the leading factors affecting creativity studies negatively is the limitations of creativity assessments. First, there are few instruments compatible with modern theories creativity. Secondly psychometric properties of these instruments are not sufficient. In the context of scientific creativity, there are fewer scientific creativity tests for primary school students. It is seen that the psychometric features of existing instruments are inadequate.

Therefore, the aim of this study is to develop a scientific creativity test for 3rd, 4th, and 5th grade students based on Scientific Discovery as Dual Search Model (SDDS).

Creative Scientific Ability Test for Primary School (C-SAT-P), which was developed according to SDSS, consists of hypothesis development and experiment designing components. There are four open-ended items in science areas Physics, Chemistry, and Biology. In developmental process of C-SAT-P, many items that are suitable to theoretical background were produced in 10 sessions with 10 expert teachers. An implementation form was created by using these items. Items were chosen according to expert opinion, try-out and pilot studies. The implementation form was given to 647 students (166 5th grade students,

251 3rd grade students, 220 4th grade students) and according to the results the final version of the test was created. Two-component structure of C-SAT-P was proved from confirmatory factor analyzes. It was also found that C-SAT-P has adequate concurrent with respect to school grades and attitudes towards science and discriminant validity with respect to ability level and school level. From the reliability analyses the internal consistency and the interrater reliability of the test was found to be high.

According to the results of the study C-SAT-P is a valid and reliable scientific creativity test for primary school students. It can be used in evaluating the effects of educational interventions in science like gifted programs, identification and screening processes in gifted education, and the research on scientific creativity, scientific reasoning, science process skills and scientific thinking.

ARTIFICIAL INTELLIGENCE AND TECHNOLOGY: IMPLICATIONS FOR THE TESTING ECOSPHERE, AND EVEN BEYOND

Thursday 23 July 2026 from 08:00 to 09:30

(C- Spadolini)

Peter Macqueen (Compass Consulting ~ Brisbane ~ Australi), Chair

In late 2022, The International Journal of Testing published a Special Issue: Technology-Based Assessments in Organizational, Psychological, and Educational Research and Applications. But this pre-dates recent technological advances and in particular the rise of LLMs and Generative AI. Scholarly contributions tend to lag in the wake of the commercial development and uptake of AI and technology-enhanced assessment tools and practices. What are the issues? How do these rapidly emerging developments affect people at work, and beyond? What are the implications for the education, training and development of psychologists and behavioural scientists?

This 90-minute panel-based symposium will explore recent and potential developments, with a Q&A via a Chair and a panel of five distinguished contributors from five countries. Holding significant consulting and/or academic and scholarly roles in test development, use, adaptation and education, several also have a strong leadership presence in international and European testing focused professional bodies. There is provision for ample engagement with the audience in the latter part of the session. Panellists will respond to a short series of pre-determined questions addressing issues such as challenges and opportunities; test development and test/assessment use (e.g. high stakes versus low stakes; small scale versus large scale; test adaptation); education and professional development; fairness; neurodiversity; ethical and effective practice; privacy and data management; and regulation.

The Chair, an IWO psychologist, was a Council member of the International Test Commission for 7 years, and for 10 years a member or Chair of the Tests and Testing Expert Group of the Australian Psychological Society.

Some slides will be presented to enhance communication, but the nature of this rapidly evolving field supports a human narrative approach in July 2026. Active audience-wide discussion later in the session is expected, and encouraged.

The topic is highly relevant to several IAAP divisions, and to the Congress theme(s).

Abstract 3581

PANELLIST 1

Schittekatte M.*

University of Ghent ~ Ghent ~ Belgium

With a PhD in Experimental Social Psychology, this panellist's main scientific activity consists of adapting psychological assessment instruments for the local culture, with a particular focus on cognitive abilities, cross-cultural bias, and digital assessment. Teaching at several universities in Europe, mostly in post-academic courses, this panellist has held professional appointments with their National Test Commission and the Board of Assessment of EFPA.

Abstract 3582

PANELLIST 2

Iliescu D.*

University of Bucharest ~ Bucharest ~ Romania

A Professor of psychology at a European university, this panellist has been active as a Consultant for more than 25 years, being involved in numerous projects, with many of these related to test adaptation projects, globally. Actively involved in the leadership of the International Test Commission, EAWOP, and a division of IAAP, research interests focus on psychometrics, particularly cross-cultural elements, and IWO psychology.

Abstract 3596

PANELLIST 3

Hernandez A.*

University of Valencia ~ Valencia ~ Spain

An Associate Professor at a Spanish university, this panellist is affiliated with the Department of Methodology and a research institute associated with personnel psychology, organizational development and the quality of working life. In the field of IWO psychology, the major interests are in team climate, leadership and underemployment. Professionally involved in a national Test Commission, they have held executive roles in bodies such as the European Association of Methodology, and EAWOP.

Abstract 3597

PANELLIST 4

Greiff S.*

Technical University of Munich ~ Munich ~ Germany

A Professor at a German university, this panellist leads the Centre for … Assessment, and oversees the national implementation of the PISA Study. Previous appointments include head of the Educational Psychology and Artificial Intelligence Unit at another German university. This panellists's research centres on systemic educational issues, and monitoring through large-scale international studies; and takes a holistic approach to education incorporating both individual and societal factors.

Abstract 3598

PANELLIST 5

Evans N.*

NEC Advisory ~ Stroud ~ United Kingdom

A Chartered Psychologist with a Masters in Organizational Psychology, this panellist applies psychology for impactful results in work, consumer, education, sports, health and forensic contexts. Actively involved for many years in professional (testing related) activities in the UK and with the EFPA Board of Assessment, including updating the EFPA Test Review Model (2025). This panellist has presented at numerous European and International conferences.

PSYCHOMETRIC TESTING OF ACADEMIC BUOYANCY AMONG INDIAN UNIVERSITY STUDENTS

Dubey A.*[2], Dhiman S.[1], Choubisa R.[1], Varghese Philipose J.[1]

[1]BITS Pilani ~ Pilani, Rajasthan ~ India, [2]Prestige Institute of Management and Research, PIMR, Bhopal, MP, India

Background: Academic buoyancy is the ability of students to successfully tackle everyday academic challenges in the form of assignments, grades, evaluation exams, deadlines and so on. The original scale was validated on school students by Martin and Marsh (2008). However, university students face similar challenges in their academic life and while the academic buoyancy scale has been used in the university and Indian context; it has not yet been validated.

Methods: To overcome this gap, we set out to validate the 4 item scale on undergraduate students of a private university located in northern region of India. In the first phase of this ongoing research, using random sampling, we collected data from N=203 undergraduate students via both offline and electronic survey.

Findings: We analysed our data using Exploratory factor analysis (EFA) which revealed one factor solution. Further, we ran correlation and multiple regression with Academic self-efficacy and Academic procrastination for convergent and divergent validity respectively. We also analysed significant differences between male and female students to further understand the role of individual gender in academic levels. Our findings indicated that all variables showed a significant relationship with each other.

Conclusion: The major implication of our study is to assess functioning of Academic buoyancy scale in the context of university in India. We also explored how this result can play a vital role in further understanding the application of the scale in predicting specific academic progress related constructs. Our research contributes for further development of policies and applications using the sustainable development goals (SDG 3, SDG 4, SDG 5).

Abstract 2295

REDEFINING EMOTIONAL INTELLIGENCE: A THREE-COMPONENT FRAMEWORK FOR GROWTH AND RESILIENCE

Salopek Z.[2], Dude K.[1], Vuletic G.*[1]

[1]Faculty of Humanities and Social Sciences ~ Osijek ~ Croatia, [2]International Institute for Emotional Maturity ~ Zagreb ~ Croatia

With the advancement of society and the increase in everyday stressors, there has emerged a need to develop more complex abilities that enable individuals to cope more effectively with new challenges. That ability is emotional intelligence, which enables individuals to manage their own and others'emotions, essential for adapting to the complexities of modern life and building meaningful relationships. Recognition of the importance of emotional intelligence led to proliferation of theoretical models and various measurement instruments, which resulted in considerable conceptual confusion within the field. This poster presents a new model of emotional intelligence based on the integration of emotions, ego, fears and self-realization skills, offering a new direction in applied psychology by integrating emotional, cognitive, and self-development processes. The Map of Humans Inner World model conceptualizes emotions as indicators of ego-driven perceptual distortions and defines emotional intelligence through three components: awareness, conscience, and courage. Distortions (e.g. need for control, self-doubt) are seen as opportunities for learning self-realization skills (e.g., forgiveness, self-acceptance). Underlying distortions are core fears that shape emotional reactivity and limit personal development. Awareness, conscience and courage represent the internal capacities required to recognize ego mechanisms and integrate experiences. Rather than focusing on regulating emotional states, the model emphasizes inner transformation and emotional maturity as pathways to development of psychological resilience. To evaluate the practical value of this model, psychoeducational workshops and intervention programs will be conducted, targeting ego-driven distortions and self-realization skills to foster emotional stability and resilience. By bridging emotional psychology and self-development frameworks, the model addresses contemporary challenges such as stress, emotional instability, and lack of resilience. Its applications span clinical (emotional processing), health (resilience, well-being), organizational (leadership, team dynamics), and educational psychology (self-regulation). By targeting ego-driven distortions and fears, the model offers pathways for emotional maturity, psychological resilience, and interpersonal effectiveness across different societal systems.

SIMULATION-INTEGRATED SITUATIONAL JUDGMENT TESTS FOR TRAINING INGENUITY

Martin--Raugh M.*[1], Watts L.[1], Harwell K.[2], Kochert J.[2], Rolwes P.[1], Mclemore P.[1]

[1]the university of texas at arlington ~ arlington ~ United States of America, [2]The Army Research Institute ~ Fort Benning ~ United States of America

Introduction: Success in unpredictable, high-stakes environments often depends on ingenuity, defined as the ability to break from established routines and avoid functional fixedness when solving problems. However, traditional training practices tend to emphasize standard procedures and rule adherence, leaving individuals underprepared for situations requiring flexible, creative responses in resource-constrained environments.

Purpose: This project introduces a novel training framework using situational judgment tests (SJTs) to strengthen ingenuity and adaptive problem solving. The research explores how SJT-based training, compared to more commonly used critical incident (CI)-based training, promotes set-breaking, creativity, and the capacity to transfer problem-solving strategies to novel contexts.

Method: Critical incidents were collected from subject matter experts to construct scenarios that require innovative responses. SMEs provided ratings of effective versus rigid approaches. A psychometric validation study with student samples examines reliability and validity prior to implementation with Soldiers. Soldiers will then be randomly assigned to SJT or CI training conditions, with performance evaluated through a transfer simulation explicitly designed to test flexibility, originality, and reduced reliance on habitual strategies.

Results: It is expected that SJT-based training will outperform CI-based training in fostering ingenuity and reducing functional fixedness. Participants exposed to SJT training are anticipated to demonstrate greater creativity, more effective set-breaking strategies, and improved adaptability in transfer tasks.

Conclusions: This project provides a proof-of-concept for integrating SJTs into training to cultivate ingenuity and reduce functional fixedness. Findings will advance theory and practice in assessment and training by offering scalable tools to prepare individuals for the cognitive demands of complex and dynamic environments.

NARRATIVE CONSTRUCTION REFLECTS THE EMOTION REGULATION COMPONENT OF ABILITY-BASED EMOTIONAL INTELLIGENCE

Pólya T.*

Károli Gáspár University of the Reformed Church in Hungary, Budapest

Ideally, ability-based emotional intelligence (AEI) should be measured in everyday emotional response. The study argues that narrative construction is a potential candidate for this purpose. The study sets up the hypothesis that constructing a problem-centered narrative reflects the level of the emotion regulation component of AEI. Ninety participants were asked to narrate four emotional episodes. The emotion regulation component of AEI, fluid intelligence and personality were assessed with self-report measures. The use of narrative transformation in narrative construction was measured with automated linguistic analysis. The results show that the level of narrative transformation reflects the emotion regulation component of AEI, and it also has a distinct relationship with fluid intelligence. The findings are discussed in terms of the usefulness of automated linguistic analysis of narrative construction in measuring AEI.

Abstract 2282

THE UNIVERSAL WELLBEING EVALUATION TOOL: A TRANSFORMATIVE LEARNING EXPERIENCE

Stevenson S.*

FREEDOM Wellbeing Institute & New Zealand Curriculum Design Institute ~ Hamilton ~ New Zealand

Post the emergence of the Universal Wellbeing Model (UWM) in 2023, from an evidence-based multi-disciplinary and authentically holistic paradigm, the Universal Wellbeing Evaluation Tool (UWET) was developed. This quantitative tool supports users to self-assess, using a 5 point Likert scale, and identify: the status of each of the 70 Determinants of Universal Wellbeing; social physical, intellectual, ethnic, cultural, emotional and spiritual dimension levels; home, work and /or study environment impacts on overall Universal Wellbeing plus the Universal Wellbeing Risk level of the person completing the UWET.

The UWET uses an applied psychology approach, it empowers users to identify their strengths and capabilities, determinants of no influence, as well as those that could be, or are harming the users overall Universal Wellbeing. Learning about the UWM, what Universal Wellbeing is and then experiencing using the tool and understanding one's own unique personal Universal Wellbeing Profile collectively contribute to the acquisition of Universal Wellbeing Literacy. Professionally accredited UWET Facilitators administer, analyse, and report UWET outcomes to individuals and organisations using powerful strategies that optimises and accelerate the acquisition of personally relevant and meaningful Universal Wellbeing Literacy.

Informed by a clear theory of change, with impenetrability, and transformative learning at its heart; gaining Universal Wellbeing Literacy has been shown in early research trials to provide rich and applied learning experiences that support behaviour changes and personal transformations. The UWET is a core element in three research interventions that have been or are being trialled to measurably improve participation, achievement, productivity and equity levels in diverse settings. Higher education trials have consistently shown 30% plus increases in programme completion rates. The digitisation of the tool has made international Tool and intervention trialling possible at scale. Currently increasing access and conducting tool and intervention trials with diverse populations and randomised control trials is a priority.

ASSESSMENT OF ADVERSE EVENTS AND EMOTIONAL DYSREGULATION IN PATIENTS WITH SUD IN RESIDENTIAL REHABILITATION

Vargas I.*, Medina Ceja Y.E., Ruvalcaba Delgadillo Y., Vargas De La Cruz C., Gálvez Contreras A.Y.

Universidad de Gudalajara ~ Guadalajara ~ Mexico

The Substance Use Disorders (SUDs) have a multifactorial origin involving bio-psycho-social factors. Recent studies suggest that the number and type of Adverse Childhood Experiences (ACEs) constitute a risk factor both for the initiation of substance use and for relapse. In this regard, ACEs have been linked to alterations in the Hypothalamic-Pituitary-Adrenal (HPA) axis, which leads to difficulties in managing stressful situations and consequent emotional dysregulation. At psychological level, ACEs have been associated with psychological trauma, which involves inadequate stress response regulation and the adoption of maladaptive coping styles when facing various everyday life situations. This is associated with the search for external forms of "regulation," such as the consumption of addictive substances. Although this relationship has been widely studied, in Mexico there is still a lack of sufficient research exploring the link between ACEs, emotional regulation, stress levels, and mild cognitive impairment.

The present study aims to evaluate, in patients with SUDs undergoing residential rehabilitation, the relationship between the number and type of ACEs, coping styles, stress levels, and mild cognitive impairment.

Methodology: The following instruments were administered to patients diagnosed with SUDs due to polysubstance use and at the beginning of the rehabilitation process residential treatment clinic: the ACEs questionnaire, HADS, PCL-5, and AMAS. Results: The data were analyzed considering the presence of adverse events, stress levels, and cognitive performance.

Conclusions: The identification of these variables may support the development of new treatment strategies.

Abstract 2013

ARTIFICIAL INTELLIGENCE–BASED CLINICAL ASSESSMENT IN MOOD DISORDERS

Comlekci M.N.*, Yilmaz T.

Marmara University ~ Istanbul ~ Turkey

Given the high risk of progression and chronicity of psychological disorders, as well as severe outcomes such as substance dependence and suicide, early and comprehensive assessment of these conditions is of critical importance. Artificial intelligence (AI)–assisted methods offer substantial potential over traditional approaches owing to their speed, accuracy, and capacity for multimodal data processing. Advances in machine learning and deep learning enable the integration of physiological and behavioral data collected from everyday devices such as smartphones and wearables into clinical processes, facilitating real-time monitoring and personalized interventions. Multimodal data—including facial expressions, postural indicators, social media content, linguistic patterns, and biomarkers—can be leveraged for early detection of mood disorders, identification of risk periods, and dynamic tracking of treatment response. Conversational agents and EEG biomarkers further support the diagnosis of conditions such as depression and bipolar disorder and the objective monitoring of symptoms through AI-based algorithms. Nevertheless, these methods are susceptible to cultural, individual, and contextual variability, data quality issues, and user motivation, which may lead to erroneous clinical inferences. Breaches of privacy and data security pose additional ethical and legal risks. Accordingly, AI-based systems should be designed to support rather than replace clinical decision-making; findings must be interpreted with caution and triangulated with other data sources. Multidisciplinary research is needed to refine these tools and address their limitations. When appropriately implemented, AI-assisted assessment instruments can complement traditional clinical practices, enhancing screening, preliminary evaluation, and risk analysis, and enabling mental health professionals to develop more comprehensive and reliable case formulations.

CULTURALLY RELEVANT PERSONALITY ASSESSMENT USING THE COMBINED EMIC-ETIC APPROACH

Thursday 23 July 2026 from 09:30 to 10:30

(C- Spadolini)

Fanny Cheung (Chinese University of Hong Kong ~ Shatin), Chair
Annamaria Di Fabio, Discussant

Personality assessment in non-Western cultures used to rely on translated imported measures purported to represent universal personality traits without consideration of local relevance. Early attempts to develop indigenous personality measures were critiqued for their lack of incremental validity. Recent developments using the combined emic-etic approach have resolved the dichotomy of the universal approach versus indigenous approach in producing culturally relevant personality measures with culturally relevant constructs beyond the dominant universal dimensions. Presenters in this symposium share recent research findings on their personality measures based on the combined emic-etic method.

Amber Gayle Thalmayer introduces the Cross-Cultural Big Two, a common-denominator model and inventory drawn from global emic lexical studies. Weiqiao Fan presents his team's reconstruction of a new two-polarities personality model based on indigenously derived Eastern measures such as the CPAI-A that include the functions of self vs. relatedness on the one hand, and independence-interdependence on the other hand. Mingjie Zhou shares their team's recent research illustrating the validity of the Interpersonal Relatedness dimension from the CPAI-2 which is distinct from other universal dimensions. Ron Fischer describes his team's a bottom-up lexical approach focusing on adjectives (or verbs) to describe fictional characters which provides an alternative bottom-up exploration of context-sensitive personality structure.

Abstract 4114

WEST MEETS EAST IN A NEW TWO-POLARITIES MODEL OF PERSONALITY: COMBINING SELF-RELATEDNESS STRUCTURE WITH INDEPENDENT-INTERDEPENDENT FUNCTIONS

Fan W.*[1], Li M.[2], Leong F.[3], Zhou M.[4]

[1]Shanghai Normal University, Shanghai, China; ~ Shangai ~ China, [2]Nanjing Normal University, Nanjing, China; ~ Nanjing ~ China, [3]Chinese University of Hong Kong (SZ), Shenzhen, China; ~ Shenzhen ~ China, [4]Institute of Psychology, Chinese Academy of Sciences (CAS), Beijing, China ~ Beijing ~ China

Most extant personality models are culturally biased towards an individualistic conception of
personality and self-construction has been the major emphasis based on WEIRD samples. These
models are incomplete because they ignore the interpersonal dimension of personality, which has
received particular attention in Eastern personality theories and is also included in early Western
models. In terms of the cultural-relevant feature, both self and relatedness and their specific
aspects may be variously highlighted in different cultural settings. On the basis of a reexamination
of several crucial two-dimension (namely, self and relatedness) personality theories
derived from the east and west, we reconstruct a new two polarities personality model to include
not only self and relatedness but also the independent and interdependent functions in terms of
some popular personality theories with the combined emic-etic approach.
Thus, we argued that there are two types of self and relatedness in personality structure. (1)
Independent self, which distinguishes and separates a person from others by autonomy and
identity coherence. (2) Interdependent self, which reflects the basic function of maintaining a
person's autonomy or identity by considering the person part of an encompassing social
relationship. Social environments, especially other people, serve as a mirror-like reflection to
show a person's uniqueness. (3) Intrapersonal Relatedness, which reflects how an individual thinks about their social world—their social cognition. This type of relatedness indicates how a
person relates his/herself to the social environment. (4) Interpersonal Relatedness,

which defines
how a person relates to the social world through behavior or performance, such as social
presentation and social transformation (namely, persona).
This work is beneficial to understanding global personality across cultures. A consistent
personality structure across Western and Eastern contexts exists, and the only difference is that
the structure possesses cultural-specific representation or different functions for individuals in
different contexts.

Abstract 4115

ROUND OUTSIDE AND SQUARE INSIDE: THE CONNOTATION AND ADAPTABILITY OF CULTURALLY RELEVANT INTERPERSONAL RELATEDNESS PERSONALITY FACTOR

Zhou M.*[1], Mu W.[1], Fan W.[2], Zhang J.[3], Cheung F.[4]

[1]Institute of Psychology, Chinese Academy of Sciences, Beijing, China; ~ Beijing ~ China, [2]Shanghai Normal University, Shanghai, China; ~ Shanghai ~ China, [3]1Institute of Psychology, Chinese Academy of Sciences, Beijing, China; ~ Beijing ~ China, [4]3Chinese University of Hong Kong, Shatin, Hong Kong SAR, China ~ Shatin, Hong Kong SAR ~ China

The Interpersonal Relatedness (IR) personality factor of Chinese people is a culturally specific
personality dimension derived through a combined emic-etic approach. To further explore the
connotation of the IR trait, Study 1 employed the Latent Profile Analysis to reveal population
heterogeneity in a normative Chinese sample of 1,911 individuals from the CPAI-2 (Crosscultural/
Chinese Personality Assessment Inventory-2). The analysis identified a four-quadrant
classification of the population based on two dimensions: "Round outside" (harmonious
flexibility externally) and "Square inside" (principled integrity internally). Study 2 conducted a
comparative analysis between Chinese and Non-Chinese groups. The results revealed significant
differences not only in IR dimensional scores but also in latent profile of IR classifications
between Eastern and Western populations. Study 3 further validated the four-quadrant
categorization of "Round outside and square inside" personality types within a university student
population (N = 2580), which demonstrated that individuals with this "Round outside and square
inside" profile exhibit greater adaptability in modern Chinese society. By linking these findings
to the traditional Chinese ideal of a virtuous person (Junzi), our discussion will focus on
the role of culture in shaping personality and the critical importance of culturally adaptive behavioral
patterns for successful in modern society. These findings also highlight the unique value of the
combined emic-etic approach in personality research.

Abstract 4116

LITERATURE-BASED EMIC PERSONALITY STRUCTURE

Fischer R.*[1], Fetvadjiev V.[2], Karl J.[3], Luczak Roesch M.[4]

[1]D'Or Institute for Research and Education ~ Rio de Janeiro ~ Brazil, [2]University of Amsterdam ~ Amsterdam ~ Netherlands, [3]Stanford University ~ Santa Clara, CA ~ United States of America, [4]Victoria University of Wellington ~ Wellington ~ New Zealand

The emic vs etic debate on personality structure has been dominated by self-report measures and survey data. In this presentation we shift the focus on the source material and explore to what extent literature may be used as an alternative source material. Using a bottom-up lexical approach focusing on adjectives (or verbs) to describe fictional characters provides for an alternative bottom-up exploration of personality structure. This approach converges with emic research, as emic researchers have often been inspired by personality descriptions in their native literature and emic personality-structure has been derived via bottom-up analyses. Because a number of adjective lists have been used with human self-reports, it becomes possible to compare the personality structure that arises from literature with the implied etic structures based on human self-ratings. An added advantage of bottom-up analyses of literature is that it provides snapshots in the (implicit) emic personality structures across time. Here, we review a series of studies that took such an emic approach based on descriptions of fictional characters in literature across a number of languages and time periods. Our results suggest that personality structure derived from literature does not correspond well to self-report data based on contemporary samples, but the observed structure can be interpreted considering the historical period, the authors and their audiences. We also note some meaningful temporal shifts that imply contextsensitivity of personality structure.

02 - Division 2: Psychological Assessment and Evaluation

AI-DRIVEN APPROACHES TO UNDERSTANDING HUMAN VALUES ACROSS CULTURES AND CONTEXTS

Thursday 23 July 2026 from 10:30 to 11:30

(C- Spadolini)

Sharon Arieli (Hebrew University of Jerusalem ~ Jerusal), Co-Chair

This symposium addresses a critical methodological gap in cross-cultural psychology by demonstrating how artificial intelligence can transform human values and their understanding. The presentations demonstrate that AI can be used to systematically identify values expressed across contexts; that these values motivate real world outcomes and behaviors, and that values of AI can motivate such outcomes. Traditional approaches to studying values rely on self-report measures that may suffer from various threats to validity. Here we showcase how AI-driven approaches can overcome these limitations.

The symposium's strength lies in its comprehensive coverage of different domains where values operate: from cross-cultural political discourse to social media influence, from media-politics interactions to workplace behavior and social media protection. Each presentation uses different computational methodologies (clustering, language modeling, longitudinal analysis, predictive modelling, experimentation) while maintaining theoretical coherence around Schwartz's value.

Each presenter adds a unique perspective on the issue. Johannes Kiesel establishes the theoretical and methodological foundations for computational value research, specifically in the context of political written media. Ella Daniel goes further to apply this methodology in a multimodal space, focusing on the digital lives of youth on TikTok. Sharon Arieli demonstrates the utility of the computational methods in organizational contexts, showing how value instantiations predict workplace outcomes across cultures. Hester van Herk goes further and shows longitudinal associations between media messaging and democratic participation, contributing to the understanding of democratic trust. Last, Naama Rozen proceeds to show causal relations, as AI values induces attitudes and behaviors in the context of social media safety and freedom.

The use of computational methods to can support organizations, policymakers, media platforms etc. in understanding the values of individuals, and in ensuring that values biases do not result in unwanted value shifts. This symposium positions ICAP at the forefront of methodological innovation in applied psychology.

Abstract 3700

USING AI TO IDENTIFY HUMAN VALUE INSTANTIATIONS IN TEXTS

Kiesel J.*[1], Arieli S.[2]

[1]GESIS – Leibniz Institute for the Social Sciences ~ Leibniz ~ Germany, [2]The Hebrew University of Jerusalem ~ Jerusalem ~ Israel

Is throwing garbage into a bin an instance of preserving nature? Previous research showed that a connection between a universal human value (such as nature preservation) and a concrete action (such as throwing garbage into a bin) that is seen as typical in one culture can be seen as much less typical in a different culture. Therefore, if two people both care for the same human value and one of them thinks an action should be done to attain a value, the other might disagree, as they do not see the action as an instantiation of the value and thus do not think the value can be attained by performing the action. To compare value-driven behavior across cultures, one thus has to ask: What are the typical instantiations for a value in a culture?

Using current AI technology, we make a step towards answering this question from large-scale behavioral data. Using the ValuesML dataset—which contains more than 2500 news articles and political manifestos in nine languages, coded for human value mentions by trained scholars from respective countries—we apply AI approaches from text clustering and language modeling to identify typical instantiations per country/culture that the data originates from and then contrast these typical instantiations between the data subsets. We make our approach available online to the research community in order to enable analyses using different and larger data in the future.

Abstract 3719

VALUE FRAMING IN MEDIA AND VOTING BEHAVIOR: CAUSAL BIDIRECTIONAL RELATIONSHIPS

Van Herk H.*[1], Leijen I.[1], Karl J.[2], Ponizovskiy V.[3], Sneddon J.[4]

[1]Vrije Universiteit Amsterdam ~ Amsterdam ~ Netherlands, [2]Stanford Graduate School of Business ~ Stanford ~ United States of America, [3]Durham University ~ Durham ~ United Kingdom, [4]University of Western Australia ~ Perth ~ Australia

The political landscape in Europe is currently changing where there is a clear trend with losses of seats among traditional (center) parties and gains among populist parties. The changes in the political landscape are significant. Where does this come from? Previous research has shown that Schwartz human values are related to political preference, but also that people's values do not change significantly especially after young adulthood.
Media have a big influence on people's voting behavior. But what is the relationship between media messages and choice of political parties? Do more media messages about dangerous situations with migrants capitalizing on security values lead to a greater preference for populist parties, or is it precisely the case that a political poll showing a larger number of seats for populist parties leads to more coverage of security value-related texts in the media?
Using the media monitoring data from the JRC in the period 2014-2024, we extract Schwartz values from Dutch media and analyze the prevalence of values over time. Relating these outcomes to bi-weekly political polling data from the highly fragmented political landscape with over 20 political parties Netherlands in the same period 2014-2024 allows us to assess the causal bidirectional relationship between value framing in the media and voting behavior.

Abstract 3726

LEVERAGING LANGUAGE MODELS TO DETECT VALUE INSTANTIATIONS AMONG EMPLOYEES

Arieli S.*[1], Starovolsky--Shitrit A.[2], Daniel E.[2], Kiesel J.[3]

[1]Hebrew University Business School ~ Jerusalem ~ Israel, [2]Tel Aviv University ~ Tel Aviv ~ Israel, [3]GESIS - Leibniz Institute for the Social Sciences ~ Leibniz ~ Germany

Understanding how values shape human behavior is a central question in psychology and organizational research. Yet, traditional value measures often show weak or inconsistent links to actual behavior. According to Maio's value framework, people are more likely to act in accordance with an abstract value when a behavior is perceived as a direct expression, i.e., instantiation, of that value. To advance this line of research beyond labor-intensive manual coding, we applied AI-based language models to automatically identify value instantiations in employee work goals.

Our computational approach leverages the structure of Schwartz's value system to derive behavioral patterns from textual instantiations. Our findings offer empirical validation for Maio's framework by showing that instantiation-based measures outperformed abstract value scores in predicting workplace behavior and outcomes, including status, tenure, income and employment in nonprofit sector. Cross-cultural analyses further revealed that Asian-American and Indian employees showed stronger alignment at the instantiation level than at the abstract value level, suggesting that globalization may promote the emergence of shared work-related values while attenuating historically entrenched cultural distinctions.

We also validated the robustness of our computational approach. When trained on Asian-American work-goal texts, the model achieved an F1-score of 0.82 against expert annotations. Applied to Indian data without further fine-tuning, performance remained high (F1 = 0.67). These findings demonstrate the portability and efficiency of our AI-based method for uncovering value instantiations.

ONTOGENETIC PSYCHOLOGY: MIND WANDERS FROM INFANCY TO OLD ADULTHOOD

Thursday 23 July 2026 from 11:30 to 12:30

(C- Spadolini)

Emanuele Castano, Chair

Communication skills, intelligence, self-control, and mindreading are among the crucial cognitive and behavioral skills scaffolding life in human societies. How do these changes throughout the lifespan? This is the central question of the symposium, which is organized chronologically with five contributions covering the entire human lifespan. The symposium aptly starts two presentations with data from infants: evidence from South Korea
suggests early emergence of the complex interplay of reasoning and communication processes in the emergence of attribution of beliefs and intentions. Next, data from Japan looks at the codevelopment of interoception and mentalizing and its relation with maternal interoceptive. The third presentation focuses instead on children of age 6-14, and reports results from a research intervention conducted in Italian schools in which the impact of a shared reading aloud program on the development of intelligence in children is highlighted. The next two presentations shift the focus from the development occurring in the infancy/childhood years to what happens to human psychology later in life. First, data from Japan are presented suggesting that the effect of attitudes toward failure on self-control changes as adults enter into old adulthood. The last presentation of the symposium brings some good news: data from South Korea shows in fact that social cognition skills do not necessarily decrease among the elderly, but rather change, and it is such a change that needs
to be understood to provide better care to the aging population.

Abstract 4154

THE ROLE OF COMMUNICATIVE INFORMATION AND SOCIAL CONTEXT IN INFANTS' PSYCHOLOGICAL AND PROSOCIAL UNDERSTANDING

Hyun--Joo S.*

Yonsei University ~ Seoul ~ Korea, Republic of

Human psychological reasoning develops early in life,
with infants demonstrating sophisticated abilities to interpret others' actions, goals, and mental states. This talk presents a series of studies investigating how infants use communicative cues to update their understanding of others' goals and beliefs, and how they evaluate prosocial actions within social contexts. In the first set of studies, we examined whether infants use verbal information to infer changes in an agent's psychological states. Using violation-of-expectation paradigms, 12- to 14-month-old infants interpreted a change in verbal labels as signaling a change in the agent's goal, suggesting that they flexibly integrate linguistic information into goal reasoning. Furthermore, 18.5-month-old infants updated agents' false beliefs only when the verbal interventions were informative, indicating sensitivity to the pragmatic content of communication. Building on these findings, we explored infants' expectations regarding prosocial actions. We found that 12- to 16-month-old infants attributed intentions even to unsuccessful helping behaviors and expected agents to help rather than hinder others. Moreover, infants anticipated that agents would help those in need and considered social group membership when evaluating acts of helping and comforting. They also expected agents to distribute resources fairly between themselves and others. Together, these findings suggest that infants not only recognize goal-directed and prosocial behavior but also evaluate the nature and informativeness of communicative acts, as well as the broader social context. This research highlights the early emergence of complex, context-sensitive psychological reasoning and underscores the foundational role of communication in the attribution of beliefs and intentions.

Abstract 4157

THE MODERATING ROLE OF ATTITUDE TOWARD FAILURE IN THE RELATIONSHIP BETWEEN SELF-CONTROL AND AGE.

Ozaki Y.*

Toyo University ~ Toyo ~ Japan

This study investigated how individuals' trait self-control relates to their age and how various attitudes toward failure moderate this relationship. In a cross-sectional online survey, a sample of 2,578 Japanese adults assessed themselves using a newly developed scale consisting of eighteen items that describe cognitive, affective, and behavioral responses to failure. An exploratory factor analysis revealed a three-factor structure: regret aversion, thought shifting, and reflection for improvement. Results from multiple regression analyses showed that trait self-control was negatively associated with regret aversion and positively associated with thought shifting, reflection for improvement, and age. Interactions between attitudes toward failure and age were significant, indicating that individuals with positive attitudes toward failure demonstrate better self-control as they grow older. Future studies should utilize longitudinal surveys to provide valuable insights into whether this pattern will replicate as a time-course improvement of self-control throughout a lifetime.

Abstract 4158

HOW DOES SOCIAL COGNITION AND SOCIAL BEHAVIORS CHANGE WITH AGE?

Cho I.*

Sungkyunkwan University ~ Seoul ~ Korea, Republic of

Aging has been known to be extensively related to changes in a variety of domains. Understanding how people differently process information and behave in a social context with age is an important issue that aging society is now facing. Not only our society but also researchers in academia have a pervasive belief about late adulthood. That is, older adults display overall declines and slowness in various physical and psychological abilities, including social cognitive domains. To address whether such an aging-related belief is genuinely observed, the current talk will introduce several studies on social cognition and behaviors in late adulthood. For example, contrary to previous literature showing the age-related declines of Theory of Mind (ToM) abilities - the ability to understand another person's mental states, including perspectives, wishes, desires, feelings, beliefs and so on-, some recent findings illustrated that compared to younger adults, older adults did not always show their decline of ToM (depending on context) and that they reported greater prosocial behaviors. Contrary to our socially stereotypical belief of aging, these findings suggest that social cognition and behaviors may not decline, but change, with age, thereby motivating the importance of scrutinizing how social cognitive abilities and behaviors differ with age and what factors are associated with such age-related changes to better understand aging.

Abstract 4155

EARLY DEVELOPMENT OF INTEROCEPTION: MECHANISMS AND SUGGESTION FOR MENTALIZING

Ohira H.*

Nagoya University ~ Nagoya ~ Japan

Interoception refers to sensations from inside the body, such as the internal organs, and it has been considered to be regulated by the principle of predictive processing in the brain, through which the brain actively maintains homeostasis. However, it is still unknown when and how the predictive processing of interoception develops. To address this issue, we used a method to examine interoception of infants. Visual stimuli synchronized or asynchronized with the heartbeat of infants were presented, and the duration of gazing to each stimulus was measured. Since asynchronous stimuli should generate greater interoceptive prediction errors, it was hypothesized that if the mechanism of interoception in infants had developed, they would pay more attention to asynchronous stimuli and look at them longer. With 3–8-month-old infants, we found that interoception emerges during the first year of life: the older infants exhibited the longer duration of gazing for asynchronous over synchronous stimuli. Importantly, this phenomenon occurred only when stimuli coincide with the baroreceptor-active period of systole, supporting a role of neural representation of cardiac signals in interoception. Further, infants' pupils which should reflect attention, showed age-dependent dilation to systole-locked asynchronous stimuli, illuminating the underlying mechanisms within the predictive processing framework. Moreover, maternal interoceptive sensibility correlated with the sizes of effects of interoception in infants, suggesting the caregiver-infant interplay should be critical in development of infants' interoception. Previously, it was claimed that the primary aspects of selfhood are shaped by embodied interactions with caregivers in early infancy, and such embodied interactions allow the development of abilities of mentalizing. Our findings shed new light on the concrete processes of such early development of interoception and mentalizing.

Abstract 379

APPLYING PSYCHOLOGY IN DIGITAL SPACES: CO-DEVELOPING A TEACHER-FOCUSED INTERVENTION FOR ADOLESCENT EMOTIONAL AND BEHAVIOURAL CHALLENGES

Dhupar M.*[1], Singh P.[2], Bambling M.[3], Edirippulige S.[3], Teoh H.[4]

[1]O.P. Jindal Global University ~ Sonipat ~ India, [2]Indian Institute of Technology ~ Delhi ~ India, [3]University of Queensland ~ Brisbane ~ Australia, [4]Queensland Health ~ Brisbane ~ Australia

This paper examines the preliminary impact of a digital teacher-training intervention targeted at reducing emotional and behavioural difficulties (EBD) amongst adolescents in Indian senior secondary classrooms. By adopting a design-based research approach, this study onboarded teachers as co-creators in the development of a contextually relevant digital intervention. Using a mixed-methods approach, the first phase investigated the causes of emotional and behavioural difficulties in students via interviews. Teachers shared concerns and strategies for classroom management. Combining their insights alongside relevant literature an intervention was developed which focused on addressing important classroom concerns such as identifying and managing behavioural difficulties, student-teacher relationships, and conflict resolution, amongst others.

The aim of this intervention study was to reduce EBD in adolescents while fostering their personal and relational resilience. Concurrently, the intervention aimed to explore if teacher self-efficacy in classroom management improved as a consequence of a consistent and emotionally supportive classroom climate. Conducted over 7 weeks, results highlighted a significant reduction in concerns such as behavioural difficulties, conduct problems, hyperactivity and conflict with peers. Additionally, the intervention also helped increase pro-social behaviour and resilience in the adolescent students. These results are encouraging and highlight the efficacy of a contextually sensitive digital intervention that can be used to improve psycho-social attributes in under-resourced systems. It especially contributes to a niche area of literature encouraging the use of the participatory intervention model, which has high significance in low and middle-income countries.

RISK-ORIENTED APTITUDE TESTING IN OCCUPATIONAL CONTEXTS

Hardegger S.C.*

Zurich University of Applied Sciences ZHAW, IAP Institute of Applied Psychology ~ Zurich ~ Switzerland

Psychological aptitude testing is part of the core body of applied psychology and has a long-standing tradition. In the context of security-related issues, it is even of crucial importance, as the prevention of human-caused damage is a very high priority. However, in order to make reliable and sustainable statements using psychological aptitude testing, it is advisable to combine the psychological component with perspectives from risk management. The presentation will first introduce a practice-oriented repertoire of human risks developed at the IAP Institute for Applied Psychology at ZHAW, and second present an approach in which risk-oriented aptitude diagnostics in a professional context (not clinical and not forensic) translates the findings of aptitude diagnostics into the language of risk management, thus making them accessible for risk-oriented decisions. The seven risk areas presented are lack of competence, self-harm, human error, lax work attitude, rule violations, intentional rule breaking, and destructive leadership behavior. The approach of risk-oriented aptitude diagnostics in a professional context is based on four steps (after a requirements analysis has been carried out and the assessment process has been developed): Recognition of conspicuous features – Identification of relevant risks – Assessment of risks – Risk communication.

Abstract 958

SELECTION SYSTEM DESIGN: EXPLORING PREDICTOR CHOICE AND PREDICTOR IMPORTANCE FOR VALIDITY AND DIVERSITY

Niessen S.*[1], Björklund F.[2], Bäckström M.[2]

[1]University of Groningen ~ Groningen ~ Netherlands, [2]Lund University ~ Lund ~ Sweden

What instruments are used in hiring procedures and how they are weighted affects validity and diversity. Moreover, given the validity-diversity dilemma, maximizing validity or diversity results in different hiring procedures. Many studies investigate how selection systems should optimally be designed, but hardly any investigate how practitioners actually design selection systems, and why. Therefore, in a pre-registered exploratory study, we used a between-subjects experiment to investigate how n = 1212 people with hiring experience designed a hiring procedure, with the aim to: 1) maximize predictive validity, 2) improve the representation of female employees or 3) improve the representation of Black employees. Out of a list of nine common selection instruments, participants chose which instruments they wanted to include, and assigned an importance weight to each chosen instrument. First, compared to having a validity only goal, people who had a female representation goal included and weighted biodata somewhat more and cognitive ability and integrity tests somewhat less. People with a Black representation goal included and weighted biodata moderately more, and included and/or weighted cognitive ability tests, structured interviews, integrity tests, and emotional stability somewhat less. Some of these choices are in line with the empirical literature on adverse impact and predictive validity, but others are not. To estimate the effects of these different choices on the predictive validity and adverse impact resulting from the chosen selection procedures, the predictive validity and adverse impact for gender and ethnicity was estimated for each participant's selection procedure, based on an empirical correlation matrix. The average composite predictive validity and adverse impact was virtually identical between conditions. So, even though professionals seem to make some different choices when designing selection systems for validity or diversity goals, they were not effective; they did not result in practically relevant differences in adverse impact or predictive validity.

Abstract 1670

HOW DO WE REGULATE OTHERS' EMOTIONS?: ADAPTATION AND VALIDATION OF THE ROES IN TURKISH-SPEAKING POPULATION

Bekaroglu E.*, Bulut B.P., Bayram--Gülaçtı H.

Ankara Haci Bayram Veli University / Department of Psychology ~ Ankara ~ Turkey

Over the past decades, the literature on emotion regulation has mainly focused on how individuals regulate their own emotions; however, the mechanisms of regulating others' emotions have been neglected comparably. Theoretical frameworks of interpersonal extrinsic emotion regulation acknowledge a variety of different regulation strategies and the Regulation of Others' Emotions Scale has been developed to assess eight strategies, namely expressive suppression, downward social comparison, humor, distraction, direct action, cognitive reframing, valuing, and receptive listening. In the present research, we adapted the Regulation of Others' Emotions Scale into Turkish to capture eight extrinsic emotion regulation strategies. In addition to this scale, Difficulties in Emotion Regulation Scale-Brief Form, Basic Empathy Scale, Basic Personality Traits Inventory, Positive and Negative Affect Schedule, Interpersonal Affect Improvement Strategies Questionnaire were used for validity. Data was collected from 201 individuals aged between 18 and 65 (M = 33.65, SD = 9.54). According to the CFA results, the initial proposed model did not fit the data well (CFI = .89, TLI = .87, RMSEA = .07). For improving the model, the error covariances between item pairs (19 and 17, 5 and 6, 21 and 22) were added. The fourth model (CFI = .90, TLI = .89, RMSEA = .07) was accepted as the final baseline model. The Cronbach's alpha of the total scale was .93, with subscale values ranging from .77 to .91, indicating good reliability. As an indication of the scale's convergent validity, positive correlations were found with concepts expected to be positively related, and negative correlations were found with concepts expected to be negatively related. Thus, the adapted instrument demonstrated to be reliable and valid, and can be used to measure Turkish-speaking individuals' interpersonal extrinsic emotion regulation capacity, which is crucial for psychological well-being, social functioning, and the quality of social relationships.

Abstract 2154

LEARNING BY FEELING: THE ROLE OF EMOTIONS AND REFLEXIVITY ON EMOTION IN TRANSFER OF LEARNING

Cova E.*, Farnese M.L.

Sapienza University of Rome ~ Rome ~ Italy

For decades, emotions were seen as barriers to rationality and productivity in organizations, and learning was conceptualized primarily as a cognitive process, detached from emotional dynamics. Recent research, however, has highlighted the importance of emotions in workplace learning, although empirical evidence remains limited. Therefore, many of these studies have focused on the role of negative emotions, underscoring their hindering effects on learning.

This study investigates the relationship between negative emotions and transfer of learning, focusing on reflexivity on emotion as a metacognitive capacity that can support emotion regulation processes, particularly in high-intensity emotional contexts. We propose that reflexivity on emotion can enhance transfer of learning, even in the presence of negative emotion, addressing limitations of traditional training evaluation models that emphasize immediate reactions and knowledge acquisition rather than deeper learning outcomes.

The research aims to contribute to organizational learning literature by identifying reflexivity as a key mechanism in learning lessons from negative emotions, also clarifying its role in the emotions–reflexivity interplay. It further offers organizations a new lens to enhance and assess training effectiveness.

A three-wave longitudinal design was conducted with 76 Correctional Police newcomers attending an entry training, using self-report questionnaires measuring emotions, reflexivity on emotion, and transfer of learning.

Findings show that reflexivity on emotions served as a protective mechanism, reducing their detrimental impact on learning. In this case, negative emotions appeared to trigger reflexivity itself, further strengthening its role in supporting learning.

Despite limitations (including self-reported data, a highly specific context, and participant attrition), this study advances organizational learning research by identifying reflexivity on emotion as a facilitator of transfer of learning, particularly in the face of negative emotions, and positioning it as an emotion regulation mechanism in organizational training contexts, especially for roles in which managing emotions is integral to the work.

Abstract 2308

ENABLING LEADERS BY DISABLING LIMITS: USING CHOICE ARCHITECTURE TO DEBIAS LEADERSHIP SELECTION

Rosenrauch S.*[1], Scholz B.[1], Arcos--Holzinger L.[2]

[1]Australian National University ~ Canberra ~ Australia, [2]Australian Government ~ Canberra ~ Australia

Leadership diversity remains constrained despite decades of anti-discrimination legislation and diversity initiatives. While underrepresented groups comprise substantial proportions of the global workforce, their participation in senior leadership roles remains disproportionately low across gender, ethnicity, disability, and other diversity dimensions. Popular diversity interventions, such as workplace bias training, demonstrate minimal sustained behavioural change, with meta-analytic evidence revealing negligible real-world impact. This suggests that attempting to change decision-makers' conscious attitudes may be insufficient in the fact of cognitive limitations, time pressures, and organisational constraints that ultimately shape selection panel behaviour.

Choice architecture interventions offer a promising complementary approach by redesigning decision-making environments rather than attempting to modify individual cognition. These "nudges" leverage bounded rationality principles to influence decision-making while preserving decision-maker autonomy. As a result, they may be more acceptable than traditional debiasing efforts, which can be perceived as reverse discrimination and trigger majority group resistance

This scoping review systematically maps choice architecture interventions tested for increasing diversity during organisational leadership selection. Using the Joanna Briggs Institute methodology and following PRISMA-ScR guidelines, we analysed interventions across underrepresented groups to identify which techniques effectively reduce selection panel bias. The review employed the COM-B Model to diagnose behavioural bottlenecks and Münscher's (2016) taxonomy to categorise interventions.

Our findings reveal that structured evaluation protocols and default option modifications demonstrate most promise for reducing reliance on stereotypes, constraining discretionary decision-making and encouraging self-efficacy. Intervention effectiveness varies by target population and organisational context, suggesting that one-size-fits-all approaches are insufficient.

This review establishes the evidence base for understanding which choice architecture techniques work, for whom, and under what circumstances. By systematically mapping

intervention typologies, effectiveness, and implementation considerations, we provide a structured framework for practitioners seeking to redesign leadership selection processes. We identify critical gaps requiring targeted research and propose methodological advancements for future intervention development.

Abstract 3784

SPECTRAL ASPECTS OF THE TEMPERAMENT-PATHOLOGY CONTINUUM - FET RESULTS

Sulis W.*

McMaster University ~ Hamilton ~ Canada

A diversity of neurochemical hypotheses related to Major Depression (MD) and Generalized Anxiety (GAD) suggests that further investigation is needed for uncovering the neurophysiological nature of MD. Since both temperament and mental illness have been linked to varying degrees of the same neurotransmitter imbalances in neurophysiological systems of behavioural regulation, the analysis of temperament traits as weak forms of neurochemical imbalances might give new insights into symptoms and nature of MD and GAD. This study analyzed the predictions of the opioid receptor hypothesis within the neurochemical model of Functional Ensemble of Temperament proposing that a dysregulation of the opioid receptors acting on monoaminergic systems gives rise to the symptoms of MD and GAD. The study investigated the coupling of sex, age and temperament traits with MD across four age groups (17-24, 25-45, 46-65, 66-85) by reviewing the records of testing in patients and volunteers with and without mental illness. In line with the hypothesis, patients with MD had significantly lower Physical Endurance, Social-verbal Endurance, Mental Endurance, Plasticity, Physical Tempo, Sensation Seeking and Satisfaction, and higher Impulsivity and Neuroticism than non-depressed individuals. Other sex- and age-related effects are reported.

Abstract 578

BEING JUST USED OR TRUELY UNDERSTOOD: A MEASURE OF USERS' COLLABORATION INTENSITY WITH CHATBOTS

Zabel S., Neef N.E., Otto S.*

University of Hohenheim ~ Stuttgart ~ Germany

How can we know when a user is truly collaborating with a machine—and not just using it? With evolving functional capabilities of conversational agents (CAs) such as ChatGPT, users increasingly engage with them not as mere tools but as collaborative partners. This shift raises the question: What contribution do users make to such a collaboration, and how can it be measured? Building on the concept of collaborative intelligence, we developed and validated the CI-Tex Scale, a behavioral scale to measure Collaboration Intensity (i.e., users' degree of engagement with conversational agents in collaborative tasks) in text-based human-CA interactions. Grounded in Item Response Theory, the CI-Tex scale quantifies users' extent of collaborative engagement across different behavioral categories. Based on data from two studies (Total N = 599), CI-Tex emerged as a unidimensional construct with good model fit and high empirical reliability of .87 (Study 1) and .84 (Study 2). A strong correlation with human–voice assistant collaboration intensity (r1 = .57, r2 = .50) supports convergent validity. Moderate correlations with attitudes toward AI (r = .42) and innovativeness (r = .36), as well as a near-zero correlation with AI anxiety (r = –.03) in Study 1, provided evidence of discriminant validity. The scale complements existing technology acceptance measures by focusing on the depth of users' actual collaboration behaviors. Thus, it offers researchers a robust and adaptable tool to assess individual differences in human-CA collaboration and provides practitioners with insights to match users to contexts where collaboration with CAs is necessary.

DEVELOPMENTAL DIFFERENCES IN FACIAL EMOTION RECOGNITION FROM PHOTOGRAPHS AND CARICATURES

Pandey R.*, Bhushan B.

Indian Institute of Technology Kanpur ~ Kanpur ~ India

Introduction: Facial Emotion Recognition (FER) is a crucial skill in day-to-day life. Deficits in FER can impair communication, social cognition, and interpersonal relations, leading to social isolation. Most studies have used photographs of facial expressions from various databases. At early developmental stages, photographic expressions may not optimally support emotion understanding due to the complexity of facial features. Caricature is an art form that magnifies physical features to capture their essence. However, facial expression studies using caricatures remain underexplored.

Purpose: This study examines how children, adolescents, and young adults recognize emotions, rate their intensity, and reaction time when viewing facial expressions in photographs compared to caricatures.

Method: In study one, A total of 132 photographs portraying basic emotional expressions were presented to two groups of participants (n = 369 and n = 310), in both photographic and caricature formats, each displayed for 5 seconds. The dependent measures included response accuracy, reaction time, and perceived intensity of the expressions.

Results: The findings indicate that recognition accuracy was significantly greater for caricatures (M = 62.7%, SD = 10%) compared to photographs (M = 54.4%, SD = 7.2%), $F(1, 677) = 153.084$, $p < .001$. Across age groups, accuracy remained consistently higher for caricatures. Reaction times were significantly shorter for caricatures (M = 1.83, SD = 1.1) than for photographs (M = 2.5, SD = 1.26). Although mean intensity ratings were higher for caricatures, the difference did not reach statistical significance.

Conclusion: Results suggest caricature-based expressions may offer a practical and engaging alternative to traditional photographic stimuli, especially for younger populations in educational settings, social–emotional learning programs, and psychological assessment. and in intervention contexts that require greater emotional clarity.

CULTURAL DIFFERENCES IN ANXIETY SYMPTOMS: MOVING INDIA TOWARDS DECOLONISING DIAGNOSTIC INSTRUMENTS

Ghani S.*[2], Sreedaran P.[3], Hr S.[1], Sahu M.[4], Mysore A.[3], Sharan P.[5]

[1]St. John's Research Institute, Bangalore, Karnataka, India. ~ Bangalore ~ India, [2]OP Jindal Global University ~ Sonipat ~ India, [3]St. John's Medical Hospital ~ Bangalore ~ India, [4]Pt. J.N.M. Medical College ~ Raipur ~ India, [5]All India Institute of Medical Sciences ~ New Delhi ~ India

Introduction: Anxiety disorders are among the most prevalent psychiatric conditions worldwide. However, their manifestations are shaped by cultural context. In India, patients often present with somatic and socially embedded symptoms, raising concerns about the validity of Western-derived diagnostic scales.

Purpose: This study examined whether standardised tools for generalised anxiety disorder (GAD) and panic disorder (PD) adequately capture culturally relevant symptom expressions in Indian populations and considered the need for decolonising diagnostic practices.

Method: A mixed-methods design was employed. Standardised anxiety measures, including HAM-A, BAI, GAD-7, and PDSS, were reviewed. A retrospective analysis of 100 case records was undertaken to identify reported symptoms. Additionally, 10 semi-structured interviews were conducted in Kannada with patients diagnosed with GAD or PD to elicit idioms of distress. Descriptive statistics and thematic analysis were applied.

Results: Standardised scales captured 21 domains of anxiety and 15 domains of panic symptoms. 352 different symptom descriptions were found in case records, with somatic complaints like "burning in the neck", "shivering", and "crawling sensations" predominating. Interviews validated distressing expressions in colloquial Kannada that resonated with the culture. Indian patients reported greater physical and socially contextualised manifestations and fewer cognitive symptoms (such as depersonalisation) than Western patients.

Conclusions: The cultural subtleties of anxiety presentations in India are not well reflected by Western diagnostic techniques. Accurate screening, diagnosis, and treatment planning depend on decolonising mental health diagnostics through the creation of indigenous, culturally grounded tools. These methods question the widespread use of Western psychiatric classifications and enhance patient-centered care.

Abstract 1692

PSYCHOMETRIC VALIDATION OF THE BURMESE VIA-72 IN PRESERVICE TEACHER EDUCATION: EVIDENCE FROM FACTOR ANALYSES

Mar T.T.*, Hercz M.

ELTE Eötvös Loránd University ~ Budapest ~ Hungary

A substantial body of research has examined the adaptability of the VIA-72 across different cultures, revealing inconsistencies in factor structures. Testing psychometric properties of the VIA-72 is limited in Myanmar, and this study aimed to validate the Burmese version of the VIA-72 in preservice teacher education by investigating the 24 character strengths grounded in Peterson and Seligman's classification. Student teachers from seven Education Degree Colleges were selected through simple random sampling and completed the Burmese VIA-72, Satisfaction with Life Scale (SWLS), and Patient Health Questionnaire-4 (PHQ-4). The questionnaires were translated into Burmese by experts in Myanmar, following the translation guidelines provided by the VIA Institute. An exploratory factor analysis (EFA; N = 304) was conducted, followed by confirmatory factor analyses (CFA; N = 593) testing three-, four-, and six-factor models. The EFA supported a four-factor structure, explaining 39.57% of the total variance, with factor loadings ranging from .34 to .81. The factors were renamed to reflect the cultural context. CFA results confirmed that the four-factor model demonstrated the best relative fit among the tested alternatives (χ^2/df = 1.87, CFI = .82, TLI = .81, RMSEA = .039, SRMR = .038). Although the model did not fully meet conventional fit benchmarks, the strong RMSEA and SRMR values indicate that it still captures meaningful aspects of character strengths in the Myanmar context. This result reflects cultural differences in how character strengths are organized. The four factors demonstrated good internal consistency (α = .8 to .85) and conceptual coherence. Correlations with SWLS and PHQ-4 provided further evidence of construct validity. The findings indicate that the Burmese VIA-72 is a suitable measure for assessing character strengths of the Burmese-speaking population. This validation contributes to cross-cultural research on character strengths and supports the integration of positive psychology in Myanmar teacher education.

BEYOND THE HYPE: CUTTING-EDGE RESEARCH IN EMOTIONAL INTELLIGENCE—LINKING THEORY, MEASUREMENT, AND PRACTICE

Friday 24 July 2026 from 09:00 to 10:30

(C- Spadolini)

Marina Fiori (Swiss Federal University for Vocational), Chair and Presenter
Dimitri Van der Linden, Discussant

This symposium presents cutting-edge perspectives on emotional intelligence (EI), a construct once debated for its scientific status, but now increasingly supported as central to human competence. The aim is to explore where EI research is heading over the next decade by highlighting innovative theoretical and applied approaches. Carolyn MacCann examines how core EI abilities—understanding emotional information and regulating emotions—translate into everyday processes. Her findings show that EI is closely tied to two mechanisms central to daily emotion regulation: context sensitivity and regulatory flexibility. Marina Fiori introduces a dual-process model that distinguishes between deliberate emotion knowledge (EIK) and a newly proposed component, emotion information processing (EIP), which reflects rapid, automatic sensitivity to affective cues. This framework offers fresh insights into the mechanisms of ability EI and their applications in education and the workplace. Antonella D'Amico presents MetaEmotional Intelligence (MEI), a multidimensional construct that captures beliefs about emotions and awareness of one's emotional abilities. By examining discrepancies between self-perceived and tested ability, MEI provides new tools for promoting emotional awareness across the life span. Don Saklofske proposes an expanded framework of Personal Intelligence (PI), integrating elements of EI, social intelligence, and motivational intelligence. His work underscores the importance of conation—a motivational component often overlooked in traditional EI models. Finally, Dimitri Van der Linden offers a critical commentary on these emerging directions, outlining future avenues for EI research. Taken together, the symposium demonstrates how the field is evolving toward more sophisticated, integrative models of emotional functioning, bridging theory and practice to better capture the complexities of human behavior.

Abstract 3126

AT THE FOREFRONT OF RESEARCH IN EMOTIONAL INTELLIGENCE (EI): EMOTION INFORMATION PROCESSING AS A NEW EI COMPONENT

Fiori M.*

Swiss Federal University for Vocational Education and Training ~ Lausanne ~ Switzerland

This presentation introduces new perspectives in ability emotional intelligence (EI) research by applying dual-process model. Traditional accounts of ability EI have focused mainly on conscious, knowledge-based reasoning about emotions. Recent advances highlight the importance of a complementary process: emotion information processing (EIP), a newly proposed component that reflects rapid, automatic sensitivity to affective cues. Evidence from recent studies demonstrates the predictive value of this conceptualization and its relevance for educational settings. By outlining this emerging framework and its practical implications, the presentation contributes to a more precise and dynamic view of ability EI, strengthening its theoretical foundations and expanding its applied potential in the workplace.

Abstract 3127

METAEMOTIONAL INTELLIGENCE: AN INNOVATIVE INSIGHT INTO RESEARCH ON EMOTIONS

D"Amico A.*

University of Palermo ~ Palermo ~ Italy

MetaEmotional Intelligence (hereafter MEI) is a multidimensional construct proposed by D'Amico (2013, 2018a, 2018b), that focuses on beliefs about emotions in everyday life and on individuals' awareness of their own emotional abilities. This is measured in terms of discrepancies between individuals' self-perceptions of their emotional abilities and their actual performances on ability tests. To measure MEI, D'Amico (2013) created the IE-ACCME Test, a multi-method tool that includes self-report and performance methodologies for exploring the emotional dimensions described in Mayer and Salovey's (1997) theoretical model. People with high levels of MEI show a belief system giving high importance to emotions and low discrepancies between performance scores and self-report scale. People low levels of MEI may own a belief system giving low importance to emotions and show low concordance between self-reported emotional abilities and actual performance.

MEI may provide new and innovative insights into research on emotions and could offer important perspectives to professionals for promoting awareness of emotions throughout the life cycle (see also D'Amico & Geraci, 2022a; D'Amico, Ruggieri, & Geraci, 2024), as it has been already confirmed in the first studies by authors (D'Amico & Geraci, 2021; D'Amico & Geraci, 2022a).

Abstract 3128

THE MISSING LINK IN EI: MOTIVATIONAL INTELLIGENCE

Saklofske D.*

University of Western Ontario ~ London ~ Canada

Emotional intelligence (EI) recently marked its 35-year anniversary (Salovey & Mayer, 1990), making this a time to reflect critically on its current conceptual and empirical foundations. In the context of Trilogy of Mind, EI has been described as both an ability/cognitive and personality/affective factor. However, conation remains a crucial yet underrepresented component. Few EI frameworks reference self-motivation and a detailed account of the internal drivers that “fuel” goal-directed behavior, perseverance, emotional resilience and shape how individuals respond to challenges, maintain effort, and channel emotional energy toward adaptive and constructive goals. A contemporary conceptualization of Personal Intelligence (PI) encompasses aspects of EI, Social Intelligence (SI), and Motivational Intelligence (MI). We present studies assessing the MI factor structure and essential competencies largely missing from traditional EI frameworks.

02 - Division 2: Psychological Assessment and Evaluation

FROM STATIC TRAITS TO SITUATIONAL CONSTRUCTS, DYNAMIC SYSTEMS, AND TEST VALIDATION: RETHINKING MEASUREMENT THROUGH CONTEXT AND INNOVATION

Friday 24 July 2026 from 10:30 to 12:00

(C- Spadolini)

Bruno Zumbo (University of British Columbia ~ Vancouv), Chair and Discussant

This symposium expands the conversation in psychometrics and assessment by bringing together international leaders whose research demonstrates how innovation—including theoretical and conceptual analysis, mixed-methods validation, computational modeling, and AI integration—can help transform psychological measurement into a more responsive, contextualized, and dynamic science. Rather than promoting unidirectional discourse, the session fosters dialogue among researchers and practitioners on how measurement science can better reflect the complexity of human experience. The focus is on advancing approaches that move beyond static, in vitro models of psychological traits and constructs.

This symposium presents four papers that challenge static, decontextualized models of psychological measurement and, in response, promote an in vivo, process-oriented perspective,capturing situated, dynamic, and context-dependent phenomena. Each presentation describes innovative approaches to capturing the complex interplay of person, context, and process that characterizes psychological phenomena.

The first paper examines the often-overlooked category of situational constructs, highlighting the mismatch between conceptual definitions rooted in context and measurement practices that ignore temporal and situational variability. It calls for psychometric theories and practices that better reflect the dynamic nature of such constructs.

The second paper addresses response process validation by integrating traditional cognitive interviews with psychophysiological measures (e.g., eye-tracking, electrodermal activity) and psycholinguistic item analysis. The study demonstrates how converging sources of qualitative and quantitative data enrich our understanding of how respondents interpret and engage with test items.Thethirdpapersituatesmeasurementwithin dynamicsystems theory,emphasizing the limitationsofstatictraitmodelsandthepromiseofintensivelongitudinaldata(e.g., EMA/ESM), multilevel and time-series modeling, and idiographic trajectories.Italsoraisesphilosophicaland methodological challenges associated with shiftingfromtraitstoprocesses.

The fourth paper explores the role of generative AI in response process validation via web probing. It presents an AI-based solution for coding and analyzing open-ended responses, comparing multiple generative models. This approach aims to enhance both efficiency and validity in online assessments by enabling automated, context-sensitive interpretation of textual

data.Thediscussantwillprovideintegrativecommentary andengagetheaudienceinaforward-looking

Abstract 4287

THE CASE OF SITUATIONAL CONSTRUCTS IN PSYCHOLOGY: BRIDGING THE GAP BETWEEN PSYCHOMETRIC THEORY AND PRACTICE

Tagliabue S.*[1], Zambelli M.[1], Zumbo B.[2]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]University of British Columbia, Vancouver, Canada ~ Vancouver ~ Canada

Many psychological constructs that have traditionally been investigated are defined as "dispositions," that is, internally held attributes that can be reduced to regular or expectable responses of individuals, generalizable across different circumstances or contexts (e.g., empathy is the ability to attribute mental states to another person; Baron-Cohen & Wheelwright, 2004). Other psychological constructs can be defined as "situational," whose theoretical definitions refer to specific situations and occurrences to which the construct is inherently linked, as well as the dynamics of change over time (e.g., empathy is a reaction to the observed experiences of another, Davis, 1983).
The primary goal of psychometrics is to operationalize and accurately measure psychological constructs, thereby representing their characteristics and properties as defined at the conceptual level (Chiorri, 2025). Operationalization choices refer not only to the creation of stimuli but also include procedural instructions for administration and design related decisions. However, a key issue is the mismatch between construct definitions and their measurement, reflecting a gap between theory and psychometric practice. For instance, it is increasingly common to assess dispositional constructs using ecological approaches and short-term repeated assessments to capture their fluctuations, despite being conceptually defined as stable dispositions. Similarly,

situational constructs are often measured using global assessments and collected through cross-sectional designs, thereby excluding the situational and temporal properties that characterize their definition from operationalization.
Psychometric theories that formalize the relationship between stimuli and dispositional constructs are widely acknowledged, as are the practices for evaluating the quality of such measures. In contrast, reflection on the operationalization and measurement of situational constructs is still in its early stages of development. This contribution aims to foster discussion on how to develop measures that operationalize the situational dimension of psychological constructs and

how to evaluate the quality of such practices, striving to reconnect psychometric theory with its practical applications.

Abstract 4288

BEYOND STATIC TRAITS: MEASURING PSYCHOLOGICAL CONSTRUCTS AS DYNAMIC SYSTEMS

Iliescu D.*[1], Ispas D.[2], Ilie A.[2], Ion A.[1]

[1]University of Bucharest (& Stellenbosch University) ~ Bucharest ~ Romania, [2]Illinois State University, Illinois, USA ~ Illinois ~ United States of America

Traditional psychometric models assume that psychological traits and attributes are stable over time; yet, growing evidence suggests they are dynamic, context-sensitive, and interactive. Current assessment tools struggle to capture these fluctuations. This issue directly engages with the shift from in vitro (static, trait-based) to in vivo (process-oriented) measurement. It challenges the reliance on classical test theory (CTT) and item response theory (IRT) by emphasizing ecological, time sensitive, and personalized assessments. Discussion points will focus on the promise and challenges of intensive longitudinal assessments (e.g., EMA, ESM), computational and dynamical systems modeling in psychological assessment, and applications of machine learning in detecting state-based fluctuations in psychological constructs.
Some challenges of this shift are methodological (e.g., data demands). Others are conceptual - these being more burdensome, e.g.: trait vs. state confusion (how to differentiate between core tendencies and contextual expressions?), generalizability (how can within-person findings be generalized to populations?), and validity (what does reliability and validity mean in a dynamic model where consistency across time is not expected?).
This shift is not just technical - the technical and methodological issues, while difficult, can be solved (multilevel modeling, time-series analysis,

dynamic structural equation models). The shift is also philosophical, challenging core assumptions about what it means to "measure" a person, leading us from traits to trajectories, from scores to systems of scores, from snapshots to streams.
From a practical perspective, this shift may align with a broader move in psychology toward idiographic science, where the goal is not just to compare people, but to understand them in context, over time, and in motion. It suggests new applications, such as personalized mental health tracking, dynamic risk patterns, and just-in-time adaptive interventions. However, it is uncertain how much predictive power it

brings beyond classical approaches for classical problems (e.g., personnel selection or admission testing).

BEYOND SELF-REPORT MEASURES IN PSYCHOLOGICAL ASSESSMENT: NEW INSIGHTS AND NEW DIRECTIONS

Friday 24 July 2026 from 14:00 to 15:30

(C- Spadolini)

Maria Anna Donati (NEUROFARBA DEPARTMENT, UNIVERSITY OF FLO), Chair and Discussant

The symposium proposes studies from different perspectives, disciplines, and methodologies, focused on exploring innovative approaches to psychometric assessment aimed at moving beyond traditional self-report measurement. The applications regard psychological assessment but also provide important insights for intervention practice. Different methodologies are proposed: Large Language Model embeddings and biosensor-based physiological monitoring, presented by Professor Davide Marocco; behavioral computerized task (i.e., the expanded version of the Cups Task), provided by Professor Joshua Weller; experimental tasks, presented by Professor Anna van Duijvenvoorde; experiments in laboratory settings associated with mobile phone applications and sensor technologies applied in natural environments, provided by Dr. Antons; and Extended Reality (Virtual Reality and Augmented Reality), presented by Professor Chirico. The various methodologies are applied for the assessment of various psychological constructs and processes: respectively, personality; decision-making; effort, i.e., the willingness to exert effortful actions for themselves and for others; habits, intended as learned stimulus-response associations that develop through repeated behaviors and eventually become automatic, despite shifts in motivation or outcomes; emotional resilience, distress, and anxiety. Findings have been obtained from studies conducted with general (older adults, adults, young adults, adolescents, and children) and clinical populations (clinical and neuropsychological patients, maltreated adolescents; oncological patients), and from different psychological perspectives (psychometrics, behavioral decision making, developmental psychology, general psychology). Overall, the contributions demonstrate the utility of the new methodologies in overcoming the limitations of traditional self-report measures, in terms of improving psychological assessment by i) enhancing test design and reducing response biases, ii) providing differential predictive validity with respect to behavioral real-world outcomes, iii) understanding the core mechanisms underlying the specific measured construct; iv) assuring high sensitivity and specificity in underlying cognitive-emotional processes, v) contributing to personalized psychological care. Thus, the symposium is fully in line with the theme of the Congress by proposing new directions in appliedpsychology.Thetalkswillbefollowedbyadiscussionaimedat underlyingtheadvantagesoftheapplicationofinnovativemethodologiesintermsofpsychometric potentialwithregardvariouspsychologicalconstructsundtargetsand clinicalutilityindifferent settings.Futureresearchdirectionswillbediscussed.

Abstract 4049

USING THE CUPS RISK TASK TO PREDICT REAL-WORLD MALADAPTIVE OUTCOMES

Weller J.*

University of Leeds Business School, Centre for Decision Research ~ Leeds ~ United Kingdom

Self- and informant report measures have traditionally been used to quantify risk tendencies, but the use of behavioral decision tasks has gained popularity due to their objective measures of decision-making processes. However, evidence of their predictive validity has been sparse. This talk examines the differential predictive validity of a risky decision-making task, the “Cups Task,” (Levin & Hart, 2003) which has been shown to detect specific risk-taking differences among clinical and neuropsychiatric patients, maltreated adolescents, older adults, and the general population.

The expanded version of the Cups Task (Weller et al., 2007; allows for the separation of risk-taking to achieve gains versus risk-taking to avoid losses, a fundamental distinction in decision literature. It also assesses expected value sensitivity for each domain, measuring the degree to which individuals make advantageous choices. These distinctions enable tests of the commonly-held belief that reward sensitivity is the primary process underlying risk behaviour.

This talk highlights findings across various populations, demonstrating how Cups Task performance relates to outcomes such as ethical risk-taking, antisocial behaviour, and externalizing disorders. We also examine the degree to which task performance relates to other traits associated with risk behaviours. These findings integrate experimental methods, individual differences, and translational science approaches. We propose that loss-based risk-taking is also a crucial factor to consider when studying the relationship between decision processes and real-world outcomes.

By examining these aspects, we aim to provide a comprehensive understanding of the predictive validity of the Cups Task and its implications for risk behaviour research. This integration of methodologies offers valuable insights into the complex interplay between decision-making processes and behavioural outcomes, emphasizing the importance of considering both gain- and loss-based risk-taking in psychological assessments.

Abstract 4050

MEASURING EFFORT BEYOND SELF-REPORT: BEHAVIORAL INSIGHTS INTO SELF-REGULATION UNDER STRESS

Van Duijvenvoorde A.*

Leiden University – Developmental & Educational Psychology ~ Leiden ~ Netherlands

Research has sought to measure self-regulated behavior experimentally, highlighting its potential benefits for collaborative learning and academic achievement. Engaging in effortful, challenging behavior is considered a key component of self-regulation. However, little is known about how individuals weigh rewards against effort costs when deciding whether to engage in self-regulatory, effortful behavior—especially under varying levels of stress. This preregistered study (https://osf.io/bne5u/) used an experimental effort task to investigate individuals' willingness to exert effortful actions for themselves and for others, and whether self-reported stress and stressful academic events (e.g., exams) influenced this behavior. Students aged 18–35 chose between resting for lower rewards or exerting effort for higher rewards. Both reward and effort levels varied across trials. In Wave 1, half of the participants completed the task during an exam period, while the other half participated during regular academic weeks. In Wave 2, no exams were scheduled. Analyses indicated that effort allocation was sensitive to both reward magnitude and effort level. Participants consistently exerted more effort for themselves than for others. Unexpectedly, effort exertion was not related to academic performance, and stressful academic events (i.e., exams) did not significantly affect effort allocation. However, higher levels of self-reported stress were associated with reduced effort exertion, suggesting that stress may alter how individuals evaluate the cost-benefit ratio of effort. We are now extending these findings to children and adolescents to examine age-related differences. This research may help clarify when and why individuals engage in effortful behavior—an essential aspect of self-regulation—and how such decisions are shaped by student well-being and perceived stress.

Abstract 4051

ASSESSING HABITS IN THE LABORATORY AND NATURAL ENVIRONMENT

Antons S.*

Center for Behavioral Addiction Research (CeBAR), Center for Translational Neuro- and Behavioral Sciences (C-TNBS), University Hospital Essen, University of Duisburg-Essen ~ Essen ~ Germany

Habits are learned stimulus-response associations that develop through repeated behaviors and eventually become automatic. Once established, habits are rigid and resistant to sudden environmental changes, such as the devaluation of reinforcers or the weakening of response-outcome contingencies. As a result, they often persist despite shifts in motivation or outcomes.

Habits are believed to play a crucial role in disorders characterized by inflexible behaviors—for example, the continued engagement in a specific behavior despite experiencing negative consequences, as observed in addictions and obsessive-compulsive disorder (OCD). Therefore, assessing habits is of great interest for understanding the core mechanisms of clinically relevant disorders. However, habit assessment remains challenging, as their development requires extensive repetition, and they are executed automatically, often without conscious awareness. Additionally, automaticity and goal-directedness exist on a continuum, making it difficult to determine when a behavior qualifies as a habit.

This presentation provides a comprehensive definition of habits, followed by an overview of experimental tasks and ambulatory assessment methods used to evaluate habits based on their degree of automaticity and goal-directedness. Special attention will be given to innovative methods, such as mobile phone applications and sensor technologies, which enable the assessment of habitual behaviors in natural environments, particularly in the context of addictions and OCD.

These methods will be critically discussed, highlighting their strengths and limitations, and future research directions will be proposed. Assessing habits in both laboratory settings and real-life contexts is crucial for understanding the core mechanisms underlying inflexible addictive and compulsive behaviors, as well as related disorders. Furthermore, these assessment approaches may help identify habitual behaviors in real time, offering valuable opportunities for timely interventions.

Abstract 4052

THE USE OF TECHNOLOGY IN PSYCHOLOGY: FROM MEASUREMENT TO INTERVENTION

Chirico A.*

"Sapienza" University of Rome, Department of Psychology of Developmental and Socialization Processes ~ Rome ~ Italy

Introduction: Extended Reality (XR), comprising Virtual Reality (VR) and Augmented Reality (AR), represents an innovative frontier in psychology, significantly transforming measurement methodologies and intervention strategies. This presentation discusses XR's recent advancements and practical applications within psychological research and therapeutic practice, specifically emphasizing different contexts.

Purpose: The presentation will critically examine XR's role in psychological measurement and intervention, highlighting evidence-based findings from our extensive research involving different target populations (e.g. cancer patients). Special focus will be given to psychometric evaluations that uncover the mental mechanisms driving XR interventions' success.

Method: Drawing from empirical data obtained through prior XR and VR studies conducted in different settings, this presentation will detail methodological approaches integrating XR for psychological assessment and therapeutic intervention. Particular attention will be devoted to examining psychometric tools utilized to quantify emotional resilience, distress, anxiety, and other relevant psychological variables.

Results: Our extensive investigations have established XR as an efficacious intervention tool capable of substantially intervening on psychological variables. Psychometric assessments using XR have demonstrated high sensitivity and specificity in identifying underlying cognitive-emotional processes, significantly advancing personalized psychological care. Moreover, our findings have clarified pivotal mental processes that are instrumental in mediating intervention effectiveness.

Conclusions: The presentation underscores XR's transformative impact on psychology, particularly highlighting its psychometric potential and clinical utility in different settings. Future directions for research and practical applications will be outlined, aiming to refine interventions to enhance outcomes through advanced XR methodologies.

Abstract 4048

BEYOND SELF-REPORT: EXPLORING LLM EMBEDDINGS AND BIOSENSORS IN PSYCHOMETRIC ASSESSMENTS

Marocco D.*

Natural and Artificial Cognition Lab "Orazio Miglino", Dept. of Humanistic Studies, University of Naples Federico II ~ Naples ~ Italy

In the presentation, we discuss a series of studies exploring innovative approaches to psychometric assessment that aim to move beyond traditional self-report questionnaires in the future. Our work integrates Large Language Model (LLM) embeddings and biosensor-based physiological monitoring to enhance personality assessment methodologies.

First, we examine how LLM-generated text embeddings can predict factor loadings in personality tests by analyzing the semantic structure of test items. Our studies on the Big Five personality test demonstrate that embeddings can effectively capture semantic similarities, providing a data-driven method for refining questionnaire design without relying on human response data. This approach offers a new perspective on evaluating and structuring psychological tests and move beyond self-rating scales towards the use of more natural language interactions.

Moreover, we present our work on biosensor-based assessment of response burden, to measure physiological signals during questionnaire completion. By recording participants' physiological responses while they engage with personality tests of different lengths, we investigate the cognitive and emotional load associated with survey completion. Our findings suggest that physiological measures can serve as objective indicators of response burden, complementing traditional self-report methodologies.

Through this presentation, we aim to share insights gained from these studies and discuss how the integration of LLMs and biosensors can improve psychometric research. These methods have the potential to enhance test design, reduce response biases, and pave the way for more robust and engaging psychological assessments.

LESSONS FROM A DECADE OF PARTNERSHIP: BUILDING A CULTURE OF EVALUATION IN FAMILY SUPPORT SERVICES

Swords L., Maiorano N.*, Daquila S.

Trinity College Dublin ~ Dublin ~ Ireland

Introduction: Evaluating the effectiveness of interventions is essential for family support services to ensure that their work is evidence-based, responsive, and impactful. Systematic evaluation helps services understand what works, for whom, and under what circumstances, enabling continuous improvement and accountability to funders and families alike. Psychology researchers can play an important role by partnering with practitioners to co-design and implement pre-post measures that capture meaningful change in areas such as parental wellbeing, family relationships, and child outcomes. Purpose: Based on ten years of collaboration between psychology researchers and a family support service in Ireland, this presentation reflects on key lessons learned in developing a culture of evaluation within applied service contexts. Method: The research strategy evolved over time but was primarily co-developed through a process of iterative dialogue. Aims and objectives balanced academic rigour with service priorities, which supported the evaluation in becoming embedded rather than externally imposed. Results: Through collaboration, researchers bring expertise in survey design, measurement, and data analysis, while practitioners contribute practical insights into service delivery and family needs. Conclusion: Bridging academic and practice cultures comes with challenges and rewards, including managing differing timelines, expectations, and definitions of success. Ultimately, this collaboration strengthens the evidence base, enhances service quality, and ensures that families benefit from approaches that are both empirically informed and contextually relevant.

VICARIOUS TRAUMATIZATION AND PERSONALE RESOURCES OF HELPING PROFESSINALS IN CONTACT WITH MIGRANTS

Franzini M.*

ANPE - Associazione Nazionale dei Pedagogisti Italiani ~ Milano ~ Italy

A study was conducted on migratory trauma and vicarious traumatization experienced by aid workers who are in contact with traumatized migrants. The research involved 41 participants, both volunteers and professionals working directly with migrants. A battery of tests was administered, including the Secondary Traumatic Stress Scale (STSS), the Brief - Coping Orientation to Problems Experienced Inventory (I-Brief COPE), the Resilience Scale for Adults (RSA), and the Posttraumatic Growth Inventory (PTG). The study assessed the psychological conditions of aid workers engaged in supporting migrants, specifically in terms of vicarious traumatization and personal resources (coping strategies, resilience, post-traumatic personal growth). Correlation analyses were conducted on the variables considered, and the study examined which of these variables predicted vicarious traumatization. The results confirmed the presence of vicarious traumatization among aid workers, highlighting that younger individuals are more exposed, and tend to exhibit arousal symptoms. Furthermore, the findings showed that the more resilient the individual, the lower the incidence of vicarious traumatization, whereas a greater reliance on external support was associated with higher levels of traumatization. These results underline the importance of providing training for professionals on the implications of trauma-related work.

Abstract 2586

BEYOND LABELS: HOW GRAMMATICAL GENDER AND TASK FRAMING SHAPE OBJECT DESCRIPTION ACROSS GREEK AND ENGLISH SPEAKERS

Nega C.*, Mamali M., Spentza I.

The American College of Greece, Deree ~ Athens ~ Greece

Introduction: Does grammatical gender color everyday categorization outside explicit language use? We tested whether grammatical gender, semantic category, animacy, and task framing (personify vs. generic instructions) guide adjective choices in an all-English task among native Greek (three-gender system) and native English speakers.
Method: In a properties-judgment task, 24 black-and-white photos (balanced by grammatical gender in Greek; natural vs. artifact; animate vs. inanimate) were presented. Participants (Greek n=40; English n=33) chose three adjectives per photo from five “feminine” and five “masculine” terms; between-subjects factors were language group and instruction.
Results: There was no Language by Grammatical Gender interaction. We found a clear main effect of grammatical gender. Items that are grammatically masculine elicited more feminine adjectives than items that are grammatically feminine, with this pattern most evident under generic instructions. Natural images drew more feminine descriptors than artifacts, and this effect was stronger for Greek speakers. Inanimate images drew more feminine descriptors than animate images, and this effect was stronger for English speakers.
Conclusions: In an unlabeled task conducted entirely in English, the usual differences between language groups that are attributed to grammatical gender did not appear. Instead, responses aligned with semantic category, animacy, and small changes in the instructions, which fit the idea of “thinking for speaking” and broader gender stereotype schemas that shape choices. For applied cognitive psychology and assessment across cultures, these findings caution against assuming language group effects in tasks without explicit linguistic labels, and they show that modest wording changes can meaningfully shift responses. Practical uses include test design across cultures, HCI prompt writing that is sensitive to bias, and communication training.

Abstract 738

CULTURAL VARIATIONS IN THE PERCEPTION AND UNDERSTANDING OF ATTENTION-DEFICIT/HYPERACTIVITY DISORDER: IMPLICATIONS FOR DIAGNOSTIC SENSITIVITY

Salajková A.*[1], Stecko L.[2], Jaworska Z.[3], Kalita L.[4], Frontczak A.[5], Ranjbaran S.[6], Pignatelli C.[7], Gonçalves T.[8]

[1]Universität Innsbruck ~ Innsbruck ~ Austria, [2]University of Wroclaw ~ Wroclaw ~ Poland, [3]University of Padua ~ Padua ~ Italy, [4]University of Ljubljana ~ Ljubljana ~ Slovenia, [5]Univesity of Social Science in Lódz ~ Lódz ~ Poland, [6]University of Pavia ~ Pavia ~ Italy, [7]Universidade Europea Lisboa ~ Lisbon ~ Portugal, [8]University of Porto ~ Porto ~ Portugal

Attention-Deficit/Hyperactivity Disorder (ADHD) is widely recognized as a neurodevelopmental condition, but how its symptoms are perceived is far from universal. Misinterpretations can lead to underdiagnosis or stigma, especially when cultural and social expectations shape what is considered “normal” - and therefore also pathological.

This study is part of a large multicultural project aiming to uncover how ADHD symptoms are perceived across countries, genders, and religious backgrounds. Using 12 randomized vignettes representing hyperactivity, inattention, emotional dysregulation, and frustration tolerance, we surveyed more than a thousand participants from Europe, Asia and North America. Participants, drawn from both students and the general population reported their knowledge of ADHD, attitudes and their perception of the presented situation.

Drawing from the results of the pilot study, we further investigated the question of perceived commonality of ADHD symptoms and tendency to recommend the protagonist in said vignettes to a mental health professional. Not only did the results uncover significant differences in demographics’ effects in perception, but they also revealed aspects of personal backgrounds that affect the approach towards stigma, knowledge and assessment of behavior presenting ADHD symptoms.

These findings highlight how diagnostic tools and interventions cannot be separated from cultural context. They have direct implications for counseling, clinical assessment, and pedagogical strategies supporting children and families affected by ADHD. Raising awareness of cultural variation in perception is crucial not only for improving diagnosis but also for fostering integration and reducing stigma in schools and communities in an increasingly globalized world.

Abstract 4584

LEMONS TO LEMONADE: NATIONAL TRANSFORMATION FROM COGNITIVE LIFE EVALUATION TO EMOTIONAL HAPPINESS

Schwartz R.*

University of Pittsburgh School of Medicine (Retired) ~ Pittsburgh ~ United States of America

Happiness is often described as an “inside job”, emphasizing the subjective nature of emotional experience. Yet, global well-being research routinely measures happiness through cognitive evaluations of life circumstances, most prominently in the World Happiness Report (WHR) rankings. While both dimensions are recognized as important, life evaluation continues to dominate how national happiness is conceptualized and interpreted. This presentation shows that when emotional happiness is formally examined alongside cognitive life evaluation, systematic patterns of national emotional transformation emerge that are obscured by life evaluation alone. Using multi-year WHR data, countries were classified according to the direction and magnitude of divergence between emotional happiness and life evaluation. Three stable profiles were identified: positive transformers, whose emotional happiness exceeds what their evaluated life circumstances would predict; negative transformers, whose emotional experience falls below their cognitive appraisal; and non-transformers, where the two dimensions closely align. These transformation patterns reveal that nations differ not only in how well life conditions are evaluated, but in how those conditions are emotionally processed and experienced at the population level. From an applied psychology perspective, recognizing national transformation profiles has implications for social policy, mental health planning, and international development. Interventions guided solely by life evaluation may mischaracterize emotional resilience or vulnerability, leading to policies that overlook how populations experience their lives. A quantitative metric of national transformation allows future research to more precisely investigate the processes and cultural dynamics that influence countries to transform wellbeing in either a positive or negative direction.

Abstract 1504

INFLUENCE OF PRIMARY LANGUAGE ACQUIRED, TIMING OF LANGUAGE ACQUISITION, AND MODALITY ON RORSCHACH RESPONSES IN PUERTO RICAN DEAF ADULTS

Padin Ocasio V.*[1], Pedrosa Roche O.[1], Rodriguez--Soto N.[2]

[1]Carlos Albizu University ~ San Juan ~ Puerto Rico, [2]University of Puerto Rico, Medical Sciences Campus ~ San Juan ~ Puerto Rico

INTRODUCTION:
The Rorschach Inkblot Test is a projective psychological measure assessing personality, cognitive and emotional functioning. Administering and interpreting the Rorschach is challenging in cross-cultural contexts, as responses rely on verbal production. Deaf individuals are particularly affected, as their cognitive and emotional development is linked to early language acquisition. Language-related factors, such as prelingual (before language exposure) and postlingual deafness (after language acquisition) are relevant, as prelingual onset disrupts language acquisition and can impact functioning and psychological test results. Therefore, it is essential to examine the interaction among language-related factors (i.e., primary language acquired, timing of language acquisition, and test administration modality) in Rorschach responses among Deaf adults.

PURPOSE:
This qualitative case study explores language-related factors, such as primary language acquired (Puerto Rican Sign Language or Spanish), timing of language acquisition (prelingual or postlingual deafness), and test administration modality (Puerto Rican Sign Language or Written Spanish) in Rorschach responses of Deaf adults. By highlighting the interaction between language-related factors, this study contributes to cross-cultural adaptation of assessment practices.

METHODS:
Six Deaf Puerto Rican adults (prelingual and postlingual with Spanish or Puerto Rican Sign Language exposure) will complete the Rorschach in Puerto Rican Sign Language (LSPR) or written Spanish. Responses will be transcribed and coded using Exner's Comprehensive System, with Puerto Rican norms established by Díaz (2003). A content analysis with MAXQDA will identify patterns related to primary language acquired, timing of language acquisition, and modality.

RESULTS:
Findings are expected to highlight how primary language acquired, timing of language

acquisition and modality shape Rorschach codifications. We expect differences in special scores and organizational activity between administration groups.

CONCLUSION:
Equal access to psychological assessment for Deaf adults is urgently needed. Findings will underscore the importance of language-related factors in psychological testing and the need to develop standardized and culturally responsive practices for assessing Deaf adults.

Abstract 2060

DEVELOPING NLP MODELS TO DETECT AND DIFFERENTIATE BURNOUT FROM OTHER PSYCHOLOGICAL CONDITIONS

Apostu A.*, Iliescu D.

University of Bucharest ~ Bucharest ~ Romania

Burnout is often conflated with depression and anxiety due to overlapping symptoms, underscoring the need for refined detection methods. Building on the conceptual framework of Maslach and Leiter (2016), this study integrates a custom-developed questionnaire with transformer-based Natural Language Processing (NLP) models to identify unique linguistic markers of burnout. Data collection has begun, focusing on professionals in high-stress settings who complete open-ended items that probe emotional exhaustion, cynicism, and perceived efficacy. Preliminary analyses, conducted on an initial subset of responses, suggest that participants endorsing burnout-related experiences more frequently employ language reflecting detachment and diminished fulfillment. However, overlaps with depressive expressions indicate that refining feature engineering remains essential.

In the first phase, questionnaire validity was assessed through expert review and pilot testing. Currently in the second phase, partial NLP model training has demonstrated promising early accuracy, but further data acquisition is in progress to bolster representativeness. Preliminary scoring of open-ended responses indicates consistent patterns of cynicism and frustration among high-burnout respondents, hinting at distinct lexical cues that may effectively separate burnout from anxiety or depression. Nevertheless, more extensive data gathering is required to conclusively validate these patterns across diverse occupational contexts. This integration of self-reported responses with advanced text analytics addresses the growing need for reliable, context-specific burnout measures and clarifies distinctions between closely related psychological conditions.

Findings from this study are anticipated to provide actionable insights for mental health professionals and organizational decision-makers, contributing to more targeted and effective approaches to mitigating burnout.

EVALUATING CHATGPT AS A DIAGNOSTIC SUPPORT TOOL FOR ADOLESCENTS AND YOUNG ADULTS: A COMPARATIVE STUDY

Colón De La Rosa S.*[1], Martínez--González K.[1], Roche--Lima A.[1], Amaya--Ardilla C.[1], Colón--Rivera Y.[2], Burgos--Fernández S.[2], García--Rosa A.[2], Figueroa--González M.[2]

[1]University of Puerto Rico, Medical Science Campus ~ San Juan, Puerto Rico ~ Puerto Rico, [2]University of Puerto Rico, Río Piedras Campus ~ San Juan ~ Puerto Rico

Introduction. Adolescence and young adulthood represent critical developmental stages frequently associated with emotional and behavioral challenges, including symptoms of depression and anxiety. These difficulties often persist into early adulthood, highlighting the importance of accurate and timely diagnosis. While evidence-based interventions such as Cognitive Behavioral Therapy (CBT) are widely implemented, the diagnostic process itself remains complex. Artificial Intelligence (AI) tools such as ChatGPT have emerged as potential supports for clinical decision-making, yet there is limited empirical evidence on their ethical and effective integration into mental health practice.

Purpose: This study aims to evaluate the use of ChatGPT as a diagnostic support tool for licensed clinical psychologists working with adolescents and young adults. The research examines diagnostic accuracy, professional confidence, and ethical considerations across different conditions of diagnostic practice.

Method: We designed 20 simulated clinical case vignettes reflecting symptoms consistent with depression, anxiety, and related conditions. Cases were assessed under three conditions: (1) ChatGPT alone, (2) licensed clinical psychologists without AI, and (3) clinical psychologists using ChatGPT as a supportive resource. Diagnostic accuracy was compared across conditions, and professional confidence was measured using standardized self-report ratings. In addition, focus group discussions were conducted to gather qualitative insights regarding perceived benefits, challenges, and ethical implications of AI-assisted diagnostic reasoning.

Results: We compare diagnostic accuracy and confidence levels between conditions. Preliminary data analysis highlights the potential of ChatGPT as a complementary resource to clinical psychologists working with adolescent and young adults. Qualitative findings will highlight clinicians' perspectives on the integration of ChatGPT into their workflows.

Conclusions: This study contributes to the growing literature on AI in clinical psychology by examining both its potential and its limitations in diagnostic support. Findings will

inform future T2 (Translation to Patients) research and lay the groundwork for T3 (Translation to Practice) studies on applied implementation in real-world clinical contexts.

Abstract 2462

GENERALIZABILITY AND COMPUTATIONAL STABILITY OF LARGE LANGUAGE MODELS FOR LANGUAGE-BASED PSYCHOPATHOLOGY DETECTION

Eyrikaya E.*

Ankara University ~ Ankara ~ Turkey

Introduction: Recent advances in large language models (LLMs) have enabled substantial progress in detecting and classifying psychopathology from linguistic data. However, their clinical applicability remains uncertain, as (1) their ability to generalize to data beyond the characteristics of the training sample or to non-standard linguistic inputs has not been sufficiently investigated, and (2) performance variations across different computational environments, such as GPU types, raise concerns regarding model consistency.

Purpose: This study examined the consistency and generalizability of language-based psychopathology classification models. Specifically, it investigated (1) whether GPU type influences the performance of BERTurk-based models trained for psychopathology detection, and (2) how well these models generalize when tested on data differing from their training sample.

Method: Using the dataset from Eyrikaya and Dağ (2025), models were trained with identical hyperparameters on four GPUs (V100, A100, L4, and T4) to isolate hardware-related effects. As in the previous study, the dataset(N=2551) was filtered based on response quality, age (18-43), at least university student status, and token-length criteria, ultimately yielding a pool of 1690 participants. Following training, all models were evaluated on three validation sets used in the prior study and one newly constructed test set. This additional dataset (Outlier_Test_Set, n=450), created from the previously excluded participants (n=861), was used to assess out-of-sample generalizability, reflecting model robustness beyond the training distribution.

Results: Model performance remained stable across all validation sets (mean baseline≈.80 AUC). Notably, the Outlier_Test_Set yielded the highest AUC (≈.84) across GPUs. Importantly, performance differences across GPU types were minimal (Δ≈0.02 AUC), indicating that hardware variations had a negligible impact on model outcomes.

Conclusions: These findings demonstrate that LLM-based psychopathology models are both consistent and generalizable across different GPU hardware and sample characteristics. They also indicate strong robustness and even improved generalization when applied to data beyond the original training distribution, highlighting the models'

reliability and potential for scalable psychological assessment.

Abstract 1137

THE ASSOCIATIONS OF ATTACHMENT TO CONVERSATIONAL ARTIFICIAL INTELLIGENCE AND MENTAL HEALTH: A PSYCHOLOGICAL NETWORK ANALYSIS

Lin L.*[1], Chan H.[2]

[1]Lingnan University ~ Hong Kong ~ Hong Kong, [2]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong

Emerging research has shown that humans can form emotional attachment to Conversational Artificial Intelligence (CAI) through interaction with the system. CAI refers to the systems that mimic human conversations, which are increasingly capable of providing personalized and emotional responsiveness. The attachment to CAI possibly brings about benefits and risks to individuals' mental health. According to attachment theory, attachment has four features, including safe haven (i.e., turning to attachment figures for a sense of safety during times of distress), secure base (i.e., obtaining confidence from attachment figure for active exploration and personal growth), proximity-seeking (i.e., maintaining or restoring closeness to the attachment figures), and separation anxiety (i.e., feeling uneasiness and distress when attachment figure is unavailable). However, past studies usually consider attachment to CAI as a unidimensional construct; little is known about which features are more associated with mental health outcomes. To fill this gap, we examined the associations between the four features of attachment to CAI and six indicators of mental health (i.e., problematic CAI use, depression, anxiety, life satisfaction, positive affect and negative affect) using psychological network analysis based on a group of young frequent CAI users (N = 399, Mean age = 22.9, SD = 2.09, female N = 264). The results showed that problematic CAI use showed partial correlations with all features except for secure base, with the strongest correlation to separation anxiety. Depression showed a positive partial correlation with separation anxiety only, life satisfaction showed a positive partial correlation with secure base only, and positive affect showed a positive partial correlation with proximity seeking. Anxiety and negative affect showed minimal partial correlations. The nuanced results highlight the differential roles of four attachment features in mental health outcomes, suggesting a need to elucidate the benefits and risks associated with CAI attachment by looking at its different manifestations.

Abstract 434

OPTIMIZING RISK ASSESSMENT SCORING IN FORENSIC PRACTICE: A COMPARISON OF MACHINE LEARNING AND MANUAL APPROACHES

Rieger D.*[1], Brown S.[2]

[1]Carleton University / Orbis Partners ~ Ottawa ~ Canada, [2]Carleton University ~ Ottawa ~ Canada

As jurisdictions and instrument developers look to optimize scoring to meet specific population needs for risk assessment, an open question is which scoring method is most optimal. Popular methods range from manual simple scoring approaches (e.g. Burgess) to more complex machine learning algorithms (e.g. random forests) to develop optimized scoring. Prior comparisons between scoring approaches have shown that different methods appear to produce similarly acceptable levels of predictive validity (Cunningham & Sorensen, 2006; Ghasemi et al., 2020; Grann and Långström, 2007; Hamilton et al., 2014; Leu et al., 2011; McLaren & Rieger, 2024; Tollenaar & van der Heijden, 2013). Considerations for item inclusion and weighting of static over dynamic information is also important depending upon what the tool is designed to inform. The present research provides a comparison of scoring methods across prediction as well as an overview of the drawbacks of each approach. Scoring was developed for the ReduCE (Author, 2024) tool using manual (Burgess, Nuffield, modified Nuffield, regression) and machine learning (artificial neural network, random forests) with an unweighted comparison. ReduCE intentionally incorporates items to gauge current risk, including historic static criminal behavior, recent behavior, and evidence of strength factors that may mitigate risk. To mimic parole practice, the optimal scoring approach ensures item inclusion and static item weight does not negate the impact of information that inform recent behavior and may mitigate risk. Overall, the machine learning approaches did not outperform the manual methods in this study. Use of machine learning methods did not outweigh the threats to decision-making introduced by the lack of transparency in item inclusion and weighting.

Abstract 1801

EVALUATION OF LLM TO LIKERT-TYPE PSYCHOMETRIC SCALE ASSESSMENT

Yasui A.*[2], Komamizu T.[1], Masuda T.[2]

[1]Nagoya University ~ Nagoya ~ Japan, [2]Bunkyo University ~ Koshigaya ~ Japan

AI technologies have been increasingly grown, and some studies have used large language models (LLMs) response to psychological scales. However, the psychometric validity of such responses has rarely been tested. As far as known, LLM outputs may contain distortions and the use of LLMs in psychometrics in Likert-type scales remains underexplored. Therefore, more direct analyses, such as comparisons with the consistency of human responses or confirmatory factor analyses, are required.

To deal with this issue, this study examined how LLMs with assigned personas respond to Likert-type scales. This study generated 300 responses using GPT-4o-mini for each of 15 conditions defined by three dimensions: type of information (Big Five, time perspective [TP], both), granularity (two-level, five-level, factor scores), and format (numeric, textual, with factor scores provided numerically only). The model was instructed to complete the Big Five and TP scales, both in a 5-point Likert format.

The results showed that persona information, granularity, and presentation format produced minimal differences. However, when factor scores were provided, both scales yielded inconsistent responses, with reliability coefficients dropping sharply (Big Five: α = .33–.41; TP: α = .19–.27). In other conditions, the Big Five scale showed moderately acceptable internal consistency (α = .70–.83), whereas the TP scale remained unstable (α = –.04–.31). Validity analyses revealed more serious issues. Confirmatory factor analyses consistently indicated poor model fitting, with indices such as CFI (.30–.85) ranging from marginal to very poor.

In conclusion, Likert-type responses generated by LLMs cannot substitute for human responses in psychometric validation. Even when internal consistency appears adequate, validity is fundamentally lacking. While this study focused on the Likert scaling, future work should examine whether alternative scaling methods yield different outcomes. Until the mechanisms underlying LLM “personality” are better understood, their psychometric use should be approached with caution.

TEMPORAL DIMENSIONS OF PERCEIVED STRESS: A PSYCHOMETRIC COMPARISON OF THE GENERAL AND SPECIFIC VERSIONS OF THE PSQ

Cadena--Povea H.*, Hernández--Martínez M.A., Bastidas--Amador G.

Universidad Técnica del Norte ~ Ibarra ~ Ecuador

Introduction: Understanding how stress manifests across different time frames is essential for selecting valid instruments and designing effective interventions in educational, occupational, and community contexts. Objective: To compare the psychometric properties of the general version (last 1–2 years) and the specific version (last month) of the Perceived Stress Questionnaire (PSQ) adapted for the Ecuadorian adult population. Method: Following translation, back-translation, expert review, and two pilot tests (N = 600), both versions of the PSQ were administered to 395 participants for exploratory factor analysis (EFA) and to 391 participants for confirmatory factor analysis (CFA) and invariance testing by sex. In addition, the four-factor model was confirmed in the general version using structural equation modeling (SEM). A non-clinical population was selected to obtain normative parameters representative of the general population. Internal consistency was assessed using Cronbach's alpha and McDonald's omega. Results: The general version exhibited a four-factor structure that accounted for 49.8% of the variance, while the specific version also yielded four factors, though with a different configuration, explaining 54.97% of the variance. In both versions, the first factor emerged as dominant, indicating the presence of a central dimension of psychological strain. Both versions demonstrated excellent internal consistency (α = 0,89 y α = 0,92). The CFA fit indices confirmed construct validity (CFI > 0,90; RMSEA < 0,06), as well as metric and scalar invariance by sex, supporting comparability across groups. Conclusions: The findings support the complementary use of both versions: the specific version for monitoring acute stress and the general version for longitudinal assessments. The results provide robust evidence of construct validity and offer normative data that can inform future research and guide the design of mental health interventions in Ecuadorian academic and community settings.

Abstract 665

AN INTEGRATED SEM FRAMEWORK FOR CONJOINT ANALYSIS ACROSS DIVERSE RESPONSE FORMATS

Cheng C.*

National Cheng Kung University ~ Tainan ~ Taiwan

Conjoint analysis is widely used to decompose holistic product evaluations into part-worth utilities, yet studies often rely on a single response format such as ratings. Alternative formats—including binary choices, paired comparisons, rankings, and categorical selections—are also common, but their coexistence has fragmented research and hindered cross-format comparisons. This study introduces an integrated structural equation modeling (SEM) framework that unifies diverse conjoint response formats within a single latent-variable representation. Building on the SEMWISE approach for rating data, the framework links structured preferences to observed responses through format-specific measurement models, allowing ratings, binary yes/no judgments, paired comparisons, rankings, and choice data to be analyzed coherently. A simulation study across six conditions (five single-format and one mixed-format design) demonstrates accurate parameter recovery and robustness, confirming that the unified preference structure can support estimation across heterogeneous data types. Overall, the proposed framework expands the methodological toolkit for conjoint research by enabling direct cross-format comparability, mixed-format analyses, and integration of evidence across studies.

Abstract 551

LATENT PROFILES OF CHARACTER STRENGTHS AND WELL-BEING: THE IMPACT OF DOMINANCE VERSUS IDEAL POINT MEASUREMENT MODELS

Goosen S.*, De Bruin D.

Stellenbosch University ~ Stellenbosch ~ South Africa

Introduction and Purpose:
This study examined how the choice of item response model—dominance versus ideal point—affects the identification of latent profiles of character strengths and their associations with well-being. While dominance models are commonly applied, recent evidence suggests that ideal point models may be more suitable for personality-type constructs such as character strengths. Using an inappropriate model may lead to biased trait estimates and distort subsequent latent profile classifications.
Method:
Participants were 872 university students who completed the IPIP-VIA Character Strengths Inventory and the Mental Health Continuum–Short Form. Trait estimates were derived using a dominance model (Generalised Partial Credit Model) and an ideal point model (Generalised Graded Unfolding Model). Separate latent profile analyses (LPA) were conducted for the two sets of trait measures.
Results:
Three distinct character strength profiles (low, medium, and high strengths) with acceptable fit emerged under both approaches. However, profile membership differed across models. The ideal point model yielded clearer differentiation between the high and medium profiles. ANOVAs revealed significant differences in well-being across profiles, with stronger effects under the ideal point model.
Conclusions:
Results demonstrate that the choice of measurement model affects latent profile identification and the relationships between the profiles and well-being. Ideal point models appear more sensitive in distinguishing individuals at higher trait levels, offering greater precision for identifying profiles, evaluating positive psychology interventions, and examining the role of character strengths in well-being.

Abstract 400

ANALYSIS OF MEASUREMENT INVARIANCE FOR THE FILIAL PIETY SCALE: A COMPARATIVE STUDY BETWEEN UNIVERSITY AND HIGH SCHOOL STUDENTS

Mao C.*, Chen Y.

Chihlee University and Technology ~ New Taipei ~ Taiwan

This study investigated whether the Filial Piety Scale applies to both high school and college students. We had to test measurement invariance, which involves a series of increasingly restrictive hypotheses. Different levels of invariance are assessed through a hierarchical procedure that compares four multi-group models in a fixed order, from the least to the most restrictive model.

The Filial Piety Scale included two filial factors: reciprocal and authoritarian. Reciprocal filial piety is characterized by gratitude and respect for parents' efforts based on affection, while authoritarian filial piety emphasizes hierarchical relationships and obligations that require children's compliance with their parents. The current study's sample consisted of 509 students, including 250 college students and 259 high school students.

An initial baseline model (Model 1) has no between-group invariance constraints on estimated parameters. Groups have the same form without restricting any non-fixed parameters across models. In Model 2, the model is the same across the groups and the factor pattern coefficients (loadings) are identical across groups because the pattern coefficients carry the information about the relationship between latent scores and observed scores. In Model 3, the factor loadings and measurement error variances were constrained to be equal in the two groups. Model 4 in this hierarchy was the most restrictive model, in which all three parameter matrices (factor loadings, intercepts, and residual variances) were simultaneously tested for equality. The results of these analyses revealed that Models 1, 2, 3, & 4 all had a good fit for RMSEA, GFI, and CFI. In the case of strict factorial invariance, the measurements across groups were unbiased and identical in terms of construct validity and reliability, as captured by the latent variables. The results show that the two factors in the Filial Piety Scale remained invariant across groups of university students and high school students.

CONTEXT MATTERS: RE-EVALUATING THE ABILITY OF PANAS IN ASSESSING EMOTIONAL EXPERIENCES OF WOMEN FACING STREET HARASSMENT

Narula N.*, Singh T.

Banaras Hindu University ~ Varanasi ~ India

Emotion measurement plays a crucial role in trauma research and policy evaluation. The Positive and Negative Affect Scale (PANAS) is widely used as a self-report measure for affective research among various populations. However, its use in trauma-affected samples, such as victims of street harassment, remains insufficiently validated. This study aimed to examine the factor structure and internal consistency of PANAS in a sample of street harassment victims and to assess the adequacy of the traditional two-factor affect model in this context.

Data was collected from 306 female participants who met the inclusion criteria. Exploratory factor analysis (EFA) was first conducted using Principal component analysis, followed by confirmatory factor analysis (CFA) using the DWLS estimator in JASP.

The scree plot in the EFA indicated a three-factor structure and thus those three components were extracted and subsequently rotated using the Varimax method. CFA supported this model moderately {$\chi^2 = 530.14$, $df = 149$, $p < .001$; Goodness of fit index (GFI) = 0.949; Root mean square error of approximation (RMSEA) = 0.092 [90% CI: 0.083–0.100]; Standardized Root mean square residual (SRMR) = 0.125}. Cronbach's alpha was also calculated for each subscale identified via EFA.

The result indicates that the three-factor model provides a significantly better fit than the null model, but does not meet all criteria for an excellent fit. Findings indicate that the PANAS may require structural adaptation for accurate affect measurement in populations affected by street harassment, and future validation efforts should emphasize context-specific model refinement.

Abstract 803

POSITIONING POSITIONALITY: AN ANALYSIS OF REFLEXIVITY IN QUANTITATIVE RESEARCH

Pownall M.*[1], Cordoba S.[2]

[1]University of Leeds ~ Leeds ~ United Kingdom, [2]London Met University ~ London ~ United Kingdom

Reflexivity is the process of critically examining how researchers' identities, values, and worldviews shape the research process. It is widely regarded as central to rigorous and ethical scholarship. While reflexive practice has long been established within qualitative traditions, its role in quantitative research is less developed. One emerging mechanism for embedding reflexivity in quantitative work is the use of positionality statements, in which researchers explicitly reflect on how their backgrounds and perspectives influence methodological choices and interpretations.

Advocates argue that positionality statements can advance three key goals: promoting equality, diversity, and inclusion; strengthening transparency and rigour; and enhancing ethical integrity. However, their use in quantitative research remains inconsistent and often superficial. Some journals have begun to encourage or mandate them, but in practice, statements are frequently reduced to brief demographic descriptions, with little engagement in how positionality informs research decisions. This raises the risk of tokenism rather than meaningful reflexive practice.

This study investigates how quantitative researchers currently employ positionality statements and what functions they serve within published work. Using a purposive sample of articles citing Jamieson et al. (2023), a widely used reflexivity toolkit, we conduct a reflexive thematic analysis to examine: (1) how positionality is framed (e.g., identity, values, epistemology); (2) where and how statements are integrated into articles; and (3) how disciplinary and institutional norms shape their form and content.

By focusing on quantitative research, this project addresses an underexplored but timely issue in applied psychology and beyond. The findings will contribute to developing clearer guidance for integrating positionality statements in ways that move beyond tokenism, supporting more intentional and transparent research practice. Ultimately, this work aims to normalise reflexivity as a cornerstone of methodological integrity across psychological research, regardless of paradigm.

CHARACTERISTICS AND PRACTICES OF FEEDBACK INFORMED BY ROUTINE OUTCOME MONITORING FOR ADULTS AND YOUNG PEOPLE ACCESSING ALCOHOL AND OTHER DRUG TREATMENT

Beck A.*[2], Hides L.[1], Stirling R.[3], Larance B.[2], Campbell G.[1], Baker A.[4], Hudson S.[4], Marsden J.[5], Pocuca N.[1], Connor J.[1], Farrell M.[4], Kelly P.[2]

[1]National Centre for Youth Substance Use Research, School of Psychology, The University of Queensland ~ St Lucia, QLD ~ Australia, [2]School of Psychology, Faculty of Arts, Social Sciences and Humanities, Northfields Ave, University of Wollongong ~ Wollongong, NSW ~ Australia, [3]Network of Alcohol and other Drugs Agencies ~ Potts Point, NSW ~ Australia, [4]National Drug and Alcohol Research Centre, University of NSW ~ Randwick, NSW ~ Australia, [5]Addictions Department, School of Academic Psychiatry, Institute of Psychiatry, Psychology and Neuroscience, King's College London, ~ London ~ United Kingdom

Introduction: Routinely monitoring therapeutic outcomes and processes, and using this data to provide clinicians and clients with progress feedback is central to evidence based practice for a range of chronic conditions, including substance use. Evidence supports the therapeutic benefits of outcome monitoring and feedback for people accessing treatment for mental health and substance use concerns (e.g. improved engagement and outcomes). However, research has largely focused on the impact of routine outcome monitoring and feedback on treatment effectiveness. Comparatively less attention has been paid to the development, characteristics, use and implementation of feedback, particularly within substance use treatment settings. To optimise the use of feedback in substance use treatment, improved understanding of feedback characteristics and practices is needed.

Method: A scoping review informed by guidelines from the Joanna Briggs Institute was conducted to describe: a) the nature and extent of evidence; b) the development, characteristics and use of feedback and c) implementation considerations. A systematic search of 11 online databases produced 796 articles. Independent title/abstract and full-text screening identified 20 evaluations of routine outcome monitoring and feedback for inclusion. Data extraction was performed independently by two researchers.

Results: Evaluations were primarily conducted in the USA (11/20), in community-based treatment settings (17/20) using non-randomised designs (14/20). Feedback characteristics and practices varied, but commonalities included technology-assisted outcome assessment to generate immediate, weekly, multi-dimensional feedback comprising a visual representation of change across time. Explicit guidance for using feedback to inform treatment was rare (1/20). Implementation considerations are discussed across fidelity and training practices; participant and provider experience; and barriers and enablers.

Conclusions: Improved attention to residential settings, diversity considerations, health literacy, provider training and fidelity are needed. To help clinicians use feedback in a

meaningful way to inform treatment, improved guidance is essential. The recently developed ‘Collect Share Act’ framework may serve as a useful template.

Abstract 1229

COGNITIVE DISENGAGEMENT SYNDROME ACROSS ADHD, AUTISM, AND INTERNALIZING DISORDERS: TOWARDS A TRANSDIAGNOSTIC CONSTRUCT

Boccaccio F.*[1], Pirrone C.[1], Buitelaar J.K.[2]

[1]Department of Educational Sciences - University of Catania ~ Catania ~ Italy, [2]Department of Medical Neuroscience, Donders Institute for Brain, Cognition and Behavior, Radboud University Medical Centre ~ Nijmegen ~ Netherlands

Introduction

Cognitive Disengagement Syndrome (CDS) is characterized by daydreaming, mental confusion, and hypoactivity. Distinct from ADHD, it is linked to internalizing symptoms, autistic traits, and impaired well-being. Whether CDS should be considered a transdiagnostic construct, a specifier, or an independent entity remains debated, requiring systematic comparison across clinical groups.

Purpose

This study aimed to (1) compare CDS across ADHD, autism and internalizing disorders, (2) test age and sex effects, and (3) examine functional impact on quality of life and CBCL DSM-oriented scales.

Methods

Participants were 958 referred children and adolescents (32.3% female; mean-age 10.66±2.84) at Karakter Child and Adolescent Psychiatry, the Netherlands, diagnosed for ADHD, autism, or internalizing disorders. CDS was measured with CBCL items 13, 17, 80, and 102 (CBCL-CDS-4). To address overlap with the CBCL-Affective Problems scale, an alternative score excluding item 102 (CBCL-CDS-3) was computed. Quality of life was assessed with the KIDSCREEN-27. Group differences were examined using t-tests, Welch's ANOVAs, and MANCOVAs controlling for sex and age. Sensitivity analyses excluded comorbidities. Functional impact was tested with regressions predicting KIDSCREEN-27 from CBCL-CDS-4, replicated with CBCL-CDS-3. Correlations with CBCL DSM-oriented scales were calculated, and Steiger tests compared their strength across domains.

Results

Autism and internalizing groups showed higher CDS scores than ADHD, both at total and item level, with findings confirmed in comorbidity-free sensitivity analyses. Adolescents scored higher than children on CBCL-CDS-4 in ADHD and autism; no sex-effects were detected. Across all groups, higher CBCL-CDS-4 scores predicted lower quality of life, with results replicated using CBCL-CDS-3. Steiger comparisons showed that correlations of all four CBCL-CDS items with CBCL-autistic traits and with CBCL-Affective Problems were consistently stronger than with CBCL-ADHD.

Conclusion

CDS was higher in autism and internalizing disorders compared to ADHD, predicted poorer quality of life, and was more strongly linked to affective and autism domains than to ADHD, highlighting its relevance as a transdiagnostic clinical construct.

Abstract 2315

SCOPE OF BRAINWAVE-LED DIAGNOSIS FOR ATTENTION-DEFICIT HYPERACTIVITY DISORDER IN THE WAKE OF LIMITED MENTAL HEALTH INFRASTRUCTURE

Basu S.*

Azim Premji University ~ Bengaluru ~ India

The global prevalence of adult Attention Deficit/Hyperactivity Disorder (ADHD) is steadily rising. In most cases, undiagnosed childhood ADHD manifests as adult ADHD. Its neurological intricacies, coupled with comorbid conditions and individual differences in symptom expressions, along with cultural complexities, often complicate the diagnostic and therapeutic models. The limitations of the existing therapies limit the generalizability of the traditional intervention's effectiveness. Trends in recent studies suggest the need to identify bio-cognitive markers of adult ADHD and develop a non-pharmacological intervention for the management of ADHD-related challenges. Research shows the association of bio-cognitive markers, such as increased activity in theta, alpha, and beta frequency bands at occipital and parietal brain areas, with comorbid conditions of depression and anxiety. Brainwave oscillations, particularly the alpha band, are often used as a discriminatory bio-cognitive marker between typically developing cases and those with ADHD across attention and working memory tasks. Interestingly, modulation of brainwave oscillations using brainwave entrainment (BWE) has also received prominence in promoting recovery through neural changes. Given its additional efficiency in reducing other psychological challenges like anxiety and depression, it is believed that BWE has the scope to manage the cognitive dysfunctions of adult ADHD. Thus, premise on the possible future of brainwave-based diagnosis and treatment for adult ADHD rests on two major research findings: a) brainwave-led biomarkers suggest neuronal differences between typically developing individuals and those with ADHD, and b) the promising results of brainwave interventions in improving cognition in these cases. Hence, in the current paper, we speculate the scope of using brainwaves at the crossroads of diagnostic and therapeutic modalities for adult ADHD. Our observations provide a future research framework on adult ADHD prognosis and enable subsequent symptom management.

Abstract 1535

DYNAMIC RELATIONS AMONG STRESS, EMOTIONAL FACTORS, AND NON-SUICIDAL SELF-INJURY IN ADOLESCENTS: A RANDOM-INTERCEPT CROSS-LAGGED ANALYSIS WITHIN THE EMOTION REGULATION PROCESS MODEL

Ling F.*, Wang Y., Zhang Z., Lei H., Zhang C.

Beijing Normal University ~ Beijing ~ China

Non-suicidal self-injury (NSSI) is a major global public health concern, defined as deliberate harm to one's own body tissue without suicidal intent. Drawing on the emotion regulation process model, which conceptualizes emotion regulation as the interaction of physiological, behavioral, and cognitive processes that alter emotional states, this study examines how stress, anxiety, and emotion regulation ability interact to sustain NSSI. A sample of 11,115 fifth- and sixth-grade students in Beijing (54.1% female; M age = 10.95, SD = 0.60) who had engaged in at least one episode of self-injury participated in four annual waves of data collection. Random-intercept cross-lagged panel models revealed that: (1) stress served as a negative trigger within the emotional system, showing an early negative association with NSSI but increasing later anxiety and NSSI severity; (2) NSSI and anxiety reinforced each other in a bidirectional vicious cycle, with each positively predicting the other over time; and (3) escalating NSSI impaired emotion regulation ability, which otherwise protected against anxiety. These findings suggest that worsening anxiety, stress, and the self-reinforcing nature of NSSI jointly deteriorate both the subjective-experiential system and the behavioral-expressive system, progressively undermining overall emotion regulation capacity. Early adolescent NSSI thus exhibits self-perpetuating characteristics, highlighting the importance of strengthening emotion regulation skills during high-risk periods to prevent onset and escalation. This study extends the benefit-impairment model by emphasizing both the preventive value of stress reduction and the role of early emotional changes in the development and maintenance of adolescent NSSI.

Abstract 1207

FROM SCROLL TO SCREENING: EVALUATING THEORY-BASED BEHAVIOURAL STRATEGIES AND EFFECTIVENESS OF SOCIAL MEDIA RECRUITMENT IN A DUTCH RANDOMIZED CONTROLLED TRIAL ON DEPRESSION SCREENING.

Zandbergen M.*[1], De Kok I.[1], Meike T.W.[2], Fleur S.[2], Jansen E.[1]

[1]Erasmus MC, University Medical Center Rotterdam, Department of Public Health ~ Rotterdam ~ Netherlands, [2]Bureau Cambio ~ Nijmegen ~ Netherlands

Background

Recruitment for clinical trials is known to be challenging, particularly in mental health where stigma hinders enrolment. Social media offers a promising, costs-efficient alternative to increase reach and diversity. This study evaluated the effectiveness of theory-based behavioural advertisements strategies to recruit participants for a Dutch randomized controlled trial on mobile depression screening.

Methods

A six-month recruitment campaign was launched in the Rotterdam (Netherlands) region using Meta Ads including three 'flights'. Each flight tested advertisement variants based on six behavioural strategies with two different stock photos: autonomy ('choice is yours'), social importance('help improve mental health for all'), social proof('hundreds have already joined'), commitment('I want to help others'), scarcity('sign up today, registration closes soon'), and altercasting('you can lead early detection of depression'). Campaign performances were evaluated through impression, clicks, cost-per-click(CPC), click-through rate(CTR), and participant enrolment. Continuous A/B testing enabled systematic comparison and optimization across flights.

Results

The campaign generated over 600,000 impressions and 8,795 clicks across all flights. Autonomy-themed advertisements consistently outperformed others, achieving the highest CTR (1.83%) and clicks (n=2,650) in Flight I with variant a (two persons in the Rotterdam subway). In Flight II, autonomy again outperformed all other strategies, with variant b (two men in front of the Erasmus Bridge) generating more clicks(n=1,448) and a higher CTR(1.73%) compared to variant a (two persons in the Rotterdam subway; n=719 clicks,CTR 1.56%). Scarcity messages (variant a and b) showed moderate average effectiveness (n=702 clicks, CTR 1.49%), while social importance, social proof, commitment, and altercasting remained consistently less engaging across all flights(<1.3% CTR). Overall, CPC were stable across flights(€0.25–0.31). Of the total reach, approximately 500 individuals registered via the study website, of whom about 260 proceeded to full RCT enrolment by providing informed consent and completing the baseline assessment. When including all costs (campaign, management, and implementation costs), average cost per enrolled participant was €7.50.

Abstract 4910

IMPORTANT CONSIDERATIONS IN LICENSING AND CERTIFICATION TESTS

Geisinger Kurt F.*

Buros Center for Testing, University of Nebraska-Lincoln ~ USA

The nature of licensing and certification tests has changed in recent decades. Once, such tests were built primarily based on what was taught in professional programs. A group of well-known professors would meet to decide what should be assessed. Today, legal decisions, at least in the United States, require that they be built on the results of practice or job analyses as such tests are employment tests if licensure is required for employment. They can only reflect curricular influences to the extent that such training relates to entry-level work performance. This requirement makes it increasingly difficult to assess one's professional skills using paper-and-pencil and even computer-administered tests in some professions. If such tests are used, there are often important aspects of the job that are neglected or missed on the examination.

To achieve validity in licensing and certification examinations, the key step is often determining the test plan based on the results of a practice analysis. When one limits testing to multiple-choice paper-and-pencil measures, then components of the job are absent from the assessment. Most such tests are justified based on content evidence of validation; under the Uniform Guidelines on Employee Selection Procedures, a professional job/practice analysis is hence required.

Using experts to help identify critical job components may generate misleading components because the requirements for licensing and certification are that one has minimally met the requirements of an entry-level professional. In many instances, experts have not dealt with such individuals, for a prolonged period. Moreover, if the experts come from academe, the test may overly reflect curricular aspects rather than those related specifically to the work of the professional.

After these validation topics are discussed, the importance of standard-setting, mode of testing, reliability, fairness, and generalizability will also be discussed. Examples from psychology, engineering, and dentistry will be provided.

Abstract 2520

PRELIMINARY VALIDATION OF THE GIUNTI PSYCHOMETRICS PSYCHOLOGICAL SAFETY SCALE

Mandolesi L., Pettenà I., Busdraghi C.*

Giunti Psychometrics ~ Florence ~ Italy

Introduction
Psychological safety, defined as the shared belief that team members can express themselves without fear of negative consequences, is a crucial construct for organizational effectiveness, learning, and innovation. Despite the growing relevance of psychological safety in the workplace context, standardized measurement instruments are lacking. Existing international tools often present cultural and linguistic limitations that hinder their applicability across different organizational settings.

Purpose
This study aims to validate the Giunti Psychometrics Psychological Safety Scale, providing preliminary psychometric evidence and laying the foundation for establishing normative data across sectors.

Method
A pilot study was conducted with 100 participants from different organizations to refine the instrument and assess feasibility. Subsequently, a validation study was carried out with a larger sample of 300 employees, recruited across diverse industries and organizational roles. Analyses focused on reliability, factorial structure, and construct validity.

Results
The results were well accepted by participants and feasible to administer in organizational contexts. Reliability indices proved adequate. Preliminary factorial analyses identified a single latent construct, providing support for a unidimensional model of psychological safety and disconfirming some of the staged models proposed in previous literature.

Conclusions
These preliminary findings support the feasibility, reliability, and construct validity of the Giunti Psychometrics Psychological Safety Scale. Further analyses will establish normative data and provide more robust psychometric evidence, paving the way for its application in research, organizational development, and HR practices.

Abstract 1007

INTELLECTUAL HUMILITY IN THE DIGITAL AGE: A STUDY ON GEN-Z STUDENTS

Choubisa R.*[1], Ruparel N.[2], Ghosh A.[3]

[1]Birla Institute of Technology & Science, Pilani ~ Pilani ~ India, [2]Indian Institute of Management, Bodhgaya ~ Bodhgaya ~ India, [3]Indian Institute of Technology, Bhilai ~ Bhilai ~ India

The research examines how Indian Gen-Z students demonstrate intellectual humility in the contemporarily distracting digital environment. Intellectual humility comprises of four facets which include: independence of intellect and ego, openness to revising one's viewpoint, respecting other's viewpoints and lack of intellectual overconfidence (Krumrei-Mancuso & Rouse, 2016; Porter & Schumann, 2018). The construct has gained international recognition but researchers have not studied its presence among young Indians who will soon join the workforce. The study will use the 22-item Intellectual Humility Scale (IHS: Krumrei-Mancuso & Rouse, 2016) to survey N≥300 Gen-Z students across three distinct Indian regions. The study will use Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) to analyze the scale structure and detect regional variations in our datasets. The research investigates how Gen-Z students in India express their intellectual humility through its constituting dimensions and how each of these facets are manifested in the Gen-Z students. The research investigates how intellectual humility affects Gen-Z students' attitudes and their ability to communicate and adapt in digital learning and proposes to deduce implications related to their workplace attitudes. Overall, our research provides detailed information about intellectual humility in Gen-Z while showing its effects on digital workforce readiness and individual growth.

Abstract 2379

HIV ANXIETY SCALE: TURKISH ADAPTATION AND PSYCHOMETRIC PROPERTIES

Sayar G.*[2], Senkal Ertürk I.[1]

[1]Ankara University ~ Ankara ~ Turkey, [2]Bogazici University ~ Istanbul ~ Turkey

Introduction: Transmitted via sexual intercourse, blood, or breast milk, HIV compromises the immune system and can progress to Acquired Immunodeficiency Syndrome (AIDS) if left untreated. HIV anxiety is the fear or worry about contracting or being diagnosed with HIV, a concern often amplified by pervasive social stigma and misinformation. In settings where HIV stigma remains a significant public health barrier, such as Turkey, valid measurement tools are crucial for effective intervention. To measure this phenomenon, HIV Anxiety Scale (HAS) is developed in 2025, which demonstrated good factor structure, acceptable validity, and excellent internal consistency.

Purpose: The purpose of the study is to adapt and validate the Turkish version of the HAS.

Method: After obtaining permission, the scale was translated into Turkish, reviewed by experts, and back-translated for approval, ensuring linguistic and conceptual equivalence. Data from 300 adults will be collected online. Convergent and divergent validity will be tested using related psychological scales, and confirmatory factor analysis will assess the factor structure. It is hypothesized that the Turkish version of the HAS will demonstrate strong validity, reliability, and factor consistency.

Results & Conclusions: This study aims to fill a major gap in Turkish mental health research by providing the first standardized tool assessing this specific anxiety, which will enable accurate diagnosis and evidence-based treatment planning, support future epidemiological and psychological research, and contribute to cross-cultural understanding. Clinically, it may reduce unnecessary HIV testing, improve care efficiency, and enhance overall public mental health.

Abstract 2401

RECOGNITION TRAUMA: A QUALITATIVE FOUNDATION FOR THE IDENTITY MISRECOGNITION AND PSYCHOLEGAL TRAUMA INVENTORY

Malette S.*

Carleton University ~ Ottawa ~ Canada

Introduction:
Recognition Trauma refers to the cumulative psychological harm that arises when identity, belonging, or legitimacy are persistently denied by others or by institutions. While structural exclusion and social invalidation are known stressors, their psychological and relational consequences remain underexplored. Drawing from recognition theory (Taylor, 1992; Honneth, 1995) and trauma psychology (Briere, 2019; Herman, 1992), this study examines how legal exclusion and institutional revictimization shape the lived experience of identity denial among the Eastern Métis, who continue to suffer from the absence of official recognition.

Purpose:
The project aims to conceptualize Recognition Trauma and to develop a qualitative foundation for a new bilingual instrument—the Identity Misrecognition and Psycholegal Trauma Inventory (IMTI/PTM). The goal is to operationalize trauma associated with identity invalidation, cultural delegitimization, and legal exclusion leading to institutional revictimization.

Method:
A qualitative phenomenological approach was used, involving 30 preliminary semi-structured interviews across two Eastern Métis communities in Canada. Although the interviews were not originally designed to elicit recognition trauma explicitly, participants spontaneously described experiences of identity denial, institutional invalidation, and emotional rupture. Transcripts were coded and analyzed in NVivo 14 using Braun and Clarke's six-phase thematic analysis, ensuring systematic interpretation and analytic transparency. Codes were generated inductively to preserve participants' language and cultural meanings, while cross-community comparison supported the identification of shared and divergent themes.

Results:
Three interrelated dimensions of recognition trauma emerged: (1) Institutional Invalidation, reflecting legal and administrative exclusion; (2) Collective Delegitimization, describing social disbelief and intra-community tension; and (3) Psychological Revictimization, expressed through chronic shame, hypervigilance, and identity

fragmentation.

Conclusions:
This preliminary phase establishes a robust empirical and conceptual basis for the study of recognition trauma. By linking legal exclusion to psychological revictimization, the research bridges law and mental health while illuminating processes transferable to other marginalized groups or individuals facing systemic identity denial.

Abstract 1561

EFFECT OF QUESTIONNAIRE LENGTH AND PERCENTAGE OF INSTRUCTED RESPONSE ITEMS ON CARELESS RESPONDING BEHAVIOR: EXPERIMENTAL DESIGN.

Cuevas Ureña C.*, Hernandez A., Tomás I., González--Romá V.

University of Valencia ~ Valencia ~ Spain

Introduction: Self-report measures are widely used in psychological research, often through online platforms that facilitate administration and access to large respondent panels (Kim & Oh, 2022). While advantageous, such settings increase careless and insufficient effort responding (C/IER), where participants fail to attend adequately to items, producing poor-quality data (Podsakoff et al., 2012). Among the methods to detect C/IER, Instructed Response Items (IRI) (e.g., Mark the option “disagree”) are valued for its simplicity, robust metric properties, and ability to identify different C/IER patterns (Kam & Chan, 2018). Previous experimental studies manipulated C/IER to analyze IRI adequacy; however further research is needed on contextual factors that may influence C/IER and affect IRI performance.

Purpose: This study aimed to assess the effect of questionnaire length and IRI percentage on the occurrence of C/IER.

Method: We conducted an experimental study with three data collections, manipulating questionnaire length (50, 100, or 150 items) and IRI percentage (4% or 7%). Questionnaire length was counterbalanced across the data collections, and IRI percentage randomly assigned. The Time 1 sample included 548 participants (53.8% men, aged 20–65). We assessed the dimensionality of the C/IER scale and modeled the relationship between C/IER (wrong IRI answers) and both questionnaire length and IRI percentage.

Results: Results partially supported the unidimensional structure of C/IER responses. Poisson regressions for count outcomes showed that questionnaire length predicted C/IER behavior, whereas IRI percentage predicted C/IER only in the first data collection.

Conclusions: These findings confirm that questionnaire length impacts C/IER, while the lack of consistent effects of IRI percentage suggest that varying their proportion does not influence the emergence or detection of C/IER. Further analyses are needed to clarify the IRI scale’s non-unidimensionality, potentially linked to item format differences. Overall, the study offers guidance for managing C/IER efficiently in psychological research.

Abstract 2021

BEYOND INATTENTION: UNDERSTANDING FAILURES OF INSTRUCTED RESPONSE ITEMS IN SURVEY RESEARCH

Hernandez A.*, Tomás I., Cuevas Ureña C., González--Romá V.

University of Valenca ~ Valencia ~ Spain

Introduction

Instructed response items (IRIs) are a common method for detecting inattentive or careless responding in psychological survey research. Yet, failures are often treated as equivalent, without considering that different types of IRIs may be missed for distinct reasons, such as brief lapses of attention, complete disengagement, or content-related resistance.

Purpose

To understand the functioning of different types of IRIs, their failing rations, why they are failed and the alignment between the reasons and the intended purpose of IRIs.

Method

Data was collected using a panel of respondents. In total 339 participants completed the survey. Up to nine IRIs were embedded in surveys of random varying length (50, 100, or 150 items). IRI position was also randomized to control for order effects. Participants who failed IRIs were asked to provide reasons for their responses. Explanations were analyzed to identify inattentiveness categories (e.g., not reading carefully, distraction, disengagement) and other motives such as denial, defensiveness, technical difficulties, or disagreement with item content.

Results

Failure rates varied from 1.7% to 12.8%, suggesting that item content influence compliance. Thematic IRIs (e.g., technology, science) showed more failures and often elicited reinterpretation, while simple directives mainly reflected inattentiveness. Self-referential IRIs, such as “I am capable of following an order, therefore mark ‘totally agree’,” tended to provoke denial or defensiveness.

Conclusions

Although the sample of participants that failed the items and provided reasons is quite small, results suggest IRI failures cannot be uniformly attributed to same levels of inattention. Failures reflect diverse processes depending on item type, ranging from minor lapses to resistance. Validating different IRI types is essential to understand attentional problems and improve the accuracy of data quality assessments in psychological research.

Abstract 2711

INVESTIGATING DIFFERENTIAL ITEM FUNCTIONING IN THE EXTRAVERSION DIMENSION OF BIG FIVE PERSONALITY TRAITS THROUGH A MIXTURE ITEM RESPONSE THEORY MODEL WITH INDICATOR SELECTION

Jing Z.*[1], Wang P.[2]

[1]Shaanxi Normal University ~ Xi'an ~ China, [2]Xi'an University of Posts and Telecommunications ~ Xi'an ~ China

The present study investigates the presence of Differential Item Functioning (DIF) within the extraversion dimension of the Big Five personality traits, with particular attention to the potential influence of demographic variables. Rather than focusing on manifest DIF, this study explores latent DIF arising from population heterogeneity by employing a Mixture Item Response Theory (MixIRT) model, which identifies homogeneous subgroups that may exhibit DIF more clearly. To facilitate subgroup identification and improve the detection of latent DIF, we introduced a novel artificial intelligence algorithm, the Hybrid Ant Colony Optimization (hACO) algorithm. This algorithm was employed to select indicators and the number of subgroups automatically within the MixIRT model, enabling us to form subgroups that most clearly reflect DIF in the extraversion-related survey items. The use of the hACO algorithm improves subgroup formation precision and highlights differential responses that would otherwise remain undetected with traditional methods. To qualify the subgroup heterogeneity, we applied the Generalized Many-Facet Rasch Model (GMFRM), a comprehensive tool for assessing item responses across multiple facets. The GMFRM accounts for the multifaceted nature of the population heterogeneity and provides a rigorous framework for examining DIF in personality measurement. We utilized the open-source dataset titled "Answers to Duckworth's Grit Scale (Duckworth et al., 2007) appended to the IPIP Big Five Scales" to evaluate the DIF of extraversion. This dataset includes responses to 62 items, comprising a 13-item vocabulary checklist and 20 demographic variables. The results of this study offer valuable insights into the fairness and bias of the psychological scale when applied to diverse populations. The integration of the MixIRT and GMFRM models, combined with the innovative use of hACO for variable selection, demonstrates a robust methodological approach for addressing latent DIF in psychological assessments.

Abstract 2216

APPLYING EXTENDED NETWORK ANALYSES TO IDENTIFY CENTRAL SYMPTOMS AND RISK FACTORS TRIGGERING DEPRESSION: EFFECTS OF GENDER AND CLINICAL STATUS

Semkovska M.*, Zhang D.

University of Southern Denmark ~ Odense ~ Denmark

Introduction
Network theory conceptualises psychological symptoms and related risk and protective factors (e.g., cognition, daily activities) as a system of mutually interacting components. Network models allow the evaluation of each factor's unique contribution to depressive symptom severity while accounting for their mutual interactions. Applied to twin designs, they can help ascertain whether the observed associations reflect an underlying genetic vulnerability or environmental influences.

Purpose
The study examined whether the network organization of depressive symptoms, cognitive functions, and daily activities differs by gender or depression diagnosis. Gender-specific patterns of associations were assessed in a cohort of like-sex twins. Then, monozygotic twins discordant for depression were compared to evaluate environmental contributions beyond shared genetics.

Method
For the extended networks construction, measures of depressive symptoms, cognition, and daily activities (intellectual, physical, social) were obtained from 3,752 Danish like-sex twins, 1,020 women pairs (459 monozygotic) and 856 men pairs (365 monozygotic). Networks were estimated with Gaussian Graphical Models regularised with glasso, and compared with the Network Comparison Test. Monozygotic and dizygotic co-twin networks within- and between- each gender group were compared. Differences between co-twins in 147 monozygotic pairs discordant for lifetime depression were also evaluated.

Results
No significant differences were detected between monozygotic and dizygotic networks within gender. However, networks differed significantly by gender in overall strength, structure, and partial correlations linking specific depressive symptoms with risk factors. Among discordant monozygotic pairs, affected twins showed denser networks connecting depressive symptoms, cognition, and activities compared to unaffected co-twins, although the relative structure of associations was similar.

Conclusions

Gender differences in network strength appear best explained by environmental factors, with women showing stronger symptom–risk factor connectedness. In discordant monozygotic pairs, depression was associated with heightened network density, also suggesting that external events affecting the ability to feel happiness likely trigger the psychopathological process (depression network activation), independently of genetics.

Abstract 310

ASSESSMENT OF INTRAPERSONAL AND INTERPERSONAL EMOTION REGULATION STRATEGIES: A VALIDITY AND RELIABILITY STUDY IN A TURKISH SAMPLE

Gunduz I.D., Can S.*

Izmir University of Economics ~ Izmir ~ Turkey

Emotion regulation is fundamental for maintaining psychological well-being and building healthy interpersonal relationships. Emotion regulation strategies are generally divided into intrapersonal and interpersonal categories. However, comprehensive measurement instruments that assess both dimensions simultaneously are scarce, which often results in neglecting the social context of emotion regulation. To address this gap, the Emotion Regulation Strategy Scale (ERSS) was developed to evaluate nine distinct strategies used at both intrapersonal and interpersonal levels. The current study aimed to examine the psychometric properties, specifically the validity and reliability, of the ERSS within a Turkish sample. The ERSS was first translated into Turkish using a forward-backward translation procedure, ensuring conceptual and cultural equivalence through expert evaluations. Cognitive interviews were subsequently conducted to refine linguistic clarity and cultural appropriateness. The psychometric evaluation involved adult participants who completed the finalized Turkish version. Confirmatory factor analysis (CFA) was conducted to verify the original nine-factor structure of the scale. Reliability was assessed by calculating internal consistency (Cronbach's alpha coefficients) and test-retest reliability. Additionally, convergent validity was examined through correlations with conceptually similar constructs. Preliminary analyses indicated that the Turkish ERSS reliably assesses both individual and interpersonal dimensions of emotion regulation. CFA supported the original factor structure of the scale. Cronbach's alpha coefficients indicated strong internal consistency across subscales. Convergent validity analyses revealed meaningful and expected relationships between ERSS subscales and related constructs, providing further support for the validity of the instrument. The Turkish version of the ERSS offers a robust tool for evaluating emotion regulation strategies in both research and clinical settings, addressing individual and social regulatory processes comprehensively.

Abstract 95

DEVELOPMENT OF THE VICTIM SENSITIVITY IN ROMANTIC RELATIONSHIPS SCALE (VSRRS) AND EVALUATION OF VICTIM SENSITIVITY BY GENDER IN TURKEY

Dogruyol S.*

Cag University ~ Mersin ~ Turkey

It is clearly seen that there is no measurement tool that evaluates the level of victim sensitivity in romantic relationships in the related literature. In the current study, the main purpose was to develop a valid and reliable measurement tool to understand how the concept of justice sensitivity in romantic relationships is perceived by married adults and to examine whether victim sensitivity differs by gender in Turkish culture. The study focuses on the effects of victim sensitivity, which constitutes one of the dimensions of justice sensitivity, on romantic relationships. The study focuses on the effects of victim sensitivity, which constitutes one of the dimensions of justice sensitivity, on romantic relationships. Within the scope of the research, victim sensitivity, one of the dimensions of justice sensitivity, was examined. The sample of the study for exploratory factor analysis included 325 adults, and confirmatory factor analysis consisted of 410 adults. The Exploratory Factor Analysis (EFA) findings revealed a 17-item structure with a single factor. The model fit indexes obtained from the Confirmatory Factor Analysis (CFA) pointed out verifying a one-factor solution. It was also found that item-total correlations varied between 0.43 and 0.69. In fact, Cronbach's alpha internal consistency coefficient and composite reliability (CR) analysis were performed for the reliability of the scale. Accordingly, the Cronbach alpha was found to be .90, and the CR value was found to be .90. On the other hand, research findings revealed that women had significantly higher levels of victim sensitivity compared to men in their romantic relationships. In conclusion, it is determined that VSRRS can measure victim sensitivity in the context of romantic relationships in Turkish culture in both a valid and reliable way.

Abstract 362

PSYCHOMETRIC ASSESSMENT OF A NEW MEASUREMENT OF BELONGINGNESS

Karimi L.*

Leila Karimi ~ RMIT UNIVERSITY ~ Australia

A review of belongingness as a construct is vital, as even after three decades the concept has been described as “broad, vague and under-theorised” (Ward, 2022). A precise and shared understanding of belongingness will facilitate the operationalisation of the construct as an entity distinct from the outcomes and antecedents with which it is closely related. This in turn may facilitate the refinement of both belongingness-centred theoretical perspectives and practical interventions. This study, therefore, will develop a new measure of belongingness and will examine the main predictors and outcomes of belongingness in work settings.

Abstract 1313

VALIDATING A GAME-BASED COGNITIVE ABILITY ASSESSMENT FOR PREDICTING ACADEMIC PERFORMANCE IN SOUTH AFRICA

Adams S.*, Apostoli B.

Stellenbosch University ~ Stellenbosch ~ South Africa

Cognitive ability is one of the most robust predictors of job performance and long-term career success. It is also strongly associated with academic achievement, making it a valuable measure in educational settings. Given the close link between academic and workplace performance, high academic achievement can be viewed as an early indicator of employability, reflecting individuals' ability to sustain concentration, acquire specialised knowledge, and develop expertise.

In this context, our research focused on the validation of Cognify, a game-based assessment of general cognitive ability among a sample of South African university students. Originally developed for employee selection, Cognify has shown promise in predicting performance in multiple contexts. However, given South Africa's diverse and complex sociocultural environment, local validation of assessments remains critical to ensure reliability, fairness, and the avoidance of bias.

Using a cross-sectional design with 219 university students, the study examined the reliability and validity of Cognify. Results indicate adequate reliability, strong construct validity, and acceptable model fit, alongside moderate convergent and predictive validity, when compared to Raven's Progressive Matrices. These findings support the utility of Cognify for assessing cognitive ability in university students within the South African context.

The findings provide initial support for the use of Cognify as a cognitive assessment tool among university students in South Africa. While the results are consistent with international research on the psychometric soundness of Cognify, the study highlights the importance of contextual validation in ensuring fairness and equity. Over, the study contributes to global discussions on technology-based assessments by demonstrating both the potential and the challenges of applying game-based measures in diverse cultural contexts.

Abstract 1106

VALIDATION OF THE PERCEIVED SOCIAL INFLUENCE AFTER INFIDELITY QUESTIONNAIRE

Dębska J.*[1], Walecka--Matyja K.[2]

[1]University of Lodz, Univeristy od Lodz Doctoral School of Social Sciences ~ Lodz ~ Poland, [2]University of Lodz,Institute of Psychology, Department of Relationship Psychology and Interpersonal Diversity ~ Lodz ~ Poland

Introduction:
Deciding whether to stay in or leave a romantic relationship after infidelity is a complex and stressful challenge. Research shows that, besides individual emotions and values, social factors – including the opinions of close others – strongly shape this process. Existing measures capture only general social support, ignoring its direction, quality, and strength.

Purpose:
This study aimed to examine how post-infidelity relationship decisions relate to social influence by developing and validating the Perceived Social Influence after Infidelity Questionnaire (KPWZ).

Method:
Guided by theories of normative and informational influence, an item pool was created to measure three dimensions: pressure to leave, pressure to stay, and autonomy-supportive neutrality, plus perceived influence strength across five sources (family, friends, mental health professionals, online groups, spiritual advisors). Content validity was assessed by expert judges, then the questionnaire was tested on adults with infidelity experience (N = 180).

Results:
Analyses showed high reliability (Cronbach's $\alpha = 0.78$) and satisfactory validity. Convergent validity revealed positive correlations with the Multidimensional Scale of Perceived Social Support ($r = 0.36$, $p < 0.001$), while discriminant validity with the Short Familism Scale confirmed the independence of constructs ($r = 0.09$, $p > 0.05$). The tool differentiates direction and strength of influence effectively, and participants rated it as clear and relevant.

Conclusions:
The KPWZ is a tool that enables quantitative measurement of perceived social influence in the context of romantic infidelity, taking into account both the quality and intensity of

influence. It has strong potential for use in psychological research on post-infidelity decision-making as well as in clinical practice and family counseling.

Abstract 975

PSYCHOMETRIC PROPERTIES OF THE STRENGTHS SCALE FOR ADOLESCENTS

Ruvalcaba Romero N.A.*, Orozco Solis M.G., Bravo Andrade H.R., Orozco Estrada V.O.

University of Guadalajara ~ Guadalajara ~ Mexico

Introduction: The Strengths Scale for Adolescents (Betancourt, Andrade, González & Sánchez, 2018) is an instrument developed in Mexico that has proven reliable for assessing aspects that foster positive adolescent development, including healthy habits, avoidance of risk behaviors, school expectations, anger expression, decision-making, parental support and supervision, and peer relationships. In light of the psychosocial changes brought about by the COVID-19 pandemic, it is important to examine whether these changes are also reflected in assessment instruments.
Objective: To analyze the psychometric properties of the Strengths Scale for Adolescents (FIE-A) in high school students. Method: Instrumental study with 315 students from a public university in Jalisco, Mexico. The scale evaluates adolescents' external and internal strengths. Exploratory and confirmatory factor analyses were conducted. Results: Initial findings revealed differences from the original scale, as the subscales "Responsibility" and "Household Rules" were excluded from the models. Two models were tested: the external strengths model with 29 items showed excellent fit indices, $\chi^2/df = 1.72$, CFI = .961, SRMR = .046, RMSEA = .049 [.043, .055]. The internal strengths model with 28 items also demonstrated adequate fit indices, $\chi^2/df = 1.85$, CFI = .958, SRMR = .051, RMSEA = .052 [.046, .059]. Evidence of convergent and divergent validity, as well as measurement invariance by sex, was also found. Discussion: The scale emerges as a solid and reliable instrument for evaluating external and internal strengths in Mexican adolescents within the post-pandemic context.

Abstract 2118

BEYOND THE WORKPLACE: DEVELOPING A SCALE TO ASSESS SEXUAL HARASSMENT IN SOCIAL LIFE

Demircioglu Z.I.[1], Toker--Gültas Y.*[1], Göncü--Köse A.[2], Ok A.B.[3], Sümer H.C.[4]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Çankaya University ~ Ankara ~ Turkey, [3]Ankara University ~ Ankara ~ Turkey, [4]Özyegin University ~ Istanbul ~ Turkey

Although sexual harassment (SH) toward women is a pervasive issue in both social and workplace contexts, most studies and existing scales have focused on workplace behaviors. Addressing this gap, the present study, supported by The Scientific and Technological Research Council of Türkiye (TÜBİTAK–Project No: 124K975), aimed to develop a scale assessing both the experience and perception of SH in social contexts beyond the workplace, including interactions with family members, friends, romantic partners, and individuals in proximal physical, social, and cultural environments. Initially, 60 women were interviewed. Thematic analysis was conducted using MAXQDA. In addition to previously identified SH factors among Turkish employees (i.e., insinuation of interest, sexual hostility, sexist hostility, and physical SH), a novel theme emerged: manipulated consent. Manipulated consent describes situations in which women are pressured, coerced, or psychologically influenced to engage in sexual intimacy while being led to believe they are freely consenting, often through relational, emotional, or cultural justifications. Based on thematic analysis, a 51-item Sexual Harassment in Social Life (SHSL) scale with five factors was developed and administered to two independent samples of women. Exploratory factor analyses (N = 305), resulted in a 42-item version, where sexist hostility and physical SH merged under a single factor, forming a four-factor structure. Confirmatory Factor Analyses (N = 420) demonstrated good model fit. This four-factor structure was identical across both the experience and perceptions of SH. Cronbach's alphas ranged from .90 to .95. Construct validity was supported through correlations between the SHSL factors and ambivalent sexism, SH attitudes, right-wing authoritarianism, and religiosity. Findings support the scale's utility for assessing SH beyond the workplace, capturing behaviors within broader social and cultural contexts. SHSL content can be utilized in developing awareness programs combatting SH in social life.

EXTREMISM AND COLLECTIVE ACTION

Wednesday 22 July 2026 from 08:00 to 09:00

(B- Spadolini)

Stefano Livi (University of Rome "Sapienza" ~ Rome ~ I), Chair

In contemporary societies, extremism and collective action represent critical yet intertwined phenomena shaping political, social, and ideological landscapes. While extremism often manifests in radicalized beliefs and behaviors that challenge societal norms, collective action serves as a mechanism for social change, mobilizing individuals around shared grievances. This symposium examines the psychological, social, and structural underpinnings of both extremism and collective action, exploring factors such as identity fusion, relative deprivation, and the role of virtual environments in fostering group mobilization. Empirical research highlights how grievances—whether personal or collective—fuel ideological extremism and how digital tools, including virtual reality, may enhance participatory engagement in social movements. By integrating findings from diverse cultural contexts, this discussion underscores the need for nuanced interventions that address both the risks of radicalization and the potential for constructive collective action. Recognizing the dual nature of group mobilization as both a driver of extremism and a force for positive societal change is essential for developing evidence-based strategies that promote resilience against ideological violence while fostering inclusive and democratic activism

Abstract 4349

EXPLORING THE POWER OF VIRTUAL REALITY IN FOSTERING COLLECTIVE ACTION AMONG SEXUAL MINORITIES AND ALLIES

Elovainio R., Tassinari M.*, Jasinskaja--Lahti I.

Faculty of Social Sciences, University of Helsinki, ~ Helsinki, ~ Finland

Virtual reality (VR) provides social psychologists with exceptional tools to conduct ecologically valid experiments without compromising experimental control, particularly for addressing persistent intergroup issues in societies. VR facilitates safe and controlled interactions with outgroup members, which are not always feasible in real-life settings. As intergroup scholars have widely noted in recent years, while reducing majority prejudice is important for achieving societal harmony, addressing structural inequalities requires empowering minority groups to advocate for their rights along with mobilizing majority groups to join the social movement as outgroup allies. However, unlike prejudice research, the study of collective action among minority and majority groups within VR contexts remains almost totally underexplored, a gap this research aims to address.

Our study involves participants of diverse sexual orientations in a VR simulation replicating a pride parade. The strengths of this research are many-fold: the study looks at the collective action in VR through both majority and minority eyes; it addresses a methodological gap by employing in-VR behavioural measurements rather than relying solely on pre- and post-experience questionnaires, thus providing more accurate and immediate data; the study's design is a field experiment among VR users representing different social backgrounds, which in addition to a larger sample size also shows the potential of future VR interventions to cover larger populations; and lastly it addresses a common and longstanding issue of the in the ecological validity of VR studies by engaging participants into a VR simulation in their chosen safe environments, thereby minimizing researcher intrusion and by testing the role of the simulation in their willingness to engage in real-life collection action in the future.Wehypothesizethat,akintoreal-lifeexperiences,VRexperiencescanfosterintentionsforcollectiveaction,inelinewiththeSocialIdentityModelofCollectiveAction(SIMCA).Accordingtothismodel,socialidentity,feelingsofefficacy,positiveemotionssuchashope(forstructuralchanges)andjoy,moraloutragetowardstheoutgroup,andperceivedinjusticecanpredictfuturecollectiveactionintentions.Thisstudydemonstratesthatmarginalizedgroups,aswellastheirallies,cangainsignificantempowermentandmotivationtoadvocateforamorejustandequitablesocietythroughbriefVRsimulations.

Abstract 4347

THE ROLE OF COLLECTIVE AND INDIVIDUAL GRIEVANCES IN EXPLAINING IDEOLOGICAL EXTREMISM

Molinario E.*

Department of Psychology, Florida Gulf Coast University ~ Fort Myers ~ United States of America

Recent research has found that extreme behavior for an ideological cause is more likely under psychological conditions that induce a search for significance and social recognition (Kruglanski et al., 2022). Two types of motivation for significance have been identified: the quest for individual significance (i.e., individual grievances) rooted in personal experiences and the quest for collective significance (i.e., collective grievances) rooted in the perception that one's social group is humiliated and/or disrespected. Whereas past research has demonstrated associations between both forms of insignificance and political extremism, it is unclear what form of frustration has a major role in explaining extremism. To test the role of the demand for recognition and respect, at the individual and collective level in predicting violent extremism, we conducted two studies. Study 1 (Sri Lanka, N = 510) examined the relation between individual and collective grievances and extremism in a population of Tamils. Study 2 (Philippines, N = 509) focuses on extremism on behalf of Islam in populations of Muslims. Across the two studies (N = 1,019) the results show a consistent positive effect of collective grievances on willingness to sacrifice for religion and for a separate state, ideological extremism, whereas individual grievances had no effect on extremism. The results are discussed within the context of the literature on extremism.

Short. In two studies (N = 1,019) conducted with Tamils and Muslims, we found that collective grievances (i.e., the feeling of not being socially recognized as a group), but not individual grievances, positively predicted several measures of extremism (i.e., willingness to sacrifice, religious extremism).

Abstract 4346

WHAT DRIVES IDEOLOGICAL VIOLENCE? A GLOBAL TOURNAMENT OF RADICALIZATION PREDICTORS ACROSS 40 NATIONS AND TERRORIST GROUPS

Bélanger J.*

Carnegie Mellon University ~ Doha ~ Qatar

In an era where violent extremism poses increasing global threats, identifying the key predictors that drive individuals towards ideological violence is paramount. This study systematically compares 12 critical predictors of violent extremism identified through recent meta-analyses, including past activism, collective relative deprivation, obsessive passion, and identity fusion. Data from over 40 nations (N=10,659), covering left-wing, right-wing, and religious extremism, are analyzed in what we term a “predictor tournament”, where each variable’s influence is competitively assessed. We employ Random Forest regressions to rank these predictors based on their association with support for ideological violence. Our methodology includes not only broad population surveys but also unique data from two distinct groups of terrorists (N=160): one incarcerated and one evading capture, thereby providing a dual lens on radicalization pathways. Our findings reveal a striking consistency in predictors across both general populations and terrorist groups, underscoring shared psychological and contextual mechanisms. This convergence suggests that radicalization drivers transcend ideological boundaries, pointing to universal motivational patterns in the pathway to ideological violence and offering crucial insights for counter-radicalization strategies.

PSYCHOLOGY AND INNOVATIVE PROFESSIONAL INTERVENTIONS

Thursday 23 July 2026 from 14:00 to 15:30

(C- Spadolini)

Ole Tunold, Chair

Abstract 4942

WHY ISN'T PSYCHOLOGY BETTER KNOWN?

Hayes N.*

University of Suffolk, UK ~ UK

Some sciences are known in everyday life. Whether people understand the actual knowledge or not, chemistry, physics and biology are recognised as sciences, with a vague perception of what they are about. Psychology is no less a science, yet it is far less well known. Why is this?

Part of the reason lies in difficulties psychologists have in communicating our knowledge. Many of our specialised words are also current in everyday speech, but with a different, or less precise, meaning. Terms like "inferiority complex", "expectation" and even "positive thinking" have a specific meaning to the psychological practitioner, but a most vague and, in some cases inaccurate (to us) meaning in everyday speech. So, a diagnostic statement from a psychologist, while encapsulating a wealth of scientific knowledge, may seem to be unimpressive common sense to a lay listener.

Other psychological concepts are less unfamiliar in everyday discourse. Ideas such as constructive memory, selective perception, personal constructs and social representations are well known and established as part of the scientific knowledge held, and sometimes taken for granted, by psychologists. But they run counter to the naive assumptions of everyday living, in which memory is experienced as factual and social experience and conventions are assumed to be much the same for everyone.

The other sciences form an established part of the school curriculum, and our colleagues who teach psychology in schools are helping to establish the recognition of our science. But we have much to do, both within our own profession and outside it, to establish a similar recognition of our science in society as a whole. Yet when psychologists work with other professionals, their contribution is respected, and psychology becomes recognised as a specialised branch of knowledge. We need to build on this, which is the aim of this symposium.

Abstract 4943

GAINING RECOGNITION OF PSYCHOLOGICAL PROFESSION THROUGH SPORTS PERFORMANCE

Kajtna T.*

University of Ljubljana ~ Ljubljana ~ Slovenia

Sport psychology has been widely used in sport to enhance sports performance and as such can serve as a good beacon of importance of psychological profession. The beginnings of sport psychology come from two different origins, in the western countries it started out as a mostly research field and went less into applied work with athletes. In the eastern part of the world, especially during the Cold war period, sport was used as means of promotion of a country and as such, all possible means were used to improve athletic promotion. One of those fields was also transference of psychological techniques into athletic performance. Over the years with consistent spreading of knowledge and increased mobility of both people and knowledge, sport psychology has developed into a strong field, which is developed in both a practical manner as well as the research field.

This area can also develop through one interesting aspect - athletes, coaches, sports managers and other people involved in sport, are very willing to tell, that they are working with sport psychologists. Many fields of psychology, a lot of them from the clinical aspect, have to face a public stigma, as people are not always willing to say that they are seeing a psychologist, as mental health issues are often something, that people are not very willing to discuss.

In sport though, seeing a sport psychologist is often considered an advantage and athletes often say that working with a sport psychologist has helped them achieve better results. This is why sports psychology can be used to promote psychological profession and surely one of the reasons, why sport psychology is developing quickly – many sport psychologists today use techniques and approaches, widely used in third wave of psychotherapy, based on mindfulness, acceptance and commitment, promoting above all psychological flexibility.

Abstract 4944

PSYCHOLOGISTS AND ARCHITECTS. AN EXPERIENCE OF JOINT ACTIVITIES

Arcidiacono C.*

University Federico II, Efpa ~ Italy

Successful stories of psychologists and architects shared planning will be discussed.This contribution will describe the work of a team of psychologists and architects, that for several years organized commune training and joint urban planning in Naples' area. This presentation will highlight the importance of describing the own professional methodology and the difficult for psychologists in being recognized as professionals. Group facilitating competencies, team building, need analyzis, social awareness of needs in the interplay of individual and the social domain, and listening competencies, are specific methodologies of the psychological background. They are used in social planning and successful shared with the whole interprofessional team. Nevertheless, it is hard their recognition as psychological competencies and their added value to the role of psychologists.

Abstract 4945

WEALTH PSYCHOLOGY – APPLYING THE SCIENCE TO BENEFIT ALL, NOT JUST THE FEW

Evans N.*

NEC Advisory , UK

It is an important life skill to personally manage money well, yet so many people struggle, even when they objectively have some excess. In the area of personal finance, psychological: theories, tools, and techniques play a tremendous role in shaping the way people hold on, grow, or part with their hard-earned money. Arguably it is the institutions who better use this psychology than citizens, with some level of marketing persuasion and social influence applied. Increasingly both entities have to cope with bad actors using the psychology of deception in an attempt to defraud them of the money they hold.

This paper will highlight the basic psychology helping 'ordinary' people in their finances - be they seen as consumers, customers, savers, business owners, investors, and similar. Innovative projects by the author as an applied psychologist will show some strong cases of return of investment and loss mitigation, as well as fraud prevention and vulnerability awareness. A showcase is formed of the direct impact in applying ‘proper psychology’ rather than giving platitudes and directives under such broad guises as ‘financial wellbeing’.

The underlying theme in all these applications is that Psychological Science is not merely a subset of Behavioural Science (or Behavioural Finance). Psychology adds a unique perspective by drawing upon established psychological knowledge of individual differences and group dynamics applied for wealth preservation and growth. A final prompt is made for psychologists to be more actively involved with financial institutions and government in helping all citizens better manage their money.

Abstract 4946

PSYCHOLOGISTS AS RECOGNIZED EXPERTS FOR PUBLIC WELLNESS

Tunold O.*

Norwegian Psychological Association, Norway, Efpa V. President ~ Norway

The psychologist community consistently experience that governments turn to political scientists, lawyers, technologists, medical doctors and behavioural economists in search for solutions, but often (COVID-19 in some countries being a notable exception) fail to include psychologists in the selection of experts.
Therefore, my presentation will give some input to understand this phenomenon.
The 3 main topic of this presentation will contribute to:

- The identification of how the profession is understood and valued
- The identification of obstacles to higher recognition and their solutions
- The identification of where psychologists are wanted, expected and employed or contracted for services

Final aim will be to define some paths for the improvement of the profession in the social and political domain.

03 - Division 3: Psychology and Societal Development

SOCIAL CHANGES - PSYCHOLOGICAL AND TRANSDISCIPLINARY APPROACHES TO DEALING WITH DEMOGRAPHIC ISSUES

Wednesday 22 July 2026 from 08:00 to 09:30

(D-Spadolini)

Daniela Eberhardt (ZHAW Department of Applied Psychology ~), Chair and Presenter
Christoph Steinebach (ZHAW Department of Applied Psychology ~), Discussant

This symposium focuses on psychological processes and practical implementation options for positively shaping social change processes, especially in connection with demographic developments and changing social realities.
Industrialised nations in particular are facing an ageing society, changes in social structures due political upheavals and polarization, rapid technological developments, and uncertainty and psychological stress for different age groups. The symposium focuses on different social groups and the psychological challenges they face, which require specific attention from a socially responsible society due to their specific life phase/situation. This requires in-depth psychological analyses and scientifically based transdisciplinary approaches for practical application that generate acceptance and are systematically reviewed and interpreted. The practical benefits are manifold, ranging from the classification of patterns of perception and action to the improvement of individual and collective development prospects and the promotion of social sustainability and social responsibility in the world of work and society.
The symposium uses an evidence-based perspective to address social and psychological challenges in a changing world. The contributions focus at least on SDG 3: Good Health and Well-Being, SDG 4: Quality Education and SDG 10: Reduced Inequalities. The discussion highlights how interconnected these problem areas are and how scientifically sound psychology can contribute to solving fundamental social issues across the lifespan and in various areas of life.

Abstract 3448

HEY – HOME TREATMENT IN THE EARLY YEARS: PARENT-INFANT PSYCHOTHERAPY AT HOME AND ONLINE

Braune--Krickau K.*

ZHAW Department of Applied Psychology ~ Zürich ~ Switzerland

Introduction:
This contribution focuses on the very beginning of life – the postpartum period. The transition to parenthood is often enriching, yet many families face significant challenges during the first year after birth. Parents may face a variety of contextual stress factors and peripartum mental health disorders are frequent. In the context of distress in parent-child interactions and child specific factors even very young children may develop mental health problems, most commonly regulatory disorders involving sleep, feeding, and soothing. Such early difficulties often persist and may negatively impact later psychological development.
Despite increasing availability of outpatient consultation services for parents with infants and toddlers, as well as some inpatient treatment options, there remains a shortage of mobile and online psychotherapeutic support for families during early infancy in German-speaking countries.

Method:
HEY (Home Treatment in the Early Years) is a pilot program developed by the Infant and Toddler Consultation Service at ZHAW based on a collaboration between the Institute of Psychology and the Institute of Midwifery and Reproductive Health. It targets families with infants aged 0–12 months who are insufficiently supported by outpatient services and for whom inpatient treatment is not indicated or not feasible. The three-month program combines home visits and online sessions across 12 treatment appointments. The intervention integrates parent-infant psychotherapy, video-based therapy and online parental counseling.
The approach is psychodynamically oriented and aims to enhance parental competence, strengthen reflective functioning, and improve parental sensitivity.

Evaluation:
The implementation of HEY is being scientifically evaluated using parent questionnaires, the CARE-Index (an assessment of the interaction quality), and qualitative interviews with parents.
Preliminary findings and learnings from the pilot implementation will be discussed with a focus on how to best support young families.

Abstract 3449

ORIENTATION ON THE LEVEL OF EMOTIONAL DEVELOPMENT TO SUPPORT THE WELL-BEING OF PEOPLE WITH DISORDERS OF INTELLECTUAL DEVELOPMENT WITH THE SEED-2

Meir S.*

Medizinisches Behandlungszentrum für Erwachsene mit Behinderungen/MZEB Berlin-Nord, GIB-Stiftung ~ Berlin ~ Germany

Adaption to social environment is for people with intellectual disabilities often challenging. They are confronted with expectations on their behaviour and adaptional skills due to their life age. But many of them don't pass development in the same speed and steps as they are aging physically.
The first look at them often is based on physical outlook. Especially people with no physically obvious retardation or malformation often are checked as not possibly being delayed in development and faced with according expectations and offers. Resultant behavior then can become maladaptive. This can be challenging and frustrating for all parts in social interaction.
The orientation on the developmental levels in emotional development is important to focus on the emotional needs in order to reach a good state of emotional satisfaction. This can give a base to being well and support to face the different challenges of daily life.

Method:
With the SEED-2 an external assessment is created, that is used in clinical and ambulant settings. It is one part of the assessment in MZEBs and results in a general classification for psychological diagnostics as well as in a differential recommendation to the constellation of support and therapy.

Evaluation:
The use of the SEED-2 is evaluated by control meetings during the treatment in MZEBs, and shows effects on well-being, measured by decline of maladaptive behavior and other medical features.

Abstract 3450

YOUNG PEOPLE'S SOCIAL LIVES IN A DIGITAL SOCIETY

Süss D.*

ZHAW Departement of Psychology ~ Zürich ~ Switzerland

Young people's social lives are increasingly taking place in hybrid environments. Face-to-face interactions are supplemented by interactions on digital social networks. It is often assumed that digital networks are displacing analog ones, making adolescents lonelier and causing them to lose social and communication skills. In addition to problematic forms of use, the focus is on content that is harmful to young people. Empirical studies can reveal which trends are becoming established in young people's everyday lives and what risks and opportunities are associated with them. The focus is on the relationship between well-being, stress, and the use of digital media.

Since 2010, the ZHAW Media Psychology Group has been conducting the JAMES study, a representative study on the media use of 12- to 19-year-olds, every two years. More than 1,000 young people throughout Switzerland are surveyed. The studies show how the media behavior of young people in Switzerland is developing in connection with rapid technological developments. The 2024 study, for example, revealed the increasing use of artificial intelligence by young people.

Key findings from the various surveys will be discussed, such as the role of influencers among young people in various areas of coping with developmental tasks, the use of smartphones and social media, and the impact of media on young people's mental health. The study examines media use in the context of young people's overall life realities.

Conclusions for practical application are drawn from the study findings, whether for media education in schools and families, the protection of young people by media and platform companies, or regulation by the state. The study series aims to contribute to all relevant socialization authorities taking their share of responsibility for ensuring that a digital society suitable for children and young people can emerge.

Abstract 3451

SUSTAINABLE SUCCESS ACROSS AGES: SOLUTIONS FOR AGE- FRIENDLY EMPLOYERS

Nuutinen L.*, Maisala--Mcdonnell H., Wallin M.

Metropolia University of Applied Sciences ~ Helsinki ~ Finland

Demographic change presents a major challenge in Northern Europe. In Finland, Sweden, and Estonia, ageing populations and shrinking labour forces require extended working lives. Older employees (55+) contribute expertise, resilience, and tacit knowledge, while age-diverse workplaces foster learning and innovation. Yet, ageism still limits opportunities and threatens workplace sustainability.

The SAFE (Solutions for Age-Friendly Employers) project brings together four partners —Tallinn University, Haapsalu College, and Golden League in Estonia; Metropolia University of Applied Sciences in Finland; and the Northern Dimension Partnership in Public Health and Social Well-being in Sweden—to improve employment opportunities for older workers.

The SAFE model was developed through country-specific assessments and ten workshops in social and healthcare organisations with supervisors and employees. Two individual supervisor interviews ensured managerial perspectives were included. Factors supporting and hindering age-friendliness were analysed and compared with literature findings. A pilot version was tested in 4–5 workplace units (approx. 40 participants) and refined based on feedback. It was presented at a cross-border seminar in October 2025, and the final version will be tested in 25 organisations.

The model includes a baseline survey, situational analysis, and tools for categorising organisations into three levels of age-friendliness: thriving, developing, or needing nurturing. Visually depicted and gamified, the model supports practical workplace development. Complementary tools include training programmes, workshops, podcasts, and policy recommendations for employers, policymakers, and stakeholders.

By embedding age-friendly values into organisational culture, the SAFE model promotes equality and sustainable employment across the life course. This presentation explores how the model addresses organisational factors such as management, inclusion, and flexibility, while reflecting on success factors and cross-sector collaboration challenges.

Abstract 3452

FLEXIBLE RETIREMENT – SELF-DETERMINED DEVELOPMENT FOR OLDER EMPLOYEES AND PRACTICAL BENEFITS FOR EMPLOYERS

Eberhardt D.*

ZHAW Department of Applied Psychology ~ Zürich ~ Switzerland

Demographic trends in industrialized nations are leading to a loss of know-how and experience as the baby boomer generation retires. Skills, technologies, and the willingness to employ older employees up to and beyond retirement age are changing. Age stereotypes and discrimination can lead to a loss of working capacity and well-being in working life. On the employee side, cognitive skills change over the course of a lifetime, as do priorities in lifestyle and much more.

Of the nearly 30,000 employees of the city administration of Zurich (Switzerland), approximately 40% of the workforce will reach retirement age in the next 5-7 years. Before the program flexible retirement was introduced, the average retirement age was 63. The program was developed, piloted, and introduced in an interdisciplinary collaboration. The aim is to give employees more flexibility in the final phase of their careers, promote well-being and reduce stress, reduce early retirements, and enable continued employment after the official retirement age of 65.

Prior to the pilot phase, 26 semi-structured interviews were conducted. Scientific studies and practical models were systematized with regard to competencies and changes in performance from a psychological perspective, as well as design options at the organizational level. Continued employment for people aged 66+ was piloted and evaluated with N=31 participants in three sectors (transport, care, and social work). The final program was developed and introduced in 2024 for all municipal employees in all sectors. The use and acceptance of the program, the perceived benefits for the employer, and the impact on the well-being of those involved will be evaluated in Q1 2026. In this presentation, we will discuss a range of psychological factors such as competence retention, performance behavior, knowledge transfer, wellbeing, and social sustainability and reflect on success factors in transdisciplinary collaboration in practical psychology.

THE GLOBAL PSYCHOLOGY ALLIANCE: INNOVATIVE APPROACHES TO MAXIMIZE IMPACT AND DRIVE SOCIETAL CHANGE

Wednesday 22 July 2026 from 09:30 to 11:00

(D-Spadolini)

Amanda Clinton (American Psychological Association ~ Was), Chair and Presenter

Global challenges require unified, global responses. The Global Psychology Alliance (GPA) is an innovative, nimble coalition, bringing together more than 80 national, regional and international psychological associations, scientific institutions, non-profit organizations and training programs from every continent. The GPA mission is to utilize psychological science to actively address global issues too big for any one association to tackle alone. Bringing together experiences, knowledge, and perspectives from every region of the globe enhances our collective ability to apply psychological science to effectively address societal issues. This session will provide an overview of the GPA organizational structure and horizontal philosophy of leadership, explaining how these foundations enable the Alliance to have current and future impact through (1) a global mentorship program, (2) United Nations advocacy, (3) democratically-selected content-focused working groups on the psychological components of climate change & sustainability, AI & digitalization, mental health & wellbeing, and marginalization & vulnerability. The final speaker will present a future-oriented summary of the GPA's roadmap of projects and activities moving forward. Through these varied approaches, panelists will explain how the Alliance applies psychology to drive positive societal change around the world, aligned with both the mission of IAAP and the aims of ICAP.

Abstract 3455

THE GLOBAL PSYCHOLOGY ALLIANCE: STRUCTURE AND LEADERSHIP

Clinton A.*

American Psychological Association ~ Washington, DC ~ United States of America

The Global Psychology Alliance established roots in 2019 at the Inaugural Summit on Psychology and Global Challenges in Lisbon, Portugal. Chief Executive Officers and Presidents from over 40 national, regional and organizational psychology associations from every continent of the world came together for a 3 ½ day working meeting with the aim of developing a road map to jointly address critical shared issues as highlighted in the Sustainable Development Goals. At the Lisbon Summit, the selected focus was Climate Change (SDG #13), resulting in an 18-month road map for collaborative next steps. Since that time, the GPA has continued to grow, now including over 80 countries and over 100 graduates of the Global Learning Leadership Institute, a program for graduate student and early career psychologists from across the world.

The GPA mission is to utilize psychological science to actively tackle global issues of such significance and complexity that they must be addressed in a collaborative fashion to have real impact. The GPA is explicit in its dedication to work in an inclusive, horizontal manner that allows for resource sharing with attention to context for local communities. This is independent of the length of time during which psychology has been established in a country and the status of recognition of the field.

The structure and philosophy of GPA have resulted in significant achievements ranging from leadership training for globally-minded psychologists to development of resources and tools relevant to mutual challenges (e.g., access to quality mental health care and effects of climate change), as well as high-level policy engagement at the United Nations and production of guidelines related to newly evolving challenges (e.g., digitalization). The GPA model has demonstrated how psychology and psychologists worldwide can come together and create highly meaningful change where it is urgently needed.

Abstract 3456

GLOBAL LEARNING LEADERSHIP INSTITUTE

Mclaughlin H.*

Kings College ~ London ~ United Kingdom

The Global Learning Leadership Institute (LLI) was founded in 2020 during the Covid pandemic and acknowledges the importance of leadership especially in challenging and uncertain times. Based on the psychological principles of inclusive leadership, the LLI is a mentoring programme with a difference. It is truly cross-cultural at its core, and the program enables emerging leaders to add value in their local context whilst gaining an appreciation of the broader global environment. The goal of LLI is to provide a framework through which emerging leaders can fulfil their potential as leaders in psychology. The aim is to enable, inspire, and motivate them and to provide opportunities to enhance their capabilities as leaders. To date, 108 emerging leaders have graduated, with a further 40 participants in the 2025-2026 cohort. At its heart is the relationship between the mentor and the emerging leader. The experience provides growth in a two-way context, with mentors gaining from the interactions as well as the emerging leaders themselves. The focus is on cross-cultural research and the application of psychological science in real world contexts. Each emerging leader puts the principles into practice through their capstone projects, and each project is directly linked to the United Nations Sustainable Development Goals 3,10 or 13. They can get involved within the wider GPA environment and learn from experts in the field as well as fellow colleagues from different countries from the global south and north. This session will explore the added value for psychology of the LLI approach and, through the lens of a mentee, will review the lived experience and learning from the LLI. The session will highlight the added value of the programme and its wider potential implications for cross cultural psychological research and practice.

Abstract 3457

THE GLOBAL PSYCHOLOGY ALLIANCE WORKING GROUPS

Kocmanová V.*[1], Gupta A.[3], Humphrey M.E.[4], Leader J.F.[2], Reyes M.E.[7], Ritter S.A.[5], Silva A.S.[6]

[1]Charles University and General University Hospital ~ Prague ~ Czech Republic, [2]European Federation of Psychologists' Associations ~ Brussels ~ Belgium, [3]Nova Scotia Health Authority ~ Halifax ~ Canada, [4]La Unión Centroamericana de Colegios y Asociaciones de Psicología ~ Tegucigalpa ~ Honduras, [5]Peace Practice for Intercultural Couple Therapy and Mediation ~ Budapest ~ Hungary, [6]Colombian College of Psychology ~ Bogotá ~ Colombia, [7]University of Santo Tomas ~ Manila ~ Philippines

The Global Psychology Alliance has four working groups:

Global Mental Health: The Global Mental Health Working Group aims to scale up mental health care globally. Two elements stand out as decisive: (1) the importance of clear guidelines for training primary care providers; and (2) the development of basic helping skills through a cross-cultural lens, including early training in psychological first aid, openness to socio-cultural diversity, and advocating for strengthening support systems.

Climate Change: The Climate Working Group aims to increase climate-positive action of individuals, communities, industry stakeholders and policymakers, with two primary focuses: (1) addressing the effects of climate change on mental health; and (2) utilizing behavioral science to motivate climate action (including national, institutional, community and individual levels). The GPA works closely with other NGOs and experts at the UN and regularly sends its representatives to high-level climate conferences such as COP and Bonn.

Marginalized and Vulnerable Communities: The Marginalized and Vulnerable Communities Working Group's vision is to strive for inclusive societies in which everyone matters. The group includes participation from over 30 individuals, over 20 countries, and 6 continents. The working group has distributed a survey across our global psychology community to learn about initiatives and needs related to marginalization and vulnerability and formed subgroups to identify projects. Knowledge and results of projects will be shared at the 2026 GPA summit.

Digitalization: The Digitalisation Working Group is developing guidance on the use of digital technologies in psychology, with a particular focus on artificial intelligence, aiming to safeguard human rights, promote trust, and ensure that technological innovation benefits individuals and communities worldwide. Drawing on psychological science and professional ethics, the group has identified ten core principles to shape digitalisation in

practice, training, and research, organised into three clusters: Ethics, Transparency and Rights; Professional Competence and Quality; and Bias, Access and Inclusion.

Abstract 3458

THE GLOBAL PSYCHOLOGY ALLIANCE AT THE UNITED NATIONS

Twose G.*

American Psychological Association ~ Washington, DC ~ United States of America

The American Psychological Association (APA), which provides the secretariat for the Global Psychology Alliance (GPA), has been accredited by the United Nations (UN) Economic and Social Council (ECOSOC) and Department of Global Communications (DGC) since 1999. APA has teams of Representatives in New York and Geneva - the latter in collaboration with the European Federation of Psychologists' Associations and the Federation of Swiss Psychologists - who bring psychological science to bear on the work of the UN through educating and advocating to foster dialogue and collaboration between psychologists, UN staff, member state representatives, and other NGOs to encourage the development of psychologically informed policies, practices, and programs. GPA provides one of psychology's most powerful tools at the UN through the global expertise represented in its membership. This talk will explain how Representatives at the UN collaborate with GPA members to advance concrete outcomes at the UN, for example, passage of a seminal General Assembly Resolution on Mental Health and Psychosocial Support in which the countries of the world pledged to prioritize mental health in national policymaking.

DECOLONIZING PSYCHOLOGY: GLOBAL PERSPECTIVES ON ANTI-RACISM, INDIGENIZATION, AND SYSTEMIC CHANGE

Wednesday 22 July 2026 from 11:00 to 12:00

(D-Spadolini)

Brigitte Khoury (American University ~ Beirut ~ Lebanon), Chair

Psychology, as both a science and profession, has long been shaped by colonial histories frameworks. While these paradigms have advanced knowledge in many domains, they have also marginalized Indigenous worldviews, sustained inequities, and contributed to systemic racism. This symposium addresses the urgent need to decolonize psychology by presenting diverse, global perspectives that interrogate dominant narratives and propose pathways toward anti-racist and socially just practice.
From Japan, Hanako Suzuki examines the tensions between imported Western psychological science and local traditions, highlighting the complex position of scholars situated between colonizer and colonized histories. Randal Tonks then explores efforts in Canada to indigenize psychology by integrating multiple knowledge systems, demonstrating the transformative potential of reconciliation in theory, pedagogy, and practice. Turning to Aotearoa New Zealand, Moana Waitoki and Kyle Tan present findings from national studies that expose systemic racism in psychology education and training, situating their work within the UN Sustainable Development Goals on health, education, inequality, and justice. From Puerto Rico, Marizaida Sánchez Cesáreo introduces the Better Ancestors System Change Model, illustrating how intersectional, community-driven approaches can dismantle structural racism and foster sustainable change in healthcare systems.

Together, these four presentations advance the Congress theme, New Directions in Applied Psychology, by critically interrogating psychology's colonial foundations and envisioning futures grounded in equity, plurality, and global responsibility. The symposium offers a transdisciplinary dialogue across regions and methodologies, underscoring psychology's potential to contribute to sustainable development and social transformation.

Abstract 3552

IN-BETWEEN COLONIZER AND COLONIZED AND SCIENCE AND TRADITION: PERSPECTIVES OF A SCHOLAR FROM JAPAN

Suzuki H.*

Ritsumeikan University ~ Osaka ~ Japan

Psychology in Japan has a long history of importing psychological knowledge from Europe and the United States since the 18th century. The development of the field has strongly been impacted by sociohistorical factors of modernization and occupation, and it has been struggling with the attempts to integrate the Western influences and traditional worldviews on human minds and mental health. Some efforts have been made to incorporate Japanese traditional value systems into psychological knowledge and practice; however, the Western influences on the knowledge production and human services are still very prevalent. While the world is becoming closer with each other and the worldviews from various parts of the world are becoming more intertwined with each other, it is becoming more difficult to pinpoint the appropriateness and adequateness of certain psychological knowledge on our minds and mental health. In this presentation, the presenter will share her journey of being a scholar from Japan which has a history of being a colonizer and whose academic discipline has been influenced by neocolonial trends, present the impact of Western-centric science on traditional worldviews, and discuss the importance of having critical lens on looking at socio-cultural-historical factors on human minds.

Abstract 3553

MOVING TOWARDS POST-COLONIALISM IN PSYCHOLOGY: EFFORTS TOWARDS INDIGENIZATION IN CANADA

Tonks R.*

Camosun College ~ Victoria ~ Canada

In recent years there has been a growth of discussion on the impact of colonization on psychological theory and practice around the globe. Canadian scholars, educators, and practitioners have engaged in considerable efforts to recovery from centuries of colonialist action and move towards reconciliation and the indigenization of psychology through the recognition of multiple knowledge systems. This presentation highlights some of those efforts to renew our assumptions around knowledge and power, systems of knowing, and pedagogical practices.

Abstract 3631

DECOLONISATION AND ANTI-RACISM IN PSYCHOLOGY IN AOTEAROA: ADVANCING THE UN SUSTAINABLE DEVELOPMENT GOALS

Waitoki M.*, Tan K.

University of Waikato ~ Hamilton ~ New Zealand

Psychology in Aotearoa New Zealand, as in other settler-colonial contexts, continues to grapple with the harms sustained through racism and the exclusion of Indigenous knowledge. Despite progress in challenging Eurocentric paradigms, systemic racism remains deeply embedded in the discipline, shaping the experiences of students, staff, and practitioners. These issues have been highlighted nationally through a claim of racism against psychology lodged with the Waitangi Tribunal, which investigates breaches of Te Tiriti o Waitangi—the Treaty of Waitangi. As part of the Working to End Racial Oppression (WERO) research programme, the Kia whakapapa pounamu te moana – may the seas be smooth as greenstone project examined the impacts of racism across psychology. A survey of programme directors (n = 15) revealed narratives that deferred responsibility for decolonisation, attributing inequities to the absence of Māori students and staff rather than to systemic barriers. A second survey of psychologists, academics, and students (n = 293) identified monocultural training practices, described through themes of the “gold standard of dominant knowledge,” “bread and butter versus condiments,” and “tokenism and afterthought.”

DOES PHOTO-BASED SOCIAL MEDIA AFFECT MY BODY IMAGE? - A BIOPSYCHOSOCIAL FRAMEWORK

Mohanty A.*, Jatin G.

Tata Institute of Social Sciences ~ Mumbai ~ India

Adolescence, marked by rapid biological and psychosocial transitions, is a phase especially vulnerable to external influences such as social media. The influence of photo-based social media on adolescent body image has intensified globally, yet research in the Indian context remains limited. This study investigates how engagement with photo-based social media platforms such as Instagram, Snapchat, and Facebook affects body image among adolescents aged 14 to 16 in an urban government school in Bhubaneswar, Odisha, India, with a special focus on differences across gender and the interplay of biological, psychological, and social variables, using a biopsychosocial framework. Employing a sequential explanatory research design, data were collected via structured surveys administered to 31 adolescents documenting their engagement with leading platforms and gathering quantitative data on perceptions of body size, shape, and societal ideals. The biopsychosocial framework was used to analyze biological, psychological, and social parameters shaping participants' body image perceptions. The research findings reveal that platforms such as Instagram, Snapchat, and Facebook are widely engaged with, by the adolescent population and significantly influence their perceptions of body image. Additionally, adolescents experience varying degrees of dissatisfaction with specific body parts including stomach, thighs, and hips, influenced by exposure to idealized body standards and frequent engagement with social media content. Gender analyses indicate significant psychological differences with a p-value of 0.018 in body image perceptions between male and female adolescents, with females showing greater vulnerability to societal appearance pressures and internalization of unrealistic body ideals propagated on social media. However, no significant gender differences were found in the biological and social dimensions of body image. The research confirms a distinct association between intensive photo-based social media use and negative body image perceptions among adolescents, particularly by amplifying psychological vulnerabilities.

THE SIGNS OF SOCIAL SAFETY: EMOTIONAL, COGNITIVE, AND BEHAVIORAL RESPONSES OF LGBTQ+ INDIVIDUALS

Katinaitė R.*, Žardeckaite -- Matulaitiene K.

Vytautas Magnus university ~ Kaunas ~ Lithuania

Introduction: The experience of social safety and belonging, rather than merely the absence of stigmatization or discrimination, may better account for the psychological well-being and flourishing of LGBTQ+ individuals. However, the mechanisms through which specific behaviors and situations are perceived as safe by the LGBTQ+ individuals, and the reactions associated with such experiences, remain underexplored. Thus, this exploratory study seeks to address this gap.

Purpose: The aim of this study is to explore how LGBTQ+ individuals evaluate the safety of unfamiliar social situations and to identify the emotional, cognitive, and behavioral consequences of experiencing social safety.

Method: Nine semi-structured interviews have been conducted with LGBTQ+ adults (aged 21-35) living in Lithuania about their experiences of social safety. Reflexive thematic analysis (Braun & Clarke, 2022), using inductive coding was employed to analyze and interpret the data.

Results: Six out of nine participants identified the feelings of unsafety as their primary reaction in unfamiliar situations, although all participants highlighted 47 visible, behavioral, and situational signs of safety that transformed social situation from unsafe to safe. This presentation focuses on the most frequently mentioned signs of safety (e.g. rainbow iconography, the presence of other LGBTQ+ individuals, normalization of LGBTQ+ identity) and the cognitive, emotional, and behavioral reactions that follow them (e.g. reduced tension and overthinking, the sense of normality).

Conclusions: These findings highlight social safety as a crucial factor of LGBTQ individuals' psychological functioning. Importantly, such safety can be strengthened through clear, unambiguous behaviors that foster a welcoming environment. Psychologists can apply this knowledge by actively cultivating safety in therapeutic contexts and broader community settings, thereby enhancing the well-being of LGBTQ individuals.

LEAVE YOUR CULTURAL BAGGAGE IN YOUR LOCKER: GROWING UP MUSLIM IN FRENCH CANADA

Etoubashi N.*, Kowalska M., Fuks N., Muis K.

McGill University ~ Montreal ~ Canada

Islamophobia is omnipresent in Western societies. Within Canada, however, it is markedly pronounced in the French-speaking province of Québec. Negative attitudes, identity politics, hate crimes, a massacre, and discriminatory laws all plague the Muslim communities in this province. Despite its gravity, there is limited research on Muslims' identity development and the impact of the school environment on their sense of belonging in this society. Semi-structured interviews were conducted with 16 Muslims from diverse and non-diverse cities in Québec (75% female, average age = 25 years old). Using Reflexive Thematic Analysis within a Critical Race Theory framework, eight overarching themes were developed. For identity development, these were: (a) Muslim Quebec identity is the putting-together of a mosaic, (b) Being Muslim is a pillar to my identity, (c) It's like balancing on a tightrope with no end, and (d) Realizing we are swans and not "ugly ducklings." Belonging was affected by school experiences, with the following themes: (a) Full belonging in Muslim schools, (b) My right to exist is respected in diverse schools, and (c) Spirit murder: The price of an education in White schools. Regarding solutions to tackling Islamophobia, the following overarching theme was developed: We need a holistic approach to addressing Islamophobia that intervenes at the micro, meso, and macro system levels. Overall, Muslims in Québec experience difficulty with managing, navigating, and developing their identity within the greater Islamophobic societal context. Being able to connect with a Muslim community and other minority groups buffers these negative effects, but ultimately, concrete and enduring societal changes are required to remedy these detrimental circumstances.

Abstract 2177

SEX AND TEMPERAMENT DIFFERENCES IN MEANING ATTRIBUTION

Trofimova I.*

McMaster University ~ Hamilton ~ Canada

The aim of the study was to investigate sex- and temperament-related differences in meaning attribution. This study applied Osgood's semantic differential using the most neutral and abstract concepts and basic adjectives bipolar scales (as a semi-projective method to study the characteristics of meaning attribution). The study was conducted in English for 1180 Canadians, in Russian for 167 Russians and in Chinese 161 Chinese subjects. The results showed gender and temperament-related differences in meaning attribution. Males in all three samples attributed more negative estimations to abstract objects than females. People with stronger endurance and tempo in verbal-social activities differed dramatically from other temperament groups. At the same time there were cultural differences in semantic spaces of various gender and temperament groups. Gender and temperament differences in meaning attribution indicate a possible contribution of biological factors in resulting attitudes. The differences between "extraverts" and other temperament groups also show deficits of so-called "lexical approach" in studying personality and individual differences, which rely on factor analysis of descriptors of human behavior.

FOOD SHARING AND SOCIAL CONNECTION: A NEUROSCIENTIFIC STUDY ON PASTA CONSUMPTION

Campo C.*[1], Accardi S.[1], Bilucaglia M.[1], Bellati M.[2], Guida S.[1], Piccoli F.[1], Brivio E.[1], Zito M.[1], Russo V.[1]

[1]Department of Business, Law, Economics and Consumer Behaviour "Carlo A. Ricciardi", Università IULM, Milan, Italy ~ Milan ~ Italy, [2]Behavior and Brain Lab IULM – Neuromarketing Research Center, Università IULM, Milan, Italy ~ Milan ~ Italy

Introduction:
Food is not only a biological necessity but also a powerful social symbol. Some foods embody the identity of entire cultures and bind people together, representing more than nourishment. For example, pasta is an iconic food of Italian culture that symbolises tradition and conviviality beyond its nutritional role. However, it is still unclear if the shared consumption of food can foster social connection among individuals.
Purpose:
Thus, this study investigates the potential of a shared consumption of food, specifically pasta, as an enhancer of social bonding from self-reported and neuroscientific perspectives, compared with other common shared experiences.
Method:
Forty healthy adults, divided into 20 dyads, participated in a within-subject experimental design with four randomized shared tasks: pasta consumption, collaborative board game, movie watching, and unstructured free interaction. Data acquisition integrated neuroscientific techniques, such as electroencephalography (EEG), heart rate (HR), and skin conductance (SC) to measure indices of emotional and cognitive engagement and neural synchrony, as well as self-report measures to measure perceived emotionality and sense of closeness.
Expected results:
We expect that the shared consumption of pasta would elicit significantly higher levels of emotional engagement compared with the other shared activities. We also expect that dyads would show higher levels of neural synchronization during this activity.
Conclusion:
This study aims to shed light on the social significance of a shared consumption of food. By comparing pasta consumption with other common interactive activities and integrating self-reported measures with neuroscientific indices of engagement and synchrony, we expect to provide novel evidence on the role of eating together in fostering social bonding. These findings may contribute to a better understanding of food as a catalyst for human connection and offer new perspectives for research in social neuroscience, psychology, and cultural studies.

Abstract 117

UNDERSTANDING THE DYNAMICS OF RELIGIOUS IDENTITY AND INTERGROUP THREAT: MEDIATING ROLE OF OUT-GROUP CONTACT

Pandey R.P.*[1], Awasthi Purnima S.[2], Singh V.[1]

[1]Department of Psychology, Central University of Haryana ~ Mahendragarh ~ India, [2]Department of Psychology, Banaras Hindu University ~ Varanasi ~ India

Introduction: According to social identity theory, identity competition plays a central role in the emergence and escalation of intergroup conflict, even when economic and political factors are also involved. This competition at both individual and group levels stems from efforts to fulfil basic human needs, including various psychological needs. Religions often address these psychological needs more comprehensively and powerfully than other cultural frameworks, making them especially influential in shaping and sustaining individual and collective identities. Aim: The study aims to examine the relationship among religious identity, intergroup threat, and intergroup contact among students. It also seeks to explore whether intergroup contact serves as a mediating factor in the relationship between religious identity and intergroup threat. Participants: A total of 200 participants (Hindu & Muslims) adults aged 21-35 years were drawn from different higher educational institutions of Haryana and Delhi, NCR by applying convenient sampling method. Religious identity, intergroup anxiety and out-group contact measure was used to assess the study variables. Results: Correlation analysis reveals that religious identity was found positively associated with intergroup threat whereas outgroup contact exhibited negative correlation with intergroup threat. Stepwise regression analysis shows that both religious identity and outgroup contact emerged as strong predictor of intergroup threat. Outgroup contact has also significantly mediated the relationship of religious identity and intergroup threat. Conclusion: The study highlights that stronger religious identity is linked to heightened intergroup threat, while increased outgroup contact reduces perceived threat. Outgroup contact significantly mediates the relationship between religious identity and intergroup threat, suggesting that fostering intergroup interactions can play a crucial role in mitigating identity-based conflicts among youth.

Abstract 753

CONTRAST AMPLIFICATION: GROUP PERFORMANCES ARE EVALUATED WITH GREATER CONTRAST THAN INDIVIDUAL PERFORMANCES

Lu J.*, Chen Y., Li Z.

East China Normal University ~ Shanghai ~ China

INTRODUCTION:
Consider an average poster depicting the Statue of Liberty designed by a team appearing in a design exhibition. How would you rate its quality? If this poster is shown alongside another excellent (or poor) poster designed by another team, how would you rate the average poster now?
Many works are completed by groups, making comparisons between group performances ubiquitous. Although the literature on social comparison has demonstrated the contrast effect, whereby a target' performance is rated lower when compared to a better standard than to a worse standard, it has mainly focused on individual-level comparisons but neglected group-level comparisons.

PURPOSE:
This study addresses how and why the comparison level (individual or group) influences the magnitude of the contrast effect.

METHOD:
We randomly assigned participants (N = 2,199) to one condition in a 2 (comparison level: individual or group) × 2 (comparison direction: upward or downward) between-subjects design. Participants viewed a target (e.g., poster) and a standard (either better or worse). They were described as being created by individuals or groups. Participants rated the quality of the target (1 = very poor, 7 = very excellent) and their focus on the differences between the target and the standard (1 = not at all, 9 = very much).

RESULTS:
First, the contrast effect was larger in the group condition than in the individual condition. Second, participants focused more on the differences between the target and the standard in the group condition than in the individual condition. Third, the focus on the differences mediated the relationship between the comparison level and the magnitude of the contrast effect.

CONCLUSIONS:
People exhibit an amplified contrast effect when evaluating group (vs. individual)

performances. This is because people tend to focus more on differences between groups than on differences between individuals.

Abstract 1610

CO-ETHNIC BONDS AS PATHWAYS TO RESILIENCE: IDENTITY NEGOTIATION AMONG KOREAN YOUTH IN NEW ZEALAND

Park J.*[1], Park L.S.[2]

[1]Inha University ~ Incheon ~ Korea, Republic of, [2]University of Auckland ~ Auckland ~ New Zealand

New Zealand is often celebrated as a multicultural society, yet ethnic minority youth continue to encounter social exclusion and subtle forms of discrimination. This study focuses on newer-generation Korean New Zealanders who grew up during the 1990s and 2000s, when the proportion of Asians was significantly lower and pressures to assimilate into the dominant culture were strongly felt. Within this context, many young Koreans experienced societal minoritisation, parental expectations of assimilation, and internalised racism, all of which shaped their sense of belonging and identity development. Drawing on thirty in-depth interviews, the study examines how participants reflected on their transitions from childhood to adolescence and young adulthood. Many described efforts to suppress or conceal their “Koreanness” in order to align with majority peers. Yet identity was never fixed; it was continuously renegotiated across changing contexts. During the transitions to high school and university, participants actively responded to more diverse environments, and often exercised agency by intentionally seeking out co-ethnic peer networks. These co-ethnic bonds offered validation, empathy, and a psychologically safe space, enabling participants to re-engage with their ethnic heritage and articulate multiple dimensions of self. A central finding is that co-ethnic relationships were not only sources of companionship but also critical protective environments. They fostered resilience, facilitated social and emotional development, and supported the integration of ethnic and national identities. Through these connections, participants transformed experiences of marginalisation into opportunities for growth and belonging in both their ethnic community and wider New Zealand society. The study underscores the pivotal role of co-ethnic communities in helping minority youth navigate identity conflicts. It highlights the importance of educational and social environments that promote such supportive relationships to enable the harmonious integration of multiple identities in multicultural societies.

03 - Division 3: Psychology and Societal Development

SOCIALIZATION OF CHILDREN AND ADOLESCENTS FOR COPING WITH SOCIETAL CHALLENGES

Wednesday 22 July 2026 from 15:00 to 16:30

(D-Spadolini)

Márta Fülöp (Károli Gáspár University of the Reformed), Chair and Presenter

Across diverse cultural contexts, these five studies explore how parents and educators socialize children to navigate competition, cooperation, and structural inequalities.

The first study, set in the United States, highlights how racial, ethnic, and immigrant parents use culturally grounded socialization practices to buffer children against the psychological and developmental harms of structural racism. By fostering cultural pride, resilience, and awareness of discrimination, parents enhance their children's self-esteem, academic achievement, and mental health.

The second study, focusing on Mexican mothers across rural, semi-urban, and urban contexts, reveals both continuity and change in socialization values. Rural mothers prioritize cooperation and community well-being, semi-urban mothers balance collectivist and individualist goals, and urban mothers increasingly emphasize personal achievement and self-development, reflecting the influence of modernization and social change.

The third study examines Chinese American mothers' guidance on learning and competition. Through longitudinal analyses of mother–child conversations, it finds that many mothers promote "self-developmental competition" — competing to grow and learn rather than to defeat others — often encouraging mutual peer support. These practices were more prevalent among middle-class families and strengthened over time.

In contrast, Hungarian parents demonstrate ambivalence toward competition, recalling stressful and unfair experiences. They prefer non-competitive school environments that promote emotional safety, reflecting a tension between protecting children from harm and preparing them for a competitive society. Preventive socialization strategies were more common than proactive encouragement.

Finally, Chinese teachers describe an intensely competitive educational system but emphasize maintaining "healthy competition" that motivates effort without fostering anxiety. They view competition and cooperation as compatible, using group contests to teach teamwork and resilience.

Together, these studies illuminate how cultural, structural, and socioecological forces shape parents' and educators' strategies for balancing competition and well-being in children's development and how parents and teachers work on to prepare young people to cope with societal challenges.

Abstract 3916

APPLIED PSYCHOLOGY PERSPECTIVES ON PARENTING FOR RESILIENCE IN THE FACE OF STRUCTURAL RACISM

Mcbride Murry V.*

Vanderbilt University (USA), Department of Health Policy, Vanderbilt University, ~ Nashville, TN ~ United States of America

Introduction: Parenting in the United States is shaped by the enduring consequences of structural racism, rooted in historical injustices such as enslavement, segregation, imperialism, and colonialism. These legacies continue to produce inequities across education, housing, healthcare, and the criminal legal system. These socio-political forces undermine multiple domains of child development. In response, racial, ethnic, and immigrant parents engage in racial-ethnic-immigrant socialization—a set of practices rooted in resistance and liberation—to support their children's healthy development. This presentation will summarize key parental socialization practices that buffer minorized children from succumbing to the ill consequences of structural racism.

Method: A review of relevant studies examining the socialization practices among minoritized parents and their protective role in fostering positive child outcomes was conducted. In addition. We also evaluated the effectiveness of culturally grounded family interventions in promoting parental socialization and strengthening youths' intrapersonal protective processes that reduce youth vulnerabilities to mental and behavioral health problems. Specific attention was given to identifying critical developmental pathways as youth transition from middle childhood through young adulthood.

Results: Findings highlight that promoting cultural heritage and pride, preparing youth to cope with discrimination and marginalization, and fostering awareness of racial bias and a strong ethnic-racial-immigrant identity enhance self-esteem, psychosocial development, and academic performance, while reducing depression, anxiety, and externalizing behaviors. Positive family relationship quality further strengthens these outcomes.

Conclusions: Racial-ethnic-immigrant socialization and culturally grounded family interventions function as key protective processes for minoritized youth growing up in contexts of structural racism. By fostering cultural pride, preparing children to cope with discrimination, and promoting strong ethnic-racial-immigrant identities, parents help buffer systemic inequities and strengthen youth self-esteem, psychosocial competence, academic achievement, and mental health. These findings underscore the value of applied psychology in advancing resilience and reducing disparities in developmental outcomes.

Abstract 3918

COMPETING BY MUTUAL PEER SUPPORT: CHINESE AMERICAN MOTHERS TALK TO THEIR PRESCHOOL CHILDREN ABOUT LEARNING

Li J.*, Yamamoto Y.

Education Department, Brown University ~ Providence, USA ~ United States of America

Introduction: Children engage in competition in and out of school, and their views of competition are shaped by sociocultural context. Different cultural values may influence how children construct the meaning of competition. Research demonstrates different types of individuals' competitive orientations (Orosz et al., 2018) and finds that self-developmental competition (SDC), which aims at self-growth rather than defeating one's rivals, is related to more positive outcomes. Research further reveals important cultural differences: Whereas more European-heritage children tend to view competition as a zero-sum game, more East Asian children favor SDC (Fülöp, 2004, 2009). Furthermore, children's family socioeconomic status may also affect parental socialization in engagement in competition differently. Yet, little research exists on how Chinese American children, born and raised in the U.S. with parents from their home cultures, are socialized in developing SDC.

Method: We recorded longitudinally 200 Chinese American mother-child conversations about learning (MCCs) with children at ages 5 and 6, balanced by gender, and half from middle-class and half from low-income backgrounds. Each mother was asked to converse with her child about both a good and a poor learning attitude/behavior without any constraints. The MCCs were audio-recorded and transcribed for analysis.

Results: Among mothers who guided their 5-year-old children to work hard in learning, 38% spontaneously discussed SDC. Among them, 24.3% probed one important aspect of SDC: Competing with peers by mutual support. These mothers encouraged their children to learn from peers but also to help their peers learn. More middle-class mothers tended to promote SDC than low-income mothers. However, their emphasis on competition by mutual peer support was similar. A year later, the patterns on general SDC and peer support increased. We use discourse analysis to document in detail how such parental socialization along with their children's responses unfolds. Implications for child development and education will be discussed.

Abstract 3919

HOW HUNGARIAN PARENTS NAVIGATE THEIR SOCIALIZATION GOALS AND EDUCATIONAL CHOICES IN THE CONTEXT OF A COMPETITIVE SOCIETY

Saád J.*[1], Fülöp M.[2]

[1]HUN-REN Institute of Cognitive Neuroscience and Psychology ~ Budapest ~ Hungary, [2]Károli Gáspár University of the Reformed Church in Hungary and HUN-REN Institute of Cognitive Neuroscience and Psychology, Research Centre of Natural Sciences ~ Budapest ~ Hungary

Background and objectives:
Previous research (e.g.Fülöp, 1998; 2004; 2013) demonstrated that Hungarians perceive the role competition plays in the Hungarian society rather negatively, while they acknowledge that the society is intensely competitive. They are also very critical towards competition in schools (Fülöp et al, 2025).
This study aims to explore how parents of 3-9 year old children (1) perceive competition in general in the Hungarian society; (2). how they plan to prepare their children to be able to function successfully in that societal context; (3) how these plans are reflected in their educational choices e.g. if they prefer a competitive or non-competitive school climate and (4) how their own experiences with competition may shape these views.
Method: Semi-structured interviews were conducted with Hungarian mothers and fathers (N=86), predominantly middle-class and well-educated. Data were collected using convenience sampling and analysed through thematic/content analysis (Braun & Clarke, 2022). Coding was performed by two independent researchers.
Results: The interviews revealed a complex, emotionally ambivalent relationship with competition. Many parents recalled their own negative childhood experiences (e.g. shame, stress, pressure) and expressed concerns about unfair competition and negative consequences, e.g. interpersonal conflicts and aggression. Many explicitly stated that that they do not want their children to attend a school with a competitive climate and prioritized other aspects like a friendly environment, teacher's personality, location of the school. A good educational programme was secondary in most of the cases to the socially positive and stress-free environment. Parents' views reflect a tension between protection and preparation: they aim to shield their children from stress and unfairness while also promoting participation in competition to a limited degree to avoid disadvantage in a competitive society. Preventive socialisation goals and practices—such as avoiding or mitigating stress and harmful interactions—are more prevalent than proactive approaches like encouragement and motivation.

Abstract 3920

CHINESE TEACHERS' VIEWS ON THE ROLE COMPETITION PLAYS IN THE SCHOOL AND IN THE CHINESE SOCIETY AND THE LINK BETWEEN THEM

Fülöp M.*[1], Saád J.[2]

[1]Károli Gáspár University of the Reformed Church in Hungary and HUN-REN Institute of Cognitive Neuroscience and Psychology, Research Centre of Natural Sciences ~ Budapest ~ Hungary, [2]HUN-REN Institute of Cognitive Neuroscience and Psychology ~ Budapest ~ Hungary

Introduction: In the social context of China, education has always been regarded as the key to social competition, and both families and society have high expectations for students' academic performance. As a result of the highly intense competition in schools the so called "double reduction" policy has been introduced in 2021 to regulate competition and keep it among healthy boundaries.
Objective: To explore how Chinese teachers perceive the presence of competition in the school and in the society and how they socialize their students to be able to meet the expectations of a highly competitive society.
Method: Altogether 126 Chinese teachers participated from all levels of schooling (kindergarten, primary school, middle school, high school) representing different age groups and also working in schools in different parts of China. Around two-third of the participants were female. A semi-structured interview was conducted and transcribed and thematically analyzed (Braun & Clarke, 2022).
Results: Teachers view both the Chinese society and the school climate as highly competitive. They emphasize the positive functions of competition and express their concern to keep competition at a "healthy" level, that increases motivation, encourages students to learn, to make an effort, to work hard while does not lead to exhaustion, increased stress and anxiety, envy and hostility and to the wish to quit i.e. "lying flat". Competition in school prepares students for their life in the future. Teachers do not see competition in conflict with cooperation but in team competitions students learn to cooperate with others. This helps students develop teamwork and communication skills, laying a good foundation for their future career development. Teachers have an elaborated concept about how to support students to cope with winning and losing and be able to withstand drawbacks. They accept the reality of Chinese society and work on to help students' successful adaptation.

Abstract 4976

MEXICAN MOTHERS SOCIALIZATION ON COMPETITION

THE DEVELOPING LANDSCAPE OF PSYCHOLOGICAL REGULATION AND ACCREDITATION IN THE ASIA PACIFIC.

Wednesday 22 July 2026 from 16:30 to 17:30

(D-Spadolini)

Simon Crowe (Asia Pacific Psychology Alliance ~ La Tr), Chair and Presenter

The Asia Pacific Psychology Alliance (APPA) is a representative body for the science and profession of psychology in the Asia Pacific region, and the current membership includes 19 countries across the region including Australia, Bangladesh, Cambodia, China, India, Indonesia, Hong Kong, Japan, Macao, Malaysia, Nepal, New Zealand, Pakistan, Philippines, Singapore, South Korea, Sri Lanka, Taiwan and Vietnam. One of the principal stated aims of our Alliance is to develop and strengthen the professional, scientific and regulatory organisations of psychology within the region to help them accomplish their missions.

Abstract 3858

INTRODUCTION AND THE CONTEXT OF THE SYMPOSIUM

Crowe S.*

Asia Pacific Psychology Alliance ~ Melbourne ~ Australia

Each of the member societies of APPA are at very different stages of development with regard to psychological regulation and accreditation and this session presents the spectrum of development from non-registered through to later phase developments in already registered contexts. This paper will introduce the aims and a brief history of APPA and develop the theme of how our regional organization helps and supports our members to in a variety of ways including contributing to progress with regard to regulation and registration.

Abstract 3860

REGULATION OF PSYCHOLOGICAL PROFESSIONAL SERVICES IN INDIA

Biswas S.*

"Tribhuvan" Sahkari University ~ Anand ~ India

The regulation of psychological professional services in India is in an early stage of development. The Rehabilitation Council of India (RCI) Act 1992 was passed to regulate health services-related professions, including clinical psychologists with an MPhil or PhD in Clinical Psychology. The National Commission for Allied and Healthcare Professions (NCAHP) Bill 2020 was passed by the Indian Parliament in 2021. The Council deviated from the accepted practices of including independent professional bodies to jointly develop the regulatory standards for the profession. Psychology was clubbed with 14 professions listed under behavioural health sciences. The latest Draft Registration of Allied and Healthcare Professionals Regulations 2025 allows psychologists to practice as counsellors and behavioural analysts. This paper reviews the existing landscape of regulation and accreditation of psychological professional services in India. It provides a road map that can be used to traverse through the existing and proposed regulatory structures.

Abstract 3862

FROM FORTUNE-TELLING TO PROFESSIONAL REGULATION: THE EVOLUTION AND LOCALIZATION OF PSYCHOLOGY IN TAIWAN

Yang C.*[1], Lo S.[2]

[1]Department of Psychology, National Cheng Kung University, Taiwan ~ Hainan ~ Taiwan, [2]Institute of Communication Studies, National Yang Ming Chiao Tung University, Taiwan ~ Tainan ~ Taiwan

Psychology in Taiwan has undergone a remarkable transformation—from being viewed as akin to fortune-telling to becoming a scientifically grounded and professionally regulated discipline. This presentation outlines that evolution in three stages. First, it traces shifts in public understanding and academic recognition of psychology. Second, it highlights the establishment of the Psychologists Act, which formalized professional regulation and licensing. Third, it showcases the Taiwanese Psychological Association's (TPA) ongoing efforts to localize psychological science, particularly through the Professor Yang Guoshu Research Paper Award for Chinese Native Psychology. This award promotes research that reflects the unique cultural and social contexts of Taiwan, advancing theories and practices rooted in local experience rather than Western paradigms. By situating Taiwan's journey within the Asia-Pacific landscape, this presentation illustrates how psychological science can grow through both cultural adaptation and professional governance.

INTERVENING IN THE SILENT SURGE: NEW DIRECTIONS IN YOUTH MENTAL HEALTH ACROSS ASIA.

Wednesday 22 July 2026 from 16:30 to 17:30

(C- Spadolini)

Andik Matulessy (ASEAN Regional Union of Psychological Sc), Chair
Simon Crowe (Asia Pacific Psychology Alliance ~ Melbo), Co-Chair

Across Asia, youth mental health has emerged as one of the most pressing psychosocial concerns of our time, a “silent surge” shaped by rapid societal change, academic pressure, digital immersion, and shifting family and community dynamics. This symposium examines how applied psychology can inform innovative, evidence-based, and culturally grounded approaches to promote resilience and well-being among young people. The rise in anxiety, depression, and emotional distress among youth reflects not only clinical concerns but also broader systemic challenges, including inequitable access to care, persistent stigma, and the mismatch between conventional service models and young people’s lived realities. Applied psychology plays a pivotal role in bridging these gaps, integrating prevention, early intervention, and capacity-building through schools, families, communities, and digital platforms. Drawing on diverse contexts across the region, this symposium highlights emerging frameworks that combine psychological science with social innovation. Presentations will explore national and community-level responses such as peer-led mental health initiatives, family-engaged interventions, trauma-informed and resilience-based approaches, and the rise of digital and tele-mental health platforms. Collectively, these developments demonstrate how the field is moving beyond the clinic to co-create accessible, participatory ecosystems of care. By bringing together regional perspectives, this symposium aims to identify shared priorities and opportunities for collaboration in youth mental health research, policy, and practice. It embodies the Congress theme “New Directions in Applied Psychology” by showcasing how science, compassion, and cultural wisdom can converge to strengthen systems that not only treat distress but also nurture belonging, purpose, and hope — empowering young people to thrive in a rapidly changing world. This presentation will be presented as a joint initiative of the two regional organizations, the ASEAN Region Union of Psychological Science and the Asia pacific Psychology Alliance.

Abstract 3865

BEYOND THE CLINIC: INNOVATIVE AND INCLUSIVE PATHWAYS FOR YOUTH MENTAL HEALTH.

Toh A.*

Singapore Psychological Society ~ Singapore ~ Singapore

Across Asia, youth mental health has emerged as a growing public health concern, a silent surge marked by rising distress and shifting social realities. In Singapore, the 2024 National Youth Mental Health Study found that nearly one in three young people aged 15–35 reported severe or extremely severe symptoms of depression, anxiety, or stress. Anxiety was most prevalent, affecting one in four, with the highest rates among those aged 20–24 years. Contributing factors include academic pressure, digital saturation, cyberbullying, and body-image concerns, while resilience, self-esteem, and social support remain protective.

In response, Singapore has developed a multi-sectoral and ecosystemic approach to mental health. Nationally, the Interagency Taskforce on Mental Health and Well-being coordinates policy efforts across ministries, integrating prevention, education, and access. The Ministry of Education has embedded well-being into schools through peer-support systems, mental health literacy training, and stress-reduction initiatives. Community-based programmes such as the Community Health Assessment Team (CHAT) provide youth-friendly assessment, self-referral, and digital outreach via webCHAT, while the Hidden Youth Intervention Program applies a biopsychosocial and family-centred model to re-engage socially withdrawn youth.

Singapore has also pioneered digital mental health solutions, notably mindline.sg, an AI-enabled self-care platform that has reached nearly half a million users. Complementary mHealth tools and university-based digital interventions offer scalable, stigma-free avenues for support.

Emerging directions emphasise family engagement, peer-led advocacy, and strengths-based frameworks that promote resilience and belonging rather than solely treating illness. Despite progress, gaps remain in professional capacity, research evidence, and equitable access.

Applied psychology has a critical role in advancing sustainable, evidence-based, and culturally grounded solutions. Singapore's experience underscores that intervening in this "silent surge" requires not only treatment, but also integration of science, compassion, and collaboration, within and beyond national borders, to enable every

young person to thrive.

Abstract 3866

UNHEARD MINDS: TRACING THIRTY-FIVE YEARS OF CHILD AND ADOLESCENT MENTAL HEALTH RESEARCH IN THE PHILIPPINES

Bengwasan P.*

Psychological Association of the Philippines ~ Manilla ~ Philippines

Over the past three and a half decades, mental health research in the Philippines has grown in scope but remains limited in depth, particularly for children and adolescents. This scoping review examined national trends in published mental health research from 1990 to 2024, drawing from a comprehensive bibliography of studies across clinical, community, and policy domains. The findings reveal a literature base dominated by descriptive and cross-sectional designs, with few experimental or longitudinal studies and limited theory-driven inquiry. While adult populations and general psychological well-being are commonly studied, empirical work focused on children and adolescents is notably sparse. Crucially, research addressing high-prevalence, critical issues in youth, such as the impact of trauma and abuse, and the foundational understanding of neurodevelopmental concerns, is severely lacking.

Intervention studies, whether preventive, psychosocial, or policy-evaluative, remain exceedingly rare. Across decades, research output has increased following major policy developments such as the passage of the Mental Health Act (2018), yet methodological rigor and local evidence for effective interventions continue to lag. Most studies rely on self-report measures and small convenience samples, offering only fragmented insight into the nation's mental health landscape. The persistent lack of intervention-based, developmental, and specialized youth mental health research (e.g., trauma-informed care and neurodevelopmental conditions) underscores a critical gap in evidence needed to inform policy, service delivery, and culturally grounded practice.

Mapping this trajectory highlights both progress and persistent silences: an expanding awareness of mental health as a public concern, but a research foundation that remains largely descriptive and adult-centered. Strengthening empirical, child- and adolescent-focused, and intervention-oriented research, particularly in areas of trauma, abuse prevention, and neurodevelopmental assessment and support, is essential to advancing an equitable and contextually relevant mental health agenda for the Philippines.

SOCIAL MARKETING MEETS THE SCIENTIST-PRACTITIONER-HUMANIST PARADIGM IN PSYCHOLOGY EDUCATION: ECO-GENERATIVITY IN ACTION

Petrovic I.*, Vukelic M., Kovacevic P.

University of Belgrade, Faculty of Philosophy, Department of Psychology ~ Belgrade ~ Serbia

Social marketing applies marketing principles to influence welfare-driven behaviors of individuals and society, providing a powerful framework for addressing social development goals and promoting the common good. Introducing Social Marketing as an elective course for master's students in the Work and Organizational Psychology module at the University of Belgrade, Serbia, aimed to strengthen a scientist-practitioner-humanist approach, empower future psychologists in societal applications of psychology, and equip them with skills to foster social change for sustainability and societal wellbeing—across domains such as environmental protection, health, climate change, and other areas of sustainable development.

Di Fabio and Svicher introduced the concept of eco-generativity and developed the Eco-Generativity Scale, encompassing ecological generativity, social generativity, environmental identity, and agency/pathways. The concept and scale were chosen as central resources for the course, alongside the book Social Marketing by Kotler, Roberto and Li.

This contribution had two main objectives: (1) to adapt and validate the Eco-Generativity Scale–Short Form (EGS-S) for use in Serbia, and (2) to explore its use as a teaching tool supporting master's students in applying the scientist-practitioner-humanist paradigm. Three student groups independently translated and adapted the EGS-S; a committee version was developed through joint review and refined using cognitive interviewing. Each team then applied the scale in situation analyses for projects promoting sustainable behaviors, including reducing plastic bag usage (Your Eco Signature), minimizing food waste, and fostering various ecologically responsible behaviors (Eco Wave). The scale demonstrated good psychometric properties. Future research should explore EGS-S application across different sustainable development goals.

Students used EGS-S results to define target audiences, set goals, and design creative interventions. By the end, they reported an "Aha!" moment in integrating EGS-S findings into their social marketing projects, effectively addressing all elements of the scientist-practitioner-humanist approach in responding to complex global challenges.

Abstract 2615

CLIMATE CHANGE, HAZARDS, AND MENTAL HEALTH IN INDIA

Suar D.*

Kalinga Institute of Industrial Technology Deemed to be University ~ Bhubaneswar ~ India

Objective: This systematic review examines how climate change in India—manifesting through heatwaves, floods, and sea-level rise—intensifies mental health challenges.
Methodology: Relevant literature was systematically retrieved from Scopus and Web of Science using the keywords climate change, specific climate hazards, and mental health in India. Additional documents were identified through frequently cross-referenced literature.
Findings: Findings indicate that greenhouse gas emissions, combined with India's diverse geomorphology, have exacerbated climate hazards, resulting in losses of lives, livelihoods, housing, infrastructure, cultural sites, agriculture, social ties, and self-esteem. These disruptions often trigger forced migration, poverty, and declining living standards, which in turn contribute to worsening mental health outcomes. The mental health consequences encompass somatic pain, substance use, suicidal ideation, sleep disturbances, post-traumatic stress, depression, anxiety, and a pervasive sense of pessimism about the future. Vulnerable groups include children, the elderly, displaced persons, pregnant women, individuals with disabilities, and those with low caste, educational, and economic status, as well as those with pre-existing mental disorders. Coordinated actions at federal, state, and community levels—such as relocation to disaster shelters, psychological first aid, and psychosocial support—have helped reduce psychosocial morbidity. However, community preparedness and adaptive strategies vary across hazard types. Enhancing behavioral preparedness, along with technological and environmental interventions such as renewable energy adoption, early warning systems, flood and coastal barriers, and mangrove restoration, can strengthen ecological resilience and counter mental ill health.
Implications/Novelty: The findings justify new directions for research on sea-level rise, risk assessments, longitudinal designs, and indigenous interventions to strengthen adaptation and mitigation efforts aimed at minimizing the adverse consequences of climate hazards and mental ill health.

Abstract 2611

DECONSTRUCTION OF MIGRATION: DISCOURSE ANALYSIS OF MIGRATION IN INDIA

Topno R.C.*[1], Kumar N.[2]

[1]Ramanujan College, University of Delhi ~ New Delhi ~ India, [2]Dr. Bhim Rao Ambedkar College, Univeristy of Delhi ~ New Delhi ~ India

Migration has emerged as a significant phenomenon shaping socio-political realities in recent times. In the Indian context, internal migration has been studied to understand demographic changes and formulate policies and mechanism of governance. In this light, migration has been seldom examined as a discourse i.e. a socially developed system of representations and meanings.

This study seeks to explore the discursive constructions of migration in India using critical discourse analysis (CDA) framework. By examining media narratives, the research aims to investigate how internal migration is framed across different socio-political contexts. Migration has predominantly been portrayed as aspirational and a developmental necessity. Through discourse analysis, the study aims to deconstruct the complex interplay of economic opportunity, power and intersectionality that shape migration discourses.

Discourse analysis focuses on how language is used to maintain and reproduce status quo through communication. Discourse analysis supposes language as symbolic and as a social action which produces, perpetuates and negotiates meanings in social interactions. Since migration and migrants are underrepresented in mainstream discourse, discourse analysis will uncover social realities of migration in contemporary India. The paper emphasises the role of language in shaping public perception, policy responses, and the socio-political position of migrants. Findings from the study will provide a critical theoretical framework for reinterpreting and promoting change in the social narratives and representation of migration.

Abstract 2725

REVISING WEATHER WARNING COMMUNICATION: A MIXED-METHODS ANALYSIS OF THE STRUCTURE OF THE GERMAN NATIONAL WEATHER SERVICE'S WARNING MESSAGES

Zwicker M.*

Deutscher Wetterdienst ~ Offenbach am Main ~ Germany

As extreme weather events become more frequent, clear and effective communication of weather warnings is crucial for safeguarding lives and property. However, these warnings are only effective if they are understood and acted upon by the public, emphasising the need for a more structured approach. The German National Weather Service (Deutscher Wetterdienst, DWD) is overhauling its weather warning system, leveraging psychological research to refine communication strategies and improve public responses to warnings. The first study in this series investigates three key aspects of weather warning structure: (1) public preferences for the order of sections (e.g., recommended actions, potential impacts, meteorological situation), (2) the naming conventions for these sections, and (3) the number of recommended actions at the highest warning level. This preregistered mixed-methods study, using a population-representative online survey (N = 800), assessed the preferences for section order and naming conventions through ranking tasks. Participants were randomly assigned to view either a longer version (nine recommended actions) or a shorter version (four recommended actions) of a weather warning. This allowed examination on how the number of recommended actions comprehension and influenced recall. After viewing the warning for at least 10 seconds, participants were asked to qualitatively recall its content. Their responses were coded to evaluate recall accuracy and the specific elements remembered, with comparisons made between the experimental conditions. Demographic information and attention and responses to various other warning elements were also recorded. The findings offer key insights into improving the structure and content of weather warnings, informing the DWD's updated communication strategy. By identifying the most understandable and memorable ways to communicate warnings, this research aims to improve warning clarity and public safety during extreme weather events. It demonstrates the practical value of psychological research in improving communication strategies with far-reaching public safety implications.

Abstract 1532

"HERE THEY WERE VALUED MEMBERS OF THE COMMUNITY": SCHOOL-BASED INTERGENERATIONAL ARTS INITIATIVE WITH CHILDREN, OLDER ADULTS, AND FACILITATORS

Ho T.C.T.*, Clifford A., O'reilly S., Byrne S., Ní Bhriain O., Jay S.

University of Limerick ~ Limerick ~ Ireland

Introduction: Populations worldwide are ageing due to declining fertility rates and increasing life expectancy. Despite living longer, many older adults experience loneliness, isolation, and ageism. Traditionally, intergenerational relationships have helped older adults remain socially connected; however, urbanisation and migration have reduced opportunities for such interactions. Planned intergenerational programmes are increasingly recognised as a way to promote holistic health and community resilience by fostering connections between age groups.

Purpose: This study explores how a school-based intergenerational arts project can strengthen relationships across generations while promoting community well-being and place-based learning.

Method: Focus groups and semi-structured interviews were conducted with children, older adults, and facilitators involved in the intergenerational arts project. Transcripts were coded and analysed using Braun and Clarke's reflexive thematic analysis to identify key themes in participants' and facilitators' experiences.

Results: Findings highlight the role of intergenerational arts programmes in fostering supportive relationships across generations and social groups, while encouraging nature- and place-based learning and enhancing individuals' connections with their community and environment. The study suggests that such programmes can effectively promote social relationships, mental health, and knowledge exchange across age groups.

Conclusions: Insights from this research may guide policymakers, educators, and community stakeholders in developing inclusive, creative programmes that reduce isolation while fostering intergenerational understanding and well-being.

Abstract 2321

CARING FOR THE WHOLE FAMILY: BIOLOGICAL CHILDREN'S EXPERIENCES IN FOSTER, ADOPTIVE, AND KINSHIP FAMILIES ACROSS SIX NATIONS

Wilke N.*[1], Harms A.[2], Lindsey N.[3], Howard A.[2]

[1]CAFO Center on Applied Research for Vulnerable Children and Families ~ Arequipa ~ Peru, [2]Samford University ~ Birmingham ~ United States of America, [3]Liberty University College of Osteopathic Medicine ~ Lynchburg ~ United States of America

Introduction: Biological children in foster, adoptive, and kinship families are a vital yet often overlooked part of the caregiving system. Although research has examined outcomes for foster, adoptive, and kinship children, the perspectives of their biological siblings sharing the family environment remain largely unexplored. Understanding these experiences is essential for promoting the well-being of the entire family. Locally and culturally informed solutions are valuable, as family experiences and expectations vary across contexts.

Purpose: This study aimed to describe the demographics of biological children raised in families providing alternative care for non-biological children and explore their reflections on the most positive and challenging aspects of their experiences. A secondary goal was to examine both shared patterns and culturally specific differences across six nations.

Method: A mixed-methods online survey was completed by 383 adults aged 18–60 (M = 29.32, SD = 9.73) from India, Kenya, Mexico, South Africa, Spain, and USA who had foster, adoptive, or kinship siblings. Participants responded to demographic items and two open-ended prompts regarding positive and challenging experiences. Descriptive statistics summarized participant characteristics, while thematic analysis identified common patterns in qualitative responses.

Results: Six key themes characterized positive experiences: personal growth, family identity, special sibling relationships, memorable shared experiences, faith and spiritual development, and complex emotions. Six themes captured challenges: loss of parental attention, emotional strain, parentification, household chaos and trauma exposure, social and external difficulties, and insufficient family preparation. Cultural variations emerged in the prominence of themes such as faith, relational expectations, and exposure to external challenges.

Conclusions: Biological children in caregiving families experience both meaningful benefits and unique challenges that differ from their siblings in care. Findings highlight

the importance of culturally informed, systemic, and family-centered support strategies. Policies and training programs should consider the needs of biological children to enhance family resilience and ensure smoother transitions in alternative care.

INTEGRATING PSYCHOLOGICAL INQUIRY INTO ELSI: INSIGHTS FROM RINCA AND BEYOND

Thursday 23 July 2026 from 08:00 to 09:30

(D-Spadolini)

Kaori Karasawa (The University of Tokyo ~ Tokyo ~ Japan), Chair and Presenter
Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Discussant

The rapid advancement of emerging science and technology has the potential to enrich human life, enhance individual and collective well-being, and contribute meaningfully to the resolution of complex societal challenges. However, such progress also poses significant risks to fundamental human values—such as autonomy and fairness—and, in extreme cases, may threaten human survival itself, potentially leading to irreversible consequences in the course of human history. In light of these dual aspects of technological development, there is a growing need for interdisciplinary approaches aimed at identifying both current and foreseeable ethical, legal, and social issues (ELSI) associated with science and technology. These approaches must also explore viable responses and future pathways to ensure responsible innovation. Reflecting this global concern, many countries have formulated and implemented science and technology policies under the guiding principles of ELSI and Responsible Research and Innovation (RRI), with the goal of fostering industrial creation and societal transformation through science and technology. This symposium presents the outcomes of one such initiative in Japan: the RInCA Program (Responsible Innovation with Conscience and Agility), a comprehensive and practice-oriented research and development effort addressing ELSI, promoted by Research Institute of Science and Technology for Society (RISTEX), Japan Science and Technology Agency (JST). In addition to showcasing the achievements of this program, the symposium will facilitate discussions on the societal implications and challenges posed by cutting-edge psychological research, including developments in neuroscience. Through these discussions, we aim to deepen our understanding of the role and responsibility of psychology as a specialized discipline in guiding better decision-making in the research, development, and implementation of science and technology. By integrating ELSI considerations and fostering collaboration among diverse stakeholders, we seek to contribute to the realization of responsible innovation that aligns with societal values and aspirations.

Abstract 3832

HOW TO MAKE RESPONSIBLE HUMAN PSYCHOLOGY RESEARCH WITH ADVANCED NEUROTECHNOLOGY ?

Shirakawa N.*

Nobuyuki Shirakawa ~ Niigata University ~ Japan

Neurotechnology has the potential to provide high-performance products and services, with its miniaturization and minimally invasiveness of devices, coupled with the development of artificial intelligence (AI) for processing, analyzing, and generating commands based on neural activity. One company predicts that the market size will reach approximately $52.9 billion by 2034. However, this technology, which enables the extraction, measurement and visualization of information on individual emotions and cognition from neural activity, has the potential to bring a paradigm shift in the field of applied psychology. Indeed, ethical concerns must be addressed, including the research participant protection in experiment using neurotechnology, ownership and privacy protection of information derived from neural activity, the potential physical and mental effects of long-term use, the prevention of dual use, misuse and malicious use of neurotechnology, and the possibility of unauthorized use in education, labor, and judicial settings without the individual's free consent. These concerns require the implementation of Responsible Research and Innovation (RRI) taking into account risk management. Based on such rationale, the research project “ELSCI and Governance as the Measures for the Era of Neurotechnology Native” funded by RInCA Program has conducted investigations by analyzing the ELSCI (ethical, legal, social, and cultural issues) of application of neurotechnologies and their impact on human cognition, behavior, and society, to support the development of domestic and international rules for the appropriate use and dissemination of neurotechnology with artificial intelligence (AI), as well as the establishment and operation of governance systems. In this presentation, the author will provide an overview of domestic and international efforts to establish rules and governance systems for human research using neurotechnology, and discuss the challenges and solutions to be considered, particularly at the R&D stage, and how these should be compatible with the sound development of psychological research including neuroscientific procedures.

Abstract 3829

STRATEGIC INTEGRATION OF ELSI IN JAPANESE SCIENCE AND TECHNOLOGY POLICY: THE ROLE OF THE RINCA PROGRAM.

Karasawa K.*

The University of Tokyo ~ Tokyo ~ Japan

In Japan, ethical, legal, and social issues (ELSI) have become increasingly central to national science and technology policy. The Science, Technology and Innovation Basic Plan now explicitly incorporates societal perspectives, reflecting a shift toward more inclusive and reflexive governance. Key institutions such as the Ministry of Education, Culture, Sports, Science and Technology (MEXT) and the Japan Science and Technology Agency (JST) have developed initiatives to embed ELSI into research and innovation processes. A notable example is JST/RISTEX's "Responsible Innovation with Conscience and Agility" (RInCA) program, launched in 2020. RInCA is designed to support interdisciplinary research that not only integrates ethical analysis, legal frameworks, and stakeholder engagement from the outset, but also proactively identifies ELSI associated with emerging technologies. The program emphasizes liaison with research and development sites, ensuring that ELSI considerations are grounded in the realities of scientific practice and technological innovation. Through anticipatory and collaborative approaches, RInCA contributes to the advancement of Responsible Research and Innovation (RRI) in Japan. This presentation introduces the conceptual foundations and institutional design of the RInCA program, focusing on its mechanisms for promoting socially responsive research. By examining how RInCA facilitates knowledge co-production and reflexive practices, we aim to provide a basis for understanding the evolving role of ELSI and RRI in Japanese science policy. The discussion will also serve as a prelude to subsequent presentations on empirical findings and future directions for embedding ELSI into scientific practice, particularly in fields where technological innovation intersects with human behavior, cognition, and social systems.

Abstract 3830

CONTRIBUTION OF PSYCHOLOGY TO ASSOCIATION BETWEEN EMERGING TECHNOLOGIES AND SOCIETY: CASES OF CELLULAR AGRICULTURE TECHNOLOGY AND VIRAL INFECTIOUS DISEASE RESEARCH

Hibino A.*

Institute of Science Tokyo ~ Tokyo ~ Japan

This presentation introduces research projects involving ELSI and RRI in the fields of cellular agriculture technology and viral infections research, which have recently attracted attention. New knowledge and technologies often cause controversy due to their unfamiliar nature in existing social systems. Because psychology employs empirical analysis, it has great potential to strike a balance between being close to the development of technology and reflecting and reconsidering its ideal way. The author has led an interdisciplinary research to examine the social impact of cell agriculture technology in collaboration with experts in political science, anthropology, and biology in RInCA. Cellular agriculture technology, represented by 'cultivated meat,' is expected to lead to a new food production system that does not involve the death of animals. We first identified the factors behind the public acceptance of cultivated meat in the Japanese context, including the relational view on nature and concerns about the food crisis. Second, we proposed the whole-part framework for meat from considerations of various social spheres. We investigate the meaning of meat in cultural constructions, wherein the relationship between the whole body and meat as a part of it is important. This insight can speculatively update some of the ELSI of cell agriculture. The project critically reviews the excessive market view of 'cultivated meat' as a mere commodity and calls attention to the broader problems that our society faces. The author is currently involved in a project examining the case of institutionalization of viral infections research, where public distrust of science can cause serious social confusion. Psychology is expected to shed light on communication gaps regarding viral infection research and provide clues for dialogue among stakeholders. Psychology can contribute to balancing the sensitive ELSI/RRI practices, but should be careful not to endorse the idea of merely enlightening the public.

Abstract 3831

COLLECTIVE ACTIVE INFERENCE AND LAW: LESSENS FROM "CO-HABITANT ROBOTS" FOR THE FUTURE LEGAL FRAMEWORK OF HUMAN-AI/ROBOTS INTERACTION

Inatani T.*

Kyoto University ~ Kyoto ~ Japan

The growing development of AI and robotics means that people are increasingly interacting with AI and robots on a daily basis. If we understand human cognitive processes as collective active inference, then daily interaction with AI and robots implies their entry as partners into this process. This means that daily interactions with AI and robots will inevitably influence the construction of people's internal models of themselves and the world.

Much remains unknown about the effects of human-AI/robots interaction on human cognition and behavior. However, interpreting the results of experiments on the impact of daily interaction with companion robots on human cognition and behavior, based on collective active inference as a theoretical foundation, reveals that a kind of "friction" in the interaction with AI/robots is actually beneficial for enhancing human well-being in various ways. Conversely, AI/robots' affirmation of a user's internal model, while seemingly respecting human autonomy, could instead lead people into self-destructive recursive feedback loops. This suggests that, when evaluating human-AI/robot interaction, it may be highly valuable to refer to concepts like relational autonomy or Foucault's theory of power relationships as a normative basis, rather than simple individual autonomy. It also suggests that incorporating a kind of "friction" might be required as a legal regulation in the design of interactive AI and robots. However, because much remains unknown about human-AI/robots interaction, it is premature to draw firm conclusions at this stage. Furthermore, even if "friction" is necessary, methods for introducing it in a way that is consistent with legal norms such as freedom of expression, particularly in the context of generative AI usage, require further consideration. That said, what can be stated with certainty is that we need more psychological research into the impact of human-AI/robot interaction on human cognition and behavior.

Abstract 3833

DESIGNING FOR A SUPER-AGED SOCIETY: INTERGENERATIONAL CO-CREATION AND RESPONSIBLE INNOVATION IN TAIWAN

Yang C.*, Lu C.

National Chang Kung University ~ Tainan ~ Taiwan

Taiwan is undergoing a convergent transition shaped by demographic headwinds and rapid technological change. Population ageing and low fertility, coupled with lifestyle shifts driven by digitalization, have made it harder for older adults to sustain social participation and maintain balanced daily lives. Anchored in a University Social Responsibility (USR) project, this project advances practice in Tainan through community symbiosis and intergenerational co-creation. We establish “micro-community” mechanisms that foster health autonomy and implement mindfulness-based strategies to strengthen emotion regulation and resilience. In doing so, we examine how intergenerational learning and collaborative making can strengthen social ties while addressing policy and institutional challenges, including pathways for senior re-employment. To gauge impact, we design and deploy well-being indicator tools combined with digital health technologies—i.e., the Happy Age app—enabling both continuous assessment and community interventions. By integrating applied psychology, community design, and public-health perspectives, the project seeks to enhance psychological resilience, social inclusion, and digital engagement among older adults.

Our findings aim to articulate an inclusive model of social development that reconciles community cohesion with digital transformation. This approach demonstrates the social value of promoting older adults’ physical and mental well-being, autonomy, and participation as Taiwan enters a super-aged era, and shows how technological progress can align with ELSI.

Abstract 2612

FROM MARGINS TO METROS: A QUALITATIVE INQUIRY ON MIGRATION AND IDENTITY AMONG TRIBAL WOMEN IN INDIA

Topno R.C.*[1], Kumar N.[2]

[1]Ramanujan College, University of Delhi ~ New Delhi ~ India, [2]Dr. Bhim Rao Ambedkar College, Univeristy of Delhi ~ New Delhi ~ India

Tribal labour migration in India is marked with two distinct features – the highest proportion of migrant households among Scheduled Tribes and significant workforce participation by women (National Sample Survey Office, 2005). Around 55% of the tribal population migrates from tribal areas due to livelihood crisis and the pursuit of better employment opportunities (Mohapatra, 2019; Planning Commission, 2005). Existing research predominantly focuses on collective dimensions, with limited attention to individual experiences – particularly of women.

Anthropologists & Indian policy makers have profiled migrant tribals across demographic parameters such as gender, socio-economic status, migration factors and, nature of livelihood. Psychological researches have focussed on negative variables like stress, cultural bereavement, alienation and clinical conditions. Berry's seminal work on acculturation, intergroup contact, and maintenance of cultural identity has been widely applied. However, studies on migrant tribal women have been documented in a limited way – especially on identity and impact on social structures. Migration of women to urban areas has been viewed as an escape from the 'status trap' (Srinivas, 1977).

This study attempts to understand the experiences of migrant tribal women and the impact of economic migration on identity. Using Focus Group Discussions, it explores the impact of migration on identity – i.e. collective self and personal identity. The study aims to understand and explore the relevant areas of impact on identity at 3 levels– cultural self, relational self, and individual self-using Social Identity Theory. The sample comprises of women migrants from the tribes of Jharkhand who have voluntarily migrated to metro cities for economic reasons. The ongoing research also intends to explore the nature of migration, challenges, and adaptive strategies. The paper aims to contribute insights on tribal migration and inform policy frameworks by addressing the needs of the marginalised migrant communities.

VIDEO AS A PSYCHOLOGICAL WEAPON: WHY AUDIOVISUAL CONTENT IS THE MOST TRAUMATIC

Diatel N.*[1], Naydonova L.[2], Hryhorovska L.[2], Hubeladze I.[2], Umerenkova N.[2], Pochwatko G.[3], Naydonov M.[4]

[1]Kyiv School of Economics ~ Kyiv ~ Ukraine, [2]Institute for social and political psychology of the National Academy of Educational Sciences ~ Kyiv ~ Ukraine, [3]Institute of Psychology of the Polish Academy of Sciences ~ Warsaw ~ Poland, [4]Institute of reflective investigations and specialisation ~ Kyiv ~ Ukraine

Introduction

During the ongoing war launched by Russia against Ukraine, media exposure has become a daily reality for many Europeans, including vulnerable groups. Across crisis contexts, related audiovisual content is gaining attention, spreading rapidly and being presented extensively to the audience.

Purpose

This study aims to bring attention to audiovisual war materials (video combined with sound) as especially trauma-inducing, and to outline implications for trauma-informed journalism and digital platform design aimed at reducing preventable harm.

Method

The study was based on a qualitative analysis of focus-group data (N=60) collected from vulnerable population groups (e.g adolescents, displaced persons, etc). Discussions explored participants' patterns of war-related media exposure, perceived distress triggers, and self-regulation strategies.

Results

Audiovisual stimuli produce stronger emotional and physiological activation than text because they increase perceived immediacy and realism ("presence"), intensifying fear, grief, anger, and helplessness. Auditory cues (e.g., screams, explosions, panicked speech) add a direct alarm component that heightens arousal and impairs recovery.

A core mechanism is immersive identification: viewers mentally simulate scenarios, imagine themselves or loved ones in danger, and experience intrusive imagery, including distressing dreams and recurrent mental replay. Another mechanism is contrast intensification: "before/after" depictions of destroyed familiar places amplify loss-related reactions and moral outrage. Finally, unpredictability functions as a trigger - sudden exposure to graphic footage undermines perceived control, disrupts sleep, and increases vulnerability to re-experiencing symptoms.

Conclusions

Audiovisual war content can act as a high-potency psychological stressor through multisensory amplification, presence effects, identification, and unpredictability. These mechanisms justify trauma-informed media standards in Europe - clear warnings, reduced autoplay, default blurring of graphic footage, and protective settings for youth

and high-risk audiences to safeguard well-being while preserving access to essential information.

Abstract 2487

FROM EMOTIONAL REACTIVITY TO SELF-REGULATION: A MIXED-METHOD STUDY OF PARENTS' GROWTH THROUGH THE SHAHKELID PLUS MODEL

Ghane Ezabadi Z.*

Child Psychology Center, Shahkelid Plus Program ~ Tehran ~ Iran, Islamic Republic of

Background and Aim:
Parenting in emotionally demanding contexts often triggers reactivity rather than reflection. The Shahkelid Plus program was developed in Iran to strengthen parents' emotional awareness, empathy, and mindful self-regulation. Alongside structured parenting education, each parent was accompanied by a professional psychologist who personalized the process, provided reflective feedback, and tailored the content to the parent's real-life challenges. Implementation booklets and home-based exercises helped parents apply learned skills in daily life. This study aimed to evaluate both quantitative and qualitative outcomes of parents' growth throughout the process.

Method:
Data were drawn from reports of 30 mothers of children aged 1.5–9 years (mean = 3.8) who completed the full Shahkelid Plus program and were accompanied by their assigned psychologist for an average of 5.6 months. Using a mixed-method design, seven interrelated indicators of emotional and behavioral growth were analyzed—most prominently emotional awareness, self-regulation, and empathy. Quantitative ratings before and after the intervention were integrated with qualitative thematic analysis of reflective narratives written by psychologists. Inter-rater reliability was confirmed by cross-checking 11 randomly selected cases by independent reviewers.

Results:
Quantitative findings showed consistent improvement across domains: emotional awareness increased from 2.3 to 4.1, self-regulation from 1.9 to 3.8, and empathy from 1.7 to 3.9. Child irritability decreased notably. Qualitative analysis revealed four recurring patterns of change: (1) increased emotional awareness and mindful pause before reaction, (2) greater empathy and acceptance of children's differences, (3) calmer family atmosphere and warmer communication, and (4) recognition of fatigue, time pressure, and extended-family interference as barriers. Continuous practice, reflective dialogue with the psychologist, and father–child quality time were reported as key facilitators.

Conclusion:
The Shahkelid Plus model effectively enhances parents' emotional regulation and

awareness through personalized, psychologist-guided practice. The findings highlight the value of culturally grounded, emotion-focused parenting interventions in fostering long-term self-regulation and relational growth among caregivers.

Abstract 4536

TRAUMA INTENSITY AS A PREDICTOR OF SOCIAL ISOLATION: A MIXED-METHODS STUDY ON THE SOCIAL CAPITAL OF UKRAINIAN REFUGEES

Polityka I.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

The global refugee crisis involves challenges in adaptation and social integration. While pre- and post-migration factors are significant, the specific mechanisms linking trauma to integration outcomes among Ukrainian refugees remain insufficiently explored, particularly the relationship between trauma intensity, psychological resources, and social restoration.

This study explores the complex relationships between trauma intensity and social isolation as a non-constructive integration strategy. Adopting the ICD-11 conceptualization of trauma, the research examines how trauma obstructs social capital reformation. Based on the Social Capital theory, Conservation of Resources (COR) theory and the ADAPT framework, the study aims to develop a psychoeducational module of a program for socially disintegrated people.

The qualitative phase involves content analysis of semi-structured interviews to analyze lived experiences, focusing on digital fixation and family separation. The quantitative phase utilizes Structural Equation Modeling (SEM), conducted within the R statistical environment, to empirically assess the hypothesized model.

The SEM assessment is expected to validate trauma intensity as a latent predictor of social integration erosion. Findings are anticipated to show that higher rates of trauma lead to defensive resource conservation, which is manifested in reduction of social integration and the dominance of a social isolation strategy. Qualitative data is expected to reveal a negative feedback loop, where "mental absence" and digital avoidance further impede psychosocial recovery.

Validating this model shifts integration efforts toward trauma-informed care. By proving that depletion of psychological resources, rather than lack of opportunity, lead to social isolation, this study provides a framework for the proposed psychoeducational program. These evidence-based tools will empower volunteers to identify avoidant behaviors, prioritize restoring internal resources, and facilitate successful social reintegration within the Ukrainian refugee community.

Abstract 2234

BODY LANGUAGE IN ANCIENT EGYPTIAN BEREAVEMENT SCENES: A PSYCHOLOGICAL AND ANTHROPOLOGICAL APPROACH

Santini V.*

CAMNES; University of Birmingham ~ Florence (Italy); Birmingham (UK) ~ Italy

The way in which mourners and grieving people were represented during the New Kingdom (approximately 1550–1080 BCE) seems to share significant similarities with actual human reactions to loss and death, as described and investigated by Psychology and Anthropology. In ancient Egypt, both individual grief and public mourning played a fundamental role in the healing process, but, while many images pertaining to communal expressions of sorrow were extensively represented in tomb wall decorations, we unfortunately almost entirely lack scenes that specifically showed personal responses to a loved one's passing – de facto preventing a complete understanding of ancient Egyptian bereavement. However, would it be viable to apply psychological insights to public mourning iconography to detect any indication of how ancient Egyptians personally reacted following a loss? Muscle contractions, scenes of hugging and (soothing?) physical interaction, and symbolic habits with potential anthropological reasons at their origins are the primary indicators for this research project, which seeks to pinpoint the psychological drives that may have influenced the iconography in ancient Egyptian bereavement scenes.

Abstract 4775

THE FELLOWSHIP: THERE AND BACK AGAIN IN THE JOURNEY OF NEURODIVERGENT THERAPY AND WELL-BEING

Hernández--Mancilla N.*, Dicaccavo A.

University of the West of England Bristol ~ Bristol ~ United Kingdom

Introduction:
Neurodivergent individuals, including people with neurodevelopmental conditions such as autism, attention-deficit hyperactivity disorder, dyspraxia, dyslexia, or Tourette syndrome, frequently experience co-occurring mental health challenges (CMHCs) and report reduced quality of life (QoL). While psychological support can be beneficial, limited research has examined the therapeutic relationship when working with neurodivergent individuals or explored how integrating their strengths and passions (focused interests) may enhance engagement in therapy and contribute to improved QoL.

Purpose:
This study explored associations between engagement in passions and QoL, alongside neurodivergent individuals' perspectives on what supports the therapeutic relationship and their overall therapy experience. The research aimed to inform neuroaffirmative, relational, adaptable and applicable therapeutic practices.

Method:
The study was co-produced with collaborators with lived experience. A convergent parallel mixed-methods design was employed. Data were collected through online surveys incorporating the Recovering Quality of Life scale (ReQoL-10) and co-produced qualitative questionnaires exploring adjustments to support therapy and the therapeutic relationship. Participants (N = 182; 103 neurodivergent, 79 non-neurodivergent; aged 18–60 years) had current or past experience of therapy. Quantitative and qualitative strands were analysed separately and integrated to produce meta-inferences.

Results:
Greater engagement in passions was positively associated with QoL in both groups, although not at a statistically significant level. Qualitative findings elucidated this association and highlighted: (1) the value of flexibility and inclusion of passions or focused interests in therapy, (2) the importance of a non-judgemental stance grounded in clinician knowledge and acceptance of neurodivergence, and (3) empathic reciprocity and mutual understanding grounded in relatability and shared interests.

Conclusions:

Findings suggest that meaningful engagement with passions and neuroaffirmative relational practices may support and strengthen therapeutic relationships and contribute to enhance QoL and overall well-being among neurodivergent adults with CMHC. Co-produced training, support and adaptations may further improve therapy accessibility and effectiveness

Abstract 4552

"WE ARE MORE OF SIBLINGS NOW": CONFLICT RESOLUTION STRATEGIES AMONG OLDER COUPLES IN LONG TERM MARRIAGES

Mutambara J.*

Midlands State University ~ Gweru ~ Zimbabwe

Effective conflict resolution has been consistently identified as a critical factor in sustaining long-term marital relationships. While much of the existing literature focuses on younger and midlife couples, older adults possess a wealth of relational wisdom that remains underexplored, particularly in relation to how they navigate and cope with marital conflict. This study aimed to explore the conflict-coping strategies used by older adult couples. A qualitative research design was employed, using in-depth interviews with twenty three couples aged 60 years and above, all of whom were in their first marriage. Data were analysed thematically to identify recurring strategies and meanings associated with conflict management. Findings revealed four overarching themes: (1) emotional safety and connection, (2) commitment and prioritisation of the relationship, (3) adaptive conflict management strategies, and (4) compassionate acceptance. The study concludes that conflict management in later-life marriages is less focused on problem-solving alone and more on preserving emotional security, shared identity, and relational continuity. The findings highlight the importance of drawing on older adults' lived experiences to inform relationship education and counselling interventions. Implications of the study include the development of counselling models informed by the living experiences of older adult couples.

TANDEM PHYSICAL EDUCATION TO ENHANCE INTRINSIC MOTIVATION AND COGNITIVE FUNCTIONS IN YOUNGER SCHOOL-AGE CHILDREN: A STUDY PROTOCOL

Buřilová M.*

Charles University, Faculty of Physical Education and Sport ~ Prague ~ Czech Republic

Introduction:
Sustained engagement in physical activity (PA) during childhood is essential for physical, emotional, and cognitive development. Yet, many children fail to meet WHO PA recommendations, and their intrinsic motivation to be active often declines with age. Tandem physical education (PE)—where a PE teacher and a sports coach co-teach—may provide a richer motivational and affective environment. Grounded in the Affective–Reflective Theory (ART), this approach promotes positive affective experiences that strengthen intrinsic motivation and thus support cognitive functioning.

Purpose:
This study introduces the protocol of a three-year school-based intervention examining how ART-informed tandem PE may increase intrinsic motivation toward PA and enhance cognitive functions (CF) in younger school-age children.

Method:
A quasi-experimental, cluster-based design will be implemented in Czech primary schools. Third-grade classes will be allocated to a control group (standard PE), a semi-intervention group (tandem PE twice per week), or a full-intervention group (tandem PE five times per week). Lessons are designed according to ART principles emphasizing enjoyment and perceived competence. Cognitive functions will be assessed using Woodcock–Johnson IV subtests (working memory, inhibition, cognitive flexibility). Affective and motivational responses will be assessed using the AFFEXX Questionnaire, which captures implicit and reflective components of affective evaluation during physical activity. PA levels and motor competence will be monitored via accelerometry, CAMSA, beep test, and parent reports. Baseline assessment is complete; the first post-testing phase will conclude in June 2026.

Expected Results:
It is hypothesized that children in tandem PE groups will show greater improvements in CF and intrinsic motivation than controls. The study will also test whether changes in motivation mediate the link between intervention intensity and CF development.

Conclusions:
This protocol highlights a novel, ecologically valid approach integrating ART-based motivation and tandem pedagogy to foster cognitive and affective benefits in younger school-age children. The findings will inform sustainable strategies for PA promotion and educational practice.

Abstract 612

PSYCHOLOGICAL MECHANISMS BEHIND ADULT CYBER DEVIANCE: THE ROLE OF DARK TETRAD TRAITS AND ONLINE DISINHIBITION

Cheng C.*, Liu Y.

National Yang Ming Chiao Tung University ~ Hsinchu ~ Taiwan

1. Introduction

The Internet has become indispensable in modern society, with rapidly evolving technologies and diverse social media functions. However, this environment also creates greater opportunities for online misconduct, such as trolling, identity theft, and cyberbullying. Dark Tetrad traits (Machiavellianism, psychopathy, narcissism, and sadism) are key predictors of deviant behavior, yet their influence on cyber deviance through online disinhibition remains unclear. Although Cyber-Routine Activity Theory has emphasized victims, a fuller understanding requires attention to perpetrators' psychological mechanisms, particularly the mediating role of online disinhibition.

2. Purpose

This study aimed to examine a mediation model in which online disinhibition explains the relationships between the Dark Tetrad traits and adults' cyber deviance, thereby providing a more comprehensive understanding of online deviant behavior in the digital age.

3. Method

A total of 454 Taiwanese adults (58% female; M = 26.98, SD = 8.27), all of whom reported daily Internet use, completed questionnaires measuring Dark Tetrad, online disinhibition, and cyber deviance. Path analysis with 5,000 bootstrapped samples was used to test mediation effects.

4. Results

Direct effects of the Dark Tetrad traits on cyber deviance were not significant. However, online disinhibition mediated the effects of psychopathy (β = .04, 95% CI [.01, .07], p = .03), narcissism (β = –.04, 95% CI [–.07, –.01], p = .01), and sadism (β = .03, 95% CI [.01, .04], p = .01) on cyber deviance. No mediating effect was found for Machiavellianism. The model accounted for 10% of the variance in online disinhibition and 6% in cyber deviance.

5. Conclusion

Findings indicate that psychopathy and sadism increase online disinhibition, thereby fostering more cyber deviance, while narcissism reduces disinhibition and decreases

deviance. These results highlight the need for policies and educational interventions to address misperceptions that cyberspace is free from accountability. Strengthening awareness of digital traceability technologies may help reduce deviant online behaviors.

Abstract 751

COMMITMENT, FIDELITY, AND INTIMACY TYPOLOGIES AND MARITAL QUALITY: A DYADIC STUDY OF TAIWANESE COUPLES

Jou Y.*

Institute of Ethnology, Academia Sinica ~ Taipei ~ Taiwan

Grounded in the socio-cultural context of Chinese society, this study investigates commitment, fidelity, and intimacy as three fundamental elements in sustaining marriage, and explores their associations with marital quality from a dyadic perspective. Data were drawn from 402 married couples in the Greater Taipei area. Measures included marital commitment (22 items), fidelity beliefs (5 items), intimacy (20 items), marital quality (14 items), and demographic controls. Analytical strategies comprised factor analysis, latent profile analysis, and hierarchical linear modeling (HLM).

The findings are as follows. First, marital commitment was decomposed into five factors: commitment to spouse, commitment to marriage, marital constraint, child-related ties, and transcendent reverence. Second, based on these factors, couples' commitment profiles were categorized into four types: indifferent-neglectful (12.5%), transcendent-constraint (26.9%), spouse-focused (30.0%), and reverent-commitment (30.6%). Third, husbands reported significantly higher levels of commitment across the five factors, greater intimacy, and better marital quality than wives, while fidelity beliefs showed no gender differences. Fourth, results from hierarchical linear models indicated that, compared with reverent-commitment couples, indifferent-neglectful couples reported significantly lower fulfillment, whereas spouse-focused couples reported significantly lower regret. Moreover, stronger fidelity beliefs and greater intimacy were both positively associated with higher marital quality. The link between commitment type and fulfillment was moderated by fidelity beliefs, with indifferent-neglectful couples low in fidelity beliefs reporting the lowest fulfillment. Likewise, the association between commitment type and regret was moderated by intimacy, such that spouse-focused couples with high intimacy reported the lowest regret.

These findings underscore the distinctive significance and functions of commitment, fidelity, and intimacy in shaping marital quality among couples.

Abstract 891

FROM CELEBRITIES TO GLOBAL BELONGING: LINKING FAN CULTURE, IDENTITY, AND WELL-BEING IN TURKEY

Tasyürek--Demirel S.[1], Koçyigit H.*[2], Çetin R.F.[3], Ari E.[1]

[1]Medipol University ~ Istanbul ~ Turkey, [2]Marmara University ~ Istanbul ~ Turkey, [3]Koç University ~ Istanbul ~ Turkey

In recent years, the global spread of social media has intensified cultural interconnectedness, contributing to the increase of fan culture and the growing salience of global identity among young people. Despite these developments, relatively little is known about how such orientations relate to one another or to broader aspects of self-concept and well-being. The present study examined the associations among celebrity attitude, life satisfaction, self-esteem, religiosity, and global identity in a sample of 312 young adults from Turkey. Participants ranged in age from 18 to 31 years (M = 23.0, SD = 3.47). Using validated self-report measures, we assessed correlations across the five constructs. Celebrity attitude was associated with life satisfaction (r = .16, p = .02), but was not related to self-esteem, religiosity, or global identity. Life satisfaction correlated positively with religiosity (r = .31, p < .001) and global identity (r = .21, p < .001), and negatively with self-esteem (r = –.25, p < .001). Self-esteem was positively correlated with global identity (r = .27, p < .001) and weakly with religiosity (r = .11, p = .05). The strongest association showed between religiosity and global identity (r = .37, p < .001). Taken together, these findings point to the interplay between identity, belief systems, and subjective well-being in Turkish youth, suggesting that globalizing cultural influences and personal orientations toward religion and self-concept shape young people's psychosocial adjustment.

Abstract 147

THE ROLE OF CULTURAL SELF-CONSTRUAL IN PREDICTING CONFORMITY ON SOCIAL MEDIA: INSIGHT FROM JAPAN AND THE UK

Kuroboshi K.*, Murakami H., Manalo E.

Kyoto University ~ Kyoto ~ Japan

Introduction:
People often behave in accordance with others' expectations and social norms, a phenomenon known as conformity. While early studies, such as Asch (1951), suggested that conformity levels were consistent across countries, later meta-analyses have indicated that collectivistic cultures (e.g., East Asia) may exhibit higher conformity than individualistic ones (e.g., Western countries). However, most cross-cultural conformity studies have focused solely on national-level comparisons, neglecting individual-level cultural factors. This study addresses this research gap by examining cultural self-construal, which refers to how individuals view themselves, and explores conformity in SNS contexts to link cultural and social psychology.

Purpose:
This study aims to clarify the relationships between participants' cultural self-construal, their place of residence, and their tendency to conform to others in a social media networking environment. Our hypothesis is that cultural self-construal, rather than place of residence, influence an individual's tendency toward conformity.

Method:
A total of 126 participants (63 Japanese and 63 British, aged 20–35) will complete an online experiment. Participants will be shown 15 controversial news topics (e.g., remote work, autonomous vehicles) as posts on an X (formerly Twitter)-like platform. Each topic will be accompanied by a quote tweet expressing either agreement or disagreement, conformity will be manipulated by high and low social engagement (likes, comments, retweets). Participants will rate their agreement with each topic after viewing. Participants will also complete validated measures of cultural self-construal, critical thinking, SNS usage, and demographic information.

Result:
A multiple regression analysis will be conducted to predict conformity levels based on residence, self-construal, and their interaction. Results will be collected and analyzed by August 2025.

Conclusion:

We predict that cultural self-construal will be a stronger predictor of conformity than country of residence.

Abstract 820

SOCIAL CATEGORIZATION IN VIRTUAL REALITY: THE ROLE OF ETHNICITY, NUMEROSITY, AND STEREOTYPICALITY

Manfredi A.*[3], Parisse C.[1], Cocco V.M.[2], Livi S.[1], Vezzali L.[2], Gabbiadini A.[3]

[1]University La Sapienza Roma ~ Roma ~ Italy, [2]University of Modena e Reggio Emilia ~ Reggio Emilia ~ Italy, [3]University of Milano-Bicocca ~ Milano ~ Italy

Virtual Reality (VR) is increasingly used to simulate encounters with avatars representing different social groups, aiming to reduce intergroup prejudice. This approach is informed by the Common Ingroup Identity Model (Gaertner & Dovidio, 2014) and the Dual Identity Model (Gonzales & Brown, 2003), which suggest that avatars must be perceived as outgroup members for recategorization to occur, mimicking real-world intergroup contact. However, the assumption that avatars with outgroup features are automatically categorized as belonging to a different group has not been empirically validated. Understanding how avatars are perceived in VR is crucial for refining applied interventions where avatars elicit meaningful social responses.

In two within-subjects studies, we explored this process using a 2 (ethnicity: Black vs. White) × 2 (numerosity: individual vs. group) × 2 (stereotypicality: neutral vs. culturally marked) factorial design. Participants, all Caucasian, viewed avatars representing the ingroup (White avatars) and the outgroup (Black avatars). In Study 1 (N = 68), participants saw two-dimensional avatar screenshots, while in Study 2 (N = 85), they experienced avatars in immersive VR, enhancing the ecological validity. After each exposure, participants categorized the avatars, and data were analyzed using multinomial logistic regression, with outgroup as the reference category.

Both studies revealed a significant three-way interaction. In Study 1, Black-avatar conditions increased the likelihood of outgroup categorization, with the Black–Group–Stereotypical configuration showing the strongest effect. In Study 2, only the Black–Group–Stereotypical condition significantly increased outgroup categorization.

These findings highlight the importance of visual cues in immersive VR for triggering outgroup perceptions. From an applied perspective, these insights are valuable for designing VR interventions to reduce prejudice, improve social integration, and promote inclusivity, enhancing VR's potential as a tool for social change.

Abstract 789

PARENTAL PERCEPTIONS OF CHILD SEXUAL ABUSE PREVENTION: INFORMING INTERVENTION NEEDS FOR SOUTH AFRICAN PARENTS OF YOUNG CHILDREN

Muller J.*, Theron L.

University of Pretoria ~ Pretoria ~ South Africa

Introduction: Child sexual abuse is a crisis in South Africa, with 45% of reported sexual offence cases involving child victims. Parents are in a position to deliver prevention education from an early age, yet they often lack the confidence, knowledge, and resources to do so effectively, particularly during the early childhood period (ages 2-6).
Purpose: This study aimed to explore South African parents' perspectives and experiences of child sexual abuse prevention education to identify the support and intervention requirements to empower them in this role.
Method: A qualitative research design was employed. Semi-structured interviews were conducted with 12 South African parents of children aged 2 to 6 years. Data were analysed using reflexive thematic analysis to identify gaps and intervention needs.
Results: The analysis identified three thematic areas: 1) Awareness gaps: Parental narratives showed a need for interventions that challenge misconceptions, including the exclusive vulnerability of girls the sole threat of adult male perpetrators, and increase awareness of child-on-child abuse; 2) Practical implementation barriers: Parents struggled with age-appropriate communication, and lacked usable resources; 3) The need for collaboration: Parents expressed a desire for collective prevention effort, but emphasised the need for controlled, pre-approved, and accredited school-based programs without conflicting with familial values.
Conclusion: The findings suggest a need for holistic intervention development. These should include targeted parental psychoeducation to address myths, the creation of accessible and practical resources for early childhood, programs specifically designed to engage fathers, and the establishment of trusted, collaborative partnerships between parents and schools. Empowering parents through these tailored interventions is important for enhancing child sexual abuse prevention efforts in South Africa.

Abstract 121

UNDERSTANDING HEALTHY RELATIONSHIPS FROM AN ADULT PERSPECTIVE: INSIGHTS FROM THEMATIC ANALYSIS

Pranawati S.*[1], Ginanjar A.S.[1], Winardy G.C.[2]

[1]Universitas Indonesia ~ Depok, West Java ~ Indonesia, [2]BINUS University ~ Jakarta ~ Indonesia

A healthy romantic relationship contributes significantly to individual well-being, fostering emotional stability, happiness, and personal development. Understanding the essential components required to build and sustain such relationships is critical, particularly among young adults navigating complex interpersonal dynamics. This study aims to identify these essential components through a qualitative survey featuring open-ended questions. The study collected descriptive data from 207 participants aged 18-40 years adults, which were subsequently analyzed using thematic analysis to uncover recurring patterns and themes in participant responses

The findings highlight that young adults perceive crucial aspects for cultivating healthy romantic relationships: effective communication skills, mental well-being, mutual support, and shared norms and values. First, participants emphasized the importance of communication skills, which encompassed components like establishing communication, communicating effectively, and open communication. Second, mental well-being was identified as a mature thinking, engaging in positive activities, and working toward shared goals were essential. Third, the study underscores the significance of mutual support. Participants described mutual support as involving actions such as helping one another, showing mutual respect, and actively listening. Finally, participants highlighted the importance of norms and values, whether religious or cultural, in maintaining a healthy relationship.

These insights carry important implications for relationship counsellors and pre-marital service providers, as they offer a deeper understanding of young adults' perspectives on healthy romantic relationships. Given the exploratory nature of this preliminary study, further research with a broader sample and diverse methodological approaches is recommended to refine and expand upon these findings. Future studies could explore additional relational dimensions, such as cultural influences and evolving social norms, to enrich the discourse on relationship dynamics.

Abstract 1000

DEATH AND MEDICAL ETHICS IN AMAMI ISLANDS

Sakata M.*

SAKATA, Maho ~ Wakayama ~ Japan

The Amami Islands, located southwest of Japan's main island, consist of eight main islands, some of which lack hospitals and resident doctors. In cases of sudden illness or venomous snakebites, common in the region, emergency medical care is typically provided via doctor helicopters. However, due to frequent typhoons, air or sea transport is not always possible, making access to medical services uncertain and dependent on weather conditions.

In contrast to Japan's mainland and other developed countries, where death due to lack of medical access is rare, the situation in the Amami Islands presents a stark difference. Interestingly, many residents choose to remain on these remote islands despite the risks. This suggests a unique perspective on life and death—one that accepts death as a natural part of life rather than something to be avoided at all costs.

This study conducted interviews with residents of the Amami Islands to explore their views on life and death. The findings reveal a prevailing attitude: while people wish to live their lives meaningfully, they do not seek aggressive life-prolonging treatments. Many expressed a desire to spend their final days with family and to maintain a lifestyle that reflects their personal values, even when facing serious illness.

In the context of modern medicine, where living wills and DNAR (Do Not Attempt Resuscitation) orders are increasingly respected, the death-related values held by the people of the Amami Islands offer valuable insights. Their perspective encourages a reconsideration of what it means to live—and die—with dignity, particularly in settings where medical resources are limited.

Abstract 855

PREFERENCE FOR GENERATIVE AI AS A COMMUNICATION PARTNER

Suzuki T.*[2], Yamada S.[1]

[1]Tokai University ~ Kanagawa ~ Japan, [2]Tokyo Future University ~ Tokyo ~ Japan

This study aimed to clarify the characteristics of individuals who prefer generative AI as a communication partner. An online survey was conducted with 98 male and 110 female participants aged 15 to 29 (M = 21.82, SD = 4.89) in Japan. First, we examined the frequency of using generative AI as a communication partner (for casual conversation, venting, or seeking advice, excluding studying or work-related tasks). The results showed that 45.7% of participants had interacted with generative AI as a communication partner in the past six months. For participants who had interacted with generative AI in the past six months, we asked whether they preferred generative AI or humans as a communication partner. Among them, 40 participants (42.1%) selected "Prefer Generative AI" or "Somewhat prefer Generative AI," 21 participants (22.1%) selected "About the same," and 34 participants (35.8%) selected "Somewhat prefer Human" or "Prefer Human." Thus, the proportion of individuals preferring generative AI as a communication partner was not negligible. We then examined whether these preferences were associated with social anxiety tendencies using the Social Interaction Anxiety Scale (SIAS-6; Peters, 2012). Analysis of variance revealed a significant main effect ($F(2,92) = 3.13$, $p = .048$, $\eta^2 = 0.64$), and post-hoc comparisons showed that those who preferred generative AI had significantly higher social anxiety scores than those with equal preference. These results suggest that individuals with higher social anxiety may avoid communication with humans and instead interact with generative AI. Additionally, beliefs about AI (AI having free will, AI's understanding of human minds, and trust in AI) were not related to AI preference, implying that AI preference may arise more from avoidance of human interaction than from positive evaluation of AI.

Abstract 4765

Occupation-Based (Versus Income-Based) Intragenerational Upward Mobility Reduces Fertility Intentions Among Working Childless Women

Zibei G.*, Gongxiang C.

School of Education and Psychology, University of Jinan ~ Jinan ~ China

Previous research has examined the influence of perceived intragenerational upward mobility on fertility intentions among working childless women; however, the findings have been inconsistent. Most studies have treated perceived intragenerational upward mobility as a single, undifferentiated construct and have overlooked the potentially distinct effects of income-based versus occupation-based mobility perceptions. To address this gap, we conducted two experimental studies (N = 641). Study 1 examined the effect of occupation-based versus income-based perceived intragenerational upward mobility on women's fertility intentions. Study 2 further investigated the mediating role of fertility efficacy and included a comparison group of men to contextualize the findings for women. Results consistently showed that occupation-based (vs. income-based) perceived intragenerational upward mobility significantly reduced fertility intentions among working childless women. This effect was mediated by reduced fertility efficacy. Moreover, the effect was more pronounced among working childless women than among working childless men. These findings advance theoretical understanding of how distinct forms of perceived intragenerational upward mobility shape fertility decision-making among working childless women and offer practical implications for the design of targeted fertility-support policies.

Abstract 2648

INTEGRATION OF ARTIFICIAL-INTELLIGENCE CHATBOTS INTO EVIDENCE-BASED PSYCHOLOGICAL SUPPORT FOR ADDICTIVE DISORDERS

Tapalova O.*[1], Zhiyenbayeva N.[2]

[1]Abai Kazakh National Pedagogical University ~ Almaty ~ ?????????, [2]Abai Kazakh National Pedagogical University ~ Almaty ~ Kazakhstan

The global rise of substance-related and behavioral addictions highlights the need for scalable, accessible, and evidence-based psychological interventions. Traditional forms of counseling and rehabilitation often fail to ensure timely support, continuity of care, and sufficient therapist availability. This study aims to analyze and systematize international research on the integration of artificial intelligence chatbots into psychological support for addiction treatment.

Methods: Literature was searched in PubMed, Scopus, Web of Science, and Google Scholar (2017–2025) using predefined keywords; inclusion focused on chatbot interventions for substance-related or behavioral addictions reporting empirical outcomes or validated therapeutic frameworks. Representative models were analyzed: Woebot/W-SUDs, Tess, Chatbot-Assisted Therapy (CAT) for methamphetamine use, Quin for smoking cessation, the simulation-based LLM system ChatThero, and a field-defining systematic review.

The analysis demonstrated that chatbot-based interventions are feasible and acceptable for individuals with substance-use and behavioral addictions. Reported outcomes include reduced craving intensity, improved emotional regulation, and increased engagement in treatment. CAT showed measurable clinical improvement through toxicology data and retention rates, while Quin and ChatThero demonstrated enhanced adaptation to motivational interviewing and relapse-prevention frameworks.

Analysis revealed that AI chatbots demonstrate high feasibility and acceptability among users with various types of addictions. Many studies have noted reduced craving intensity, improved emotional self-regulation, increased engagement in therapy, and enhanced motivation for change. Certain models have demonstrated clinically significant effects, including improved toxicology scores and increased retention in treatment programs.

The findings indicate that AI-mediated conversational systems can effectively complement traditional therapy by providing continuous support and promoting self-management. Further research is needed to verify long-term clinical outcomes, ensure ethical oversight, and adapt interventions to diverse cultural, linguistic contexts.

This research was supported by the Committee of Science of the Ministry of Science and Higher Education of the Republic of Kazakhstan (Grant No. BR24992927, “Integrative Study of Gambling Addiction in Kazakhstan and Multidisciplinary Strategies

for Its Minimization).

SHARED ORIGINS, DIVERGENT PATHS: LOCAL COMMUNITY SYSTEMS IN TAIWAN AND JAPAN

Baba Y. T.*

Japan Institute for Group Dynamics ~ Fukuoka ~ Japan

This study examines submunicipal organizations in Taiwan and Japan, both of which can be traced back to ancient Chinese systems of local governance. In Taiwan, villages (li/tsun) have developed into formal units of democratic administration, integrated into the broader framework of local government. In contrast, Japanese neighborhood associations (chōnaikai/jichikai) remain private, voluntary groups without any statutory authority. For much of the twentieth century, this status was unclear, and many citizens assumed that joining their local association was a civic duty. More recently, however, residents have recognized that no such obligation exists, resulting in declining membership across many urban areas.

Participant observation conducted in a Taiwanese village in 2011 revealed marked differences in organizational practices compared to Japanese cases and suggested more systematic and rational approaches to local governance. Building on this initial fieldwork, over the past decade I have conducted extensive investigations in Japan, examining both rural and urban communities. This longitudinal research has allowed a clearer understanding of how Japanese neighborhood associations operate in practice and how historical and cultural factors, especially the centrality of irrigation for rice cultivation, continue to shape governance. In rural areas, farmers' councils allocate water through collective decision-making, with all participants bearing both rights and obligations; this tradition persists today, whereas urban residents, detached from rice-cropping culture, lack comparable duties, complicating local community governance.

Although Taiwan and Japan are culturally very similar, differences in agricultural conditions—particularly the critical role of irrigation in Japan—have led to divergent institutional trajectories. These contrasts illustrate how environmental factors can shape governance practices, even between neighboring Far Eastern societies that share historical roots. Continued collaboration with Taiwanese scholars and residents is necessary to further clarify historical developments and the distinct evolution of local community institutions in the two countries.

Abstract 1153

THE IMPACT OF BELIEF IN FREE WILL ON PRO-SOCIAL THINKING IN RELIGIOUS AND NON-RELIGIOUS PEOPLE

Fudali--Czyż A.*, Wojciechowska B.

University of the National Education Commission ~ Krakow ~ Poland

Free will can be understood as the ability to choose and act independently of external influences and deterministic factors. Christians, compared to atheists, are attributed with a greater belief in free will. Experiment aimed to test the effect of the degree of belief in free will on the willingness to help and the attribution of blame to victims by religious and non-religious people. It was predicted that the effect would be stronger in religious individuals. A total of 204 people were surveyed (M = 20.33 years, SD = 1.58), including 100 religious people (39.70% women) and 104 non-religious people (40.70% women). The study was conducted stationarily using the Psytoolkit platform. Subjects were randomly assigned either to (1) the control group, starting by filling the Free Will and Determinism Scale (FAD-Plus) or one of the two experimental groups, reading before FAD-Plus the text regarding: (2) free will, or (3) determinism. Next, individuals read stories and rate on a seven-point Likert scale how much they would give the protagonist help and how much they would blame the victims. It turned out that religious people had a higher belief in free will than non-religious people ($F(1, 197)=4.52$, $p=.035$, $\eta^2= .022$). Religious people's belief in free will was also more resistant to deterministic belief manipulation (M = 16.27, SD = 3.34) than non-religious people's belief in free will (M = 14.76, SD = 3.85; $t(68)= - 1.74$, $p= .042$). Only in non-religious people, the manipulation of belief in free will made people with a higher score in FAD-Plus compared to those with a lower score more willing to help others ($t(30)= -2.39$, $p = .012$), while being more inclined to blame victims ($t(30)= -2.16$, $p = .019$). It appeared that the manipulation used had a greater effect on non-religious people compared to religious people.

Abstract 1133

CLUSTERING PROFILES OF CAREER INDECISION: SOCIAL CAPITAL, SOCIAL MEDIA USE, AND WELL-BEING IN JAPANESE UNIVERSITY STUDENTS

Fukuzawa A.*[1], Yazawa M.[1], Sugawara I.[1], Hata K.[2]

[1]Musashino University ~ Tokyo ~ Japan, [2]strobolights Inc. ~ Tokyo ~ Japan

Introduction: Career decision-making is a crucial developmental task during university years, influencing later job performance and satisfaction. However, many Japanese students remain in a state of career indecision. Previous studies argued that social capital—such as support from friends, trust in university staff, face-to-face networks, and appropriate social media use—may facilitate adjustment in university students. This study explores whether those findings can be applied to career decisions, namely how social capital relates to career indecision and job-search self-efficacy among first-year university students.

Methods: 170 undergraduates (43 males, 123 females, 4 other; Mean age = 18.43, SD = 0.98) completed a web-based survey. Measures included a career indecision scale (career indecision, career decision, stability-oriented career value), job-search self-efficacy, well-being (life satisfaction, loneliness), social capital (face-to-face, online), and social skills.

Results: Regression analyses revealed that having more LINE/Instagram friends was positively associated with career decision and job-search self-efficacy, whereas reliance on pre-university friends showed negative associations. Time spent on X (formerly Twitter) was related to career indecision and stability-oriented career value. Cluster analysis identified four profiles: (1) socially active students with high career decision, high stability-oriented career value, and high well-being; (2) socially inactive students with low skills, high indecision, high stability-oriented career value and low support; (3) moderately indecisive students; (4) determined but less socially engaged students. Although profiles (1) and (2) both exhibited high stability-oriented career value, their underlying functions differed: profile (1) reflected flexible career attitudes and higher well-being, whereas profile (2) reflected indecision and lower adjustment.

Discussion: These findings highlight the nuanced role of social networks in shaping career development. They further suggest that stability-oriented students can be classified as “flexible” or “career-indecisive and socially inactive” subgroups. Career guidance should consider individual differences in social capital and online engagement, particularly for students low in social skills.

Abstract 1150

POLARIZATION, CONGRUENCY, AND METACOGNITION SKILLS IN TRUTHFULNESS JUDGMENTS OF SOCIAL MEDIA POSTS

Priedols M.*, Dimdins G., Austers I., Rubene Z., Olups R., Evelis K.

University of Latvia ~ Riga ~ Latvia

This study examines how the alignment of content with one's beliefs (congruency) and the quality of that content influence perceived truthfulness of social media posts, and whether metacognitive skills mitigate confirmation bias towards more congruent content. Results were replicated in two samples: a university student sample (N = 96) and a social-network sample (N = 121). Participants rated the truthfulness of simulated social media posts about socially salient domains – migration and women's traditional gender roles. Five posts per topic were designed - four to either align with the participant's stance (congruent) on the topic or contradict it (incongruent), two of those four contained either high-quality, accurate information or low-quality, misleading content, with an additional fifth post mimicking a high-quality, balanced view. We expected that, overall, high-quality content would be deemed more truthful than low-quality content, and that content congruency would bias truth ratings—especially for individuals with stronger attitudes on the topic.

In line with our hypothesis, congruent and balanced posts that were factually accurate and high-quality were rated as more truthful than low-quality content. However, individuals with stronger attitudes toward topics differed more in truthfulness ratings between congruent and incongruent information, reflecting a stronger confirmation bias – particularly for content about women's traditional gender roles. The patterns of effects were similar across the two samples.

When accounting for individual differences in metacognitive skills (measured via a novel metacognitive skills questionnaire for information-processing contexts), the influence of congruency on truth ratings was reduced. Participants scoring higher in metacognitive skills exhibited a smaller confirmation bias in evaluating the truthfulness of content.

These findings highlight that topic-specific attitudes alter how congruent versus incongruent arguments, and their quality, are perceived as truthful, while metacognitive skills can help mitigate this bias, leading to more objective and accurate judgments.

Abstract 928

EXPLORING THE CONCEPT OF FLOURISHING IN RELATION TO OPTIMISM, RESILIENCE AND SELF-ESTEEM

Sharma R.*

Ms. ~ Chandiagrh ~ India

Researchers have recently started acknowledging the various positive psychology approaches and inputs that safeguard the individuals against stress and mental problems. Positive mental health and Flourishing are the present day concepts which have contributed widely to the area of well being. The present investigation aimed to study the gender differences and the relationship of Flourishing with optimism, resilience and self-esteem among adolescents. A random sample comprising 50 males and 50 females (N=100) ranging from 15 to 17 years of age was selected from Patiala, India. Participants completed a questionnaire booklet consisting of a demographic form, The Flourishing Scale (Diener et al., 2009), The Brief Resilience Scale (Smith et al., 2008), The Life Orientation Test –Revised (Scheier et al., 1994) and The Rosenberg Self- Esteem Scale (Rosenberg, 1965). Results revealed that males scored significantly higher on Flourishing, Optimism and Self-esteem as compared to females. Scores were found to be non-significant on the correlate of Resilience. Gender differences were found to be significant for Flourishing, optimism and self-esteem only. Various positive psychology interventions can be utilized at school level to enhance flourishing and psychological well being among adolescents. More research needs to be done in order to better understand the relationship between chosen variables among adolescents.

Abstract 2240

INCLUSION OF MEN IN GENDER BASED VIOLENCE PREVENTION CAMPAIGNS: PERCEPTIONS OF STUDENTS IN A UNIVERSITY IN SOUTH AFRICA

Setwaba M., Maboga V.*, Mashaba K.

HPCSA ~ Department of Health ~ South Africa

Background: South Africa has the highest rate of GBV in the world, rooted in a complex interplay of socio-cultural, economic, and historical factors. Campaigns like #TotalShutdown, 16 Days of No Violence Against Women and Children, #Not in my name are comprehensive initiatives used to address GBV, thus emphasising the urgency for collective action. Such campaigns are core in demanding justice for victims, protecting their rights, and striving for global eradication of GBV. Engaging men in GBV preventative initiatives is critical.

Aim: To explore perceptions of university students on the inclusion of men in GBV prevention campaigns.

Objectives: To determine the perceptions of university students regarding the inclusion of men in GBV prevention campaigns, to determine their understanding of GBV and the importance of GBV prevention campaigns and the role of multi-gender approach (MGA) in the GBV prevention campaigns.

Methodology: Qualitative approach using the Social Learning Theory and Feminist Theory frameworks. Sixteen 3rd year Psychology and Criminology students (10 females/6 males) aged between 22 and 29 years were sampled. Thematic Analysis approach was used to analyse data.

Results: The results indicate that students had adequate understanding of GBV and prevention campaigns which informed their perceptions. They supported the inclusion of men in GBV prevention campaigns and advocated for MGA aimed at increasing awareness, protecting the rights of GBV victims and demanding justice for them. MGA was perceived as core in championing, intensifying the fight against GBV to its extinction. Community-based initiatives in GBV prevention campaigns were also seen as crucial in the eradication of GBV.

Conclusion: There was a quest for transformation in GBV and engagement of men and boys to change their social practices and attitudes towards women and children. GBV prevention initiatives promotes the inclusion of men in GBV prevention campaigns paramount to reducing the pandemic in South Africa.

Abstract 2384

KOREAN MOTHERS' PARENTINGL ROLE STRESS AND SUBJECTIVE WELL-BEING: FOCUSING ON THE MEDIATING EFFECTS OF SOCIAL SUPPORT AND MARITAL CONFLICT

Sung M.*, Ki P.

Korea National Open University ~ SEOUL ~ Korea, Republic of

Introduction

In Korean society, where academic success is highly valued, mother of middle school students often experience cosiderable parenting role stress due to social expectations emphasizing children's achievement. Middle school second year, when developmental characteristics of adolescence and academic burdens converge, is a period of high parenting role stress and child-rearing burdens, so much so that a new term, 'middle school second year syndrome,' has emerged in Korea. Particularly in a context where traditional gender role perceptions persist, mothers are often seen as solely responsible for their children's achievements, leading to significant parenting role stress during this period.

Purpose

This study examines how parenting role stress among mothers of eighth-grade children affects their subjective well-being, focusing on the mediating roles of social support and marital conflict to identify the underlying mechanisms.

Method

Data were drawn from 1,225 mothers participating in the 15th Korea Child Panel Survey conducted by the Korea Institute for Child and Family Policy. Mediation analysis was performed using Hayes' PROCESS Macro Model 4, and bootstrapping was used to verify the significance of indirect effects. Mother's age, education level, and household income were controlled for.

Results

Mothers' parenting role stress negatively affected subjective well-being ($\beta = -.26$, $p < .001$). Parenting role stress also decreased social support ($\beta = -.15$, $p < .001$) and increased marital conflict ($\beta = .35$, $p < .001$). Social support positively predicted mothers' subjective well-being ($\beta = .06$, $p < .05$), whereas marital conflict negatively predicted it ($\beta = -.34$, $p < .001$).

Conclusions

In Korean society, reducing parenting role stress and marital conflict while strengthening social support networks can improve the subjective well-being of mothers with adolescnet children.

Abstract 2389

THE ASSOCIATION BETWEEN PARENTAL ACHIEVEMENT PRESSURE AND DEPRESSION AMONG MIDDLE SCHOOL STUDENTS IN SOUTH KOREA

Ki P.*, Sung M.

Korea National Open University ~ Seoul ~ Korea, Republic of

Introduction

Achievement pressure from parents influences adolescents' depression. Such parental pressure may be especially salient in affecting adolescents' depression in Korea, where academic competition is highly intense. In explaining the association between parental achievement pressure and depression, we can include family communication and academic stress as mediating variables because they explain the association through relational and emotional processes. Supportive communication can buffer the negative effects of parental pressure, whereas increased academic stress may aggravate depression.

Purpose

This study aimed to examine mediating effects of family communication and academic stress on the association between parental achievement pressure and depression among middle school students in South Korea.

Method

Data were drawn from the 15th wave of the Panel Study on Korean Children, which is a nationally collected dataset in Korea. We analyzed responses from the middle school students (N = 1,208). Descriptive statistics and mediation analyses were conducted using SPSS 22.0 and PROCESS macro model 4.

Results

The results showed that family communication and academic stress significantly mediated the association between parental achievement pressure and depression, although there was no direct effect of parental achievement pressure on depression. Higher levels of achievement pressure lowered the level of family communication (β = -.27, $p < .001$), which in turn increased depression (β = -.32, $p < .001$). In addition, higher achievement pressure increased academic stress (β = .38, $p < .001$), which further worsened depression (β = .35, $p < .001$).

Conclusion

This study found that parental achievement pressure affects adolescents' depression indirectly through family communication and academic stress. High parental pressure reduced family communication and increased academic stress, which led to depression among Korean adolescents. These findings highlight the importance of fostering positive family communication and reducing excessive academic pressure to promote adolescents' psychological well-being, offering important implications for counseling

psychologists.

GENDER STEREOTYPES AND SEXUAL VIOLENCE IN THE THIRD MILLENNIUM.

Thursday 23 July 2026 from 11:30 to 13:00

(D-Spadolini)

Norma De Piccoli (University of Turin ~ Turin ~ Italy), Chair and Presenter
Maria Vargas Moniz (ISPA, Instituto Universitário APPsyCI –), Discussant

The interest of this symposium arises from the possibility of addressing the topic of gender violence in its various facets. The targets of the investigations presented are adolescents (De
Piccoli et al.; Del Buono), minor victims of sexual violence (Gallardo et al.,), professionals (Gallardo), couples (Pecini et al.); various areas are investigated, such as: the different sources
and communication styles that have a role in legitimizing stereotypes, attitudes and harassing
and violent behaviours, in particular the role of the mass media in consolidating these stereotypes
(Del Buono's contribution) and the communication styles with which social violence is narrated
and presented (see Crapolicchio et al.); finally, other contributions investigate psychosocial processes that underlie the legitimation of sexual violence: see the contribution by De Piccoli et
al., which considers the role of sexism, rape myths belief and the perception of control in intimate
relationships, and the contribution by Pecini et al., which focuses on intimate relationships by
investigating the relationship between sexual objectification and violence in couple relationships.
An important aspect to point out is that the contributions presented here have an applicative aim,
either because they provide indications of interventions to be implemented or because, based on
implemented interventions, they present the results, showing “evidence-based best practices”.
The Symposium therefore constitutes an opportunity for an international exchange on practices
and possible interventions that can be implemented on the topic of combating stereotypes and
gender violence according to an ecological point of view.

Abstract 4297

CHALLENGING GENDER AND SEXUALITY STEREOTYPES TO PREVENT GENDER BASED VIOLENCE: AN INTERVENTION WITH THE ADOLESCENT POPULATION

De Piccoli N.*, Rollero C., Bosaia L., Berlin E.

Department of Psychology, University of Turin ~ Turin ~ Italy

Gender-based violence (GBV) is a public health issue that affects not only victims and perpetrators, but also society as a whole. According to the social-ecological perspective, both individual psychological variables and social dimensions influence and bias perceptions of GBV, but evidence based interventions aimed at preventing GBV are still lacking. The present study reports the evaluation of a participatory training conducted with adolescents. Specifically, the main psychosocial dimensions related to GBV - such as sexist stereotypes, rape myths, the issue of control and power in intimate relationships, and the recognition of different forms of harassment as actual violence - were addressed during the training intervention using participatory methodologies. Participants were about 250 adolescents and were involved in eight training sessions. The research included the administration of a questionnaire before the training (T0, autumn 2024) and a questionnaire at the end of the training (T1, spring 2025). A control group of the same age and attending the same schools as the experimental subjects was also included. The questionnaire investigated the psychosocial dimensions reported above in relation to the perception of GBV.

In terms of the results, significant gender differences are expected at T0 in the experimental group and at T0 and T1 in the control group. In line with the literature, compared to girls, boys are expected to report higher levels of sexism, rape myths endorsement, more favourable attitudes toward control in intimate relationships, and lower levels of ability to recognise GBV. Moreover, it is expected that between T0 and T1 the experimental group will show a decrease in endorsement of sexist stereotypes and rape myths, and an increase in the ability to recognise the more subtle forms of GBV. The intervention should also improve the general well-being of adolescents, as well as the sense of community in the classroom.

Abstract 4298

THE NEED FOR COUNTER-PROGRAMMING TOXIC MASCULINITY ON SOCIAL MEDIA FOR ADOLESCENTS

Del Buono C.*[1], Di Napoli I.[2]

[1]Our House Meriden, Fullbright scholar, phd University Federico II, ~ New York ~ United States of America, [2]University Federico II, Naples, Italy

Toxic masculinity is the harmful masculinity norms that expect boys and men to be dominant, aggressive, unemotional, and physically strong in order to maintain their status in society. It is well documented that misogynistic content is widely available on social media and has a very strong influence. Gender stereotypes and misogyny on social media is influencing youth by the millions. Since there is a strong link between toxic masculinity and gender-based violence, this is highly problematic. Adolescence is a critical time period when ideas about gender and relationships are being solidified and this age group is learning directly from what they see on social media. Therefore, there is a strong need to counter-program the ubiquitous and harmful gender norms being pushed online in order to help prevent gender-based and sexual violence for the next generation before they begin intimate relationships.

It is important to address the “app-gap” for this age group by merging entertainment and education in the creation of counter-programming content online. Information regarding gender preconceptions, role models, and influences were gathered through surveys and focus groups with adolescents in schools in Naples, Italy. This will be used to inform the video content that would be most successful for this age group. Using advertising and marketing strategies can be an effective way to change deep-rooted cultural beliefs, to influence behavior, and inform adolescents about healthy relationships. With the creation of a video series blueprint and pilot video, the ultimate goal is to create an ongoing video series that can be scaled up for a wider audience in different countries.

Abstract 4299

INTIMATE PARTNER VIOLENCE AND STIGMATIZATION: AN EXPERIMENTAL STUDY ON HELPING INTENTIONS TOWARDS FEMALE SURVIVORS

Crapolicchio E.*[1], Pecini C.[2], Di Bernardo G.A.[3]

[1]Catholic University of Sacred Heart, Department of Psychology, Milan, IT ~ Milan ~ Italy, [2]University of Genoa, Department of Education, IT ~ Genoa ~ Italy, [3]University of Modena and Reggio Emilia, Department of Human Sciences, IT ~ Reggio Emilia ~ Italy

Media narratives about intimate partner violence (IPV) against women significantly shape public perceptions and intentions to engage in activism in support of survivors. This series of studies investigated how the communication of IPV events, particularly through depictions of survivors, impacts public support intentions by addressing the roles of emotions, attitudes, and stigma. In the first study (N = 235), portraying survivors as proactive and resilient reduced negative emotions in readers; however, this reduction was paradoxically associated with lower intentions to engage in activism in support of survivors. The second study (N = 105) demonstrated that similar portrayals increased victim-blaming attributions, which mediated a decrease in public support intentions. Lastly, the third study (N = 302) found that the way IPV is communicated influences beliefs in IPV myths, which in turn affect intentions to engage in activism. The direction of this effect, however, remains to be clarified. These findings offer a nuanced understanding of how communication shapes public responses to IPV. Highlighting survivors' agency and resilience can reduce stigma and challenge harmful stereotypes but may also produce unintended effects, such as reinforcing victim-blaming attitudes or reducing public motivation to act. This underscores the need to craft IPV narratives that balance these goals, fostering empathy and meaningful activism while minimizing risks.

Abstract 4300

DID YOU SAY SOMETHING? THE RELATIONSHIP BETWEEN OBJECTIFICATION, SELF-SILENCING, AND VIOLENCE IN ROMANTIC RELATIONSHIPS

Pecini C.*[1], Tallone B.[2], Di Bernardo G.A.[3]

[1]University of Genoa, Department of Education, IT ~ Genoa ~ Italy, [2]University of Milano-Bicocca, Department of Psychology, IT ~ Milano ~ Italy, [3]3University of Modena and Reggio Emilia, Department of Human Sciences, IT ~ Reggio Emilia ~ Italy

Recent research on sexual objectification has increasingly focused on its dynamics within romantic relationships. To contribute to this growing field, we conducted a study with approximately 250 heterosexual couples from Italy. Both partners completed an online questionnaire assessing partner objectification (hereafter referred to as partner-objectification), perceived objectification by their partner, self silencing, and experiences of intimate partner violence. Using the Actor-Partner Interdependence Model within a Structural Equation Modeling framework, our findings revealed that partner-objectification and perceived objectification, particularly for women, were significantly associated with higher levels of self-silencing and increased IPV experiences. Mediation and moderation analyses were also performed to better understand the mechanisms linking objectification to the outcomes. Our results provide valuable insights into how objectification processes affect relational dynamics and underscore the importance of addressing these patterns in research and interventions.

THE VALUE OF VALUES IN ADDRESSING SOCIAL CHALLENGES

Thursday 23 July 2026 from 13:00 to 14:15

(D-Spadolini)

Daniela Barni (Department of Human and Social Sciences,), Chair and Presenter

Values shape attitudes, expectations, and behaviors, influencing how individuals and groups respond to
pressing social challenges such as multicultural coexistence, gender equality, intergenerational solidarity, etc.
This symposium brings together diverse perspectives on the role of values, highlighting their developmental,
educational, family and societal implications.
The high scientific quality of the contributions, their content, and potential practical implications make this
symposium highly relevant to the Congress. By integrating research across childhood, adolescence, and young
adulthood, the studies presented in the symposium employ longitudinal, qualitative, multi-informant, and cross
cultural approaches to deepen our understanding of how values can promote or hinder positive social change
and how they can serve as a focus for intervention programs.
The first presentation (Daniel et al.) examines the relationship between Schwartz's higher-order value dimensions and the trajectories of prosocial behavior (i.e., sharing behavior) in children. Through a longitudinal
perspective, it highlights how values contribute to the stability and change of prosocial behavior over time.
The second study (Makarova et al.) extends this focus by exploring value development during middle childhood
and its connection to observed prosocial behavior. Drawing on a large-scale longitudinal dataset, it discusses
the implications of self-transcendence values for educational programs aimed at promoting prosociality.
The third presentation (Esposito et al.) shifts the focus to adolescence, investigating the intergenerational
transmission of gender values and stereotypes. Using qualitative methods, it examines the role of teachers and
parents in reinforcing or challenging gender norms, offering insights into the socialization processes.
The fourth study (Barni and Danioni), in continuity with previous research, explores socialization processes in
families with adolescent children, examining how value-related dynamics may serve as resources for
developmental tasks and family well-being.
Thefinalcontribution(Albert)examinestherelationshipbetweenvaluesandintergenerationalsupportinfamilieswithandwithoutamigrationbackground.It shedslightonhowculturalvalueorientationsinfluencetheexpectationsandpracticesofmutualsupportbetweengenerations(adultchildrenandtheirparents),particularlyinthecontextofmigrationandaging.Thediscussionwillprovideimplicationsforpractitionersandpolicymakersworkingtofostermoreinclusiveandresilientsocieties.

Abstract 4304

VALUE CHANGE IN PRIMARY SCHOOL CHILDREN: A LONGITUDINAL STUDY ON BENEVOLENCE AND PROSOCIAL BEHAVIOR

Makarova E.*[1], Scholz--Kuhn R.[1], Biechele L.[1], Doering A.[2]

[1]University of Basel ~ Basel ~ Switzerland, [2]University of Westminster ~ London ~ United Kingdom

Previous research has provided valuable insights into value development during middle childhood. This study examines changes in personal values among Swiss primary school children, with a particular focus on benevolence, which has been identified as the most important value for children. Using data from the VALISE project and its follow-up project, we conducted a two-point longitudinal comparison of value change in children from grades 1-2 (N= 1,342 children, Mage at T1: 6.82) to grade 6 (Nanticipated = 600 children, Mage: 12). Our research addresses
two key areas: First, the change in values, especially benevolence, between early and late primary school years. Second, the relationship between children's values and observed prosocial behavior. To analyze value change between the two time points, we calculated value change scores for benevolence and other values. Our findings provide insights into how values evolve during this critical period of child development and highlight the connection between children's personal values and their actual prosocial behaviors. Preliminary results show that children's value priorities are quite stable over time, with self-transcendence (benevolence and universalism values) being the most important values. This comprehensive approach contributes to the broader discussion on how values can be effectively fostered in educational settings to promote societal well-being. The results have implications for educational policy and practice, particularly in designing interventions to nurture positive values and prosocial behavior in young children. Understanding these developmental changes can inform the creation of age appropriate value education programs and help educators tailor their approaches to support children's moral development throughout primary school.

Abstract 4306

VALUES IN FAMILY LIFE: PROMOTING RELATIONSHIP QUALITY DURING ADOLESCENCE

Barni D.*[1], Danioni F.[2]

[1]1University of Bergamo ~ Bergamo ~ Italy, [2]Catholic University of the Sacred Heart, Milan ~ Milan ~ Italy

This study examines how values, understood as guiding life principles, serve as key resources for addressing relational challenges within families during adolescence. In line with the symposium's focus on the value of values in addressing social challenges, the contribution investigates how parents' values shape parenting styles and are related to the quality of family relationships at a developmental stage characterized by increasing autonomy needs and evolving family roles.

Building on Schwartz's Theory of Basic Human Values, the study distinguishes among three types of parental values: personal values (those held by the parents), perceived children's values (those parents attribute to their adolescent children), and socialization values (those they aim to transmit). The degree of congruence or divergence between these value sets—both within individual parents and between partners—is considered a potential correlate of parenting practices and relational quality.

Participants were 418 Italian heterosexual parental couples (mothers: Mage = 44.93, SD = 4.68; fathers: Mage = 48.19, SD = 5.46), all living in Italy and having at least one adolescent child. Mothers and fathers independently completed a self-report questionnaire, including the Portrait Values Questionnaire and validated measures of parenting behavior and perceived parent–child relationship quality.

Data analyses (currently ongoing) will adopt dyadic and family-level strategies that account for the interdependence between family members, in line with a systemic approach. Preliminary results will be discussed in relation to how value (in)congruence is associated with parenting styles—particularly acceptance versus rejection—and how these dynamics impact the quality of parent–child relationships. The findings offer new insights into value-related dynamics within families, highlighting the psychological processes through which values contribute to relational functioning and support adolescent development as well as overall family well-being.

Abstract 4307

VALUES AND INTERGENERATIONAL SOLIDARITY IN THE CONTEXT OF MIGRATION AND AGEING

Albert I.*

University of Luxembourg ~ Esch-sur-Alzette ~ Luxembourg

Value orientations play a crucial role for intergenerational solidarity as they are linked to norms, expectations, and behaviors within families and societies. Earlier studies have focused on family norms and obligations, relationship quality or forms of reciprocity in mutual intergenerational support whereas they have less frequently addressed general values and needs.
The question of how families with a migration background negotiate expectations for mutual support between adult children and their parents is gaining importance in light of a first generation of migrants close to retirement age, with studies showing higher expectations for mutual intergenerational support.
The present study will focus on how values as guiding principles in people's lives that express underlying motives or goals are related to intergenerational support and reciprocity in the context of migration.
A sample of N = 134 young adults as well as their parents from Portuguese compared to Luxembourgish families living in the Grand Duchy indicated their preferences of ten human values as well as their mutual support (given and received).
Results showed differences in support provision between Luxembourgish and Portuguese families: whereas in Luxembourgish families, direction of support was rather downward the generational ladder, in Portuguese families, young adults indicated to provide as much support to parents as they received from them. As far as relations to value orientations are concerned, whereas in Luxembourgish families self-transcendence values were most strongly related to mutual support, in Portuguese families also conservation values, in particular security, were related to higher support exchange, whereas young adults' striving for stimulation was related negatively to the readiness to support parents.
Results will be discussed in the framework of an integrative model of intergenerational family relations, considering the specific role of security and conservation in the context of migration and ageing.

Abstract 4303

TRAJECTORIES OF PROSOCIAL BEHAVIOR IN MIDDLE CHILDHOOD: THE ROLE OF VALUE IMPORTANCE

Daniel E.*, Lankri Avital B., Sharabi S., Gerera--Heilprin N.

Tel Aviv University ~ Tel Aviv ~ Israel

This study investigates the trajectories of change in prosocial behavior and their association with Schwartz values in a longitudinal sample of 290 children, starting from grades 1-2 and followed over four annual waves. The mean age of children at Time 1 (T1) was 86.77 months (SD = 7.68), with 49% girls. Prosocial behavior was measured using a resource allocation task (Abramson et al., 2018), while values were assessed through a picture-based values survey (Döring et al., 2010).

Latent Class Growth Analysis (LCGA) revealed two distinct trajectories that best described the data, as determined by the Bootstrap Likelihood Ratio Test (BLRT) and the Lo-Mendell-Rubin Adjusted Likelihood Ratio Test (LMR). The two trajectories identified were: a high-stable trajectory, comprising 48% of the participants, and a low-increasing trajectory, comprising 52% of the participants. The study found that values at T1 significantly predicted class membership. Specifically, higher levels of self-transcendence values (i.e., benevolence, universalism) and lower levels of self-enhancement values (i.e., power, achievement) were associated higher likelihood of belonging to the high-stable trajectory, versus the low-increasing trajectory. However, values related to conservation (i.e., security, conformity, tradition) versus openness to change (i.e., self-direction, stimulation) did not predict class membership.

These findings suggest that some children are more likely to change in levels of sharing behavior than others. Moreover, they suggest that children become more likely to behave prosocially over time. We also found that values can predict the level of prosocial behavior over time in middle childhood. We did not find indication that they predict changes in prosocial behavior. This research contributes to our understanding of the role of values in the development of prosocial behavior and highlights the importance of fostering self-transcendence

values in early childhood to promote stable prosocial behavior trajectories.

Abstract 4305

THE INTERGENERATIONAL TRANSMISSION OF GENDER VALUES AND STEREOTYPES WITHIN A GROUP OF ITALIAN HIGH SCHOOL STUDENTS AND TEACHERS: A GROUNDED THEORY INVESTIGATION

Esposito C.[1], Agueli B.[2], Di Napoli I.*[3]

[1]1University of Foggia ~ Foggia ~ Italy, [2]University of Modena and Reggio Emilia ~ Reggio Emilia ~ Italy, [3]University Federico II, ~ Naples ~ Italy

Gender values represent the beliefs and principles that society attributes to the roles and identities of men and women, influencing expectations and behaviors. These values lead to gender stereotypes, rigid simplifications that assign specific qualities and tasks to the two sexes. The intergenerational transmission of gender values and stereotypes is a social phenomenon through which beliefs, norms and expectations about gender roles are passed from one generation to another, influencing identities, behaviours and life opportunities. This transmission occurs mainly in the family and through school, media and religious and cultural institutions. In particular, gender stereotypes and sexist attitudes continue to persist in educational settings, with significant implications for student performance and well-being. This study aimed to investigate the development of gender stereotypes and sexist attitudes among Italian high school students and trainees. A series of focus groups was conducted with 24 high Italian students (all 18 years old) and 24 teachers in training (aged 37-61) to discover the complex interaction between individual, interpersonal, institutional and social factors contributing to these trends' formation and perpetuation. Analysis was conducted using an approach based on the Grounded Theory Methodology, adopting a constructivist lens (GTM; Charmaz, 2017; Mills, 2006). The results reveal a nuanced and multifaceted understanding of the issue, highlighting teacher attitudes, peer influence and broader cultural values and norms in shaping student perceptions and behaviors. A key finding of the study is the central role teachers and parents play in reinforcing or challenging gender stereotypes. The study provides insights for educators, policymakers and researchers seeking to address gender inequalities in education and promote more inclusive and equitable learning environments. The practical implications of the results will be extensively discussed.

Abstract 1311

GENDER DIFFERENCES IN THE IMPACT OF SEXUAL HARASSMENT ON MENTAL HEALTH

Clopotel--Aldea A.*, Tanasie E., Nedelcea C.

University of Bucharest ~ Bucharest ~ Romania

Sexual harassment has become a significant issue in workplace and academic settings, affecting the mental health of individuals across all genders. Despite extensive research, inconsistencies persist in understanding the gender-differentiated impact of sexual harassment on mental health. This study represents the first multi-level and network meta-analysis that distinctly examines the impact of sexual harassment on the mental health of women and men, followed by a comparative analysis of these two genders—an aspect previously unexplored in the literature.

The study is a work in progress which will include quantitative research involving heterosexual adult participants who report direct experiences of sexual harassment, with gender-differentiated data, within a physical setting, and published in English. Data will be extracted from academic databases, open-access sources, peer-reviewed literature, and gray literature. The selected studies will undergo methodological quality and relevance assessment through a double-review process to ensure the consistency and validity of the results. A random-effects model will be employed to account for variability between studies, while standardized mean differences will quantify the impact on mental health. Studies with insufficient data for statistical analysis will be incorporated into the systematic review and analyzed qualitatively The mental health effects of sexual harassment will be categorized according to the biopsychosocial model, covering both clinical and non-clinical outcomes.

The expected contributions include clarifying how sexual harassment influences the mental health of both women and men, considering individual and contextual factors. By examining psychological consequences and contextual influences such as gender norms and social support, this research aims to refine theoretical frameworks and provide directions for the development of nuanced interventions and policies. Despite the anticipated heterogeneity of results, this study will contribute to the development of a conceptual framework that can guide future research and interventions.

Abstract 1794

A QUALITATIVE ANALYSIS OF SCHOOL VIOLENCE IN GUANAJUATO, MEXICO, FROM AN ECOSYSTEMIC PERSPECTIVE

García Y Barragán L.F.*, Correa Romero F.E., Zamudio García V., Fabian Martinez C.

Universidad de Guanajuato ~ León ~ Mexico

Based on focus groups and individual interviews with students, teachers, and parents, an ecosystemic analysis is proposed that highlights the complex phenomenon of school violence, which is underpinned by individual, family, and institutional dynamics. A spectrum of violence is identified that encompasses physical, verbal, psychological, and cyber aggression, as well as bullying, intimidation, discrimination, and peer conflicts. Additionally, the influence of domestic and gender violence in the school context is added to this picture. It is important to note that the perception of these types of violence varies depending on the actor: students are more aware of physical, verbal and cyber aggression, while teachers highlight a persistent lack of respect.

The causes of these behaviours are multifactorial. At the individual level, psychological factors such as low self-esteem, lack of communication skills, fear, frustration, stress and anxiety are identified as precursors to violence. The family context emerges as a determining factor, with family breakdown, lack of emotional support and parental supervision being recurring causes. At the institutional level, weaknesses such as lack of supervision by authorities, perception of impunity, and inadequate enforcement of regulations exacerbate the problem.

This leads to a weak and deficient reporting culture, where students do not report incidents for fear of reprisals, shame, or a generalised lack of trust.

Against this backdrop, key informants also identify a robust set of protective factors that are essential for mitigating violence. These consist of promoting effective communication, trust, mutual respect, and parental and emotional support. The key to resolving these situations lies in a comprehensive approach that combines the development of individual skills such as resilience and autonomy with coordinated institutional actions such as prevention, rapid intervention and conflict resolution.

Abstract 1523

REACHING DIVERSE STUDENTS: SOCIODEMOGRAPHIC PATTERNS IN CAMPUS SEXUAL VIOLENCE PREVENTION PARTICIPATION

Lateef R.*[1], Paquette G.[1], Dion J.[2], Hébert M.[3], Baril K.[4], Bergeron M.[3], Dagenais C.[5], Fethi I.[3], Parent S.[6], Pelland M.[7], Savoie L.[7], Senn C.[8], Daigneault I.[5]

[1]Université de Sherbrooke ~ Sherbrooke ~ Canada, [2]Université du Québec à Trois-Rivières ~ Trois-Rivières ~ Canada, [3]Université du Québec à Montréal ~ Montréal ~ Canada, [4]Université du Québec en Outaouais ~ Saint-Jérôme ~ Canada, [5]Université de Montréal ~ Montréal ~ Canada, [6]Université Laval ~ Québec ~ Canada, [7]Université de Moncton ~ Moncton ~ Canada, [8]University of Windsor ~ Windsor ~ Canada

Campus sexual violence is a pervasive problem worldwide. Students from marginalized groups are more vulnerable to campus sexual violence, but often do not trust or access campus resources, including prevention programs. Applied psychology plays a vital role in understanding these dynamics and ensuring that sexual assault prevention programs effectively reach those who need them most.

This study examined participation trends in a French adaptation of the Enhanced Assess, Acknowledge, Act (EAAA) program (also known as Flip the Script with EAAATM), an evidence-based sexual violence prevention program designed for 17- to 24-year-old for university students who self-identify as women, across five Canadian universities. Using data collected over three years, we compared the characteristics of students who chose to participate in the program (n = 268) with those in a representative student control group (n = 710). Sociodemographic variables included gender identity, sexual orientation, disability status, ethnic background, and residency status (domestic or international student). Alcohol use and history of childhood trauma were also compared between groups.

Results revealed an overrepresentation among program participants of students from several groups at higher risk of campus sexual violence, including international students, students with disabilities, gender-diverse students, and those reporting childhood trauma, among others. At the same time, some high-risk groups were not more likely to participate in the program, particularly students who binge drink. These findings suggest that some students may perceive a greater need for prevention programs, while others remain unreached.

Conclusions highlight the importance of considering sociodemographic and risk factors when designing and implementing campus sexual violence prevention programs. In this study, recruitment strategies appeared to encourage higher participation among students from many marginalized groups. Tailoring outreach strategies to increase

accessibility and trust among marginalized groups can enhance program reach to those most vulnerable to campus sexual violence.

Abstract 1669

CONFORMIST BIAS UNDER SOCIAL AND NON-SOCIAL THREATS

Natsumeda M.*, Yokota K., Nakanishi D.

Hiroshima Shudo University ~ Hiroshima ~ Japan

Researchers across various fields have sought to address the fundamental question of why humans wage war (e.g., the Russia–Ukraine war). Psychologists have often conceptualized war as a form of intergroup conflict, and considerable attention has been devoted to investigating the psychological mechanisms. Previous studies have shown that intergroup conflict situations foster stronger ingroup cohesion and promote cooperative behavior. However, the free-rider problem theoretically makes achieving mutual cooperation difficult. Thus, it remains unclear why people tend to cooperate in intergroup conflict. This study aims to elucidate the mechanisms through which individuals address the free-rider problem and develop cooperative groups.

Cultural group selection theory posits that conformity bias—the tendency to conform excessively to the majority—may facilitate the achievement of mutual cooperation within a group. The theory suggests that conformity bias also works to foster mutual cooperation within groups. However, there is little empirical evidence regarding conformity bias not only in ingroup cooperation situations, but in intergroup conflict situations. Furthermore, this study examined the qualitative differences between threats originating from outgroups and those arising from other sources, such as a natural disaster.

We conducted a vignette experiment with 452 crowd workers who played a public goods game. In the social-threat condition, groups lost 20% of funds if they contributed less than another group; in the no social-threat condition groups lost 20% of group funds independently if they fell below a threshold. Participants first decided whether to contribute, then repeated the decision under four informational conditions (0, 3, 6, or 9 of 9 others' contributions).

The results showed conformity bias across conditions, with similar patterns in both threat situations. These findings suggest that conformity bias contributes to achieving mutual cooperation in various group-based threat situations.

THE RELATIONSHIP BETWEEN NEGATIVE PHYSICAL SELF AND COGNITIVE FLEXIBILITY IN YOUNG ADULTS: THE CRITICAL ROLE OF PERCEIVED CONTROL

Sun Y.*, Wang Y.L.

Ming Chuan University ~ Taoyuan ~ Taiwan

Introduction: Concerns about physical appearance have long been a major source of psychological distress among young adults, while cognitive flexibility may influence how individuals cope with such concerns.

Purpose: This study aimed to examine the relationship between negative physical self and cognitive flexibility, with a particular focus on the role of perceived control in relation to body-related self-perceptions.

Method: A total of 100 young adults aged 18–25 were recruited. Participants completed the Negative Physical Self Scale (five subscales; fatness, shortness, facial appearance, and general appearance concern) and the Cognitive Flexibility Inventory (two subscales; alternatives, perceived control). Bivariate correlations were conducted to examine the association between different aspects of negative physical self and cognitive flexibility.

Results: The results revealed a significant negative correlation between NPSS and CFI total scores. Further examination showed that CFI-Control was significantly and negatively associated with NPSS subscales (i.e., Fatness, Facial Appearance, and General Appearance), whereas CFI-Alternatives demonstrated weak associations with the NPSS.

Conclusions: The findings highlight the critical role of perceived control in relation to negative physical self among young adults. Nonetheless, the potential involvement of third variables cannot be ruled out and warrants further investigation.

Abstract 1368

SELF-COMPASSION AS A MODERATOR OF INTERGROUP CONTACT AND ATTITUDES TOWARDS IMMIGRANTS

Wong K.*, Bailis D.

University of Manitoba ~ Winnipeg ~ Canada

According to past research on the contact hypothesis, increased frequency and higher quality of intergroup contact leads to more positive attitudes and social relations between members of higher- and lower-status groups. Contact is most beneficial for highly prejudiced individuals, as indicated by right-wing authoritarianism and ingroup identification, but few other individual differences have been examined as moderators in prior research. This study investigated self-compassion as a potential moderator of intergroup contact on attitudes. Self-compassion is an adaptive quality that reflects how supportive and accepting someone typically feels toward themselves in difficult times. In an intergroup context, it could lead to greater correspondence between one's personal experience of contact and attitudes toward outgroup members. A total of 159 Canadian-born participants with diverse backgrounds and political affiliations were recruited online through Prolific. They responded to an online survey about contact with immigrants (quantity and quality), attitudes towards immigrants, self-compassion, and demographics. In line with the contact hypothesis, this study found an inverse relationship between contact quality and negative attitudes towards immigrants ($r = -.51$, $p = .01$). Novel to this research, self-compassion further moderated the relationship between contact quality and negative attitudes ($B = -.325$, $t(153) = -3.467$, $p = .001$), such that this inverse relationship was stronger for participants higher (vs. lower) in self-compassion. Thus, relative to participants lower in self-compassion, those higher in self-compassion reported especially less negative attitudes towards immigrants when contact quality was high, and more negative attitudes when contact quality was low. The findings of this study suggest that individuals with higher (vs. lower) self-compassion may rely more on their personal experiences to inform their attitudes. In contexts where high-quality intergroup contact experiences with immigrants are likely (e.g., welcomes, festivals, celebrations), fostering self-compassion may accelerate the development of positive intergroup attitudes.

Abstract 1890

DO EMOJIS SPEAK THE SAME LANGUAGE? CROSS-CULTURALLY ADAPTING A DIGITAL WELLBEING ASSESSMENT TOOL FOR CHINESE POPULATION

Mao Y.*, St Jean N.

Northwestern University ~ Chicago ~ United States of America

Introduction: Digital technologies and pictorial screeners are increasingly used to enhance access to care and monitor mental health, yet most are designed in Western contexts. Although the concept of pictorial or emoji-based screeners may appear universal, their meaning can differ across cultural settings. When applied to diverse cultural contexts, evidence-based adaptations must be incorporated to enhance the rigor and validity of such tools.

Purpose: The purpose of this study was to utilize an evidence-based process to adapt WellCheq, a digital, emoji-based screening tool, developed in the United States, that captures wellbeing states of youth to be culturally responsive to the Chinese youth population within a larger global wellbeing study.

Methods: Adults from mainland China (n=105) completed a survey to assess emoji preferences of affective states. Participants were presented with six emojis: three Apple emojis and three WeChat emojis (Chinese emoji dictionary) for the ten states used in WellCheq. Participants selected the emoji that they believed best represented each affective state.

Results: Chi-squared tests confirmed that the leading emoji for each emotion was chosen far more often than expected (χ^2 = 11.6–165.1, all $p < .05$), with 7 of 10 top selections belonging to WeChat. Although the overall 7–3 split between platforms was not statistically significant (χ^2 = 1.6, $p = .21$), the consistent per-emotion preferences highlight that even pictorial tools assumed to be universal require cultural adaptation to ensure validity and relevance.

Conclusion: Cultural adaptation of well-being assessments is necessary to ensure accuracy across populations. Integrating culturally familiar symbols strengthens validity, promotes inclusivity, and improves accessibility. Such adaptation helps psychologists capture experiences of groups often overlooked in mainstream research, including Asian populations and those with lower education levels. By reducing cultural blind spots in measurement, this work contributes to addressing inequalities and advancing global mental health.

Abstract 1713

PREDICTING MENTAL HEALTH HELP-SEEKING INTENTIONS IN FIRST-YEAR UNIVERSITY STUDENTS: AN EXTENDED THEORY OF PLANNED BEHAVIOUR APPROACH

Freire M.*, Gauld C., Quinn K.

The University of Newcastle, Australia ~ Callaghan, New South Wales ~ Australia

Introduction

First-year university students represent a diverse cohort navigating a critical period of transition. While they share the experience of entering higher education, recent school leavers and mature-aged students often differ markedly in life circumstances, developmental stage, and support needs. These differences may shape how students perceive and respond to psychological distress, particularly in relation to seeking help. Despite growing attention to student wellbeing, universities often adopt a one-size-fits-all approach to mental health support and help-seeking promotion, overlooking how age and life stage shape students' needs and behaviours. Understanding the psychological factors that drive or inhibit help-seeking across these subgroups is essential for inclusive and effective support.

Purpose

This study aimed to identify predictors of mental health help-seeking intentions in first-year university students using an extended Theory of Planned Behaviour (TPB) framework. It examined the roles of attitudes, subjective norms, perceived behavioural control, shame, and stigma, and compared predictors across professional and non-professional help-seeking pathways for recent school leavers and mature-aged students.

Method

Participants (N = 458) completed validated measures of TPB constructs, shame, and stigma. Hierarchical multiple regression analyses were conducted separately for professional and non-professional help-seeking intentions.

Results

Attitudes toward help-seeking emerged as the most consistent and robust predictor across both models. For professional help-seeking, shame significantly improved model fit and uniquely predicted intention, particularly among mature-aged students. In contrast, non-professional help-seeking was more strongly influenced by perceived behavioural control and subjective norms, especially among school leavers. Shame and stigma did not significantly predict non-professional help-seeking intentions.

Conclusions

TPB constructs remain central to predicting help-seeking intentions, but shame and stigma offer additional predictive value, particularly for professional support. These

findings highlight the need for tailored interventions to promote professional and non-professional help-seeking, noting that the predictive influence of attitudes, social norms, and shame differ across diverse student populations.

Abstract 1730

INVESTIGATING SLEEP DEPRIVATION, MENTAL HEALTH, AND WELL-BEING: AN ECLECTIC APPROACH-BASED INTERVENTION AND ITS PSYCHOLOGICAL EFFECTS ON GRADUATE STUDENTS

Bajre P.K.*, Rajan G., Kashyap C.

FLAME University ~ Pune, Maharashtra ~ India

Sleep deprivation and poor sleep quality have been increasingly recognized as critical factors affecting psychological functioning and well-being in young adults. The present study examined the associations between sleep quality, mental health, and well-being indicators among college students in India, with the aim of informing an intervention framework. The study sample comprised 95 graduate students (Male = 63, Female = 28; M age = 24.6 years, SD = 3.32). Participants completed the Pittsburgh Sleep Quality Index, the Depression, Anxiety, and Stress Scale (DASS-21), Multidimensional Flourishing Scale, Peace of Mind Scale, and Harmony in Life Scale. Analyses indicated a significant positive correlation between poor sleep quality and depression ($r = 0.40$; $p < 0.01$), anxiety ($r = 0.57$; $p < 0.01$), and stress ($r = 0.57$; $p < 0.01$). Furthermore, poor sleep quality showed negative correlations with indicators of well-being; with psychological ($r = -0.30$; $p < 0.01$), social ($r = -0.14$; $p = 0.16$), emotional well-being ($r = -0.39$; $p < 0.01$), along with peace of mind ($r = -0.48$; $p < 0.01$) and harmony in life ($r = -0.42$; $p < 0.01$). It suggested that inadequate sleep affects multiple domains of functioning beyond mental health. Based on our findings, an eclectic mindfulness-based intervention has been developed and piloted to address the psychological effects of sleep deprivation. The intervention integrates yoga asanas, pranayama, mudras, and mindfulness meditation, offering a culturally sensitive and holistic approach to enhance sleep quality, reduce psychological distress, and foster overall well-being. The present exploratory study addresses sleep-related concerns among college students, not only as a matter of mental health but also as a broader well-being management framework. Incorporating eclectic, mindfulness-based practices into student support systems may provide a promising avenue for mitigating the adverse consequences of sleep deprivation in academic populations.

Abstract 2251

INDIVIDUAL VULNERABILITIES AND PROTECTIVE FACTORS IN TECHNOLOGY-FACILITATED INTIMATE PARTNER VIOLENCE VICTIMIZATION: A LATENT PROFILE ANALYSIS

Sam J.M.*, Raina M.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Technology-facilitated intimate partner violence (TF-IPV) is an emerging form of abuse wherein digital and modern technologies are used to control, monitor, intimidate, humiliate, or harass a current or former partner. The rising prevalence of TF-IPV, coupled with its physical, psychological, and economic impacts on victims, necessitates urgent attention. However, research in this area is nascent, especially in examining associated individual factors. This study employed a person-centered approach to identify distinct latent profiles based on dark personality traits, emotion regulation difficulties, self-compassion, and conflict resolution styles, and examined their relationship to TF-IPV victimization outcomes. A sample of 221 Indian adults (≥ 18 years) in intimate relationships completed validated measures of dark personality traits, emotion regulation difficulties, self-compassion, conflict resolution styles, and TF-IPV victimization experiences. Latent profile analysis was conducted to identify different subgroups, followed by non-parametric tests to examine profile differences in TF-IPV outcomes. Three distinct profiles emerged: Adaptive (14.9%; characterized by low dark traits, effective emotion regulation, high self-compassion, and high positive problem solving), Normative (71.0%; near-average levels across all variables), and High-Risk (14.0%; elevated dark traits, emotion regulation difficulties, low self-compassion, and high conflict engagement and withdrawal). Significant differences were found across profiles for monitoring/control behaviors ($\chi^2(2) = 10.384$, $p = .006$), humiliation ($\chi^2(2) = 6.017$, $p = .049$), threats ($\chi^2(2) = 7.904$, $p = .019$), and total TF-IPV scores ($\chi^2(2) = 13.959$, $p = .001$). The High-Risk profile demonstrated the highest levels of TF-IPV victimization across all dimensions, with effect sizes ranging from small to medium ($r = .145$ to $.240$). The findings reveal meaningful heterogeneity in individual vulnerability to TF-IPV victimization, suggesting that specific combinations of personality traits, emotion regulation capacities, and protective factors create differential risk. Results support developing targeted interventions based on individual risk and protective factor profiles.

Abstract 1971

FROM CLASSROOM TO COMMUNITY: MIO EMOCIONE CAFÉ AS AN EXPERIENTIAL MODEL FOR CULTIVATING EMOTIONAL INTELLIGENCE

Goenka R.*, Mudadi E., Kundu S.

Rishihood University ~ Sonipat ~ India

Emotional Intelligence(EI) is widely recognized as essential for relationships, leadership, well-being, and community health, yet few interventions directly target its full richness, and large-scale community applications remain rare. Mio Emocione—Italian for “My Emotions”—is an innovative café model that combines pedagogy and public engagement to cultivate EI as a way of life. Conceived as a pedagogical strategy for Emotional Intelligence course for undergraduate psychology students, the café provides learners with hands-on experience in designing and delivering a mass intervention, while simultaneously functioning as a community initiative that makes conversations about emotions as natural as sharing a cup of tea. The café integrates herbal teas, themed menu items, and creative décor with evidence-based activities drawn from the RULER framework of EI: Recognizing, Understanding, Labeling, Expressing, and Regulating emotions. Visitors engage with emotion body maps, gratitude walls, cultural message rewrites, self-compassion letters, reflection cards, and creative art and music stations. Piloted in 2024 at Rishihood University, initial feedback suggested enhanced emotional vocabulary, openness to vulnerability, and stronger engagement with EI learning.

The forthcoming November 2025 café will expand to two days, with an expected 1000–1500 participants from the university and neighboring institutions. Evaluation employs a mixed-methods design: quantitative measures include pre–post EI scores (Schutte Self-report EI test), emotion vocabulary expansion, willingness to revisit or advocate for such cafés, and behavioral engagement indices; qualitative data includes focus group interviews, facilitator observations, and thematic analysis of artefacts such as gratitude notes, emotion maps, and reflection cards. Anticipated outcomes include measurable improvements in EI subscales, richer emotional fluency, and emergent themes of psychological safety, connectedness, and reframed cultural narratives.

By uniting pedagogy, community participation, and evidence-based design at scale, Mio Emocione offers a replicable model for embedding emotional intelligence into everyday life, with future plans for permanent cafés in Indian cities as sustainable hubs for emotional well-being.

Abstract 1025

PARENTING CHALLENGES AND SUPPORT NEEDS IN RELATION TO SLEEP, NUTRITION, AND EMOTION DURING INFANCY AND EARLY CHILDHOOD: A SURVEY OF SOUTH AFRICAN PARENTS

Visagie E.*, Muller J.

University of Pretoria ~ Pretoria ~ South Africa

Introduction

Sleep, nutrition, and emotional regulation are important for child development and family wellbeing. Deficits in these areas may negatively influence children's development and add to parental responsibilities and stress. In South Africa, parents often struggle to access health-related information and support, highlighting the need for focused and practical educational interventions. Understanding parents' challenges and preferences for receiving support is therefore essential for designing effective, accessible, and contextually appropriate interventions.

Purpose

This mixed-methods study explored the challenges South African parents face in managing their young children's sleep, nutrition, and emotions, and examined the preferred formats and timing for receiving psychoeducational support.

Method

Parents of children during infancy and early childhood completed an online survey to explore the challenges and support needs of their children. The survey included a combination of open-ended narrative, multiple-choice, and Likert-scale items on perceived challenges in three domains: sleep, nutrition, and emotions. Parents also indicated preferred formats for psychoeducation interventions (e.g., WhatsApp/social media, pamphlets, videos, workshops) and the times they would most likely access such resources. Descriptive and content analyses were conducted.

Results

The analyses suggest that parents experience a wide range of challenges across all three domains, with sleep difficulties being most frequent during infancy, and eating and emotional challenges more common during early childhood. In terms of support, most parents preferred easily accessible, flexible formats such as WhatsApp/social media content and short videos, with workshops (both online and in-person) being less frequently selected. Evening and weekend times appeared to be the most preferred periods for engaging with support materials.

Conclusion

Findings highlight the everyday difficulties South African parents experience in supporting young children's sleep, nutrition, and emotional wellbeing. It illustrates the need for tailoring interventions to parental preferences. The findings will inform the development of an intervention to enhance parenting effectiveness and child wellbeing.

Abstract 1828

PARENT–ADOLESCENT DYNAMICS IN YOUTH ONLINE RISK BEHAVIORS: APPLIED PSYCHOLOGY INSIGHTS FROM QUALITATIVE AND QUANTITATIVE LENSES

Olenik Shemesh D.*[1], Heiman T.[2]

[1]Dorit Olenik Shemesh ~ The Open University of Israel, Education and Psychology Department ~ Israel, [2]Tali Heiman ~ The Open University of Israel, Education and Psychology Department ~ Israel

The rapid integration of digital technologies into adolescents' lives has amplified both opportunities for growth as well as exposure to risks. Adolescents' digital behavior patterns are a central topic in current research, requiring in-depth scholarly attention for developing develop deeper and broader understanding and designing applied coping and intervention programs. This study examined two online risk behaviors: cyberbullying (CB) and problematic internet use (PUI), from an intergenerational psychological perspective, integrating adolescents' and parents' voices to identify risk and resilience factors that shape youth online risk behaviors.

Using a mixed-methods design, two strands of research were conducted. First, semi-structured interviews with 30 adolescents aged 12–17and 30 parents, analyzed through a risk–resilience framework, revealed five interrelated factors influencing online risk involvement: social status and skills, peer and parent relationships, risk awareness, screen-time exposure, and prevention programs. These factors reflected both vulnerabilities and protective processes as experienced and interpreted by adolescents and parents. Second, a large-scale survey of 3,306 adolescents (ages 12-17) examined the psychological impact of parental involvement, parental control, and parent–child relationships on youth digital behaviors. Generalized Estimating Equation (GEE) analyses showed that excessive parental control was associated with reduced risk awareness, while strong parent–child relationships emerged as a protective factor, predicting higher risk awareness, lower PUI, and higher resilience to cybervictimization. By combining qualitative insights with large-scale quantitative evidence, this study highlights the complex psychological mechanisms underlying adolescent online risks relating to parental influences.

The findings point to the translation of theory into practice through the development of evidence-based programs that empower both youth and parents in navigating online challenges. Implications are discussed for applied psychology, including the development of interventions that strengthen intergenerational communication, enhance parental guidance, and support healthier digital environments for youth.

THE STAGE OF SOCIETY: PSYCHO-COMPLOTISM

Akbulut O.*, Çakir M., Gençöz F.

Middle East Technical University, Department of Psychology ~ Ankara ~ Turkey

Conspiracy theories arise in contexts of trauma, crisis, and uncertainty, where individuals and communities seek to manage overwhelming anxiety. Though lacking empirical grounding, they present themselves as coherent explanations by attributing responsibility to external, malevolent forces. This presentation explores their psychosocial function through a psychoanalytic lens, integrating Kleinian and Lacanian frameworks with examples such as the belief that COVID-19 pandemic was man-made.

From a psychoanalytic perspective, this mechanism can be understood through Melanie Klein's concept of splitting: complex and contradictory realities are divided into wholly "good" and wholly "bad" objects, reducing anxiety through simplification. In Lacanian terms, conspiracy theories may also be read as defenses against the Real, which resists symbolization. When the Symbolic order (law, institutions, social discourse) fails to provide stability, alternative narratives step in. These narratives create pseudo-symbolic structures "everything is planned," "there is a hidden enemy" that externalize responsibility and deflect recognition of vulnerability, systemic shortcomings, or complicity.

Conspiracy narratives shape public health behaviors (vaccine hesitancy during COVID-19), influence political participation (framing crises as government "plots"), and erode trust in institutions such as science, media, and governance. By reducing complex realities to binary oppositions, conspiracy theories provide short-term relief but hinder constructive engagement with social challenges.

Using Goya's The Sleep of Reason Produces Monsters as a metaphor, we show how producing conspiracy theories makes the subject both victim and author of their own narrative, drawing others into shared fantasy while displacing responsibility. In line with Žižek's notion of the "decline of the symbolic order," conspiracy theories function as perverse substitutes that promise false clarity and agency. We term this dynamic "psycho-complotism," where the mind constructs and becomes trapped in its own conspiratorial logic.

This presentation contributes to applied psychology through a psychoanalytic and societal perspective on conspiracy theories, with implications for mental health and media literacy.

Abstract 1256

SPIRITUAL INTELLIGENCE, QUALITY OF LIFE AND LIFE SATISFACTION – AN INTEGRATIVE REVIEW

Calin M.*, Avram E.

University of Bucharest, Faculty of Psychology and Educational Sciences ~ Bucharest ~ Romania

Introduction.
In the last 20 years there has been a growing interest in the scientific community regarding the impact of spirituality, and later, spiritual intelligence (SI) on quality of life (QoL) and life satisfaction (LS). Still, the research on SI is characterized by a high level of heterogeneity which impedes generalizability.
Purpose.
The present study aims to review, synthesize and integrate the findings on the relationship between SI, QoL and LS by population studied, culture and model employed in order to identify potential underlying mechanisms.
Methods
The study follows Toronto and Remington's (2020) guidelines for developing an integrative review with The JBI Manual for Evidence Synthesis and the PRISMA 2020 checklist as secondary resources. The research protocol includes: Preparation, Search, Screening and Critical Appraisal, Quality Assessment, Extraction, Synthesis and Reporting.
The following databases were searched for primary sources: PubMed, Web of Science Core Collections, ScienceDirect, NUS Library, PROSPERO, Sage Journals, Scopus, SpringerLink, Wiley, OSF Repository and ProQuest using a interface-specific query.
A thematic analysis of the entities extracted and sources was performed with the application of the constant comparison method for data synthesis.
Results.
Four main themes arose in the relationship between SI, QoL and LS: identity and self perception, behaviour, relationship with others and life perception, closely following King's (2008) conceptualization of SI. Along with the themes, several influencing factors of the modelling of this relationship were observed: culture, cultural change, age, gender, life experience and context, with divergent results across studies.
Conclusion.
SI influences people's perception towards themselves and others, encouraging positive behaviors and the use of spiritual resources in stressful situations, accentuating the sense of connection with others, while maintaining a meaningful, holistic life perspective.
Addressing SI in the therapeutic practice could facilitate the creation of meaning and purpose in life, while allowing the client to develop more self-oriented coping strategies

and strengthen the sense of connectedness.

Abstract 1524

INTERPERSONAL CONTACT WITH LGB PEOPLE IS ASSOCIATED WITH BROADER ACCEPTANCE ACROSS DOMAINS OF INTIMACY, WORK, AND POLITICS AT THE INDIVIDUAL AND THE NATIONAL LEVELS IN EUROPE

Nakai K.*[1], Hasegawa O.[2]

[1]Toyo University ~ Tokyo ~ Japan, [2]Hokkaido University ~ Sapporo ~ Japan

Interpersonal contact with outgroup members is known to reduce prejudice, which is widely applied to attitudes toward LGB people. However, this effect across different socio-cultural contexts, which vary in the prevalence of openly LGB individuals, social norms, and legal frameworks, remains underexplored. Through cross-national analysis, we aim to investigate whether the effects of personal contact with LGB people hold across differing socio-cultural contexts, even when controlling for various social factors such as religiosity, economic development, and individualism, as well as demographic factors such as education, and whether they operate at both the individual and the societal level.

We conducted a secondary analysis of the Eurobarometer 83.4 (2015, EU), which includes multiple items on acceptance of LGB people (continuous) and personal contact with LGB people (dichotomous). After excluding cases with missing responses and national-level covariates, sample sizes ranged from 18,853 to 26,085, nested within 25-30 countries. Outcome variables were acceptance of sexual relationships between same-sex people, comfort with an LGB colleague, and comfort with an LGB political leader. For each outcome, we estimated multiple multilevel random-intercept models.

Across models, personal contact with an LGB person predicted higher acceptance for all outcomes (βs = .21 - .25). At the national level, higher contact rates also predicted greater acceptance (βs= .24 - .36), with effects comparable to the legalization of same-sex marriage (βs = .21 - .27) and other societal factors.

The findings indicate that interpersonal contact with LGB individuals is a significant factor associated with acceptance at both individual and national levels across different socio-cultural contexts, with effects comparable to structural or legal conditions. Although causal inferences cannot be drawn due to the cross-sectional design and the inclusion of LGB respondents may affect estimates, the results underscore the potential of contact-based approaches for reducing prejudice, at least in European countries.

Abstract 1192

WHEN ALTRUISM SHINES TOGETHER: GROUP FRAMING TO ALLEVIATE THE DISPLAY DILEMMA

Wang T.*[1], Xiaofei X.[2]

[1]Anhui University ~ Hefei ~ China, [2]Peking University ~ Beijing ~ China

Conspicuous altruism-publicly displaying one's good deeds-has the potential to inspire further prosocial actions and facilitate the diffusion of altruism. Yet individuals often face a "display dilemma": they wish to spread good deeds to encourage others, but fear their motives may be questioned. To address this paradox, we propose group-framed conspicuous altruism as a nudging strategy. Group framing situates altruistic acts within a collective context (e.g., presenting multiple participants in photos, certificates, or social media posts), shifting the focus from the individual to the group. This framing provides a more legitimate external attribution, reduces the psychological burden of self-display, and enhances group identity and perceived social impact, thereby increasing willingness to share altruism.

We conducted five studies (N = 1,396), including two field studies and three online experiments, across diverse contexts such as public service messages, blood donation, teaching support, charity hiking, and online donations. Field studies demonstrated that group framing increased both willingness to display and actual prosocial displays. Online experiments further confirmed its effectiveness regardless of whether altruistic acts were performed individually or collectively. Mediation analyses revealed that group framing operates by strengthening impression management motivation, which in turn promotes conspicuous altruism.

This research extends the application of nudge theory to the diffusion of altruistic behavior and provides a practical strategy to alleviate the conspicuous altruism dilemma. As a low-cost and easily implementable intervention, group framing does not alter altruistic acts themselves but adjusts how they are presented. These findings offer valuable implications for nonprofits, charities, and social marketing, helping to design more effective strategies to amplify the societal impact of altruism.

Abstract 1968

VOLUNTARY CARE AND FELT CONNECTION: CULTURAL DIMENSIONS OF SATISFYING SOCIAL SUPPORT AMONG FILIPINOS

Robles A.M.*, Guilaran J., Alingasa--Aguirre A.P.

Division of Social Sciences, University of the Philippines Visayas ~ Municipality of Miagao, Iloilo ~ Philippines

This study explores what makes social support satisfying for Filipino adults, moving beyond general measures of support quantity, outcomes, and network access. Through a qualitative survey of 424 Filipinos aged 18 to 65, we gathered instances of receiving help and reasons for finding it satisfying or dissatisfying. Using reflexive thematic analysis, we identified key dimensions of satisfying support within the Philippine cultural context. Filipinos value help that offers effective solutions without undermining their agency. Support is most satisfying when it restores confidence, encourages persistence, and affirms self-worth. Conversely, help that blames, belittles, or imposes weakness is dissatisfying. The source and delivery of support also matter: Filipinos prefer voluntary and wholehearted help over transactional or socially obligated aid. Support is seen as more authentic when it arises from genuine care rather than pressure to appear kind. Many respondents expressed discomfort with help that creates a sense of indebtedness. The expectation to reciprocate can feel burdensome and cast doubt on the sincerity of the gesture. Help is most appreciated when it comes freely and when it affirms one's place in a caring social network. Dissatisfaction also arises when received support feels disproportionate to one's past efforts in helping others. The study highlights how cultural values shape support expectations. Filipino indigenous values such as "kagandahang loob" (shared inner nobility) and "pakiramdam" (shared inner perception) inform how help is given, received, and appraised. These findings challenge earlier definitions of "utang na loob", reframing Filipino social support as a commitment to solidarity rather than a transactional obligation. This culturally grounded understanding offers a more nuanced framework for theorizing and measuring social support in collectivist settings.

Abstract 267

ASSESSMENT OF SUSTAINABLE WELL-BEING AMONG INDIAN YOUTHS

Mohanty A.*, Vadlamani K., Mohanty A.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Introduction

Sustainability has become an important aspect in everyday lives. Its priority is being increasingly highlighted globally. The integration of sustainability in our daily lives is inevitable. Through decades, sustainability did not gain enough weightage to make it as the essential indicators of well-being, let alone measuring sustainable well-being. This paper highlights the need and importance of a holistic well-being questionnaire.

Purpose

Well-being questionnaire/s took into account various aspects like physical, mental, social, spiritual and emotional. However financial, environmental and sustainability of well-being were hardly considered as indicators in any questionnaire. A more inclusive questionnaire to determine well-being, its longevity and sustainability is crucial. Thus, a 'Sustainable well-being Questionnaire' has been developed and administered among Indian youth.

Method

An extensive sustainable well-being questionnaire is developed, with various aspects like Physical, Mental, Spiritual, Social, Environmental, Economic, and Sustainability. The questionnaire has 97 items in total. A Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree) is used. The students' responses (N=500) were then quantitatively analyzed to find out the correlations among the sub-aspects. Thus, the importance of sustainability, environmental well-being and the reason behind its inclusion is highlighted.

Results

The Indian youth hailing from urban areas exhibited a higher economic well-being. Environmental well-being is significant in people hailing from semi-urban and rural areas. Sustainability stood among one of the top scored average items in the questionnaire. Males recorded high on economic well-being while females dominated in social well-being.

Conclusions

The results indicate that there is a need for an in-depth analysis of sustainable well-being. This basic research is the foundation of such an attempt to determine which aspect of well-being is high amongst Indian youth and which ones need improvement. Further frameworks on improving well-being of youth can be devised with extensive studies, focusing on necessary aspects.

Abstract 568

A GENERAL THEORY OF HAPPINESS MANAGEMENT

Sherman A.*

Ruppin Academic Center ~ Emek Hefer ~ Israel

The ultimate goal of all human activity is happiness; happiness like other goals must be managed to be achieved. Thus, happiness management is an established business practice. To further promote opportunities for happiness, the novel general theory presented integrates three additional realms, parents, governments, and the self. The theory's generality is based on the idea that, regardless of culture, religion or gender, happiness in adulthood is a function of two principles: (a) both hedonic and eudaimonic components are required, and (b) active production is needed to transform attention, time, effort, and money into hedonic and eudaimonic capital in both the work and leisure spheres. In adulthood these forms of capital are produced when each "happiness manager" creates appropriate opportunities. In childhood, parents and governments affect these opportunities directly by making decisions regarding cognitive and non-cognitive skills, emotional health, autonomy, and beliefs acquired at home and/or at school. Later, parents become happiness advisers for adults, while governments affect individuals' propensity to invest in capital through their conduct and public expenditures. The theory predicts that faulty management that is detrimental to the accumulation and preservation of capital stock can cause happiness turbulence throughout the life cycle (e.g., mid-life crisis). The motivation to engage in happiness management emerges from the third principle proposed: that individual happiness spills over. It carries objective benefits for the self, business performance, governments and society. Thus, proper happiness management could result in higher level of happiness for a larger number of people.

Abstract 1457

CAN PSYCHOLOGY "SAVE THE WORLD" FROM ENVIRONMENTAL COLLAPSE? A PRAGMATIC DIAGNOSIS AND PRESCRIPTION FOR THE FUTURE OF OUR FIELD

Markowitz E.*

University of Massachusetts Amherst ~ Amherst ~ United States of America

There is a growing recognition amongst policymakers, business leaders, civil society actors and others that the major environmental challenges we face—e.g., climate change, biodiversity and habitat loss, degradation of air and water quality—are fundamentally problems of human behavior. This welcomed, if belated, recognition of the core nature of these problems has resulted in an increased interest in the possible application of psychological science to inform and improve efforts to avoid adverse outcomes in the future. Indeed, there has been an explosion of both descriptive and experimental research in the field of environmental psychology over the past two decades, much of which explicitly aims to support efforts to address these and related problems of environmental conservation through the promotion of targeted behavior change (particularly at the individual and household levels). Although there is some evidence that this field of research has had positive impacts (e.g., improved efforts to address problems of environmental sustainability through voluntary changes in behavior), there is also a growing (and sometimes heated) discussion around the limitations and potential unintended (negative) consequences of this approach to promoting environmental conservation. Given this context and the stakes of “getting it right,” my goals for this talk are twofold: first, I want to clarify and contextualize the key considerations, assumptions and arguments that those on all sides of this much-needed conversation are bringing to the table; second, I want to provide a fair yet critical assessment of what our field does and does not have to offer to broader real-world efforts to promote environmental conservation and sustainability, particularly given the nature of our current political moment around the world. Finally, I will provide my own prescription for where the field could go next as a function of our individual and collective goals and values.

Abstract 1731

PSYCHOSOCIAL RESOURCES AND YOUTH PATHWAYS TO SUSTAINABLE WORK: EVIDENCE FROM SOUTH AFRICA'S BASIC EDUCATION EMPLOYMENT INITIATIVE

Veldsman N.A.*[1], Meyer I.[1], Harvey J.[2], Mncwango B.M.[2], Ngandu S.[2], Yousuff Motala S.[2], Budlender J.[1], Leibbrandt M.[1]

[1]University of Cape Town ~ Cape Town ~ South Africa, [2]Human Sciences Research Council ~ Cape Town ~ South Africa

Youth unemployment is a persistent global challenge with consequences for both individual well-being and sustainable development. Public employment programmes have been widely implemented to provide short-term employment and skills development opportunities. However, existing research has primarily focused on economic indicators of such programmes, with far less attention to the psychosocial resources that support longer-term transitions into decent work. This gap is particularly salient in the Global South, where unemployment rates remain among the highest worldwide. To partially address these gaps, this study will examine South Africa's Presidential Employment Stimulus (PES), implemented through the Basic Education Employment Initiative (BEEI). The BEEI typically places over 200,000 unemployed youth with temporary employment as Education and General Support Assistants in public schools. Although designed as a short-term intervention, the programme provides an opportunity to assess the extent to which public employment programmes, like the BEEI, can strengthen participants' psychosocial resources and contribute to pathways into sustainable and decent work. We will adopt a quasi-experimental, longitudinal design, tracking psychosocial and economic outcomes across three survey waves: baseline (after selection but before placement), during employment, and after programme completion. A sample of approximately 5,000 BEEI applicants, comprising both beneficiaries (treatment group) and non-beneficiaries (control group), will be surveyed. Key variables include psychological resources (self-efficacy, self-esteem, personal initiative, belonging), indicators of well-being (quality of life), and economic measures (job search barriers and income). This design will enable stronger causal inference about how temporary public employment programmes, like the BEEI, shape young people's labour-market trajectories and psychosocial well-being. Our findings will generate policy-relevant insights with societal applications, illustrating the applied contributions psychology can make to addressing youth unemployment and informing the design of future youth unemployment interventions and policies in high-unemployment contexts.

BREAKING THE SILENCE: HOW HUMOR SHAPES NEUROPHYSIOLOGICAL RESPONSES TO DEATH-RELATED ADVERTISING

Fici A.*[1], Gifuni G.[1], Pasculli V.[1], Bilucaglia M.[1], Jacomuzzi A.C.[2], Russo V.[1], Zito M.[1]

[1]Department of Business, Law, Economics and Consumer Behaviour "Carlo A. Ricciardi", Università IULM, Milan, Italy ~ Milano ~ Italy, [2]Department of Philosophy and Cultural Heritage, Ca' Foscari University of Venice, Venice, Italy ~ Venezia ~ Italy

Introduction

Death is a universal experience, but it remains a taboo in commercial communication. According to Terror Management Theory, death awareness provokes existential anxiety, which individuals manage through cultural worldviews and consumption choices that provide symbolism. Depending on tone and structure, advertising can amplify or mitigate anxieties, shaping interpretation and emotional processing. Humor acts as a mechanism that reduces anxiety and facilitates the processing of distressing content. However, little research has examined its role in funeral advertising.

Purpose

This study examines how humorous funeral advertisements affect neurophysiological and self-reported responses and whether individual characteristics moderate these effects.

Method

A within-subject experiment was conducted with 58 participants, who were divided into three groups: young (M_age=29.29), adults (M_age=43.6), and elderly (M_age=60.89). The groups were balanced for gender (48% female). Participants observed 18 stimuli (9 humorous and 9 traditional) to determine whether people of different ages are more sensitive to death communication. Recorded measures included electroencephalographic indices of cognitive engagement and memorization, as well as physiological indices of heart rate variability and galvanic skin response. After each stimulus, participants reported emotional valence, perceived humor, purchase intention, brand awareness, and ad liking. Personality, emotional style, and communication apprehension and anxiety about death were also assessed.

Results

Ongoing analyses are expected to reveal that humorous advertisements elicit higher engagement, consistent with evidence showing that humor enhances attention and recall. These advertisements are expected to evoke different responses from individuals with varying levels of death anxiety or apprehension. Negative attitudes and emotional reactions are anticipated among elders, who can relate to the content more closely.

Conclusions

This research aims to improve our understanding of how framing strategies influence cognitive and emotional responses in sensitive situations. Building on the literature on taboo communication and terror management in marketing, it offers implications for effective, age-sensitive death care advertising.

Abstract 2058

PREDICTING PRODUCTIVE TIME ORIENTATION: THE ROLE OF PERCEIVED SOCIAL SUPPORT, LIFE AND SOCIAL CHANGES

Blazhevska Stoilkovska B.[1], Frichand A.*[1], Tomevska Ilievska E.[2]

[1]Institute of Psychology, Faculty of Philosophy, Ss. Cyril and Methodius University in Skopje ~ Skopje ~ North Macedonia, Republic of, [2]Institute of Pedagogy, Faculty of Philosophy, Ss. Cyril and Methodius University in Skopje ~ Skopje ~ North Macedonia, Republic of

This paper aimed to investigate the contribution of perceived life and social changes, along with self-assessed support by family and friends in prediction of productive time orientation as a positive conception and evaluation of past and future and continuity between them.

Three measures were administered on a sample consisted of 340 participants (female=234) at various age to assess study variables. The data were collected during the winter, 2024.

It was expected that social support by family and social support by friends will be the strongest predictors of productive time orientation, followed by perceived quantitative and qualitative life changes, while self-evaluated level as well as quality of social changes was proposed to be less powerful predictors of criterion variable.

Hierarchical linear regression analysis revealed that, after controlling for participants' age and sex, the quantity of life changes negatively and the quality of life changes positively and significantly predicted productive time orientation (β= -.14, p<.01 and β= .23, p<.001, respectively), explaining 11% of its variability (F(2, 333)=21.66, p<.001). Level and quality of social changes as evaluated by the study participants, accounted for 5% of the variance of productive time orientation (F(2, 335)=8.69, p<.001), but their individual contribution in predicting criterion variable was not statistically significant. As found, stronger productive time orientation was predicted by highly assessed family support (β= .31, p<.001), as well as by highly rated friends support (β= .21, p<.001). Perceived social support accounted for 15% in the variance of criterion variable (F(2, 331)=36.73, p<.001).

The results will be discussed in line with the existing theoretical and empirical findings/knowledge. In addition, recommendations for future research and practical implications of the study findings, particularly in the field of psychological well-being, will be presented.

Abstract 2099

CULTIVATING PUBLIC-FACING SCHOLARS: A MIXED-METHODS STUDY OF PSYCHOSOCIAL AND EDUCATIONAL IMPACTS OF GRADUATE TRAINING IN SCIENCE ENGAGEMENT

Trott C.*, Smeyne C.

University of Cincinnati ~ Cincinnati ~ United States of America

Academic researchers are increasingly called upon to engage public audiences outside the academic sphere in order to communicate scholarly findings and raise awareness of empirical evidence. Graduate programs are increasingly aware of this need, yet most focus almost exclusively on research skills training. When public engagement training is offered, it is usually brief and focused narrowly on dissemination of scientific knowledge —an approach known to be less effective. This presentation describes findings from a mixed-methods research study examining the impacts of a multi-tiered graduate education curriculum in Public Engagement with Science (PEWS) based on extensive community partnership and interdisciplinary collaboration. Specifically, Engaging Science is a three-level interdisciplinary curriculum sequence for graduate students consisting of: (Level 1) an intensive two-day session providing hands-on PEWS experience at a museum; (Level 2) a semester-long course including multi-disciplinary team projects carried out with community organizations; and (Level 3) an application-based fellowship working with a community organization facilitated by faculty and peer mentorship, culminating in an independent PEWS project. Through surveys, focus groups, and interviews with graduate students, this interdisciplinary research project explores the transformative potential of the Engaging Science curriculum to: (1) equip graduate students to engage public audiences in a meaningful, robust way, (2) encourage collaboration across disciplines, and (3) support the success of graduate students through opportunities for community engagement. Findings suggest that the transformative potential of Engaging Science is rooted in its innovative approach to PEWS instruction that goes beyond mere dissemination of scientific findings to emphasize reciprocal interaction addressing a range of critical issues including scientific processes, trust in science, the cultivation of awe, and a sense of belonging within the physical, biological, behavioral, and social sciences.

THE LINKS BETWEEN SEXUAL OBJECTIFICATION OF WOMEN AND TOLERANCE OF SEXUAL HARASSMENT ON SOCIAL NETWORKING SITES AMONG HETEROSEXUAL MEN IN LITHUANIA

Štulaite R.[1], Žardeckaite -- Matulaitiene K.*[2]

[1]Student ~ Kaunas ~ Lithuania, [2]Dr. ~ Kaunas ~ Lithuania

Introduction: Although previous studies confirm links between objectification of women and tolerance of sexual harassment, but these relations still are understudied in the context of social networking sites (SNS) (Galdi & Guizzo, 2021; Ligman et al., 2024). Considering that women are more likely to be sexually objectified and sexually harassed by heterosexual men, it is important to fill-in the gap of knowledge how prevalent is tolerance of sexual harassment on SNS among heterosexual adult men, considering their individual characteristics as well as their tendency to sexually objectify women.
The aim of the study was to reveal links between tendency to sexually objectify women and tolerance of sexual harassment on SNS, in a sample of adult heterosexual men.
Method: 109 heterosexual Lithuanian men, aged 18-65 (mean age 25.6 years) participated in the online study. The study questionnaire consisted of the Sexual-Other Objectification Scale (Bloom, Tavakoli, & Romito, 2024), four vignettes purposely created by the authors to assess tolerance of sexual harassment on SNS and the short version of the Balanced Inventory of Desirable Responding (Paulhus, 1991). The study participants were also asked some socio-demographic and SNS use related questions.
Results: The study results revealed no significant age, education, time spend on SNS or marital status differences in heterosexual men to sexually objectify women. There were also no statistically significant differences in tolerance of sexual harassment on SNS by participants' age or education, but single men were more likely to tolerate sexual harassment than those with a romantic partner. A positive strong association was found between sexual objectification and tolerance of sexual harassment on SNS.
Conclusions: These findings highlight the need to target tendency to sexually objectify women while implementing prevention strategies working with heterosexual men, as this phenomenon is closely linked to greater tolerance of sexual harassment on SNS.

UNDERSTANDING AND ADDRESSING THE ROLE OF PROVIDER BIAS IN GLOBAL HEALTHCARE DISPARITIES

Thursday 23 July 2026 from 16:30 to 17:30

(C- Spadolini)

Nao Hagiwara (University of Virginia ~ Charlottesville), Chair and Presenter

Racial and ethnic disparities in healthcare persist across the globe, partly due to biases held by healthcare providers, which affect clinical interactions and patient outcomes. This symposium highlights new research uncovering the nature of these disparities, the mechanisms through which provider bias contributes to them, and innovative strategies designed to mitigate the impact of such bias. Presentation 1 applied a social comparison framework to mental health disparities. Three studies with Brazilian participants showed that unfavorable social comparisons predicted depressive symptoms and suicidal ideation, while experimentally or cognitively shifting to favorable comparisons improved mental health outcomes. Presentation 2 examined ethnicity-based disparities in psychotherapy among Italian psychology trainees, finding that participants were less inclined to approach or assist a Romanian patient compared to an Italian patient—an effect largely mediated by differences in humanity attributions. These relations were also investigated in the context of racial disparities between Black and White patients. Presentation 3 explored attentional bias in healthcare scenarios under resource scarcity. Across two studies in Portugal, participants exhibited race-modulated attentional biases under scarcity conditions, with heightened attention to Black faces when intensive care stimuli were presented. These results underscore the importance of contextual factors, such as scarcity, in activating subtle bias processes. Presentation 4 tested the clinical impact of a provider implicit bias intervention.

Abstract 4310

ETHNIC DISPARITIES IN PSYCHOTHERAPEUTIC CONTEXTS

Milauro G.*, Falvo R., Capozza D.

University of Padova ~ Padova ~ Italy

Research has shown that patient and physician ethnic group membership affects how they engage in clinical interaction. In the US, for instance, physician's verbal and non-verbal communication differs when the patient is White or Black; therapeutic recommendations may also vary. The present study focuses on clinical relationships in psychotherapy. We propose that, even in this context, ethnicity-based differentiations can be observed, and that these disparities may depend on psychotherapist's attitudes and attributions of humanity. We employed a scenario, describing the case of a 43-year-old man (a specialized technician) suffering from panic attacks, where patient's ethnicity was experimentally manipulated, in a between-participants design. Participants were Italian students enrolled in Master's degree programs in Dynamic or Clinical Psychology, or in Specialization Schools in Psychotherapy (N = 172). They were asked to imagine being licensed professionals treating the patient: in one condition, the patient was Romanian (Alecu), in the other, he was Italian (Paolo). They answered an online questionnaire including measures of attitude and items designed to assess humanity attributions (to Alecu or Paolo). The questionnaire also included implicit and explicit measures that allowed for the detection of ethnicity-based disparities. Mediation models were tested. It was found that participants were less inclined to approach and help the Romanian patient compared to the Italian one (a SC-IAT of approach/avoidance and a SC-IAT of helping/ignoring were used as implicit measures). They provided fewer contact details to the Romanian patient and expected less adherence to treatment recommendations from him. These ethnic disparities were explained by different attitudes, but mostly by the attribution of a lower human status to the Romanian patient. Results allow for the proposal of interventions aimed at mitigating ethnic disparities in the psychotherapeutic context. The study was replicated considering the Black-White relationship (White participants). These data also will be reported.

Abstract 4311

RACIAL ATTENTION IN TIMES OF SCARCITY: COGNITIVE PATHWAYS TO INEQUITY IN HEALTHCARE

Madeira F.*, Ribeiro C., Pereira C.

Institute of Social Sciences, University of Lisbon ~ Lisbon ~ Portugal

Racial disparities in healthcare persist even in systems with universal access, and previous evidence suggests that such inequities are often sustained by subtle, implicit cognitive bias operating even among well-intentioned healthcare professionals. One such mechanism is attentional bias—the differential allocation of visual attention based on social categories such as race. While racialized attention has been widely studied in general social contexts, less is known about how it operates in healthcare settings, particularly under conditions of resource scarcity. Across two experimental studies conducted in Portugal, we investigated whether perceived scarcity modulates racial attentional bias toward intensive care stimuli. In Study 1 (N = 200 White Portuguese medical students), participants completed a dot-probe task in which racialized faces (White vs Black) were subliminally presented before the appearance of intensive care–related or neutral objects. Results showed a general attentional preference for intensive care stimuli (B = 17.22, t = 2.21, p = .03), but no significant racial modulation of attention. In Study 2 (N = 181 lay participants), we introduced an experimental manipulation of resource availability (scarcity vs abundance). Under scarcity, participants showed greater attentional bias toward Black faces (vs White) when followed by intensive care stimuli—consistent with an outgroup threat pattern. Although the effect did not reach conventional significance levels (B = 101.94, SE = 55.08, z = −1.85, p = .128, 95% CI [−209.89, 6.02]), the pattern supports the race-threating hypothesis. Under abundance, participants showed no attentional bias based on race. A differential attentional bias score showed that resource scarcity increased race-based attentional allocation.These findings underscore the importance of investigating how attentional bias may operate in healthcare contexts, particularly under contingency situations, such as scarcity. They highlight the need to address subtle, implicit processes that may shape clinical perception and judgment, even in the absence of explicit prejudice.

Abstract 4313

FEASIBILITY AND ACCEPTABILITY OF INNOVATIVE IMPLICIT BIAS INTERVENTION FOR HEALTHCARE PROVIDERS

Hagiwara N.*, Brown--Iannuzzi J., Adams G., Cohn W., Dalrymple S.

University of Virginia ~ Charlottesville, Virginia, ~ United States of America

Despite many US educational institutions' efforts to tackle provider implicit bias, our systematic review uncovered that current implicit bias trainings show limited effectiveness in improving patient outcomes. Findings from extensive research suggest that minoritized patients are likely responding to a constellation of nonverbal/paraverbal communication behaviors displayed by providers, stemming from implicit bias, rather than isolated key behaviors. Managing multiple communication behaviors in a coordinated manner is difficult, which poses scalability challenges. Patients' communication behaviors during clinical encounters are also affected by patient expectations about the medical interactions, which are often negative. To address these challenges, we developed a novel, theory-driven implicit bias intervention—a concise script providers use to start their clinical encounters with new patients. The goal of this mixed methods study using a community engagement approach was to assess the acceptability and feasibility of the script. We conducted four focus groups with 21 Black/African Americans and two expert panel reviews with 6 family medicine physicians to refine the script. In a subsequent survey (N = 304 Black/African Americans, 67.4% women, age M = 45.17), respondents reported trusting a provider who begins an appointment using the script significantly more (M = 4.00, SD = .65, range 1–5) than healthcare providers in general (M = 3.05, SD = .77), t(303) = 19.86, SE = .05, p < .001, d = .83. Respondents also reported strong intentions to adhere to the provider's recommendations (M = 4.15, SD = .69, range 1–5). A pilot study to test the implementation and preliminary efficacy of the script in improving patient-centered outcomes is currently underway. The implications of these findings for future healthcare provider training and policy changes will be discussed.

BEYOND THE CLOSET: EXAMINING SEXUAL MINORITY OUTNESS, SOCIAL VIGILANCE, AND THE ROLES OF DISCRIMINATION AND BELONGING

Straughan A.*, Kaminski P., Griggs T.

University of North Texas ~ Denton ~ United States of America

Introduction: Even with increased societal acceptance of LGBTQ+ identities, LGBTQ+ individuals continue to experience discrimination (NASEM, 2020). While LGBTQ+ identity disclosure may alleviate the burden of concealment (Kosciw et al., 2015), it may expose individuals to discrimination (Wall et al., 2022). Social vigilance is linked to experiences of discrimination (Timmins et al., 2017). A sense of belonging may act as a buffer against discrimination (Perrin et al., 2020).

Purpose: Few studies have examined social vigilance in LGBTQ+ populations or the relationship between heterosexism and social vigilance.

Method: The current study utilized an archival dataset of 248 sexual minority identifying individuals. Participants were recruited through a university in the south-central region of the United States. Participants between the ages of 18 and 29 completed an online survey and answered demographic questions, indicated contexts they were “out” in, and completed the Heterosexist Harassment, Rejection, and Discrimination Scale, Social Vigilance Questionnaire, and the Sense of Belonging Instrument.

Results: We used PROCESS Macro (Hayes, 2013) to run a mediated moderation model examining the relationship between outness of sexual orientation, social vigilance, if heterosexist discrimination mediated this relationship, and if sense of belonging moderated this relationship. The current study did not observe any significant relationships in our proposed model. Preliminary analyses revealed monosexual individuals were more out than polysexual individuals.

Conclusions: Limitations of the current study include using a general sense of belonging measure instead of an LGBTQ+ specific belonging measure and a young university sample recruited through snowball sampling. Polysexual individuals may experience unique discrimination that explains the observed lower levels of outness. The sample was collected at a university that has historically been accepting and affirming to LGBTQ+ students, which may explain the unexpected non-significant findings. Future research should explore global differences in LGBTQ+ individuals’ “coming out” experiences.

Abstract 2486

CHARACTER STRENGTH AND EMOTIONAL INTELLIGENCE ON HUMAN FLOURISHING AMONG EMERGING ADULTS

Bada B.*, Falade O.

University of Lagos ~ Lagos ~ Nigeria

The main aim of this study is it investigate the Influence of character strength and emotional
intelligence on human flourishing among emerging adults in Akoka, Lagos, it also evaluate the
degree to which character strength and emotional intelligence can predict human flourishing
among emerging adults in Akoka, Lagos. 387 participants were used for this study and were administered
test instruments, using Character Strengths Rating Form (CSRF),
Schutte Emotional Intelligent Scale (SEIS) and Flourishing
Scale. The result of the study revealed that Character strength
independently predicts human flourishing given the Beta and P value scores to be (b = .275, P
<.001), also, emotional intelligence independently predict human flourishing given the Beta and
P value scores to be (b = .259, P <.001), Furthermore, Character strength and emotional
intelligence are jointly responsible for 23.4% variance in human flourishing (R square =.234).
which implies that Character strength and emotional intelligence jointly explained 23.4% human
flourishing of the participants. Secondly, result of the study revealed there was a significant
positive relationship between character strength of respondents (r = .646, P<.001) and emotional
intelligence. Also, a significant positive relationship was observed between human flourishing of
respondents (r = .436, P>.05) and emotional intelligence as well as between human flourishing
of respondents (r = .442, P>.05) and character strength. The study
therefore concludes by suggesting that positive character strength, such as resilience, empathy,
and integrity, significantly contribute to an individual overall well-being and flourishing.

Furthermore, emotional intelligence serves as a pivotal factor, enhancing the ability of these
young adults in navigating social complexities, manage stress, and build meaningful relationships

Abstract 2471

ROMANTIC RELATIONSHIP QUALITY DURING YOUNG ADULTHOOD: A SYSTEMATIC LITERATURE REVIEW

Cavagnis L.*[2], Paleari F.G.[1], Ferrari L.[2], Ranieri S.[2]

[1]Department of Human and Social Sciences, University of Bergamo ~ Bergamo ~ Italy, [2]Department of Psychology, Catholic University of Milan ~ Milano ~ Italy

The quality of romantic relationships during young adulthood represents a key developmental factor that is
associated with psychological and social well-being. During this life stage, individuals refine their
interpersonal skills and expectations of intimacy, making romantic relationships a central context for
emotional growth. Despite extensive research, there remains a lack of consensus on which indicators best
define and measure relationship quality in this specific life stage.
This systematic review aimed to identify and synthesize empirical evidence on romantic relationship quality
among young adults, examining both core dimensions and the potential influence of broader social systems,
such as family and peers.
Following PRISMA 2020 guidelines, a systematic literature search was conducted across four electronic
databases (PubMed, PsycINFO, Scopus, and Web of Science), ensuring a rigorous and structured selection of
relevant studies. Eligible studies included empirical investigations assessing romantic relationship quality
among individuals aged approximately 18–30 years. Studies were screened and evaluated according to
predefined inclusion and exclusion criteria.
Preliminary findings revealed considerable heterogeneity in both theoretical frameworks and measurement
instruments, indicating the multidimensional nature of romantic relationship quality.
Findings, practical implications, and directions for future research will be discussed.

Abstract 2428

BEYOND SYMPTOM TREATMENT: ANALYSING SOCIAL CHANGE PROPOSALS IN BRAZILIAN PSYCHOLOGICAL LITERATURE DURING THE COVID-19 PANDEMIC

Hamacek C.*, Cruz R.

Pontifical Catholic University of Minas Gerais ~ Belo Horizonte ~ Brazil

Since Covid-19's early months, scientific research in psychology has focused mainly on its impacts on population's mental health during and after this event. However, psychology can also analyze the pandemic from a psychosocial perspective, which considers it as an intensifier of issues already present in our society that are also causes of psychological distress. Therefore, an approach capable of analyzing this period under different determinants and suggesting ways to solve such problems from their origins is needed. In our research, we aimed to examine how Brazilian psychology fits into the discussions about the Covid-19 pandemic, focusing on proposals for social changes to improve this scenario. A systematic review of the literature was conducted, and the materials for analysis were collected from publications in Brazilian psychology journals indexed in the Latin American and Caribbean Center on Health Sciences Information (BIREME/PAHO/WHO) and the Scientific Electronic Library Online Brazil (Scielo). Among the 462 Covid-19 related articles published by March 2025, only 37 elaborated their debates through a psychosocial perspective. Our analysis revealed that more than half of the publications originated from the fields of social psychology and political psychology, reflecting the historical tendency within Brazilian psychology that social crises are topics primarily addressed by these disciplines. Additionally, the articles mainly proposed an epistemological shift in Brazilian psychology through a critical conception of this science, calling for the Brazilian state to act democratically through social public policies, and raising political and critical awareness among the population. Finally, we discussed the fragmentation of psychological science as a key component for lack of involvement of other fields in the psychosocial debate and in proposing concrete actions for social change, in light of the criticism of the Brazilian political and social scenario, as well as the implications of this for the resolution of social problems.

Abstract 2393

THE DIFFERENCES IN TAIWANESE PEOPLE'S ATTITUDES TOWARD HOMOSEXUALITY BETWEEN 2012 AND 2022

Hsu C.*

Chang Jung Christian University ~ Tainan ~ Taiwan

In 2019, Taiwan legalized same-sex marriage, becoming the first region in Asia to do so. This study examines whether there were significant differences in Taiwanese people's attitudes toward homosexuality between 2012 and 2022. The Taiwan Social Change Survey (TSCS) conducted nationwide random sampling in both years to investigate public opinions on various gender-related issues, including attitudes toward homosexuality. In 2012, 2,072 participants were surveyed, and in 2022, 1,728 participants took part.

Results showed that over the ten-year period, negative stereotypes toward homosexuality among the Taiwanese public had significantly decreased. However, in both surveys, more than 60% of respondents believed that coming out as gay or lesbian would cause emotional distress to one's parents. Although the proportion of people who supported the right of same-sex couples to marry increased significantly, the proportion of those who opposed it also rose slightly.

The proportion of people who agreed that same-sex couples could fulfill parental roles as well as heterosexual couples increased significantly. Nevertheless, the proportions of those who agreed and disagreed that gay men could be competent parents were nearly equal. Interestingly, the 2022 survey found that 66% of participants believed homosexuals should have the right to raise children, yet only 55% believed that lesbian couples could perform parental roles well, and 48.2% thought that gay men possessed good parenting abilities.

These findings indicate that while negative stereotypes toward homosexuality in Taiwan have declined substantially, and despite the legalization of same-sex marriage and adoption rights for same-sex couples, a considerable number of people still doubt whether homosexuals can serve as competent parents.

Abstract 2404

AI-DRIVEN DIGITAL STORYTELLING ROBOTS ON STUDENT ENGAGEMENT AND MOTIVATION

Fung K.Y.*, Sin K.F.

The Education University of Hong Kong ~ Hong Kong ~ Hong Kong

Creativity is recognized as an essential skill in 21st-century education. Storytelling can facilitate student motivation, engagement, and cognitive development. However, conventional storytelling approaches often lack interactivity and fail to capture learners' attention. According to Self-determination Theory (SDT), satisfying basic psychological needs (i.e., autonomy, competence, and relatedness) is essential for fostering motivation and well-being. This study examines how a multi-sensory digital storytelling system incorporating an interactive robot affects student engagement and psychological well-being compared to paper-based and PowerPoint (PPT) modalities. The research addresses the gap in exploring how different storytelling delivery modes influence students' intrinsic motivation and performance in well-being. Twenty-four students (12 female, 12 male) aged 7-8 years participated in a comparative study in three conditions: paper-based storytelling (n=8), PPT-based storytelling (n=8), and robot-assisted storytelling (n=8). A human-like robot is equipped with multisensory support, including animations, instant feedback via a large language model (LLM), and interactive movements. The five-day intervention delivers one story per day. Students complete pre- and post-questionnaires and conduct semi-structured interviews to provide insights into emotional experiences and learning preferences. The robot-assisted group demonstrates statistically significant improvements in behavioural (pre: μ=70.83, σ=18.15; post: μ=90.00, σ=9.43; +27.06%, $p<.05$) and cognitive engagement (pre: μ=66.67, σ=18.86; post: μ=86.67, σ=10.08; +30.00%, $p<.05$). Qualitative findings reveal that students express excitement, reduce frustration, and feel confident interacting with the robot. Interactive robot-assisted storytelling significantly enhances behavioural and cognitive engagement and promotes psychological well-being. The integration of multisensory and interactive technologies aligns with SDT principles to foster intrinsic motivation and happiness. Future longitudinal research with larger samples will strengthen these findings and explore sustained effects on well-being.

Abstract 4543

WHAT IT IS LIKE TO LIVE WITHOUT SOCIAL MEDIA DURING THE RUSSO-UKRAINIAN WAR?

Ocheretianko P.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction

Social media have developed rapidly over the past two decades, becoming increasingly embedded in everyday life. Perceived primarily as platforms for entertainment, they have evolved into more complex tools for facilitating social interactions, shaping self-representation and creating new forms of economic activity. Within the context of the Russian–Ukrainian war, social media have acquired new roles, serving as crucial sources of information, fostering political engagement, social support, and community building.
However, an intense information flow may lead to cognitive overload, and the experience of individuals who refrain from using such platforms under the pressure during wartime remains an underexplored area of research.

Purpose

The purpose of this study is to explore central aspects of the subjective experience of individuals who discontinued the use of social media during the Russian-Ukrainian war, making a contribution into an understanding of the respondents` sense-making activity in a case under investigation.
Method
The study uses qualitative approach to phenomenon. The data were collected by the semi-structured interviews, coded and interpreted through interpretative phenomenological analysis. The interviews were conducted with six young adults aged 19-29 residing in Kyiv, Ukraine.

Results

The experience of disengaging from social media during wartime was interpreted through three categories: a regained sense of control over the information environment, enabling selective news consumption, emphasized value of face-to-face interactions regarding social communication, and viewing social media as a distractor while longing for time and space free from media noise.

Conclusions

The findings demonstrate that despite reducing distractions and information overload, participants have still retained a limited access to social media for communicating safety and wellbeing with others, using these platforms as primary sources of information during wartime.
Disengagement from social media was also associated with a diminished sense of a link between war-related news, personal life, and the possibility of meaningful change.

HIDDEN IN PLAIN SIGHT: AN ANALYSIS OF SEX DIFFERENCES IN AUTISM PRESENTATION, CO-OCCURRING CONDITIONS AND INDIVIDUAL RESILIENCE

O"Donoghue J.*, Healy O.

Trinity College Dublin ~ Dublin ~ Ireland

Introduction

Autism Spectrum Disorder (ASD) is a developmental condition characterised by persistent difficulties with social communication, restricted interests and repetitive behaviours, which appears during early childhood (APA, 2013). While an early diagnosis of ASD has been identified as being beneficial, with improved access to supports and services, reduced judgement and self-criticism and the creation of a positive self-identity all improving quality of life (Ruiz Calzada et al., 2012; Russell & Norwich, 2012; Wong et al., 2015), research has indicated that when compared with males, those assigned female at birth (AFAB) are at an increased risk of remaining undiagnosed and must often present with more severe symptoms in order to have their ASD recognised (Kreiser & White, 2014).

Purpose

To identify the sex differences in ASD presentation, symptomology and co-occurring conditions and to investigate whether there is an association between these differences and age of diagnosis.

Method

The research involved an online survey of autistic adults (both diagnosed and suspected), measuring various demographic factors, and ASD screener measure, as well as participant scores on a battery of screening measures for diagnoses such as ADHD, depression and anxiety disorders etc. Scores on a measure of personal resilience were also included. A between-groups comparison study was conducted to identify the differences between those assigned male at birth (AMAB) and AFAB individuals.

Results

Results of the data analysis describe the differences in ASD presentation, prevalence of co-occurring conditions and individual resilience levels, as well as differences in diagnostic age between AMAB and AFAB participants.

Conclusions

Supported by the literature, it is evident that there are sex differences in ASD presentation and that females with a diagnosis of ASD often also receive secondary and tertiary diagnoses, occasionally prior to receiving the ASD diagnosis. Sex differences must be considered to improve diagnostic pathways and reduce diagnostic age for

AFAB individuals.

SOCIAL COMPARISON AND ITS PSYCHOLOGICAL CORRELATES IN KOREA: A META-ANALYSIS

Park H.*, Yu J., Lee S., Lee Y.

Jeonbuk National University ~ Jeonju ~ Korea, Republic of

In Korea's collectivistic culture, social comparison influences various domains, including mental health, emotion, personality, academics, and career. This meta-analysis reviewed 70 studies (135 effect sizes) on social comparison published in Korea up to August 29, 2025, with 26,669 participants ranging from adolescents to older adults, drawn from local to nationwide samples. Social comparison was primarily measured using the INCOM(Iowa-Netherlands Comparison Orientation Measure) and its modified versions. Among the 18 variables related to social comparison identified in this meta-analysis, strong associations were found with fear of negative evaluation (ESr = .60, 95% CI [0.55, 0.64]) and public self-consciousness (ESr = .59, 95% CI [0.54, 0.64]), followed by anxiety (ESr = .52, 95% CI [0.45, 0.58]), intolerance of uncertainty (ESr = .42, 95% CI [0.40, 0.45]), social anxiety (ESr = .40, 95% CI [0.35, 0.45]), and fear of missing out (ESr = .39, 95% CI [0.27, 0.50]). Medium effect sizes were revealed for career anxiety, depression, pursuit of happiness, socially prescribed perfectionism, and SNS addiction tendencies. Small effect sizes were observed for academic burnout, subjective well-being, self-esteem, and self-encouragement. In particular, subjective well-being, self-esteem, self-compassion, self-encouragement, and self-concept clarity were negatively related to social comparison, whereas other variables were positively related with statistical significance. This study systematically integrates research on social comparison in Korea and provides empirical evidence of its associations with diverse psychological and behavioral variables, offering important implications for future research.
