The use of electronic cigarettes (EC) has increased substantially in recent years, particularly among young adults, raising concerns about its potential impact on mental health. Although often perceived as a safer alternative to traditional smoking, growing evidence links EC use to symptoms of depression, anxiety, stress, low self-esteem, and suicidal ideation. In Latin America, especially in Panama, there is limited empirical research addressing this topic. This study aimed to analyze the relationship between EC consumption and mental health comorbidities among young adults in Panama City. A quantitative, descriptive-correlational, and non-experimental design was conducted with 74 participants aged 20–30 years. Participants completed sociodemographic questionnaires and validated psychological scales that included the Beck Depression Inventory-II (BDI-II), Beck Anxiety Inventory (BAI), Perceived Stress Scale (PSS-14), Rosenberg Self-Esteem Scale (RSES), and Beck Hopelessness Scale (BHS). Statistical analyses were performed using JAMOVI (v.2.3), applying descriptive statistics, Pearson correlations, and Student's t-tests ($p < .05$). Results indicated that 59.5% of participants were active EC users, with men showing a higher use of EC ($p = 0.025$). Strong correlations emerged between depression and anxiety ($p < .001$), anxiety and stress ($p = 0.023$), and stress and suicidal tendencies ($p = 0.013$). Women presented significantly higher scores in depression ($p = 0.004$), anxiety ($p < .001$), and stress ($p = 0.002$) compared to men. Furthermore, a comparison between EC users and non-users, evidenced significant differences in perceived stress levels ($p = 0.040$), showing higher stress among users. Overall, the findings suggest that EC consumption is associated with elevated stress and interconnected emotional symptoms, highlighting the need for public health policies and preventive mental health interventions focused on young adults as a vulnerable population.

Abstract 2298

BORDERLINE PERSONALITY DISORDER FEATURES MODERATE THE LINK FROM ATTACHMENT TO PSYCHOLOGICAL SYMPTOMS VIA MENTALIZING: A TEST OF A MODERATED MEDIATION MODEL IN A NON-CLINICAL SAMPLE

Kaynar Yaman G.*

Ankara Medipol University ~ Ankara ~ Turkey

Research supported that people with borderline personality disorder (BPD), or BPD features had higher attachment insecurity, psychological symptoms, and impairments in mentalizing compared to non-clinical controls. Yet, little is known about the mediational link from attachment to psychological symptoms via mentalizing dimensions in BPD. The aim of this study was to test a moderated mediation model where BPD features moderated the mediation model of attachment, mentalizing, psychological symptoms. In the study, 516 participants aged between 18 and 35 from the general population completed the Parental Bonding Inventory (PBI), the Mentalization Questionnaire (MZQ), the Brief Symptom Inventory (BSI), and the Borderline Personality Inventory (BPI). Moderated mediation model using PROCESS indicated that the indirect effect of parental attachment security on psychological symptoms severity via mentalizing dimensions was conditional on levels of BPD: parental attachment security via the MZQ-pre-mentalizing modes dimension decreased psychological symptoms in the two groups with higher and medium BPD levels, but not via emotional self-reflection and regulation affect. The findings are discussed in the context of mentalization-based model of BPD, suggesting that hyper mentalizing specifically may play an important role psychological symptoms severity in BPD.

Abstract 2588

PREDICTORS OF SUICIDE RISK AMONG UNIVERSITY STUDENTS: THE ROLE OF PERCEIVED SOCIAL SUPPORT, SOCIAL PROBLEM-SOLVING, AND SUBSTANCE USE ACROSS LIVING CONDITIONS

Yalçın M.*, Baglamis B.

Çanakkale Onsekiz Mart University ~ Çanakkale ~ Turkey

Suicide, responsible for nearly one million deaths annually, is recognized by the World Health Organization (WHO) as a major public health problem. Epidemiological data indicate that suicidal behaviors are particularly prevalent among individuals aged 15–29, a developmental period characterized by identity exploration, social conflict, and emotional instability. In line with international data, Turkish statistics show that suicide rates are highest among individuals aged 15–34, corresponding to late adolescence and emerging adulthood. University students constitute a particularly vulnerable group facing intense academic, social, and economic stressors, and recent reports indicate an increase in suicide attempts among those living in dormitories, suggesting that dormitory environments may present additional psychosocial risk factors. This study aims to examine the extent to which perceived social support, social problem-solving, and alcohol–substance use predict suicide risk among university students, considering differences in accommodation type (living at home vs. in dormitory). Ethical approval for the study has been obtained, and data collection will begin in December 2025. The planned sample will consist of approximately 580 Turkish university students aged 18–29. Data will be collected using self-report questionnaires, including a Demographic Information Form, the Multidimensional Scale of Perceived Social Support, the Social Problem-Solving Inventory, the BAPI Risk Screening Scale, and the Suicide Probability Scale. Statistical analyses (correlation, independent samples t-test, one-way ANOVA, and hierarchical regression) will be conducted after data collection is completed. The study is expected to reveal that low perceived social support, ineffective problem-solving, and higher levels of alcohol–substance use significantly predict higher suicide risk, with potential moderating effects of living conditions. Findings will be discussed in light of current literature, emphasizing implications for suicide prevention and mental health promotion among young adults.

POSITIVE EMOTIONS AS MECHANISMS OF CHANGE IN PSYCHEDELIC THERAPY: EVIDENCE FROM TWO STUDIES

Zeifman R.*[1], Danias G.[1], Agin--Liebes G.[2], Pagni Broc A.[1], Kettner H.[3], Bhat V.[4], Ross S.[1], Carhart--Harris R.[3]

[1]NYU Grossman School of Medicine ~ New York ~ United States of America, [2]Yale School of Medicine ~ New Haven ~ United States of America, [3]University of California San Francisco ~ United States ~ United States of America, [4]Unity Health Toronto ~ Toronto ~ Canada

Background: Positive emotional experiences during psychedelic therapy may play a key role in facilitating treatment outcomes, yet little is known about the effects of psychedelics on specific positive emotions or their relative importance.
Methods: Two studies examined links between acute positive emotions and mental health outcomes. Study 1 was a prospective observational study of individuals planning to use psychedelics (N=359), assessing well-being at baseline and four weeks after use. Study 2 was a clinical trial comparing psilocybin with escitalopram among individuals with major depressive disorder (N=59). Participants completed two dosing sessions (25 mg or 1 mg psilocybin) and measures of mental health at baseline and three weeks after their second session. In both studies, participants retrospectively rated seven acute positive emotions (ecstasy, self-compassion, compassion, gratitude, love, awe, peace) experienced during dosing. MANOVAs evaluated dose-related differences in emotions, correlations examined associations with mental health, and mediation models tested whether emotions accounted for psilocybin's effects (vs. escitalopram) on mental health improvements.
Results: Across studies, higher doses were associated with greater levels of all positive emotions. In Study 1, self-compassion, compassion, gratitude, love, and awe correlated with change in well-being. In a model including all emotions, only self-compassion predicted well-being, even when mystical experience or positive mood were included. In Study 2, self-compassion, compassion, awe, love, and peace correlated with reductions in depression. Several emotions mediated treatment outcomes (depression, suicidal ideation, anxiety, and well-being), with the strongest evidence for self-compassion as an independent mediator above mystical experience and positive mood.
Conclusions: Positive emotional experiences, especially self-compassion, appear to play an important role in facilitating improvement in mental health following psychedelic use. These findings highlight positive emotions as therapeutic mechanisms. Deliberate focus on the experience and integration of specific positive emotions may help guide the therapeutic process, refine psychotherapeutic components of psychedelic-assisted interventions, and optimize treatment outcomes.

Abstract 2111

FROM PAPER TO CLOUD: VALIDITY AND RELIABILITY OF PHQ-9 AND GAD-7 IN DIGITAL SCREENING FOR DEPRESSION AND ANXIETY

Doval Moreno S.*[1], Fausor R.[2], Carpallo--González M.[3], Tavira--Sánchez F.J.[2]

[1]Faculty of Health, International University of La Rioja (UNIR) ~ La Rioja ~ Spain, [2]Faculty of Health, Valencian International University (VIU), 46002, Valencia, Spain ~ Valencia ~ Spain, [3]Department of Personality, Assessment and Psychological Treatments, Faculty of Psychology. Universitat de València. Valencia, Spain ~ Valencia ~ Spain

Introduction: The digital transformation in mental health has accelerated the migration of traditional paper-based screening instruments to digital platforms. While PHQ-9 and GAD-7 are well-established tools for depression and anxiety screening respectively, their transition to digital environments raises important questions regarding the preservation of their psychometric properties.

Purpose: To examine the validity and reliability of PHQ-9 and GAD-7 when administered through digital platforms, analysing their psychometric performance across different administration modalities.

Method: A systematic review was conducted following PRISMA guidelines. PubMed, PsycINFO, Web of Science, and Embase databases were searched using terms related to PHQ-9, GAD-7, digital administration, validation, and psychometric properties. Studies evaluating validity, reliability, or equivalence of these instruments in digital versus paper formats were included. The COSMIN checklist was applied to assess methodological quality.

Results: The systematic review identifies relevant studies examining psychometric properties of digital versions of both instruments. Patterns regarding validity and reliability measures across different digital platforms and populations are being analysed, with variations observed across different technological approaches.

Conclusions: The transition from paper to digital formats presents both opportunities and challenges for depression and anxiety screening instruments. Understanding the factors that influence psychometric performance in digital environments is crucial for informed implementation decisions. Further research is needed to establish comprehensive guidelines for digital administration of these widely used screening tools.

Abstract 2660

A WEB-BASED INTELLECTUAL HUMILITY INTERVENTION TARGETING INTERPERSONAL CONFLICT: RANDOMIZED CONTROLLED TRIAL

Mancuso E.*[1], Lorona R.[2], Lee A.[1]

[1]Pepperdine University ~ Malibu, California ~ United States of America, [2]Point Loma Nazarene University ~ San Diego, CA ~ United States of America

Interpersonal conflict about religion has been associated with anger, loneliness, and psychological distress. The current research consists of a pre-registered, randomized controlled trial (N = 447) on the effectiveness of a 4-week online intellectual humility intervention for adults experiencing distressing religious conflicts. Intellectual humility is a form of meta-cognition that involves awareness that one's knowledge is imperfect; that particular thoughts and beliefs might be inaccurate or incomplete. The intervention is secular, yet spiritually-sensitive, making it appropriate for individuals of any or no religion or spirituality. Measures were administered at baseline, immediately post-intervention, and one month later. Generalized linear mixed models with robust covariance estimation and intent-to-treat principle revealed a time by condition interaction for general intellectual humility, intellectual humility about the conflict, conflict intensity, cognitive and affective self-stigma, stress, somatization, depression, anxiety, personal growth, and forgiveness of the conflict partner. There was no time by condition interaction for self-stigmatizing behavior. Pairwise contrasts with Holm's sequential Bonferroni adjustment were conducted. The intervention and waitlist control groups did not differ from one another on any variables at baseline. Immediately post intervention, the intervention group was higher than the control group in general intellectual humility, conflict-specific intellectual humility, conflict resolution, personal growth, and forgiveness of the conflict partner. Immediately post intervention, the intervention group was lower than the control group in conflict intensity, cognitive and affective self-stigma, stress, somatization, depression, and anxiety. These differences were maintained one month later for general and conflict-specific intellectual humility, intensity of the conflict, conflict resolution, cognitive and affective self-stigma, stress, personal growth, and forgiveness of the conflict partner. This research supports the efficacy of a low-cost, convenient intervention for religious conflict—an interpersonal stressor for which specialized services are limited. The results suggest promise for promoting mental health and wellbeing in this context.

Abstract 1145

ENHANCING EMOTIONAL COMPETENCE OF CHILDREN WITH AUTISM THROUGH SOCIAL ROBOT–ASSISTED INTERVENTIONS

Liu X.*[1], Bi Y.[1], Zhang J.[1], Dou D.[2]

[1]Capital Normal University ~ Beijing ~ China, [2]Central University of Finance and Economics ~ Beijing ~ China

Introduction: Children with autism spectrum disorder (ASD) often show deficits in emotional understanding and expression, which limit their social interactions and overall adaptation. Social robots, with their predictable and structured interactions, provide an innovative avenue for emotional interventions, yet evidence from controlled comparative studies remains limited.

Purpose: This study aimed to evaluate the effectiveness of social robot–assisted interventions, compared with therapist-only interventions, in improving the emotional competence of children with ASD.

Method: A randomized controlled trial was conducted with 13 children with ASD, assigned either to a robot-assisted rehabilitation group (n = 7) or a therapist-only group (n = 6). Interventions targeted emotion understanding (naming, re-recognition, and perspective-taking) and emotion expression (facial expressions in structured tasks and natural contexts). Assessments included behavioral tasks and observational measures across pre- and post-test sessions.

Results: Both groups showed significant improvements in emotional competence after intervention. However, the robot-assisted group demonstrated greater gains. Specifically, post-test scores for emotion naming, re-recognition, and perspective-taking were significantly higher in the robot-assisted group than in controls. Regarding emotion expression, children in the robot-assisted group exhibited significant improvements in happy and sad expressions under task conditions and sustained enhancement of happy expressions across later stages of the intervention. No significant improvements were found for anger and fear expressions, which may represent more threat-related emotions.

Conclusions: Findings indicate that social robot–assisted interventions can effectively enhance emotional understanding and the expression of non-threatening emotions (happy and sad) in children with ASD, with outcomes surpassing those of therapist-only approaches. These results highlight the potential of human–robot collaborative models in applied psychology and suggest promising directions for integrating emerging

technologies into educational and clinical practices to support children's socio–emotional development.

Abstract 1850

DIGITAL PARENTING: SMARTPHONE USE AND MEDIA EDUCATION PRACTICES AMONG PARENTS OF TODDLERS

Von Wyl A.*, Wernli J., Joliat A., Schneebeli L., Braune--Krickau K.

ZHAW Zurich University of Applied Sciences ~ Zurich ~ Switzerland

Introduction: In an increasingly digitalized society, parents of toddlers frequently engage in smartphone use, even in the presence of their children. Moreover, parental smartphone use constitutes a significant factor influencing early childhood media socialization.

Purpose: The aim of this study was to explore how parents of toddlers aged 30–36 months incorporate smartphone use into everyday life, examines their attitudes toward parental media education, and seeks to identify distinct typologies based on their media practices and educational orientations.

Method: We conducted 44 semi-structured, guideline-based interviews with parents of children aged 30 to 36 months. A mixed-methods design was applied, combining Ideal-Type Analysis with quantitative evaluation of sociodemographic and usage-related data, including measures of smartphone distraction.

Results: Six distinct ideal types were identified along the dimensions of parental smartphone use (functional vs. multifunctional) and child-related use (restrictive, situational, open). These types systematically differed in their smartphone practices and parenting attitudes regarding their toddlers' media exposure. At the same time, overarching patterns emerged, such as the consensual use of smartphones for family communication.

Conclusion: The findings suggest that it is not merely the quantity of smartphone use that matters, but rather the quality, reflexivity, and contextualization of media practices within everyday family life. The integration of empirical results with media education models and developmental psychology theories highlights the importance of a balanced and consciously regulated media education in early childhood. The results offer practice-relevant implications for parent education, prevention, and research. They demonstrate how intrafamilial smartphone use can be typologically differentiated and what dynamics this entails for the media socialization of young children.

Abstract 2387

GIVE WORDS TO FEELINGS: A LARGE LANGUAGE MODEL-BASED CHATBOT INTERVENTION FOR EMOTIONAL SELF-AWARENESS

Zhou C.*[1], Wang R.[2], Li Y.[2], Wang X.[3], Ji L.[1]

[1]Queen's University ~ Kingston ~ Canada, [2]Huazhong University of Science and Technology ~ Wuhan ~ China, [3]Jiangxi Normal University ~ Nanchang, ~ China

Emotional self-awareness, the ability to recognize and articulate one's own feelings, is essential for emotional regulation and adaptive coping. However, many individuals struggle to connect with their inner states, particularly in East Asian contexts such as China, where emotional restraint is culturally emphasized. To address this challenge, we developed a large language model (LLM)-based chatbot intervention designed to enhance emotional self-awareness by guiding individuals to identify and reflect on their feelings regarding a personally distressing interpersonal event. In our preliminary study, participants who engaged with the emotion-focused chatbot showed greater improvements in emotion identification and description compared to those in the control condition discussing neutral lifestyle topics. Moreover, participants in the emotion-focused condition exhibited greater decrease in state anxiety and stress immediately after the intervention compared to those in the control condition. These findings provide preliminary evidence that a structured LLM-based conversational intervention can effectively promote emotional awareness and improve momentary well-being.

Abstract 1350

MINDFULNESS MEETS VIRTUAL REALITY: A RANDOMISED CONTROLLED TRIAL COMPARING VR-INTEGRATED AND CONVENTIONAL MINDFULNESS INTERVENTION FOR IMPROVING UNIVERSITY STUDENTS' MENTAL HEALTH

Yuen W.*, Lam B., Cheung Y.

Hong Kong Shue Yan University ~ Hong Kong ~ Hong Kong

Introduction: Rising global concerns about youth mental health highlight the need for evidence-based prevention. University life, while often stressful and demanding, offers a key window for early intervention to promote resilience and psychological wellbeing. Mindfulness-based interventions (MBIs) are increasingly used in higher education, with virtual reality (VR) showing promise in enhancing mindfulness, emotional well-being, and engagement. However, research on VR-integrated MBIs among Chinese university students remains limited.

Purpose: The present pilot study aimed to assess the effectiveness of MBIs with a VR component on neuropsychological and mental health outcomes and investigate the relationship between mindfulness, self-compassion, mind wandering, and mental health outcomes. It hypothesizes improved outcomes in self-compassion, resilience and reduce levels in stress, anxiety and depressive symptoms for VR-integrated MBI group compared to MBI-only group.

Method: 70 university students aged 18–25 are being recruited via convenient and snowball sampling. Participants were randomly assigned to MBI-only or MBI with VR groups The MBI intervention includes six 90-minute group sessions with mindfulness practices, inquiry, and discussion, in which VR mindfulness breathing exercises are added for the VR group. Neurocognitive and psychosocial outcomes, including stress, anxiety, depression, resilience, and mindfulness, were measured at baseline and post-intervention.

Findings: Preliminary results from questionnaires showed that revealed significant improvements in mindfulness and reduction distress following both mindfulness interventions. Qualitative interviews revealed increased emotional awareness and a stronger intention for self-care following the group sessions. VR enhanced participants' engagement and interest in mindfulness practices, although some encountered barriers such as technical difficulties.

Conclusions: The cultural adaptation and impact of VR-enhanced mindfulness interventions on mental health outcomes and student engagement will be discussed.

The findings offer insights for designing more accessible, culturally relevant, and tech-integrated mental health programmes tailored to young adults in higher education.

THE PSYCHOLOGY OF HUMAN-AUTONOMY TEAMING

O'neill T.*

University of Calgary ~ Calgary ~ Canada

I will discuss the results of my systematic review on Human-Autonomy Teams in which I outline a definition and differentiate it from Human Automation Interaction. I will report on preliminary results of my updated systematic review that documents and evaluates research methods in the Human-Autonomy Teams literature. Finally, I will explore the psychology of Human-Autonomy Teams. Specifically, the roles of social identity and small groups evolutionary processes in human perceptions of AI agents as teammates versus tools will be considered. A model will be provided that explains how the integration of AI agents as fully fledged team members impacts socialization and reflection processes in the team, and ultimately AI agent social and task integration depending on the identify processes mentioned earlier. Future research and practice opportunities will be offered.

Abstract 752

ASSOCIATIONS AMONG AUTONOMY SUPPORT, MOTIVATION, AND COMPETENCE FOR HEALTHY EATING IN INDIVIDUALS WITH OBESITY AND/OR TYPE 2 DIABETES

Kato Y.*, Mikajiri R., Tabuchi S., Kuroda M., Yamamoto N., Nakade K., Murata Y., Takahashi M.

Kobe University ~ Kobe ~ Japan

Introduction: Dietary therapy is a fundamental component in the management of obesity and type 2 diabetes. However, modifying long-established eating habits remains a considerable challenge. Interventions grounded in Self-Determination Theory (SDT) have demonstrated promising outcomes, and studies conducted in Japan suggest that autonomous motivation for healthy eating is associated with metabolic indicators. Nevertheless, few studies have specifically investigated motivational factors in individuals diagnosed with obesity or type 2 diabetes. To implement SDT-based interventions effectively, it is essential to understand the psychological characteristics related to motivation in these populations.

Objective: This preliminary study aimed to examine the relationships among perceived autonomy support, autonomous motivation for healthy eating, perceived competence for healthy eating, and physical health indicators in individuals with obesity and/or type 2 diabetes.

Methods: Participants were 67 individuals diagnosed with obesity and/or type 2 diabetes (17 men, 49 women, 1 other; mean age = 48.37 ± 1.33 years). Measures included Japanese versions of the Motivation for Healthy Eating Scale, the Perceived Competence for Healthy Eating Scale and the Health Care Climate Questionnaire, and physiological indicators (BMI, waist circumference, blood pressure, fasting glucose, HbA1c, triglycerides, LDL cholesterol, HDL cholesterol).

Results: Perceived autonomy support was significantly associated with autonomous motivation ($\beta = 0.452$, $p < 0.001$), which in turn was significantly associated with perceived competence for healthy eating ($\beta = 0.387$, $p = 0.002$). No significant associations were found for controlled motivation. Perceived autonomy support also directly predicted perceived competence ($\beta = 0.284$, $p = 0.014$). A trend toward a negative association was observed between perceived competence and BMI ($\beta = -0.217$, $p = 0.083$).

Conclusion: Autonomy-supportive care may enhance motivation and perceived competence for healthy eating in individuals with obesity and/or type 2 diabetes, potentially contributing to weight management. Further research with larger samples is warranted.

DO ADVERSE CHILDHOOD EXPERIENCES ASSOCIATE WITH INTERPERSONAL DIFFICULTIES? EXAMINING THE MEDIATING ROLE OF EMOTIONAL DYSREGULATION IN A FEMALE-IDENTIFYING SAMPLE IN PUERTO RICO

Luna--Rodríguez L.*, González--Rodríguez E., Pérez--Pedrogo C., Matos--Moreno A.

Universidad Albizu ~ San Juan ~ Puerto Rico

Objectives: Adverse Childhood Experiences (ACEs) are a significant risk factor for physical and mental health issues, as well as interpersonal difficulties throughout life. Even so, the mechanisms underlying these associations remain unclear. This study explores the relationship between ACEs, interpersonal relationships, and emotional dysregulation. Its primary objective was to investigate whether emotional dysregulation mediates the link between ACEs and interpersonal difficulties in adulthood within a female-identifying sample. Method: A total of 171 female participants over the age of 21 were recruited through social media using a non-probabilistic convenience sampling method. Participants completed three self-report questionnaires that assessed ACEs, interpersonal difficulties, and emotional dysregulation.

Results: The findings revealed a significant positive relationship between ACEs and Interpersonal Difficulties. Upon introducing the mediating variable (emotional dysregulation), both the direct effect of ACEs on interpersonal difficulties and the indirect effect through emotional dysregulation were significant.

Conclusions: These results suggest that emotional dysregulation is a key factor in explaining how ACE's contribute to interpersonal difficulties in adulthood. Examining ACEs, emotional dysregulation, and interpersonal difficulties in a sample of female-identifying adults residing in Puerto Rico can inform the provision of person-centered services, as well as trauma-informed interventions.

Abstract 955

THE ASSOCIATION BETWEEN DEPRESSION SEVERITY AND COGNITIVE IMPAIRMENT: SYSTEMATIC REVIEW AND META-ANALYSIS

Nikolic J.*, Andersen N.D., Semkovska M.

University of Southern Denmark ~ Odense ~ Denmark

Introduction: Major depressive disorder, one of the most prevalent mental disorders, is associated with cognitive impairment across multiple domains, including processing speed, memory, executive function, verbal fluency, and attention. Although several studies suggest a link between depression severity and the extent of cognitive deficits, findings remain inconsistent. The last systematic review on this association, published in 2009, was limited in scope (e.g., inclusion limited to cross-sectional designs, moderators not considered). Since then, a substantial body of literature has emerged, yielding comprehensive synthesis. Purpose: This meta-analysis aims to determine the strength of the association between depression severity and cognitive impairment in different cognitive domains, investigate whether this relationship differs across depressive states (acute vs. remitted), and evaluate the influence of potential moderators. Methods: We systematically searched PubMed, PsycINFO, PsycARTICLES, and Embase using variations of keywords related to depression, cognition, and correlation. In total, 19,706 records were identified and after duplicate removal, 10,725 were screened by title and abstract, with 1,951 retained for full-text review. Eligible studies reported correlations between depression severity and cognitive variables or provided sufficient data (means, standard deviations, sample sizes) to calculate correlations. When available, data on moderators such as the number of previous episodes and current treatment are being extracted. Results: Full-text screening and data extraction are ongoing. To date, most extracted studies provide sufficient data to calculate correlations, and many include information on potential moderators. The meta-analysis will be completed, and results will be presented at the conference. Conclusions: By including both reported correlations and calculated correlations, as well as potential moderators, this review expands on previous work. Findings are expected to provide a more nuanced understanding of the relationship between cognitive impairment and depression, with implications for relapse prevention and treatment strategies.

Abstract 1105

SOCIO-DEMOGRAPHIC AND TRAINING FACTORS INFLUENCING MENTAL HEALTH PROVIDERS' ATTITUDES TOWARDS TREATMENT-SEEKING TRANS AND GENDER DIVERSE PEOPLE

Olaseni A.*[1], Nel J.[1], Horne S.[2]

[1]Department of Psychology, University of South Africa ~ Pretoria ~ South Africa, [2]Department of Counseling & School Psychology, University of Massachusetts ~ Boston ~ United States of America

There is a dearth of empirical research on the attitudes of healthcare professionals toward trans and gender populations in Africa, particularly concerning the influence of socio-demographic and training-related factors. This gap limits the development of inclusive, affirming mental health services for trans and gender individuals in South Africa. The study that informs this article examined how healthcare professionals' socio-demographic characteristics and training experiences influence their attitudes toward trans and gender diverse clients in South Africa. It also explored which specific variables are associated with more positive or negative dispositions. A quantitative, survey design was used. 432 participants were engaged in the study including registered psychologists, psychiatrists, psychiatric nurses, social workers, and other mental health professionals. Data were collected via Qualtrics and analysed using a multi-level one-way analysis of variance in IBM SPSS Statistics (version 23). Findings revealed that among the provinces of South Africa, professionals residing in the Western Cape, KwaZulu-Natal and Gauteng; professionals in middle adulthood; professionals self-identifying as pansexual, lesbian or queer; clinical social workers, clinical psychologists, psychiatric nurses and psychiatrists; professionals with a master's, doctoral, of honours degree; professionals employed in the higher education/school sector, multi-sectors, or in private practice; professionals with a history of LGBT+-related research, those who completed a LGBT+-specific course, or had exposure to LGBT+ content during their clinical training; and respondents with more than 10 LGBT family members, friends or acquaintances exhibited the most positive attitudes towards trans and gender diverse clients when compared to counterparts in respective categories. The study concluded that provincial location, age, sexual orientation, occupation, education, training experience, and interpersonal relationships with LGBT+ populations play in shaping healthcare professionals' attitudes toward trans and gender diverse individuals in South Africa. Interestingly, some factors, like sex assigned at birth and years of experience, showed no significant influence.

Abstract 1113

PREVALENCE AND RISK FACTORS OF TEEN DATING VIOLENCE IN CHILD PROTECTIVE SERVICES: DIRECTIONS FOR PREVENTION

Piché E.*, Lafleur E., Hébert M., Paradis A.

Université du Québec à Montréal ~ Montreal ~ Canada

Teen dating violence (TDV), encompassing physical, psychological, and sexual forms, represents a prevalent issue associated with lasting consequences for adolescents' health and well-being. Although research on child protective services (CPS) youth is limited, this population may be especially vulnerable, as childhood maltreatment is a well-established risk factor for both TDV victimization and perpetration. Consequently, CPS youth should be prioritized in preventive efforts; however, little empirical evidence is available to guide such initiatives. Thus, this study examined the prevalence of different forms of TDV (i.e., psychological, physical, sexual) and identified potential risk factors associated with both victimization and perpetration among CPS youth. From a larger study of adolescents recruited from 34 high schools in Quebec, Canada, a subsample of 290 CPS-involved adolescents (Mage = 15.60; SD = 1.03) who reported having dated was selected. Participants completed a self-report questionnaire. Results indicated high prevalence rates of both TDV victimization (n = 162; 66%) and perpetration (n = 154; 67%), with psychological TDV emerging as the most prevalent form. Hierarchical regression analyses showed that, after controlling for sex, age, and childhood maltreatment, self-efficacy to deal with TDV and acceptance of gender norms were significantly associated with both TDV victimization (R^2 = .187) and perpetration (R^2 = .148). Lower self-efficacy was associated with higher risk of victimization (β = –.274, p < .001) and perpetration (β = –.140, p = .048), while stronger acceptance of gender norms was linked to increased victimization (β = .174, p = .016) and perpetration (β = .191, p = .009). No significant associations were found for conflict resolution strategies (i.e., problem-solving, withdrawal, and emotion-focused). These findings highlight the alarming prevalence of TDV among CPS youth. Moreover, targeting self-efficacy and challenging gender norms in preventive interventions offers a promising avenue within clinical or community settings targeting at-risk youth.

Abstract 913

ASSOCIATIONS BETWEEN COGNITIVE FLEXIBILITY, PHYSICAL APPEARANCE PERFECTIONISM, AND COMPARISON-BASED SOCIAL MEDIA USE IN YOUNG ADULTS

Wang Y.*[1], Wang Y.L.[2]

[1]The Unviersity of Hong Kong ~ Hong Kong, [2]Ming Chuan University ~ Taoyuan City ~ Taiwan

Introduction: Social media use is particularly prevalent among younger populations. While there may be positive effects associated with social media use, excessive comparison-based activities online may result in negative consequences such as poor mental health and body image. It remains unclear what individual differences and processes are related to increased frequency of engaging in social media-related comparison activities online.

Purpose: The aim of this study was to examine the relationships between cognitive flexibility, perfectionism (general and physical appearance-related), and comparison-based social media use in young adults.

Method: University students (N = 100) aged between 18 and 25 years old and without a history of schizophrenia or bipolar disorder diagnosis were recruited. Participants completed a battery of questionnaires, including cognitive flexibility, perfectionism, and frequency of social media use. Mediation effects were examined using multiple regression and bootstrapping.

Results: Lower cognitive flexibility was associated with greater frequency of comparison-based social media use. Greater levels of physical appearance perfectionism were associated with greater frequency of comparison-based social media use. Physical appearance perfectionism mediated the relationship between cognitive flexibility and frequency of comparison-based social media use. The same association was not found in general perfectionism.

Conclusions: The study helps understand individual differences in engaging in comparison-based social media use among young adults. The present results inform new directions for the design of interventions to prevent excessive social media use. We suggest that reducing physical appearance perfectionism and promoting greater cognitive flexibility may be potential targets to promote adaptive social media habits and well-being. Longer-term associations and directions for future research will be discussed.

Abstract 4597

BEHAVIORAL MANIFESTATIONS BETWEEN HORSES AND CHILDREN WITH AUTISM DURING INITIAL INTERACTIONS: AN ETHOLOGICAL AND RELATIONAL STUDY

Diegues Gomes Da Cruz V.*[2], Dôgo De Resende B.[1]

[1]University of São Paulo, Institute of Psychology, Department of Experimental Psychology ~ São Paulo ~ Brazil, [2]Cafarnaum Center for Equine-Assisted Interventions ~ São Vicente ~ Brazil

This study aims to investigate the behavioral manifestations that emerge during the initial moments of interaction between horses and children with autism, using an ethological framework with emphasis on relational dynamics.

Previous research on interspecies interactions and equine-assisted therapies suggests that the presence of animals may enhance communicative behaviors in children with autism. Horses appear to function as facilitators of social expression, and the initial phase of interaction may be particularly relevant for emotional regulation and communication, as it allows observation of how the horse–child relationship begins to form.

The objective of this study is to analyze individual behaviors of both the child and the horse, as well as interspecific behaviors expressed during their interactions.

Designed as a longitudinal observational study, the research will employ systematic video coding of individual and relational behaviors. The sample will include ten children diagnosed with autism spectrum disorder and three horses participating in equine-assisted therapy sessions.

Across twelve behavioral observation sessions, the study will focus specifically on the initial approach phase, examining the first minutes of each encounter and the establishment of contact between child and horse, documenting the behaviors that emerge during this critical moment.

This project seeks to deepen understanding of how interspecific engagement between children with autism and horses develops, identifying factors that may facilitate or hinder relationship formation, communication, and bonding. The findings are expected to contribute to future research and inform clinical practice in equine-assisted therapy, animal welfare, and the promotion of social skills in children with autism.

Abstract 2681

RELATIONAL PATHWAYS FROM TRAUMA TO RESILIENCE: A CLUSTER APPROACH TO PERINATAL MATERNAL HEALTH

Mineo R.*, Bevacqua E., Guarneri C., Sottile J., Rini C., Riolo M., Infurna M.R.

University of Palermo ~ Palermo ~ Italy

Introduction
Maternal health trajectories during perinatal period are influenced by both protective and risk factors, with adverse childhood experiences, social support, quality of the couple relationship and antenatal attachment being particularly significant. Identifying distinct profiles can provide clinically meaningful insights for prevention and intervention, especially when early adversities and current relational functioning are considered togheter.

Purpose
This study aimed to identify groups of pregnant women based on childhood trauma, couple functioning, and attachment to the fetus, and to interpret their significance as trajectories in which past and present relational experiences intersect.

Method
A sample of N = 774 pregnant women completed self-report measures assessing adverse childhood experiences (CTQ-SF), perceived social support (MSSS), couple relationship quality (DAS), and maternal antenatal attachment (MAAS). After preprocessing (KNN imputation, z-score scaling), clustering was performed using K-means (k = 3), validated with BIC and silhouette indices. Clusters were described through descriptive statistics and tested for between-group differences (ANOVA/Kruskal-Wallis with post-hoc comparisons).

Results
Three distinct relational profiles were identified:
Fragile Balance (31%): a profile of “moderate vulnerability,” navigating past adversities with limited protective relational resources.
Trauma-related vulnerability (15%): a “high-risk” profile, in which unresolved childhood trauma affects the functioning of the adult couple, while maintaining a high level of attachment to the fetus.
Resilient Bonds (54%): a protective configuration. Here, secure couple functioning and strong antenatal attachment serve as buffers against early adversity.
Differences across clusters were highly significant ($p < .001$) for most CTQ-SF and DAS items.

Conclusions

Rather than simple gradients of low-to-high risk, the clusters illustrate how early adversities and adult relational quality intertwine. Childhood trauma may undermine trust and regulation capacities, weakening the protective role of the couple bond; conversely, resilient relational dynamics can mitigate the long-term impact of adversity and influence maternal attachment to the fetus. .

Abstract 2708

MMPI-2 AND MMSE-2 ASSESSMENT OF BREAST PATHOLOGY

Munteanu C.*

Prof. Dr. Agrippa Ionescu Clinical Emergency Hospital – Outpatient Department ~ Bucharest ~ Romania

Introduction

Emotional disturbances in response to breast pathology (MP) can affect a person's physical health and psychological well-being. Previous research has shown that a large proportion of people with PM experience multiple concurrent psychological symptoms during the care trajectory, such as stress, anxiety, depression and cognitive impairment. The current study expands on existing research and aims to assess psychological resource levels and cognitive impairment by using coping indicators of the Minnesota Multiphasic Personality Inventory®-2 (MMPI®-2) and the tasks of the Mini-Mental State Examination, 2nd Edition™ (MMSE-2®).

Method

The clinical sample consisted of 12 women with a mean age of 43.75 years (SD = 6.77 years; range: 33-52 years). The normative MMPI-2 (n = 1115) and MMSE-2 (n = 677) samples of the female population of Romania were analyzed for comparison of means.

The psychological instruments used included the MMPI-2 and the extended version of the MMSE-2. Cut-off scores for clinically significant increases were set at different T-score levels according to the MMPI-2 scales analyzed: Demoralization (RCd), Anxiety (A), Ego Strength (Es) and mean scores on clinical scales 1-4 and 6-9. MMSE-2 reported impaired cognitive areas.

Results

MMPI-2 scores showed moderate-intensity psychological symptoms (mean of scales 1-4 and 6-9, T = 67) and moderate-severe unhappiness, demoralization (RCd, T = 69). Mid-level scores on the A (T = 41) and Es (T = 53) scales suggested a favorable prognosis for psychotherapy, with a good adaptive psychological response to the disease condition.

The most commonly impaired cognitive function was attention, followed by short-term memory and impaired verbal learning ability.

Conclusions

The results were consistent with the study purpose. The study provides support for future research on larger PM samples.

Abstract 4540

A COMPARATIVE ASSESSMENT OF TRUST CRITERIA TOWARD VOLUNTEERS ON SOCIAL MEDIA ACROSS DIFFERENT AGE GROUPS IN UKRAINE

Mykhalakii Y.*, Diatel N.

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction

After the full-scale war launched by Russia against Ukraine, social media platforms have evolved into more than just entertainment outlets. They have become critical infrastructures for civic resistance, humanitarian coordination, and public trust-building. These networks evolved into spaces for volunteers, especially those who raise supplementary funds to buy equipment for different needs. However, the mechanisms for building trust are not constructed or interpreted uniformly across generations. Understanding those variances helps establish effective digital humanitarian communication and maximize resource mobilization within credible interactions.

Purpose

This study aims to explore and compare the credibility assessment criteria for the organization and its social media accounts across two age cohorts mainly involved in volunteering: early adulthood (18 - 25 years) and middle adulthood (26 - 44 years). This research focuses on online communication and identifies which communication strategies and social media attributes could influence trust and donation decisions toward a specific organization/person.

Method

The study adopted the semi-structured interview combined with a visual-stimulus task. During the interview, participants will be asked some questions, then evaluate volunteer profiles and assess their credibility. This methodology will help identify trust criteria in real-time. Data would be collected through semi-structured interviews with 10-12 participants from each age group who regularly donate at least 4 times a month. The responses will be analyzed by using thematic analysis to characterize the core pattern of criteria to trust.

Results

The study identifies pattern differences in trust assessment of volunteers' profiles across two age groups, along with generally shared criteria of credibility.

Conclusion

The findings contribute to a generational model of digital trust in volunteer communication during war. It would provide a framework for credibility criteria that people across different age groups rely on when donating. Ultimately, this research supports more sustainable resource mobilization and strengthens public trust in the digital space.

Abstract 2672

HOW NEGATIVITY BIAS FUELS ANXIETY AND DEPRESSION: RESULTS FROM A NOVEL EASY-TO-USE INTERPRETATION BIAS TASK

Rho K.*, Kataria A., Flores J., Birch S.

University of British Columbia ~ Vancouver ~ Canada

Introduction. Negative interpretation bias (IB) – a tendency to interpret ambiguous stimuli negatively– has been shown to be a risk factor for developing psychiatric disorders. Scrambled Sentences Task (SST) is a widely-used experimental paradigm for measuring IB. In SST, participants are shown a series of 'scrambled' words that can be rearranged into either negative or positive grammatically correct sentences. SST is traditionally administered with time limits and cognitive demand (e.g., working memory task) to prevent response bias. However, a small body of research suggests that the magnitude of convergent validity is comparable between conditions with and without cognitive load, though the role of time limit has not been well-researched. Purpose. Our study aims to address this gap by examining psychometric properties (e.g. reliability, validity) of an untimed, self-administered SST without cognitive load administered online. Method. 66 Canadian university students (80.3% Woman, 28.8% White) completed an online SST task (no time limit or cognitive load) and self-report questionnaires of anxiety and depression (Hospital Anxiety and Depression Scale), and affect (Positive and Negative Affect Schedule). Results. In our sample, SST displayed excellent internal consistency reliability ($\alpha = 0.90$) and convergent validity ($r = .540$, $p < .001$ [depression], $r = .544$, $p < .001$ [anxiety]). SST also displayed increment validity above and beyond demographic covariables and negative affect by explaining an additional 30% of variance in depression ($\Delta F(1, 62) = 28.02$, $p < .001$) and an additional 24% in anxiety ($\Delta F(1, 62) = 25.38$, $p < .001$). The same pattern of results held with secondary measures of anxiety (GAD-7) and depression (PHQ-9). Conclusions. Our findings suggest that IB can be reliably detected without time limit, cognitive control, or experimenter supervision, substantially improving the ease of use for researchers and participants. Practical applications of this work will be discussed.

Abstract 2620

HEROISM AS A PATHWAY TO COLLECTIVE WELL-BEING

SÜrÜ D.*, Buyukcorak M.

Ibn Haldun University ~ Istanbul ~ Turkey

Introduction: Heroism has long been conceptualized as an individual act of moral courage and prosocial risk-taking. Yet, as argued by scholars such as Franco and Zimbardo, heroism also serves collective functions that extend beyond individual morality. When understood as a relational and symbolic process, heroism can foster shared meaning, inspire moral elevation, and strengthen community resilience—key components of collective well-being.

Purpose: This conceptual paper explores heroism as a social mechanism that promotes collective well-being. It proposes that heroic acts—whether directly observed, remembered through cultural narratives, or symbolically represented—reinforce collective moral values and strengthen social cohesion. The paper integrates ideas from moral exemplarity theory, social identity theory, and collective emotion research to construct a conceptual model linking heroism to communal flourishing.

Discussion: Heroic exemplars function as moral anchors that evoke emotions such as admiration, gratitude, and elevation. These shared emotions enhance interpersonal trust and a sense of moral unity within groups. By modeling prosocial courage and altruism, heroes embody the moral ideals that motivate collective action and social solidarity. Heroism, therefore, operates as both a psychological and cultural resource that helps communities maintain coherence and hope during periods of moral uncertainty or crisis.

Conclusions: Viewing heroism through the lens of collective well-being reframes it not merely as an individual virtue but as a catalyst for societal resilience and moral growth. This perspective highlights the importance of fostering everyday heroism in education, leadership, and community contexts to strengthen collective efficacy and cooperative engagement.

Abstract 4599

THE PREDICTIVE ROLE OF ATTACHMENT STYLES ON ATTITUDES TOWARD DATING VIOLENCE IN EMERGING ADULTHOOD

Bacaksiz M.[1], Uyanik R.*[1], Bakir B.[2]

[1]Mersin University ~ Mersin ~ Turkey, [2]Ankara University ~ Ankara ~ Turkey

Attachment theory suggests that early relational experiences shape individuals' internal working models and influence romantic relationship dynamics in adulthood. Dating violence remains a significant interpersonal and societal concern among emerging adults. The present study examined the association between adult attachment styles and attitudes toward dating violence, as well as gender differences in these variables. The sample consisted of 194 emerging adults (115 women, 79 men) aged 18–25 in Turkey. Participants completed the Relationship Scales Questionnaire and the Dating Violence Attitude Scale via online data collection. Ethical approval was obtained from the Mersin University ethics committee, and informed consent was secured from all participants. Data were analyzed using Pearson correlation and independent samples t-tests. Correlation analyses revealed a significant positive association between dismissing attachment and attitudes toward sexual dating violence ($r = .127$, $p < .05$). A significant negative association was found between preoccupied attachment and attitudes toward sexual dating violence ($r = -.129$, $p < .05$). No other significant associations emerged between attachment styles and other dating violence dimensions. Independent samples t-tests indicated a significant gender difference in overall dating violence attitudes, with women reporting higher scores than men, $t(192) = -5.40$, $p < .001$. However, attachment styles did not significantly differ by gender. Findings suggest that insecure attachment patterns may be specifically linked to sexual dating violence attitudes rather than to broader violence dimensions. The results highlight the importance of considering attachment-based relational dynamics in preventive interventions targeting dating violence among emerging adults.

Abstract 4598

EXAMINING THE RELATIONSHIP BETWEEN CHILDHOOD TRAUMA AND ATTITUDES TOWARD DATING VIOLENCE IN EMERGING ADULTHOOD

Keskin B.[1], Uyanik R.*[1], Bakir B.[2]

[1]Mersin University ~ Mersin ~ Turkey, [2]Ankara University ~ Ankara ~ Turkey

Childhood trauma has long been associated with later interpersonal vulnerabilities. Dating violence represents a critical public health issue among emerging adults. The present study examined the relationship between childhood trauma and attitudes toward dating violence and explored potential gender differences. The sample consisted of 180 emerging adults (120 women, 60 men) aged 18–25 in Türkiye. Participants completed the Childhood Trauma Questionnaire (CTQ) and the Dating Violence Attitude Scale via online data collection. Ethical approval was obtained from the Mersin University institutional ethics committee, and informed consent was secured from all participants. Pearson correlation analyses revealed significant interrelations among childhood trauma subdimensions and among dating violence attitude subdimensions. A modest but significant positive association was found between physical neglect and attitudes toward sexual dating violence ($r = .181$, $p < .05$). However, no significant relationship emerged between overall childhood trauma and general dating violence attitudes. Independent samples t-tests demonstrated a significant gender difference in dating violence attitudes, with women reporting less supportive attitudes compared to men, $t(178) = 5.05$, $p < .001$. No significant gender differences were observed in childhood trauma levels.

These findings suggest that childhood trauma may not directly shape attitudes toward dating violence in emerging adulthood. Instead, gender-related socialization processes and broader sociocultural norms may play a more central role. The implications for gender-sensitive prevention and trauma-focused intervention programs should be considered.

Abstract 2480

PSYCHOLOGICAL EXPERIENCES OF YOUNG WOMEN RAISED BY SOCIAL FATHERS IN A RURAL SOUTH AFRICAN COMMUNITY

Mashaba J.*, Rantho M.

University of Limpopo, South Africa ~ Polokwane ~ South Africa

Psychological experiences of young women raised by social fathers in a rural South African community

Abstract

Introduction: Social fathers, or, lamely, ‘stepfathers’, often assume the parenting role of children who are not biologically theirs. The present study aimed to describe the psychological experiences of young women growing up under the care of social fathers.

Methods: The study employed a qualitative research approach and utilized a phenomenological design to gather firsthand information from twelve young women. A purposeful sampling technique was used to enrol young women raised by social fathers. Data were collected through face-to-face interviews and analysed using an inductive thematic analysis method.

Results: The study findings revealed that young women raised by social fathers suffer from psychological challenges such as feelings of worthlessness, loneliness, lack of a sense of belonging, fear of abuse, and inability to speak about their challenges. The study revealed that some affected young women turned to prayer, some to drugs, and still others to their significant others for support in coping.

Conclusion: Despite the various overlooked psychological experiences of young females, their experiences underscore an urgent need for culturally sensitive mental health interventions to support young females in non-traditional households. The study also recommends educational and awareness campaigns for young women and social fathers.

Abstract 746

WHEN THE SELF FEELS DISTANT: INDIVIDUAL DISPOSITIONS BEHIND DEPERSONALIZATION

Fortuna D.*, Golonka K.

Jagiellonian University ~ Krakow ~ Poland

Introduction: Depersonalization (DP) is a phenomenon that can be placed on a continuum, from transient episodes to a chronic, clinical form (Depersonalization-Derealization Disorder) (DPDR) (DSM-5). DPDR affects around 1% -2% of the general population. Transient experiences of DP may appear in healthy individuals triggered by fatigue, anxiety, substance abuse, trauma or stress. The present study aims to examine the associations between depersonalization and individual dispositions of the nervous system—specifically trait anxiety, sensory processing sensitivity, and symptoms of attention deficits and hyperactivity—in a healthy adult population.

Methods: The sample consisted of 366 young adults (184 women, 180 men, 2 not reported; Mage=25.57 years, SD=3.2), who participated in an online survey conducted via a national research panel. The following instruments were used: Depersonalization Mechanism Scale (DMS), Highly Sensitive Person Scale (HSPS), Trait Anxiety Scale (SL-C), and Adult ADHD Self-Report Scale (ASRS-v1.1).

Results: Depersonalization symptoms were significantly associated with sensory processing sensitivity ($r = .63$, $p < .001$), trait anxiety ($r = .46$, $p < .001$), and—most strongly—with symptoms of attention deficits and hyperactivity ($r = .71$, $p < .001$). Regression analysis indicated that symptoms of depersonalization are significantly predicted by individual dispositions of nervous system ($F(3, 362) = 145.70$, $p < .001$). The model explained 55% of the variance in depersonalization symptoms (adjusted $R^2 = .55$), with attention deficits and hyperactivity emerging as the strongest predictor ($B = 0.63$, $SE = 0.06$, $\beta = 0.54$, $p < .001$).

Conclusions: An in-depth analysis of the relationships between depersonalization and sensory processing sensitivity, anxiety, and ADHD symptoms, allows for a better understanding and explanation of how individual dispositions influence coping strategies. A better understanding of these associations may inform therapeutic approaches, particularly in interventions targeting crises, trauma, and post-traumatic stress disorder (PTSD).

Abstract 648

WHEN HELPING HURTS: THE ROLE OF GRANDIOSE AND VULNERABLE NARCISSISM AND THE NEED FOR SOCIAL APPROVAL IN PATHOLOGICAL ALTRUISM

Kavlak A.F., Üzümcü E.*

Baskent University ~ Ankara ~ Turkey

Altruism is generally regarded as a beneficial characteristic involving concern for others' well-being, yet pathological altruism refers to the maladaptive tendency to prioritize others' needs at the expense of one's own well-being. While research on its risk factors remains scarce, emerging evidence suggests that narcissistic traits may contribute to pathological altruism. The present study aimed to investigate risk factors for pathological altruism by examining the predictive roles of need for social approval, grandiose narcissism (characterized by attention-seeking and inflated self-esteem), and vulnerable narcissism (marked by low self-esteem and rejection sensitivity) among individuals training in mental health disciplines. We hypothesized that vulnerable narcissism would be a stronger predictor of pathological altruism compared to grandiose narcissism. The sample consisted of 256 undergraduate students (230 female, 25 male) aged 18 to 30 ($M = 22.95$, $SD = 2.395$), enrolled in psychology, psychological counseling and social work programs, with no psychiatric diagnosis. Data were collected using the Sociodemographic Information Form, the Need for Social Approval Scale, the Healthy Selfishness and Pathological Altruism Scale, and the Pathological Narcissism Inventory. Results indicated that vulnerable narcissism was positively associated with the need for social approval and pathological altruism, whereas grandiose narcissism showed negative correlations with these variables. Hierarchical regression analyses revealed that need for social approval initially predicted pathological altruism ($\beta = .27$, $t = 4.55$, $p < .001$, $\Delta R2 = .08$). When vulnerable narcissism was included in Model 2, the predictive role of need for social approval disappeared, while vulnerable narcissism significantly predicted pathological altruism ($\beta = .55$, $t = 8.62$, $p < .001$, $\Delta R2 = .21$). In contrast, grandiose narcissism, entered in the third model, was not a significant predictor of pathological altruism. These findings highlight the role of vulnerable narcissism as a significant risk factor for pathological altruism.

Abstract 726

EXPLORING REFLECTIVE FUNCTIONING MECHANISMS IN DYNAMIC INTERPERSONAL THERAPY FOR DEPRESSION

Xie X.*

University College London ~ London ~ United Kingdom

Introduction: Dynamic Interpersonal Therapy (DIT), a psychodynamic and mentalization-based treatment, demonstrates efficacy for depression through theoretically enhancing mentalizing—the capacity to understand behaviours through intentional mental states. While mentalizing is considered central to DIT's theoretical framework, empirical evidence for its specific therapeutic mechanisms remains limited.
Purpose: This study aimed to explore how mentalizing contributes to therapeutic change in DIT for depression.
Method: Data derived from an RCT comparing DIT (n = 73), LIT (Low-Intensity Therapy, n = 54), and CBT (Cognitive-Behavioural Therapy, n =20). Patients were assessed at baseline, mid-treatment and post-treatment using the Hamilton Rating Scale for Depression (HRSD-17), Beck Depression Inventory-II (BDI-II), and Reflective Functioning Questionnaire (RFQ: certainty/uncertainty dimensions). Mixed-effect Linear Models, mediation analysis (DIT vs LIT and DIT only), and individual slope extraction examining change-to-change relationships were conducted. In the cases of mediation and slope analysis, CBT was excluded due to a small sample size.
Results: Mentalizing uncertainty showed significant treatment-dependent effects in DIT ($\beta = 0.59$, $p = .003$; LIT vs DIT: $\beta = -0.97$, $p = .002$). Only within-DIT mediation showed significant mentalizing uncertainty-depression Pathways (RFQ-Uncertainty → HRSD-17: $\beta = 0.615$, $p = .032$; BDI-II: $\beta = 1.62$, $p = .003$). Individual slope analysis revealed distinct mentalizing-depression relationships: in DIT, depression improvement was significantly predicted by mentalizing uncertainty (BDI-II: $\beta = 1.099$, $p < .001$; HRSD: $\beta = 0.358$, $p = .042$) and marginally by certainty (BDI-II: $\beta = 0.871$, $p = .059$), without significant associations in LIT.
Conclusions: Mentalizing functions as a therapeutic factor in DIT, with enhanced clinical associations compared to control therapy. Findings challenge simple mediation models, suggesting DIT's effectiveness derives from amplifying mentalizing's regulatory power for depression outcomes rather than solely building mentalizing capacity. These insights inform therapeutic training, highlighting the importance of deepening mentalizing in psychodynamic treatments.

Abstract 597

PREVALENCE OF PSYCHOPATHY IN A COMMUNITY SAMPLE OF SPANISH ADULTS: A REPLICATION AND VALIDATION

Sanz--García A.*, Morán N., Gesteira C., Roldán L., Vallejo Slocker L., Garcìa Vera M.P., Sanz J.

Universidad Complutense de Madrid ~ Madrid ~ Spain

The main objective of this work is to examine the prevalence of psychopathy in the general adult population from the main currently existing theoretical perspectives of psychopathy, using for this purpose the five-factor or Big Five model as a common language that allows the comparison and integration of the personality traits considered as defining psychopathy by these different perspectives. In our previous study (Sanz-García et al., 2022), we administered the NEO Personality Inventory-Revised (NEO PI-R) to a sample of 682 adults of the general Spanish population. We calculated the prevalence of clinical and subclinical psychopathy according to different definitions of these two constructs based on Hare's, Lilienfeld's, triarchic, and DSM-5-hybrid models, and the simultaneous presence of a minimum number of personality traits that differed from the sample mean by one standard deviation. However, we did not validate those definitions. In this study, we replicated our previous work, but also validated those definitions with measures of antisocial and harmful behaviors. We administered the NEO PI-R to a new sample of 581 adults of the general Spanish population. Prevalence rates for the different definitions of psychopathy were consistently low, indicating that the prevalence of clinical psychopathy in the general Spanish population is around 0.53%, and that of subclinical psychopathy is around 1.32%. These prevalence rates were similar to those found in our previous work (0.55% and 1.65%). On the other hand, people with subclinical or clinical psychopathy showed higher levels of antisocial behaviors, psychological coercion and aggression towards their partner, and workplace harassment. This last result validated the definitions of psychopathy based on the NEO PI-R. Finally, the results of both studies question the alarmist claims that warn about the existence in society of a very high number of people with psychopathy who can cause many physical, and psychological damage to others.

PROMOTING SENSE OF COMMUNITY AT SCHOOL. TEACHERS' PERSPECTIVES IN ACTION

Albanesi C.*[1], Giannotta C.[1], Fellini N.[2]

[1]University of Bologna ~ Bologna ~ Italy, [2]Coop. Controvento ~ Cesena ~ Italy

Introduction A positive school climate is essential for school well-being and the educational process. Relationships between teachers and family play an essential role. The quality of teacher–parent interaction depends on mutual appreciation of each other's work and on the recognition of the parent's educational role. Alignment of educational goals supports parental involvement and strengthens parents' perception of the school's value. Conversely, when this alliance is poorly developed, inter-actions may become conflictual, especially when role perceptions are misaligned.
Teachers often report a decline in the authority and support they receive from families, characterised both by total delegation of educational functions and by intrusive interference in school matters.
Purpose
Understand the quality of teacher-parent relationship, its impact on teachers' well-being, and sense of community (SoC) in the 4 primary schools of a school district of Cesena, as part of the project "La scuola e la città" (Fondazione con i bambini)
Method
A participatory action research approach was used. Four focus group were organised with the teachers (73 participants). Thematic analysis was done on the transcripts of the focus group.
Results The focus group results showed consent among teachers on the idea that clear boundaries for participation are needed, and teachers must define explicit limits on parental involvement. What resulted even more important, was coherence and a common strategy between teachers and across schools in approaching those issues, despite differences across the four schools of the district.
Based on this evidence, to support the co-creation of a common strategy to facilitate teacher-parent relationships, a world cafè with all the teachers of the school district was organised to design a "a vademecum to survive parents"
Conclusions
PAR was effective in strengthening teachers' sense on community and their ownership on the strategies to handle their relationships with parents.

Abstract 2557

PROMOTING MENTAL HEALTH IN CHILDREN AFTER THE COVID-19 PANDEMIC: A QUASI-EXPERIMENTAL STUDY CONDUCTED IN BRAZIL

Pessoa A.S.G.*

Federal University of São Carlos - UFSCar ~ São Carlos, São Paulo ~ Brazil

Understanding the pandemic's impact on individuals and communities, expanding affective-social support networks, and strengthening family and community bonds are crucial strategies for promoting children's mental health and resilience, as these factors foster social and psychological resources for coping with adversity. This study aimed to adapt and evaluate the effectiveness of a psychosocial intervention targeting children who experienced adverse events related to the COVID-19 pandemic. Conducted in Brazil, this quasi-experimental study employed a cross-sectional design integrating quantitative and qualitative methodologies to assess a program originally developed by Save the Children in Denmark. The Brazilian adaptation, Programa ConViVer, consisted of eight sessions. A total of 116 children aged 8–12 years (M = 9.8; SD = 1.1) were recruited and randomly assigned to an Experimental Group (EG; n = 69) or a Waiting Group (WG; n = 47), with 52.6% identifying as female. Participants were from five Brazilian cities: Belém, Brasília, Fortaleza, Porto Alegre, and São Carlos. Program effectiveness was assessed at pre-test (T1) and post-test (T2) using validated psychological instruments measuring depression, stress, affect, resilience, self-esteem, self-efficacy, and life satisfaction, along with field diaries. Statistical analyses characterized group performance across all measures and examined changes between T1 and T2 using robust t-tests for trimmed means in paired samples. Results showed that Programa ConViVer significantly increased positive affect and reduced indicators of negative affect, depression, and stress among EG participants. No significant changes were observed in the WG, confirming the intervention's effectiveness. Additionally, the program enhanced children's perceptions of their affective and social support networks —factors widely recognized as essential for promoting mental health and resilience in contexts of adversity. The dissemination of these findings may guide further research and support the replication of this intervention among children facing post-pandemic challenges.

Abstract 600

PARENT–CHILD INTERBRAIN SYNCHRONY IS LINKED TO PARENTING PRACTICES AND CHILDREN'S PSYCHOLOGICAL SYMPTOMS

Liu S.*[1], Han Z.[2]

[1]Central China Normal University ~ Wuhan ~ China, [2]Beijing Normal University ~ Beijing ~ China

Parenting practices are fundamental to children's psychological adjustment. However, the neural processes involved in real-time parent–child interaction have remained understudied. The present study examined whether and how two core parenting dimensions—autonomy support ("secure base") and emotional warmth ("safe haven")—differentially predict interbrain synchrony in father–child and mother–child dyads, and whether such synchrony predicts children's later psychological symptoms. Leveraging a longitudinal, within-family design, 105 families including fathers, mothers, and children participated (child mean age = 6.63 years, 50.5% girls). Parenting practices were self-reported one month prior to the lab visit, and children's psychological symptoms were reported by parents one year later. During the lab visit, each child engaged in structured collaborative tasks separately with their father and mother while parent–child interbrain synchrony was measured with functional near-infrared spectroscopy (fNIRS) hyperscanning. Paternal autonomy support uniquely predicted greater father–child interbrain synchrony, whereas maternal emotional warmth uniquely predicted greater mother–child interbrain synchrony. Notably, only father–child synchrony significantly predicted fewer attention, internalizing, and externalizing problems, further mediating the link between paternal autonomy support and reduced child attention problems. These findings offer novel neural-level evidence that autonomy support and emotional warmth play distinct roles in shaping parent–child neural dynamics. Interbrain synchrony may thus serve as a key mechanism linking specific parenting practices to children's psychological adjustment, particularly underscoring the role of father–child interactions in early attention development.

Abstract 2491

CHASING PERFECTION, FEELING ASHAMED: A DAILY DIARY STUDY OF ADOLESCENT PERFECTIONISTS

Sirianni Molnar D.*, Blackburn M., Zinga D.

Brock University ~ St. Catharines ~ Canada

Introduction: Perfectionism and shame are central to understanding psychological distress in adolescence. Perfectionism contributes to mental health problems and psychosocial difficulties, while shame often mediates distress associated with perfectionism, linking it to depression, anxiety, and social withdrawal. Adolescence, a developmental period of rapid cognitive, emotional, and social change, is particularly sensitive to these processes due to heightened self-consciousness and social awareness. Theoretical frameworks such as Self-Conscious Emotion Theory, Perfectionism Cognition Theory, and the Perfectionism Social Disconnection Model converge in highlighting links between perfectionism and shame. Yet, little is known about how these dynamics unfold in daily life among adolescents. Examining their day-to-day interplay can illuminate how perfectionistic cognitions and shame co-occur and fluctuate over time, shedding light on patterns that may contribute to their persistence. These insights are essential for developing effective prevention and intervention strategies for young perfectionists.

Purpose: This ecological momentary assessment study examined reciprocal day-to-day relations between perfectionistic cognitions and shame among adolescent self-identified perfectionists.

Method: A community sample of 96 adolescent self-identified perfectionists (Mage = 15.15 years, SD = 1.72; 67.71% female; 68.75% White) completed daily assessments of perfectionistic cognitions and shame across seven consecutive days. Random intercept cross-lagged path analyses were conducted to examine both within-person and between-persons associations.

Results: Findings indicated robust associations between perfectionistic cognitions and shame. At the within-person level, higher perfectionistic cognitions on Day 2 predicted increased shame on Day 3, which, in turn, predicted higher perfectionistic cognitions on Day 4, suggesting a reinforcing cycle. Perfectionistic cognitions and shame were also positively and strongly associated at the between-persons level.

Conclusions: This study demonstrates a dynamic, reciprocal relationship between perfectionistic cognitions and shame in adolescents. Results highlight the complexity of

perfectionism-related emotional processes and underscore the importance of addressing shame in interventions targeting adolescent perfectionism.

Abstract 2593

THERAPEUTIC FACTORS UNDERLYING COGNITIVE-BEHAVIORAL GROUP THERAPY FOR JUVENILE DELINQUENTS IN TURKEY: A MIXED-METHODS STUDY

Yalçın M.*[1], Aritürk S.[2]

[1]Çanakkale Onsekiz Mart University ~ Çanakkale ~ Turkey, [2]Katip Çelebi University ~ Izmir ~ Turkey

Understanding not only whether a therapy is effective but also how and why it works is essential for advancing evidence-based rehabilitation. Examining therapeutic factors provides insight into what makes treatment effective and lasting. This study investigated the mechanisms underlying a culturally adapted Cognitive-Behavioral Group Therapy (CBGT) for anger management in a Turkish juvenile correctional facility. Sixty male juvenile delinquents were randomly assigned to CBGT, a sharing (peer-support) group, or a waitlist control. Therapeutic processes were assessed using the Therapeutic Factors Inventory–Short Form (TFI-SF). Post-intervention interviews were analyzed using thematic analysis. A MANOVA revealed significant group differences on TFI-SF subscales, $F(4,24) = 3.24$, $p = .02$, $\eta p^2 = .35$. Specifically, CBGT participants reported higher scores on Secure Emotional Expression and Social Learning than the sharing group. In both groups, emotional expression was the most salient factor. Thematic findings supported these results, highlighting group cohesion, emotional expression, and social learning as key processes that contribute to the overall experience. Context-specific elements—such as group rules, engaging activities, and the therapists' role—also enhanced participation and safety. Overall, findings suggest CBGT for anger management promotes skill development and supports relational and emotional growth critical for rehabilitation. Understanding how structured techniques interact with broader therapeutic factors provides valuable insight into the mechanisms of change for juvenile delinquents and helps inform group-based interventions.

Abstract 4928

EFFECTIVENESS OF A TARGETED, EMOTIONAL SAFETY INTERVENTION PROGRAM FOCUSSING ON CO-RUMINATION IN ADOLESCENT GIRLS: THE HAPPY FRIENDS, POSITIVE MINDS RANDOMIZED CONTROLLED TRIAL

Vuijk P.*

Rotterdam University of Applied Sciences, The Netherlands

The prevalence of internalising problems and disorders in girls rises sharply between 10 and 18 years of age, with an onset often occurring during puberty, starting for girls at a mean age of 10 years old onwards. The transition from childhood into early adolescence is a developmental period in which girls experience challenges and difficulties in emotion regulation (ER). Difficulties in ER and the use of maladaptive ER strategies have been associated with heightened negative emotional reactivity and, hence a strong impact on internalising problems. Co-rumination is a goal-directed interpersonal ER strategy that exists within dyadic friendships in which girls disclose distressing worries or problems to downregulate distress.

Co-rumination within girls' friendships increases significantly during early adolescence. Although girls' friendship dyads experience co-rumination as socially rewarding in terms of building trust, emotional intimacy, and support exchange, girls also experience the intrapersonal costs of co-rumination. High levels of co-rumination about distressing experiences and related unpleasant thoughts, feelings, emotions, memories, and bodily sensations within close friendships cultivate an attentional bias towards unpleasant information, making girls more prone to noticing unpleasant stimuli. These processes have been linked to greater stress, negative feelings and problem perceptions directly evolving after conversations, rumination, the onset and exacerbation of symptoms of depression and anxiety, clinical depression, as well as the severity and duration of future depression.

The Happy Friends, Positive Minds program, offered via schools and implemented via trained school professionals, is the first prevention program worldwide, developed by Patricia Vuijk and Per Norrgren, aimed at reducing and preventing excessive co-rumination and related mental health complaints among adolescent girls. This presentation will discuss the building blocks and working mechanisms of the program, aimed at supporting girls to restore emotional safety and emotional balance by learning them to introduce safety signals at moments when worries would normally take over. The program reduces the nervous system's dependence on repetitive "talk loops" for regulation and closeness, and supports a shift to a connection that is calmer, clearer, and more sustainable.

Biography

Dr. Patricia Vuijk is Research professor Girls and mental wellbeing at Rotterdam University of Applied Sciences. Together with Per Norrgren, she develops targeted intervention programs for adolescent girls aimed at the prevention of mental health problems and to support mental wellbeing. She is the Principal Investigator of several Randomized Controlled Trials studying the effectiveness of the programs.

Abstract 1458

MODERN INTERPERSONAL RELATIONSHIPS: A QUALITATIVE ANALYSIS OF QUALITY AND FEATURES

Bellanca N.*[1], Di Napoli I.[2], Gatti F.[2], Fortuna P.[2]

[1]University of Modena and Reggio Emilia ~ Modena ~ Italy, [2]University of Naples Federico II ~ Naples ~ Italy

INTRODUCTION Relationships are fundamental in people's lives and represent an essential human need (Perlman, 2007). Recent decades have seen a drastic alteration in the way humans interact and communicate, both online and offline, within a sociocultural context where the digital transformation has brought about significant changes in society (Van Veldhoven & Vanthienen, 2022). Considering that, and according to the Interdependence Theory (Kelley & Thibaut, 1959; 1978), which states that relationships change interdependently with the characteristics of the social and physical environment (Van Lange & Balliet, 2015), it is essential to understand how social relationships develop and how the connections among young adults are characterized.

PURPOSE An exploratory research study was conducted to investigate the quality and features of young adults' interpersonal relationships, considering various levels (dyadic couple, family, peer group, social).

METHOD A sample of 56 young adults between 19 and 21 (58.9% women) was recruited via a Psychology course at the degree level. The textual corpora, consisting of the collection of individual responses, are subjected to Thematic Analysis of Elementary Contexts through T-Lab Plus, to explore the main contents.

RESULTS Transversal characteristics emerged with respect to the quality of interpersonal relationships that are described as characterized by depth and superficiality. An intense ambivalence, with both positive and negative elements and expectations, also characterize each relation. Positive aspects are intimacy and trust, as expressions of respect and justice, a sense of fairness and mattering for others, and presence. Instead, the negative aspects include competitiveness and a lack of commitment and respect. Time dedicated to relationships is regarded as vital for personal development and building the future. A preference for offline relationships is also noted.

CONCLUSIONS This emphasizes understanding relationship qualities to foster authentic social connections and build strong social networks among young adults. It also raises questions about technology's role in this process.

Abstract 1782

FROM INTIMATE PARTNER VIOLENCE TO DEPRESSIVE AND SOMATIC SYMPTOMS: LONELINESS AND EXPRESSIVE SUPPRESSION AS MEDIATING PATHWAYS

Fidantek H.*[1], Tuna E.[2]

[1]Ankara University ~ Turkey, [2]Izmir University of Economics ~ Izmir ~ Turkey

Intimate partner violence (IPV) is one of the most prevalent forms of violence against women and has serious negative effects on women's well-being. Research shows that women who are victims of IPV are at an enhanced risk for mental health problems; however, the mechanisms underlying these associations have not been sufficiently understood. The present study aimed to test the serial mediating roles of loneliness and expressive suppression in the association between IPV exposure and depressive and somatic symptoms. The sample consisted of 479 women, aged 18 to 66 (M = 28.81; SD = 10.32), who reported being in a romantic relationship for at least one year. Data was collected via an online survey. Two serial mediation models were tested using the SPSS PROCESS macro, Model 6. The results indicated that IPV exposure had a significant indirect effect on both depressive and somatic symptoms through loneliness, as well as a significant serial indirect effect through loneliness and suppression. The indirect effects through suppression alone were not significant, suggesting that the mediating role of suppression emerged only when preceded by loneliness. These results indicate that loneliness and expressive suppression may be important processes linking IPV to depressive symptoms and somatic difficulties in women. These findings imply that prevention and intervention programs targeting depressive and somatic symptoms in women who are exposed to IPV may benefit from addressing these processes.

Abstract 1515

INTERPERSONAL AND INTRAPERSONAL EMOTION REGULATION IN OBSESSIVE–COMPULSIVE DISORDER: NEW INSIGHTS FROM RELATIONSHIP-FOCUSED SYMPTOMS

Soysal D.E.*[2], Akin Sari B.[1]

[1]Baskent University ~ Ankara ~ Turkey, [2]Başkent University, Department of Psychology and Middle East Technical University (METU), Guidance and Psychological Counseling PhD Program

Emotion regulation is a core process in the onset and persistence of psychological disorders. Intrapersonal strategies such as Suppression and Reappraisal have been widely studied, yet interpersonal strategies including Soothing, Social Modeling, Perspective Taking, and Enhancing Positive Affect have received limited empirical attention. Obsessive–compulsive disorder (OCD) is characterized by intrusive thoughts and repetitive behaviors, but some symptom dimensions emerge specifically in relational contexts, as in Relationship Obsessive–Compulsive Disorder (ROCD). ROCD includes two dimensions: relationship-centered (RC-OC) and partner-focused (PF-OC) symptoms. The aim of this study was to test whether specific intrapersonal and interpersonal strategies predict symptom severity across OCD, RC-OC, and PF-OC, thereby clarifying their respective contributions to general and relationship-related symptom domains.

A sample of 749 Turkish-speaking adults (aged 18 to 65, M = 25.75, SD = 7.44), all with prior romantic relationship experience, completed validated measures of obsessive–compulsive symptoms and emotion regulation strategies. Hierarchical regression analyses were conducted while controlling age and relationship status.

Suppression emerged as the most consistent predictor of higher symptom severity across all domains. Soothing was associated with greater symptoms in OCD and ROCD, while Social Modeling predicted only RC-OC. Perspective Taking showed weaker associations, predicting only OCD symptoms, and Reappraisal negatively predicted OCD symptoms. Younger participants and those currently in relationships reported higher levels of ROCD symptoms.

These findings indicate that obsessive–compulsive symptoms are linked to specific patterns of both intrapersonal and interpersonal strategy use. In clinical practice, understanding the differential contributions of these strategies could lead to more tailored therapeutic approaches that integrate social support and interpersonal skill training alongside cognitive–behavioral techniques targeting intrapersonal regulation. Positioning OCD and ROCD within this broader framework not only advances an emerging direction in the field but also emphasizes the societal relevance of addressing relational well-being alongside symptom reduction.

Abstract 1677

WHEN ANXIETY SEEMS NORMAL: DE-PATHOLOGISING ANXIETY IN TIMES OF CRISIS

Kovacovsky Z., Hohenegger J.*, Bodrogi B.A., Stetina B.U.

Sigmund Freud Private University ~ Vienna ~ Austria

The negative effects of the COVID-19 pandemic on mental health are well documented, showing increased psychological distress. The Psychological University Outpatient Clinic at Sigmund Freud Private University continued to provide low-threshold, income-based services throughout all phases of the pandemic. This study examines how distress levels among help-seekers at the outpatient clinic changed as a result of the pandemic.

The sample comprises 1,664 patients (59.4% female, 39.6% male) and includes medical history, interviews, and the Symptom Checklist SCL-90-R [1]. Analyses revealed a significant group differences (pre-, peri-, and post-pandemic) on the anxiety scale (scale 5 of the SCL-90-R; ($F(2,1248.19)=4.41$, $p=.012$, $\eta^2=.01$). Post-hoc tests showed higher anxiety scores pre-pandemic ($M=62.65$, $SD=11.30$) than during the pandemic ($M=60.84$, $SD=12.51$; $p=.019$). No significant differences emerged between pre- and post-pandemic ($p=.26$) or peri- and post-pandemic groups ($p=1.00$). Help-seekers during the pandemic were also significantly younger ($M=32.9$) than those before ($M=35.6$) or after ($M=35.8$; $p=.001/.012$).

Findings suggest that in collective crises, anxiety may be depathologised—increasingly regarded as a normal, shared response rather than a clinical condition—even while stress persists. This potential normalization may explain why reported anxiety decreased despite widespread distress. The disproportionate presence of younger patients highlights shifts in age-related help-seeking and the relevance of resilience profiles. Moreover, heightened public discourse and reduced stigma around mental health likely encouraged individuals to seek support, even when their anxiety no longer seemed exceptional.

For clinical practice and theory, these results underscore a critical implication: crises may blur the boundary between pathological and normal anxiety. Outpatient services must therefore carefully differentiate adaptive from maladaptive anxiety, while expanding preventive and psychoeducational programs. Strengthening resilience—particularly among younger populations—is essential to mitigate long-term risks masked by the apparent normalization of anxiety.

Abstract 1331

SOCIAL COGNITIVE MECHANISMS OF IMPULSIVITY-RELATED RISK FOR STIMULANT USE DISORDER

Gullo M.*[1], Thomsen N.[2], Wanigasooriya A.[2], Connor J.[2], Clark P.[3]

[1]Griffith University ~ Brisbane ~ Australia, [2]The University of Queensland ~ Brisbane ~ Australia, [3]Princess Alexandra Hospital ~ Brisbane ~ Australia

Introduction: Impulsivity is a risk factor for addiction, including stimulants. The precise mechanisms through which impulsivity conveys risk is unclear. Identifying these mechanisms could inform targeted intervention. bioSocial Cognitive Theory (bSCT) hypothesises two mechanistic pathways linking dimensions of impulsivity to addiction. The first predicts that higher reward drive/sensitivity leads to the development of more positive drug outcome expectancies, encouraging problematic use. The second pathway predicts that a greater propensity to act without forethought (rash impulsiveness) leads to reduced confidence in one's ability to resist rewards, which include drugs (low refusal self-efficacy), encouraging problematic use. bSCT has received empirical support in studies of alcohol and cannabis use.

Purpose: This study tests bSCT in a stimulant treatment population.

Method: 151 stimulant users (73.5% methamphetamine; 19.2% cocaine) attending a specialist outpatient clinic in an Australian tertiary-level public hospital were administered a battery of questionnaires assessing impulsivity, social cognition, and severity of dependence (SDS). Data were analysed using structural equation modelling with robust maximum likelihood estimation to test bSCT predictions.

Results: The hypothesised model explained 51.8% variance in severity of stimulant dependence and showed good fit to the data, chi-square= 29.195, df= 12, p= .004, CFI= 0.956; RMSEA= 0.098; SRMR= 0.067). Lower stimulant refusal self-efficacy mediated the effects of higher rash impulsiveness and positive expectancies on dependence severity. Positive stimulant expectancies mediated the effects of higher reward drive.

Conclusions: Findings support bSCT in stimulant addiction, highlighting the potential importance of stimulant refusal self-efficacy as a treatment target and identifying potential biosocial cognitive factors influencing it.

Abstract 1118

INVESTIGATING THE COGNITIVE MECHANISMS LINKING LONELINESS TO INTERNALIZING SYMPTOMS

Kataria A.*

University of British Columbia ~ Vancouver ~ Canada

Background: With global rates of mental illness on the rise, it is crucial to better understand how to improve well-being. Loneliness and cognitive biases are well-established risk factors for anxiety and depression. One bias—negative interpretation bias (i.e., the tendency to interpret ambiguous stimuli negatively)—is strongly linked to the development of anxiety and depression. In this talk, I review research on interpretation bias and practical applications, including strategies to reduce this bias. I will also present the results of research investigating the relationships between interpretation bias, loneliness, perspective-taking, and anxiety and depression.

Method: Sixty-six university students (Mage = 20.58, SDage = 1.93) completed measures of loneliness (UCLA Loneliness Scale), negative interpretation bias (Scrambled Sentences Task), anxiety and depression (Hospital Anxiety and Depression Scale), and perspective-taking (a 4 measure composite: Four-Item Mentalizing Index, 10-item Cambridge Mindreading Voice Battery, Interpersonal Reactivity Index, and 5-item Autism Quotient).

Results and Discussion: Loneliness was positively correlated with negative interpretation bias ($r = .42$, $p < .001$), anxiety ($r = .59$, $p < .001$), and depression ($r = .58$, $p < .001$). Negative interpretation bias was also associated with anxiety and depression ($r = .54$, $p < .001$). Loneliness explained nearly half the variance in anxiety (48.8%) and depression (49.3%; $p < .05$). Interestingly, perspective-taking abilities may serve as a protective factor against loneliness, depression and negative interpretation bias. That is, individuals with higher perspective-taking abilities showed lower levels of loneliness, depression and interpretation bias compared to those with high perspective-taking (ps < .05). These findings offer valuable insights for clinicians, researchers, educators, and policymakers. Implications for interventions targeting interpretation bias and perspective-taking to improve mental health will be discussed.

Abstract 1646

INTERPRETATIONS AND EXPERIENCES OF INDIVIDUALS DIAGNOSED WITH BIPOLAR DISORDER REGARDING THIS DIAGNOSIS

Manka M.*[1], Canbolat F.[2], Gençöz F.[1]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Çankaya University ~ Ankara ~ Turkey

Bipolar disorder is a mood disorder that is characterized by fluctuations between mania and depression. For individuals suffering from bipolar disorder, although receiving a diagnosis provides them with a relief that comes through naming and explanation, it can also result in an alienation and containment. In addition to the difficulties they experience due to bipolar disorder, receiving a diagnosis can also be perceived as a stigma, and in this regard, individuals may also encounter social and economic inequalities. The aim of this study will be to examine how individuals diagnosed with bipolar disorder interpret and give meaning to their diagnosis, and how they experience this diagnosis in their daily lives. In order to reach a diverse and rich data, qualitative research will be conducted in the study. For this purpose, semi-structured interviews will be carried out with five to ten individuals who were diagnosed with bipolar disorder, and the data will be analyzed with thematic analysis. Through qualitative analysis, data will be examined in depth, and individuals' interpretations, experiences, and difficulties concerning bipolar disorder diagnosis will be at center of the study. Results will be discussed in the light of various theories such as psychoanalytic and psychodynamic, humanistic, social and cultural approaches, by bridging both clinical and social psychology. By investigating individuals' experiences regarding the diagnosis and treatment processes, problems they may encounter with the health care system, or the challenges they may face on a social or economical level; possible ways to enhance both their physical and mental health, and their socio-economical status will try to be discovered in the present study.

DIMENSIONS OF HOPE FROM PSYCHOTHERAPEUTIC INTERVENTIONS OF ADOLESCENTS WITH DELINQUENT BEHAVIORS

Bengwasan P.*

De La Salle University/Psychological Association of the Philippines ~ Manila ~ Philippines

Children in conflict with the law (CICL) underwent intervention programs which involve psychotherapy, educational assistance, life skills training and family interventions. Given the
severity of the cases of these individuals, this study explored the interplay of locus of hope dimensions in 10 CICLs that underwent individual psychotherapeutic process. Hindrances were evident in these cases, which centered on family relational difficulties, presence of abuse and cognitive limitations. But notably, internal locus of hope dimensions such as motivations to learn life skills and continue formal education, acknowledgment of responsibility and the drive to achieve goals were emphasized during psychotherapeutic sessions. Likewise, external locus of hope dimensions such as support from significant others, gaining approval from one's parents and family members during reintegration, and having a sense of community with one's co-residents were apparent in their experiences. Especially towards latter sessions of psychotherapy, themes that directly speak of hope appear to be strengthened by professional help (including psychotherapy, legal assistance and case management), which seem to answer the deficits possessed by the participants prior to institutionalization.

Abstract 4539

WHAT IT IS LIKE TO BE A CHILD EXPERIENCING AN AMBIGUOUS LOSS DURING RUSSIA'S WAR AGAINST UKRAINE?

Butsykin Y.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction

Ambiguous loss – characterised by the physical absence but psychological presence of the lost person – is a particular challenge for children, as it disrupts identity, restricts lived time, and relationships with the world. During Russia's war against Ukraine, many children face the disappearance of one or both parents, a form of loss that resists "closure" and other conventional models of grief.

Purpose

This study aims to reveal the underlying structure of ambiguous loss experience and explore how general aspects of the loss are embodied and embedded in the case under investigation.

Method

The research used a qualitative approach to the studied phenomenon: interpretive phenomenological analysis. This involves two: a phenomenological description of the participants' experiences and the researcher's interpretation of these experiences. The data were collected by semi-structured interviews with eight children aged 10-16 who experienced the disappearance of one or both parents due to the war.

Results

The experience of ambiguous loss is summarized in three main categories. Each of these categories, in turn, contains several subordinate ones:

1. The presence of the absent (painful reminiscences; repulsive radiation of the lost person's presence; attractive radiation of the lost person's presence)
2. Alienation of the world (alienation of the objective world; alienation of social relations; alienation of the actual course of time)
3. Identity crisis (searching for a new self; loss as a basis of self-awareness

Conclusions

The findings challenge stage-based and closure-oriented models of grief, emphasizing the non-linear, embodied, and relational 'nature' of children's experience of ambiguous loss. Ambiguous loss disrupts children's sense of time, continuity, and meaning, producing affective ambivalence, depressive alienation, and the coexistence of parallel timelines of life with and without the lost parent.

Abstract 2661

STORIES IN THE SAND: INTRODUCING THE THERAPEUTIC SANDSTORY METHOD AS A NARRATIVE, MULTIMODAL INTERVENTION FOR CHILDREN IN SOUTH AFRICA

Knoetze J.*[1], Stroud L.[2]

[1]Rhodes University ~ Makhanda ~ South Africa, [2]Nelson Mandela University ~ Gheberha ~ South Africa

The Therapeutic Sandstory Method (TSM) is a newly developed, multimodal child psychotherapy intervention that integrates three expressive therapeutic pillars: sandtray therapy, therapeutic storymaking, and the use of therapeutic documents. This presentation introduces the TSM and reports on a qualitative case-study project involving five South African middle-school aged children experiencing emotional distress and behavioural challenges. Developed for use in resource-scarce settings, the TSM offers a structured yet flexible protocol designed to support children's meaning-making, emotional regulation, and identity development through symbolic play and narrative co-construction.

Guided by Narrative Therapy and social constructionist principles, the study documented and analysed each child's therapy process to explore how engagement unfolded, how sandstories were collaboratively created, and how these stories facilitated therapeutic change. Case material shows that children used the TSM to externalise problems, process complex emotions, and author alternative identity-rich narratives that strengthened their sense of agency and coherence. Themes emerging across cases highlight the importance of collaboration, the therapist's role as co-creator, and the value of therapeutic documents in consolidating new meanings.

The findings indicate that the TSM is an effective, developmentally attuned, and culturally adaptable short- to medium-term intervention for children; both in under-resourced and resourced contexts. Mechanisms of change and factors that support or hinder engagement are identified, contributing to the first formal articulation and evaluation of this method. Recommendations for refining the protocol include careful preparation for the storytelling phase and the incorporation of a definitional ceremony involving caregivers in the concluding phase to reinforce children's emerging narratives.

The presentation will outline the TSM protocol, illustrate its application through selected case examples, and share practical guidelines captured in a provisional implementation manual. Overall, the study offers initial evidence for the TSM as a promising new psychotherapeutic intervention for children and a valuable extension of narrative-informed sandtray practice.

Abstract 4611

CONFIGURATIONS OF THE MATERNAL IMAGO IN CHILDREN WITH DEPRESSIVE TRAITS: A PROJECTIVE STUDY

Poppe A.*, Sneiderman S.

University of Business and Social Sciences (UCES), Buenos Aires, Argentina ~ UCES, Buenos Aires ~ Argentina

Early disruptions in primary caregiving relationships affect the organization of object representations and influence emotional development in childhood. This study investigated how the maternal imago is configured in the psychic life of institutionalized children.

Participants were nine children aged 7 to 11 years living in a child protection service in Northeastern Brazil. The children were not selected for depressive pathology. Instead, apathy, sadness, and inhibition were examined as clinical indicators associated with depressive experience. The research followed a multiple case study design. Two expressive projective procedures were used: the Family Drawing by Corman and collage proposed by Oaklander. The material was analyzed through a psychoanalytic framework articulating Freud's theory of mourning and melancholia, Klein's depressive position, Winnicott's concepts of holding, handling, false self and transitional object, Bion's theory of containment, and Green's notion of the dead mother.

The productions revealed six configurations of the maternal imago organized not as simple absence but as distinct modes of psychic presence. Drawings and collages associated inhibition, sadness, and apathy with specific relational organizations including distant, substitute, idealized, fragmented, ambiguously present, or affectively emptied maternal figures. The findings suggest differentiated internal object organizations through which the child seeks relational continuity despite environmental discontinuities.

The material also presented symbolic activity and reparative gestures, indicating preserved elaborative potential. Projective procedures allowed access to relational experience not readily verbalized and functioned as mediating spaces for expression and meaning construction.

The study contributes to applied psychology and psychoanalytic clinical practice by demonstrating that institutionalized children do not lack maternal representation but organize multiple relational solutions to early affective disruption. Recognition of these configurations may support more precise assessment and the development of caregiving environments capable of sustaining symbolization and emotional integration processes. These patterns offer clinically actionable markers for staff training and for planning interventions that support play, care, and continuity daily.

FAMILIAR AND UNIVERSITY FACTORS ASSOCIATED TO SUICIDE IDEATION IN LATIN-AMERICAN YOUNG ADULTS (2020 – 2024). SCOPING REVIEW

Castro Munoz J.A.*, Garavito Ariza C.E.

Universidad Piloto de Colombia ~ Bogotá ~ Colombia

The aim of this study was to identify the social factors associated with suicidal ideation, on an scoping review, selecting the available evidence in the Latin American context between 2020 to 2024, the period afte the global pandemic of Covid - 19. This study focused specifically on those arising from interactions within the family and the university environment, given the lack of reviews focused on these two socialization environments that are central to the development of young people. This differential constitutes the main contribution of this review. The study also considered the increase in suicide rates among young people following the COVID-19 pandemic. The method consisted of a review of the scientific literature using the Scoping Review methodology according to the PRISMA-ScR model, which consists of a broad review of the literature based on search criteria supported by a review of the background of the problem. This search was conducted in the scientific databases of ProQuest, Redalyc, and Scopus, including only studys in latin-american countries. A total of 914 records were identified, of which 23 were selected based on the content of the abstract, and finally by complete reading according to their relevance to addressing the study objective, 15 were selected. The results identified and concluded that among the protective family factors, cohesion, involvement, and support prevail, and in the university context, social support from peers. Among the risk factors in the family is coercion teh principal one, and in the university context is the cyberbullying. Finally, the implications for suicide prevention based on the social factors of both contexts of interaction in young adults are discussed, conssidering its contributions and implications to the development of future intervention programs and public health policies in the latin-american region.

Abstract 1538

SUICIDAL IDEATION TRAJECTORIES AND MENTAL HEALTH PREDICTORS AMONG KOREAN UNIVERSITY STUDENTS: A GROWTH MIXTURE MODELING APPROACH

Choi S.*, Song J., Lee M.

Soonchunhyang Univercity ~ Asan ~ Korea, Republic of

This study aimed to identify latent classes of suicidal ideation trajectories among university students and to examine the predictors of class membership, thereby providing longitudinal evidence regarding suicide risk in this population. Given the increasing concerns about suicide among young adults, this research provides critical insights into subgroup-specific risk factors. Data were collected from 300 undergraduate students enrolled in 4-year universities across the nation at three time points: T1 (January 2025), T2 (April 2025), and T3 (June 2025). Suicidal ideation was measured using the Suicidal Ideation Attributes Scale (SIDAS; 11-point Likert scale), and the sum score (range: 0-50) of its five sub-dimensions (frequency, uncontrollability, closeness to attempt, distress, interference with daily activities) was utilized. Psychological distress was assessed with the Brief Symptom Inventory-18 (BSI-18; 5-point Likert scale), focusing on four sub-dimensions : depression, somatization, anxiety, and panic. Analyses were conducted using Growth Mixture Modeling (GMM), which classified participants into three groups: C1 (I=29.30***, S=-0.90*), C2 (I=2.76***, S=-0.64***), and C3 (I=17.17***, S=-0.39). Accordingly, C1 was designated as the “High-decreasing group,” C2 as the “Low-increasing group,” and C3 as the “Moderately stable group.” Regarding predictors, when the “High-decreasing group” was used as the reference group, only somatization (OR: 0.202, 95% CI: 0.067–0.609) significantly predicted membership in the “Low-increasing group.” This finding suggests that somatic symptoms are a salient factor associated with elevated risk of suicidal ideation. Furthermore, when the “Low-increasing group” was employed as the reference group, depression (OR: 2.663, 95% CI: 1.418–5.001) significantly predicted membership in the “Moderately stable group.” This indicates that depressive symptoms may play a pivotal role in maintaining a moderately elevated level of suicidal ideation. Collectively, these findings suggest that the predictors of suicide risk differ across subgroups and underscore the importance of interventions tailored to the specific characteristics of each group.

Abstract 1634

THE PREDICTIVE ROLE OF PERCEIVED PARENTAL ATTITUDES AND PERSONALITY ORGANIZATION ON NON-SUICIDAL SELF-INJURY

Türk Y.*[2], Uyar Suiçmez T.[1]

[1]Baskent University ~ Ankara ~ Turkey, [2]Demiroglu Bilim University ~ Istanbul ~ Turkey

As research started to differentiate Nonsuicidal Self Injury (NSSI) from suicidal behaviors and to recognize it beyond being merely a symptom of specific diagnoses or a result of trauma histories, NSSI is now seen as a distinct clinical phenomenon. In line with this changing perspective in the literature, examining NSSI by reviewing its relationship with personality organization, which offers a transdiagnostic approach, and with perceived parental attitudes that shape how individuals experience adverse events may provide more in-depth insights into understanding the functions of NSSI. For this purpose, a total of 194 participants aged between 25 and 40, reporting no history of suicide attempts, were recruited via online platforms. Data were collected using a sociodemographic information form, the EMBU (My Memories of Upbringing) scale, the Inventory of Personality Organization (IPO), and the Inventory of Statements About Self-Injury (ISAS). Hierarchical Multiple Regression Analysis revealed that both personality organization and perceived maternal overprotection significantly predicted NSSI functions, whereas perceived paternal overprotection and perceived parental rejection did not. Among the significant predictors, personality organization emerged as the strongest predictor. Findings regarding the relationship between personality organization and NSSI are expected to provide valuable insights for therapists in understanding NSSI. These insights may support the development of tailored therapeutic frameworks and enhance interventions by addressing the subdimensions of personality organization, such as primitive defenses, identity diffusion and reality testing. Additionally, the relationship between maternal overprotection and NSSI demonstrates that overprotective parenting is also associated with adverse behavioral outcomes, even though it is considered less extreme than rejective parenting. The finding also emphasizes the importance of mental health-family relationship. Supporting parents by providing psychoeducation on parenting attitudes and their impact, as part of a family-centered protective and preventive mental health initiatives, is considered to be beneficial when targeting NSSI.

Abstract 1076

THE INTERVENTION EFFECTS OF POSITIVE PSYCHODRAMA ON DEPRESSIVE SYMPTOMS IN COLLEGE STUDENTS: A RANDOMIZED CONTROLLED TRIAL

Wang Q.*[1], Xi J.[1], Guan Z.[1], Gao Y.[1], Zhang J.[2]

[1]East China Normal University ~ Shanghai ~ China, [2]Shanghai Jiao Tong University School of Medicine

Background: Depression, a pervasive mental health challenge among college students, necessitates innovative interventions that move beyond conventional paradigms. While widely used, approaches like cognitive behavioral therapy (CBT) often demonstrate modest effect sizes and a disembodied methodology. Positive psychodrama (PPD) emerges as a promising integrative, integrating the health promotion principles of positive psychology with the embodied action techniques of psychodrama. This dual-focus framework aims not only at symptom reduction but also at the cultivation of holistic well-being. This study empirically investigates and verifies the intervention effects of positive psychodrama on alleviating depressive symptoms in college students.
Methods: In this randomized controlled trial, 60 college students with depressive symptoms (PHQ-9 ≥5; 65% female, Mage = 23.58) were allocated to a two-day PPD intervention (n = 28) or a waitlist control group (n = 32). Depressive symptoms, core self-evaluations, spontaneity, and life satisfaction were assessed at baseline, post-intervention, 7-day follow-up, and 2-month follow-up.
Results: The PPD group demonstrated significant reductions in depressive severity post-intervention (Cohen's d = 1.444, p < .001), with sustained effects at 7-day (d = 0.961, p < .001) and 2-month (d = 0.746, p <. 05) follow-ups. Clinically meaningful remission (85.71%) and response rates (78.57%) were observed.
Limitations: The generalizability of the findings is constrained by the modest sample size, lack of an active control group, reliance on self-reported measures, and cultural specificity to Chinese students.
Conclusion: This study highlights PPD as a scalable and transdiagnostic intervention. By integrating trauma processing, strengths-based role-playing, and future-oriented rehearsals, PPD bridges symptom alleviation with health promotion. Future research should examine its cross-cultural applicability, underlying mechanism, and efficacy compared to existing evidence-based therapies.

Abstract 1089

EPISTEMIC INJUSTICE AND CLINICAL PHENOMENOLOGY: A CO-PRODUCTIVE APPROACH TO MENTAL DISTRESS IN UNIVERSITY STUDENTS

Chiarani M.*

Salesian University Institute ~ Venice ~ Italy

The mental health of university students has become a global priority, underscored by rising rates of psychological distress within this demographic. This transitional phase to adulthood, known as Transitional Age Youth, constitutes a critical juncture for the onset of psychopathology, and its challenges are often exacerbated by destabilizing socio-cultural factors that heighten vulnerability. Traditional nosographic approaches, primarily based on behavioral anomalies, prove insufficient to grasp the experiential core of suffering. This is particularly true for paucisymptomatic presentations linked to developmental and existential challenges, which often result in heterogeneous and inadequate diagnoses. Furthermore, monological and asymmetrical models of care can foster forms of epistemic injustice (both testimonial and agential), which undermine the young person's credibility and active participation in the therapeutic process, ultimately compromising its outcome. Overcoming such models has become an ethical, clinical, and epistemic necessity. In contrast, clinical phenomenology grounded in a Person-Centered Dialectic Approach conceives of suffering not as a discrete neurobiological or intrapsychic problem, but as the result of a defensive position-taking in the face of an "existential knot" that overwhelms the individual's resources. A co-productive approach, which values the first-person perspective and its epistemic authority, is therefore essential for understanding the individual's suffering. This process is enriched by the dialogical exchange of perspectives within the therapeutic dyad, which facilitates the overcoming of defensive closure, enables the modification of this position-taking, and fosters a therapeutic alliance founded on mutual recognition. Through the analysis of brief clinical vignettes from a university counseling service, this presentation will illustrate how such an approach unfolds in practice. Promoting collaborative care pathways, based on a phenomenological understanding of the person's way-of-being-in-the-world, not only improves clinical outcomes but also responds to a crucial ethical imperative: to enrich the scientific understanding of "mental pathology" by integrating the first-person perspective, which is too often marginalized.

Abstract 218

HOTPOT AND THE HOLDING VESSEL: CULTURAL CONTAINMENT AND SYMBOLIC HEALING IN URBAN LIFE

Shang Y.*

Pacifica Graduate Institute ~ Carpinteria ~ United States of America

This paper explores hotpot, a communal Chinese cooking practice, as a culturally grounded symbol of psychological containment and collective rejuvenation. Drawing on Hillman's notion of the "valley of the soul"—a descent into imaginal warmth and shared depth—the hotpot is framed not only as food but as a living metaphor for relational depth and symbolic containment: a low, open vessel where differences can coexist in heat, rhythm, and time.

The study is anchored in clinical theory and symbolic imagination. Insights from Bion, Winnicott, and Ogden support the view that healing unfolds in spaces capable of receiving, holding affect, and metabolizing inner states. Unlike sealed systems, hotpot enacts relational participation, where nourishment is negotiated, not owned, and time is shared, not controlled. Clinical vignettes show how images of fire, shared meals, and inward spaces emerge in dreams, signaling movement toward psychological reintegration, tonal coherence, and intersubjective resonance.

Beyond the clinical domain, this paper also considers a cross-disciplinary cultural case: West Village Basis Yard by Chinese architect Liu Jiakun, awarded the 2025 Pritzker Architecture Prize. Built in Chengdu, a city deeply affected by the 2008 Wenchuan earthquake, the courtyard echoes the hotpot's symbolic structure while remaining porous to the life of the street—a container that is both open and protective. The project's recognition reflects a growing global sensitivity to therapeutic architecture—spaces that attune to collective repair, emotional tone, and symbolic renewal.

Bringing together clinical dreamwork, cultural symbolism, and spatial design, the paper draws subtle parallels with Taoist metaphysics and alchemical traditions, where the vessel recurs as a matrix of psychological transformation. It invites a rethinking of applied psychology—not only as method, but as a field that should also hold space for depth, for warmth, and for shared meaning in times of fragmentation.

Abstract 305

CULTURAL DIFFERENCES IN EMOTION REGULATION: THE MEDIATING ROLE OF EMOTION BELIEFS

Tuna E.*[1], Chentsova Dutton Y.[2]

[1]Izmir University of Economics ~ Izmir ~ Turkey, [2]Georgetown University ~ Washington DC ~ United States of America

Previous research suggests that the frequency of using specific emotion regulation (ER) strategies varies across cultures. While individuals from East-Asian Western cultural contexts often report using expressive suppression more frequently than those from Western cultures, findings remain inconsistent for strategies such as rumination and cognitive reappraisal. On the other hand, the Turkish cultural context, which has elements of both individualistic and collectivist values, has received limited research attention in this area. The present study examined the link between culture and the use of several ER strategies (i.e., cognitive reappraisal, expressive suppression, and rumination) in American and Turkish young adults, and tested the mediating role of emotion beliefs as a potential mechanism in these associations.

The sample consisted of 716 young adults from the United States and Turkey (Mage = 20.92, SD = 2.01; 74.3% female). Participants completed online questionnaires on ER strategies and emotion beliefs. Three parallel mediation models were tested for cognitive reappraisal, expressive suppression, and rumination using the SPSS PROCESS macro, statistically controlling for gender.

Results showed that a belief in the uncontrollability of negative emotions mediated the link between culture and cognitive reappraisal, as well as the link between culture and rumination. Furthermore, believing that positive emotions are not useful mediated the association between culture and expressive suppression. However, only the total effect of culture on cognitive reappraisal was statistically significant, with participants from the Turkish sample reporting lower use of reappraisal. Findings suggest that cross-cultural differences in the use of cognitive reappraisal may be partially explained by beliefs about the controllability of negative emotions.

Abstract 37

CULTURALLY ADAPTIVE CBT FOR GLOBAL MENTAL HEALTH PRACTICE: EXPANDING PSYCHOLOGICAL FRONTIERS

Williams N.*

N.S. Williams Psychology Professional Corporation ~ Toronto ~ Canada

As applied psychology evolves, there is increasing recognition that traditional therapeutic models must be adapted to meet the diverse needs of global populations. Culturally Adaptive Cognitive Behavioural Therapy (CA-CBT) has emerged in Canada as a promising approach for addressing mental health disparities among Black populations by integrating racial identity, intergenerational trauma, and culturally relevant coping strategies into CBT. This presentation will explore how CA-CBT can inform global mental health practice, particularly in regions where Black communities and other racially marginalized groups face systemic barriers to care. By bridging cultural competence with evidence-based interventions, CA-CBT represents a new direction in applied psychology, expanding the frontiers of mental health treatment beyond Eurocentric paradigms. Research findings and clinical applications will illustrate the model's effectiveness, adaptability, and potential for implementation worldwide. This session will highlight how psychology must evolve to meet the demands of an increasingly diverse and interconnected world.

NO CARE WITHOUT INCLUSION: BARRIERS AND SOLUTIONS IN MIGRANT MENTAL HEALTH SUPPORT SYSTEMS

Wu Y., Chen S.*

National Tsing Hua University ~ Taipei ~ Taiwan

As transnational migrant workers have become a vital part of the labor force and economic system across countries, their mental health has emerged as a growing focus of global research and practice in psychology. Prior studies indicate that culture and language barriers remain one of the most significant obstacles in delivering effective mental health and social support services. This study adopted an action research design, centering on the training of bilingual interviewers within a migrant worker support initiative in Hsinchu County, Taiwan. Insights drawn from their reflections and feedback underscored the cultural and ethical complexities of interpretation, guiding recommendations for improved practice and training.

The ten interviewers who participated were primarily new immigrants, second-generation immigrants, or Taiwanese participants with English proficiency. While their backgrounds provided cultural and linguistic advantages, they encountered practical challenges such as inconsistent word choices, difficulty with technical terms, and limited sensitivity to ethical concerns. These observations reinforce that linguistic ability alone cannot ensure service quality; interpretation must also incorporate cultural mediation, professional empathy, and standardized terminology to support migrant workers' needs being communicated with accuracy and respect.

Based on these findings, the study highlights the importance of systematic training, clear ethical guidelines, and institutional recognition of interpreters as professional contributors to mental health services. These measures are essential for advancing equity and sustainability in cross-cultural support. Additional recommendations will be presented during the conference, with the aim of demonstrating how applied psychology can contribute to migrant workers' well-being and social justice across diverse contexts.

Abstract 646

GENDER DIFFERENCES IN THE RELATIONSHIP BETWEEN EMPTY SELF, FRAGMENTED SELF, AND POSTTRAUMATIC STRESS WITH COMORBID PSYCHIATRIC SYMPTOMS IN SYRIAN REFUGEES

Chung M.C.*[1], Wang N.[2], Alblooshi J.[1], Albalooshi A.[1], Banimalek N.[1], Al Ali F.[1], Nashwan A.[3]

[1]Zayed University ~ Dubai ~ United Arab Emirates, [2]Huazhong University of Science and Technology ~ Huazhong ~ China, [3]University of Sharjah ~ Sharjah ~ United Arab Emirates

Introduction: Posttraumatic stress disorder (PTSD) has been identified in Syrian refugees with prevalence rates ranging from 24% to 52% (e.g., Chung et al., 2017). According to the posttraumatic self hypothesis, trauma can reconfigure a person's inner world, distorting their self-concept and self-monitoring abilities (Wilson, 2006). However, no studies have investigated the relationships between trauma exposure, empty self, and fragmented self in the posttraumatic stress reactions of this population. Furthermore, despite the highlighted importance of examining gender differences in PTSD (Christiansen & Hansen, 2015), this aspect remains unexplored.

Purpose: This study aimed to investigate gender differences in the interrelationships between trauma exposure, empty self (subjective emptiness), and fragmented self (internal disconnection) among Syrian refugees.

Method: Four hundred and seventy-four (F=242, M=232) Syrian refugees were recruited via a humanitarian organisation in Jordan. Participants completed the Harvard Trauma Questionnaire, the General Health Questionnaire-28, the Subjective Emptiness Scale, and the Fragmented Self Inventory.

Results: Latent Profile Analysis revealed distinct gender-based profiles. For men, a three-profile model was optimal: Resilient, Minimal Distorted Self, and a group with Minimal Emptiness but High Fragmentation. The latter group reported the most severe PTSD and comorbid symptoms. For women, a four-profile model emerged, which included an additional profile for Fragmented individuals only. Women in both the Minimal Emptiness/High Fragmentation and the Fragmented-only profiles exhibited the highest levels of distress, reporting greater PTSD and comorbid symptoms than other profiles.

Conclusions: This study concludes that significant gender differences exist in trauma manifestation. The most distressed men were those experiencing high internal disconnection with little emptiness. In contrast, the most distressed women were those experiencing internal disconnection, irrespective of their level of emptiness. These findings underscore that profound psychological vulnerability can persist over a decade post-trauma and that internal self-fragmentation is a key factor, with its impact varying by gender.

Abstract 1039

EXPLORING THE IMPACT OF MENTALIZATION-BASED PSYCHOEDUCATION ON HOSTILE ATTRIBUTIONS

Fortin R.*, Gagnon J.

Université de Montréal ~ Montréal ~ Canada

Hostile attribution bias (HAB) is a well-documented cognitive tendency to perceive ambiguous social cues as hostile, contributing to aggressive behaviors and poor interpersonal outcomes. Mentalization-Based Therapy (MBT) seeks to enhance the capacity to reflect on one's own and others' mental states. Its psychoeducational module appears promising for individuals whose cognitive biases impair their ability to accurately infer intentions. Recent work suggests that this module may attenuate HAB among incarcerated women. However, their findings were limited by a small sample and reliance on qualitative data.

The present study builds on this foundation by implementing a six-session psychoeducational module of MBT in a Quebec detention facility for incarcerated women. Participants (n = 14) attended three days of structured workshops and completed pre- and post-intervention assessments, including self-reported questionnaires and a neurocognitive task. Questionnaires measured hostile attributions (Ambiguous Intentions and Hostility Questionnaire), hostile versus benign interpretations (Word Sentence Association Paradigm–Hostility), and mentalization ability (Mentalization Scale). The Hostile Expectancy Violation Task (HEVT) assesses neural responses to ambiguous social scenarios by measuring the N400, an event-related potential that emerges when revealed intentions contradict initial expectations. This paradigm offers a valid, real-time measure of HAB that is independent of conscious control, reducing susceptibility to response biases and capturing the spontaneous processes underlying attributional tendencies.

Our presentation will discuss the feasibility and potential impact of short-term psychoeducational MBT modules in correctional settings, emphasizing the integration of self-reported and neurocognitive outcomes. This design allowed us to assess both subjective and objective indicators of change in hostile attribution tendencies and mentalization. ERP measures provide novel insights into whether such changes are reflected in neural responses to ambiguous social scenarios. By advancing beyond qualitative accounts, this research contributes to the development of scalable, evidence-based strategies aimed at reducing aggression-related biases and supporting rehabilitation efforts in correctional populations.

Abstract 1124

EFFICACY OF THE COMBINED TREATMENT WITH TRANSCRANIAL DIRECT CURRENT STIMULATION AND MINDFULNESS TRAINING FOR THE TREATMENT OF CHRONIC STRESS

Yang Q.*, Liang W., Li M., Liu B.

Airforce Military Medical University ~ Xi'an ~ China

Abstract

Background: The combined utilization of transcranial direct current stimulation (tDCS) and mindfulness training has the potential to yield more favorable outcomes in addressing mental health issues, yet its efficacy for chronic stress treatment is unclear. The present study aims to examine the effect of this combination on stress symptoms and accompanying anxiety, depression, and sleep disturbances in individuals with chronic stress.

Methods: 109 participants with chronic stress were randomly assigned to four groups: sham, tDCS, mindfulness, and combination groups. All groups received a 6-day intervention, with one 20-minute session per day. The primary outcome was the change in participants' stress symptoms at baseline, post-test, one-week follow-up, and one-month follow-up. The secondary outcome was the assessment of anxiety, depression, and sleep disturbances, as well as the occurrence of adverse events.

Results: The results indicated that the combination group had significantly lower PSS-14 scores compared to the other three groups at post-test, 1-week follow-up, and 1-month follow-up ($p < 0.001$). The combination group had significantly lower GAD-7 and PHQ-9 scores compared to the sham group at post-test ($p = 0.011$, $p = 0.001$), 1-week follow-up ($p = 0.013$, $p < 0.001$), and 1-month follow-up ($p = 0.003$, $p < 0.001$). The combination group also had significantly lower PSQI scores compared to the sham group at 1-month follow-up ($p = 0.004$).

Conclusions: The combination of tDCS and mindfulness training could improve symptoms of stress, anxiety, depression, and sleep disturbances in individuals with chronic stress, and its improvement effect and duration of effect are better than those of monotherapy.

Abstract 573

REHABILITATION EFFICACY: THE INTERPLAY OF HUMOR, EMOTIONAL REGULATION AND RECOVERY OUTCOMES

Bhatia N.*[1], Banerjee B.[2], Suhruth A.[3], Bedi R.P.[4], Choubisa R.[1]

[1]Birla Institute of Technology and Science, Pilani ~ Pilani ~ India, [2]Birla Institute of Technology and Science, Pilani ~ Hyderabad ~ India, [3]Birla Institute of Technology and Science, Pilani ~ Goa ~ India, [4]University of British Columbia ~ Vancouver ~ Canada

This study examines the complex interplay between maladaptive personality traits, coping with humor, emotional regulation, and recovery outcomes among a sample of individuals seeking psychological support. When it comes to assessment, specialized inventories capture maladaptive personality traits and directly or indirectly predict recovery outcomes through maladaptive humor and emotional regulation. On the contrary, adaptive humor and effective emotional regulation strategies ideally buffer these negative effects, therefore enhancing recovery outcomes. To quantitatively validate this idea, we took a sample of n=152 respondents from a few rehabilitation centers from the NCR region. We measured PID-5 trait domains, coping with humor, and emotional regulation strategies (reappraisal, suppression, acceptance) using standardized tools. Recovery outcomes were operationalized through measures of empowerment, self-esteem, symptom management, and social reintegration. We analyzed the hypothesized relationships and tested the model through a structural modeling approach. Our results highlight the critical role of coping with humor and emotional regulation in rehabilitation success when assessing the pathway between maladaptive traits and recovery outcomes. Our findings underscore the importance of assessing implied mechanisms in addition to the explicit mechanisms to better understand the dynamics of the recovery process. Our research has direct implications for therapeutic approaches and practices that augment overall rehabilitation efficacy.

Abstract 2546

HOW ACCURATELY ARE PSYCHOLOGISTS AND PSYCHIATRISTS ABLE TO IDENTIFY DISSOCIATIVE SYMPTOMS AND DISORDERS?

Hamer R.*, Nedeljkovic M., Mackelprang J.

Swinburne University of Technology ~ Melbourne ~ Australia

Introduction: Dissociation is a common symptom across various mental health conditions, including borderline personality disorder, posttraumatic stress disorder, and panic disorder, with a prevalence of approximately 10% in inpatient and outpatient settings. Despite its prevalence, dissociative symptoms often go unidentified and dissociative disorders are often underdiagnosed. This gap in identification has important implications for clients' treatment outcomes and quality of life—if dissociation is not identified, appropriate treatment is unlikely to be offered. Prior research has demonstrated that one significant contributing factor to this issue is mental health professionals' lack of knowledge and clinical skills to address dissociation, in part due to insufficient training. Purpose: Given the clinical importance of correctly identifying dissociative symptoms and disorders, the aim of this cross-sectional study was to investigate psychologists' and psychiatrists' accuracy in identifying dissociative symptoms and disorders and to examine the influence of confidence and training on diagnostic accuracy. Methods: Sixty-nine fully registered psychologists (n = 59) and psychiatrists (n = 10) completed an anonymous online survey that presented participants with two expert-designed clinical vignettes to assess applied diagnostic knowledge. The survey also queried clinicians' self-reported confidence and prior training on dissociation. Results: Analyses revealed that only 50% of clinicians accurately identified all symptoms of dissociation from a clinical vignette (Vignette 1), and only 28% clinicians accurately diagnosed dissociative identity disorder (Vignette 2). Conclusion: These findings highlight the lack of knowledge about dissociative symptoms and disorders among psychologists and psychiatrists and underscore the potentially critical need for training to enhance clinicians' ability to detect them accurately. Integrating dissociation-focused education into formal training pathways and professional development may be critical to reducing misdiagnosis and improving client outcomes.

Abstract 536

THERAPEUTIC MICRO-MOMENTS AND THE DROPOUT PARADOX: A PRELIMINARY ANALYSIS OF WITHIN-SESSION CHANGE PATTERNS IN PSYCHOTHERAPY PROCESS RESEARCH

Gülüm I.V.*, Gözde I., Dilekler Aldemir I., Karanci A.N.

TOBB University of Economics & Technology ~ Ankara ~ Turkey

Background: Traditional psychotherapy outcome research focuses on between-session changes, overlooking critical within-session micro-changes that may predict treatment outcomes and dropout patterns. Recent process research suggests that micro-moments of change within sessions may be more predictive of therapeutic improvement than previously recognized.

Objective: To investigate within-session micro-changes in client shame and identify patterns that differentiate between therapeutic improvement dropout and problematic dropout in psychotherapy.

Methods: We analyzed 98 psychotherapy cases from a university training clinic, examining within-session changes in client shame (pre-post session differences) across up to 39 sessions. State shame was assessed at the beginning and end of each session using a single-item 7-point Likert scale (1 = not at all, 7 = extremely). Using change point analysis and risk prediction modeling, we developed a two-type dropout classification system distinguishing therapeutic improvement dropout from true dropout.

Results: Critical micro-change moments occurred most frequently in session 4 (24 instances), followed by sessions 3, 2, and 1. Paradoxically, dropout clients showed significantly stronger within-session improvement (M = -0.464) compared to treatment completers (M = -0.047), $t(62) = -2.25$, $p = .049$, $d = 0.89$. Two distinct dropout patterns emerged: therapeutic improvement dropout (33.3% of analyzable dropouts) characterized by rapid improvement and early goal achievement, and stagnant process dropout (33.3% of analyzable dropouts) characterized by minimal change despite adequate therapeutic process.

Conclusions: Early-session micro-moments of shame reduction appear to be important indicators of therapeutic progress and may paradoxically signal risk for premature dropout. These findings should be interpreted cautiously due to the use of a single-item shame measure and the small dropout subsample. Replication with validated multi-item measures and larger samples is warranted.

Abstract 341

MINDFULNESS-BASED ART THERAPY WITH HOSPITALIZED DEPRESSED INDIVIDUALS – THE TEMPORAL ORDER OF CHANGE IN MINDFULNESS, RUMINATION, AND AFFECT.

Stanko--Kaczmarek M.*[2], Jankowski T.[1], Bartel R.[3], Stankowska M.[4], Andrzejewska M.[4], Rybakowski F.[4], Kaczmarek L.[2], Rybakowski J.[5]

[1]Institute of Psychology, The John Paul II Catholic University of Lublin ~ Lublin ~ Poland, [2]The Faculty of Psychology and Cognitive Science, Adam Mickiewicz University ~ Poznan ~ Poland, [3]Department of Sculpture and Spatial Activities, Poznan University of Arts ~ Poznan ~ Poland, [4]Department of Adult Psychiatry, Poznan University of Medical Sciences ~ Poznan ~ Poland, [5]Department of Adult Psychiatry, Department of Psychiatric Nursing, Poznan University of Medical Sciences ~ Poznan ~ Poland

Introduction:
Mindfulness-Based Art Therapy (MBAT) is an integrative intervention that combines mindfulness training with creative expression. While MBAT has shown efficacy in reducing depressive symptoms, little is known about the temporal sequence of psychological changes during therapy. Understanding the order in which changes occur may improve intervention planning and personalization.

Purpose:
This study aimed to explore session-to-session changes in mindfulness, rumination, and affect among hospitalized patients with depressive disorders participating in MBAT. We investigated whether mindfulness precedes changes in cognitive and emotional processes during therapy.

Method:
Forty-seven inpatients diagnosed with major depressive disorder or bipolar depression took part in twice-weekly MBAT sessions over several weeks. Each session included mindfulness meditation, mindful art-making, and group reflection. Participants completed self-report diary assessments of mindfulness, rumination, and affect twice weekly. Multilevel and autoregressive modeling was used to analyze within-person temporal dynamics.

Results:
Participants demonstrated increased mindfulness and positive affect, and decreased rumination and negative affect over time. However, session-to-session changes in mindfulness did not predict subsequent changes in rumination or affect. Instead, more frequent home mindfulness practice was associated with reduced rumination, while engagement in art activities was linked to improved affect. Temporal effects appeared to oscillate, with greater variability among participants with shorter therapy durations.

Conclusions:
These findings highlight distinct roles for mindfulness and art components in MBAT: mindfulness may target cognitive patterns such as rumination, while art activities enhance emotional regulation. The absence of lagged effects suggests that changes may not follow a simple linear progression. Future studies should examine how session structure and timing influence outcomes and incorporate control groups to better isolate treatment-specific effects.

WHICH BATTERING INTERVENTIONS WORK: AN UPDATED META-ANALYSIS OF DOMESTIC VIOLENCE TREATMENT OUTCOME STUDY RESEARCH

Babcock J.*[1], Gallagher M.[1], Godfrey A.[2], Richardson A.[3], Reeves V.[4]

[1]University of Houston ~ Houston ~ United States of America, [2]Neurobehavioral Center for Growth ~ Bountiful ~ Uruguay, [3]Star Strong ~ San Antonio ~ United States of America, [4]San Antonio Veterans Administration ~ San Antonio ~ United States of America

This meta-analytic review is an update to the first meta-analysis of battering interventions (Babcock et al., 2004) and includes 59 studies that evaluated treatment efficacy for domestically violent men and women. The outcome literature of controlled quasi-experimental and experimental studies was reviewed to test the relative impact of Duluth, cognitive-behavioral therapy (CBT), and novel types of treatment on subsequent recidivism of violence. The first model examines studies comparing interventions to no treatment control conditions. The second model compares novel interventions to treatment as usual (i.e., the Duluth curriculum). Study design and type of treatment were tested as moderators in both models. Consistent with previous meta-analyses, effect sizes were in the small range, smaller in true experiments as compared to quasi-experimental designs when recidivism was based on partner or police reports. However, new experiments comparing novel treatments to the Duluth curriculum reveal effect sizes comparable to when comparing novel interventions to an untreated comparison group. Novel interventions, including Acceptance and Commitment Therapy and Circles of Peace had the largest effect sizes when put head-to-head with Duluth control groups. Future research directions include testing moderators and mechanisms of change of the battering interventions that work. Implications for evidence-based practice in criminal justice include broader implementation and continued testing of these novel interventions with demonstrated efficacy in stopping intimate partner violence.

Abstract 1181

ARE RELATIONSHIP- AND PARTNER-FOCUSED SYMPTOMS A SUBTYPE OF OBSESSIVE-COMPULSIVE DISORDER? A NETWORK ANALYSIS

Koç Ö., Erol Y.*, Toroslu B., Soysal D.E.

Baskent University ~ Ankara ~ Turkey

Relationship- and partner-focused obsessive-compulsive symptoms (ROCD) are defined as obsessive-compulsive symptoms (OCD) that occur within close relationships. Although these symptoms have been suggested as a distinct OCD subtype, there are ongoing discussions about whether they represent genuine obsessions or merely worry and rumination.

To address this, the present study examined conditional dependencies and probabilities among ROCD and general OCD sub-dimensions using network analytic approaches with 1701 non-clinical participants recruited via convenience sampling; therefore, findings were interpreted at the symptom level. Gaussian Graphical Models (GGM) and Bayesian networks (BN) were estimated to investigate unique associations between symptoms. Results indicated that, in both the GGM and BN models, “obsessions” might function as a bridge symptom. ROCD symptoms appeared to form one network community, while general OCD symptoms formed a separate community; the BN further suggested that these communities could be linked via obsessions and doubts about the partner’s love, a pattern consistent with the GGM model.

Notably, doubts about a partner’s love constitute the only ROCD subdimension directed toward another person’s inner state, whereas the other subdimensions primarily center on one’s own emotions and cognitions about the relationship or the partner. This other-focused quality, especially when considered alongside risk factors such as fear of abandonment and partner-contingent self-worth, may explain why these doubts uniquely bridged ROCD with “obsessions” subdimension of general OCD. Findings also indicate that ROCD and OCD may not be entirely independent constructs, with doubts about the partner’s love exhibiting a more obsessive quality. According to the psychological network theory, clinical applications targeting these doubts could alleviate ROCD symptoms, highlighting a potential focus for clinical interventions. Future research should investigate these networks in clinical populations, track longitudinal changes, and test whether interventions targeting bridge symptoms produce broader symptom reduction in both ROCD and general OCD.

Abstract 1157

THE EFFICACY OF COGNITIVE-BEHAVIORAL THERAPY (CBT) AND ACCEPTANCE AND COMMITMENT THERAPY (ACT) IN MITIGATING THE EFFECTS OF EMOTIONAL ABUSE AMONG TURKISH WOMEN: AN EXPERIMENTAL DESIGN STUDY

Mor G.*, Cihan H.

Ankara Yildirim Beyazit University, Social Sciences Institute ~ Ankara ~ Turkey

This study developed and implemented a Cognitive-Behavioral Therapy (CBT) and Acceptance and Commitment Therapy (ACT)-based intervention program to enhance the well-being of Turkish women exposed to emotional abuse.The intervention was designed to reduce emotional abuse (perpetration and victimization) and perceived stress while improving emotion regulation and psychological well-being. A pilot study (N = 24) was conducted to refine the program content, structure, and assessment procedures. The main randomized controlled trial (N= 60) assigned participants to either an intervention or waitlist control group. The nine-week program combined CBT strategies with ACT methods. Standardized measures—the Cognitive Emotion Regulation Questionnaire (CERQ), Multidimensional Measure of Emotional Abuse (MMEA), PERMA Well-Being Scale, and Perceived Stress Scale (PSS)—were administered at baseline, post-test, and two-month follow-up. The intervention group demonstrated statistically significant improvements in adaptive emotion regulation and psychological well-being, alongside reductions in perceived stress and both emotional abuse perpetration and victimization compared with the control group. Most effects were maintained at follow-up. Limitations include the use of a small, homogeneous sample of married Turkish women, reliance on self-report data, a short follow-up period, and the absence of partner or clinician-reported assessments. Clinically, the
findings highlight the potential of a structured, low-cost, and trauma-informed CBT–ACT program to enhance emotional recovery, resilience, and relational health in women affected by emotional
abuse. The approach is applicable in both clinical and community settings and holds promise for integration into prevention as well as treatment frameworks.

Abstract 1178

SPECIFIC AND COMMON COGNITIVE VULNERABILITIES IN RELATIONSHIP AND PARTNER-FOCUSED OBSESSIVE-COMPULSIVE SYMPTOMS: SUBDIMENSIONS OF INTOLERANCE OF UNCERTAINTY AND PERFECTIONISM

Toroslu B.*

Baskent University ~ Ankara ~ Turkey

Relationship and partner-focused obsessive–compulsive symptoms (ROCD) represent an emerging field in clinical psychology, referring to intrusive doubts and preoccupations concerning one's romantic relationship (r-OCD) or perceived attributes of one's partner (p-OCD). Previous findings suggest that cognitive vulnerabilities such as perfectionism (PERF) and intolerance of uncertainty (IU) contribute to the onset and persistence of these symptoms. However, research often examines r-OCD and p-OCD together or focuses on only one dimension. Despite evidence that these symptom clusters may differ in their underlying risk factors, studies clarifying which cognitive factors are specific to r-OCD and which to p-OCD remain limited. To address this gap, the present study investigated which subdimensions of IU and PERF are most strongly associated with r-OCD and p-OCD, and in what ways they diverge.

The non-clinical sample comprised 290 individuals from Turkey (aged 18–58) who were in a romantic relationship. Data were collected through convenience sampling, and the study employed a cross-sectional design. Multivariate General Linear Modeling (GLM) was used to examine which IU and PERF subdimensions predicted the two ROCD dimensions. Results indicated that doubts about actions (PERF) predicted both r-OCD and p-OCD symptoms. However, IU subdimensions showed differentiation: r-OCD was predicted by perceiving uncertainty as stressful and by negative self-appraisals about uncertainty, whereas p-OCD was predicted by perceiving uncertainty as an obstacle to action.

Findings highlight distinct cognitive risk factors for r-OCD and p-OCD. r-OCD appears more closely linked to uncertainty about emotions and relationship evaluation, while p-OCD is tied to decision-making and behavioral inhibition under uncertainty. Clinically, these results emphasize the need to tailor interventions accordingly. Addressing anxiety and negative appraisals of uncertainty may be particularly useful in r-OCD, while strengthening tolerance for indecision and action-related difficulties may benefit p-OCD. Perfectionistic doubts about actions also represent a shared therapeutic target to alleviate ROCD symptoms.

Abstract 2152

NARRATIVES OF INTIMATE PARTNER VIOLENCE AND THE JOURNEY BACK TO SELF

Tiwari P.*

Department of Psychology, University of Delhi ~ New Delhi ~ India

This research paper presents a comprehensive qualitative study on the process of meaning-making and post-traumatic growth (PTG) among 11 Indian survivors of gaslighting and mental abuse in intimate partner relationships. Gaslighting is a profound form of psychological manipulation that systematically undermines a victim's perception of reality, leading to profound confusion, self-doubt, and a fractured sense of identity. While the traumatic nature of such abuse can shatter a person's core beliefs and worldview, this study posits that the active process of making sense of the experience is crucial for healing and recovery. Through narrative interviews, this research sought to illuminate the complex journey survivors undertake from the depths of self-blame to a state of transformative growth. The findings contribute significantly to the existing literature on this under-researched topic, particularly within the sociocultural context of India.

The thematic narrative analysis of the participants' stories revealed a nuanced progression from the initial stages of abuse to a final state of reconciliation and growth, captured in distinct themes involving a fundamental reconstruction of their worldview and a redefinition of the relationship as abusive, a necessary step for regaining a sense of personal agency. PTG in this context is not merely a return to a pre-trauma state but a dynamic and gradual change that leads to a deeper understanding of one's inherent worth and a more resilient outlook on life.

The findings have significant implications for therapeutic interventions, suggesting a need for trauma-centered psychotherapy that specifically supports the narrative meaning-making process. By helping survivors reconstruct their experiences, therapists can facilitate healing and contribute to their long-term growth and well-being.

Abstract 683

EMOTIONAL INTIMATE PARTNER VIOLENCE: THE ROLE OF DARK TRIAD AND BASIC PSYCHOLOGICAL NEED SATISFACTION AND FRUSTRATION

Karaca Ö., Tuna E.*

Izmir University of Economics ~ Izmir ~ Turkey

Emotional intimate partner violence (IPV) refers to behaviors such as controlling, isolating, and punishing the partner using fear, humiliation, and manipulation. Emotional IPV affects both men and women worldwide and poses serious risks to well-being. The Dark Triad personality traits (narcissism, psychopathy, Machiavellianism) may increase the likelihood of perpetrating emotional IPV in a relationship. Moreover, the satisfaction and frustration of the basic psychological needs —autonomy, relatedness, and competence — may also play a role in IPV perpetration. The present study investigated the effects of dark triad traits and basic psychological need satisfaction and frustration on emotional IPV perpetration. 382 Turkish adults (M= 41.05, SD= 10.63, 208 female) who were in a romantic relationship for over one month participated in the study. Participants completed online self-report questionnaires, including the Short Dark Triad Scale, the Multidimensional Measure of Emotional Abuse, and the Basic Psychological Need Satisfaction and Frustration Scale. Two hierarchical multiple regression analyses were conducted, predicting emotional IPV perpetration from the dark triad traits and the dimensions of basic psychological need satisfaction and frustration, statistically controlling for age and gender. Results of the first model revealed that higher levels of psychopathy and frustration of the need for autonomy predicted higher levels of emotional IPV perpetration. In the second model, psychopathy predicted IPV perpetration, whereas psychological need satisfaction dimensions did not. Across both models, being male and older were associated with greater IPV perpetration. Overall, the findings suggest that emotional IPV may be influenced by both the perpetrator's personality traits and the level of frustration of their basic psychological needs. Addressing these factors may contribute to reducing the risk of emotional IPV.

MULTI-ELEMENT BEHAVIOR SUPPORT (MEBS): BUILDING CULTURES OF COMPASSION AND COMPETENCE

Dotson L.*

IABA Research and Education Foundation ~ San Diego ~ United States of America

Multi-Element Behavior Support (MEBS) provides a comprehensive and compassionate approach to supporting individuals with complex behavioral needs. More than a clinical methodology, MEBS serves as an organizational framework grounded in non-linear applied behavior analysis and humanism. It integrates proactive and respectful strategies—ecological adjustments, skills teaching, preventative strategies, and non-aversive reactive techniques—to ensure individuals are supported in pursuing meaningful, connected lives.

This presentation explores MEBS as both a clinical and systemic model for promoting dignity, safety, autonomy, and personal growth. Drawing from real-world case studies and cross-sector implementations, we will examine how MEBS fosters inclusion, reduces restrictive practices, and enhances quality of life across disability, education, and health settings.

We will also discuss how leadership can embed MEBS into organizational culture through values-based supervision, workforce development, and continuous quality improvement. Participants will leave with practical tools for aligning organizational systems with MEBS principles, supporting staff competency, and advancing person-centered outcomes.

Ultimately, MEBS is not simply a tool for behavior support—it is a framework for creating the conditions and supports necessary for a life well lived.

Abstract 2016

REFLECTIVE MENTORSHIP AS A FRAMEWORK IN GROUP CLINICAL SUPERVISION

Alianan Jr A.*, Rodriguez G., Macuha M.

Ateneo de Manila University ~ Quezon City ~ Philippines

Literature on the training and supervision of future mental health professionals in the context of the global south and Southeast Asia is limited (Gojar, 2025). Even less studied are group supervision sessions in this context, despite the modality potentially maximizing existing resources (Endale et al., 2020). Given the potentially threatening notion of clinical supervision, using reflective mentorship (SA Health, 2023) as a basic framework is utilized in fostering the development of graduate students in counseling psychology who are providing brief teleconsult interventions for free. Using conversation analysis, this study aims to expound on the interactions among two mentors who alternately lead their three trainees through 11 mentorship sessions. The analysis reveals a shift in responsibility from mentors to trainees in taking hold of their own development as practitioners. The evolving and fluid power dynamics and the emergence of reflective practice of the trainees enabled them to gain better confidence in responding to various client concerns. Limitations of the study, future directions, and recommendations are also discussed.

Abstract 1948

TRANSLATING RESEARCH INTO CLINICAL PRACTICE: IMPLEMENTING THE PARENTS UNDER PRESSURE PROGRAM TO SUPPORT FAMILIES WITH COMPLEX NEEDS IN CHILD PROTECTION

Dawe S.*, Harnett P.

Griffith University ~ Brisbane ~ Australia

Background: Improving family functioning and child outcomes in families with multiple and intersecting problems—such as parental substance misuse, mental health difficulties, financial stress, and parental histories of childhood maltreatment—is essential to breaking intergenerational cycles of adversity. The Parents under Pressure (PuP) program is an evidence-based intervention that addresses these complex needs through a strengths-based, trauma-informed framework grounded in developmental psychopathology and attachment theory. While the program has demonstrated effectiveness in clinical trials, translating evidence into sustainable practice across child protection and family support systems presents considerable challenges.

Method: In response, the PuP program developers have drawn on Proctor's Implementation Model to design a structured training and implementation process, ensuring practitioners from diverse disciplines can deliver the program with fidelity. Dissemination required the development of an integrated theoretical framework to scaffold practice, alongside flexibility to tailor family support plans.

Results: Over 400 agencies worldwide have now been trained in the PuP program. Implementation experience demonstrates the importance of strong practitioner training, supervision, and organisational support to address barriers such as workforce turnover and engagement difficulties with highly vulnerable families. The journey of implementation will be illustrated through two case examples: (i) training in a nongovernment organsation across 4 sites in Syria, and (ii) integration into services in the Republic of Ireland. Outcomes are described at organisational, practitioner, and family levels, highlighting improvements in practitioner confidence, family engagement, and child wellbeing.

Conclusions: Dissemination of evidence-based practice in child protection requires more than proof of efficacy. Success depends on developing a coherent framework of practice, embedding flexible but clearly articulated program components, and aligning training, supervision, and policy supports. The PuP program illustrates how implementation science principles can overcome dissemination challenges, sustain fidelity, and ensure that families with complex needs benefit from interventions capable of transforming long-term trajectories.

Introduction: Substance use disorder (SUD) is one of the most common mental disorders. Individuals with an acquired brain injury (ABI) are at increased risk of SUD, which reduces rehabilitation engagement and increases risk of subsequent brain injuries (e.g., from a fall). Effective interventions for ABI and SUD exist in isolation, but are inaccessible to individuals with both.

Purpose: Co-design a SUD intervention optimised for people with ABI.

Method: We used co-design methods and user-centred design principles. Six people with lived experience of substance use in ABI participated in two co-design rounds. In round one, a needs analysis was used to develop a shared understanding of the experiences and challenges faced by people with ABI seeking substance use treatment and consider ways to optimise delivery. The Project Advisory Group reviewed these findings and provided further feedback for intervention refinement. An optimised intervention was drafted and shared with the consumers in a second round of co-design to gauge the intervention's appropriateness and feasibility.

Results: The co-design team comprised six consumers with lived experience of ABI (ABI=5; family member=1) and substance use (methamphetamine=3, alcohol=2,

cannabis=1). Needs analysis priorities identified were: 1) better-equipped care to support individuals with ABI+SUD (e.g., in-home); 2) treatment tailored to each individual's needs; 3) holistic treatment inclusive of one's environment, community, and broader goals; 4) meaningful, personalised support person involvement. Priorities highlighted during the draft intervention 'walk-through': 1) tailoring information presentation to individual needs (e.g., visual, paper-based/digital, shared with support person); 2) inclusion of consumer-generated materials (e.g., testimonials, completed worksheets); 3) flexible content pacing (e.g., more/less time on psychoeducation).

Conclusions: Engaging consumers with lived experience in co-design is recommended to ensure meaningful and clinically feasible psychosocial intervention development. Future research will evaluate the acceptability, feasibility, and efficacy of the co-designed SUD intervention optimised for individuals with ABI.

Abstract 1370

PRIMARY CARE PSYCHOLOGY: THE EXPERIENCE OF THE CAMPANIA REGION

Zunno R.*[1], Cozzuto A.[2], Cioffi P.[1], Schinardi E.[1], Grandinetti A.[2]

[1]ASL Salerno ~ Salerno ~ Italy, [2]Order of Psychologists of the Campania Region ~ Campania ~ Italy

Introduction

Pyschological disorders are often characterized by psychosomatic symptoms such as muscle tension, headache, insomnia, gastro-intestinal pain, asthenia, arrhythmias or tachycardia. However, many patients do not recognize the psychological origin of these disorders, focusing their concerns exclusively on physical symptoms. These symptoms cause significant distress and interference regarding quality of life (QoL) in those who experience them.

Purpose

This study proposes a multidisciplinary approach that involves psychological counseling, and integration with general practioner, in order to manage psychosomatic symptoms. With the Regional Law of 3 August 2020, Campania is the first Italian Region to have established a Primary Care Psychology service, named “Psicologia di base”, in local health companies (ASL Salerno) with the aim of supporting and integrating the action of general practitioners and paediatricians in intercepting and responding to unexpressed psychological needs, as well as, health promotion and disease prevention.

Method

After excluding organic issues, general practioner suggested a primary care psychology counseling for patients with psychosomatic symptoms to evaluate the presence of anxiety-depressive disorders. Depression Anxiety Stress Scales – Short Form (DASS-21) were administered to 7 adult patients, at baseline (T0) and six months later first access to the Primay Care Psychology service (T1).

Results

The results show that patients with acute psychosomatic symptoms, who promptly adhered to both their general practitioner’s counseling, psychological ones have shown significant remission of psychosomatics symptoms. Instead, those who refused the psychological counseling, a worsening was found in the initial psychosomatics which evolved in depressive and anxious symptoms, and consequently, worse QoL.

Conclusions

This study suggests the importance of a multidisciplinary approach to improve the QoL of patients and decrease psychosomatic symptoms and psychological distress. In particular, Primary Care Psychology have proven to be effective at the beginning of psychosomatic symptoms, reducing the risk of evolving into depressive and anxious symptoms.

Abstract 2526

VALIDATION OF THE ITALIAN VERSION OF AULA ATTENTION KIDS: A VIRTUAL REALITY TOOL FOR ASSESSING ATTENTION AND INHIBITORY CONTROL IN CHILDREN AND ADOLESCENTS

Chicchi Giglioli I.A.*[2], Rebón--Ortiz F.[2], Busdraghi C.[1]

[1]Giunti Psychometrics ~ Florence ~ Italy, [2]Nesplora ~ Madrid ~ Spain

Introduction

Assessing attentional functioning in children and adolescents is crucial in both research and applied settings. Traditional tools, while standardized, often lack ecological validity and may not adequately capture attentional performance in naturalistic situations. Virtual reality (VR)-based instruments, such as AULA Attention Kids, offer a promising alternative by simulating real classroom dynamics to assess sustained attention, inhibitory control, and processing speed. While validated in the Spanish context, an Italian version of AULA has not yet been standardized.

Purpose

This study aims to validate the Italian version of AULA Attention Kids in a sample of typically developing children and adolescents, providing preliminary psychometric evidence and laying the foundation for establishing Italian normative data.

Method

A total of 160 children aged 6 to 16 were recruited from schools and clinical sites across northern, central, and southern Italy. All participants were assessed under standardized conditions with AULA Attention Kids. Analyses are focused on reliability, developmental trends, and the general feasibility of administration across age groups.

Results

Preliminary findings indicate that AULA Attention Kids is well accepted by children and feasible to administer within both research and school contexts. Early analyses suggest adequate reliability and developmental differences consistent with attentional maturation, although full analyses are still ongoing.

Conclusions

These preliminary results support the feasibility and ecological validity of the Italian version of AULA Attention Kids for assessing attention and inhibitory control. Further analyses will establish normative reference values and provide more robust psychometric evidence, paving the way for its clinical and educational application in Italy.

Abstract 2699

UNIVERSITY-BASED APPROACH TO MENTAL HEALTH SERVICES IN THE COMMUNITY

Grinko N.*

Ukrainian Catholic University ~ Lviv ~ Ukraine

Amid Russia's full-scale invasion, the Ukrainian people are facing pressing mental health needs. A January 2024 survey found that 77 per cent of Ukrainians reported stress or severe nervousness recently (Gradus, 2024). The World Health Organisation estimates that 22 per cent of individuals impacted by conflict experience a mental health disorder (Charlson et al. The Lancet 2019; 394 10194). The current system relies on inpatient psychiatric hospitals with limited community-level access points. Another major shift is the expansion of community mental health multidisciplinary mobile teams that treat severe to moderate disorders at the community level. There is also a market for private mental health practices.

A holistic approach is essential to address these challenges. A well-trained and competent mental health workforce, providing care at multiple levels, is essential for delivering effective services that enable Ukrainians to fully recover and participate in social and economic growth. The role of the Ukrainian Catholic University extends beyond academics, aiming to serve the people of Ukraine by equipping the new generation with the skills to meet modern challenges, particularly in post-war reconstruction and development. UCU's commitment to health initiatives is reflected in various degree programs and non-degree initiatives. In addition to training, UCU Faculty of Health Sciences provides mental health services to the university and city community. Our interest is in developing and implementing a model of interdisciplinary training on mental health. At our faculty, this model could be applied to the education of students in physical therapy, occupational therapy, psychology, and social work. Over the past few years, significant progress has been made at the legislative level in Ukraine to implement the concept of interdisciplinarity in practice, both within the education system and in community services. The next step - to make this strategic approach an achievement for university interdisciplinary education as well.

Abstract 2727

NATURE-BASED APPROACHES TO DEPRESSION AND MENTAL WELLBEING

Owens M.*, Bunce H.

University of Exeter ~ Exeter ~ United Kingdom

Mental health difficulties, including depression, are highly prevalent and associated with high levels of disability worldwide. The associated economic costs are large, approximately GBP 118 billion per year in the UK alone. Unfortunately, the majority of individuals in need of treatment receive none and traditional treatment approaches to mental health alone may be insufficient. Novel approaches to improving mental wellbeing include increasing contact and connection to natural environments, and the extant evidence suggests that nature-based approaches may reduce stress and improve mood and mental wellbeing. Our UK-based research group (Research grOup for Wellbeing and Nature; ROWAN; rowantree.uk) has carried out a number of research studies investigating the link between natural environments and wellbeing, including studies on nature-based interventions (NBI). We are developing a short self-guided NBI (Roots and Shoots©), which in pilot work has shown to be feasible and acceptable to participants. Furthermore, in a pilot randomised controlled trial, we have demonstrated that the Roots and Shoots intervention is likely to be effective in improving mental wellbeing in those with poor mental wellbeing. Future research is planned to investigate the efficacy of this novel NBI in a larger, fully powered clinical trial. In addition, we are testing a guided 8-week version of the intervention (Roots and Shoots Plus ©), designed for individuals with mental health difficulties. This iteration is comprised of both self-led activities and facilitator-led group psycho-social elements in nature. Preliminary findings on these novel approaches will be presented and future directions will be discussed.

Abstract 4541

THE DEVELOPMENT OF PSYCHOLOGICAL CRISIS HOTLINE AMIDST THE WAR IN UKRAINE

Palii V.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction: Following the full-scale Russian military invasion, Ukrainian psychologists organized systematic crisis care for individuals and communities experiencing extreme acute trauma, distress, and psychological disorientation. According to the Mental Health Coordination Center under the Cabinet of Ministers of Ukraine (2022), at least 50% of the population will require mental health support of varying intensity. In response, the National Psychological Association, with international partners, launched a psychological support hotline providing crisis psychological and psychiatric consultations in Ukraine and abroad. The hotline operates direct numbers in 21 countries with the largest Ukrainian populations under temporary protection. In December 2023, the Association launched a website enabling access via audio and video calls for individuals in countries without direct numbers and in temporarily occupied territories where Ukrainian mobile networks are not operational.

Purpose: This contribution describes the processes and conditions in creating an extensive psychological crisis care line for Ukrainians under war conditions: lessons learned and key data.

Methods: Based on reports completed by hotline professionals, an analysis using descriptive statistics was conducted of 20,206 completed one-time consultations (psychological, psychiatric, and social).

Results: Over 3.5 years, the hotline provided 20,206 one-time consultations (20–60 minutes each), including psychological (76%), psychiatric (12%), and social support (12%). Consultations addressed acute stress, mental health symptoms, family and interpersonal conflicts, and parenting challenges. Most requests came from women (66.6%) and adults aged 25–64, with 82% originating in Ukraine and 18% abroad. This large-scale data provides insights into the nature, distribution, and needs of crisis-affected populations during ongoing conflict.

Conclusions: Data-based implications for developing national and international mental health crisis response during large-scale catastrophes, such as wars, are discussed.

Abstract 4563

ASSOCIATION BETWEEN VITAMIN D INTAKE AND SLEEP DISORDERS IN THE OLDER POPULATION OF KAZAKHSTAN

Abduldayeva A., Doszhanova G., Safonov N.*

Scientific research institute of preventive medicine named after Academician Y.D. Dalenov, Astana Medical University ~ Astana ~ Kazakhstan

Background.
Aging is accompanied by changes in sleep regulation, reduced nutrient adequacy, and an increased prevalence of chronic conditions. Vitamin D is considered a potentially modifiable factor influencing neuroendocrine regulation of sleep, circadian rhythms, and neuroinflammatory processes. However, data on the association between actual vitamin D intake and sleep disorders in older populations remain limited, particularly in Central Asian countries.
Objective.
To assess the association between dietary vitamin D intake and the presence of sleep disorders in older adults.
Methods.
This cross-sectional study included 425 geriatric participants aged 60 years and older, recruited from social service centers and active longevity centers. Dietary intake was assessed using a 24-hour dietary recall and an adapted food frequency questionnaire. Sleep disorders were evaluated based on questionnaire data. Group differences were analyzed using the Mann-Whitney U test. The predictive value of vitamin D intake for sleep disorders was assessed using receiver operating characteristic (ROC) analysis.
Results.
Median vitamin D intake among participants with sleep disorders was 2.10 μg (Q1-Q3: 0.89-4.40), compared with 2.34 μg (Q1-Q3: 1.31-6.00) among those without sleep complaints. Statistically significant differences were observed between the groups ($p = 0.033$). ROC analysis demonstrated a moderate but statistically significant discriminatory ability of vitamin D intake for sleep disorders (AUC = 0.561; $p = 0.033$). The optimal cut-off value was 1.56 μg, with a sensitivity of 68.2% and a specificity of 45.2%.
Conclusions.
Low dietary vitamin D intake is associated with a higher prevalence of sleep disorders in older adults. These findings highlight the importance of considering nutritional status in the prevention of age-related sleep disturbances and support the need for further research.

Abstract 2423

PROMOTION OF DIGITAL INDEPENDENCE IN DAILY FUNCTIONING FOR THE ELDERLY AND ITS RELATIONSHIP WITH SELF-AGEISM AND SUBJECTIVE WELL-BEING

Bluvstein I.*, Koton S.

Department of Nursing Sciences, Tel Aviv University ~ Tel Aviv ~ Israel

Older adults in their third and fourth ages, face persistent challenges adapting to the increasing role of digital technologies in areas such as healthcare, financial management, and social engagement. The digital divide continues to affect their participation in daily digital life compared to younger populations.

This interventional study aimed to improve digital literacy among older adults using smartphone-based training in health, finance, and leisure domains. It also explored the relationship between digital literacy, subjective age, self-ageism, and subjective well-being.

The study included 199 participants aged 65+, with a mean age of 81.6 (SD = 6.9); 75% lived in assisted living facilities. They attended eight 90-minute in-person sessions focused on smartphone use for social, medical, and financial purposes. After a 22.1% dropout rate, the final sample included 155 participants. Pre- and post-intervention questionnaires assessed digital literacy (smartphone use, internet knowledge, digital confidence, technophobia), subjective well-being, and age-related variables (chronological age, subjective age, self-ageism). Demographics and health status were assessed at baseline.

Significant improvements were found in smartphone use scope ($t=2.9$, $df=132$, $p<.01$), digital confidence ($t=4.5$, $df=133$, $p<.001$), internet knowledge ($t=3.8$, $df=133$, $p<.001$), and life satisfaction ($t=1.8$, $df=130$, $p<.05$). Subjective age was negatively correlated with scope of smartphone use ($r=-.19$, $p<.05$), duration of use ($r=-.20$, $p<.05$), digital confidence ($r=-.23$, $p<.01$), and internet knowledge ($r=-.21$, $p<.01$), and positively with self-ageism ($r=.38$, $p<.001$). Chronological age showed lower correlations with digital literacy measures. Self-ageism correlated negatively with smartphone use scope ($r=-.17$, $p<.05$) and digital confidence ($r=-.24$, $p<.01$), and positively with technophobia ($r=.15$, $p<.05$). Overall, digital literacy measures were positively related to life satisfaction, resilience, and perceived health.

Digital literacy among older adults can be enhanced through targeted interventions. Improving digital skills may support subjective well-being, while reducing the digital divide could promote active and positive aging by fostering autonomy, engagement in healthcare, and social functioning.

Abstract 2494

COGNITIVE FUNCTION AND PHYSICAL FRAILTY AS DETERMINANTS OF MORTALITY AMONG PUERTO RICAN OLDER ADULTS: IMPLICATIONS FOR APPLIED GEROPSYCHOLOGY

Castillo Collazo D.*[1], Matos--Moreno A.[2], Gómez--Martínez H.[1]

[1]Albizu University ~ San Juan ~ Puerto Rico, [2]Albizu Population Research Center, Albizu University ~ San Juan ~ Puerto Rico

Introduction:
Puerto Rico is undergoing a rapid demographic transition, with adults aged 60 and older comprising nearly one-third of the total population (29.6% in 2023). Studies have shown the importance of examining clinically relevant indicators of vulnerability to support healthy aging among older adults, especially those lacking familial support networks. Little is known about the effects of cognitive frailty on late-life mortality in Caribbean older adults. This construct provides a multidimensional perspective for understanding mortality risk in late-life.
Purpose:
This study examined whether cognitive functioning and physical frailty independently predict mortality among older adults in Puerto Rico.
Method:
Data were derived from the Puerto Rican Elderly Health Conditions (PREHCO) longitudinal study. The analytic sample included 2,330 community-dwelling adults aged 60 years or older (mean age = 74.13; SD=7.30, 60.6% female). Cognitive functioning was assessed using the Mini-Mental Cabán, a culturally validated cognitive screening tool, and physical frailty was measured using the Modified Frailty Index (mFI-5), with higher scores indicating greater frailty. Cox proportional hazards regression models were estimated controlling for age, gender, and years of education.
Results:
Higher cognitive functioning significantly predicted reduced mortality risk (HR = 0.944; 95% CI: 0.923–0.966), representing a 5.6% decrease per additional point on the Mini-Mental Cabán. Conversely, greater frailty was associated with an increased risk of mortality (HR = 1.224; 95% CI: 1.166–1.285), representing a 22.4% higher mortality risk per unit increase in the frailty index. Both associations remained significant after covariate adjustment, supporting the conceptual validity of cognitive frailty as a clinically meaningful construct in aging populations.
Conclusions:
Cognitive and physical frailty independently predict mortality in older Puerto Rican adults. Incorporating cognitive frailty screening into primary care could enhance early

detection of vulnerability and guide personalized interventions that promote resilience and healthy aging in culturally diverse populations.

Abstract 1430

AGE DIFFERENCES IN LEARNING FROM FEEDBACK ON ADVERTISEMENT CREDIBILITY

Fung N.L.*[1], Lay J.[3], Tse D.C.K.[2], Gong X.[4], Fung H.H.[4]

[1]CUHK Jockey Club Institute of Ageing, The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]School of Psychological Sciences and Health, University of Strathclyde ~ Glasgow ~ United Kingdom, [3]Department of Psychology, University of Exeter ~ Exeter ~ United Kingdom, [4]Department of Psychology, The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong

Older adults showed reduced tendency to distinguish between credible and noncredible advertisement. Although learning opportunities exist in everyday life, such as public promotion and news reports exposing fraudulent practices, little is known about how younger and older adults differ in their ability to learn from these feedback. In this study, we addressed this question by adopting a 2 (Age Group: Younger vs. Older adults; between-subject) x 2 (Credibility: Noncredible vs. Credible; within-subject) x 2 (Feedback: Random vs. Accurate; between-subject) x 2 (Phase: Baseline vs. Testing; within-subject) study design. We recruited 92 older (M = 67.6, SD = 5.19, 55 – 80) and 94 younger adults (M = 21.4, SD = 4.55, 18 - 37). During the baseline, participants read 16 advertisements (8 credible and 8 noncredible) and reported whether they would recommend this product to their friends or family after each advertisement. Then, participants received either accurate or random feedback on the credibility of the advertisement they have read. In the testing phase, the same procedure as in the baseline was repeated with a new set of credible and noncredible advertisements. We found a significant 4-way Age Group x Feedback x Credibility x Phase interaction (b = -0.99, p = .03). When feedback was accurate, the Credibility x Phase x Age Group interaction was significant. Both younger and older adults were more likely to recommend the products when the advertisements were credible (vs. noncredible) in the testing phase than the baseline phase. This learning effect was larger in younger adults than in older adults. When feedback was random, learning did not occur in either age group. Our results suggested that older adults benefitted less from feedback than did younger adults. Future studies should investigate the underlying mechanisms of this age difference and explore potential interventions to enhance older adults' learning.

Abstract 2070

LANGUAGE AS A MARKER OF RESILIENCE: DIFFERENCES BETWEEN SUPERAGERS AND NON-SUPERAGERS

Gómez--Martínez H.*, Maxwell C., Reyes--Valentín V.

Albizu University ~ San Juan ~ Puerto Rico

Introduction: Normal cognitive aging is often associated with declines in memory and language, yet some older adults, known as SuperAgers, maintain exceptionally high performance into advanced age. SuperAgers exemplify cognitive resilience, preserving superior memory and language abilities despite the challenges of aging. Understanding these mechanisms is critical for identifying protective factors that sustain well-being and cognition.

Purpose: This study examined differences in verbal fluency and naming abilities between SuperAgers and non-SuperAgers, defined by delayed recall, to evaluate whether superior memory functioning supports language outcomes in older adulthood.

Method: Data were drawn from the Alzheimer's Disease Neuroimaging Initiative (ADNI), including cognitively normal older adults aged ≥80 (N = 118; M = 83.33, SD = 2.44; 62 males, 56 females). Participants were classified as SuperAgers (AVDEL30MIN ≥ 9; n = 35, M age = 83.08; 11 males, 24 females) or non-SuperAgers (AVDEL30MIN ≤ 8; n = 83, M age = 83.43; 51 males, 32 females). Language measures included phonemic fluency (FFLUENCY), semantic fluency (CATANIMSC), and confrontation naming (BNTTOTAL). Normality tests guided analysis: independent-samples t-tests were used for normally distributed variables, and the Mann-Whitney U test for non-normal data. Effect sizes (Cohen's d, r) were reported.

Results: SuperAgers significantly outperformed non-SuperAgers in FFLUENCY ($t(122) = 2.44$, $p = .017$, $d = 0.44$) and CATANIMSC ($t(122) = 2.89$, $p = .005$, $d = 0.52$). No significant difference was observed in BNTTOTAL ($U = 1297.5$, $p = .076$, $r = 0.16$).

Conclusions: SuperAgers demonstrate stronger verbal fluency than non-SuperAgers, underscoring the role of episodic memory in sustaining language during advanced aging. These findings support resilience-based approaches in applied psychology and geriatric care. Memory stimulation combined with language activities may help preserve communication and independence, guiding clinical practice and public policy to promote successful aging.

Abstract 1139

INTERGENERATIONAL INTERACTION AND MOTIVATIONS FOR PARTICIPATION AMONG YOUNGER AND OLDER ADULTS

Kamada A.*, Tanaka M., Akiyama M.

Bunkyo University ~ Saitama ~ Japan

This study examined intergenerational interaction and motivations for participation among younger and older adults in Japan. Participants included 450 younger adults (275 males, 175 females; ages 25–39 years, M = 34.08, SD = 3.91) and 450 older adults (275 males, 175 females; ages 70–84 years, M = 74.50, SD = 3.53). Measures included frequency of intergenerational conversations and activities, perceived friendliness and comfort during intergenerational interactions, motivation for intergenerational contact, and the Interpersonal Orientation Scale (IOS). Results indicated that 58.9% of older adults reported no opportunities for interaction with individuals in their 20s and 30s, while 55.6% of younger adults had no opportunities for interaction with individuals in their 70s and 80s, reflecting a general lack of intergenerational exchange. Stepwise multiple regression analyses were conducted with the frequency of intergenerational conversations and activities as the dependent variable and motivations and affinity for others as predictors. For interactions with younger adults, both groups were primarily motivated by positive emotions, such as enjoyment, warmth, vitality, and satisfaction derived from contact. For interactions with older adults, in addition to the aforementioned positive emotions, both groups valued the consolation and support gained through conversation. These findings suggest that, while opportunities for intergenerational interaction remain limited, motivations for participation are shared across age groups.

Abstract 1272

RECIPROCAL DAY-TO-DAY ASSOCIATIONS BETWEEN SELF-CONTROL AND LONELINESS AMONG KOREAN MIDDLE-AGED AND OLDER ADULTS

Lee S.C.*[1], Jeon B.[1], Choi Y.[1], Kim H.[1], Kim M.[1], Kim J.H.[2], Noh S.R.[1]

[1]Department of Psychology, Chungnam National University ~ Daejeon ~ Korea, Republic of, [2]Institute of Health Policy and Management, Seoul National University Medical Research Center ~ Seoul ~ Korea, Republic of

Loneliness is a global public health concern with documented associations with morbidity and mortality. Recent studies indicate that self-control and loneliness are reciprocally associated. Self-control refers to the capacity to inhibit impulses and align behavior with long-term relational goals. Lower self-control can degrade relationship quality through norm violations and social withdrawal, thereby increasing perceived exclusion and loneliness. In the opposite direction, loneliness can deplete cognitive and motivational resources and bias social information processing toward threat appraisals, which in turn compromises subsequent self-control. However, evidence at the day-to-day, within-person level remains limited in midlife and older adults. We analyzed a 7-day daily diary study of middle-aged and older adults in Korea (N = 630; age 40–71 years; Mage = 58.28; 56.5% men). Each evening, participants reported self-control (K-BSCS), loneliness (3-item UCLA Loneliness Scale), and perceived social exclusion (Ostracism Short Scale) using validated instruments adapted for daily assessment. A random-intercept cross-lagged panel model (RI-CLPM) partitioned within-person temporal dynamics from stable between-person differences, adjusting for demographic and health covariates. At the between-person level, lower average self-control was associated with greater loneliness and social exclusion. Within persons, lower-than-usual self-control prospectively predicted higher next-day loneliness (e.g., day 5 to 6: b = -.266, p = .006), and higher-than-usual loneliness prospectively predicted lower next-day self-control (day 6 to 7: b = -.097, p = .017), evidencing reciprocal coupling. Perceived social exclusion was related to both constructs but showed no evidence of mediating their day-to-day linkage. Findings indicate a reinforcing cycle connecting self-regulatory capacity and social experience in later life; accordingly, interventions that enhance self-regulation or reduce loneliness may yield spillover benefits for the other. Methodologically, results underscore the value of intensive longitudinal designs and RI-CLPM for isolating within-person mechanisms relevant to prevention and healthy aging.

Abstract 2124

INTERPERSONAL SUPPORT PREDICTORS OF DISTRESS DISCLOSURE LGBTQIA+ FILIPINO YOUNG ADULTS

Mindanao R.*, Alinsod E.L., Dela Paz L., Domingo M.E.

Polytechnic University of the Philippines - Santa Rosa ~ Santa Rosa Laguna ~ Philippines

Elevated distress disclosure of LGBTQIA+ Filipino young adults causes disproportionately high rates of anxiety, depression, suicidal ideation, and self-harm often faced with compounded distress due to various intersecting sources (religious and familial cultural expectations). Despite the known protective value of interpersonal support, recent empirical models are insufficient, as they have not yet established which specific dimension of support (appraised, belonging, or tangible) offers the most significant leverage in determining an individual's decision to engage in the vulnerable process of distress disclosure. This study, aims to determine which specific facet of Interpersonal Support (appraised, belonging, or tangible) is the most significant determinant of subsequent distress disclosure behaviors among LGBTQIA+ members aged 19–23 in the Philippines. The results will provide culturally-relevant, evidence-based recommendations for designing targeted interventions that prioritize the most critical forms of support necessary to facilitate effective coping and mental health resilience in this vulnerable population. In this study, 102 young adult LGBTQIA+ MEMBERS, lesbian (n= 16), gay (n=25), bisexual (n=28), transgender (n=26), queer (n=12), allied (n=15) ages 18-23 were investigated. A multiple regression analysis revealed the model was significant (R^2=.433, $F(5,78)$=11.91, $p<.001$), with Tangible Support (β=0.354, p=.005) emerging as the strongest positive determinant, followed by Appraisal Support (β=0.245, p=.031)." This reveals that for LGBTQIA+ Filipino young adults, the functional capacity of the social network to provide concrete assistance and cognitive guidance is more critical to disclosure behavior than a general sense of belonging. Consequently, interventions aimed at increasing emotional expression and help-seeking within this vulnerable population should prioritize training support providers on offering practical and problem-solving resources.

Abstract 1769

DEVELOPMENTAL TRAJECTORIES OF GENERATIVE AND RECEPTIVE INTERNET USE AND BIDIRECTIONAL ASSOCIATIONS WITH MENTAL HEALTH IN OLDER ADULTS: A LONGITUDINAL STUDY

Qiu J.*, Peng H.

Faculty of Psychology, Beijing Normal University ~ Beijing ~ China

With the rapid advancement of information technology, the link between internet use and older adults' mental health has drawn increasing attention. However, little research has examined the active engagement in internet use in later life. The present study distinguished between generative and receptive internet use among older adults. Using data from the 2018, 2020, and 2023 waves of the China Longitudinal Aging Social Survey (N = 5,553; Mage = 67.40, SDage = 4.76; 50% female), we examined the developmental trajectories of these two types of internet use and their bidirectional associations with depressive symptoms and cognitive function.

Latent growth modeling indicated a linear upward trend in receptive internet use, whereas generative internet use showed a nonlinear growth pattern characterized by a decelerating increase over time. Cross-lagged panel analyses revealed that, after adjusting for demographic variables, receptive internet use and depressive symptoms predicted each other over time. Depressive symptoms predicted subsequent generative internet use, but not vice versa. Neither type of internet use showed significant bidirectional associations with cognitive function.

These findings highlight the distinct roles of generative and receptive internet use in older adults' mental health. Internet use appears to provide protective and promotive effects for emotional well-being but has limited influence on cognitive health. In turn, older adults' emotional health shapes their subsequent internet engagement. These findings provide insights for developing targeted strategies to guide internet use and promote well-being in later life.

Abstract 1243

MECHANISMS OF COGNITIVE FUNCTION IMPACTING HEALTH STATUS IN MIDDLE-AGED AND OLDER ADULTS: THE MEDIATING ROLE OF DEPRESSIVE SYMPTOMS

Zhu L.*, Su S., Wu L.

Shaanxi Normal University ~ Xi'an ~ ??

Introduction: China has entered an aging society, and achieving successful aging has become a pressing issue for both society and individuals. Health is a crucial prerequisite for successful aging; however, data indicate that the health status of middle-aged and older adults in China is far from optimistic, with approximately 55% experiencing multimorbidity. Existing research has shown that cognitive decline is a critical factor affecting health in older populations. Nevertheless, current studies face two key limitations: First, health assessments predominantly focus on physical function and activity indicators, overlooking multidimensional factors such as chronic diseases. Second, the underlying mechanisms through which cognitive function influences health remain inadequately explored. Objective: To examine the direct and indirect effects of cognitive function on health by measuring multiple health indicators, using depressive symptoms as a mediating variable. Methods: Using data from the China Health and Retirement Longitudinal Study in 2011 (T1), 2015 (T2), and 2020 (T3), this study included 10,855 participants aged 45 and older. Descriptive statistics and cross-lagged models were conducted, with mediation effects tested via Bootstrap. Results: (1) Cognitive function at the prior time point was positively correlated with self-rated health and negatively correlated with the number of chronic diseases at the subsequent time-point, while showing unstable associations with health behaviors; (2) All three cross-lagged models met goodness-of-fit criteria. Cognitive function at T1 negatively predicted depressive symptom at T2; Depressive symptoms at T2 negatively predicted self-rated health and health behaviors at T3, positively predicted number of chronic diseases at T3; (3) Mediation analysis further confirmed that a decline in cognitive function can lead to an increase in depressive symptoms, which in turn result in lower self-rated health, fewer health behaviors, and more chronic diseases. Conclusion: Cognitive function is a risk factor for health in middle-aged and older adults, with depressive symptoms mediating its effect.

Abstract 1351

WHEN CONFORMITY MEETS HELP-SEEKING: DIVERGENT PATTERNS IN JAPANESE AND SOUTH KOREAN AGING POPULATIONS

Ikeuchi T.*[1], Han D.[2], Osada H.[3]

[1]Takachiho University ~ Tokyo ~ Japan, [2]Research Institute of Science for the Better Living of the Elderly ~ Busan ~ Korea, Republic of, [3]University of Tokyo Health Sciences ~ Tokyo ~ Japan

Help-seeking behaviors in later life significantly impact health outcomes and quality of life globally. This study investigates how cultural conformity shapes help-seeking attitudes among middle-aged and older adults in Japan and South Korea. We operationalized conformity as valuing “being ordinary and the same as others.” Both nations are rapidly aging societies where social harmony, expressed as wa in Japanese and hwa-hap in Korean, remains paramount.

We surveyed 800 Japanese and 600 Korean participants online (M age = 58.0, range = 40–81). Over half of respondents in both countries agreed with the statement “Being ordinary and the same as others is important,” indicating strong conformity values. Multiple regression analyses revealed striking cross-cultural differences. Among Japanese participants, valuing ordinariness was significantly associated with greater reluctance to seek help from both in-group members, such as family and close friends, and out-group members (broader social networks). This suggests that conformity uniformly inhibits help-seeking in Japanese culture. Conversely, Korean participants who valued ordinariness showed reduced reluctance to seek help from in-group members, with no significant association for out-group help-seeking.

These contrasting patterns demonstrate how identical cultural values can produce divergent behavioral outcomes across different social contexts. In Japan, conformity appears to create universal barriers to help-seeking through burden avoidance norms. However, in South Korea, conformity paradoxically facilitates in-group help-seeking, possibly because accepting support from close others aligns with group solidarity expectations.

Mental health professionals and policymakers working with East Asian populations should recognize that promoting help-seeking requires culturally specific approaches. For Japanese older adults, interventions could frame help-seeking as maintaining group harmony. For Korean older adults, leveraging existing in-group support patterns while expanding help-seeking to professional services may prove effective. These insights are particularly relevant for multicultural societies addressing aging population challenges.

COMPREHENSIVE PERSPECTIVES ON AGING: INNOVATIONS IN DETECTION, INFORMAL CARE, AND PUBLIC HEALTH POLICY

Thursday 23 July 2026 from 08:00 to 09:30

(M-Lorenese)

Ana Kraljević (Department of Mental Health and Addictio), Chair and Presenter

As global populations age, the complexity of supporting cognitive and emotional well-being in later life demands integrated, evidence-based approaches. This symposium brings together international experts to explore ageing through the lenses of early detection, informal caregiving, and policy implementation. It highlights the urgent need to bridge gaps between clinical innovation, psychosocial support, and systemic change.

The first thematic strand focuses on early detection of neurocognitive disorders, showcasing embodied and AI-driven technologies that enable ecologically valid, cost-effective screening and monitoring. These innovations offer promising tools for timely intervention and improved diagnostic accuracy, particularly in under-resourced settings.

The second strand centres on informal caregivers—often family members—who provide essential but undervalued support to people living with dementia and other age-related conditions. Presentations include the adaptation and implementation of the START programme in Southeastern Europe, emphasising cultural responsiveness, feasibility, and sustainability. The psychological burden of caregiving is addressed through frameworks for burnout prevention and mental health promotion.

The third strand examines how research and practice can inform public health and social care policies. Discussions will explore how scalable interventions can be embedded within existing systems, and how caregiver support can be recognised and resourced through policy reform. The symposium also considers broader psychosocial dimensions of ageing, such as loneliness and its differential impact on mental health.

By integrating clinical, technological, and policy perspectives, this symposium aims to foster cross-sector collaboration and promote holistic, person-centered care for ageing populations.

Abstract 3641

THE DIFFERENTIAL IMPACT OF PERCEIVED AND PREFERRED LONELINESS ON DEPRESSIVE SYMPTOMS IN OLDER ADULTS

Ljopis Barca J.*

University of Valencia ~ Valencia ~ Spain

Loneliness in later life is not a uniform experience. While perceived loneliness is often associated with social dissatisfaction and emotional distress, some older adults report a preference for solitude, experiencing it as an adaptive and even enriching choice. This distinction raises important questions about how different forms of loneliness relate to depressive symptoms and overall well-being in aging populations. The presentation will address conceptual and clinical perspectives on perceived and preferred loneliness, highlighting their differential impact and relevance for understanding mental health in older adults.

Keywords: Loneliness, older adults, mental health

Abstract 3643

IMPROVING DEMENTIA SUPPORT IN SOUTHEASTERN EUROPE THROUGH ADAPTING EVIDENCE-BASED PSYCHOLOGICAL INTERVENTIONS: A COMPARATIVE EXAMPLE FROM THE START (STRATEGIES FOR RELATIVES) PROGRAMME IN CROATIA AND NORTH MACEDONIA

Kraljević A.*[1], Taneska M.[2], Kušan Jukic M.[1], Rapaport P.[3], Livingston G.[3]

[1]Department of Mental Health and Addiction Prevention, Teaching Institute of Public Health "Dr. Andrija Štampar", Zagreb, Croatia ~ Zagreb ~ Croatia, [2]Alzheimer's Society, London, United Kingdom Institute for Alzheimer's Disease and Neuroscience, Skopje, North Macedonia University College London, London, United Kingdom ~ London ~ United Kingdom, [3]Division of Psychiatry, University College London, London, United Kingdom Camden and Islington NHS Foundation Trust, London, United Kingdom ~ London ~ United Kingdom

Introduction: Family caregivers of people with dementia (PwD) face significant psychological burden, particularly in regions with increasing dementia prevalence and critical gaps in support provision, such as Southeastern Europe START is a UK-developed, evidence-based psychosocial intervention for family caregivers of people living with dementia with short- and long-term cost- and clinical-effectiveness. It has been proven feasible and acceptable when adapted for use in minority groups and other countries.

Purpose: This study presents and compares the process of translating, culturally adapting, and piloting the START programme in two Southeastern European countries: Croatia and North Macedonia. It aims to identify key factors that influence feasibility and acceptability, and to offer practical recommendations for structured, scalable implementation that is accessible and sustainable within public health systems.

Method: In North Macedonia, the adapted intervention has been evaluated for feasibility, acceptability, and preliminary outcomes using mixed-methods. In Croatia, the programme has undergone cultural adaptation, with implementation preparations ongoing. Both versions retained fidelity to the original model while integrating context-specific modifications.

Results: In N.Macedonia START bridged an important gap in postdiagnostic support and could be delivered with surface-level adaptations, and in Croatia, validation results point to high potential for successful implementation, with stakeholders expressing strong interest and engagement.

Conclusions: The adaptation of START in Croatia and North Macedonia demonstrates the potential of evidence-based psychological interventions to be scaled across diverse

health systems. The study highlights the importance of regional collaboration and provides actionable recommendations for systematic implementation that meet the needs of informal caregivers in low- and middle-income settings.

Keywords: dementia, informal caregivers, adaptation, feasibility, START programme, Southeastern Europe

Abstract 3921

AGE-RELATED DECLINE IN READING AND INTERVENTION BY EYE-GUIDED VIDEO GAMES

Daini R.*

Department of Psychology and Mind and Behavior Technological Center (MiBTec), Università di Milano Bicocca, Milan, Italy ~ Milano ~ Italy

Aging leads to a physiological decline in many cognitive functions, even without pathological processes. These cognitive changes affect the elderly's quality of life and well-being, impacting their daily activities. Reading is among the skills most affected by aging since it requires the integrity of several cognitive components, such as linguistic, visual, oculomotor, and attentional processes. While language remains largely intact, visual and cognitive components may decline, affecting reading efficiency. Different components of attention are involved in the reading process, but their roles in age-related changes in reading remain unclear. Study 1 aimed to investigate the presence of an actual decline in reading and the causal relationships between attention and this potential age-related decline. 120 neurologically healthy older adults (age range 62-75) underwent neuropsychological assessment to investigate global cognitive functioning, reading skills, crowding, and attention components. Results showed a mediation effect of many attentive components and a moderator effect of crowding and visuospatial attention. Study 2 aimed to explore the effectiveness of an eye-guided video game to improve visuomotor, visual, and attentional skills involved in reading in healthy older adults. Forty healthy participants aged over 65 underwent a battery of cognitive, visual, attentional, and reading tests to assess their initial cognitive performance and register changes after a training period. Only half of them (experimental group) performed training sessions with custom-built eye-guided video

games;
each session lasted 45 minutes and was administered twice a week for 5 weeks. Only participants
in the experimental group improved their reading and visual abilities (a decrease in reading time,
a reduction in the number and duration of fixations, and an increase in the amplitude of saccades).
Unexpectedly, no changes in attentional parameters were observed. Our findings indicate that
eye-guided video games enhance reading abilities in healthy older individuals, without training
reading directly.

Keywords: Reading, Healthy Aging, Attention, Neuropsychological Assessment, Video games,
eye movements.

Abstract 3640

AN EMBODIED INTELLIGENT DIGITAL PLATFORM FOR EARLY DETECTION OF NEUROCOGNITIVE DISORDERS

Marocco D.*[1], Simeoli R.[1], Taurisano P.[2]

[1]NAC Natural and Artificial Intelligence Laboratory, Department of Humanistic Studies, Federico II University of Naples, Italy ~ Naples ~ Italy, [2]Department of Translational Biomedicine and Neuroscience (DiBraiN)), University of Bari Aldo Moro, Apulia, Italy ~ Apulia ~ Italy

Introduction. Neurocognitive disorders (NCDs), including Mild Cognitive Impairment (MCI)
and Alzheimer's disease, are associated with progressive decline across cognitive, motor, and
functional domains. Early detection remains a major challenge due to fragmented clinical
procedures, limited integration of diagnostic data, and reliance on self-reporting, particularly in
the initial stages.
Purpose. Run2cog is a novel digital health application designed to support clinicians in the
early identification and continuous monitoring of NCDs. By combining embodied technologies
with artificial intelligence (AI), the app aims to provide ecologically valid, cost-effective, and
accessible tools for healthcare systems and patients.
Descriptions. The platform integrates sensorimotor, cognitive, and physiological measures
collected through widely available devices such as smartphones, tablets, and wearable
sensors. Run2cog offers gamified, user-friendly tasks targeting key neurocognitive domains,
including executive functions, working memory, visuospatial abilities, attention, and
psychomotor parameters.
Innovation. Unlike traditional assessments, Run2cog leverages an embodied cognition
perspective, linking cognitive decline to measurable alterations in everyday motor and
behavioral patterns. AI-based algorithms analyze multimodal data in real time, enabling
personalized monitoring, predictive modeling, and adaptive feedback for patients and
clinicians.
Conclusions. By embedding Run2cog within the E-Move project, the initiative represents a
step forward in bridging technology and clinical practice for neurocognitive health. Its
embodied and AI-driven approach provides continuous, non-invasive monitoring that

can
enhance diagnostic accuracy, reduce clinical variability, and facilitate timely interventions. By
improving the sustainability and efficiency of healthcare systems, Run2cog has the potential to
significantly impact quality of life for individuals at risk of or living with NCDs.

PREPARATION FOR LATER LIFE THROUGH MOTIVATIONAL INTERVIEWING AND EDUCATION (PREP-ME) FOR AGEING ADULTS: A TWO-ARM RANDOMISED CONTROLLED FEASIBILITY TRIAL

Bai X.*, Zhang Y.

The Hong Kong Polytechnic University ~ Hong Kong ~ China

Objectives

Later-life preparation—spanning financial, health, family life, social participation, and long-term care domains—is critical for ageing well. However, there lacks theory-guided interventions to address sustainable engagement for comprehensive later-life preparation. Incorporating transtheoretical model, social cognitive theory, and preparation for future care needs model, the PREParation for later life through Motivational interviewing and Education (PREP-ME) project compared Motivational Interviewing (MI) versus Education for later-life preparation.

Methods

This two-arm randomised controlled feasibility trial allocated 59 community-dwelling adults aged 50–75 to four weekly sessions: MI (n=30) resolving ambivalence and eliciting change talk, or Education (n=29) emphasising knowledge/skill-building. Outcomes for later-life preparation were assessed at baseline (T0), post-intervention (T1), 1-month (T2), and 3-month (T3) follow-ups. Generalised estimating equations assessed differential changes in outcomes over time and groups.

Results

Recruitment (90.9%), attendance (100%), retention (100%), and satisfaction (4.54±0.63 out of 5) indicated high feasibility. Both interventions improved preparedness and psychosocial outcomes (e.g., attitudes towards later life, self-efficacy, life satisfaction, self-rated health, family relationship; $p<0.05$). However, MI showed superior sustained effects in advancing preparation stage (e.g., overall: $p<0.001$, $d=0.77$; social participation: $p=0.02$, $d=0.52$) and maintaining preparedness gains (e.g., overall: $p=0.049$, $d=0.33$; health: $p=0.03$, $d=0.41$) at T3. Education yielded earlier confidence/goal improvements at T1 but plateaued over time.

Discussion

MI is feasible, effective in promoting sustained engagement in later-life preparation, bridging the intention-action gap through intrinsic motivation. Education offers immediate skill-based benefits. A dual-pathway model—tailoring MI for long-term behavioural change and Education for knowledge acquisition—empowers practitioners to address ageing adults' diverse needs.

Abstract 1269

AUDIOVISUAL IDENTITY CARD AS A NARRATIVE TOOL FOR PEOPLE WITH DEMENTIA: PRELIMINARY FINDINGS

Covelli V.*[3], D"Anastasio C.[1], Scarpino R.[1], Melloni E.[2], Marelli A.[3], Feyles M.M.[4]

[1]Association for Research and Care in Dementia (ARAD) ~ Bologna ~ Italy, [2]Director and Screenwriter, Curator of the Memofilm Project, Cineteca di Bologna, Italy ~ Bologna ~ Italy, [3]Department of Theoretical and Applied Sciences, eCampus University ~ Como ~ Italy, [4]Department of Human and Social Sciences, eCampus University ~ Como ~ Italy

Although the literature has long recognized the usefulness of narrative tools in facilitating the care of people with dementia, the use of audiovisual instruments as mediators of personal identity within the relationship between persons with dementia and their formal and informal caregivers remains less explored. This contribution will first present a narrative review of the literature on the use of narrative medicine and narrative tools with elderly individuals. It will then discuss the theoretical paradigm integrating the phenomenological theory of narrative identity, the psychological theory of autobiographical memory, and narrative medicine approaches, all of which are relevant to the processes of constructing personal identity and narration in people affected by dementia. The contribution will then present the research design, methodology, and preliminary results of an experimental study conducted by a multidisciplinary team. The study involved the creation of five audiovisual identity cards for five individuals with Alzheimer's disease or other forms of dementia, as well as the participation of 36 social care workers engaged in their daily care. Data were collected through validated instruments, including the Mini-Mental State Examination (MMSE) for cognitive functioning, the Neuropsychiatric Inventory (NPI) for assessing behavioral and psychological symptoms of dementia (BPSD), and the Zarit Burden Interview (ZBI) for caregiver burden, administered before and after exposure to the audiovisual cards. Qualitative feedback from caregivers and family members was also collected to explore their perceptions of changes in communication, relational quality, and emotional well-being. Finally, the potential role of the audiovisual identity card as a tool to support the progression and worsening of the disease will be discussed, to enhance the relationship between dementia patients and their caregivers and promote a more effective, person-centered care approach.

Abstract 2106

PSYCHOLOGICAL PATHWAYS IN A 9-MONTH MULTIDOMAIN COGNITIVE-IMPAIRMENT PREVENTION TRIAL

Li J.*, Ma Z.

Institute of Psychology, Chinese Academy of Sciences ~ beijing ~ China

We tested whether adding meditation-based emotional training to a 5-component lifestyle program improves cognition in high-risk community elders and explored mediating pathways. Ten Beijing communities were cluster-randomised (1:1); 182 eligible elders (MoCA <26 plus ≥2 vascular/psychosocial risks) received weekly 60–90 min group sessions plus daily homework (meditation, cognitive training, exercise, diet, vascular care) or usual lifestyle for 9 months.

89 % satisfaction and 81 % attendance indicated high feasibility. Relative to controls (n=90), the intervention (n=92) improved global cognition (21 %), memory (73 %) and subjective complaints (42 %), gains sustained 12 months. Positive affect ↑, negative affect ↓, social network and physical activity improved (all p<.01).

Structural-equation and group-based trajectory models showed: (1) lifestyle change enhanced psychological well-being (β=.38), which fully mediated intervention effects on memory and complaints; (2) three cognitive trajectories emerged—low-stable, moderate-improving, high-improving—predicted by baseline age, leisure activity, physical activity and depression.

Integrating psychological training into multidomain lifestyle programs is feasible and effective; emotional change is a key mechanism and individual baseline profiles forecast differential benefit, supporting personalised dementia-prevention strategies.

Abstract 1348

EFFECTIVENESS OF MOTIVATIONAL INTERVIEWING BRIEF INTERVENTION AGAINST TRADITIONAL CASE MANAGEMENT APPROACH IN MANAGING ELDER ABUSE

Yan E.*[1], He J.[1], Lai D.[2], Burnes D.[5], Pillemer K.[3], Lachs M.[4]

[1]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [2]The Hong Kong Baptist University ~ Hong Kong ~ Hong Kong, [3]Cornell University ~ New York ~ United States of America, [4]Weill Cornell Medicine ~ New York ~ United States of America, [5]University of Toronto ~ Toronto ~ Canada

Introduction: Elder abuse is a prevalent phenomenon affecting one in six older adults in the general population. It results in compromised physical health, psychological distress, and increased mortality risk in victims, as well as greater financial burdens on social and health care for the society at large. Given such detrimental consequences, considerable efforts have been made to develop interventions to address this issue.

Purpose: This study compared the effectiveness of a 4-session motivational interviewing (MI) program and an 8-session case management (CM) program in reducing abuse severity, promoting physical and mental health, general self-efficacy, social support, and motivation to change. Trained social workers with a background in gerontology delivered the intervention.

Methods: Baseline data was collected from 129 older adults screened positive for elder abuse in a community survey. Assessments were repeated at the end of the intervention for the 86 cases receiving MI intervention and 43 cases receiving case management, and at 3-month follow up for 20 cases in the MI group. No demographic difference was observed between cases assigned to MI and CM at baseline.

Results: Wilcoxon signed-rank tests were conducted to examine intervention outcomes by different time points. At post-test, the MI group demonstrated significant improvement in abuse severity, psychological distress, general self-efficacy, social support and motivation to change ($p<.001$). The CM group also showed improvement in these areas with the exception of general self-efficacy ($p<.01$). Significant difference was observed between MI and CM groups in their improvement in general self-efficacy. Abuse severity and psychological distress continued to decrease between post-intervention and 3 month-follow-up in the MI group ($p<.05$).

Conclusion: Our findings suggest that MI is a cost-effective intervention for reducing abuse severity and improve the risk profiles of participants.

Abstract 4564

ANTIOXIDANT NUTRIENT INTAKE AND PSYCHOEMOTIONAL DISTURBANCES IN OLDER ADULTS

Abduldayeva A.*, Khaldenova A., Suleimenova R., Boranbayeva G.

Scientific research institute of preventive medicine named after Academician Y.D. Dalenov, Astana Medical University ~ Astana ~ Kazakhstan

Background. Psychoemotional disturbances such as stress, insomnia, and depressive symptoms are highly prevalent in older adults and are linked to oxidative stress and neuroinflammatory processes. Antioxidant nutrients, including vitamins C and E and selenium, are involved in neuroendocrine regulation and adaptive stress responses, yet their association with psychoemotional status in older populations remains unclear.
Objective. To evaluate the relationship between dietary intake of antioxidants and sleep-related and psychoemotional disturbances in older adults.
Methods. This cross-sectional study included 425 participants aged ≥60 years. Dietary intake was assessed using a 24-hour dietary recall and an elderly-adapted food frequency questionnaire. Psychoemotional disturbances and sleep characteristics, including early morning awakenings, were assessed by questionnaire.
Results. Median vitamin C intake was higher among participants reporting early morning awakenings compared with those without this complaint (55.10 mg [Q1-Q3: 33.25-95.05] vs 41.55 mg [17.32-71.90]; p = 0.013). ROC analysis showed an AUC of 0.604, with an optimal cut-off of 37.0 mg. Mean vitamin E intake was 8.42 mg (Q1-Q3: 5.70-11.00), below recommended levels; more than 65% of participants had insufficient intake. Participants with stress, insomnia, or depressive symptoms had higher vitamin E intake (9.40 mg vs 8.20 mg; p = 0.025), with an AUC of 0.645 and cut-off of 9.10 mg. Median selenium intake was also higher in participants with psychoemotional disturbances (49.30 µg vs 35.60 µg; p = 0.022); ROC analysis yielded an AUC of 0.649 and a cut-off of 33.8 µg.
Conclusions. Statistically significant but moderate associations were identified between antioxidant nutrient intake and psychoemotional disturbances in older adults. Higher intake of vitamin E and selenium may reflect compensatory or adaptive responses to chronic stress, emphasizing the need for individualized nutritional assessment in geriatric care.

Abstract 319

SELF-PERCEPTIONS OF AGING AS PREDICTORS OF PSYCHOLOGICAL WELL-BEING AND SUCCESSFUL AGING AMONG OLDER INDIAN ADULTS

Bharti D.A.*[1], Bharti A.[2]

[1]Central University of South Bihar, Gaya ~ Gaya ~ India, [2]~ Gaya ~ India

Objective: Self-perceptions of aging (SPA) played a critical role in shaping the psychological and functional outcomes in later life. Positive SPA has been associated with enhanced psychological well-being (PWB) and successful aging (SA), yet empirical evidence from Indian contexts remains limited. This study aimed to examine the relationship between various dimensions of SPA (positive and negative) and their associations with PWB and SA among older Indian adults (OIAs).

Methods- Correlational survey research was conducted with 297 OIAs (age= 60 & above) drawn from Patna, Bihar using stratified random sampling technique. Brief Aging Perception questionnaire, Successful Aging Scale and available Hindi-version of PERMA- Profiler were used to assess SPA, SA and PWB respectively. Statistical tools of pearson product moment correlation and stepwise linear regression analysis were used to test the hypotheses.

Results : Dimensions of SPA except for the 'timeline chronic' was significantly positively associated with PWB and SA. Negative SPA and emotional representations also demonstrated notable associations, suggesting the multifaceted and complex nature of SPA in influencing aging outcomes. Among these, 'consequences positive' emerged as a significant predictor of both PWB and SA, highlighting its central role in shaping internalisation of aging outcomes for OIAs. Other dimensions of SPA were also found to hold predictive power for PWB and SA.

Conclusion & Implications- Findings underscored the importance of promoting positive SPA to enhance PWB while promoting SA in OIAs. These findings have practical relevance for geriatric mental health services and community-based aging interventions in India. These findings supported global efforts under Sustainable Development Goal 3: Good Health and Well-being, to ensure healthy lives and promote well-being for all at all ages.

Abstract 50

ORCHESTRA LIFESTYLE AS A MEDIATOR OF WELL-BEING AND AGEING: POSSIBLE RESILIENCE FOR ILL-EFFECTS OF AGEING AMONG SYMPHONY ORCHESTRA MUSICIANS

Brodsky W.*

Ben-Gurion University of the Negev ~ Beer-Sheva ~ Israel

Introduction
Few studies have explored life-long music-making among professional full-time contract Symphony Orchestra players. None have investigated orchestra lifestyle as a co-factor considering ageing.

Purpose
The current study examined orchestra musicians who have sustained a vocational career despite the ill-effects of aging for a longer number of years than any other profession requiring highly efficient and accurate expert motor-precision.

Methods
N = 52 full-time players from 5 professional Symphony Orchestras in 3 countries participated. This paper forwards a conceptual interface that puts forward the notion of successful positive ageing among orchestra musicians based on an 11-measure assessment package. The psychological scales were: Selection, Optimization, And Compensation (SOC); Life Management In The Occupational Domain (LMOD); Self-Evaluation Skills & Abilities (SESA); Lifespan-Longings (L-L); Positive And Negative Affect Schedule (PANAS); and Maslach Burnout Inventory (MBI).

Results
The model of successful positive ageing advances a profile based on the following components: High SOC, High LMOD, High SESA, Low L-L, High PANAS-PA with Low PANAS-NA, High MBI-PA with Low MBI-DP and Low MBI-EE.

Conclusions: The study explored the attitudes, perceptions, and experiences of professional full-time contract orchestra musicians, and occupational lifestyle, leading to the conception of resilience to the ill-effects of ageing among Seasoned Musicians who have retained their music performance skills and career past the 5th Decade. The study puts forth occupational lifestyle of orchestra musicians as a possible co-factor in developing increased levels of protective immunity to neurodegenerative diseases than is usually depicted among the general population.

Abstract 1751

THE POWER OF REMINISCENCE: THE IMPACT OF VIRTUAL REALITY ON THE EMOTIONAL WELL-BEING OF OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Marchioro D.M., De Bei L.*, Caniglia M.L.

IUSVE Istituto Universitario Salesiano Venezia ~ Mestre (VE) ~ Italy

The present study investigates the impact of Reminiscence Therapy integrated with Virtual Reality on the emotional well-being and quality of life of older adults with cognitive impairment. The aim is to evaluate whether the immersive experience offered by virtual reality, allowing more vivid and engaging access to autobiographical memories, can enhance the positive effects of traditional reminiscence, particularly on mood and depressive symptoms.

The research was conducted in two phases: a theoretical in-depth study, based on the consultation of international scientific literature and specialized manuals, and an experimental phase. The latter involved 54 participants, divided into three groups: an experimental group (reminiscence therapy with virtual reality), an active control group (traditional reminiscence therapy) and a passive control group (daytime and standard activities). The design adopted was mixed with pre and post-intervention evaluations using standardized tools.

The results indicate that the experimental group experienced a significant improvement in mood, a reduction in depressive symptoms, and an increase in perceived quality of life, especially in the emotional and relational domains. Progress in language abilities and spatio-temporal orientation also emerged, while memory skills remained stable.

Despite the limitations related to sample size and intervention duration, the findings support the initial hypothesis: virtual reality, when integrated with reminiscence therapy, facilitates deeper recall of memories and amplifies the benefits on emotional wellbeing and quality of life. This suggests that the synergy between reminiscence and virtual reality represents a promising therapeutic frontier in the psychology of aging.

Abstract 2097

EFFECTS OF COMBINED POSITIVE PSYCHOLOGICAL AND LIFESTYLE INTERVENTION ON CARDIOVASCULAR HEALTH IN COMMUNITY-DWELLING OLDER ADULTS

Li J.*, Liu X., Zhai B.

Institute of Psychology, Chinese Academy of Sciences ~ Beijing ~ China

Combined positive psychological and lifestyle intervention (PPLI) improves cardiovascular health (CVH) in older adults, yet direct physiological evidence is lacking. We conducted a 6-month three-arm RCT with 253 community-dwelling seniors at CVH risk. Participants were randomized to weekly PPLI (24×1 h), lifestyle-only (8×1 h), or passive control. PPLI significantly reduced total cholesterol ($p = 0.005$, $d = –0.31$), LDL ($p < 0.001$, $d = –0.45$) and non-HDL ($p = 0.002$, $d = –0.33$), and increased subjective health ($p < 0.001$, $d = 0.42$); control groups showed no change. PPLI also elevated meaning-in-life ($p < 0.001$, $d = 0.45$), cut negative affect ($p = 0.025$), and improved diet ($d = 0.46$) and physical activity ($d = 0.44$). Structural-equation modelling revealed that activity gains mediated subjective-health improvement. Integrating positive psychology into lifestyle programs is feasible and efficacious for CVH in older adults.

Abstract 657

BIDIRECTIONAL ASSOCIATIONS OVER TIME BETWEEN SOCIAL SUPPORT AND WILL TO LIFE IN LATE LIFE

O"Rourke N.*, Carmel S.

Ben-Gurion University of the Negev ~ Be'er Sheva ~ Israel

Social support and will to live are correlated phenomena, especially among older adults with more limited social networks. In the current study we examined longitudinal bidirectional associations between social support and will to live among those 75+ years of age. We recruited and followed a sample of Israeli adults (N = 824; M = 80.84; range 75-96 years). Structured interviews were conducted in the homes of participants who reported social support and will to live at each point of measurement. We examined a cross-lagged, longitudinal structural equation model (SEM) in which social support and will to live predict each other over time, covarying for previously reported social support and will to live. We found that both will to live and social support are largely consistent in late life. Will to live and social support reported at baseline predict levels reported 1- and 2-years thereafter. At each point of measurement, social support contemporaneously predicts will to live. Cross-over effects also emerged over time. Loss of social support at baseline (not measured in future) predicts lower will to live 1-year later. And will to live at Time 2 predicts greater social support 1-year thereafter.. These findings suggest that associations between will to live and social support are bidirectional in late life. Further research is needed to replicate findings in other cultures and over longer periods, ideally until end of life.

NORMAL AGING AND SERVICES FOR ELDERLY

Thursday 23 July 2026 from 13:30 to 15:00

(M-Lorenese)

Santo Di Nuovo (University of Catania ~ Catania ~ Italy), Chair and Presenter

The symposium presents research and experiences on services for normal aging free of neurological or psychiatric conditions. This topic is highly relevant because existing services for older adults are primarily aimed at people with pathologies, and those for normal older adults are almost exclusively for assistance, lacking specific psychological interventions that can stimulate cognitive and emotional functions and prevent deterioration or reduction in quality of life.
Presenters will discuss predictors of subjective well-being and quality of life in various European countries (Zamalijeva, Lithuania), specific training to stimulate memory skills and increase well-being (Fairfield, Italy), applications of Artificial Intelligence and robotics (Cangelosi, UK), strategies for preventing falls (Albert & Hoffmann, Luxembourg), and services for preventing deterioration and abnormal aging (Di Nuovo, Italy).
The contributions that psychology can offer to society to promote a better quality of life for older people in their living contexts will be presented in detail

Abstract 3535

EXPLORING PREDICTORS OF SUBJECTIVE WELL-BEING TRAJECTORIES AMONG OLDER EUROPEAN ADULTS

Zamalijeva O.*, Gudžinskaitė U., Dunajevas E., Kairys A., Navickė J.

University of Vilnius ~ Vilnius ~ Lithuania

Introduction. Population ageing, observed in numerous developed countries, has highlighted an important aspect – the social security and healthcare systems now have to be responsible not only for a longer life, but also promote well-being during these extended life years. Though well-being, life satisfaction and subjective quality of life have been extensively researched, longitudinal approach allowing for a more reliable identification of well-being determinants is still lacking.

Purpose of this study is to identify well-being trajectories among older European adults and to explore biopsychosocial predictors of said trajectories.

Method. The data for this analysis was drown from the Survey of Health, Ageing and Retirement in Europe (SHARE). A total of 15 880 respondents aged 65 and older (mean age – 72.7, 57.6% – female) that participated in 3 data collections (wave 7, 8 and 9) were included. The well-being of respondents was assessed using two measures: 1) life satisfaction measured using a scale ranging from 0 (not at all satisfied) to 10 (completely satisfied); 2) subjective quality of life was measured with a twelve-item Control, autonomy, self-realisation and pleasure scale (CASP-12).

Results of growth mixture modelling approach showed that similar trajectory patterns were identified for both well-being measures, however proportions were different within the classes, with CASP-12 identifying more respondents in a stable-low trajectory. Preliminary multinomial logistic regression analysis indicated that presence of frailty symptoms and limitations with activities of daily living were associated with less favourable well-being trajectories, while having a partner and social participation predicted more favourable outcomes. Personality traits and cognitive functioning were significant predictors of well-being trajectories, but reported use of anxiolytic and antidepressant medication was not significant.

Conclusions. Obtained results not only help identify risk groups, but also can provide guidelines for developing interventions facilitating well-being in later life.

Abstract 3536

TRAINING FOR IMPROVING MEMORY AND WELLBEING IN OLD PERSONS

Fairfield B.*

University "Federico II" ~ Naples ~ Italy

Longevity is the result of a dynamic relationship between health, cognition and social abilities. Accordingly, training modifiable risk factors such as physical activity (e.g. balance, coordination and muscle strength), different cognitive abilities (e.g. working memory, attention, executive functions), as well as social abilities is fundamental to daily life and wellbeing. In this talk we will present a series of trainings aimed to improve memory and wellbeing in older adults. We will present two training interventions. The first is a training based on a dual interaction of cognitive tasks and physical exercises with older adults in a virtual environment aimed to stimulate functional activities and promote social interactions as well as aid adhesion to and maintenance of training programs by increasing motivation. The second is a modified version of the method of loci, a mnemonic device that relies on spatial relationships between “loci” (e.g., locations on a familiar route or rooms in a familiar building) to arrange and recollect memory content to evaluate the efficacy of a computer-based memory training intervention on older adults by measuring its ability to improve memory performance and promote wellbeing. We also aim to evaluate the added value of remote interaction in delivering trainings, by potentially increasing compliance and maximizing memory effects, providing a basis for a potential translation into a home experimenter-supervised program.

In general, results suggest both specific effects related to different training programs and more general benefits on subjective health, underlining the suitability of such strategies in promoting successful aging and wellbeing.

Abstract 3537

APPLICATION OF ARTIFICIAL INTELLIGENCE AND ROBOTICS FOR ELDERLY

Cangelosi A.*

University of Manchester ~ Manchester ~ United Kingdom

In this talk we will review a series of collaborative studies on the development and testing of robot companion applications for older people. One project is based on the interaction of three robot companions (for indoor and outdoor services) with older people users. Another project looks at the integration of robotic agents within a wider ambient intelligence setup, combining social robots with IoT sensors. These systems combine social robotics and human-interaction principles with AI and machine learning methods. We will also discuss aspects of trust in human-robot interaction, the strategies for verbal and non-verbal communication and ethics principles for transparent robots.

Abstract 3538

A CONTROLLED INTERVENTION STUDY ON FALL PREVENTION STRATEGIES FOR SENIORS: INSIGHTS FROM THE FLUX2 PROJECT

Albert I.[1], Hoffmann M.*[2]

[1]Institute for Lifespan Development, Family, and Culture - University of Luxembourg ~ Luxembourg ~ Luxembourg, [2]GERO-Competence Center for Ageing in Luxembourg ~ Luxembourg ~ Luxembourg

Falls are a leading cause of injury, disability, and mortality among adults aged 65 and older, with Luxembourg consistently ranking among the highest in Europe for fall incidence and fall-related deaths. Addressing this critical public health challenge, the FLUX1 project successfully established a comprehensive framework for fall risk assessment in older adults. Building upon these results, the FLUX2 project now seeks to evaluate targeted intervention strategies designed to prevent falls and promote functional independence.

FLUX2 is a controlled intervention study conducted through a collaborative effort between GERO, the University of Luxembourg, and the Luxembourg Institute for Health and Sport Science Research. The study enrols 100 participants aged 65 years and above, stratified into three intervention groups: (1) motor and physical training, (2) cognitive training, and (3) combined motor-cognitive training. Stratification is based on key parameters such as age, gender, fall history, physical activity levels, and baseline fall risk assessment outcomes.

Each intervention spans a 10-week training period, followed by comprehensive fall risk assessments at baseline and post-intervention to evaluate changes in risk indicators and functional outcomes. Additionally, a 12-month follow-up will monitor fall incidence rates. To capture improvements under real-life conditions, all participants are equipped with sensorized insoles, enabling continuous monitoring of foot pressure distribution and gait stability throughout the study.

Advanced statistical analyses assess the comparative effectiveness of the three training modalities in reducing fall risk and enhancing mobility. By integrating precise risk assessment with targeted interventions, FLUX2 aspires to establish a scalable and sustainable model for fall prevention that fosters autonomy, reduces fall-related injuries, and mitigates the associated healthcare burden. Preliminary findings will be presented at the symposium.

Abstract 3615

INSTRUMENTS AND SERVICES FOR EARLY DIAGNOSIS AND PREVENTION OF ABNORMAL AGEING

Di Nuovo S.*

University of Catania ~ Catania ~ Italy

The decay of neurocognitive functions in elderly may assume various forms and levels, differently susceptible to preventive interventions to be implemented in specific services. Alzheimer syndrome, whose incidence in the population is increasing, with a consequent impact on the social health systems, is sometimes preceded by Mild Cognitive Impairment (MCI). Biological, cognitive, emotional and behavioural aspects are involved in the possible conversion from MCI to dementia, as demonstrated by a wide literature.

Multidimensional interventions integrating neurobiological and cognitive strategies (e.g., memory and imagery training, social interaction) for people at risk for dementia can be a successful answer for active ageing.

The aim of our research is to implement services for both the prevention and the intervention, useful to foster "well aging societies", using also procedures and devices based on technologies and Artificial Intelligence.

Prevention regards the early identification of psychological and social age-related risks of frailty and mental and/or social decline. The impact of psychological risk or protective factors on aging trajectories towards frailty are studied: e.g., the role of cognitive reserve, psychological resilience, emotional regulation, and personality traits on neurocognitive, physical, and functional performance in the “frail” elderly through multidisciplinary assessment and intervention.

Prevention strategies for better health and wellness, to promote active living in aging are the premises for designing and validating interventions aimed at contrasting psychological risk factors and reinforcing psychological protective factors (e.g., cognitive reserve) to avoid dysfunctions and maladaptive behaviors.

Action-research models will be addressed at enhancing the epigenetic factors of elderly, and at fostering the empowerment of families and caregivers.

The effectiveness of interventions will be evaluated, using a multidisciplinary approach integrating different professionals and procedures, and assessing the usefulness of technologies based on Artificial Intelligence.

Abstract 1668

LONELINESS EXPERIENCES AND COPING STRATEGIES AMONG COMMUNITY-DWELLING OLDER ADULTS: A QUALITATIVE STUDY

Sun Y.*[1], Gu J.[2], Tang T.[1], Mo P.[1]

[1]The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]Sun Yat-sen University ~ Guangzhou ~ China

Introduction: Loneliness is a negative emotional reaction to perceived isolation and has detrimental impacts on both physical and mental health among older adults. A complete understanding of the loneliness experienced by older adults is essential for the development of effective and patient-centered interventions.

Purpose: This study aimed to describe the loneliness experiences and coping strategies among community-dwelling older adults in China.

Method: One-on-one interviews were conducted among 28 community-dwelling older adults aged 60 to 84 years between April and June 2024. The interviews were audiotaped, literally transcribed, and then analyzed using thematic analysis, combining inductive and deductive methods.

Results: Both social and emotional types of loneliness were identified, with associated factors aligning closely with the perceived types of loneliness. Lack of social networks contributed to social loneliness, and unmet inner needs increased the feeling of emotional loneliness. Other factors associated with loneliness included lack of hobbies and personal arrangements, negative attitudes and personalities, declining physical health status, and financial challenges. Five patterns of daily routines were identified, which provided an outline of retirement life for Chinese older adults and the loneliness risks across different lifestyles. Cognitive strategies, including acceptance and endurance were used to mitigate loneliness. Behavioral activities were summarized to address loneliness. At the social level, friends, former colleagues, and old classmates were particularly suitable social networks for older adults to combat loneliness.

Conclusions: The study identifies that loneliness existed with complexity and heterogeneity among older adults. To address loneliness, it is critical to offer patient-centered programs that promote social connections and change cognitions.

Abstract 1886

REPRESENTATION OF OLDER INDIVIDUALS: NEWS FRAMING OF SENIOR TRAVEL CONCESSION ON FACEBOOK

Szeto S.*[1], Chan S.[1], Ye F.[2], Fung K.Y.[1], Chan S.[1]

[1]Saint Francis University ~ Hong Kong ~ Hong Kong, [2]HKU SPACE Community College ~ Hong Kong ~ Hong Kong

Active aging involves participation and social engagement. Older individuals in Hong Kong began to reintegrate into active lifestyles after the relaxation of COVID-19 social distancing measures. However, a news story emerged alleging abuse of the senior travel concession, known as HK$2 fare, which went viral on Facebook – a platform where approximately 50% of Hong Kong people consume news. Existing literature indicates that news framing could shape societal perceptions. Yet, the impact of the news representation on older individuals using the concession, particularly its potential role in perpetuating ageism, remains largely unexplored. The present research aims to examine how older individuals were portrayed in the narratives of such news.

Methodology: A commercial web crawler from Apify - Facebook Post Search Scraper - was used to scrape publicly available Traditional Chinese Facebook posts regarding the concession, with 15 Chinese search terms equivalent to “senior travel concession” and “HK$2 fare”. Data collection targeted posts from local Hong Kong news media pages starting from 28th February 2023, coinciding with the lifting of the COVID-19 mask mandate. A mixed-method content analysis was conducted on the extracted data, including quantitative word frequency analysis and qualitative thematic analysis.

Preliminary findings: A total of 1,915 posts were scraped. After filtering out duplicates (N = 701), non-news Facebook pages (N = 910), and irrelevant posts (N = 44), 260 valid posts remained for examination. The findings showed that negative narrative was predominantly used in the posts, such as “deficit”; “Hong Kong faces challenges with an aging population and suboptimal post-COVID economic recover”; and “government subsidy expenditures are largely increased”. Such negative frames might contribute to negative societal attitudes towards older individuals.

Conclusion: The negative portrayal of older individuals might reinforce alleging abuse of the senior travel concession while ignoring positive impacts of the concession on active aging.

Abstract 1771

HIGHER MARITAL SATISFACTION BETTER COGNITIVE FUNCTION ? EVIDENCE FROM A MULTI-WAVE LONGITUDINAL STUDY AMONG OLDER ADULTS

Yang X.*, Li J., Wang D.

Beijing Normal University ~ Beijing ~ China

Existing research shows inconsistent findings on the relationship between marital satisfaction and cognitive functions in later life . Focusing on different domains of cognition and a longitudinal perspective, this study aims to examine long-term changes of cognitive functions in older adulthood and the role of marital satisfaction in these changes. Latent curve modeling (LCM) was applied to six-year longitudinal data from 751 older adults (Age = 67.62 ± 5.31), assessed every two years. Cognitive functions was assessed across five distinct domains: word fluency, verbal ability, backward digit span, numerical comparison speed, and associative learning. Results revealed that:(1) marital satisfaction, backward digit span, and verbal ability declined significantly over time, while associative learning showed a significant increasing trend. (2) The marital satisfaction has a long-term process effect on cognitive functions. Specifically, the long-term process of marital satisfaction was negatively associated with the long-term process of word fluency and verbal ability. In addition, the initial level of marital satisfaction was positively associated with the the long-term process of word fluency, but negatively associated with that of backward digit span. This study revealed the developmental trajectories of marital satisfaction and cognitive functions and their changing associations over time. The findings provide a new perspective on existing debates by examining different domain of cognition longitudinally and highlight how distinguishing unique domains of cognitive functions allows for a more comprehensive understanding of the relationship between marital satisfaction and cognitive functions.

HEALTH AND FUNCTION IN OLDER ADULT POPULATIONS

Friday 24 July 2026 from 14:30 to 15:30

(M-Lorenese)

Elias Mpofu (College of Health and Public Service, Un), Chair and Discussant

The aging process at older adulthood is associated with bio-physical changes that require appropriate management for healthy aging. Undergirdingthesechangesarephysicalhealth2 processes that may escalate into acute health care needs and risk for premature mortality if not attended to. Moreover, while cardiovascular conditions are widely acknowledged to drive health and function in older adult populations, this symposium is presents novel approaches to unraveling their mediation by antecedent pre-existing conditions, oral hygiene, and cancer survivorship and in predicting hospitalizations outcomes. This symposium is relevant to the international research scholarship goals of the Congress in presenting evidence on older adults health populations from Australia, South East Asia and the United States. Elias Mpofu et al. will present the weighted evidence on sacral ulcer risk among older adults (60 years >) with emergency hospitalization for acute health conditions. Cheng Yin et al will consider COVID-19 hospitalization outcomes for older adults with neurodevelopmental disorders (55 years >) by their cardiovascular health. Liang Ke et al., will present the evidence on the role of cardio-metabolic conditions and Vitamin D deficiency in health statuses of older adults (60 years >). The presentation by Kaye Brock et al. consider the role of hypertension in older adults (50 years >) with oral health conditions. Renata Komalasari et al present the evidence of cardiovascular health in middle to older adult (45 years >) cancer survivors' cognitive and everyday function. What the presentations achieve is a unique perspective on how cardiovascular health indicators vary among older adult health populations, so that "a one-size would not fit all" would be inappropriate. From this collection of studies, the symposium makes a novel contribution pointing to an apparent need for studies that apply hierarchical typologies of cardiovascular health indicators nested in older adult health populations by their social determinants for preventive or health promotive care.

Abstract 3923

SACRAL ULCER DEVELOPMENT IN HOSPITALIZED OLDER ADULTS: MODERATION BY AGE COHORT AND MEDIATION BY COMORBIDITIES INDEX SCORES AND LENGTH OF STAY IN HOSPITAL

Yin C.[1], Mpofu E.*[2], Brock K.[2], Li X.[3]

[1]College of Health and Public Service, University of North Texas, ~ Denton, TX USA ~ United States of America, [2]College of Health and Public Service, University of North Texas ~ Denton ~ United States of America, [3]School of Health Sciences, Southern Illinois University ~ Illinois ~ United States of America

Background and aims: Sacral ulcers (SUs) or pressure sores on the lower back and spine areas are a health risk with extended periods of bed confinement and prolonged immobility, as would be the case with rehabilitation hospitalization. Rehabilitation hospitals aim to provide treatment care for their recovery of functional abilities following illness or injury. Sacral ulcer risk outcomes vary among rehabilitation hospital older adults patients. We hypothesize that sacral ulcer risk outcomes with rehabilitation hospitalization would vary by their age, comorbid health conditions and length of stay in hospital. Methods: Utilizing a retrospective cohort analysis, we sampled 1,290 patients aged 60+ with SUs and 37,626 patients without SUs from the Texas Inpatient Public Use Data File. The data analysis included Binary logistic regression for moderation and mediation effects on SU outcomes. For the moderation effects by age cohort, the 60-69 years old was the reference group and by 10 year age incremental up to 90+ years. The mediation analysis employed weighted comorbidity index scores and length of hospital admission. Results: As would be expected, hospital admission significantly increased SU risk (AOR = 2.13, 95% CI: 1.85-2.42), and with longer length of stay. Surprisingly, comorbidities had a minimal effect on SU risk while patients aged 80+ had a lower SU risk than those aged 60-69.

Conclusion and implications: Admission for hospital stay singularly presents high risk for SUs regardless of older adult patient characteristics. Rehabilitation hospitals should address care practices for minimizing SU risk for older adult, and particularly with extended stay. Such targeted care plans would minimize SU risks by the vulnerabilities of older age and comorbidities.

Abstract 3925

THE ASSOCIATION BETWEEN HYPERTENSION AND ORAL HYGIENE IN OLDER AUSTRALIANS ATTENDING PUBLIC DENTAL CLINICS

King S.[1], Marschner S.[1], Chow C.[1], Brock K.*[2]

[1]Sydney Dental School and the Westmead Applied Research Centre ~ Sydney ~ Australia, [2]New South Wales Cancer Council ~ Sydney ~ Australia

Background and aim: Poor oral hygiene and oral disease are associated with an increased risk of hypertension. For this older population public dental clinics offer a unique opportunity to screen for hypertension and provide primary prevention. This study aimed to characterize the oral disease burden among older adults and to determine the prevalence, awareness, treatment and control of hypertension in a population attending a large public dental clinic.

Method: Participants (n=302) were adults (mean age 59.9 ± 9 years, 60.7% female) recruited from a public dental clinic located in Western Sydney, Australia. Blood pressure was measured with an automatic digital device (Omron HEM-907®) with the participant in the seated position after resting in the dental chair for 5 minutes. Oral health and medical history details were obtained by patient self-reporting.

Results: A total of 302 participants, were recruited. Over a third (33.1%) had significant tooth loss (< 20 teeth), nearly half (49.5%) were identified as needing treatment for gum disease and less than half (47.5%) brushed their teeth twice or more time per day. The prevalence of hypertension was 74% (95% CI: 66%, 81.%) in those >65 compared to 28% (21% CI: 36%, 81.%) In those younger... Of those with hypertension (n=157), 82.7% were aware of their diagnosis, 76.9% were receiving antihypertensive medication (treated), and 56.5% of those on medication had their blood pressure controlled.

Conclusion and Implication: Oral health practitioners could play an important role in primary care by screening patients with a high burden of oral disease for undiagnosed or poorly controlled hypertension. By providing preventive care targeting common risk factors shared by oral disease and hypertension, older adults would have improved health prospects.

Abstract 51

PSYCHOMOTOR FINGER-TAPPING ACROSS THE LIFESPAN AMONG SYMPHONY ORCHESTRA PLAYERS; RESILIENCE TO THE EFFECTS OF AGEING

Brodsky W.*

Ben-Gurion University of the Negev ~ Beer-Sheva ~ Israel

Introduction
Lifespan Psychology scrutinises timing of fine motor movements; rhythmic control and tapping asynchrony are more variable with age-related changes to executive functions. It is assumed that certain skills may not show age-related decline because of domain-specific practice. For example, despite ageing musicians should retain finger-tapping speed, reaction time, and hand-symmetry (i.e., lack of right-hand superiority among right-hand dominant musicians).

Purpose
The current study compared between Younger Players versus Seasoned Musician.

Methods
N = 38 professional Symphony players from 5 orchestras in 3 countries participated. There were 23 String players, 12 Wind (Woodwinds and Brass) players, 2 Harp players, and 1 Xylophone player. They were roughly 49 years old (SD = 9.87, Range 27-64), with 23 (61%) males. Each player completed 5, 30-second, isochronous finger-tapping tasks: self-paced tapping at spontaneous and preferred rates, speeded uni-manual single-finger tapping (right and left hand), and bi-manual alternate-hand finger-tapping. To tease out differences between younger versus seasoned musicians, 2 subgroups were compared: LTE45 (n = 13, MAge = 37, SD = 6.39, Range 27-44) versus GTE55 (n = 14, MAge = 58, SD = 2.83, Range 55-64).

Results
Seasoned musicians performed all finger-tapping tasks just as fast as younger players, and they were just as consistent. Spontaneous tempos were moderate (83bpm) pace, while preferred tempos were slightly faster (88bpm); no significant differences surfaced between subgroups. Uni-manual forced-speeded finger-tapping for both hands were between 326bpm-347bpm, consisting of 157-177 extremely controlled stable taps (i.e., SDs of ITIs). Bi-manual alternating-hand forced-speeded finger-tapping was between 450bpm-500bpm; these were significantly more variable than uni-manual tapping. Music-instrument training-induced symmetry was found for all players.

Conclusions

Comparative studies with normal older adults indicate a systematic age-related decline in cognitive mechanisms including tapping rates. This is not the case for seasoned musicians beyond the 5th decade.

Abstract 1022

EXAMINING THE LINK BETWEEN GERIATRIC FALLS, INSOMNIA, AND WORKING MEMORY IN THE ELDERLY POPULATION

Tiwari T.*[1], Raj N.[1], Singh A.L.[2]

[1]Cognitive Science Laboratory, Department of Psychology, Banaras Hindu University ~ Varanasi ~ India, [2]Department of Psychology, Vasanta Kanya Mahavidyalaya, College admitted to the privileges of Banaras Hindu University, Kamachha ~ Varanasi ~ India

As individuals age, they often encounter a diverse range of challenges, including physical health, mental health, and social issues. One such concern is insomnia, a prevalent problem among older adults. Insomnia manifests as the inability to fall asleep, stay asleep, or obtain adequate sleep, resulting in daytime fatigue and other adverse consequences. Research has established a strong association between insomnia and geriatric falls among older adults. Geriatric falls occur involuntarily when older adults come to rest on the ground without any intentional action. These falls can lead to severe or minor injuries, and in rare cases, even death. Furthermore, older age is also associated with cognitive deficits, particularly in working memory. Working memory temporarily holds and manipulates information that helps in problem solving, reasoning and learning. A comprehensive review conducted for the present study revealed a correlation between insomnia and not only geriatric falls but also with working memory. Older individuals experiencing insomnia exhibit a significantly higher incidence of falls and a higher risk of falling. Additionally, studies also showed an association between a decline in working memory and insomnia. The primary objective of the present study is to establish a link between geriatric falls, insomnia, and working memory among the older adult population. The study aims to underscore the importance of screening for sleep disorders and cognitive deficits during routine geriatric assessments. By investigating the relationship between geriatric falls, insomnia, and working memory, the study has the potential to revolutionise our understanding of fall prevention, management, and treatment among older adults. This knowledge can ultimately enhance health outcomes and improve the quality of life in an aging society.

Abstract 617

FINANCIAL CYBERCRIME AGAINST OLDER ADULTS IN INDIA: EXPLORING THE RISK FACTORS, CONSEQUENCES AND COPING STRATEGIES

Sharan A.*

Independent Researcher ~ Patna ~ India

Although cybercrimes in India have been a major concern for the persons of all ages, there is a surge of financial cybercrime against elderly resulting in huge financial loss and declined mental health. More often cybercriminals have appeared themselves as government authorities and have digitally arrested (forcing the victim to be constantly on a videocall with a cybercriminal) elderly persons for durations ranging from few hours to many days. However, most of these cases are not reported to police and law enforcing authorities. The trauma of crime, financial loss and the associated stigma and guilt often results in mild to severe mental health consequences among these elderly persons.

This study, therefore, was conducted to understand the risk factor and consequences of financial cybercrime and to explore the use of coping strategies by older adults. A sample of 28 older adults (9 older adults who had been the victims of cybercrime and 19 friend or close associate of such victims) participated in this study. Semi-structured interviews were conducted to record their experiences related to cybercrime. The results of the thematic analysis of the interviews reveals that factors such as cognitive decline, limited understanding/skills about cybersecurity measures, elevated fear about being the victim of fraud, social isolation, lack of the availability of immediate support, wealth and insider fraud are some of the salient risk factors while loss of money, guilt, social isolation, decline in physical and psychological and physical health were the major consequences of such experiences. Participants reported passive strategies such as attribution to fate, God will and karma as means of coping while few participants also reported using legal means and strengthening their knowledge about cybersecurity as coping measures. These results are important as they warrant for the initiatives to benefit older age groups mitigate risks of financial cybercrime.

PSYCHOLOGICAL DISTRESS AMONG OLDER MEN WHO HAVE SEX WITH MEN IN HONG KONG AND MAINLAND CHINA: A CROSS-SECTIONAL INVESTIGATION INTO THE INTERPLAY OF SOCIOECONOMIC STATUS, DISCRIMINATION, AND SOCIAL CAPITAL

Chan A.S.W.*[3], Nestor A.[2], Wong F.[4], Ku H.B.[1], Yan E.[1]

[1]The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [2]University of Essex ~ Essex, ~ United Kingdom, [3]Hong Kong Baptist University ~ Hong Kong ~ Hong Kong, [4]Factor Inwentash School Of Social Work, University of Toronto, Canada ~ Toronto ~ Canada

Background: This cross-sectional study investigated psychological distress among older men who have sex with men (OMSM) in Hong Kong and Mainland China (N = 302; 151 participants per region).

Objectives: This study aimed to investigate the prevalence and determinants of psychological distress among OMSM in Hong Kong and Mainland China. Specifically, it examined how socioeconomic status, social capital, and experiences of discrimination contribute to mental health outcomes within this population.

Methods: This cross-sectional study was conducted in 2022 using an anonymous online survey of 302 OMSM, with 151 participants recruited from Hong Kong and 151 from Mainland China. Eligible participants were aged ≥60 years, had a history of male-to-male sexual intercourse, resided in one of the study regions, and demonstrated Chinese language literacy. Recruitment was carried out through partnerships with LGBT organizations, NGOs, and academic institutions using convenience, snowball, and targeted sampling. Data were analyzed using descriptive statistics, chi-square tests, t-tests/ANOVA, and hierarchical logistic regression to assess associations between psychological distress and socioeconomic status, social capital, and discrimination.

Results: Two predictors emerged as particularly robust. Higher monthly income (>HK$18,700) was consistently associated with elevated psychological distress (OR = 2.82). Most notably, everyday discrimination showed the strongest effect: each unit increase on the Everyday Discrimination Scale (EDS) corresponded to a 17% increase in the likelihood of distress (OR = 1.17), accounting for 35.9% of variance explained. Once discrimination was included, previously significant predictors such as education and social capital lost significance, underscoring its central role in OMSM mental health outcomes.

Conclusions: Discrimination was identified as the principal determinant of psychological distress among OMSM, outweighing traditional socioeconomic and social factors. These findings emphasize the need for targeted interventions to mitigate minority stress in aging sexual minority populations, with sensitivity to regional sociocultural contexts.

Abstract 1642

'HEARTS IN DIALOGUE': THE ROLE OF THE PARTNER AND HEALTHCARE TEAM IN ACTIVATING ELDERLY CARDIAC PATIENTS

Donato S.*[1], Demaria C.[1], Gioia C.[1], Gorini A.[2], Bussotti M.[2], Bertoni A.M.M.[1]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Istituti Clinici Scientifici Maugeri IRCCS ~ Milano ~ Italy

Introduction: Cardiovascular diseases particularly affect the population over 65, representing a complex challenge both for patients and their partners.
Aim: This study explored how patient activation in older adults during the rehabilitation process and post-discharge is associated with partner reactions (i.e., pessimism about the illness, overprotection, hostility, support for activation, dyadic appraisal of the illness, and shared coping), as well as with the quality of the relationship with healthcare professionals (i.e., clarity of information received, relationship satisfaction, and the quality of the partner–physician relationship).
Method: A longitudinal dyadic design was adopted. 86 couples participated at the start of rehabilitation, and 62 patients were reassessed at discharge using a multidimensional questionnaire.
Results: Results showed that, at admission, patient activation was significantly higher when the partner displayed lower pessimism, lower overprotection, and a greater tendency toward shared coping. These associations were not significant at discharge; however, significant associations emerged between patient activation and the partner's support for engagement in care, as well as dyadic appraisal of the illness. Regarding healthcare professionals, satisfaction with nursing staff and the cardiologist was found to be correlated with patient activation. These associations were not significant at discharge.
Conclusions: Overall, the results suggest that the couple's relationship and the therapeutic alliance with the healthcare team change during rehabilitation, contributing in different ways to patient activation. The findings highlight the importance of tailored interventions that take into account dyadic and relational dynamics throughout the entire rehabilitation process.

Abstract 1498

A MEDIATING ROLE FOR FUTURE ORIENTATION IN ASSOCIATIONS BETWEEN ATTITUDE TOWARDS AGING AND IMPULSIVITY IN YOUNG ADULTS

Wang X.*, Li T.

The Chinese University of Hong Kong, Shenzhen ~ Shenzhen ~ China

Attitude towards aging (AtA) is related to young adults' future expectations, which could also influence their current behaviors. Impulsivity is a risk factor related to a number of health concerns in young adulthood. The current study investigated how AtA was related to young adults' impulsive behaviors and explored whether future orientation was a mediator. A total of 371 Chinese young adults were recruited and completed a survey on their demographic characteristic, AtA, consideration of future consequences (CFC) and impulsiveness. The results showed that AtA had a significant negative curvilinear relationship with impulsiveness (β = -.02, p = .03). Notably, participants with very positive or very negative AtA both reported lower impulsiveness level compared with those who were in the middle. Furthermore, CFC mediated this curvilinear relationship (β = -.02, p = .03). There was a significant curvilinear relationship between AtA and CFC (β = .08, p < .001), with both very positive and very negative AtA related to higher levels of CFC. Higher CFC was further related to lower impulsiveness. The results suggest that young adults holding very positive or very negative AtA are both concerned about their future and are more capable of restraining from impulsive behaviors. The inverted U-shaped pattern between AtA and young adults' impulsiveness provides a new perspective to understand the role of AtA in early adulthood. Future studies could further investigate the different motives driving the future orientation for young adults with either positive or negative AtA.

08 - Division 8: Health Psychology

PSYCHOLOGICAL RESILIENCE PROMOTION IN YOUTH: A BIOPSYCHOSOCIAL-ECOLOGICAL PERSPECTIVE

Wednesday 22 July 2026 from 08:00 to 09:00

(E- Spadolini)

Cheuk Chi Tam (Arnold School of Public Health, Univers), Chair

Psychological resilience has emerged important for mitigating negative stress influences and promoting psychosocial or behavioral health outcomes among youth exposed to long-term crisis. The emerging trajectory of resilience research embraces a novel perspective of the biopsychosocial-ecological systemic model, underscoring the integrative approaches that collaborate factors from a wide range of domains, from the intrapersonal systems (e.g., neurological and cognitive), external systems (e.g., social and community), to extra-personal systems (e.g., natural).

By gathering recent empirical findings from youth across diverse cultural contexts (i.e., African, Asian, and American), the symposium will present evidence in resilience promotion in line with the biopsychosocial-ecological perspective. Topics include the risk exposure in terms of climate change, COVID-19, HIV, economic inequality, and adverse early childhood experiences. Presentation will cover theoretical and clinical studies demonstrating how resilience could be improved through promotive and protective factors from various levels, including political (Presenter 1 [Dr. Sherr]; e.g., good referral mechanisms and poverty alleviation), interpersonal/family (Presenter 2 [Dr. Harrison]; e.g., neighborhood assets and social communication), intrapersonal/cognitive (Presenters 3 & 4 [Drs. Du & Zhou]; shift-and-persist coping strategies and self-compassion), and neurological (Presenter 5 [Dr. Lin]; brain network connectivity).

Abstract 3895

PROMOTION OF INDIVIDUAL AND COMMUNITY PSYCHOLOGICAL RESILIENCE IN THE AFTERMATH OF WILDFIRES

Harrison S.*

Department of Psychology, University of South Carolina ~ Columbia, SC ~ United States of America

Climate change is rapidly increasing the frequency, intensity, and duration of wildfires, resulting in stress, anxiety, and trauma exposure for individuals in affected communities. In addition, even brief exposure to harmful fine particulate matter (PM2.5) from wildfires has serious negative health consequences and contributes to unique psychosocial challenges (e.g., social isolation, difficulty accessing needed mental health services). This presentation will examine psychological impacts of wildfire and wildfire smoke exposure, including acute and long-term mental health impacts. We will review extant literature and recent empirical findings to inform best practices for building resilience in the wake of wildfires. Specifically, we will share findings from a recent study we conducted to investigate associations between wildfire exposure and mental health among California households. This study integrated high-resolution satellite data on wildfire points, exposure to wildfire smoke (i.e., harmful levels of PM2.5), and symptoms of anxiety and depression. Using two-way fixed effect logit models, we show that exposure to >10 days of elevated wildfire-driven PM2.5 nearly doubles a household's probability of having a family member experience symptoms of depression and anxiety in the following year.

Given these impacts, we will next share a conceptual framework of psychological resilience that has been adapted for wildfire response. The framework highlights the importance of understanding pre-existing vulnerabilities of individuals and communities and promoting socio-ecological factors that facilitate individual and community resilience. Resilience promotion is conceptualized as mobilizing three key resource domains: 1) individual assets (e.g., awareness and knowledge, motivation for response), 2) interpersonal/family resources (e.g., social supports, communication), and 3) community resources (e.g., social services, neighborhood assets). We will discuss how this resilience framework can be adapted to the unique nature of wildfire disaster, and we will describe practical strategies across these three resilience domains that can be used to support post-wildfire psychological disaster response.

Abstract 3896

SHIFT-AND-PERSIST STRATEGIES MITIGATE THE NEGATIVE ASSOCIATION BETWEEN PERCEIVED ECONOMIC INEQUALITY AND ADOLESCENT MENTAL HEALTH

Du H.*

Department of Psychology, Beijing Normal University ~ Zhuhai ~ China

Adolescents face increasing mental health challenges amid rising economic inequality. We posit that shift-and-persist strategies—an effective coping approach that involves adapting one's mindset to reinterpret stressors positively while maintaining resilience—would mitigate the negative effects of perceived economic inequality on adolescents' mental health. Using data from 4,760 middle school students in China, we tested this hypothesis. We found that perceived economic inequality of adolescents predicted higher levels of anxiety and depression. More importantly, as hypothesized, shift-and-persist strategies significantly attenuated the negative association between perceived economic inequality and both anxiety and depression. Our findings suggest that shift-and-persist strategies may protect adolescent mental health against economic inequality. This research provides valuable guidance for future research and educational practices on adolescent mental health.

Abstract 3898

PSYCHOLOGICAL RESILIENCE MODERATES THE RELATIONSHIP BETWEEN CHILDHOOD ADVERSITY, BRAIN NETWORK CONNECTIVITY, AND WELLNESS

Li Y.*, Lin D.

Institute of Developmental Psychology, Beijing Normal University ~ Beijing ~ China

Background: Although childhood adversity has a lasting negative effect on individuals' well-being, children with high psychological resilience can buffer against these negative impacts. However, the brain mechanism underlying the protective role of psychological resilience remained unknown, especially concerning different adversity dimensions. Therefore, this study aimed to investigate how psychological resilience shielded children's brain network connectivity against different dimensions of adversity (e.g. abuse and neglect) and evaluated the immediate and long-term benefits of this protection on mental and physical health.

Methods: Childhood adversity history, and psychological resilience with functional MRI scanning were obtained from 94 China rural children aged between 10 and 14 years old at baseline. Moreover, baseline and six months later somatization symptoms, depression, and anxiety were collected.

Results: The results showed that psychological resilience buffered the effect of childhood abuse, but not neglect, on resting-state functional connectivity (rs-FC). Specifically, children with low psychological resilience had increased limbic-somatomotor network (LN-SMN) and limbic-ventral attention network (LN-VAN) connectivity after abuse. In contrast, this association was absent in individuals with higher psychological resilience. Furthermore, among children with lower psychological resilience, childhood abuse was linked to severe concurrent somatization and depressive symptoms through heightened LN-SMN connectivity and to severe six-month-later anxiety via both heightened LN-SMN and LN-VAN connectivity.

Conclusion: The results identified the specific protective effect of psychological resilience against the neurotoxic effects of childhood abuse but not neglect, involving emotion regulation, salience processing, and somatomotor networks. These findings highlight that individualized interventions should be provided to children facing different adversities.

Family, Couple & Caregiving Processes in Health

Wednesday 22 July 2026 from 08:00 to 09:00

(S-Monumentale)

Division 8: Health Psychology Division 6: Clinical and Community Psychology SDG 3: Good Health and Well-being

Abstract 1149

PSYCHOSOCIAL DETERMINANTS OF TREATMENT ADHERENCE IN CHRONIC DISEASE COMPLICATIONS: THE ROLE OF CAREGIVERS IN ROMANIA

Farcas A.M.*[1], Gavan N.A.[2], Popescu Codruța A.[3], Nasui B.[1], Bala C.[1]

[1]Iuliu Hatieganu University of Medicine and Pharmacy ~ Cluj-Napoca ~ Romania, [2]Worwag Pharma ~ Cluj -Napoca ~ Romania, [3]University of Medicine and Pharmacy "Iuliu Haţieganu" ~ Cluj-Napoca ~ Romania

Background

Social determinants of health (SDH), such as caregiver support, strongly influence chronic disease management. Within the biopsychosocial model, caregivers act as social enablers of preventive behaviors and treatment adherence. In Romania, where a complication like diabetic neuropathy is underdiagnosed and prevention culture is weak, the "Stand up for your feet" campaign aimed to raise awareness and improve outcomes. This study examined how caregiver awareness, preventive practices, and campaign recall contribute to patient adherence and health outcomes.

Methods

A cross-sectional analysis was conducted using data from the "Stand up for your feet" campaign evaluation (N=1,133; 760 sufferers, 373 caregivers). Key outcomes included awareness of diabetic neuropathy, preventive foot care (QU2 items), treatment adherence (QS9), and digital engagement (QM2). Comparisons used chi-square tests and independent t-tests.

Results

Awareness of diabetic neuropathy was higher in caregiver-supported households (33% vs. 25%). Patients with caregivers reported more preventive foot checks (62% vs. 50%), and self-examination was more common (64% vs. 47%). Treatment adherence was significantly greater in caregiver-supported sufferers (52% vs. 37%; $\chi^2=7.8$, $p < .01$). Caregivers were more digitally active (M=1.52 vs. 2.98; $p < .001$), facilitating health information seeking and campaign recall. Preventive behavior scores were slightly higher in sufferers than caregivers (M=2.33 vs. 2.07; $t=6.39$, $p < .001$), but caregiver presence clearly improved sufferers' health outcomes.

Conclusions

Caregivers significantly improve patients' treatment adherence, preventive foot care, and disease awareness, acting as a protective social determinant of health. Their younger age, higher income, and stronger digital engagement position them as essential allies in chronic disease prevention. Public health campaigns and interventions should systematically engage caregivers to maximize health outcomes in

patients.

Abstract 1499

PREDICTIVE EFFECT OF FILIAL RESPONSIBILITY ON COPING IN DEMENTIA CARE: A VIGNETTE-BASED STUDY

Salduz M.*, Durak Batigün A.

Ankara University ~ Ankara ~ Turkey

Introduction

The increased prevalence of dementia globally is associated with greater dependence on others, resulting in higher caregiver involvement. Dementia caregivers frequently report exhaustion, poor physical and mental health, and psychological distress.

Purpose

Despite caregivers' burdens, research also highlights positive aspects of caregiving through higher filial responsibility—adult children's responsibility to care for parents—on caregiver outcomes. This study aimed at how filial responsibility predicts coping styles in general population.

Method

A total of 246 participants (aged 20–66; M = 36.29, SD = 10.86) were recruited online via snowball sampling. A vignette was developed to depict a parent with moderate dementia and an adult child caregiver. An expert panel confirmed its validity, and a pilot test (n = 10 study participants) supported its realism, clarity, and usability. Hierarchical regression was conducted in IMB SPSS 24: Step 1 included socio-demographic variables and illness perception (α = .50), and Step 2 added filial responsibility (α = .92). Dependent variables were effective and ineffective coping (α = .80 & .75).

Results

Regression assumptions were met, except for a few multivariate outliers. However, Cook's distances were below 0.5 in all data set and sensitivity analyses showed negligible impact after removing the outliers. The only statistically significant effect was seen for effective coping. After controlling covariates, [$F(14,231) = 5.29$, $p < .001$, $R2 = .243$], addition of filial responsibility expectation added 3.4% [$F(1,230) = 10.67$, $p = .001$, $\Delta R^2 = .034$], concluding higher filial responsibility predicts higher effective coping.

Conclusions

In collectivistic societies such as Türkiye, filial responsibility is expected to be high, particularly in caregiving contexts. However, research on this issue within the Turkish literature is scarce. This paper not only addresses this limitation but also serves as a pioneer for future investigations, further recommending the integration of filial responsibility into psychosocial support interventions for caregivers.

Abstract 4240

GENERATIVE AI FOR QUALITATIVE ANALYSIS IN A MATERNAL HEALTH STUDY: CODING SEMI-STRUCTURED INTERVIEWS USING LARGE LANGUAGE MODELS (LLMS)

Qiao S.*

University of South Carolina, Arnold School of Public Health, Department of Health Promotion, Education, and Behavior ~ Columbia, South Carolina, ~ United States of America

Semi-structured interviews are one of the most widely used approaches for qualitative studies in public health. The coding of transcripts is a critical step for information extraction and preliminary analysis. However, manual coding is often labor-intensive and time-consuming. The emergence of generative artificial intelligence (GenAI), supported by Large Language Models (LLMs), presents new opportunities to understand human languages, which may significantly facilitate the coding process. This study aims to build a computational coding framework that uses GenAI to automatically detect and extract themes from semi-structured interview transcripts. We conducted an experiment using transcripts of semi-structured interviews with maternity care providers in South Carolina. We leveraged ChatGPT to perform two tasks automatically: (1) deductive coding, which involves applying a predefined set of codes to dialogues; and (2) inductive coding, which can generate codes from dialogues without any preconceptions or assumptions. We fine-tuned ChatGPT to understand the content of the interview transcripts, enabling it to detect and summarize codes. We then evaluated the performance of the proposed approach by comparing the codes generated by ChatGPT with those generated manually by human coders, involving human-in-the-loop evaluation. The results demonstrated the potential of GenAI in detecting and summarizing codes from in-depth interview transcripts. ChatGPT could be utilized for both deductive and inductive coding processes. The overall accuracy of GenAI is higher than 80% and the codes it generated showed high positive associations with those generated manually. More impressively, GenAI reduced the time required for coding by 81%, demonstrating its efficiency compared to traditional methods.

Abstract 4778

An Evaluation of Parental Beliefs in Abuse Myths within the Framework of Sexual Communication Levels, Digital Parenting Skills, and Belief in a Just World

Güngör Ç.*, Şen PakyÜrek G.

Manisa Celal Bayar Üniversitesi ~ Manisa ~ Turkey

Background: Child sexual abuse (CSA) remains a critical global and local issue, with judicial cases in Turkey doubling between 2015 and 2023. This study investigates the psychosocial mechanisms that contribute to the secrecy and prevalence of CSA. Specifically, it examines how ebeveyn (parental) beliefs in CSA myths—scientifically unfounded but widely held stereotypes—influence sexual communication skills and digital parenting awareness.
Method: The study utilized a relational survey model with a sample of 362 parents living in Turkey who have at least one child aged 6–12. Data were collected using the:
•Childhood Sexual Abuse Myth Scale – Parent Form
•Parental Sexual Communication Scale
•...Digital Parenting Awareness Scale
• General Belief in a Just World Scale
The complex interactions were analyzed using the Hayes PROCESS Macro (Model 14), positioning CSA myths as the independent variable, sexual communication as the dependent variable, digital parenting as the mediator, and Just World Belief (JWB) as the moderator.
Results (Primiry Findings)
Based on the initial analysis of the 362 participants, the following preliminary results were obtained:
Negative Correlation with Communication: There is a significant negative relationship between CSA myth acceptance and sexual communication skills. As parents' belief in myths (e.g., "children invite abuse") increases, their ability to establish open, age-appropriate sexual communication decreases. Impact on Digital Parenting: Higher belief in CSA myths is associated with lower digital parenting skills. Parents who subscribe to these myths are less likely to effectively monitor and protect their children from online risks such as cyber-grooming or exposure to inappropriate content. The Role of Just World Belief (JWB): Preliminary data supports the hypothesis that parents with a high General Just World Belief are more likely to endorse CSA myths. This suggests that the psychological need to see the world as "fair" leads to cognitive distortions like victim-blaming and the denial of abuse frequency. Moderated Mediation (Model 14): Initial findings indicate that JWB acts as a significant moderator in the relationship between digital parenting and sexual communication. The effectiveness of digital awareness in facilitating better home communication is conditioned by the parent's underlying belief in a just world. Barriers to Disclosure: Myths such as "stereotyping the perpetrator" (e.g.,

believing married or "clean-cut" people don't abuse) continue to pose a significant risk by creating a false sense of security, which hinders parents from recognizing actual threats.

Conclusion

These preliminary findings suggest that intervention programs should not only focus on providing information but also on dismantling CSA myths and addressing deep-seated psychological beliefs like Just World Belief. Enhancing both digital awareness and sexual communication is vital to breaking the cycle of secrecy surrounding child abuse in the digital age.

The current study, conducted with 362 parents, provides critical insights into the psychosocial barriers to child sexual abuse (CSA) prevention in Turkey. The findings primarily demonstrate that CSA myths function as a significant cognitive barrier, negatively predicting both sexual communication skills and digital parenting strategies. This suggests that when parents subscribe to scientifically unfounded stereotypes—such as the belief that children "invite" abuse or that perpetrators are always "strangers"—they become less equipped to engage in protective dialogues or monitor digital risks effectively.

Theoretical Implications: The Paradox of Just World Belief

A pivotal finding of this research is the role of General Just World Belief (JWB). While JWB often serves as a motivational resource for individuals, in the context of CSA, it appears to act as a cognitive distortion. Parents with high JWB are more likely to endorse CSA myths as a way to maintain the perception of a "predictable and controllable" world. By attributing blame to victims or minimizing the prevalence of abuse, these parents protect their own sense of security but inadvertently leave their children vulnerable by failing to recognize actual threats. This confirms that JWB moderates the relationship between digital awareness and protective communication, suggesting that high levels of JWB can "blind" parents to the necessity of proactive intervention.

Practical Implications for Applied Psychology

As an applied psychology study, these results offer a framework for evidence-based interventions:

Shifting Parental Education: Prevention programs should move beyond merely providing information about "stranger danger." Instead, they must actively target and dismantle CSA myths.

Digital Literacy as Protection: Since digital environments have made abuse more "invisible" and widespread, enhancing digital parenting awareness is no longer optional—it is a primary protective strategy.

Holistic Communication: Training should emphasize that sexual communication involves more than just "the talk"; it includes non-verbal cues, body language, and creating a safe emotional climate for disclosure.

Global Impact and Sustainable Development Goals (SDGs)

By identifying the mechanisms that keep CSA hidden, this study directly contributes to the United Nations 2030 Agenda:

SDG 16.2 (Ending Abuse): The findings provide a roadmap for reducing the "secrecy"

and "denial" that allow abuse to persist, thereby supporting the global mandate to end all forms of violence against children.

SDG 3 & 4 (Well-being and Education): Empowering parents with accurate psychological knowledge and digital skills ensures the long-term mental health of the youth population and elevates the quality of informal education within the home.

In conclusion, the intersection of CSA myths, digital parenting, and Just World Belief creates a complex landscape for child protection. To break the cycle of secrecy, psychological interventions must address the deep-seated beliefs that prevent parents from acting as their children's first line of defense in both the physical and digital worlds.

Abstract 1233

RACIST EVENTS, RACE-BASED TRAUMATIC STRESS, AND MENTAL HEALTH SYMPTOMS AMONG IMMIGRANTS AND REFUGEES IN CANADA

Jin L.*, Zamudio G.

University of Calgary ~ Calgary ~ Canada

Background: Immigrants and refugees constitute over 23% of Canada's population and face disproportionate mental health challenges, including elevated symptoms of depression, anxiety, and posttraumatic stress disorder (PTSD). For marginalized groups such as immigrants/refuges, frequent exposure to racist events is a key predictor of these mental health outcomes, as repeated experiences of racism can undermine safety, belonging, and dignity. Prior research, including studies with Chinese immigrants, has shown that more frequent racist events are associated with higher levels of race-based traumatic stress symptoms (racial trauma), manifesting as anger, avoidance, intrusion, hypervigilance, and diminished self-worth. However, few studies have comprehensively examined the links among racist events, racial trauma, and mental health symptoms in Canadian immigrants/refugees. To address this gap, this study examines how racist events relate to mental health symptoms (PTSD, depression, anxiety) both directly and indirectly through racial trauma.

Methods: A sample of 181 immigrants and refugees in Canada completed self-report measures.

Results: The PROCESS Model 4 results indicated that racial trauma significantly explained the relationship between racist events and mental health outcomes, including PTSD (B = 0.35, CI [0.20, 0.56], depression (B = 0.11, CI [0.06, 0.18]), and anxiety (B = 0.12, CI [0.08, 0.17]). The model accounted for 20.56% to 45.68% of the variances in mental health outcomes.

Conclusions: Greater exposure to racist events increases the likelihood of experiencing racial trauma, which in turn contributes to elevated PTSD, depression, and anxiety symptoms. These findings highlight racial trauma as a distinct contributor to mental health disparities among immigrants and refugees. Clinicians, community organizations, and policymakers should integrate anti-racism strategies and racial trauma frameworks to better support the mental health of these populations.

Abstract 1737

MANIPULATED MINDS AT WORK: HOW GASLIGHTING SHAPES EMPLOYEE OUTCOMES – A SYSTEMATIC REVIEW

Kahraman F.*

Istanbul Kultur University ~ Istanbul ~ Turkey

Gaslighting is a form of psychological manipulation that has gained increasing attention in recent years and can occur across various types of relationships (e.g., romantic, familial, political, and organizational). In such dynamics, one or more gaslighters attempt to maintain power and control, while the target gradually loses confidence in their own perception of reality and begins to doubt themselves. Although gaslighting has been extensively studied in the context of romantic relationships, research on its presence and impact within workplace settings remains limited.

This study aims to systematically examine the effects of gaslighting in organizational contexts, following the PRISMA-P guidelines. A comprehensive search was conducted using the formula: (“gaslighting” OR “manipulation”) AND (“work” OR “workplace” OR “employee” OR “organization”). To identify studies from the last 10 years, 1,001 articles were retrieved from Science Direct, Scopus, and Google Scholar. After an initial screening of titles for relevance, and subsequent application of inclusion and exclusion criteria, 11 studies were ultimately reviewed. The findings indicate that workplace gaslighting is associated with a wide range of psychological outcomes (e.g., depression, well-being, aggression) and behavioral outcomes (e.g., engagement, turnover intention, motivation and performance).

This review is significant in that it provides the first systematic synthesis of employee outcomes associated with workplace gaslighting. As no comprehensive review has previously been identified, it is anticipated that this study will contribute to filling a critical gap in the literature.

Abstract 654

WHEN VIOLENCE MEETS RESILIENCE: MEANING IN LIFE, COHERENCE, AND SPIRITUALITY AS MODERATORS OF ANTIRETROVIRAL THERAPY ADHERENCE IN JOHANNESBURG

Phiri--Sithole L.*

University of Johannesburg ~ Johannesburg ~ South Africa

Intimate partner violence (IPV) negatively impacts antiretroviral therapy (ART) adherence among people living with HIV (PLWH); however, psychosocial resources may buffer this effect. This cross-sectional study examined whether meaning in life (ML), sense of coherence (SOC) and spirituality moderated the IPV-ART adherence relationship among 200 PLWH in Johannesburg, South Africa, a setting with high HIV and IPV prevalence. Participants completed measures of IPV exposure (Violence Against Women Instrument), ART adherence (ACTG adherence questionnaire), ML (Meaning in Life Questionnaire), SOC (SOC-13), and spirituality (Spiritual Well-Being Scale).

Participants were mostly women (67% women) with a mean age of 34.90 years (SD = 7.90). Average ART adherence was 79.0%, and 51.0% of participants reported experiencing IPV. Moderation analyses (Hayes' PROCESS macro) revealed a significant negative association between IPV and ART adherence ($b = -7.90$, $p = .007$). While ML's moderating influence was non-significant ($p = .069$), SOC significantly attenuated the IPV-adherence link ($b = 0.53$, $p = .013$). Spirituality demonstrated the strongest buffering effect ($b = 0.72$, $p < .001$), with high levels of spiritual well-being reducing the negative impact of IPV on ART adherence.

South Africa's strong affiliation with spirituality may account for its enhanced protective effect relative to the more individual-centred constructs of ML and SOC. Findings suggest that interventions leveraging spirituality (e.g., faith-based partnerships) and SOC (e.g., coping skills training) could enhance adherence among IPV-affected PLWH, particularly in high-stigma settings.

Abstract 1884

ALIGNING THEORY AND PRACTICE: A PRAGMATIC APPROACH TO CONDUCTING VOCATIONAL RESEARCH WITH VULNERABLE POPULATIONS

Smith N.*[1], Martinez L.[1], Graham B.[2]

[1]The University of Texas at Arlington ~ Arlington ~ United States of America, [2]The Pennsylvania State University ~ University Park ~ United States of America

An increasing proportion of the population is prone to “vulnerable work” or ‘precarious work that places people at risk of continuing poverty and injustice resulting from an imbalance of power in the employer-work relationship.’ Understanding the experiences of vulnerable workers has recently emerged as a research priority. By definition, these workers’ circumstances exacerbate the possibility of negative mental and physical health, vocational, and personal outcomes, which highlights the practical significance of this research. However, vulnerable workers may experience barriers to participation in research and be more prone to coercion or exploitation in research contexts than those in less vulnerable circumstances and this research can present unique challenges for researchers including the emotional toll associated with gaining participants’ trust and being privy to difficult stories. To articulate practical recommendations for conducting research with vulnerable workers, we integrate principles from philosophy of science, community-based research methodologies, and feminist perspectives. Specifically, we present pragmatism as a paradigmatic approach to conducting this research and propose a number of methodological best practices grounded in this approach. Pragmatism is a particular form of inquiry in which its effectiveness is determined by its ability to meet its intended goals and the practical usefulness of its outcomes. We outline how pragmatism aligns with many of the principles associated with ethical, mindful research with vulnerable populations and discuss several “pragmatic” best practices for engaging in this type of research. In doing so, we link philosophy to practice, and suggest that pragmatism presents an opportunity to think about the process of research in terms of its practical outputs—which is of key importance to any research conducted among the vulnerable workforce. A cornerstone of building trust with vulnerable workers is conducting research in ethical, responsible, inclusive, and sustainable ways.

Abstract 4272

SELF-COMPASSION ON COMPLEX POSTTRAUMATIC STRESS SYMPTOMS AND POSTTRAUMATIC GROWTH UNDER INTERPERSONAL STRESS

Chi P.*, Huang L.

Department of Psychology, Faculty of Social Sciences, University of Macau ~ Macau SAR, ~ China

This study investigates the impact of self-compassion on stress responses indicated by complex posttraumatic stress symptoms (CPTSS) and posttraumatic growth (PTG) among individuals with interpersonal trauma when facing interpersonal stress. Specifically, the research has three aims: 1) to examine how trait self-compassion influences stress responses following interpersonal stress induction; 2) to investigate the impact of state selfcompassion on stress responses; 3) to assess how changes in state selfcompassion affect CPTSS and PTG through the mediation of basic psychological needs satisfaction (BPNS). 159 valid participants (Mage = 23.36, SD = 4.35; 91 females, 57.2%) completed baseline measurements assessing both the trait and state levels of the studied variables. They then viewed a series of images of ostracism to induce interpersonal stress. Following this, participants were randomly assigned to either a self-compassion writing intervention group (n = 80) or a neutral writing control group (n = 79). State levels of self-compassion, BPNS, CPTSS, and PTG were measured after these two manipulations. Results showed that after adjusting for baseline CPTSS, trait self-compassion negatively predicted CPTSS following interpersonal stress induction. Trait self-compassion inversely predicted state PTG following interpersonal stress. The self-compassion writing intervention successfully increased state self-compassion, reduced state CPTSS, and enhanced PTG. Changes in self-compassion directly influenced changes in CPTSS and PTG, as well as indirectly through BPNS. This study suggests that both trait and state self-compassion play crucial roles in reducing CPTSS. The differing directions of influence between trait and state self-compassion on PTG following interpersonal stress or self-compassion intervention indicate that PTG may involve more complex cognitive processing. The mediation effect of BPNS demonstrates its importance. These findings provide important empirical support for the application of self-compassion interventions in managing posttraumatic stress and promoting growth following interpersonal trauma

EMOTION REGULATION AND PTSD SYMPTOMS: A META-ANALYTIC INVESTIGATION

Li S.*

Chongqing Normal University ~ Chongqing ~ China

This meta-analytic investigation examines the critical role of emotion regulation in posttraumatic stress disorder (PTSD) symptomatology. Synthesizing data from diverse populations, we computed effect sizes using Fisher's Z transformations and applied random-effects models to account for study variability. Results reveal a robust association between emotion dysregulation and heightened PTSD symptoms, with specific regulation strategies demonstrating differential impacts on symptom clusters. These findings underscore the centrality of emotion regulation in trauma adaptation and highlight its potential as a target for clinical interventions. Implications for personalized treatment, resilience-building, and future cross-disciplinary research are discussed. By integrating quantitative synthesis with applied clinical insights, this study offers actionable evidence for both practitioners and researchers aiming to mitigate the burden of PTSD and enhance mental health outcomes.

Abstract 1862

TRAJECTORIES OF POSTTRAUMATIC STRESS SYMPTOMS AMONG ADOLESCENTS AFTER SUPER TYPHOON "YAGI": A THREE-WAVE LONGITUDINAL STUDY

Fan W.*, Liang Y.

East China Normal University ~ Shanghai ~ China

Background :In 2024, Super Typhoon "Yagi" made landfall in Hainan, causing severe damage. Understanding adolescents' psychological symptoms after typhoons is crucial for future disaster prevention and mitigation efforts in mental health, yet most existing studies on post-typhoon post-traumatic stress symptoms (PTSS) trajectories have predominantly focused on adult populations.

Objective: The current study examined the trajectories of PTSS among adolescents after exposure to the super typhoon and explored potential predictors of distinct PTSS trajectories.

Methods: At 1, 6, and 12 months after the disaster, three waves of offline surveys were conducted with 870 adolescents (58.7% female, M age = 16.12, SD = 0.44) from the most severely affected areas in Hainan Province. The trajectories were identified with Latent Growth Mixture Modelling, and the predictors were explored with multinomial logistic regression.

Results: The following four latent PTSS trajectories were found among adolescent: resilience (78.6%), recovery (6.4%), moderate-stable(10.9%) and delayed dysfunction (4.1%). Adolescents who reinforced doors and windows before the typhoon, had higher knowledge of the destructive power of super typhoons, perceived stronger family worry during the event, and received peer support afterwards were more likely to follow a resilience trajectory. Higher knowledge of the typhoon’s severity was related to a moderate-stable trajectory, stronger perceptions of family fear during the typhoon were related to a delayed dysfunction trajectory, and a higher number of typhoon-related exposure events was related to either a moderate-stable or a recovery trajectory.

Conclusion: These findings deepen the understanding of adolescents' psychological symptom trajectories, highlighting the importance of pre-disaster preparedness, knowledge about super typhoons, perception of family members’ emotional and peer support. The study provides valuable insights for tailoring targeted psychological interventions based on distinct adaptation patterns.

Abstract 772

INFLUENCE OF THE ENVIRONMENT ON NEURODEVELOPMENT AND BEHAVIOUR IN CHILDHOOD

Martín D.*

University of Cordoba ~ Cordoba ~ Spain

Childhood is a particularly sensitive period for neurodevelopment because the central nervous system (CNS) is in a state of constant maturation, functional and anatomical change. In recent decades, the study of how the environment influences human behaviour and the brain has gained increasing interest in the scientific community due to the identification of health risks and threats related to factors such as: environmental pollution, food, the emergence of new habits related to the use of technology, the type of community resources available depending on the area where one lives, the availability of socio-economic resources, etc. This has a direct impact on children's health and development, and can also lead to diseases and health problems that can become chronic into adulthood. Therefore, in this work we will review the main environmental variables that affect children's neurodevelopment, in order to understand the relationship between the environment and neurodevelopment during childhood, how the former influences the ontological trajectory of children, as well as to identify potential health risks. The results show behavioural, anatomical and functional changes related to different variables in the children's environment. In conclusion, more high-quality research is needed to better understand the relationship between the environment and children's neurodevelopment, but the results point to potential health risks.

Abstract 836

SAFE AND UNSAFE INFANT SLEEP PRACTICES IN SOUTH AFRICA: PATTERNS OF ADHERENCE AND PARENTAL MOTIVATIONS

Muller J.*

University of Pretoria ~ Pretoria ~ South Africa

Introduction: Healthy, safe sleep is important for child development and family well-being. Despite international safe sleep recommendations, sleep-related infant injury and death remain major concerns. However, adherence to guidelines may be influenced by contextual factors, yet data from low- and middle-income countries like South Africa is scarce, limiting development of tailored interventions.

Purpose: This study examined adherence to international safe sleep recommendations and underlying parental motivations among South African parents of infants (M age = 5 months), with the aim to inform contextually relevant interventions strategies.

Method: An online cross-sectional survey was completed by 203 caregivers (predominantly mothers, M age = 30 years). Measures included the Brief Infant Sleep Questionnaire and additional items on motivations for sleep practices. Descriptive statistics were used to assess adherence to recommended practices.

Results: Analysis revealed complex adherence patterns. While recommended practices such as room-sharing (86%) and providing breastmilk (84%) was typical, pacifier use was low (28%), and risky practices such as non-supine sleep positioning (67%) and bed-sharing for most of the night (61%) were prevalent. Bed-sharing was primarily motivated by managing infant sleep difficulties (96%) and ensuring child safety (91%). Feeding (67%) and bonding (61%) were also important drivers, while convenience (41%) and cultural and parental beliefs (40%) were secondary. Financial factors had a limited impact (11%).

Conclusion: Substantial disparities exist between global recommendations and South African practices, yet motivations for non-adherence were multifaceted and often driven by functional, emotional and contextual needs. This highlights a need for interventions that address parental motivation for bed-sharing and knowledge gaps on safety, educate on safer shared sleep practices, and offer feasible, culturally sensitive alternatives that support infant safety and family well-being.

Abstract 650

ACOUSTIC ANALYSES OF INFANT VOCALIZATIONS: METHODS AND INSIGHTS FROM 0 TO 12 MONTHS

Muñoz A.C.*, Caballo V., Salazar I.

Universidad de Granada ~ Granada ~ Spain

Several studies have shown that acoustic analysis of infant vocal productions provides valuable insights into early developmental processes. This line of research suggests that protophones may serve as early markers of typical and atypical development. Acoustic measures allow researchers to identify characteristics linked to developmental trajectories as well as potential early indicators of neurodevelopmental disorders. Because detailed descriptions of these acoustic components have only recently been explored, a systematic review was conducted to examine the methodologies applied in studies of infant vocal productions from 0 to 12 months of age, including sample characteristics, data processing, acoustic features analyzed, statistical approaches, limitations, and reported findings. Searches were conducted in Web of Science, Scopus, and ProQuest without year restrictions, targeting article titles, abstracts, and keywords. Inclusion criteria focused on studies involving infants within the target age range, using acoustic methods to analyze vocalizations. Exclusion criteria encompassed studies including other age ranges, non-articles, unavailable studies, nonhuman or animal research, interactional or behavioral analyses, samples with motor or hearing disorders, airway malformations, reliance on phonetic transcription alone, or use of simulations and secondary datasets. A total of 125 studies were screened, of which 9 met all inclusion criteria. These studies were characterized by small sample sizes, reliance on manual segmentation, and lack of environmental control in naturalistic recordings, all of which restrict generalizability. Additional issues were limited longitudinal follow-up and insufficient reporting of experimental conditions. Considerable methodological heterogeneity was observed, leading to a qualitative rather than quantitative synthesis. Notably, several studies reported significant differences in acoustic parameters across groups, underscoring the need for continued investigation. Future research should focus on developing a replicable methodological framework to define acoustic patterns of protophones and their associations with neurodevelopment.

Abstract 105

PREDICTIVE MODEL OF WEIGHT BIAS INTERNALIZATION ON BODY DISSATISFACTION, RISKY EATING BEHAVIORS AND BODY IMAGE CONTROL IN PHOTOGRAPHS IN MEXICAN ADOLESCENTS

Roldán Barrios D.*, Meza Peña C., Moral De La Rubia J.

Facultad de Psicología de la Universidad Autónoma de Nuevo León ~ Monterrey, Nuevo León ~ Mexico

Introduction: Weight bias internalization (WBI) has won interest in research due to its negative effects both physical and mental health. It has been proved, that WBI enhances body image dissatisfaction (BID), risky eating behaviors (REB) and body image control in photography (BICP). Even though, the role of WBI in these health variables remains under study.

Purpose: Test a model in which directly predicts BID, and indirectly predicts REB and BICP through BID, using path analysis both in the group of students (single-group analysis) and across both sexes (multigroup analysis).

Method: The sample included 187 middle and high school students, men and women, with ages between 12 to 17 years old (m=13.26 years). A self-administered questionnaire consisting of sociodemographic questions and four scales validated in Spanish and for adolescents were used. Path analysis was used to test the structural model. This involved a single-group analysis (total sample) and a multigroup analysis (women/men). Both analyses were performed using the asymptotically distribution-free least squares method.

Results: The model was validated in the single-group sample by an admissible solution with significant weights in both the direct and indirect pathways, in addition to having a good fit, explaining 30% of the variance for BICP, 50% of the variance for REB and 76% for BID. The multigroup analysis revealed that the model is suitable for both sexes, but it is not invariant. The explained variance of BICP is 28% in women versus 23% in men. The explained variance of REB is 55% in women versus 47% in men, and the explained variance of BID is 76% in women and 69% in men.

Conclusions: The model in which WBI directly predicts BID; and indirectly REB and BICP through BID, is validated in a sample of Mexican middle and high school students, having greater predictive capacity in women than in men.

EXPLORING THE SIMILARITIES AND DIFFERENCES BETWEEN SUZHOU, CHINA, AND HELSINKI, FINLAND ON SOCIAL-EMOTIONAL SKILLS: A NETWORK ANALYSIS

Huo M.*, Wang H., Lin D.

Northeast Normal University ~ Changchun ~ China

Social-emotional skills rarely operate in isolation. In everyday life, they function as interconnected systems. Using data from the 2019 OECD Survey on Social and Emotional Skills, we applied network analysis to model interconnections among 15 skill facets and compared networks of 10- and 15-year-old students in Suzhou, China and Helsinki, Finland. Across all four networks, Cooperation, Optimism, and Persistence emerged as the most central skills (highest expected influence). At the same time, their roles varied across ages and municipalities. Contextual differences were evident in which facets played the most central roles: Optimism became especially important among adolescents in Helsinki, whereas Cooperation, and increasingly with age, Persistence, were the most central skills in the Suzhou networks. Node predictability was consistently higher in Suzhou than in Helsinki, indicating greater interdependence among measured skills in Suzhou. The Network Comparison Tests showed that the adolescents' networks were more tightly integrated and had greater global strength, which indicates stronger, more interconnected interconnections among the skills. These findings provide valuable insights for designing education programs and policies that promote social-emotional well-being in children and adolescents.

MUSIC FOR CHILD WELLBEING INITIATIVE: AN INTERNATIONAL, INTERDISCIPLINARY EVIDENCE BASED APPROACH TO SUPPORT GLOBAL WELLBEING

St Jean N.*

Northwestern University, Feinberg School of Medicine ~ Chicago ~ United States of America

Introduction: Development and implementation of low cost, community-based mental health (MH) and wellbeing practices that can mitigate the global MH pandemic are desperately needed. In 2022, Buffett Institute for Global Affairs at Northwestern University tasked a group of interdisciplinary researchers and clinicians to do just this. Leveraging expertise across Northwestern's Department of Psychiatry and Behavioral Sciences, School of Music Education, and the School of Engineering, the Music for Childhood Wellbeing Initiative (MCWI) emerged as one response. MCWI has been implemented in four global locations (USA, Mexico, England, and China) with promising success as an emerging evidenced based, wellbeing practice.

Purpose: MCWI is an interdisciplinary designed, group-singing and breathwork intervention for 8–11-year-old youth. It is an 8-week, culturally modifiable curriculum, implemented in schools and community settings. Activities focus on stimulating the autonomic nervous system through the voice and breath in a group setting designed to foster connection and belonging. MCWI is evaluated through mixed method strategies, including quantitative, qualitative, and biomedical measurements of heart rate variability collected by a wireless, wearable sensor.

Method:
8–11-year-olds (n=154; Mexico City, Chicago, England, China; high & low resource communities); Eight, weekly 1-hour sessions. Measures: Heart rate variability, State Trait Anxiety Index; Community Sense of Belonging, School Sense of Belonging; WellCheq, & qualitative interviews

Results:
All cohorts reported clinically significant improvement in Wellbeing (p=.005) and declines in state anxiety from pre to post p=.001 intervention.
Low frequency band for HRV indicates clinically significant interaction sympathetic and parasympathetic nervous system alongside reductions in anxiety (STAI) (1-B, p=.05)

Conclusion:
MCWI demonstrates clinically significant improvement in wellbeing, declines in anxiety,

and improvement in HRV

MCWI has a more positive, robust effect on those from low resourced communities compared to high resourced communities

MCWI is emerging as an evidenced-based approach to mitigating anxiety and stress and enhance subjective wellbeing

Abstract 2559

EXPLORING THE DETERMINANTS OF WELL-BEING IN YOUNG CARERS: THE ROLE FAMILY DYNAMICS, EMOTIONAL REGULATION, AND RECOGNITION

Justin P.*[2], Chevrier B.[1], Doba K.[2]

[1]Aix-Marseille University ~ Marseille ~ France, [2]University of Lille ~ Lille ~ France

Introduction : Young carers (YC) are children, adolescents or young adults who provide regular and significant support to an ill or disabled relative. The repercussions of this role are numerous, particularly in terms of the emotional distress experienced by these young people. Previous studies have shows that YCs who receive adequate support and recognition for their caring role tend to experience more positive outcomes. The development of these emotional regulation strategies is thought to be partly shaped by parental relationships and family communication. This study aims to clarify these relationships and identify the processes by which these factors influence the emotional well-being of young people who provide care.

Method: To date, 571 adolescents and young adults have completed a survey exploring various aspects of their lives, including socio-demographic and health information, social support, family functioning, caring involvement, psychollogical distress, emotion regulation, and recognition as a carer. Among them, 160 participants reported providing regular assistance and were identified as young carers.

Results: Young carers reported significantly higher levels of psychological distress compared to their non-carer peers. Family dynamics, particularly cohesion, appear to play a fundamental role. Both, intra- and interpersonal recognition also seem to influence the level of distress experienced by young carers.

Discussion: Although preliminary, these findings provide valuable insights into the mechanisms underlying emotional distress among young carers. They highlight the importance of considering family-level factors and recognition processes to better understand and support this still largely invisible population.

TRACING ADVERSITY ACROSS GENERATIONS: PARENTAL ACES AND CHILD RISK IN FAMILY SUPPORT CONTEXTS

Swords L.*, Maiorano N.

Trinity College Dublin ~ Dublin ~ Ireland

Introduction: Recent developments in the study of adverse childhood experiences (ACEs) have explored how parents' exposure to neglect, abuse or dysfunctional home environments in their own early years confers risk for their children. The mechanisms by which threats to child wellbeing cascade across generations is a central concern in family support contexts designed to address complex needs which are often compounded by wider social and economic factors such as poverty, housing instability, and isolation. Purpose: Drawing on a decade of partnership with a non-governmental organisation working therapeutically with families in Ireland, the present study presents key findings from a number of studies involving up to 500 parent-child dyads. In particular in aims to describe their adversity experiences and shed light on potential pathways linking parental ACEs to child psychosocial and behavioural outcomes. Method: Parents completed a survey on behalf of themselves and their child capturing a range of socio-demographic and wellbeing information, as well as an ACE measure that tallied exposure to a range of potentially traumatising life situations or events prior to an individual's 18th birthday. Results: Parents' own ACE history was a significant positive predictor of their children's ACE exposure. Parents' own experiences of childhoos adversity predict the presence of psychosocial and behavioural difficulties in their children both directly and indirectly via their negative impact upon maternal mental health and the quality of parent-child interactions. Conclusions: Family support services are uniquely positioned to identify and interrupt intergenerational cycles of adversity by adopting trauma- and relationship-informed approaches. By recognising how parental histories shape family dynamics, practitioners can promote understanding, resilience, and recovery rather than focusing solely on presenting problems. Addressing adversity across generations enables services to deliver more holistic, sustained support that enhances both parental wellbeing and child outcomes.

Abstract 634

ASSOCIATIONS BETWEEN MOBILITY PATTERNS, CAREER AWARENESS, AND LOCAL ORIENTATION IN FUKUI PREFECTURE STUDENTS

Morimoto K.*

Professor Kyoto Sangyo University Japan ~ Japan

Introduction: The continuous outflow of young people from rural to metropolitan areas in Japan has accelerated population decline and labor shortages. Although national and local policies have attempted to promote local settlement, their effectiveness remains limited. Previous studies examined associations between mobility patterns, local orientation, and career awareness, but limited research has clarified whether these variables are shaped by similar or distinct mechanisms.

Purpose: This study explored how mobility patterns, including university location (inside/outside Fukui Prefecture) and subsequent trajectories, are associated with career awareness (career action and career vision) and local orientation (settlement orientation and emotional attachment) among Fukui students.

Method: A web-based survey was conducted in October 2024 with 575 students from Fukui Prefecture (215 men, 355 women, 5 unspecified; M age = 20.4, SD = 1.40). Of these, 160 were enrolled in universities within Fukui and 415 outside the prefecture. Measures included the Career Action Vision Test (CAVT: action, vision) and the Local Orientation Scale (settlement, attachment).

Results: Analysis of variance (ANOVA) showed that students outside Fukui scored higher on career action ($\eta^2 = .042$) and career vision ($\eta^2 = .081$), whereas no differences appeared in settlement or attachment. Regarding mobility patterns, significant differences were found in career action ($\eta^2 = .045$) and vision ($\eta^2 = .085$), with students showing higher mobility scoring higher. For local orientation, settlement showed a large effect ($\eta^2 = .441$), strongly shaped by mobility patterns, while attachment showed only a small effect ($\eta^2 = .026$).

Conclusions: Findings suggest that career awareness and local orientation are regulated by different mechanisms. University location and mobility experiences foster career development, whereas settlement intention depends heavily on mobility, and attachment remains relatively stable. This two-layered structure provides useful insights for both career education and regional settlement policies.

Abstract 2289

INDICATORS OF QUALITY INTEGRATION BETWEEN MENTAL AND PHYSICAL HEALTH

Ip L.S.L.*

West London NHS Trust ~ London ~ United Kingdom

About 30% of people with long-term medical conditions experience anxiety or depression and those with co-morbid mental and physical health conditions have worse morbidity, mortality and use emergency services 2-3 times more than the general population (Kings Fund 2012). It is therefore essential that mental and physical healthcare is joined-up and this is often done through embedding clinical health psychologists within medical specialities in a collaborative model of care. This poster will describe such a model in West London in the UK covering conditions such as chronic pain, diabetes, heart failure and respiratory disease. All of these clinical health psychology teams show improved outcomes in depression, anxiety, quality of life and physical functioning unique to the medical condition treated, as well as reduced overall service utilisation. However, in addition to direct clinical input, clinical and counselling health psychologists widen their impact through indirect input into medical specialities - the value of which is often harder to capture but can be reflected in qualitative feedback, process measures and artefacts. Due to the different context and sub-culture of these medical specialties, embedded clinical and counselling health psychologists have to adapt and find different ways to ensure an integrated approach to care is offered to all patients in the specialty. This poster will explain the practicalities and challenges of integration on the ground, as well as the structures and processes that lead to better integrated care within each of the aforementioned specialties. This includes involvement in multi-disciplinary team meetings, multi-disciplinary group therapy, education on psychologically informed care, recognising psychology's value in improving rehabilitation adherence, routine screening, coproduction and staff wellbeing. Qualitative data from staff and patients will also be discussed which will help explain what matters most in driving truly integrated care and the importance of adapting to specific contexts.

Abstract 4763

Developing Optimized Screening and Comprehensive Diagnostic Tools for Adolescent Depression: A Multi-Methodological Approach

Perepjolkina V.*, Krone I., Kolesnikova J., Bezborodovs N., Stepens A.

Riga Stradinš University (RSU) research team ~ Riga ~ Lettonia

Introduction: Adolescent depression necessitates rapid screening and robust diagnostic tools that reflect unique developmental presentations. Traditional models often overlook the central role of existential distress and hopelessness, which are critical precursors to suicidal ideation in this age group.

Purpose: This study aimed to develop both an optimized screening instrument and a comprehensive diagnostic version by identifying the most predictive symptom clusters through an integrated methodological approach.

Method: The sample consisted of 688 adolescents aged 13–18. The community group included 627 participants (252 males; M_age=15.5, SD=1.57), and the depression group included 61 participants (13 males; M_age=16.0, SD=1.32). Data analysis was performed using the JASP Network module. Optimal cut-off points were determined using the Uncertain Intervals (UI) module within the jYS package in Jamovi, specifically applying the Dichotomization (no uncertainty) method with a Youden index threshold to maximize classification accuracy.

Results: Network analysis identified "Sense of Meaninglessness" (D8) and "Depressed Mood" (D1) as critical system mediators (Betweenness = 1.73). Comparative analysis revealed that weighted scoring (Sc_w) consistently yielded superior prognostic accuracy over simple total scores. The 12-item screening version (Sc_12_w) achieved a high sensitivity of 0.869, a specificity of 0.754, and a positive likelihood ratio (LR+ = 3.54). The full 23-item diagnostic version further enhanced the clinical profile, achieving a sensitivity of 0.852, a specificity of 0.801, and a higher likelihood ratio (LR+ = 4.28).

Conclusions: The 12-item tool provides an efficient screening option with prioritized sensitivity, while the 23-item version serves as a robust diagnostic aid with higher specificity. The application of the Uncertain Intervals methodology ensures that optimal thresholds are identified, confirming that weighted scoring based on symptom centrality significantly improves the identification of adolescent suicidal risk compared to traditional summation methods.

Abstract 52

WHY NOT DONATE? EMOTIONAL AND PSYCHOSOCIAL INSIGHTS INTO HONG KONG UNIVERSITY STUDENTS' ORGAN DONATION INTENTIONS

Liang W., Tse C.*

Chinese University of Hong Kong ~ Shatin ~ Hong Kong

Despite substantial advancements in transplantation technologies, the disparity between the organ demand and donor availability continues to widen globally. Hong Kong, in particular, exhibits one of the lowest organ donation rates among developed regions. This study aimed to explore the psychosocial and emotional determinants of organ donation intentions among university students in Hong Kong—an important demographic frequently targeted by advocacy campaigns due to their perceived openness to organ donation initiatives.

Using a sample of 280 Hong Kong university students, we examined a comprehensive array of psychosocial and emotional variables, including depressive thinking, altruism, death anxiety, self-efficacy, perceived social support, personality traits assessed via the Big Five inventory, and cultural beliefs related to Buddhism and Karma. Mediation and moderation analyses were used to assess the interplay among these variables in predicting participants' organ donation intentions. Results showed that death anxiety emerged as a significant negative predictor of donation intention, whereas higher levels of self-efficacy and perceived social support positively predicted intentions. Contrary to expectations, altruism, depressive thinking, cultural beliefs, Big Five personality traits, social media exposure, and knowledge about organ donation did not directly predict donation intentions. Further mediation analysis revealed a moderated mediation effect, wherein depressive thinking indirectly reduced intention through increased death anxiety—particularly among individuals with lower self-efficacy.

These findings underscore the prominence of emotional and situational factors, rather than dispositional traits or cultural values, in shaping donation intentions among young adults in Hong Kong. Public health interventions and awareness campaigns should therefore strategically focus on alleviating death-related anxiety, bolstering individual self-efficacy, and enhancing social support networks to foster greater willingness toward organ donation.

Abstract 61

CHRONIC DISEASES AMONG UNIVERSITY STUDENTS: A COMPARATIVE STUDY

Durquet M., Bolzonella L., Walburg V.*

Catholic University of Toulouse ~ Toulouse ~ France

Many students suffer from chronic conditions that can affect their psychological well-being and therefore potentially affect their academic outcomes. Indeed, previous studies suggest that students with chronic conditions have lower subjective well-being (Shaminqov et al., 2020) and more cognitive difficulties (Taras & Potts-Dakema, 2005). Furthermore, the study by Herts et al. (2014) suggests that feelings of loneliness mediate the relationship between chronic illness and quality of life. On the other hand, the study by Traino et al. (2019) seems to indicate a possible protective role of grit. However, relatively few studies have directly examined the impact of chronic illness and mental health (depressive and anxiety symptoms) among students. The aim of the present study is to examine the impact of having one of four chronic conditions (asthma, diabetes, endometriosis, irritable bowel syndrome) on students' depressive and anxiety symptoms. Second, to assess the mediating and/or moderating effects of feelings of loneliness and grit.

Six hundred and twenty-nine students took part in the study. They were divided into five groups: sixty-five students with endometriosis, sixty-two with diabetes, thirty-six with asthma, twenty-one with irritable bowel syndrome, and four hundred and forty-five students without chronic diseases, the control group. All participants completed a sociodemographic questionnaire, a questionnaire on anxiety and depressive symptoms, a questionnaire on grit, and finally, a questionnaire on feelings of loneliness.

The results indicated that chronic illness increases the risk of experiencing anxiety and depressive symptoms. In addition, feelings of loneliness play a moderating role between the perceived impact of illness and anxiety and depressive symptoms by increasing these symptoms. These findings highlight the importance of assisting students with chronic illness, and in particular, preventing their social isolation.

Abstract 92

PROFILES OF CONSISTENCIES AND DISCREPANCIES IN FILIAL PIETY BELIEFS AMONG PARENT-CHILD DYADS, AND THE POTENTIAL OUTCOMES

Zhang L.R.*

University of Macau ~ Macau ~ Macao

This longitudinal study identified distinct parent-child dyadic filial piety belief profiles, and the family dynamics and psychological outcomes correlated across two waves. Using a dyadic approach, 317 Chinese parent-child pairs (adult children aged 18–29) completed measures of dual filial piety (reciprocal and authoritarian), parent-child relationship quality, and subjective well-being at Wave 1, with 153 dyads retained at Wave 2, completing the same measures and mental health measures. Latent profile analysis revealed three typologies at Wave 1: Discrepant Reciprocal, Discrepant Strong Filial, and Similar Authoritarian. Wave 2 profiles shifted to Discrepant Authoritarian, Similar Balanced, and Discrepant Low Reciprocal. Significant between-profile differences emerged in both parents' and adult children's perceptions of parent-child relationship quality, mental health, and subjective well-being. This research highlights how dual filial piety beliefs (mis)alignment dynamically shapes relational and psychological adjustment across emerging adulthood. Practical implications for family counseling and intergenerational intervention programs are discussed.

Abstract 4782

Desire and Anxiety in Clinical Practice: A Psychodynamic Exploration

Özge Özcan Ç.*

Clinical Psychologist ~ Istanbul ~ Turkey

This study explores the relationship between desire and anxiety within clinical practice from a psychodynamic perspective. While anxiety is often approached as a symptom to be reduced or managed, this paper proposes that anxiety may instead be understood as an expression of underlying, unarticulated desire.

Drawing on classical and contemporary psychodynamic theory, particularly Lacanian conceptualizations, anxiety is reconsidered not as a disruption but as a structural signal within the subject's psychic organization. The study examines how anxiety emerges in relation to the subject's position within symbolic structures, and how it reflects the tension between conscious identifications and unconscious desire.

Through clinical reflections and theoretical integration, the paper highlights how attempts to eliminate anxiety may obscure the deeper processes at play. Instead, engaging with anxiety as a meaningful formation can open space for the articulation of desire and transformation within the therapeutic process.

The findings suggest that re-framing anxiety within a structural and relational context allows clinicians to move beyond symptom-focused interventions and towards a deeper engagement with the subject's psychic reality. This perspective contributes to contemporary clinical discussions by bridging psychodynamic theory with ongoing debates in mental health practice.

EXPLORING THE LINKS BETWEEN COSMETIC HABITS AND WOMEN'S WELL-BEING: INSIGHTS FROM THE NAGAHAMA COHORT

Courrèges S.*[1], Latreille J.[1], Harada Y.[2], Couderc S.[2], André N.[1], Matsuda F.[3], Bardel M.[1], Ben Khalifa Y.[1]

[1]IRD, Chanel Parfums Beauté ~ Pantin ~ France, [2]IRD, Chanel Parfums Beauté ~ Tokyo ~ Japan, [3]Center for Genomic Medicine, Graduate School of Medicine, Kyoto University ~ Kyoto ~ Japan

Introduction:
Despite their widespread use among women worldwide, cosmetics remain understudied in scientific psychology. Yet, cosmetics play a significant role in women's daily routines and may contribute to their well-being.
Objective:
The present research investigates the relationships between cosmetic use, well-being, self-esteem, and appearance of health and age among Japanese women, utilizing data from the Nagahama cohort.
Methods:
Two studies were conducted within this cohort.
Study 1: 989 participants, aged 34–79, completed questionnaires on well-being and self-esteem (Rosenberg scale), and reported their overall cosmetic usage. Standardized photographs of their bare faces were taken and later rated for perceived health and age by 200 naïve assessors. Statistical analyses, including correlation and PLS-PM modeling, explored direct and indirect links among the variables.
Study 2: In a subsequent wave, 893 participants, aged 40–79, completed similar questionnaires, supplemented with the Ryff Psychological Well-Being Scale (PWBS) and a detailed assessment of skincare and makeup habits. Hierarchical clustering identified profiles based on 13 cosmetic usage questions, and the relations between these clusters and the scores of the PWBS dimensions were analized.
Results:
Study 1 revealed both direct and indirect relationships between cosmetic use, well-being, self-esteem, perceived health and perceived age. Study 2 identified five main cosmetic usage profiles, each differentially associated with specific PWBS well-being dimensions. Notably, daily cosmetic usage was positively linked to the dimensions of self-acceptance, positive relations with others, personal growth and environmental mastery.
Conclusion:
These findings suggest that cosmetic use is meaningfully linked to well-being among women. Further research, including interventional designs, is needed to clarify how cosmetics impact psychological health. Then, exploring the psychological dimensions of

everyday practices like cosmetic use could enrich both research and practical approaches to women's well-being.

Abstract 213

DO GENDER, INCOME, EDUCATIONAL QUALIFICATION, CULTURAL DRINKING HABITS, AND GEOGRAPHICAL LOCATION INFLUENCE LIFE SATISFACTION?

Baruah R.*, Thingujam N.S.

Tripura University ~ Agartala, Tripura ~ India

Life satisfaction is a significant element of subjective well-being, as it represents a person's overall perception of their quality of life. Life satisfaction is a salient indicator of well-being, particularly throughout young adulthood, with urban and rural environments offering distinct advantages and challenges that shape residents' well-being. So, the primary objective of the research was to determine the role of socio-demographic factors in life satisfaction among young adults in India.

To carry out the proposed aim of the study, a sample of 600 young Assamese adults between the age of 18-40 years (Mean = 25.54; SD= 4.33) residing in one of the North-East states of India i.e., Assam (districts- Tinsukia, Dibrugarh, Sibsagar, Jorhat) participated in the study. A random sampling technique was used to collect data using a standardized scale such as the Satisfaction with Life Scale (Diener et al., 1985). The socio-demographic variables, such as gender, cultural drinking habit (drinking for a particular social gathering), educational qualification, geographical location (urban-rural), and family income, were included. The factors, such as geographical location and family income, were self-identified by the respondent. To analyze the collected data and to compare the differences among the groups, ANOVA was used.

The findings revealed significant differences in four socio-demographic characteristics: females scored significantly higher life satisfaction than males, participants who did not drink had higher life satisfaction, respondents with higher family income had higher life satisfaction, and participants who had completed a master's degree had high life satisfaction, whereas participants from urban or rural areas had no significant difference on life satisfaction.

Life satisfaction can be influenced by a variety of facets, including gender, income, educational qualification, and cultural drinking. So, understanding this impact is imperative for reducing inequalities and increasing well-being among different populations.

Abstract 1789

FROM MENARCHE TO MENOPAUSE: ESTRADIOL AND BRAIN AGING IN WOMEN

Luders E.*

University of Deusto ~ Bilbao ~ Spain

The transition to menopause is characterized by declining estradiol levels, which coincides with an increased risk of dementia in women. This temporal overlap suggests estradiol may influence brain aging and age-related neuropathology. We investigated whether reproductive events associated with estradiol exposure—namely, age at menarche and menopause—relate to brain aging. Using a validated machine learning model, we analyzed structural MRI data from 1,006 postmenopausal women. We found that earlier menarche, later menopause, and a longer reproductive span were each associated with less evident brain aging. These findings support the hypothesis that longer cumulative exposure to estradiol may have neuroprotective effects. However, the observed effects were modest, and estradiol levels were not directly measured. Further research is needed to clarify causal mechanisms and to examine the influence of additional factors, including genetic predispositions, lifestyle, and comorbidities. Future work incorporating hormone assays and more diverse samples will be critical for improving our understanding of the relationship between reproductive history, estradiol, and female brain aging.

Abstract 263

PSYCHOLOGICAL PREDICTORS OF RISK BEHAVIOUR AND ITS ASSESSMENT

Roy J.*, Mishra S., Lata S.

Banaras Hindu University ~ Varanasi ~ India

Background: Risk-taking behavior encompasses actions that heighten the likelihood of harm, whereas risk assessment involves identifying and evaluating potential hazards. Understanding psychological factors such as personality, cognitive style, and emotional intelligence elucidates individual differences in how risks are assessed and acted upon.
Objectives: This study aims to explore gender differences in personality traits, emotional intelligence, and cognitive styles, examine the association between the variables and identify predictors of risk assessment and risk-taking behavior.
Method: A sample of 130 adults aged 21-30 years (62 males, 68 females) from Kolkata, India, was recruited using a purposive sampling technique. Participants completed standardized measures to assess personality traits (Big Five Inventory), emotional intelligence (self-report emotional intelligence tests), cognitive style (cognitive style indicators), and risk assessment and risk-taking behavior(RT-18). Independent samples t-tests, correlation, and multiple regression analyses were performed for analysis of the data.
Results: Findings revealed significant gender differences in extraversion, neuroticism, risk-taking behaviour, and risk assessment. Correlation analysis reported that agreeableness, emotional intelligence, and the planning and knowing cognitive styles were negatively associated with risk assessment. Neuroticism was negatively associated with risk-taking behaviour, whereas the creating cognitive style was positively correlated with risk-taking behavior. Regression results showed that neuroticism, emotional intelligence, planning, and knowing cognitive styles have emerged as significant predictors of risk-taking behaviour and explained 6.4%, 5.3%, 9%, and 3.6% of the variance, respectively. Agreeableness and cognitive style were predicted to influence risk assessment, explaining 8.9% and 11.9% of the variance, respectively.
Conclusion: The study highlights significant gender differences and identifies key personality traits and cognitive styles that influence risk-taking behaviour and risk assessment. Notably, neuroticism, emotional intelligence, and specific cognitive styles emerged as significant predictors, explaining meaningful variance in these behaviors.

Abstract 642

CAN THE TRAITS OF THE DARK TETRAD IMPROVE SPIRITUAL WELL-BEING?

Ershova R.*[1], Bakoushkin I.[2]

[1]People Friendship University of Russia named after Patrice Lumumba ~ Moscow ~ Russian Federation, [2]Department for Missionary Work and Youth Affairs of Kolomna Diocese ~ Kolomna ~ Russian Federation

The study of human well-being and its determinants is a growing field in psychology, yet the relationship between spiritual well-being (SWB) and malevolent personality traits remains underexplored, particularly in non-Western contexts. This research presents the first investigation of the relationship between spiritual well-being and the Dark Tetrad traits (Machiavellianism, Psychopathy, Narcissism, and Sadism) on a Russian-speaking sample.

A cross-sectional study was conducted with 959 participants (761 women, 198 men; mean age 38.6±14 years). Spiritual well-being was assessed using the Spiritual Well-Being Scale (SWBS), and the Dark Tetrad traits were measured with the Short Dark Tetrad (SD4) questionnaire. Data analysis involved Spearman's correlation, along with univariate and multivariate linear regression models.

Correlation analysis confirmed significant negative relationships between all Dark Tetrad traits and spiritual well-being. Sadism demonstrated the strongest negative correlation with overall SWB (ρ=-0.38, $p<0.001$). Multivariate regression revealed more complex, nuanced interactions. Sadism was identified as the most powerful negative predictor of SWB, particularly its religious component. When controlling for the effect of Sadism, Psychopathy switched from a negative to a significant positive predictor of religious well-being (β from -0.44 to +0.38, $p<0.001$). Narcissism contributed positively to both existential well-being (EWB) (β=0.32, $p<0.001$) and overall SWB (β=0.26, p=0.009) in multivariate models, suggesting its potential adaptive role in a certain psychological context.

The findings indicate that the relationship between spiritual well-being and dark personality traits is not merely negative but involves intricate interactions. While Sadism is a primary detrimental factor, elements of Psychopathy and Narcissism may, under specific conditions (e.g., low Sadism), associate with or even contribute to certain aspects of spiritual well-being.

Abstract 733

CAN INTERPRETATIONS OF SELF-COMPASSION INFLUENCE EXPRESSIONS OF SELF-COMPASSION?

Nguyen N.*, Bailis D.

University of Manitoba ~ Winnipeg ~ Canada

Self-compassion is approaching one's own difficult situations with kindness, mindfulness, and common humanity. Although defined without references to behaviours, self-compassion has been linked to many positive health behaviours. However, when people try to enact self-compassion, it is unclear if this is the definition they use. It is also unknown whether or how their personal interpretations of self-compassion or self-care affect their behaviours. In Study 1, I surveyed 219 university students online, asking them to first reflect on a difficult experience and report their state self-compassion, then to indicate eating behaviours they considered as self-compassionate and self-caring from a list of both adaptive and maladaptive behaviours. The eating behaviours participants labeled as self-compassionate and self-caring were mostly adaptive. Participants who were higher in state self-compassion also associated more adaptive behaviours with self-compassion and self-care. In Study 2, after inducing state self-compassion in half of 219 participants, I observed their eating behaviours in a bogus taste test, in which they were provided with both healthy and unhealthy foods to freely eat for 10 minutes. I found that participants interpreted self-compassion as eating more healthy foods than unhealthy foods. The results also showed that participants' own self-compassion interpretations and food preferences, but not their state self-compassion, predicted their eating behaviours in this situation. Altogether, the results suggest four main conclusions about the relationship between self-compassion and eating: (1) Self-compassionate feelings correlate with adaptive eating and interpretations; (2) They might instill motivations and subsequent actions to be self-caring rather than self-compassionate; (3) These feelings lead to eating more of what one likes (which tends to be healthy and adaptive choices); and (4) A person's state self-compassion is highly insufficient to predict their actions, without also taking into account their behavioural interpretations of self-compassion and self-care.

08 - Division 8: Health Psychology

ADVANCES AND NOVEL APPLICATIONS OF INTEGRATED MODELS FOR CHANGING BEHAVIOUR

Wednesday 22 July 2026 from 11:00 to 12:00

(G-Spadolini)

Jacob Keech (Griffith University ~ Griffith ~ Austra), Chair and Presenter

Changing health-related behaviour requires identification of behavioural determinants, and the development of interventions targeting these determinants and the mechanisms accompanying them. Decades of research has demonstrated the ability of various prototypical social cognition models such as the theory of planned behaviour, in explaining health behaviour. However, these models have inherent limitations, which may be overcome through consideration of other constructs. To realise the benefits of such complementary perspectives, researchers have more recently sort to combine constructs and mechanisms into integrated theoretical models to explain behaviour. Such models may include constructs such as attitudes, norms, self-efficacy, and self determined motivation which may underpin motivated reasoned actions; volitional constructs such as planning and action control; and constructs such as behavioural automaticity, habits, and implicit social cognition which may underpin non-conscious processes. Such comprehensive integrated approaches are well-suited to understanding the determinants of behaviours which have been traditionally considered difficult to change, such as physical activity, swimming-related behaviours, and behaviours used in the context of coping with stress. This symposium will showcase synthesised research and empirical studies from Australia, Asia, Canada, and the USA which highlight the range of processes likely to impact behaviour through advances in the application of integrated models and theories.

Abstract 4280

CHILDREN'S COMPETENCE IN SWIMMING AND THE INTEGRATED MODEL OF SELF DETERMINATION THEORY AND THE THEORY OF PLANNED BEHAVIOR

Chan D.*

Hong Kong Metropolitan University ~ Hong Kong ~ China

Two studies examined the role of swimming competence on children's motivation and intentions under the framework of the integrated model of self-determination theory (SDT) and the theory of planned behavior (TPB). The studies were conducted to investigate the direct and moderating effects of swimming competence on the psychological pathways and constructs in the model integrating SDT and the TPB. Study 1 utilized a cross-sectional survey involving 4,959 primary school children, and examined the relationships between swimming competence and the model variables. Study 2 employed a pre-post-test quasi-experimental design with 1,609 primary school children to assess changes in swimming competence and its association with shifts in the model variables. In Study 1, significant positive relationships were found between swimming competence and all model variables (β = .061 to .330, $p < .05$), except for intention (β = -.009, $p > .05$). The moderation effects of swimming competence on model parameters were either small or not statistically significant. In Study 2, improvements in swimming competence correlated with change scores in all model variables (β = .046 to .230, $p < .05$), except for subjective norm (β = .049, $p > .05$). Notably, swimming competence did not significantly moderate the parameter estimates of the integrated model at the change-score level ($p > .05$). Our two large-scale studies demonstrate that the psychological pathways of the integrated model of SDT and TPB are robust across varying levels of swimming competence. The findings suggest that sports training programs for children should not solely emphasize competence development or skill acquisition. Instead, they must also consider the motivational and social cognitive factors that influence children's long-term intentions to engage in a sport. Enhancing these psychological aspects may be essential for fostering sustained participation in physical activities like swimming.

Abstract 4281

LEVERAGING META-ANALYTICALLY SYNTHESIZED DATA TO PROVIDE LARGE-SAMPLE TESTS OF ESTABLISHED AND NOVEL INTEGRATED THEORETICAL MODELS IN HEALTH BEHAVIOR RESEARCH

Hagger M.*[1], Hamilton K.[2]

[1]Department of Psychological Sciences, University of California, Merced ~ California ~ United States of America, [2]Health Sciences Research Institute, University of California, Merced ~ CALIFORNIA ~ United States Minor Outlying Islands

Testing the predictive validity of theories in health behavior research is highly salient to the development of an evidence base of potentially modifiable health behavior determinants and the processes by which they relate to health behavior. Such evidence may signal potential targets for efficacious behavior change interventions to promote health. Such tests typically involve evaluating the fit of models specifying theory stipulated nomological networks among psychological constructs and outcomes with observed data in health behavior contexts. Analytic techniques combining meta-analysis and multivariate analyses such as structural equation modeling affords researchers opportunity to conduct large-sample tests of such theoretical networks using synthesized data across multiple studies. Importantly, the techniques also provide opportunity to test predictions of unique theoretical perspectives, including integrated theoretical models, that draw constructs and process-related predictions from multiple perspectives to arrive at comprehensive accounts of health behavior. Such models, for example, incorporate multiple processes beyond those specified in typical social cognition and motivational theories, such as volitional and implicit processes. In this paper, we provide a non-technical overview of this approach and outline its advantages including: leveraging of the large sample size from multiple data sources to provide robust point and variability estimates of theory effects with high statistical power; capacity to provide overall evaluations of existing and new theoretical models across extant research and guideline ranges for theory effects in subsequent tests; and ability to test mechanistic effects, namely, mediation effects and effects of study- and sample-level moderator variables on theory effects. To illustrate our points, we outline a series of examples that illustrate the application of this approach to test existing and novel integrated theoretical models in health behavior research. We conclude by summarizing some of the limitations of this approach and

recommend future innovations that may advance theoretical knowledge in the field.

Abstract 4283

PREDICTING COPING BEHAVIOR USING INTEGRATED DUAL PROCESS MODELS

Keech J.*

School of Applied Psychology, Griffith University ~ Brisbane ~ Australia

Experiencing stress has been associated with a range of adverse outcomes for health and wellbeing. Directly implicated in the health consequences of stress is the coping behavior individuals utilise in an attempt to manage their stress. Interventions to aid in coping with stress often aim to teach coping skills and promote the uptake of particular behaviours for coping. Despite such approaches relying on an individual to change their behaviour, these interventions have rarely incorporated behavior change methods targeting the complex processes underpinning engagement in these behaviours. Given their ability to explain behaviour as a function of reasoned conscious and automatic non-conscious processes, integrated dual process models have substantive practical value for intervention design in this context. This presentation will demonstrate two tests of integrated dual process models predicting two distinctive types of coping behavior: problem focused coping behaviour and emotion-focused coping behavior. The models were tested in a sample of university students in Australia, a population who consistently reported high levels of stress, well exceeding population norms. Participants were aged 17 and older (N = 332), and a prospective correlational design with a 1-week follow-up was adopted. At Time 1 (T1) participants completed measures of constructs from the theory of planned behaviour reflecting reasoned psychological processes (intention, attitude, subjective norm, perceived behavioral control), and behavioral automaticity, regarding problem-focused coping behaviour and emotion-focused coping behaviour. At Time 2 (T2) participants completed follow up measures of problem-focused and emotion-focused coping behavior. Well-fitting structural equation models revealed that both reasoned and automatic psychological processes predicted problem-focused and emotion-focused coping behaviour, with stronger effects for automatic processes. Future research aiming to increase uptake of particular coping behaviours should use behaviour change techniques known to influence constructs reflecting reasoned and automatic psychological processes as opposed to just imparting coping skills.

Abstract 4284

DYNAMIC REPRESENTATIONS OF PSYCHOLOGICAL CONSTRUCTS FOR THEORY TESTING AND EVALUATION IN ECOLOGICAL MOMENTARY ASSESSMENT: A GUIDE TO MEASUREMENT OF MULTI-PROCESS ACTION CONTROL

Rhodes R.*[1], Kwan M.[2]

[1]School of Exercise Science, Physical and Health Education, University of Victoria ~ Victoria ~ Canada, [2]Department of Child and Youth Studies, Brock University ~ Victoria ~ Canada

s) Behavioral theories are essential in understanding physical activity and developing effective intervention strategies, yet most theories have been developed alongside common research methods available at their inception. Traditional methods have included infrequent assessments, capturing one's usual level of behavior or average score on a theoretical construct at a small set of time points. More contemporary data collection methods such as intensive longitudinal designs (e.g., Ecological Momentary Assessment; EMA) are beginning to facilitate more advanced approaches to theorizing. One of the primary challenges in applying traditional behaviour change theories, however, relates to measurement, as traditional multi-item measures are not practical nor may they accurately capture the dynamic elements of the construct sought in intensive longitudinal sampling. The purpose of this presentation is to provide a user's guide of measures of the Multi Process Action Control (M-PAC) Framework for use in EMA, followed by preliminary working examples. EMA offers opportunities to sample and obtain real-time (or near real-time) information that include processes that are more automatically or immediately activated in response to environmental stimuli or informational cues. As a result, we propose a slight re-operationalization of M-PAC as it relates to the interacting psychological systems in determining physical activity. We outline some of the measurement challenges with M-PAC using EMA, and the opportunities to blend more traditional and contemporary real-time approaches to advance theory and our understanding of physical activity utilizing the M-PAC framework. Together, this presentation is intended to be a starting point, acknowledging the need to adapt traditional behavioral theories to incorporate the dynamic factors in determining physical activity. By doing so, we can advance our understanding of physical activity behaviors and develop more effective, and theory based, interventions tailored to individual needs and contexts.

Abstract 1003

PSYCHOLOGICAL PATHWAYS TO QUALITY OF LIFE IN POLYCYSTIC OVARY SYNDROME: SELF-COMPASSION AS A PROTECTIVE RESOURCE

TunÇel A.*[1], Tekinsav--SÜtcÜ G.S.[2]

[1]Çanakkale Onsekiz Mart University ~ Çanakkale ~ Turkey, [2]Ege University ~ Izmir ~ Turkey

Polycystic Ovary Syndrome (PCOS) is a chronic health condition that extends beyond its physiological manifestations to encompass profound psychosocial challenges that substantially affect women's quality of life. Among these, disturbances in body image and self-perceptions play a central role, often leading to increased distress and diminished quality of life. The present study investigated the role of psychological factors, specifically self-compassion, in relation to body image flexibility, body shame, and quality of life related to PCOS symptoms. The study involved 286 women (M = 25.51, SD = 5.15) diagnosed with PCOS. Participants completed validated self-report measures, the Self-Compassion Scale, the Body Image Flexibility Questionnaire, the Objectified Body Consciousness Scale (body shame subscale), and the PCOSQ-50 Scale. Using Hayes' PROCESS macro (Model 6), a serial mediation analysis was conducted to test whether body image flexibility and body shame sequentially mediated the relationship between self-compassion and PCOS-related quality of life. Results indicated that self-compassion was significantly associated with more adaptive ways of relating to the body, fostering greater flexibility in body image experiences, and reducing the tendency toward body shame. In turn, these body-related processes emerged as significant contributors to enhanced quality of life among women with PCOS. The results highlight the role of body shame as a risk factor that undermines well-being. In contrast, self-compassion and body image flexibility emerged as important protective factors that promote psychological resilience. From a psychosocial perspective, these findings highlight the importance of incorporating self-compassion into interventions for women with PCOS. By cultivating a kinder, less judgmental stance toward oneself, women may better mitigate body-related distress. Additionally, strengthening body image flexibility may help individuals adaptively respond to body-related distress and resist internalizing negative evaluations. Such approaches hold promise for enhancing both psychological resilience and overall quality of life in women with PCOS.

Abstract 1262

ONLINE RESEARCH BASED ON POSITIVE PSYCHOLOGY ABOUT COLLEGE STUDENTS' HAPPINESS

Gai X.*[1], Qiu Z.[2]

[1]Northeast Normal University ~ Changchun ~ China, [2]Beijing Normal University ~ Beijing ~ China

Positive psychological intervention aims to systematically strengthen individual "positive resources". Network-based interventions can better match university students' lifestyles with greater flexibility and interest. This study integrated multiple positive psychological intervention and applied both qualitative and quantitative methods to examine two intervention schemes for enhancing university students' subjective wellbeing.

In the qualitative study, 70 third-year psychology majors were selected for a 12-month intervention. Analysis of their expressive writing revealed the mechanism through which network-based expressive writing increased positive experiences.

In the quantitative study, 90 engineering students completed pre-tests of SWLS, PANAS, SES, and SAS and were ranked by life satisfaction scores. Odd numbers formed the intervention group and even numbers the positive control group. Over 10 weeks, the intervention group engaged in positive psychological practice and expressive writing, while the control group only read materials and submitted notes. Pre-, mid-, and post-tests were conducted. After intervention, 31 students remained in the experimental group and 27 in the control group. Results showed significant increases in life satisfaction, positive mood, and self-esteem in both groups, with greater improvement in the intervention group. Anxiety and negative mood decreased more markedly in the intervention group.

These findings indicate that long-term network-based expressive writing steadily enhances subjective happiness. Suggestions are provided for promoting psychological health education for university students.

Abstract 1643

MOMENTARY AFFECT, EMOTION REGULATION, AND EMOTIONAL EATING: INSIGHTS FROM ECOLOGICAL MOMENTARY ASSESSMENT

Omori M.*[1], Chen X.[2], Shono Y.[2], Aizawa N.[1], Nakamura T.[3]

[1]Ochanomizu University ~ Tokyo ~ Japan, [2]Claremont Graduate University ~ Claremont ~ United States of America, [3]Osaka University ~ Osaka ~ Japan

Emotional eating—consuming food in response to emotions rather than hunger—is associated with cravings, overeating, and disordered eating. While emotion regulation (ER) is a known protective factor, most evidence comes from Western, laboratory-based studies. This study applied ecological momentary assessment (EMA) to examine how ER moderates real-time links between affect, cravings, and eating among Japanese students. Eighty-four university students (aged 18–25) completed a seven-day EMA protocol via smartphone. Multilevel models showed that negative affect, particularly depressive mood (β = 0.29, p = .014) and anxious mood (β = 0.30, p = .013), significantly predicted cravings for salty snacks. Anxious mood was also weakly associated with overall eating episodes (β = 0.06, p = .058). Crucially, ER emerged as a consistent moderator. Higher ER attenuated the impact of negative mood on cravings (e.g., depressive mood × ER: β = –0.63, p = .004) and reduced affect-driven eating episodes (e.g., depressive mood × ER: β = –0.21, p < .001; stress × ER: β = –0.14, p < .001). In contrast, perceived stress alone was not a significant predictor of eating behavior.

These findings highlight ER as a robust protective factor, buffering against affect-driven eating in daily life. The study suggests that interventions strengthening ER may reduce vulnerability to cravings and overeating. Moreover, the EMA design illustrates the promise of real-time, technology-based tools (e.g., just-in-time adaptive interventions) for applied psychology and public health.

Abstract 1567

AMBIGUOUS LOSS AND UNRESOLVED GRIEF IN THE CONTEXT OF SOCIAL CONFLICT: THE CASE OF CYPRUS

Yeniada--Kirseven M.*

Hacettepe University, Department of Psychology ~ Ankara ~ Turkey

This qualitative study explores the psychological and experiential dimensions of ambiguous loss among Turkish Cypriots who experienced the disappearance of a loved one during the conflict and war period between 1963 and 1974 in Cyprus. Drawing on a phenomenological framework, the study aims to understand the subjective meanings, grief processes, and coping strategies of individuals affected by this unresolved and disenfranchised form of loss. The sample consists of 10 first-degree relatives of missing persons, most of whom have received the remains of their loved ones and and one of whom have not. In-depth, semi-structured interviews were conducted with participants currently residing in Cyprus. Quantitative instruments, including the Prolonged Grief Disorder Scale (PG-13) and the Beck Depression Inventory (BDI), will be used to assess symptom severity. The qualitative data will be analyzed using phenomenological methods supported by MAXQDA software to identify key themes related to continuing bonds, resilience, meaning reconstruction, and the impact of identification or lack thereof. Ethical approval has been granted by the Hacettepe University Ethics Committee. This study contributes to the literature by addressing the long-term consequences of ambiguous loss in a post-conflict context and by highlighting the cultural, historical, and psychological complexities of grieving without closure. Findings are expected to inform culturally sensitive psychosocial support practices for families of the missing and expand the conceptual understanding of grief under conditions of prolonged uncertainty.

INTERNAL CONSISTENCY AND CONSTRUCT VALIDITY OF THE KEYES SOCIAL WELL-BEING SCALE IN COLOMBIAN YOUTH

Castro Munoz J.A.*[1], Pineda Roa C.A.[2]

[1]Fundación Universitaria Sanitas ~ Bogotá ~ Colombia, [2]Specialized Center for Research Advice in Behavioral Sciences - CENAMI ~ Bogotá ~ Colombia

Social well-being is understood as "The assessment we make of our circumstances and functioning within society" (Keyes, 1998, p. 122). The present study sought to evaluate the internal consistency and construct validity of the social well-being scale in colombian socio cultural context, according to the variables of sex and age in a sample of 241 young people living in Colombia, 44% women and 56% men. their age ranged from 18 to 40 years (M = 23.48; SD = 5.39). The participants completed Keyes' (1998) social well-being test, adapted to Spanish in Spain by Blanco and Diaz (2005), which is composed of five subscales (integration, acceptance, contribution, actualization, and social coherence), whose items range in a 5 point likert scale from strongly disagree (1) to strongly agree (5). The results of the Confirmatory Factor Analysis (CFA) confirmed the original 5-factor structure. The reliability of the subscales measured using Cronbach's Alpha ranged from 0.67 to 0.81, which is considered adequate internal consistency. The results confirm previous findings and are discussed in light of the limited literature available, considering its implications for the assessment of well-being of young adults in the Colombian context.

Abstract 420

A STUDY EVALUATING THE FEASIBILITY OF A SELF-COMPASSION MEDITATION ON BODY IMAGE IN RETIRED ATHLETES

Hough S.*

University of Victoria ~ Victoria ~ Canada

Background: Retirement from sport is a major life transition that can cause emotional and psychological distress, particularly related to body image. Former athletes with strong athletic identities may be especially vulnerable to body dissatisfaction and related issues. Although interventions for practicing athletes are increasing, few target body image in retired athletes. Self-compassion meditations have shown promise in improving body appreciation and reducing body shame and appearance-based self-worth, but no studies have examined their impact in this population.

Purpose: This study evaluated the feasibility of a three-week, 20-minute daily self-compassion meditation intervention, adapted from Albertson et al. (2015), for retired athletes with body image concerns. Primary outcomes included recruitment, retention, and participant satisfaction. Secondary outcomes included changes in self-compassion, body dissatisfaction, body shame, body appreciation, and appearance-contingent self-worth.

Methods: A mixed-methods feasibility trial was conducted with 32 retired athletes (18+) who had competed at the collegiate, provincial, or national level. Participants engaged in a 21-day self-guided online meditation intervention. Recruitment and retention rates were recorded. ANCOVAs controlling for baseline values were used to assess secondary outcomes. Thematic analysis was conducted on open-ended responses from a satisfaction survey.

Results: Retention was high (86.49%) but recruitment was low (10 participants/month). Participants reported improvements in body appreciation (d=0.83) and self-compassion (d=1.43), and reductions in body dissatisfaction (d=-0.54), body shame (d=-1.36), and appearance-based contingent self-worth (d=-0.59). Qualitative feedback indicated greater body awareness, positive self-perception shifts, and high acceptability of the intervention.

Conclusion: A self-compassion meditation intervention appears feasible and well-received among retired athletes with body image concerns. Preliminary outcomes suggest psychological benefits, warranting a larger randomized controlled trial. Future

research should improve recruitment strategies, incorporate objective measures, and enhance sample diversity.

Abstract 673

CLASSIFYING TYPICAL BURNOUT TRAJECTORIES VIA WORK COMMITMENT: CLUSTER VALIDATION AND A SELF-CHECK APPLICATION

Igawa J.*[1], Tokuoka M.[2], Iotake R.[3], Nakanishi D.[4]

[1]Tohoku Gakuin University ~ Sendai ~ Japan, [2]University of Human Environments ~ Matsuyama ~ Japan, [3]Hiroshima Bunka-Gakuen University ~ Hiroshima ~ Japan, [4]Hiroshima Shudo University ~ Hiroshima ~ Japan

Research on burnout has traditionally emphasized symptoms, while the processes leading to burnout have received less attention. Burnout, in which proactive work attitudes paradoxically harm mental health, may arise through mechanisms different from those of other stress responses. This study therefore, focused on work commitment as a prerequisite for understanding burnout processes.
At Time 1 (T1, 2023), we conducted a web-based survey of nurses and care workers (N = 933). Participants completed a burnout scale and a Work Commitment Scale comprising five dimensions: engagement with clients, responsibility, communication, sense of mission, and self-improvement. Using a latent rank model, we derived ranks for commitment peak, decline, and mental symptoms. These ranks were subjected to cluster analysis, which identified five distinct groups: a Typical Burnout cluster (N = 160), a Work Engagement cluster (high and stable commitment with low symptoms; N = 66), an Adjustment cluster (moderate adjustment of commitment with reduced burden; N = 89), a Maladjustment cluster (low commitment but high symptoms; N = 132), and an Inert cluster (low commitment and low enthusiasm; N = 19).

At Time 2 (T2, 2024), a follow-up survey with 466 respondents included external indicators such as workplace evaluation, turnover intention, and depressive symptoms (PHQ-9). One-way ANOVAs showed that the Typical Burnout and Maladjustment clusters had significantly higher PHQ scores and turnover intention, whereas the Work Engagement and Adjustment clusters scored lowest. The Inert cluster fell in the middle on PHQ and turnover intention, but showed turnover rates comparable to the Burnout and Maladjustment clusters. These findings support the validity of the T1 classification and highlight the role of typical burnout trajectories.
In the conference presentation, we will introduce a web-based self-check application that enables individuals to assess their responses and identify their own cluster membership.

Abstract 2353

FACTORS INFLUENCING DRIVERS' YIELDING BEHAVIOR IN TAIWAN: THE ROLES OF CONFORMITY EFFECT AND PERSONALITY TRAITS

Kuo C.*[1], Lo S.[2], Wang X.[1]

[1]Department of Transportation and Logistics, Feng Chia University ~ Taichung City ~ Taiwan, [2]Institute of Communication Studies, National Yang Ming Chiao Tung University ~ HSINCHU CITY ~ Taiwan

This study examines drivers' yielding behavior toward pedestrians in Taiwan and explores its relationship with conformity effects and personality traits. In recent years, pedestrian accidents have remained frequent in Taiwan, raising concerns about traffic safety. International media have also highlighted the disorder of Taiwan's traffic environment. To better understand the factors influencing drivers' willingness to yield, this research compares differences in traffic engineering design, education, and law enforcement between Taiwan and other countries. Psychological aspects such as conformity and personality traits are also considered. A questionnaire survey was conducted, and 210 valid responses were collected. A binary logistic regression model was applied to identify key influencing factors. The results show that time and traffic volume, road markings and signs, the number of pedestrians crossing, sidewalks, and related facilities significantly affect drivers' yielding behavior. Time and traffic volume have negative effects, while clear markings, sidewalks, and adequate pedestrian facilities have positive effects. Personality traits did not show a significant influence, whereas conformity proved to be an important psychological factor. These findings suggest that drivers' decisions to yield are shaped not only by physical and environmental conditions but also by social and psychological influences. Future studies are encouraged to use driving simulators and eye-tracking methods to further explore drivers' decision-making processes in real-world scenarios.

Abstract 525

EXPLORING THE ASSOCIATION BETWEEN ORAL HEALTH LITERACY, SELF-CARE, AND GRIT AMONG COMMUNITY-DWELLING OLDER ADULTS: A PILOT STUDY

Liu Y.*

Mackay Medical University ~ New Taipei City ~ Taiwan

Introduction: With population aging, healthy aging is critical. Few studies have examined how oral health literacy, self-care, and grit relate in middle-aged and older adults, despite grit's potential role in sustaining self-care behaviors and promoting oral health.
Purpose: This study was to examine the associations among oral health literacy, self-care, and grit in community-dwelling middle-aged and older adults.
Method: A cross-sectional design was employed, and 49 participants were recruited online from the community. The study protocol was approved by the institutional review board of the participating hospital. All participants completed a demographic questionnaire, the short version of the Chinese Sarcopenia Functional Questionnaire, the Eating Assessment Tool (EAT-10), the short-form Health Literacy Dental Scale (HeLD-14), the Oral Self-Care Behaviors Scale, and the Grit-10 Scale. Data were analyzed using SPSS version 26.
Results: A total of 49 participants were included in this study, comprising 18 men and 31 women, aged 41 to 82 years, with a mean age of 62 years. Most participants had an education level of high school or below (63.3%), followed by college (24.5%). The majority were married (81.6%), with 10.2% unmarried and 8.2% widowed. The most common chronic conditions were hypertension (30.6%), diabetes (14.3%), and hyperlipidemia (12.2%). Most participants reported no smoking (95.9%), no alcohol consumption (95.9%), and no betel nut chewing (100%). Grit was not significantly associated with age, gender, education level, or marital status. However, the Oral Self-Care Behaviors Scale was positively correlated with grit, suggesting that individuals with higher grit tended to engage in better oral self-care behaviors.
Conclusions: This study found that grit was not significantly associated with age, gender, education level, or marital status, but was positively correlated with oral self-care behaviors, indicating that middle-aged and older adults with higher grit demonstrated better oral self-care practices.

Abstract 461

A QUALITATIVE INQUIRY INTO THE PSYCHOLOGICAL EXPERIENCES OF RENAL TRANSPLANT RECIPIENTS IN SINGAPORE

Neo H.L.M.*[1], Tiong H.Y.[1], Kaur H.[1], Goh S.Y.S.[2], Ho C.S.H.[1]

[1]National University Hospital Singapore ~ Singapore ~ Singapore, [2]Singapore Institute of Technology ~ Singapore ~ Singapore

Introduction: Patients often begin their renal transplantation journey after a period of coping with organ failure due to their chronic medical illnesses. This is often fraught with periods of uncertainty, medical complications, multiple hospitalizations, as well as personal losses. After living- or deceased-donor renal transplantation, it is necessary that recipients continue to receive ongoing treatment and medical surveillance, including the use of lifelong immunosuppressive drugs, adherence to regular clinic and laboratory attendance, infection prevention, and lifestyle guidelines. These expectations and demands can have psychological implications for renal transplant recipients. However, little is known about the psychological experiences of renal transplant recipients in Singapore.

Purpose: This study seeks to understand and document the psychological experiences of renal transplant recipient, to inform service provision and provide better psychological support for patients.

Method: This qualitative study involved the recruitment of 15 kidney transplant recipients via purposive sampling. Inductive thematic analyses of focus-group discussions and in-depth interviews were undertaken.

Results: The analyses revealed five main themes: (1) the paradox between gratitude and indebtedness, (2) adjustment to a “new normal”, (3) the importance of self-management, (4) fear of the future, and (5) systemic discrimination.

Conclusions: This study helps us to understand the complex and ever-evolving psychological experiences of undergoing a renal transplant, identifying both the positive and negative aspects that can be targeted in post-transplant care. It also underscores the need for access to psychotherapy as an integral part of holistic transplant care.

Abstract 4764

Development and Psychometric Validation of a Multidimensional Adolescent Depression Scale: A Content-Driven and Empirical Approach

Krone I.*, Perepjolkina V., Kolesnikova J., Bezborodovs N., Stepens A.

Riga Stradinš University (RSU) research team ~ Riga ~ Lettonia

Introduction: Accurate assessment of adolescent depression requires instruments that are both developmentally sensitive and clinically robust. While many tools exist, there is a continuous need for scales that integrate ICD-11 criteria with language suitable for the adolescent population.

Purpose: This study describes the development and validation of a new 23-item depression scale, evaluating its factor structure, reliability, and demographic nuances.

Method: Item generation followed a rigorous process: 16 core symptom domains based on ICD-11 were identified, followed by expert evaluation (n=6) and a pilot study. After initial testing, one item was removed due to low factor loading and network centrality. The final 23-item version was validated using a sample of 688 adolescents (627 community, 61 clinical; ages 13–18). The clinical group consisted of adolescents with a confirmed diagnosis of depression or a clinical psychologist's assessment.

Results: EFA supported a four-factor structure: F1: Emotional-Cognitive; F2: Suicidal Ideation; F3: Interpersonal Distress; and F4: Somatic Symptoms. While the 4-factor model was consistent for girls, a simpler 2-factor model emerged for boys. The scale demonstrated excellent reliability (omega = 0.96). Significant demographic trends were observed: scores progressively increased with age, and girls reported significantly higher average scores compared to boys. Criterion validity was robust, with the clinical group (M=106.0) scoring significantly higher than the community sample (M=44.1); this was confirmed by a Mann-Whitney U test ($U = 5536$, $p < .001$, $r_{rb} = 0.711$). A strong negative correlation with the WHO-5 Well-being Index was also observed ($r = -0.51$).

Conclusions: The 23-item scale is a psychometrically sound tool for assessing adolescent depression. It effectively differentiates clinical cases from non-clinical populations, with 19.9% of the community sample exceeding the optimal Youden-indexed threshold. The findings highlight the scale's sensitivity to developmental and gender-based symptom presentations.

Abstract 663

THE RELATIONSHIPS OF LONELINESS AND RUMINATION WITH SLEEP QUALITY AMONG UNIVERSITY STUDENTS IN HONG KONG

Shu T.*[2], Lam H.W.H.[1]

[1]Department of Psychology, Lingnan University ~ Hong Kong ~ Hong Kong, [2]Division of Social Science, Hong Kong University of Science and Technology ~ Hong Kong ~ Hong Kong

Research demonstrates that sleep is one of the physical issues disturbing university students and predicting academic performance. Loneliness and rumination have been shown to predict sleep quality in many Western samples. Yet these research studies did not consider the mixed features of the two dimensions of rumination, brooding and reflection, in their investigation. No study has yet examined the relationships between these factors together. In a cross-sectional sample of one thousand and sixty-nine university students in Hong Kong, the present study investigated the relationships between loneliness, sleep quality, ruminative brooding, and ruminative reflection. Results showed that sleep quality was negatively correlated with loneliness and ruminative brooding, but not with ruminative reflection. Similarly, loneliness was negatively correlated with ruminative brooding, but not with ruminative reflection. The findings provide the first empirical evidence to investigate the relationships between loneliness and sleep quality among university students in Hong Kong, and also suggest the implications of the mixed features of rumination in the context of loneliness and sleep.

FRONTLINE RESILIENCE, STRESS AND COPING STRATEGIES IN HEALTHCARE WORKERS: A SYSTEMATIC REVIEW

Singh J.*[1], Harleen K.[2]

[1]Jaipur National University Institute for Medical Sciences and Research Centre, [2]O.P. Jindal University, India ~ Haryana ~ India

Healthcare workers face unique and intense stressors stemming from long hours, high emotional demands, life-and-death decision-making, trauma exposure, and resource limitations. These factors can lead to chronic stress and burnout, affecting both personal well-being and professional performance. Understanding their experiences is essential for developing interventions that protect mental health and sustain high-quality care. Resilience, the ability to adapt, recover, and thrive amid adversity, is a vital protective factor. Far from being purely innate, resilience can be cultivated through personal strategies and supportive environments. Resilient healthcare workers maintain emotional stability, problem-solving capacity, and motivation even under pressure. This reduces burnout risk, enhances job satisfaction, and improves patient safety. Our systematic review examines the relationship between stress, resilience, and coping strategies in healthcare professionals. It highlights evidence-based approaches such as mindfulness, peer support, physical activity, healthy sleep, and clear professional boundaries. We followed PRISMA guidelines and included 27 studies in our review at the last stage. Organizational measures, including access to mental health services, workload adjustments, and open communication, are equally important in building systemic resilience. By addressing both individual coping skills and institutional support, this work underscores that resilience is not merely a wellness initiative but a strategic necessity. Supporting those who care for others strengthens the healthcare workforce and ensures the delivery of compassionate, high-quality care.

Abstract 485

NEGATIVE SOCIAL INTERACTIONS MODERATE THE RELATIONSHIP BETWEEN LGBTQ2+ STATUS AND HEALTH

Speed D.*

University of New Brunswick ~ Saint John ~ Canada

INTRODUCTION
Individuals who identify as Lesbian, Gay, Bisexual, Trans, Queer, or 2-Spirited+ (LGBTQ2+) experience pervasive barriers to participating in society and are often targets of discrimination. In parallel to this, women tend to experience socially-enforced disadvantages around their gender identity. Finally, negative social interactions describe the frequency in which an individual experiences adversity during social participation.
PURPOSE
Using a lens of Minority Stress Theory (the idea that multiple minority identities compound health vulnerabilities) the current study explored whether gender identity, LGBTQ2+ identity, and negative social experiences, interacted with one another. I hypothesized that LGBTQ2+ individuals would report lower health, and individuals with multiple marginalized identities (e.g., LGBTQ2+ and being a woman) would have the lowest health.
METHOD
The 2022 Mental Health and Access to Care Survey is a nationally representative survey collected by Canada's federal statistics agency. It contained a large number of clinical outcomes that followed World Health Organization – Composite International Diagnostic Interview criteria, these included distress, alcohol abuse/dependence, bipolar disorder, depression, suicidal thoughts, anxiety, social phobia, and cannabis abuse/dependence. Using a series of weighted regression models representing more than 20,000,000 respondents, I explored my research question.
RESULTS
Key findings were: 1). LTBTQ2+ individuals report significantly higher levels of negative social interactions relative to non-LGBTQ2+. 2). Negative social interactions impacted LGBTQ2+ individuals more profoundly; 3). LGBTQ2+ individuals tended to report poorer health outcomes. 4). LGBTQ2+ Women were particularly vulnerable to NSI – it dramatically increased the predicted probability of experiencing distress, depression, suicidal thoughts, and social phobia; and 5). LGBTQ2+ Men were more vulnerable to cannabis abuse/addiction.
CONCLUSION
My work was broadly supportive of Minority Stress Theory, although it did not emerge in all cases (notably cannabis abuse/dependence). It is important to understand how multiple marginalized identities of an individual may interact to shape that person's

health and wellness.

DISPOSITIONAL MINDFULNESS AND SERENITY: MECHANISMS OF COGNITIVE EMOTION REGULATION IN MENTAL WELL-BEING AND STRESS DURING THE COVID-19 PANDEMIC

Zhang F.*[1], Soysa C.K.[2], Parmley M.[1]

[1]Assumption University ~ Worcester, MA ~ United States of America, [2]Worcester State University ~ Worcester, MA ~ United States of America

Dispositional mindfulness and dispositional serenity were found in previous research to complement one another in promoting mental health. Extending this research, the present study investigated the effects of both in relation to mental well-being (MWB) and stress during the COVID pandemic. It also examined whether distinct cognitive emotion regulation (CER) strategies mediated relationships between them and MWB and stress. Using a cross-sectional design, the present study found that mindfulness and serenity incrementally predicted greater MWB and less stress. Furthermore, adaptive and maladaptive CER differentially mediated the relationships between aspects of mindfulness and serenity and both MWB and stress. Among the mindfulness facets, most notably, acting with awareness and nonjudging were only associated with maladaptive CER, which partially mediated their relationship with both MWB and stress. Among the serenity dimensions, adaptive CER and maladaptive CER mediated the relationships between the serenity factors and both MWB and stress. Individuals with high serenity appeared to engage in more meaning-restructuring positive thinking and dwell less on negative thoughts and emotions that helped to promote MWB and reduce stress. In contrast, those who were more mindful seemed to decrease rumination, catastrophizing, and self-blame to promote MWB and reduce stress. Clinical implications of the present findings are discussed.

NAVIGATING STRESS THROUGH A POSITIVE LENS: CHALLENGES AND PROMISING AVENUES

Wednesday 22 July 2026 from 12:00 to 13:00

(E- Spadolini)

Yueqin Hu (Beijing Normal University ~ Beijing ~ Ch), Chair and Presenter

Stress is often viewed negatively, yet increasing attention is being given to its potential positive side. This symposium brings together five speakers who examine both the benefits and challenges of approaching stress from a positive perspective. Presenter 1 investigates the bidirectional link between self-compassion and stress, showing that self-compassion may be ineffective in high-stress situations and thus not uniformly beneficial. Presenter 2 analyzes internal and external processes shaping a positive stress mindset, revealing its fragility and the difficulty of cultivating such beliefs. Presenter 3 uses the transactional model of stress to demonstrate how procrastination reminders can push individuals toward desirable but less feasible actions, underscoring unintended downsides of seemingly positive behaviors.

While these talks highlight limitations of positive approaches to stress, the next two speakers offer potential pathways forward. Presenter 4 examines rumination on stressful work events, showing that not detaching from work is not always harmful; rather, intentional reflection can support recovery, learning, and well-being. The final speaker shifts to the community level, demonstrating how strong community cohesion can buffer the adverse impacts of childhood stress and promote collective well-being.

Together, these studies span individuals, workplaces, and communities, and draw on diverse methods including qualitative research, ecological momentary assessment, field experiments, and large-scale longitudinal analyses. Collectively, they offer a nuanced and integrative understanding of how positive perspectives on stress can inform more effective coping in daily life.

Abstract 4222

THINKING ABOUT STRESSFUL WORK EVENTS WHILE NOT AT WORK: THE ROLE OF RUMINATION

Zhan Y.*, Rodrigues K.

Wilfrid Laurier University ~ Waterloo ~ Canada

In spite of research evidence suggesting that detaching oneself from work during off-work hours aids in better work stress recovery and reduction in burnout symptoms (Sonnentag & Fritz, 2007; Sonnentag et al., 2010; Weigelt et al., 2019), it is sometimes inevitable for employees to think about past work experiences, particularly negative or stressful work experience, in their downtime (Sandoval-Reyes et al., 2021). Many stressful work events, such as having a frustrating interaction with a colleague, receiving negative feedback from a supervisor, and making a major mistake in solving a complex task problem, may linger in one's head even during work breaks, evenings, weekends, or vacations. While mentally "switching off" from work during off-work hours has been associated with well-being outcomes (Sonnentag et al., 2010), the implication of mentally engaging in or thinking about past stressful work events during off-work hours can be complicated, as it may depend on how one is thinking about them. The present research (a) explores different dimensions or forms of rumination of stressful work events and (b) empirically tests how different forms of rumination of stressful work events relate to employee outcomes. Qualitative and quantitative studies have been designed to address these research questions. Preliminary results suggest that thinking dynamics involved in RSWE may be cyclic (i.e., thinking about an event over and over again in a cyclic manner with no attempt to reflect on the experience), counterfactual (i.e., repetitively thinking about alternative scenarios how an event could have occurred or its alternative outcomes), and/or deliberate (i.e., purposefully thinking about an event to gain closure or to search for greater understanding). In follow-up studies, we expect to show that lack of work detachment does not necessarily lead to detrimental consequences; rather, deliberate rumination of stressful work events can facilitate recovery and learning, enhancing employee well-being.

Abstract 4223

COMMUNITY COHESION: A RESILIENCE FACTOR TO ADVERSE CHILDHOOD EXPERIENCES

Saxon A., Shen Y.*

Texas State University ~ San Marcos ~ United States of America

Prior studies have examined factors attributable to resilience and have found individual, family, and community characteristics that contribute to the construct's protective power. However, resilience factors protective for the negative effects of household dysfunction in the context of adverse childhood experiences (ACEs) have been seldom researched (Benzies & Mychasiuk 2009). This study examined the relationships among household dysfunction, externalizing behaviors, and community cohesion in U.S. adolescents.

Data for this study were obtained through the largest ongoing longitudinal research initiative on adolescent development: the Adolescent Brain Cognitive Development study (ABCD). Participants included N = 11,868 youth (52% male and 97.1% US born) and their parents/guardians. This study analyzed the following constructs assessed using a combination of adolescent and parent/guardian reports: household dysfunction (measured at adolescent age 9-10; Wave 1), adolescent externalizing behaviors (measured at age 11-12 and 12-13; Waves 3 and 4), and community cohesion (measured at Wave 3).

Multiple regression analyses suggested a significant moderating effect of community cohesion for the predictive effect of household dysfunction on Wave 3 externalizing behaviors: $B = -.288$; $SE = .051$; $p < .001$. In addition, community cohesion served as a moderator for the relationship between household dysfunction and Wave 4 externalizing behaviors: $B = -.261$; $SE = .054$; and $p < .001$. Dummy-coded demographic covariates such as adolescent sex, race/ethnicity, and nativity were controlled for in the analyses.

Findings of this study suggest that factors such as community cohesion could moderate the negative effects of household dysfunction on externalizing behaviors for adolescents both concurrently and longitudinally. These findings indicate that strengthening community cohesion could serve as a possible intervention strategy to support adolescents who are at risk for developing externalizing behaviors due to experiencing dysfunctional household environments.

Abstract 4224

POSITIVE STRESS MINDSET IS VULNERABLE: UNPACKING THE INTERNAL AND EXTERNAL DYNAMIC LOOPS OF STRESS MINDSET

Hu Y.*, Ma J., Luo X.

Beijing Normal University ~ Beijing ~ China

Research has shown that individuals' stress mindset—the belief that stress is enhancing or debilitating—can be altered through interventions. However, the daily fluctuations of stress mindset and its interplays with psychological outcomes in natural context remain underexplored. This study aimed to investigate the dynamic characteristics of positive and negative stress mindset in daily life, as well as its reciprocal effects with psychological well-being. 356 college students completed their stress mindset and psychological well-being measures for seven consecutive days (five assessments per day). We examined the dynamic characteristics of the internal system of positive and negative stress mindset, as well as their interplay with psychological well-being. Dynamic structural equation modeling found that positive stress mindset was significantly weakened by negative stress mindset. More importantly, the self-perpetuating loop between negative stress mindset and negative affective experience further diminished positive stress mindset. These findings highlight the dynamic nature of stress mindset, pinpointing the susceptibility of positive stress mindset to daily negative influences, as such call for targeted interventions on protecting and cultivating a positive view of stress.

TRANSITION STRESSORS IN TIMES OF MULTIPLE CRISES – INNOVATIVE POTENTIALS FOR MITIGATION IN DIFFERENT CONTEXTS AND ACROSS THE LIFESPAN

Wednesday 22 July 2026 from 14:00 to 15:30

(E- Spadolini)

Esther Greenglass (Department of Psychology 233 BSB York), Chair and Presenter
Sonia Lippke (Hamburg University of Applied Sciences/H), Co-Chair
Ralf Schwarzer, Discussant

This symposium showcases innovative research and interventions in applied psychology, addressing pressing psychological challenges across the world and in different settings. The presentations span diverse populations and methodologies, unified by a commitment to contextual sensitivity, co-creation, and digital or online innovation.

First, a study with 661 Canadian university students explores psychological responses to the return to in-person classes post-COVID-19. Findings reveal that perceived health risks, especially among students with disabilities, are linked to lower well-being and reduced attendance, while perceived benefits predict greater engagement. The study highlights the importance of addressing health-related anxieties to support student mental health and academic participation.

In the second presentation, Parenting in the Moment (PIM) is used, a multilingual, trauma-informed online intervention for forcibly displaced families in the U.S. Grounded in the ADAPT parenting model, PIM supports emotion regulation, positive parenting, and stress management. Preliminary RCT results with 100 families who were refugees to the United States show improvements in parental efficacy and reduced family stress, emphasizing the potential of scalable, culturally responsive interventions.

In the third presentation, Meaning in Life as a Self-Regulatory Resource for Physical Activity is investigated. Through three studies, this research tested the role of meaning in life (MIL) in reducing exercise procrastination and promoting physical activity. Experimental, daily diary, and intervention-based designs demonstrate that MIL enhances positive emotion, self-control, and future orientation, leading to sustained behavioral change. These findings position MIL as a promising target for integrated well-being interventions.

The fourth presentation is reporting on a quasi-experimental study with 181 chronically ill and multimorbid patients who evaluates two psychological interventions during a multi-week hospital stay. Drawing on the EASE model and DGP guidelines, the interventions target anxiety, depression, and loneliness. Social support emerged as a key mediator between self-efficacy and depression, underscoring the need for individualized, socially embedded mental health care.

The firth study dives into co-creative approaches to loneliness among international students. A mixed-methods study in Germany addresses loneliness and social stress among international students. Two co-designed interventions—a campus gardening initiative and a literacy campaign—foster emotional safety and social participation. Early feedback suggests these strategies offer a replicable model for inclusive academic environments.

Finally, the effectiveness of a self-help online Acceptance and Commitment Therapy (ACT) intervention in enhancing meaning-making and psychological flexibility was evaluated among seven male patients after hematopoietic cell transplantation (HCT), using a multiple-baseline single-case experimental design. Individual results highlighted the sense of identity and psychological flexibility during the intervention phase.

Abstract 4214

PSYCHOLOGICAL REACTIONS AND RETURN TO IN-PERSON UNIVERSITY CLASSES FOLLOWING COVID-19

Greenglass E.*

Department of Psychology 233 BSB York University ~ toronto ~ Canada

With the 2022 return to in-person university classes, students experienced ambivalent psychological reactions following two years of mandatory isolation due to COVID-19. On the one hand, they were eager to return to campus, see their friends and attend classes. On the other hand, since the COVID-19 virus was still circulating, there was some fear of catching the virus. The purpose of this research was to study university students' psychological reactions to returning to in-person classes. Previous research suggests that students experienced stress, anxiety and depression when returning to in-person classes. In the present study, the prospect of attending in-person class is seen in the context of health decision-making involving perceptions of benefits and health risks of in-person class attendance. An online study was conducted in 2022 with 661 university students in a large Canadian university. Participants responded anonymously to a questionnaire that assessed whether they perceived any benefits and health risks of returning to in-person class, their health in general and psychological well-being, and whether they were at increased risk of contracting the COVID virus due to disability. A theoretical model was designed where the greater the health risks associated with class attendance, the lower the well-being and the worse participants' health. The better the health in general, the more frequently students should report attending class. Path analysis was used to test the fit of the model to the data. Result showed the model was a good fit to the data and regression coefficients indicated that perception of health risks of attending class was associated with poor health or being disabled which was related to the perception of fewer benefits of attending class. The more benefits were perceived, the more frequently participants reported attending class. Theoretical importance of the results is discussed as well as implications for student well-being.

Abstract 4215

IMPROVING STRESS MANAGEMENT AND PARENTING BEHAVIOR AMONG PARENTS WHO ARE REFUGEES TO THE UNITED STATES

Gewirtz A.*

Arizona State University ~ Arizona ~ United States of America

A large body of literature has documented the detrimental impact of life stressors and traumatic stressors in families. Family stress models document how stressful events impair children's adjustment by increasing parental stress and parents' negative and coercive interactions with children. Applying a family stress model, and a social interaction learning perspective, we have developed and tested parenting interventions for families affected by traumatic stressors, including war, homelessness, and domestic violence. ADAPT (Adaptive Parenting Tools) is a well-validated intervention for families affected by a parent's deployment to war. Three randomized trials of several formats of the ADAPT intervention demonstrated the effectiveness of both in-person and online formats of the program in improving parenting, parents' and children's mental health, and reducing family stress.

The current presentation documents the contextual modification of the ADAPT online program as a self-directed, multilingual online intervention for families forcibly displaced to the USA and early findings from a randomized controlled trial of the intervention. Parenting in the Moment/PIM provides 14 online modules in Arabic, Spanish, French or English that deliver parenting and stress management/mindfulness tools to help parents regulate intense negative emotions (i.e. trauma triggers), teach children through encouragement, family problem solving, effectively set limits, be positively involved with children, and socialize children's emotions. PIM was developed closely with a diverse range of families, community leaders, and social service agencies. The RCT is recruiting families forcibly displaced from the Middle East, Africa, and Latin America. and Asia. Preliminary findings from the first 100 families focus on sample characteristics, program usage, and initial findings examining change in parental efficacy and perceptions of family stress. Results, and implications for broadband refugee parenting interventions are discussed.

Abstract 4216

MORE MEANINGFUL, MORE PHYSICALLY ACTIVE: VALIDATION AND INTERVENTION ON THE ROLE OF MEANING IN LIFE IN EXERCISE PROCRASTINATION

Miao M.*

Department of Medical Psychology, School of Health Humanities, Peking University ~ Beijing ~ China

Physical activity is vital for physical and mental well-being, yet inactivity and exercise procrastination are increasingly prevalent. This research, consisting of three studies, investigates the self-regulatory role of meaning in life (MIL) in reducing exercise procrastination and promoting physical activity, and explores its potential as an intervention target for health behavior promotion.

Study 1 employed an experimental design among 212 Chinese adults to examine the immediate and follow-up effects of MIL induction on emotion, exercise procrastination, and physical activity. The results showed that MIL manipulation significantly increased positive emotion and decreased negative emotion. Positive emotion, in turn, predicted reduced exercise procrastination after one week, ultimately leading to greater physical activity. A significant sequential mediation effect of positive emotion and exercise procrastination between MIL induction and physical activity was supported.

Study 2 adopted a 14-day daily diary design with 186 university students to further explore within-person associations among MIL, self-regulatory resources, and exercise procrastination. Multilevel analyses showed that daily MIL predicted lower levels of exercise procrastination through enhanced positive affect and future orientation, thereby further supporting a dynamic self-regulatory mechanism at the daily level.

Based on these findings, Study 3 developed a four-week integrated intervention grounded in Positive Psychology Intervention (PPI). Using a randomized controlled trial (RCT) design, the intervention targeted MIL and self-regulatory resources through structured exercises and reflection tasks. Preliminary findings demonstrated improvements in MIL, self-control, and a reduction in exercise procrastination.

Taken together, these findings highlight MIL as a key self-regulatory resource in fostering physical activity. These results suggest that intervening on MIL not only enhances psychological well-being but also contributes to meaningful and sustainable behavioral change, offering both theoretical value and practical implications for designing integrated well-being interventions.

Abstract 4219

SUPPORTING CHRONICALLY ILL, MULTIMORBID OLDER PATIENTS DURING A TWO WEEK INPATIENT HOSPITAL STAY TO COPE WITH DISTRESS: EFFECTS OF TWO PSYCHOLOGICAL SHORT-TERM INTERVENTIONS

Roskoschinski A.*, Burgmann N., Lippke S.

Constructor University Bremen ~ Bremen ~ Germany

In a quasi-experimental study with N=181 chronically ill and multimorbid patients in a multi-week hospital stay two measurement time points at admission and discharge were collected. The main aim of the study was to promote mental health through two targeted psychological interventions and psychosocial support by means of an intervention drawing upon recommendations from the Deutsche Pneumologen Gesellschaft e.V. (“DGP”) or the "Extend Yourself, Action Plan, Selection und Expect The Best - EASE" approach developed by Cacioppo and Patrick (2008) in comparison to a control group, which did not undergo any intervention but received psychosocial support as usual “Care as usual”; CAU). While the main aim was to test effects on stress indicators such as anxiety, depressiveness and loneliness, the study also investigated the associations, and potentially, the causal relationships between the two short-term psychological interventions and symptoms of anxiety, loneliness, depression, and self-efficacy. Interventions on anxiety, loneliness, depression, and self-efficacy can provide insights into how these factors interact and influence each other in the context of chronic illness and multimorbidity during a several week hospital stay. Findings indicate that the two interventions did not differ significantly but depending on the outcome they have differential effects. With mediation analyses, social support appeared as a significant mediator in the relationship between self-efficacy and depression between two measurements. Given the observed gender differences and the differential impact on anxiety and depression, the psychosocial support provided by interventions should be individualized to address specific mental health issues, like anxiety or depression and demographic factors like sex. In general, all patients improved over the course of the hospital stay, and additional psychological interventions can help those who are responsive to social support mobilization. This calls for dyadic or social network approaches in addition to pure individual interventions, which should be investigated in further research

Abstract 4923

THE EFFECT OF AN ONLINE ACCEPTANCE AND COMMITTED THERAPY ON MEANING MAKING: A MULTIPLE-BASELINE EXPERIMENTAL CASE STUDY IN CANCER PATIENTS

Kroemeke A.*[1], Dudek J.[2], Kijowska M.[1], Sobczyk--Kruszelnicka M.[3]

[1]Institute of Psychology, SWPS University ~ Poland, [2]Department of Psychology, SWPS University ~ Poland, [3]Department of Bone Marrow Transplantation and Oncohematology, Maria Skłodowska-Curie National Research Institute of Oncology Gliwice Branch ~ Poland

Background: Restoring meaning is an important element of adaptation to disease. It could potentially be supported by enhancing psychological flexibility through an Acceptance and Commitment Therapy intervention (i.e. by building explanations of the disease and treatment burden that are personally values based and flexible). Thus, this study investigated the effectiveness of self-help online acceptance and committed therapy (ACT) intervention using a multiple-baseline single-case experimental design (MBSCED) across 7 male patients following hematopoietic cell transplantation (HCT).

Methods: Participants were randomly assigned to a baseline period lasting 7-21 days following HCT hospital discharge, followed by the ACT-based intervention (14 days), one- and three-month follow-up phases (7 days each). Primary outcome included meanings made (i.e., sense making, benefit finding, and sense of identity). Secondary outcome included meaning-making coping (automatic and deliberate), and psychological flexibility. Data were analyzed using multilevel modeling on an individual and group level.

Results: On an individual level, the intervention showed a positive, statistically significant effect on one- and three-month follow-up sense of identity among 3 patients. The effect on other variables was mixed – no, positive, or negative. On a group level, participants showed no significant changes in meanings made and meaning-making coping. Psychological flexibility significantly increased in the intervention phase, but decreased in follow-ups as compared to baseline.

Discussion: Online ACT-based intervention showed mixed meaning-related results in post-HCT patients, and its effectiveness on meaning-related outcomes varied among participants.

FAMILY FRAGILITIES AND ADDICTIONS: PREVENTION AND REHABILITATION

Breci E.*[1], Gattuso C.[2], Quadarella M.[4], Tordonato G.[3], Spinali D.[5], Vitale G.[6]

[1]Elisa Breci ~ Carlentini ~ Italy, [2]Gattuso Chiara ~ Augusta ~ Italy, [3]Tordonato Guendalina ~ Augusta ~ Italy, [4]Quadarella Martina ~ Siracusa ~ Italy, [5]Spinali Damiano ~ Augusta ~ Italy, [6]Vitale Giulia ~ Augusta ~ Italy

Pathological addictions, including those related to substances and the new forms of behavioral addictions, represent one of the most pressing challenges for public health today. These phenomena can only be understood by considering the family context. Attachment styles, through which emotional regulation models and relational expectations are formed early in life, constitute a crucial factor of vulnerability or protection.

Scientific literature (Bianchi et al., 2005; Fischer-Grote et al., 2019; Sohn et al., 2019) confirms that loneliness, low social support, and family difficulties strongly influence the propensity to develop addictive behaviors, particularly during adolescence, a critical phase in the process of emancipation from the parental nucleus.

This study, conducted by the Addiction Services Unit of Augusta (Ser.T, ASP SR), explores the link between attachment styles and addictions, highlighting two privileged contexts of intervention: schools and prisons. In schools, prevention programs focused on emotional awareness and the conscious use of smartphones were implemented, with positive results in reducing psychological distress and the use of the device as a dysfunctional coping strategy.

In the prison context, individual and group psychological interventions were carried out with inmates affected by addictions. The FACES-IV test was used to investigate the quality of family relationships and underlying attachment styles. The results highlighted how affective fragilities, often denied or not elaborated, contributed to risky behaviors that led to involvement in the penal system. Furthermore, a significant connection emerged between problematic smartphone use, difficulties in emotion regulation, and the same dysfunctional attachment models observed in inmates.

In conclusion, school-based prevention and prison rehabilitation must be seen as complementary stages of a single process: intervening early to reduce risks while simultaneously transforming vulnerability into a resource to foster resilience, belonging, and social reintegration.

ASSOCIATIONS BETWEEN AUTONOMOUS AND CONTROLLED MOTIVATION, HEALTH-RELATED EATING AND EXERCISE HABITS, AND METABOLIC SYNDROME

Kato Y.*[1], Wang Y.[2], Murata Y.[1], Kojima A.[3]

[1]Kobe university ~ Kobe ~ Japan, [2]Qingdao Technical College ~ Qingdao ~ China, [3]Fukui Prefectural University ~ Eiheiji ~ Japan

Introduction: In Japan, specific health checkups are conducted to prevent lifestyle-related diseases. These assess the presence of health-promoting eating and exercise habits. Motivation for such behaviors can be autonomous or controlled, with autonomous motivation generally associated with more favorable outcomes.
Purpose: This study aimed to examine the relationships among autonomous and controlled motivation, eating and exercise habits, and metabolic syndrome (MetS), to identify effective motivational pathways for lifestyle improvement.
Method: Participants were 1,411 adults (1,100 men, 311 women; mean age = 46.8 ± 9.7 years). Motivation was assessed using self-determination theory. Eating habits included fast eating, late dinners, snacking between meals, and breakfast skipping. Exercise habits included regular moderate exercise, daily physical activity, and walking speed compared to peers. MetS indicators (body weight, height, waist circumference, blood pressure, blood glucose, and blood lipids) were measured.
Results: Fast eating was positively associated with MetS ($\beta = .136$, $p < .001$). Autonomous motivation showed a weak negative association with fast eating ($\beta = -.133$, $p = .012$), while controlled motivation showed a positive one ($\beta = .141$, $p = .027$). Autonomous motivation was negatively associated with MetS ($\beta = -.197$, $p < .001$); controlled motivation was positively associated ($\beta = .185$, $p = .003$). In the exercise model, autonomous motivation was positively associated with regular moderate exercise ($\beta = .444$, $p < .001$), and controlled motivation was negatively associated ($\beta = -.316$, $p < .001$). Regular moderate exercise showed a weak negative association with MetS ($\beta = .087$, $p = .009$). Importantly, autonomous motivation for exercise was negatively associated with MetS ($\beta = -.376$, $p < .001$), while controlled motivation showed a positive association ($\beta = .448$, $p < .001$).
Conclusions: Fostering autonomous motivation may improve lifestyle habits and reduce MetS risk, supporting its application in health-focused psychological interventions.

Abstract 735

ASSOCIATIONS BETWEEN AUTONOMOUS AND CONTROLLED MOTIVATION AND METABOLIC SYNDROME VIA WEIGHT GAIN SINCE EARLY ADULTHOOD

Kojima A.[2], Wang Y.[3], Murata Y.[1], Kato Y.*[1]

[1]Kobe University ~ Kobe ~ Japan, [2]Prefectural University of Fukui ~ Eiheiji ~ Japan, [3]Qingdao Technical College ~ Shandong Province ~ China

Background and Objectives:
Preventing lifestyle-related diseases is a critical public health issue, contributing not only to individual well-being but also to societal productivity. Weight gain from early adulthood to middle age reflects lifestyle transitions and serves as a predictive marker for metabolic syndrome (MetS).
Previous research suggests that autonomous motivation—engaging in health behaviors for personally endorsed reasons—may be more effective in preventing MetS than controlled motivation, which is driven by external pressures or obligations.
This study aimed to examine the relationships among motivation type, weight gain since age 20, and MetS indicators in a working-age population.
Methods:
A total of 1,411 participants (1,100 men and 311 women; mean age = 46.8 ± 9.7 years) were surveyed. Motivation for healthy eating and physical activity was assessed using constructs from self-determination theory. Weight gain was measured by self-report (“Have you gained more than 10 kg since 20 years old?” Yes/No). MetS-related indicators—including BMI, waist circumference, blood pressure, blood glucose, and lipid profiles—were collected.
Structural equation modeling was conducted with MetS diagnosis as the dependent variable, weight gain as a mediating variable, and motivation type as independent variables.
Results:
Autonomous motivation was negatively associated with both weight gain and MetS diagnosis. In contrast, controlled motivation showed positive associations with weight gain and MetS. Weight gain itself was positively associated with MetS.
Conclusions and Implications:
These findings suggest that fostering autonomous motivation may help mitigate weight gain and reduce the risk of MetS. This highlights the importance of motivational quality in health behavior interventions and supports the integration of self-determination theory into applied psychological practice.

Abstract 801

INTRUSIVE AND DELIBERATE RUMINATION AS MEDIATORS BETWEEN PERCEIVED BULLYING IMPACT AND POSTTRAUMATIC GROWTH: THE MODERATING ROLE OF COGNITIVE EMOTION REGULATION

Liu Y.*, Chiu H.W.

National Yang Ming Chiao Tung University ~ Hsinchu ~ Taiwan

Introduction

Bullying involves repeated exposure to hostile experiences that can negatively impact psychological well-being. However, some individuals may engage in cognitive reflection after trauma, leading to posttraumatic growth (PTG). This study explores how perceived impact from bullying contributes to PTG through rumination processes.

Purpose

This study tested a moderated serial mediation model in which intrusive and deliberate rumination mediate the relationship between perceived bullying impact and PTG. Cognitive emotion regulation strategies (CERS) were tested as moderators of these mediation pathways.

Methods

A total of 772 adults (Mean age = 35.21, SD = 9.62; 463 females) with childhood bullying experiences (verbal, physical, sexual, or cyber) completed an online survey. Measures included perceived bullying impact, intrusive and deliberate rumination, PTG, and adaptive/non-adaptive CERS. Structural equation modeling with 5,000 bootstrapped samples (95% CI) tested the serial mediation. Interaction terms were included to examine moderation by CERS.

Results

The model showed good fit (adaptive CERS: χ^2 = 916.023, df = 254, CFI = .953, RMSEA = .058; non-adaptive CERS: χ^2 = 6034.804, df = 3381, CFI = .959, RMSEA = .032). A significant serial mediation pathway was observed: perceived bullying impact → intrusive rumination → deliberate rumination → PTG. However, neither adaptive nor non-adaptive CERS significantly moderated the paths between intrusive and deliberate rumination, or between deliberate rumination and PTG.

Conclusion

The findings support a serial cognitive pathway linking perceived bullying impact to PTG through rumination. While CERS did not moderate these processes, the results highlight the critical role of intrusive and deliberate rumination in transforming trauma into growth. Interventions that promote constructive meaning-making may be effective for individuals recovering from bullying-related trauma.

Abstract 905

RESILIENCE, EMOTION REGULATION DIFFICULTIES, AND PERCEIVED STRESS IN UNDERGRADUATE AND GRADUATE STUDENT POPULATIONS

Moore Z.*, Gardner F.

Touro University ~ New York City ~ United States of America

The Perceived Stress Scale (PSS-10) assesses whether individuals perceive their lives as stressful, uncontrollable, and unpredictable. Although perceived stress is a relatively stable characteristic, significant variability exists across individuals, suggesting that PSS-10 scores reflect the interaction between life experiences and an individual's ability to manage stress. Difficulties in emotion regulation may shape one's perceptions of their ability to handle stress. Emotion regulation strategies, such as emotion differentiation and cognitive reappraisal, influence responses to stress and moderate the relationship between perceived stress and internalizing psychopathologies. Likewise, resilience, which represents a person's ability to cope with perceived stressors, inversely correlates with perceived stress. We examined the moderating role of resilience on the relationship between difficulties in emotion regulation and perceived stress using the Difficulties in Emotion Regulation Scale (DERS), the PSS-10, and the Connor-Davidson Resilience Scale (CD-RISC). Twenty graduate/16 undergraduate students from two U.S. universities wore an Oura ring for 40 days to gather biometric data and assess the bidirectionality of physiological and emotional arousal. Participants completed DERS prior to participation via a smartphone application utilized for Experience Sampling Methodology data collection. A linear mixed model analysis revealed that difficulties in emotion regulation significantly predicted perceived stress ($\beta=0.18$, $p<0.0001$), with higher DERS scores associated with increased perceived stress. Time had a significant effect on PSS ($\beta=0.17$, $p<0.0001$), indicating that perceived stress increased throughout the study. Resilience did not significantly moderate this relationship, nor was there a significant three-way interaction with time. Resilience showed a significant inverse relationship with perceived stress ($\beta=-1.12$, $p=0.05$). While the DERS and CD-RISC independently predict stress, their interaction does not reach significance, suggesting that resilience and emotion regulation contribute independently to stress levels rather than one moderating the effect of the other. Higher resilience appears protective, significantly predicting lower perceived stress, even when accounting for emotion regulation difficulties.

Abstract 871

DOES ATTACHMENT STYLE MODERATE CROSSOVER OF STRESS AND BURNOUT IN MARRIED COUPLES?

Oren L.*

Ariel University ~ Ariel ~ Israel

Crossover is an interpersonal process through which negative and positive experiences and states experienced by one person are transmitted to another person in the same social environment. Recently, crossover received much theoretical and research attention, but the role of moderators in the crossover process has largely been neglected. In the current study, we hypothesized that stress and burnout will cross over between romantic partners, and the attachment style will moderate the level of crossover.

One hundred and twenty-three dual-working heterosexual couples participated. At Time 1 both partners filled out questionnaires measuring stress, burnout, and attachment style. At Time 2, after 1 month, both partners filed, again, questionnaires measuring stress and burnout. They were analysed using the actor–partner interdependence model, which takes interdependencies between couples into account.

Actor-partner effects were not significant for stress and for burnout. Regarding stress, positive associations were found between male stress at T1 and female stress at T2, for high levels of female anxiety, as well as between female stress at T1 and male stress at T2, for high levels of female avoidance. Regarding burnout, positive associations were found between female work burnout at T1 and male work burnout stress at T2, for high levels of female anxiety and avoidance.

Findings are discussed, and theoretical as well as practical implications are suggested.

Abstract 914

THE RELATIONSHIP AMONG STRESSORS ASSOCIATED WITH PATIENT INTERACTION, EMOTIONAL WORK, AND EMOTIONAL EXHAUSTION IN PSYCHIATRIC NURSES

Orlando J.*, Kato Y.

Graduate School of Human Development and Environment, Kobe University ~ Kobe ~ Japan

Introduction:
In light of the growing recognition that mitigating burnout among psychiatric nurses is a critical issue, this study aimed to provide insights that may contribute to the development of concrete strategies to alleviate emotional exhaustion, the core symptom of burnout.

Purpose:
The objective of this study was to examine the relationships among stressors associated with patient interaction (patient-related stressors), emotional work, and emotional exhaustion in psychiatric nurses.

Method:
Data were collected from 162 psychiatric nurses (mean age = 38.24 years, SD = 11.59). On average, participants had 14.84 (SD = 10.83) years of nursing experience and 5.77 (SD = 5.01) years of psychiatric nursing experience. Validated scales were administered to assess patient-related stressors, emotional work (including negative and empathetic/positive emotional expressions toward patients), and emotional exhaustion.

Results:
The covariance structure analysis revealed that patient-related stressors were directly associated with emotional exhaustion ($B = .08$, $p < .01$) and with negative emotional expression toward patients ($B = .06$, $p < .001$), which in turn was associated with emotional exhaustion ($B = .36$, $p < .01$). Furthermore, the bootstrap mediation analysis indicated a significant indirect effect of patient-related stressors on emotional exhaustion via negative emotional expression toward patients ($B = .16$, $p < .01$).
Moreover, the analysis further showed that patient-related stressors tended to positively correlate with empathetic/positive emotional expression toward patients ($B = .03$, $p < .05$), which was not significantly associated with emotional exhaustion ($B = .01$, $p = .93$).

Conclusions:
To mitigate emotional exhaustion, it may be effective to alleviate negative emotional expression toward patients by promoting regulation of negative emotions caused by

patient-related stressors. A key future challenge will be to apply the findings of this study to reduce emotional exhaustion among psychiatric nurses through intervention studies and the development of practical programs for clinical settings.

Abstract 839

PERSONALITY AND EVERYDAY USE OF BACKGROUND MUSIC: AN EXPLORATORY INVESTIGATION

Wu G.*[1], Zhang Q.[1], Suh K.[2]

[1]School of Music, Xianda College of Economics and Humanities, Shanghai International Studies University, Shanghai, China ~ Shanghai ~ China, [2]Department of Counseling Psychology, Sahmyook University, Seoul, South Korea ~ Seoul ~ Korea, Republic of

This study explores whether personality traits and temperamental dispositions are associated with adults' use of background music in daily life. Taking an exploratory approach, we sought to identify underlying personal dispositions that may account for individual differences in everyday engagement with background music. The participants in this study were 270 Chinese adults, both male and female, aged 18 years and older. We measured participants' personality traits based on the Big Five factors, and their temperamental dispositions based on the concepts of the Behavioral Activation System (BAS) and Behavioral Inhibition System (BIS). Background music use in daily life was measured using a subscale of the Use of Music Inventory. All data were collected online following approval from the Institutional Review Board (IRB) and after obtaining informed consent from the participants. In the correlation analysis, extraversion, openness, conscientiousness, and agreeableness were found to be positively correlated with background music use in daily life, whereas neuroticism showed no significant correlation. In contrast, the temperamental dispositions of BAS and BIS were not significantly correlated with background music use. In the multiple regression analysis with the Big Five personality traits, the model accounted for 10.7% of the variance in background music use, with extraversion and openness being identified as significant predictors. These findings suggest that personality traits play a notable role in everyday background music use. Further research should focus on developing more refined instruments for assessing background music use in daily life, which would allow for a deeper understanding of its relationship with individual psychological factors.

Abstract 719

THE ROLE OF PERSONALITY IN ENJOYMENT OF SINGING: AN EXPLORATORY STUDY

Zhang Q.*[1], Suh K.[2]

[1]Music, Xianda College of Economics and Humanities, Shanghai International Studies University ~ SHANGHAI ~ China, [2]Department of Counseling Psychology, Sahmyook University ~ Seoul ~ Korea, Republic of

This study explored the relationship between personality traits—including temperament—and adults' enjoyment of singing, investigating how these traits predict individual differences in singing enjoyment and highlighting the psychological basis of musical engagement. The participants were 270 Chinese adults aged between 18 and 65 years, consisting of 135 males and 135 females, with a mean age of 41.14 years (SD = 12.94). We measured temperamental tendencies related to behavioral activation and inhibition, broader personality traits based on the Big Five model, and the degree to which participants enjoy singing. In addition, participants provided self-assessments of their singing ability, which were included as a covariate in the analysis. Data were collected online following approval from the Institutional Review Board (IRB), and all procedures, including obtaining informed consent, were conducted in accordance with ethical guidelines. In the correlation analysis, neurotic tendencies were not significantly associated with enjoyment of singing, whereas extraversion, openness, conscientiousness, and agreeableness showed positive correlations. BIS was unrelated to enjoyment of singing, while the BAS subdimensions of reward sensitivity, drive, and fun seeking demonstrated negative correlations. The Big Five personality traits accounted for approximately 29.0% of the variance in enjoyment of singing, and they accounted for an additional 14.2% beyond self-reported singing ability. Meanwhile, BAS and BIS were found to account for only about 6.2% of the variance in enjoyment of singing. In the stepwise regression analysis, conscientiousness, openness, fun seeking, and agreeableness emerged as significant predictors, with conscientiousness being the most prominent predictor of singing enjoyment, accounting for 19.6% of its variance. These findings suggest that personality and temperament significantly influence enjoyment of singing, thereby advancing knowledge of the psychological foundations of musical participation.

Abstract 895

THE SIGNIFICANCE OF RELIGIOUS AND NON-RELIGIOUS COPING STRATEGIES FOR THE PSYCHOLOGICAL WELL-BEING OF PARENTS OF CHILDREN WITH CANCER

Ziolkowska N.*[1], Bargiel--Matusiewicz K.[1], Gruszczynska E.[2]

[1]University of Warsaw ~ Warsaw ~ Poland, [2]SWPS University ~ Warsaw ~ Poland

A child's oncological disease is a highly stressful situation for parents, which can affect family functioning in many aspects. In the face of the COVID-19 pandemic, this situation may be further associated with an accumulation of distress. Therefore, the main aim of the study was to analyze differences in hedonic and eudaimonic well-being, as well as in religious and non-religious coping with stress among parents of children with an oncological disease during the COVID-19 pandemic compared to parents of children with cancer before the pandemic. In addition, the study aimed to verify the mediating role of religious and non-religious coping strategies in the relationship between the aforementioned situational conditions and well-being. The study was conducted in two high-reference clinics. A total of 310 parents of children with oncological diseases during the treatment participated in the study. After propensity score matching, 111 pairs were extracted and included in the analyses.

In the series of analyses of variance, higher levels of positive affect and positive reappraisal were observed in the group of parents assessed during the pandemic compared to the analogous group assessed before the pandemic. A series of mediation analyses revealed the mediating role of negative religious coping in the relationship between situational conditions and well-being: lower negative religious coping during the pandemic translated into higher eudaimonic and hedonic well-being. The results indicate that contrary to expectations, the accumulation of stressors did not result in a further deterioration of parental functioning, which may be due to the central nature of the specific stressor, i.e. the child's illness. The study also represents an important contribution to the understanding of religious and non-religious meaning-focused coping in the context of accumulated chronic stress of different origins.

Abstract 1468

SYSTEMATIC ANALYSIS OF PSYCHOSOCIAL DETERMINANTS OF ADOLESCENTS' SEXUAL AND REPRODUCTIVE HEALTH OUTCOMES IN SOUTH AFRICA

Adekola A.P.*

University of South Africa ~ Pretoria ~ South Africa

Introduction: Adolescents in South Africa face significant sexual and reproductive health (SRH) challenges, shaped by various psychosocial determinants such as socioeconomic status, cultural norms, gender dynamics, peer influences, and mental health.

Purpose: This systematic review aims to consolidate existing knowledge, identify critical gaps, and inform the design of more comprehensive, equitable, and contextually resonant SRH interventions for South African adolescents

Method: Through a PRISMA-guided systematic review (PROSPERO Registration Number: CRD420251069776) of peer-reviewed articles, reports, and policy documents (2014–2024) from PubMed, Scopus, Sabinet, Google Scholar and other databases, we identified key themes using thematic analysis.

Results: Findings reveal that peer influence and parent-adolescent communication are critical determinants of SRH behaviours, while gender power imbalances and cultural stigma exacerbate risks. Mental health, particularly depression and trauma, significantly impacts SRH decision-making, yet integrated care models remain scarce. Existing policies show gaps in youth-friendly service delivery and disability inclusion, with successful interventions like mHealth, peer-led programs hindered by scalability challenges. A multi-level conceptual framework rooted in the Social Ecological Model and Intersectionality Theory is proposed to address systemic barriers.

Conclusions: This study underscores the need for culturally sensitive, gender responsive SRH programs that integrate mental health support and prioritise marginalised groups. By synthesising evidence from 29 studies, we provide actionable insights for policymakers, healthcare providers, and educators to improve adolescent SRH outcomes in South Africa.

Abstract 1791

PORNOGRAPHY USE IN NON-HETEROSEXUAL YOUTH

Wingert F.[1], Chaise R.[2], Pizzinato A.[1], Bones Rocha K.*[2]

[1]Instituto de Psicologia, Universidade Federal do Rio Grande do Sul ~ Porto Alegre ~ Brazil, [2]Pontifícia Universidade Católlica do Rio Grande do Sul (PUCRS) ~ Porto Alegre ~ Brazil

Pornography is a medium that impacts the formation, arousal and sexual development of young people, having a unique role among those who identify as gays, bisexuals and pansexuals. Objective: This study investigated perspectives on the use of pornography by non-heterosexual youth, focusing on its impact on their sexual development, self-esteem, expectations of partners, and sexual behaviors. Methods: The research included a quantitative stage using scales and a questionnaire (N = 42) and a qualitative stage, with in-depth interviews (N = 5). Descriptive and inferential analyses were conducted, in addition to a qualitative analysis, by means of the Collective Subject Discourse method. Results: The data were organized into three axes: the role of pornography in sexual development; self-esteem, self-image and expectations of sexual partners; and pornography and sexual behavior. Pornography was perceived as a learning tool, but also as something that promotes rigid sexual scripts and idealized standards. Correlation analyses indicated an association between greater consumption of pornography and a larger number of sexual partners was observed. Furthermore, lower levels of sexual satisfaction were associated with a higher perceived utility of pornography. Conclusions: The findings highlight the importance of sexual education programs that critically address pornography consumption.

Abstract 2034

HEALTH BEHAVIOUR PROFILES AND THEIR ASSOCIATION WITH SOCIAL DETERMINANTS DURING ADOLESCENCE IN ITALY: A PERSON-CENTERED APPROACH

Ghelfi M.*[1], Guerini J.[1], Hbsc Lombardy Committee 2.[2], Velasco V.[1]

[1]University of Milano-Bicocca, Psychology Department ~ Milano ~ Italy, [2]DG Welfare, Lombardy Region ~ Milan ~ Italy

Introduction: To improve health outcomes for young people, it is essential to research their lifestyle, health behaviours, and social determinants. This is particularly important during adolescence, which is a critical period for growth. Health Behaviour in School-aged Children (HBSC) is a wide cross-national research study involving around 50 countries, representing a key source for this aim. In Italy, HBSC research is carried out in collaboration with the Lombardy Region and the regional school office.

Purpose: This study aims to: i) identify profiles of 15-year-old Italian students based on different health behaviours through a person-centered perspective; ii) understand how these subgroups are associated with sociodemographic, relational, and contextual variables; iii) compare the results from a previous study conducted in Italy on HBSC 2014 data.

Method: A representative sample of 15-year-old students (N=4,272) of the Lombardy region (Italy) was collected in 2022 through the HBSC survey. The participants were 45.5% female; 93.3% were born in Italy, and 45.5% attended a Lyceum. The Latent Class Analysis approach was used to identify profiles in the current sample based on health behavior indicators. The two-step approach was performed to investigate the association between the profiles and covariates.

Results: The four clusters identified in 2014 were partially confirmed, but a more varied and multifaceted scenario has now emerged. Physical activities and substance use indicators were those that best distinguished the students' profiles. Six different profiles were identified: active nonusers (42.3%), passive nonusers (19.6%), active recreational users (16.5%), active excessive users (10.4%), inactive users (5.7%), and media lovers (5.5%). Interesting associations emerged between the profiles and variables relating to family and friend relationships, the school environment, and perceived physical and psychosocial health conditions.

Conclusions: The identification of these profiles could be useful in planning tailored preventive interventions in accordance with the specific risk and protective factors identified.

Abstract 1473

PROCESSING THE WORLD IN TIMES OF UNCERTAINTY: COGNITIVE FUNCTIONING IN ADOLESCENTS DURING THE PANDEMIC

Jara L.*, Rivera S.

Pontificia Universidad Católica del Perú ~ Lima ~ Perú

The COVID-19 pandemic represented a profound disruption in the lives of adolescents globally, especially in Peru, where prolonged lockdown kept schools closed until 2021. This health and social crisis coincided with a critical stage of human development, a period in which the world acquires new meanings and higher cognitive functions became consolidated. How did adolescents process and make sense of a context of uncertainty and change? This study analyzes how adolescents from Lima incorporated information, translated reality, and constructed meanings during the pandemic. For this purpose, the Rorschach Psychodiagnostic Test under the Exner Comprehensive System was applied remotely to 100 adolescents from Lima of middle and high socioeconomic status, aged between 12 and 16, homogeneously distributed by sex and age. The results show significant differences by sex. In males, a higher presence of responses suggests a distorted or unrealistic interpretation of the world and of themselves (presence of FABCOM and a decreased in H). In contrast, female presented indicators of a partial and self-centered perspective, as well as a rationalizing strategy (decreased in W, increased in EGO, and presence of AB). Regarding age, older adolescents showed a resurgence of indicators associated with emotional and cognitive disorganization in the face of increasing external demands, without having yet consolidated the internal resources necessary to cope with them, they regressed in their adjustment to social expectations and in the clarity of communication and thought (presence of DV and INCOM). Overall, the findings demonstrate that the pandemic had a significant impact on the cognitive functioning of adolescents and the need to continue exploring how exceptional events can leave lasting marks on their development and well-being.

Abstract 1943

HETEROGENEITY IN ADOLESCENT MENTAL HEALTH SYMPTOM NETWORK DYNAMICS: A CROSS-LAGGED PANEL NETWORK ANALYSIS

Zhang C., Lei H.*, Wang Y., Zhang Z., Ling F., Ke L.

Beijing Normal University ~ Beijing ~ China

Network theory posits that mental health problems arise from causal interactions among psychopathological symptoms. Through activation, spreading, and self-sustaining, symptoms gradually form closely connected networks, which is a core mechanism in the onset and development of mental health problems. Adolescence is a critical period for this process. Although previous studies have used longitudinal network analysis to examine temporal associations among psychopathological symptoms, individual differences in their severity are often overlooked, limiting a comprehensive understanding of heterogeneity in network dynamics. This study utilized group-based multi-trajectory modeling (GBMT) and cross-lagged panel network analysis (CLPN) to explore the structural characteristics, longitudinal associations, and core symptoms of adolescent psychopathological networks across different developmental trajectories. A total of 9653 fifth-grade students (49.7% female; Mage = 10.14 ± 0.36 years) from Beijing completed self-reported measures of depression, anxiety, and problematic smartphone use across four annual waves. Results showed that (1) Three developmental trajectories of mental health problems were identified: “Normal Group” (34.5%), “Potential Risk Group” (50.4%), and “High-Risk Group” (14.9%); (2) Symptom network structures differed across these groups: the Normal Group showed a stable dormant network with low connectivity, the Potential Risk Group exhibited a transitional active network with moderate connectivity, and the High-Risk Group demonstrated a stable active network with strong connectivity; (3) Core symptoms also varied across developmental trajectories and stages: in the Potential Risk Group, “Painful”, “Interpersonal complaints” and “Loss of control2” predicted other symptoms most, while “Nomophobia”, “Excessive use” and “Performance worry” were most predicted by other symptoms; in the High-Risk Group, “Worthlessness/guilt”, “Habitual excessive use” and “Loss of control1” predicted other symptoms most, while “Nomophobia” was consistently most predicted by other symptoms. These findings enhance understanding of symptom spreading and maintenance in the dynamics of adolescent mental health problems, offering insights into comorbidity, precise risk identification, and targeted prevention strategies.

Abstract 2100

NUTRITIONAL HEALTH, FITNESS, AND MOTHER'S EDUCATION AND THEIR RELATION TO CHILDREN'S IQ

Parcon A.M.*

University of the Philippines ~ Diliman ~ Philippines

The health and intellectual ability of Filipino children limits the Philippines' capacity to rise from its developing country status to that of a developed one. The present study examined the association of nutritional status (anthropometry, micronutrients), physical fitness, and immune health with Filipino schoolchildren's intellectual ability. Using a cross-sectional design, 166 apparently healthy kindergarten and first grade children whose parents signed consent forms underwent the following tests: Wechsler Preschool and Primary Scale of Intelligence (WPPSI)-IV; anthropometric measurements (weight, height), physical fitness tests, blood tests to assess the following: C-reactive protein; vitamins C, D, riboflavin, and iron; white blood cell count (WBC); Epstein-Barr virus (EBV) infection. Data were collected February to December 2023. Chi-square test and Fisher's exact test were used to determine the association of categorical variables with IQ level; that of continuous variables were assessed using t-test. Multiple linear regression was used to identify nutrition and health factors that contributed to the variance in IQ scores after controlling for Epstein-Barr virus and demographic factors (child age, sex, mother's educational attainment). Results showed that most children (88.8%) tested positive for EBV. Many (52%) had below average IQ. Improved intellectual capacity was associated with sufficient serum vitamin D (p=.036) and higher physical fitness scores (p=.010). Mother's education contributed significantly to the variance in children's overall IQ scores (p=.031), with increasing maternal education predicting higher scores. Under conditions of continuing viral infections, sufficient serum vitamin D and higher physical fitness levels were positively associated with children's intellectual capacity. Maternal education was the strongest predictor of children's overall IQ suggesting the need for educational opportunities for women and girls to improve the quality of the country's human resources.

CONSTRUCTION OF A SCALE FOR THE ASSESSMENT OF SOFT SKILLS AND PSYCHO-EMOTIONAL ASPECTS: ONTOLOGICAL MODELING OF SOFT SKILLS IN IT, PSYCHOLOGY AND ONTOPSYCHOLOGY

Wazlawick P.*[1], Wazlawick R.S.[2], Rampinelli V.[3], Pompermaier J.[4], Oliveira J.[5], Celuppi I.[6], Rothmann A.R.[7], Fleck Da Silva B.[8]

[1]Patrícia Wazlawick ~ São João do Polêsine ~ Brazil, [2]Raul Sidnei Wazlawick ~ Florianópolis ~ Brazil, [3]Vanessa Pereira Corrêa Rampinelli ~ Florianópolis ~ Brazil, [4]João Paulo Lucchetta Pompermaier ~ Florianópolis ~ Brazil, [5]Júlia Meller Dias de Oliveira ~ Florianópolis ~ Brazil, [6]Ianka Cristina Celuppi ~ Florianópolis ~ Brazil, [7]Any Regina Rothmann ~ São João do Polêsine ~ Brazil, [8]Bruno Fleck da Silva ~ São João do Polêsine ~ Brazil

In the era of digital transformation and Industry 4.0 and 5.0, IT professionals are confronted with increasing cognitive and emotional demands. Soft skills have emerged as key determinants not only for technical performance but also for mental health; however, their relationship with psycho-emotional symptoms remains poorly understood. This study aimed to investigate the correlation between soft skills and psycho-emotional aspects among professionals at a Brazilian technology development organization. A cross-sectional study was conducted between November and December 2024, involving 114 employees who completed an online questionnaire comprising 30 items assessing soft skills and 13 psycho-emotional aspects, all evaluated on a Likert scale. Descriptive analysis was performed to characterize the sample, social skills, and psycho-emotional symptoms. The soft skills with the highest positive prevalence were commitment/engagement, responsibility, and persistence. The most frequent symptoms identified were anxiety, impostor syndrome, and knowledge insecurity. Significant correlations were observed, notably between proactivity and knowledge insecurity; time management and both lack of concentration and knowledge insecurity; self-awareness/conscientiousness and lack of concentration; leadership and knowledge insecurity; innovation and knowledge insecurity; and passion and symptoms of depression. The results indicate that professionals with higher levels of soft skills also exhibit higher levels of psychological well-being. These findings underscore the importance of programs aimed at balanced development of interpersonal and emotional skills to promote mental health and optimize performance in the IT sector.

FROM DECENT WORK TO PSYCHOLOGICAL SAFETY: CROSS-SECTIONAL EVIDENCE FROM PORTUGUESE EMPLOYEES

Pereira S.A.*[1], Lopes S.[2], Rodrigues A.[3], Carvalho V.S.[4]

[1]Universidade da Maia, Maia, Portugal and NECE-UBI, Research Center for Business Sciences, Covilhã, Portugal ~ Maia ~ Portugal, [2]CICPSI, Faculdade de Psicologia, Universidade de Lisboa, Lisboa, Portugal and Faculdade de Psicologia e de Ciências da Educação, Universidade de Coimbra, Coimbra, Portugal ~ Lisboa ~ Portugal, [3]Faculdade de Filosofia e Ciências Sociais, Centro de Estudos Filosóficos e Humanísticos, Universidade Católica Portuguesa, Braga, Portugal ~ Braga ~ Portugal, [4]CICPSI, Faculdade de Psicologia, Universidade de Lisboa, Lisboa, Portuga ~ Lisboa ~ Portugal

Introduction: Decent work (DW) is theorised to facilitate fair, safe, and dignified employment conditions that may enhance psychological safety. This involves shared beliefs that interpersonal risk-taking is acceptable. However, the specific contextual factors (e.g., work modality, sector) that influence DW and psychological safety remain insufficiently detailed.

Purpose: To examine the association between DW and psychological safety, the mean differences by work modality (i.e., onsite, remote, or hybrid work) and sector (i.e., industry or services sector), and the moderating role of work modality and sector in the relationship between DW and psychological safety.

Method: Data were collected from 423 employees in Portugal using a self-report questionnaire. The sample mainly consisted of women (60.8%), with an average age of 35. Most participants (48.0%) held a university degree. Statistical analyses were conducted using SPSS, AMOS and PROCESS macro.

Results: The findings showed a strong positive relationship between DW and psychological safety. Work modality also influences DW and psychological safety. Specifically, hybrid work employees scored higher on DW and psychological safety than on-site workers. The sector of activity also affects DW and psychological safety, with employees in the services sector scoring higher in both variables than those in the industry sector. The data did not support the moderating roles of work modality and sector in the relationship between DW and psychological safety.

Conclusions: DW shows a strong positive link with psychological safety, while hybrid work and services sector settings exhibit higher average levels of both constructs. However, the moderating influence of work modality and sector on the relationship between DW and psychological safety was not confirmed. This implies that contextual effects mainly occur at the level rather than in the relationship between the variables.

Abstract 1448

WORKING CONDITIONS, STRESS AND INCIVILITY IN HIGHER EDUCATION INSTITUTIONS

Guidi S., Currò F.*, Marchigiani E., Bracci M., Palmitesta P., Parlangeli O.

Department of Social, Political and Cognitive Sciences, University of Siena ~ Siena ~ Italy

Research on stress and well-being in Higher Education Institutions (HEI) has often highlighted high stress levels, but only recently the relationship between stress, working conditions and unethical behaviours have been the focus of investigation. In a study conducted as part of a psychosocial risk assessment within a medium sized Italian university we investigated explicitly the relationship between stress, well-being and incivility in the workplace. The study was conducted with an online survey, involving a total of 702 employees, 351 administrative and technicians (PTA), and 351 faculty. The questionnaire included standardized scales to measure stress factors (HSE) and perceived stress (PSS) and a scale for determining the occurrence of uncivil behaviour, both perceived and perpetrated.

Perceived stress levels were associated with worse working conditions with respect to demands, role definitions and relationships in the workplace. Perceived stress and perceived occurrence of incivility were both significant predictors of perpetrated incivility. Among the work-organizational factors, work demands, control on work, peer support, relationships and role were associated with perpetrated incivility, but only when perceived stress and perceived incivility were not controlled for. A structural equation model revealed that the effects of demands on perpetrated incivility was fully mediated by perceived stress and perceived incivility, while the effect of relationships was partially mediated by perceived invincibility.

Abstract 1837

WHEN CALLING BACKFIRES: HOW SUPERVISOR APPRECIATION FUELS OVERCOMMITMENT AND IMPAIRS WELL-BEING

Tian Y., Wang M.*, Xu Y.

Xi'an Jiaotong-Liverpool University ~ Suzhou ~ China

Introduction

Employees who are living a calling often demonstrate heightened engagement and dedication, but this can also lead to overcommitment, with potential negative consequences for their well-being. Despite these risks, prior research on calling has primarily emphasized its positive side. Moreover, much of this literature has focused on individual factors, while the critical role of social context remains underexplored. To address these gaps, we examine supervisor appreciation as a contextual factor that may shape the consequences of living a calling and potentially contribute to undesirable outcomes.

Purpose

This study aims to investigate how supervisor appreciation may influence the relationship between living a calling and overcommitment, which in turn may impair employee well-being. Drawing upon self-verification theory, we propose that calling represents a central aspect of employees' identity. Accordingly, supervisor appreciation may service as a form of self-verification which may intensify the extent to which employees express their calling through heightened work investment. Thus, we argue that supervisor appreciation will strengthen the positive relationship between living a calling and overcommitment. Further, this strengthen effect may subsequently translate into excessive work involvement (i.e., presenteeism behavior) and impair employee health (i.e., emotional exhaustion)

Method

Two-wave time-lagged survey data were collected from 262 middle school teachers. Regression analyses were used to examine our hypotheses.

Results

The results revealed that living a calling positively related to overcommitment, particularly when teachers perceived high levels of supervisor appreciation. In turn, overcommitment was found to predict both presenteeism behaviors and emotional exhaustion.

Conclusions

Our findings enrich the research on calling by discovering that living a calling can impair employee well-being through increased overcommitment, particularly when supervisor appreciation is high. Practically, organizations should recognize that while supervisor appreciation generally supports employees, it may also exacerbate overcommitment

among those who are living a calling, with important implications for well-being.

Abstract 1126

LIFE EVENTS AND POSTTRAUMATIC GROWTH IN YOUNG ADULTS OF PARENTAL CANCER

Chin J.*

University of Taipei ~ Taipei ~ Taiwan

A family crisis, such as a parent's chronic illness like cancer, can be a devastating experience for children, particularly during their dependent years. While some children experience impaired psychological functioning, others report positive adaptations, including personal growth, strengthened family relationships, and an enhanced appreciation of family life. This evidence suggests that posttraumatic growth can occur as children navigate a parent's cancer. Drawing on Tedeschi et al.'s theoretical framework of posttraumatic growth, this study aimed to explore the types of experiences that contribute to posttraumatic growth, based on young adults' retrospective accounts of experiencing parental cancer in childhood.

The study employed a qualitative interpretive approach, interviewing seven young adults aged 18–25. All participants had experienced their parental cancer journey beginning at the age of nine or later. Prior to data collection, written consent was obtained from each participant. The interview questions explored their history of parental cancer, the coping strategies they employed during that period, and how they interpreted and reflected on both the experience and their coping processes in retrospect. All interview data were transcribed verbatim and analyzed thematically.

The results revealed five types of family experiences that facilitated the development of posttraumatic growth: (a) the shocking or unexpected experiences of parental physical weakness or emotional breakdown; (b) feelings of guilt arising from the struggle between personal issues and parental illness; (c) witnessing the dying process; (d) parental disclosure—limited to patient mothers—of past experiences, including cancer coping processes or growing-up history; and (e) establishing boundaries between personal and family issues. These experiences reflected the occurrence of incongruence that challenged children's expectations or assumptions about parental illness, their identity as children, and the social world, triggering reappraisals and leading to the integration of adversity into a new reality.

Abstract 1187

IMPACT OF PARENTAL PERCEIVED ECONOMIC WELL-BEING ON PARENTING BEHAVIOR AND CHILDREN'S PSYCHOSOCIAL ADJUSTMENT

Hirata H.*

Kagawa Nutrition University ~ Sakado ~ Japan

Introduction: Recently, researchers have increasingly focused on the impact of household economic hardship on parental mental health and children's development. According to Bronfenbrenner's ecological systems theory (1979), family factors and broader environmental conditions, including parental employment and economic stability, shape children's development. Purpose: This study examined how fathers' and mothers' subjective perceptions of household economic well-being influence parenting behavior, parents' depressive tendencies, and children's psychosocial adjustment, including reduced activity levels, depressive mood, and self-esteem. Method: A questionnaire survey was conducted in 3,039 Japanese households, including 255 fathers and 2,784 mothers, paired with their children aged approximately 13 to 14 years, who were in the second year of junior high school in Japan (1,379 boys, 1,415 girls, and 245 unspecified). Parents were categorized into three groups based on their perceived economic well-being. Analyses of variance and Tukey's post hoc tests assessed group differences. Results: Fathers who perceived their household as middle-class showed the lowest levels of depressive tendencies ($p < .05$), while no significant differences were found in other variables. With regard to mothers, those who perceived economic affluence reported the lowest depressive symptoms ($p < .01$), the highest levels of child self-esteem ($p < .05$), and the least depressive mood ($p < .05$). Mothers experiencing economic strain demonstrated significantly lower parenting behavior compared to the other groups ($p < .001$), whereas no significant difference was observed between affluent and middle-class mothers.Conclusions: These findings indicate that parental perception of economic well-being has a more pronounced impact on mothers than on fathers, particularly in relation to psychological health, parenting practices, and children's socio-emotional adjustment. This evidence underscores the need to establish comprehensive support systems that integrate family assistance and community resources, while addressing poverty reduction, health promotion, and the enhancement of economic stability and parenting environments.

Abstract 1129

EXPLORING THE ROLE OF CULTURAL FACTORS IN COPING STRATEGIES OF CANCER PATIENTS IN INDIA

Jain N.*[1], Singh P.[2]

[1]O.P. Jindal Global University, Sonipat, Haryana, India ~ Haryana ~ India, [2]Indian Institute of Technology, Delhi ~ Delhi ~ India

Dealing with cancer is often considered a critical incident in a person's life as it is an immensely traumatic and tumultuous time. Research suggests that cancer patients often experience high rates of distress, death anxiety, and depression. Several coping mechanisms have been identified that helps cancer patients to improve their wellbeing. However, most research largely comes from the West and little attention has been given to the role of cultural factors such as spirituality, close knit family structures, and traditional beliefs that are particularly important in a culturally diverse country like India. The study explored the role of such cultural factors in the coping mechanisms employed by cancer patients to deal with the illness. The sample consisted 20 cancer patients in India with age above 18, having either undergone treatment or taking treatment currently. The data was collected using in-depth interviews and was analysed using Interpretative phenomenological analysis. It was found that the impact of cancer treatment went beyond the physical side-effects and deterioration in health. The cancer patients experienced a debilitating feeling of 'becoming a burden' on their family members and intense affective distress. This subsumed feelings of vulnerability, anxiety, stress (mild and severe), shock, situational negativity, struggle, suffering, and loneliness. The analysis revealed 4 major themes: belief in god, fate, and karma; acceptance of illness, life, and imminent death; multidimensional social support structures; and role of relationships and attachment with family. The findings highlight the crucial role of cultural factors in shaping the coping mechanisms of cancer patients that helps in maintaining psychological strength during the harsh treatment process. This study is significant for developing culturally sensitive interventions within sustainable development frameworks to enhance the psychological well-being of cancer patients.

Abstract 1086

STABILITY OF THE REASONED ACTION APPROACH FOR PREDICTING SEASONAL INFLUENZA VACCINATION ACROSS TWO YEARS

Kowalsky J.*[1], Temmen C.[2]

[1]The Ohio State University at Newark ~ Newark ~ United States of America, [2]University of Louisville ~ Louisville ~ United States of America

Introduction: Influenza virus is a global concern. In temperate regions, influenza follows a seasonal pattern and annual immunization in advance of the epidemic curve is recommended (WHO, 2025). The Reasoned Action Approach (RAA) has been used to predict health behaviors, including influenza vaccination. According to the RAA, behavior is predicted by intention, while intention is predicted by affective and cognitive attitudes, descriptive and injunctive norms, confidence, and control. The purpose of the present study was to evaluate the stability of the RAA, and test predictors of vaccine uptake after accounting for stability.

Method: Participants were recruited online for a longitudinal survey study assessing factors associated with seasonal influenza vaccine uptake at the beginning and end of the 2019-2020 and 2020-2021 influenza seasons (T1-T4) in the United States. Participants (N=1082; M age=43.98 years, 60.37% female, 80.38% White, non-Hispanic, 89.35% postsecondary graduates) were included in analyses if they had participated at the beginning and end of the 2019-2020 flu season (T1 and T2).

Results: A random-intercept cross lagged panel model was estimated to examine how each construct of the RAA, measured at each time point (T1-T4), were related to vaccine uptake at the end of each influenza season (T2 and T4). Results indicated that, overall, each construct was stable across the four time points. After accounting for that within-person stability, greater intention (β=.32-.34) and cognitive attitudes (β=.23-.39) at each time point (T1-T3) were related to greater intentions at subsequent time points (T2-T4). Additionally, greater intention (β=.36) at T1 and (β=.37) T3 were related to vaccine uptake at T2 and T4, respectively.

Conclusions: The RAA constructs predicting influenza vaccination are stable over time. Intention consistently predicts seasonal influenza vaccine uptake, while cognitive attitudes predict intention. Health promotion efforts should focus on utility of the seasonal influenza vaccine and strategies to support intention to vaccinate.

Abstract 1080

PSYCHOLOGICAL PREPARATION FOR THE FIRST IVF CYCLE: TRANSLATING RESEARCH INTO SUPPORTIVE PRACTICE

Opsenica Kostić J.*, Mitrovic M., Cirovic N., Jankovic I., Spasic Šnele M., Todorovic J.

Department of Psychology, Faculty of Philosophy, University of Niš ~ Niš ~ Serbia

Introduction: In vitro fertilization (IVF) is often experienced as an emotionally demanding process, especially during the first treatment cycle. Feelings of uncertainty, loss of control, and social pressure may intensify stress, making psychological support a crucial part of infertility care. Preparing women for IVF through targeted psychosocial support can improve their coping strategies and reduce potential negative consequences.

Purpose: This study aimed to identify women's representations of their first IVF cycle in order to design a program of psychological support tailored to their needs during the preparation phase.

Method: Semi-structured interviews were conducted with eleven heterosexually partnered women (ages 21–39) preparing for their first IVF cycle. A thematic analysis with a social constructionist framework was applied to explore how participants constructed meanings and expectations of IVF.

Results: Four central themes emerged: (1) IVF as a helpful step toward success, bringing hope and enthusiasm; (2) IVF as a stressful journey into the unknown, characterized by fear and uncertainty; (3) IVF as a game of chance, emphasizing the lack of personal control over the outcome; and (4) IVF as something I (do not) ask about, reflecting different health information-seeking styles. These themes reveal women's representations that shape women's emotions, thoughts, and coping strategies.

Conclusions: Based on these findings, we propose a group support program for women preparing for their first IVF cycle. The program would include several sessions with a psychologist, structured around the identified themes. Sessions would focus on: (a) sharing expectations and hopes, (b) addressing fears and uncertainties, (c) exploring the experience of lack of control and developing adaptive coping strategies, and (d) discussing information-seeking styles and ways to balance between being informed and avoiding overload. By addressing the themes identified in women's narratives, such support could foster resilience and contribute to better psychological adjustment during IVF treatment.

Abstract 1340

SOCIAL SUPPORT AND HIV: EXPERIENCES AND PERCEPTIONS AMONG MEN

Sánchez--Medina R.*[1], Rosales--Piña C.R.[1], Enríquez--Negrete D.J.[1], Torres--González J.C.[2]

[1]Universidad Nacional Autónoma de México ~ Mexico city ~ Mexico, [2]Clínica Condesa ~ Mexico city ~ Mexico

The aim of this study was to analyze the perception of social support in men living with HIV and in men who attend HIV testing, using Bronfenbrenner's ecological model as a reference framework. The study included 213 participants: 93 without a confirmed diagnosis and 120 diagnosed with HIV, all of whom reported being men who have sex with other men (MSM). The Modified Natural Semantic Networks method was applied to identify meanings attributed to support from partners, family, friends, and society.

The results indicate that both groups agree that they feel supported when they are listened to, understood, accompanied, and cared for. However, significant differences were observed; in the case of men with HIV, family and healthcare personnel are the main sources of support, with mothers and siblings playing a particularly important role. On the other hand, those who only came for testing report greater trust in friends and partners, as well as an expectation of community support. Regarding partners, men with a diagnosis report negative perceptions associated with a lack of support or even experiences of rejection, while the other group emphasizes trust, affection, and honesty. Regarding friends, both groups agree on the importance of loyalty and understanding, although those diagnosed consider this network to be limited. Finally, both groups mention stigma, discrimination, and ignorance in society, along with perceptions of a lack of adequate programs.

The findings confirm that social support plays a protective role by promoting adherence to treatment and mitigating the emotional impact of diagnosis. However, tensions arising from stigma and social exclusion persist. It is concluded that strengthening family, community, and social support networks is key to improving the quality of life and sexual health of men with HIV.

Abstract 929

PATHWAYS LINKING EARLIER STRESSFUL EVENTS TO CURRENT MENTAL HEALTH IN ADOLESCENTS: A LONGITUDINAL STUDY

Tian F.*[1], Zhang C.[2], Zhang Y.[1], Xiang K.[1], Lei H.[2], Wang Y.[1]

[1]State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University ~ Beijing ~ China, [2]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China

Adopting a lifespan developmental perspective, this study views adolescent mental health as the result of dynamic interactions between past and present experiences. The study aims to investigate two potential pathways through which stressful events experienced earlier in life may influence an adolescent's current mental health: These pathways are : (1) the long-term direct effects and (2) the short-term indirect effects mediated by current stress. A longitudinal study tracked 9642 fifth graders (51.5% male; mean age = 10.37±1.38) over five years, conducting annual assessments. Self-report data were collected on stressful life events, as well as on symptoms of depression and anxiety. Regression and mediation analyses were conducted. Analyses controlling for gender, age, SES, and T1 mental health problems showed the following: (1) T1 stress significantly and positively predicted T5 mental health problems (β_depression = 0.690, p < 0.001; β_anxiety = 0.417, p < 0.001); and (2) complete mediation emerged for depression, with T1 stress exerting a significant positive indirect effect via T5 stress (β = 0.686, p < 0.001) , but no significant direct effect on T5 depressive symptoms (β = 0.001, p = 0.941). (3) For anxiety, competitive mediation emerged, with T1 stress exerting a positive indirect effect via T5 stress (β = 0.602, p < 0.001) as well as a significant negative direct effect on T5 anxiety symptoms(β = -0.186, p < 0.001). The findings suggest that the detrimental effects of stress experienced earlier in life on the mental health of adolescents are largely explained by current stress. Therefore, interventions targeting the reduction of current stress may promote positive mental health outcomes.

Abstract 1123

THE LONGITUDINAL RELATIONSHIP BETWEEN AI DEPENDENCE AND DEPRESSIVE SYMPTOMS IN ADOLESCENTS: A NETWORK PERSPECTIVE

Wang H.*[1], Huang S.[2], Lai X.[3], Ke L.[1], Xiang K.[1], Zhang Y.[1], Wang Y.[1]

[1]State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University ~ Beijing ~ China, [2]Institute of Sociology, Chinese Academy of Social Sciences ~ Beijing ~ China, [3]Institute of Future Education, China National Academy of Educational Sciences ~ Beijing ~ China

Current findings on the relationship between AI dependence and depression are inconsistent. Existing studies some overemphasize the harms of AI dependence, while others highlight the potential value of AI as a tool for mental health interventions, suggesting that AI dependence does not impair mental health. Most researches rely on total depression scores, overlooking that different nodes of depressive symptoms may exhibit differential sensitivity to AI dependence. Using Cross-lagged Panel Network Models (CLPN), we aimed to reveal the relationship between AI dependence (as defined by five symptoms: salience, tolerance, functional impairment, withdrawal and loss of control, adapted from the Smartphone Addiction Scale) and the development of nine depressive symptoms as measured by the PHQ-9. 4,647 adolescents (Mage = 14.6 ± 1.6, 48.2%male) were assessed twice at 12-month intervals in 2023 and 2024. The network structure was estimated using a mixed modelling approach (glmnet package: LASSO regression for variable screening and lavaan package: structural equation modelling), and stability was assessed using Bootstrap sampling. The CLPN model showed moderate accuracy and stable estimates of node centrality. The results suggest that: (1) Salience has high mediation centrality and acts as a bridging symptom between AI dependence and depressive symptoms. (2) There is a vicious cycle between loss of control, anhedonia and sleep disturbances. Furthermore, sleep disturbances, concentration difficulties and suicide ideation are significant precursors to the development of AI dependency. (3) Sad mood and salience negatively predict each other, with salience negatively predicting appetite and withdrawal negatively predicting appetite. Results suggest that relying on AI to alleviate depression may be counterproductive as its effects are potentially harmful. Furthermore, preventing AI dependence should involve identifying and alleviating an individual's depressive emotions rather than simply restricting their use of AI. Future research could explore the underlying psychological mechanisms further, such as motivations for using AI.

Abstract 1184

PROTECTIVE FAMILY ENVIRONMENT, ADOLESCENT NSSI, AND SUICIDALITY: GENDERED ROLES OF LIFE SATISFACTION AND GROWTH MINDSET

Wang Y.*, Ng J.C.K., Zhu S.

The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong

Introduction

Positive family environment demonstrated protective effects against adolescent self-harming intentions and behaviors. Emerging evidence suggested that overall life satisfaction and mindsets toward negative emotions play critical roles in these relationships, with potential gender-specific variations.

Purpose

This study examined whether life satisfaction mediates, and growth mindset moderates, the relationship between family environment and adolescent non-suicidal self-injury (NSSI) and suicidality among boys and girls.

Method

Data from a large-scale school survey with two waves was collected at a one-year interval (N=3,151) to examine the longitudinal association. Descriptive statistics, correlations, as well as mediation and moderation models were employed to investigate the interaction mechanisms separately among girls and boys.

Results

Compared to girls, boys reported lower prevalence of NSSI and suicidality, higher life satisfaction, and stronger growth mindsets. A positive family environment was found to reduce NSSI, suicidal ideation, and attempt by enhancing adolescents' life satisfaction. Growth mindset amplified the protective effects of positive family environment, with gender differences observed: it moderated the longitudinal association between family environment and life satisfaction among boys ($p = 0.011$), and the direct link to suicidal attempt in girls ($p = 0.036$).

Conclusions

The study highlighted the universal protective mechanisms of positive family environments and life satisfaction, alongside heterogeneity in the moderating effects of growth mindset across genders.

Implications

There is a need to advance more nuanced theoretical frameworks of adolescent development. Moreover, both life satisfaction and growth mindset represent promising targets for intervention and policy development, with attention to gender-sensitive pathways recommended to optimize effectiveness.

Abstract 1349

HOW CONFLICT SHAPES SUSPENSE AND ENJOYMENT IN NARRATIVES

Tsumura M.*

Kanagawa University ~ Yokohama ~ Japan

This study investigated how conflict depiction in narratives shapes readers' attitudes. Although conflict is widely recognized as central to narrative engagement, empirical research in psychology remains limited. Drawing on preliminary survey results, we used generative AI to create stories depicting "being trapped or cornered" scenarios, reflecting high conflict intensity. We produced two types of stories, with and without conflict (two stories each, four in total), while controlling for word count. Participants (n = 119; Mage = 19.5, SD = 0.69; 53.8% men, 46.2% women) read one story and rated its perceived conflict intensity, suspense, and enjoyment. Reliability was adequate across scales (conflict intensity: α = .86; suspense: α = .85; enjoyment: α = .91). A manipulation check confirmed higher conflict intensity in the conflict condition compared with the no-conflict condition ($t(117) = 10.20$, $p < .001$, $d = 1.87$). Mediation analysis showed that conflict increased suspense ($\beta = .393$, $p < .001$), and suspense enhanced enjoyment ($\beta = .586$, $p < .001$). However, the direct effect of conflict on enjoyment was negative ($\beta = -.246$, $p = .002$). The indirect effect via suspense was significant ($\beta = .23$, 95% CI [.10, .36], $p < .001$). Thus, conflict does not directly enhance enjoyment but exerts its influence through the mediating role of suspense, clarifying the psychological mechanisms underlying narrative engagement.

Abstract 1929

COUNTRY SATISFACTION DURING THE COVID-19 PANDEMIC: A 2 YEAR LONGITUDINAL STUDY

Morrison M.*[2], Laskey N.[1]

[1]University of Toronto ~ Toronto ~ Canada, [2]King's University College at Western University ~ London ~ Canada

The proposed paper examined predictors of satisfaction with one's country during the COVID-19 pandemic using longitudinal, cross-regional data collected between May 2020 and May 2022. Participants were drawn from the United States, Anglo regions, Latin Europe, and Latin America. Variables included patriotism, national attachment, perceptions of government competence, perceptions of government care during the pandemic, and regional COVID-19 death rates as an indicator of objective pandemic severity. Analyses employed three-level multilevel models, with timepoints nested within participants and participants nested within regions. Patriotism showed the strongest associations with country satisfaction across between-person (βs = .41–.49) and within-person (βs = .26–.35) models, and had consistent significant effects across regions and timepoints. National attachment (βs = .05-.16), perceptions of government competence (βs = .06-.11) and perceptions of government care (βs = .05-.13) also demonstrated positive associations, though with smaller effect sizes. COVID-19 death rates were unrelated to model improvement, indicating that subjective perceptions were more closely associated with country satisfaction than objective pandemic severity. Cross-lagged analyses revealed reciprocal associations between identity-related variables and country satisfaction. Higher patriotism and national attachment at earlier timepoints were associated with higher satisfaction at later timepoints, while prior satisfaction was also associated with subsequent increases in these identity variables. Perceptions of government competence and care showed similar bidirectional associations, though effects were less consistent. Region-specific analyses reinforced the stability of patriotism's associations across cultural contexts. The findings highlight the central role of national identity in predicting satisfaction with one's country during times of crisis. These findings further suggest the possibility that leaders and policymakers who foster more positive national identification can potentially enhance collective resilience and satisfaction during crises. Furthermore, the consistent cross-regional patterns regarding patriotism underscore its importance for understanding public attitudes towards one's country and government in times of uncertainty.

Abstract 4270

SOCIAL RELATIONSHIP EXPERIENCES AND SLEEP QUALITY FROM AN INTERPERSONAL PERSPECTIVE

Xie Y.*

Department of Psychology, University of Macau, Macau, China

Sleep quality is crucial for our physical and mental health; however, poor sleep has become a widespread public health issue requiring research that identifies factors that can be targeted in interventions. In this talk, I will discuss two studies that focus on understanding the links between social relationship experiences and sleep quality. In Study 1, 238 older adult couples completed daily diaries for 7 days, assessing their relationship and sleep experiences. In Study 2, 110 younger and middleaged adult couples completed daily diaries and wore wrist actigraphy (to measure their objective sleep quality) for 10 days. Both studies demonstrate the dyadic effects of social relationship experiences on sleep quality, elucidate the mechanisms underlying these effects, and show how relationship and sleep experiences cyclically influence one another.

Abstract 4588

SOCIAL ISOLATION DUE TO COVID-19 AND THE DARK TRIAD IN MEXICO

Rivera--Aragon S.*, Diaz--Loving R., Jaen--Cortes C.I., Platas--Acevedo R.S., Rivera--Garcia J.L., Soler--Anguiano F.L.

National Autonomous University of Mexico ~ Mexico City ~ Mexico

Regarding the relationship between the Dark Triad and social isolation due to COVID-19, Triverti et al. (2021) find that Machiavellianism and psychopathy show negative correlations with health behaviors (Doerfler et al., 2021). Furthermore, this personality is associated with situations in which people experienced isolation as if nothing was happening, not complying with health and social isolation recommendations during the COVID19 pandemic (Chávez-Ventura et al., 2022).

The objective of this work was directed to find differences in the Dark Triad, between people who were in social isolation and those who were not, as well as differences in those who had problems with their partner, during social isolation.

After informed consent was obtained, 500 participants collaborated voluntarily, anonymously and confidentially, of which 261 were men and 239 women, of legal age and residents of Mexico City, with an age range of 18 to 78 years (M= 39.68; SD 15), most of them married. The dark personality triad scale made up of 27 items was used in its short version SD3 (Jones & Paul, 2013). In addition, a closed questionnaire was used to assess social isolation (if you were in social isolation, level of impact of isolation on your daily life, problems in your relationship with your partner during isolation).

Results show there were differences in the psychopathy factor between people who were in isolation and those who were not (t=3.99; p=.000), with a higher mean for those who were not in social isolation. Finally, significant differences were found in Psychopathy (t=8.0; p=.000), Machiavellianism (t=8.78; p=.000) and Narcissism (t=4.67; p=.000), showing that people with these traits presented more problems in their relationships during isolation.

In conclusion, lack of empathy, manipulation and control could increase, affecting the mental and emotional health of people who were in relationships with individuals who have these traits (PAPIIT IN301825).

Abstract 1649

LONELINESS AS A VITAL SIGN: TOWARD A BIOPSYCHOSOCIAL REFRAMING OF SOCIAL DISCONNECTION

Warren A.*

The George Washington University School of Medicine and Health Sciences; Harvard University Extension School ~ District of Columbia; Boston ~ United States of America

Loneliness is increasingly recognized as a global health challenge with profound physical and psychological consequences, linked to cardiovascular disease, depression, cognitive decline, and premature mortality. Yet despite its broad impact, loneliness remains under-assessed in health and mental health systems. Conceptualizing loneliness as a “vital sign” offers both a compelling metaphor and a practical framework for integrating routine assessment into care, alongside established indicators such as blood pressure or heart rate.

This presentation advances a biopsychosocial reframing of loneliness to strengthen its visibility in clinical, community, and policy contexts. Drawing on empirical studies and conceptual models from psychology, gerontology, and public health, it synthesizes evidence on prevalence, health outcomes, and mechanistic pathways, including stress physiology, immune dysregulation, maladaptive cognition, and social determinants of health. Pilot efforts to implement loneliness screening in primary care suggest feasibility but reveal barriers such as limited provider awareness, time constraints, and variability in social prescribing practices.

Reframing loneliness as a vital sign has the potential to transform its treatment from a private, stigmatized experience into a measurable determinant of health. This translational lens bridges research, practice, and policy, promoting earlier detection, reducing stigma, and informing holistic interventions that address emotional, social, and systemic dimensions of disconnection. Applied psychology has a central role to play in developing valid screening tools, training providers, and shaping global strategies for healthy aging.

PSYCHOLOGICAL BURDEN PREDICTS EMERGENCY DEPARTMENT UTILISATION AMONG OLDER INDIVIDUALS WITH CHRONIC ILLNESS

D"Antono B.*, Longpré--Poirier C.

Research Centre, Montreal Heart Institute/Université de Montréal ~ Montreal ~ Canada

Background: Psychological distress, hostility, and low social support increase risk for morbidity and mortality in individuals with coronary artery disease (CAD), with inconsistent evidence for other chronic illnesses. Their influence on emergency department (ED) visits has received little attention.

Objectives: To assess 1) the association of psychological risk factors with all-cause ED utilisation over a period of up to 8 years in men and women with stable CAD or other non-cardiovascular (NCV) chronic disease, and 2) whether results differ by sex and CAD.

Methods: Men and women (N=1267; 60.38% men; 60.85±7.01 years) with CAD or NCV disease completed validated questionnaires on depression, anxiety, stress, hostility, and social support. The primary outcome was a composite defined by at least one ED (all-cause) visit, using Quebec administrative databases. Analyses included multivariable Cox proportional hazard models and controlled for sociodemographic and health parameters.

Results: Over a median follow-up of 6.06 years, there was a total of 760 cases of ED visits. Symptoms of anxiety and chronic stress increased the risk for ED utilisation by 10% (95%CI, 1.02-1.19) and 15% (95%CI, 1.06-1.25) respectively, for each standard deviation (SD) increase in score. Depression symptoms (HR=1.21 per 1SD, 95%CI, 1.11-1.31) significantly increased risk only among those with CAD.

Conclusion: Psychological distress and chronic stress predicted increased risk of adverse outcomes in patients with chronic disease, with CAD individuals showing a particular vulnerability. In light of increasing health care costs, addressing patients' psychological well-being appears essential in the management of chronic disease.

Abstract 1639

DYADIC COPING AND PTSD IN CARDIOVASCULAR DISEASE: EVIDENCE FROM A DYADIC LONGITUDINAL STUDY

Donato S.*[1], Gioia C.[1], Demaria C.[1], Gorini A.[2], Bussotti M.[2], Bertoni A.M.M.[1]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Istituti Clinici Scientifici Maugeri IRCCS ~ Milano ~ Italy

Introduction: Cardiovascular diseases represent a complex challenge both for patients and their partners, forcing them to reconsider and reorganize their relationship in the light of an unexpected, potentially traumatic event.
Aim: This study explores the psychological and relational impact of heart disease within the couple, with particular attention to how stress communication and different dyadic coping styles (positive, negative, common), used during the rehabilitation process and in the post-discharge period, correlate with the symptoms of PTSD (Post-Traumatic Stress Disorder) in both members of the dyad.
Method: A longitudinal dyadic design was adopted. A total of 120 couples participated at admission to rehabilitation, and of these, 40 patients and 36 partner were reassessed six months after discharge using a multidimensional questionnaire.
Results: Results showed a higher incidence of PTSD among partners compared to patients, at both assessment points. Also, the results indicate a significant negative correlation between common dyadic coping and post-traumatic symptomatology (in terms of the amount of patients' symptoms at T0), but not at the end of rehabilitation. The results didn't reveal any significant correlations between positive dyadic coping and PTSD across the different measurements, either in patients or in partners.
Conclusions: Overall, the present results suggest that couple dynamics change over the course of rehabilitation , contributing in different ways to the onset of PTSD symptoms in both patients and partners. The findings highlight that, also for partners, the cardiac event represents a stressful experience, underscoring the importance of effective communication, which can improve both the relationship and post-traumatic symptomatology.

Abstract 1483

CHILDREN AND YOUNG PEOPLE IN THE DIGITAL AGE: A HEALTH PSYCHOLOGY APPROACH TO MENTAL HEALTH AND RESILIENCE

Perez J.*

Jessica Perez ~ Boca Raton ~ United States of America

The increasing mental health challenges among children and young people, including rising rates of anxiety, depression, loneliness, and stress-related difficulties, are a global concern. One contributing factor is the shift toward digital-centered childhoods, which may disrupt developmental processes and interfere with health-promoting behaviors. This poster applies a robust health psychology framework to explore how digital overexposure affects the mental health, brain development, and coping processes of children and young people. It also identifies effective strategies for prevention and intervention. Evidence from research on stress regulation, coping, and health behavior change demonstrates that excessive screen use is linked to disrupted sleep, reduced physical activity, social isolation, and diminished connectedness—mechanisms that increase vulnerability to anxiety, depression, and loneliness. Neuroscientific findings further suggest that constant digital stimulation can alter brain development by affecting reward pathways, attention regulation, and stress-response systems, making it more difficult for children and young people to manage emotions and sustain focus. Digital overexposure also undermines adaptive coping by heightening social comparison and reducing opportunities for unstructured play, both of which are protective during critical developmental stages. At the same time, health psychology emphasizes the importance of buffering factors, such as strong peer support, family connectedness, and community engagement, which can help mitigate loneliness and foster resilience. Effective interventions, therefore, require a multi-level approach: promoting individual coping skills, supporting families in regulating digital use, and advancing school and policy initiatives that safeguard developmental health. This perspective aligns with the International Association of Applied Psychology's mission to advance psychological science and practice globally, emphasizing the importance of collaborative, evidence-based strategies to protect the well-being of children and young people in the digital age.

Abstract 1472

RESILIENCE AND SOCIAL SUPPORT IN MEN LIVING WITH HIV

Sánchez--Medina R.*[1], Rosales--Piña C.R.[1], Enríquez--Negrete D.J.[1], Muñoz--Maldonado S.I.[1], Plascencia--De La Torre J.C.[2]

[1]Universidad Nacional Autónoma de México ~ Mexico city ~ Mexico, [2]Universidad de Guadalajara ~ Guadalajara ~ Mexico

Introduction. Empirical evidence highlights the role of social support as a protective factor against HIV, as it strengthens preventive behaviors, coping strategies, and safer sexual practices. Understanding how different support networks contribute to resilience is essential to design effective interventions for men living with HIV.

Purpose. This study aimed to examine the predictive role of social support from family, friends, partners, and society on three resilience factors: strategies for HIV prevention, coping strategies in the face of HIV, and safe sexual behavior strategies in risk contexts.

Method. A cross-sectional study was conducted with 729 men living with HIV, with a mean age of 33.5 years (SD = 9.0). Participants completed validated measures of perceived social support and resilience. Descriptive statistics, correlations, and stepwise regression analyses were performed.

Results. Correlation analyses showed significant associations between social support and the three resilience factors. Family support was more strongly related to prevention strategies ($r = .230$, $p < .01$), while support from friends was the main correlate of coping strategies ($r = .348$, $p < .01$). Safer sexual behavior strategies were associated, though modestly, with partner and societal support. Regression models confirmed these findings: (1) prevention strategies were predicted by family, partner, and societal support (adjusted $R^2 = .079$); (2) coping strategies were predicted by friends, partner, and family support (adjusted $R^2 = .159$); and (3) safe sexual behavior strategies were predicted by partner and societal support (adjusted $R^2 = .019$).

Conclusions. Findings suggest that different support networks have distinct functions: family support enhances prevention, friends contribute to coping, and partners and society promote safer sexual practices, albeit with limited explanatory power. These results highlight the importance of developing psychosocial interventions tailored to strengthen the specific type of social support most relevant to each resilience dimension in men living with HIV.

Abstract 1592

BEYOND DIAGNOSES: THE GENERAL PSYCHOPATHOLOGY FACTOR AND ITS CORRELATES IN ADOLESCENTS

Yalaç Dolay A.*, Kaynar Yaman G.

Ankara Medipol University ~ Ankara ~ Turkey

High rates of comorbidity and symptom overlap in child and adolescent psychiatry suggest the existence of a general psychopathology factor (p-factor) that underlies diverse mental health difficulties. Moving beyond categorical diagnostic systems, the p-factor framework provides a dimensional approach to understanding vulnerability and resilience across disorders. This study investigates the role of parental reflective functioning, adolescent executive functioning, resilience, and childhood trauma in relation to the p-factor in adolescence.

The sample consists of 150 adolescents aged 11–18 years, including a clinical group recruited from a child and adolescent psychiatry unit and a community control group, along with their parents. Both adolescents and parents completed standardized measures: the Reflective Functioning Questionnaire, Adolescent Executive Function Inventory, Resilience Scale for Children and Adolescents (ÇGPSÖ-12), Childhood Trauma Questionnaire (CTQ-33), and the Child Behavior Checklist (CBCL). Preliminary analyses were conducted using descriptive statistics and correlational tests, with confirmatory factor analysis planned to evaluate the dimensional structure of general psychopathology.

Preliminary findings indicate that adolescents in the clinical group demonstrate significantly higher p-factor scores compared to controls. Initial correlations suggest that parental reflective functioning is negatively associated with internalizing symptoms, whereas childhood trauma shows strong positive associations with overall psychopathology. Resilience appears to act as a protective factor, partially buffering the relationship between trauma and symptom severity.

This ongoing study is expected to clarify the mechanisms underlying the p-factor in adolescence and highlight the mediating role of mentalization and resilience. By integrating dimensional models with applied contexts, the study contributes to Sustainable Development Goals (SDG 3: Good Health and Well-Being, SDG 4: Quality Education, and SDG 10: Reduced Inequalities). Full analyses and implications for intervention will be presented at ICAP 2026.

VIRTUAL REALITY INTERVENTIONS FOR ANXIETY ACROSS THE LIFESPAN: CLINICAL APPLICATIONS IN PEDIATRIC, ADULT, AND GERIATRIC POPULATIONS

Wednesday 22 July 2026 from 17:30 to 19:00

(A - Spadolini)

Alexander Moreno (Department of Psychology, Université de), Chair and Presenter

According to the World Health Organization, anxiety disorders represent the most prevalent mental health conditions globally, frequently manifesting during childhood or adolescence. Untreated anxiety can significantly impair social functioning and participation across multiple domains, including family, academic, and occupational settings. Psychological interventions have demonstrated efficacy in anxiety management, and virtual reality (VR) has recently emerged as a promising, safe, and cost-effective adjunctive modality that facilitates immersive, nonpharmacological treatment.

This symposium aims to present empirical evidence illustrating the clinical utility of VR-based interventions across diverse age groups. The initial presentation compares the efficacy of an experiential simulation and a biofeedback-enhanced relaxation protocol in seriously ill children and adolescents. Subsequently, findings from a clinical trial involving adults diagnosed with anxiety disorders reveal significant reductions in anxiety symptoms, decreased respiratory rates, and improved subjective relaxation following four VR sessions. Both studies use the Czech-developed VR application BreezeTerraVR.

A systematic review then synthesizes current research on VR applications in palliative care across pediatric, adult, and geriatric populations. The final three presentations focus on the co-development and implementation of a Canadian VR platform, “Come with me,” designed to alleviate anxiety among hospitalized patients receiving end-of-life care and their family caregivers in Quebec.

Collectively, these six presentations offer valuable cross-cultural and cross-generational perspectives, demonstrating how psychological theory and technological innovation converge to deliver brief, targeted VR interventions for anxiety. The findings underscore VR’s potential to enhance the accessibility, engagement, and efficacy of evidence-based anxiety treatments throughout the lifespan, representing a significant advancement in clinical psychological science.

Abstract 3355

BREEZETERRAVR: A VIRTUAL REALITY RELAXATION TOOL WITH RESPIRATORY BIOFEEDBACK FOR ANXIETY AND STRESS RELIEF IN ADULT POPULATION

Jablonská M.*, Zuzánková K., Langová T., Darmová B., Fajnerová I.

Center for Virtual Reality Research in Mental Health and Neuroscience, National Institute of Mental Health ~ Klezany ~ Czech Republic

Introduction:
Virtual Reality (VR) technologies provide immersive environments that may enhance conventional interventions used in the treatment of anxiety disorders. BreezeTerraVR is a relaxation-based VR application combining guided breathing with optional respiratory biofeedback aimed to reduce anxiety symptoms.

Purpose:
This study evaluated the effectiveness and tolerability of BreezeTerraVR in 25 patients with anxiety disorders.

Method:
A randomized crossover design was conducted with patients diagnosed with anxiety disorders. Each participant completed four sessions: two with integrated biofeedback and two without, in randomly assigned order. Primary outcomes included reductions in anxiety and respiratory rate, and increased subjective relaxation. Tolerability was monitored through cybersickness ratings and dropout rates.

Results:
BreezeTerraVR was well tolerated, with low levels of cybersickness and minimal dropout. Both conditions—sessions with and without biofeedback—were associated with significant reductions in anxiety and respiratory rate, alongside improved subjective relaxation. Although no statistically significant main effect of biofeedback was found, exploratory analyses suggested greater benefits when biofeedback was introduced after initial non-biofeedback sessions, possibly due to reduced cognitive load or increased task familiarity. Importantly, biofeedback significantly improved participants' ability to synchronize breathing with the guided rhythm, highlighting its value for promoting consistent breathing patterns.

Conclusions:
BreezeTerraVR demonstrates promise as a non-pharmacological intervention for individuals with anxiety disorders. Its ability to reduce anxiety and support relaxation, while enhancing breathing synchronization, suggests clinical applicability. Larger studies with extended follow-up are needed to confirm these preliminary findings and optimize

intervention design.

Funding: The study was supported by the project DigiWELL CZ.02.01.01/00/22_008/0004583, co-financed by the European Union.

Abstract 3356

VIRTUAL REALITY IN PALLIATIVE CARE ACROSS THE LIFESPAN: A SYSTEMATIC REVIEW OF ITS APPLICATIONS IN LIFE-LIMITING CONDITIONS

Dubois M.*[1], Côté E.[2], Fajnerová I.[3], Zubková A.[4], Rigoulat C.[5], Pichon C.[6], Belhouari S.[7], Pelletier P.[1], Caamano C.[2], Moreno A.[1]

[1]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [2]Centre de recherche de l'institut universitaire de gériatrie de Montréal, (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada, [3]Center for VR Research in Mental Health and Neuroscience, National Institute of Mental Health ~ Klecany ~ Czech Republic, [4]Department of Psychiatry and Medical Psychology, Third Faculty of Medicine, Charles University ~ Prague ~ Czech Republic, [5]École Universitaire de Recherche (EUR) Healthy, Université Côte d'Azur ~ Nice ~ France, [6]Faculté de Médecine, Université Côte d'Azur ~ Nice ~ France, [7]Department of Psychology, Université du Québec à Montréal ~ Montreal ~ Canada

Introduction:
Virtual reality (VR) has demonstrated usability, acceptability, and clinical benefits in various healthcare settings. In palliative care, it is increasingly employed to help manage physical and psychological symptoms.

Purpose:
To systematically review the scientific literature on the use of virtual reality in palliative care across the lifespan.

Method:
A systematic search was conducted across five databases from inception to June 2025 using keywords such as "Virtual Reality," "Palliative Care," and "End-of-Life." Titles and abstracts were independently screened using Covidence software, followed by independent full-text reviews. In the final phase, four reviewers conducted data extraction, assessed the level of VR immersion, study quality, and reported adverse effects.

Results:
Out of 1,395 records identified, 54 studies met the inclusion criteria. The overall quality of studies was rated as good, with most utilizing highly immersive VR experiences. The majority of studies included mixed populations of adults and older adults, while only a small number focused exclusively on children or the elderly. Adverse effects were reported in 9% of the studies. VR was applied across a range of contexts with positive outcomes, including clinical symptom management in end-of-life care and life-limiting conditions, oncological palliative care, palliative care training, caregiver support, and decision-making at the end of life.

Conclusion:
Virtual reality is a safe, user-friendly, and effective non-pharmacological intervention for managing physical and psychological symptoms in individuals receiving palliative care across the lifespan. It also serves as a valuable tool for caregiver support and education in palliative care settings.

Abstract 3377

TOWARD VIRTUAL REALITY ADAPTED TO PALLIATIVE AND END-OF-LIFE CARE: COLLABORATING WITH ALL STAKEHOLDERS TO CO-CREATE DIGITAL CONTENT

Pelletier P.*[2], Rigoulat C.[1], Dubois M.[2], Caamano C.[3], Turk C.[2], Moreno A.[2]

[1]École Universitaire de Recherche (EUR) Healthy, Université Côte d'Azur ~ Nice ~ France, [2]Department of Psychology, Université de Montréal ~ Montreal ~ Canada, [3]Centre de recherche de l'Institut universitaire de gériatrie de Montréal (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada

Introduction:
Virtual reality (VR) has demonstrated efficacy in managing physical and psychological symptoms; however, its role in supporting family caregivers of individuals receiving palliative care remains underexplored. The VR experience Come with me™ was co-created by the Canadian start-up Nipper Media in collaboration with stakeholders specializing in palliative care. This codesign process resulted in an immersive experience tailored to the unique needs and context of palliative and end-of-life care.

Purpose:
To examine the impact of the Canadian VR application Come with me™ on anxiety levels among family caregivers of individuals receiving end-of-life care.

Method:
Outcome measures included the State-Trait Anxiety Inventory (STAI), the revised Edmonton Symptom Assessment System (ESAS-r), the System Usability Scale (SUS), and visual analogue scales assessing satisfaction and perceived safety.

Results:
Following a single VR session, participants reported a significant reduction in anxiety levels, with no symptoms of cybersickness. Usability ratings were excellent, and participants reported high levels of satisfaction and a strong sense of security during the experience.

Conclusion:
To our knowledge, this is the first study to demonstrate a significant reduction in anxiety among family caregivers of individuals in end-of-life care following a short, single-session exposure to VR content. Come with me™ appears to be a safe, user-friendly, and promising tool to support the psychological well-being of caregivers in palliative care settings.

Abstract 3379

REDUCING END-OF-LIFE ANXIETY USING A CANADIAN VIRTUAL REALITY TECHNOLOGY: USABILITY, SATISFACTION, AND PERCEIVED SAFETY IN HOSPITALIZED INDIVIDUALS RECEIVING PALLIATIVE CARE

Moreno A.*[1], Rigoulat C.[2], Dubois M.[1], Pichon C.[3], Pelletier P.[1], Turk C.[1], Caamano C.[4]

[1]University of Montreal, Department of Psychology ~ Montreal ~ Canada, [2]cole Universitaire de Recherche (EUR) Healthy, Université Côte d'Azur ~ Nice ~ France, [3]Faculté de Médecine, Université Côte d'Azur ~ Nice ~ France, [4]Centre de recherche de l'institut universitaire de gériatrie de Montréal, (CRIUGM) - Innovation, Technology, and Cognition (INTECOG) Laboratory ~ Montreal ~ Canada

Introduction:
Virtual reality has been used to reduce pain, diminish anxiety, and improve psychological wellbeing in palliative care. However, its use in end-of-life palliative care needs further investigation in hospital settings.

Purpose:
To explore the efficacy, usability, satisfaction, and perception of security of virtual reality content co-developed in Canada in hospitalized individuals receiving palliative care.

Method:
The virtual reality content "Come with me™" is a series of videos filmed with a 360-degree camera in 5.7K resolution by the Montreal-based company Nipper Media. Eight French-speaking hospitalized individuals receiving palliative care, with a mean age of 74.2 years (SD=13) and a mean hospital stay in palliative care of 3.8 days (SD=2.7) tested this application in an end-of-life unit in Montreal using Pico 3 goggles during a session lasting 8.7 minutes (SD=0.5) and 25 seconds (SD=1.8). They completed the 20-item State-Trait-Anxiety-Inventory (STAI-Y), the 10-item Edmonton Symptom Assessment System Revised (ESAS-r), the 10-item System Usability Scale (SUS), and 11-point visual analog scales to evaluate the user's perceived satisfaction and security with the technology.

Results:
The results of a Wilcoxon Signed Rank Test revealed a significant decrease in anxiety as measured by the STAI-Y after the VR experience, $z=-2.1$, $n=8$, $p<.05$, with a large effect size ($r=.74$). The median score on the STAI-Y decreased from before the VR experience (Md=39) to the post-VR experience with «Come with Me™» (Md=29). They also reported high levels of usability (M=79.1; SD=16.5) and satisfaction (M=7.6; SD=2.4), with low levels of risk of use (M=1.1; SD=2.1) indicating a high perception of safety.

Conclusions:
The virtual reality content "Come with me™" reduces end-of-life anxiety in hospitalized individuals in end-of-life palliative care with high levels of usability, satisfaction, and security. The preliminary results support the use of this technology in clinical practice in palliative and end-of-life care.

HEALTH COMMUNICATION AND CHRONIC DISEASE: NEUROPHYSIOLOGICAL EVIDENCE ON EFFECTIVE DOCTOR–PATIENT INTERACTION

Fici A.[1], Casiraghi C.[1], Bilucaglia M.[1], Rossi C.*[1], Bellati M.[2], Zito M.[1], Russo V.[1]

[1]Department of Business, Law, Economics and Consumer Behaviour "Carlo A. Ricciardi", Università IULM, Milan, Italy ~ Milano ~ Italy, [2]Behavior and BrainLab - Università IULM ~ Milano ~ Italy

Introduction. The doctor–patient relationship is one of the key elements for maintaining adherence to therapeutic pathways in chronic diseases. Several factors within the physician's working context may negatively affect communication, thereby reducing the perceived quality of the relationship, with serious consequences for the patient's emotional sphere and sense of support.

Purpose. This study aimed to identify strategies to improve doctor–patient communication by analyzing its impact on the relationship, through a combined neuroscientific and self-report approach.

Method. A preliminary questionnaire study (n = 132) identified strengths and weaknesses of communication, focusing on responsiveness, perceived competence, involvement, trust, empathy, and relational depth, based on validated scales adapted to the Italian context. Building on these findings, eight videos of doctor–patient interactions across different therapeutic stages (n = 4) were created, employing two communication styles: consistent (n = 4) or inconsistent (n = 4) with patients' preferences. Emotional and cognitive responses of 20 participants - patients (n = 10) and non-patients (n = 10) - were measured while viewing the videos through skin conductance, heart rate, and emotional valence via EEG.

Results. Neurophysiological analyses revealed that the communication style preferred by patients in the initial questionnaire phase was indeed more effective in eliciting positive emotions and greater involvement, leading to a general improvement in the perceived quality of the doctor–patient relationship. This effect was consistent across both subgroups.

Conclusions. The findings highlight how communication styles consistent with patients' preferences can strengthen relational quality and foster more positive emotional responses, offering practical strategies to enhance healthcare interactions. Future research could extend this approach to other chronic conditions, broader patient populations, and different healthcare contexts, thereby contributing to the development of communication practices that support more effective, empathetic, and sustainable health systems.

Abstract 4211

EFFECT OF A FUTURE-ORIENTED THINKING-BASED NUDGE INTERVENTION ON COLONOSCOPY ADHERENCE IN POPULATIONS WITH HIGH RISK OF BEING DIAGNOSED WITH COLORECTAL CANCER: A CLUSTER RANDOMIZED CLINICAL TRIAL

Zhang N.*

School of Public Health, Zhejiang University School of Medicine ~ Hangzhou Zhejiang ~ China

Background: To maximize the benefits of colorectal cancer screening, it is essential to ensure that high-risk populations with positive initial screening results promptly complete diagnostic follow-up colonoscopy. This study tested the effect of a nudge intervention based on future-oriented thinking on improving adherence to colonoscopy among high-risk populations.
Methods: A pragmatic, cluster-randomized clinical trial was conducted across six community health centers in China, enrolling patients who had positive results from initial colorectal cancer screenings between January 1, 2024, and September 20, 2024. The community health centers were randomly assigned to either a nudge intervention group based on future-oriented thinking or a usual care group. The primary outcome was the adherence rate for colonoscopy within the year of 2024.
Results: A total of 1639 individuals with high risk of being diagnosed with colorectal cancer, 1180 (72.0%; mean [SD] age, 63.4 [6.7] years) in the intervention group and 459 (28.0%; mean [SD] age, 63.3 [7.1] years) in the control group, belonging to three community health centers in the intervention group and three in the control group, were included in the study. The proportion who completed recommended follow-up colonoscopy was 41.6% in the intervention group (n = 491) and 34.9% in the control group (n = 160) ($P < 0.05$). Participants in the nudge intervention were more likely to attend colonoscopy compared to usual care (OR, 1.33 [95% CI, 1.04-1.70]).
Conclusion: The study find that the nudge intervention based on future-oriented thinking improved adherence to colonoscopy among high-risk populations. Further research is needed with larger and more balanced samples.

Abstract 4777

THERAPEUTIC PHOTOGRAPHY, PHOTOVOICE AND EXPRESSIVE WRITING IN CARDIOVASCULAR RARE DISEASES: A PILOT STUDY FOR PSYCHOLOGICAL WELL-BEING IN MARFAN SYNDROME

Alessia S.*, Udugampolage N., Caruso R., Pini A., Saita E., Vagnini D., Callus E.

IRCCS Policlinico San Donato ~ Milan ~ Italy

Background: Therapeutic photography (TP), Photovoice (PV) and expressive writing (EW) are creative practices that leverage visual imagery and narrative disclosure, supporting the expression of emotions through low-cost and scalable interventions. These psychologists-guided approaches assist patients' expressive processing of psychological distress, stigma, and disease identity in chronic conditions. Marfan syndrome (MFS), an autosomal-dominant connective tissue disorder with cardiovascular, ocular, and skeletal manifestations, profoundly impacts health-related quality of life (HRQoL).

Purpose: This pilot study evaluates the feasibility of implementing TP, PV and EW in the clinical pathway of MSF patients and their impact on psychological well-being, emphasizing patients' experiences of disease expressivity in multidisciplinary care.

Methods: In a mixed-methods sequential exploratory design, 10 MFS patients (>13 years) from a rare diseases reference center in Milan participated in 11 monthly 120-minute theoretical and practical sessions (in-person/online), facilitated by a psychologist and a nurse, exploring photography-based activities and expressive writing techniques. Psychological well-being was assessed pre/post via Psychological General Well-Being Index questionnaire (PGWBI), while semi-structured interviews and User Experience Questionnaire (EUQ) detected changes in the expression of illness-related emotions and thoughts.

Results: Patients reported transformative experiences: novices discovered TP, PV, EW as novel tools to visually/narratively express disease embodiment, emotions, and identity, overcoming reluctance via guided reflection. Thematic analysis revealed enhanced emotional granularity, sharing of "invisible" burdens, and reframed self-perception. PGWBI improved significantly across domains ($p=0.034$, Cohen's $d=1.08$, large effect; Mann-Whitney U); EUQ indicated high efficiency (mean=-1.25 on satisfaction scale; others neutral).

Conclusion: TP, PV and EW empower MFS patients to articulate and process unique disease experiences, fostering self-care, empowerment and coping. Larger trials in rare diseases are warranted to validate this patient-centered approach for improving HRQoL.

Abstract 2129

RISK FACTORS UNDERLYING DISTINCT SYMPTOM TRAJECTORIES OF PROLONGED GRIEF, DEPRESSION, AND POST-TRAUMATIC STRESS

Yeniada--Kirseven M.*

Hacettepe University ~ Ankara ~ Turkey

The grieving process is typically expected to resolve within six months after bereavement, allowing the bereaved individual to regain functional adaptation. However, some people experience prolonged psychological difficulties, including Prolonged Grief Disorder (PGD), Depression, and Post-Traumatic Stress Disorder (PTSD), which may co-occur following loss. The present study aimed to identify distinct symptom trajectories across these conditions and to examine risk factors predicting class membership.

Participants were 1,060 bereaved adults aged 18 and above who had lost a loved one. Symptom clusters were identified through Latent Class Analysis (LCA), while risk factors for class membership were examined using Multinomial Logistic Regression. Predictor variables included socio-demographic characteristics, loss-related factors, relational processes, and meaning-related measures.

Results revealed a four-class solution: a resilient group, a high-symptom comorbid group, a PGD-dominant group, and a depression-dominant group. Systematic predictors of resilience included being male, higher perceived social support, fewer unfulfilled wishes and unresolved conflicts (unfinished business), and lower attachment anxiety. In contrast, high-symptom membership was predicted by elevated unfinished business and impaired meaning reconstruction. Prolonged grief was specifically associated with attachment anxiety, while depression was predicted solely by inadequate meaning reconstruction. Additional predictors such as time since loss, kinship (spousal or child loss), age of the deceased, and longer caregiving duration were also linked to adverse trajectories.

These findings highlight the multifaceted nature of bereavement risk, emphasizing the critical role of relational vulnerabilities (attachment anxiety, unfinished business, continuing bonds), contextual stressors (unexpected or close kin losses, caregiving strain), and protective factors (social support, meaning-making). Recognizing these predictors provides a framework for developing targeted, dimensional interventions that address the unique needs of bereaved individuals and mitigate the risk of persistent psychopathology.

PROMOTING POSITIVE MENTAL HEALTH AMONG EUROPEAN EMERGING ADULTS: THE ROLE OF PSYCHOLOGICAL RESOURCES AND SOCIAL CONNECTIONS

Thursday 23 July 2026 from 08:00 to 09:30

(S-Monumentale)

Antonella Delle Fave (Università degli Studi di Milano ~ Milan), Chair and Presenter
Veronica Velasco, Discussant

Emerging adulthood was identified as a distinct period in life, characterized by specific challenges, opportunities and developmental requirements. It presently comprises youth born between the end of the previous century and the beginning of the present one, labelled as Generation Z. The distinctive developmental feature of this generation of emerging adults is their regular access and fruition of internet-based information and social media through smartphones from pre-adolescence. This unprecedented early exposure to the virtual world, together with the social isolation imposed by the Covid-19 pandemic, have been associated with the steady increase in malaise and affective disorders detected among emerging adults across countries. In order to identify strategies to contrast this worrying scenario, this symposium is aimed to explore well-being and daily experience among emerging adults from three European countries, through different methodologies and research instruments. Specifically, Monica Molino presents a study conducted among citizens from Turin (Italy), detecting lower well-being levels in emerging adults, compared to older age groups, and highlighting the need to support youth's social inclusion and civic engagement. Lukasz Kaczmarek discusses results from two experiments and one longitudinal study conducted among Polish youth, showing that video-game practice may foster positive emotions when it is actively shared with others. Gaja Zager Kocjan, through real-time data collected in Slovenia, provides evidence of creativity as a psychological resource contributing to emerging adults' experience of well-being during daily activities, such as learning and academic tasks,routine chores and passive leisure. Antonella Delle Fave summarizes results of a study conducted among college students from 8 Italian universities, focusing on the interplay between positive and negative dimensions of mental health, and highlighting their connection with participants' lifestyle and socioeconomic conditions. The unifying and original conceptual framework underlying the four presentations is the view of mental health as a set of positive emotionalandpsychosocialdimensions,ratherthanthemereabsenceofmentalillness.Theshar edgoalistoidentifypersonalandcontextualresourcesthat couldinforminterventionsaddressingthespecificneedsandchallengesofemergingadults,aswel laspromotingtheirpositivedevelopmentandwell-being.

Abstract 4130

CIVIC HAPPINESS AND MENTAL WELL-BEING IN EMERGING ADULTS: EVIDENCE FROM A POPULATION-BASED STUDY IN TURIN, ITALY

Molino M.*[1], Mercuri A.[2], Sacchi A.[1]

[1]Department of Psychology, University of Turin, Italy ~ Turin ~ Italy, [2]Associazione Nessuno, Turin, Italy ~ Turin ~ Italy

Emerging adulthood is a critical developmental stage, marked by transitions, identity exploration, and psychosocial vulnerability. The experience of citizenship, through belonging, participation, and access to urban resources, can significantly influence how emerging adults navigate the challenges and opportunities of this life phase. In this study, we investigated civic happiness, defined as psychological well-being and satisfaction with various life domains in relation to one's community, using a representative sample of citizens (aged 18+) from the city of Turin. The main aim was to map levels of happiness and mental well-being, along with their key antecedents, across different age groups. A total of 2,402 individuals completed a self-report questionnaire. The age distribution was as follows: 18–29 years (18.7%), 30–49 years (32.8%), 50–64 years (26.0%), and over 64 years (22.5%). Additionally, 53% of participants were female. Analyses were conducted using SPSS 28. Findings revealed that emerging adults reported significantly lower levels of mental well-being (measured through the Mental Health Continuum – Short Form) and happiness compared to older age groups. Regression analyses (adjusted R^2 = .29) identified three key predictors of mental health within emerging adults' group: (1) satisfaction with social relationships within one's neighborhood, (2) satisfaction with one's family situation, and (3) feeling accepted and able to participate in and contribute to the functioning of the community. Despite some study's limitations, these results highlight the importance of community-based and relational factors in shaping the psychological well-being of emerging adults in urban environments. They also underscore the need for targeted local policies and interventions that foster social inclusion, educational support, and meaningful opportunities for civic participation. Addressing these specific needs may play a crucial role in preventing psychological distress and enhancing mental health outcomes among young urban citizens.

Abstract 4132

THE ROLE OF EVERYDAY CREATIVITY IN EMERGING ADULTS' MOMENTARY WELL-BEING: INTERACTIVE EFFECTS ACROSS DAILY ACTIVITIES

Zager Kocian G.*, Socan G., Avsec A.

University of Ljubljana, Faculty of Arts ~ Ljubljana ~ Slovenia

Promoting well-being in everyday life requires understanding the situational and personal factors that shape emotional experience in the moment. Everyday creativity (mini-c) has been linked to well-being, yet its role in influencing momentary emotional states across daily situations remains underexplored. This study examines how everyday creativity relates to valence and activation in daily life, and how these associations differ across activities. A sample of 143 emerging adults participated in a 7-day experience sampling study, providing 4,183 momentary reports. Five times daily, participants rated their current valence, activation, perceived creativity, and categorized their ongoing activity. Multilevel models showed that everyday creativity was positively associated with both valence and activation. Activities also shaped well-being: valence was lower during cognitively demanding contexts, such as attending lectures and studying, and during passive or routine activities like idling and running errands, compared to socializing. For activation, the lowest scores were reported during lectures, studying, and idling, while physical activity was the only activity linked to higher activation levels. Crucially, interaction effects revealed that the relationship between creativity and well-being varied across activities. For valence, creativity buffered the negative effects of activities typically associated with lower well-being—lectures, studying, idling, and errands. Notably, creativity also enhanced positive valence during physical activity, possibly because it provides a mentally less constrained environment, allowing creative thought to emerge. Similarly, for activation, the positive effect of creativity was strongest in less stimulating contexts, such as academic settings and idling, but also in routine situations involving personal hygiene and meals. These findings highlight that creativity amplifies momentary well-being most strongly in contexts characterized by lower emotional engagement - such as studying, idling, or routine tasks - by offsetting the emotional costs of cognitively demanding and passive activities. Creativity thus emerges as a psychological resource for managing less intrinsically rewarding daily experiences.

Abstract 4133

THE INTERPLAY BETWEEN POSITIVE MENTAL HEALTH AND DISTRESS AMONG ITALIAN UNIVERSITY STUDENTS: THE ROLE OF LIFESTYLE AND SOCIO-ECONOMIC FEATURES

Delle Fave A.*[1], Velasco V.[2], Bassano N.[3], Brugnera A.[4], Cena L.[5], Daccò S.[6], Profeta P.[7], Trotti E.[8]

[1]Università degli Studi di Milano; ~ Milan ~ Italy, [2]Università di Milano-Bicocca ~ Milan ~ Italy, [3]3Politecnico delle Arti di Bergamo; ~ Bergamo ~ Italy, [4]Università degli Studi di Bergamo ~ Bergamo ~ Italy, [5]Università degli Studi di Brescia; ~ Brescia ~ Italy, [6]Humanitas University ~ Milan ~ Italy, [7]Università Bocconi ~ Milan ~ Italy, [8]Università dell'Insubria ~ Varese ~ Italy

During the last two decades a worrying increase of psychological vulnerability, affective disorders, and difficulties in social relationships has been detected in adolescents and youth; this negative trend was more evident in post-industrial countries, leading policymakers and educators to invest resources to address this societal issue. In this context, the Italian Ministry of University and Research is currently supporting the development of research and intervention programs targeting university students, by encouraging the collaboration among universities, to investigate the phenomenon and identify effective solutions. The present study, conducted in 8 major universities in Lombardy, Northern Italy, involved over 7.000 participants. Data were collected through different research tools, including among others the Mental Health Continuum – Short Form, to investigate positive mental health and well-being, and the General Health Questionnaire, investigating distress. Information was also gathered on participants' socio-economic conditions, health and lifestyle. The opportunity to collect data through the same instruments in a large sample of students differing by academic degree, family and social background, daily time budget and lifestyle may provide important information on the interplay between the positive and negative dimensions of mental health, and their relationship with environmental and social characteristics. Results may help design and implement well-being promotion programs more accurately tailored to the needs and resources of specific groups of students, with the aim of building a welcoming university context based on equality and inclusion, and offering youth the opportunity to identify their own constructive pathway towards professional and personal goal achievement.

EATING DISORDERS: WHAT CONSIDERATIONS SHOULD BE MADE TO IMPROVE PATIENTS SUPPORT CARE AND MANAGEMENT?

Colombi M.*[1], Campana M.[2], Milanese P.[2], Mucci C.[1], Morganti F.[1], Greco A.[1]

[1]Università degli Studi di Bergamo ~ Bergamo ~ Italy, [2]ASST Bergamo Est ~ Bergamo ~ Italy

Introduction: COVID-19 pandemic has significantly impacted the incidence and severity of Eating Disorders (EDs), a growing pathology marked by a decreasing age of onset. In Italy, there is currently a lack of knowledge concerning the useful principles to develop a standardised protocol for establishing a priority setting system in ED care. Increase in requests for treatment together with the scarcity of economic and human resources available highlights the urgency of this issue.

Purpose: Since everyone has a personal opinion of the most important features to consider in order to define the “priority patients”, the study aims to evaluate the subjective perceived importance of various factors among caregivers, clinicians, and (former)patients- individuals with direct experience of the disorder.

Method: A total of 357 subjects (caregivers 17%, clinicians 32%, [former]patients 51%), filled out the questionnaire included in the article "A Delphi study to explore clinician and lived experience perspectives on setting priorities in eating disorder services". Respondents rated the importance of nine dimensions (e.g. diagnostic factors, duration of EDs, social context) on a Likert scale. Qualitative and quantitative analyses were conducted to highlight priority conditions and differences between groups.

Results: Qualitative analyses show that the privileged issues among the whole sample are mental and physical health; whereas the chronological order of request appears to be the least significant. The following aspects are considered more relevant by clinicians and caregivers than patients: early onset ($F(2, 162) = 16.5$, $p<0.001$), physical severity ($F(2, 151) = 13.9$, $p<0.001$), quantity and frequency of compensatory behaviors ($F(2, 166) = 5.90$, $p<0.010$). Patients significantly underestimate the “body weight” factor importance ($F(2, 354) = 4.34$, $p<0.05$).

Conclusion: Results indicate the need to create a biopsychosocial assessment tool, including psycho-physical risk indicators, to establish the priority to access care, finding a compromise between the above-mentioned categories.

Abstract 2080

EXPLORING PATIENT ENGAGEMENT WITH MEDICINE INFORMATION: FROM LEAFLETS TO DIGITAL TOOLS

Calvete--Labouz M.*, Costa Pereira A., Graffigna G., Usta D.

1.EngageMinds HUB-Consumer, Food and Health Engagement Research Center, Catholic University of Sacred Heart, ~ Cremona ~ Italy

Electronic package leaflets (ePLs) are a key channel for communicating medicine information, yet limited health literacy often constrains their effectiveness, resulting in difficulties retrieving, comprehending, and applying content. Such barriers increase confusion among users and reliance on non-validated sources, undermining safe medicine use and reducing treatment adherence. Despite this, few digital solutions have been empirically tested to overcome latter barriers. Gravitate Health (GH), a European health application, addresses this gap through the G-Lens, a digital interface that highlights ePLs based on users' medical information, to support personalized choices, sustained adherence, and patient engagement.

Purpose This study investigated (1) how Italian patients with chronic conditions and over the counter (OTC) medicine consumers engage with ePLs, and (2) how they evaluate and accept the G-Lens concept.

Method A quantitative survey (206 patients, 305 OTC consumers) explored sociodemographic, some dimensions of health literacy: HLQ (Osborne et al., 2013), eHLQ (Kayser et al., 2018), and patterns of ePL use. Within the survey, a narrative-based video demonstrator introduced two personas navigating the G-Lens, enabling participants to appraise the tool in realistic scenarios.

Results Most respondents reported consulting ePLs (Patients 85.4%, OTC 90.5%), yet substantial proportions experienced difficulties in retrieving (Patients 42%, OTC 49.6%) and comprehending (Patients 39.8%, OTC 42%) information. These findings reveal literacy-sensitive barriers to effective engagement. By contrast, the G-Lens concept was positively received: over half intended to use it when starting new medication (Patients 54.4%, OTC 45.6%), and more than 65% (Patients 65.5%, OTC 65.9%) would recommend it to others, reflecting perceived value and trust.

Conclusions While ePLs remain essential, they are insufficient to meet psychological and practical user needs. Human-centered, literacy-aware solutions such as the G-Lens hold promise for academia, clinical practice, and society by reframing medicine

information as an empowering resource that strengthens comprehension, autonomy, and quality of life.

Abstract 89

POSITIONS ON FUTURE HEALTH CRISIS MANAGEMENT AND INTENTIONS TO FOLLOW GOVERNMENTAL RECOMMENDATIONS: A CLUSTER STUDY AMONG BRUSSELS RESIDENTS

Roussel S.*, Guisset S., Carbon L., Vanpee D., Van Den Broucke S.

Université catholique de Louvain ~ Louvain-la-neuve ~ Belgium

Introduction: In an age of poly-crisis, pandemics and other crises are expected to be more frequent, deadly, and costly. To improve the preparedness of governments and citizens to deal with future crises, it is important to identify challenges in crisis management. This study aimed to determine profiles of how people relate to challenges in crisis management and the characteristics associated with these profiles.
Method: A quantitative survey was conducted in a sample of the Brussels adult population (n=429). Multiple correspondence analysis and hierarchical classification were performed to identify clusters of people based on crisis management.
Results: Three clusters were identified related to reactions to a future health crisis. A first cluster grouped people who showed a high level of confidence in politicians and scientists who had decision-making power. They followed the advice of politicians and scientists who had to find a consensus. Citizens must be prepared by means of disaster plans and health education. According to them, the level for managing the crisis had to be national or European. A second cluster included people who were undecided or nuanced. They preferred not to express an opinion on how to deal with a crisis and on how to prepare citizens. A third cluster grouped citizens who opposed to following the protective measures imposed by the government, distrusting the authorities, media and scientists, and valuing individual freedom. The main actors in crisis management were citizens themselves, who must be prepared and be part of the decision-making process. For them, the appropriate level for crisis management was the local level.
Conclusions: To address future crises, it is important to diversify and tailor the response to the crisis to groups within society. A monitoring tool to consider these differences should be introduced and supported.

Abstract 768

DO TAILORED INFOGRAPHICS INCREASE FLU SHOT INTENTIONS AMONG HESITANT INDIVIDUALS?

Matthijssen M., Van Leeuwen F.*, Cloin M., Van De Goor I., Achterberg P.

Tilburg University ~ Tilburg ~ Netherlands

Objectives: To reduce vaccination hesitancy, it is important to know what type of interventions are effective. Interventions to lower vaccine hesitancy often have positive effects among people who hold a favorable attitude towards vaccination and more mixed effects among people who are hesitant about vaccination. One possible explanation is that typical interventions are generic and not tailored to the specific reason why a person is hesitant towards vaccination. The attitude-roots model proposes that interventions are more successful when tailored to the specific underlying cause or reason for a person's opposition. In this study, we tested this proposition by assessing whether a tailored information intervention is effective in increasing flu shot intentions. Methods: Participants (N = 1,021) rated 66 vaccination statements, reported their flu shot intentions at two time points, and were presented with either a tailored infographic, a generic infographic, or no infographic. Results: Flu shot intentions increased significantly after participants were presented with a tailored infographic, but this increase was not significantly greater than the increase observed among participants who were presented with the generic infographic or no infographic. Explorative analysis showed that tailoring might be more effective for some motivations (e.g., unwarranted beliefs) and not effective for others (e.g., religion). Conclusions: Overall, our findings showed mixed support for the effectiveness of a tailored infographics to increase flu shot intentions. This suggests that more research is needed to determine if and how tailored information interventions are a viable strategy to reduce vaccination hesitancy.

Abstract 1930

PRESENT EVIDENCE IN THE MORNING, TELL STORIES IN THE EVENING: NARRATIVE AND NON-NARRATIVE MESSAGES EFFECTS DIFFER FROM THE EGO-DEPLETION PERSPECTIVE

Zheng H.*

Wuhan University ~ Wuhan ~ China

Introduction: In recent years, influenza has become a major problem threatening the health and economy of people worldwide, making vaccination promotion an important issue. Message format has played an important role in promoting vaccination willingness. While prior studies have explored the effectiveness, extensively exploring conditions for applicability and moderating factors based on external aspects, they have given limited attention to the audience's internal state during message processing. Ego depletion, a common internal state, is known to influence message processing and communication effectiveness.

Purpose: The present study aimed to investigate the interaction between ego-depletion and message format in vaccination willingness, as well as its underlying mechanisms. In addition, natural time as a proxy for ego-depletion seeks to enhance the external validity.

Method: Two web-based experiments using 2 (ego-depletion: high vs. low) × 2 (message format: narrative vs. non-narrative) factorial designs were conducted (N=473), which manipulated ego depletion through both a lab-based Stroop task and a natural time-of-day proxy.

Results: Study 1 experimentally manipulated ego depletion level (high vs. low). Results showed that under high depletion, the narrative message significantly enhanced vaccination willingness compared to the non-narrative messages, whereas this advantage was absent under low depletion. Study 2 examined ego depletion in a naturalistic setting. Results showed that in the evening (when depletion is typically higher), the narrative message significantly enhanced vaccination willingness compared to the non-narrative messages, whereas this advantage was absent in the evening (when depletion is typically higher). Message processing fluency mediated interaction effect: the mediating role of fluency was significant under high ego depletion but not under low ego depletion.

Conclusions: This research demonstrates the role of dynamic cognitive states in narrative and non-narrative persuasion. Furthermore, it offers a practical strategy for

message timing, suggesting that narrative messages may be prioritized for communication in the evening.

Abstract 1667

HOW TO MITIGATE THE PSYCHOLOGICAL REACTANCE OF THE EXTENDED PARALLEL PROCESS MODEL: THE INTERACTION BETWEEN DEATH REFLECTION AND MESSAGE ORIENTATION

Zheng H.*

Wuhan university ~ Wuhan ~ China

Introduction: Smoking cessation is critical in reducing global mortality caused by tobacco use. Fear appeal messages based on the Extended Parallel Process Model (EPPM) have played an important role in promoting smoking cessation, but their effectiveness is limited by psychological reactance and a ceiling effect from relying on internal message optimization.

Purpose: The present study aimed to investigate how death reflection enhances the effectiveness of fear appeal messages by mitigating psychological reactance, and its interaction with self-oriented vs. other-oriented message framing.

Method: A web-based experiment using a 2 (death reflection: absent vs. present) × 2 (message orientation: self-oriented vs. other-oriented) factorial design was conducted (N=300).

Results: First, death reflection significantly increased smoking cessation intentions through a serial mediation of enhanced posttraumatic growth and reduced psychological reactance, compared to fear appeal messages without death reflection component. Second, death reflection interacted with message framing, specifically, in the death reflection group, the intention was significantly higher in other-oriented condition than self-oriented condition. In the control group, the intention for both self-oriented and other-oriented conditions did not have significant differences, and psychological reactance mediated the interaction effect. Third, other-oriented messages were more effective than self-oriented messages.

Conclusions: These findings explore new pathways of research to contribute to EPPM by integrating external psychological mechanisms and providing practical strategies for optimizing anti-smoking messages.

Abstract 1693

INFORMATION AND GUIDANCE FOR PARENTS THROUGH A MOBILE APPLICATION ON THE DEVELOPMENT AND CARE OF PREMATURE BABIES

Canellas Tropiano L.M., Blascovi--Assis S.M.*, Kelm K., Dionísio Corrêa A.G.

Mackenzie Presbyterian University ~ São Paulo ~ Brazil

Introduction: Prematurity is a global health problem, with high rates of infant morbidity and mortality. Parents take on numerous responsibilities with the birth of a premature child, requiring specialized care and supportive therapies to stimulate development. The risks associated with premature birth bring emotional challenges and insecurities about how to stimulate the child. Developing strategies based on accessible educational technologies to support families can minimize stressful situations.
Objective: To develop and evaluate the usability of an educational mobile application aimed at parents of premature babies, aiming to provide information and guidance on developmental and health care.
Method: The study, conducted in São Paulo, Brazil and approved by the Ethics Committee, consisted of three phases: a) interviewing 24 parents to identify the type of information needed to assist with baby care and their expectations regarding the content provided; b) application development, usability assessment using the Systems Usability Scale (SUS), and content validity; c) use of the app by a group of 20 people, including professionals and parents.
Results: The satisfaction survey revealed that 90% of parents responded that the app helped them stimulate their children, reassuring them, and clarifying their doubts. When asked about the language, ease of navigation, clarity, and usefulness of the information, 100% of evaluators responded satisfactorily. Usability and the content validity index (CVI) received excellent ratings from specialists (SUS = 85.4 and CVI = 0.9) and parents (SUS = 82.5).
Conclusions: The use of technology in healthcare represents a significant advance, especially in mobile technologies. The developed app proved to be an effective educational tool, capable of guiding parents on their children's development and health, facilitating safe home care and addressing the challenges of prematurity.

Abstract 1844

CONDITIONS FOR CHANGE: A SYSTEMATIC REVIEW ON WHAT SUPPORTS OR HINDERS SCHOOL CHANGE

Branda M.*, Delbosq S., Vecchio L., Velasco V.

University of Milano-Bicocca ~ Milano ~ Italy

Introduction

School change is a complex, multi-level process involving intentional and sustained transformations within educational institutions. Literature emphasizes that effective transformation requires not only structural reforms but also deep shifts in cultural, relational, and organizational practices. However, many studies focus on isolated factors, limiting our understanding of broader dynamics. For example, while research often explores the impact of transformative leadership, it tends to overlook how this interacts with other critical dimensions—such as teacher professional development and school organizational culture. This fragmented approach hinders a comprehensive understanding of what enables or obstructs effective school change. A more integrated framework is needed to capture the complexity and interdependence of the elements involved.

Purpose

This study presents a systematic literature review aimed at identifying and analyzing key personal, interpersonal and organizational factors that facilitate or hinder school change processes. It offers a critical and up-to-date overview relevant to both academic research and educational practice.

Method

A systematic review will be conducted on peer-reviewed literature published between 2000 and 2024, using international databases (Scopus, ERIC, Web of Science). Inclusion criteria focused on empirical and theoretical studies explicitly addressing the concept of School Change, in middle and high school settings. Thematic analysis will be used to categorize factors as either facilitating or hindering.

Results

Previous research suggests that facilitating factors include distributed leadership, shared vision, ongoing professional development, and supportive policies. Barriers often involve staff resistance, lack of resources, fragmented initiatives, and misalignment between school-level and policies. The present review adopts a multi-level lens to explore how these factors interact across educational layers, aiming to deepen understanding of school transformation dynamics.

Conclusions

Effective school change requires a systemic, participatory approach that integrates both structural and cultural dimensions. Understanding the factors that influence change processes can support more intentional and sustainable interventions within educational institutions.

Abstract 1792

FNIRS ASSESSMENT OF BRAIN ACTIVITY DURING VOLUNTARY ATTENTION TASK IN YOUNG ADULTS WITH ADHD

Carreiro L.R.*[1], Pereira L.C.[1], Santos Junior A.A.[1], Oliveira R.[1], Machado--Pinheiro W.[2], Muñoz M.Á.[3]

[1]Universidade Presbiteriana Mackenzie ~ São Paulo ~ Brazil, [2]Universidade Fedeal Fluminense ~ Rio das Ostras ~ Brazil, [3]Universidad de Granada ~ Granada ~ Spain

Introduction: Attention-deficit/hyperactivity disorder (ADHD) is a neurodevelopmental condition that affects functioning across the lifespan. Functional Near-Infrared Spectroscopy (fNIRS) as non-invasive brain imaging technique that uses light to measure brain activity can be used to investigate neural mechanisms in ADHD. Voluntary attention is frequently impaired in ADHD, making it important to assess bilateral activity in frontoparietal networks to identify potential discrepancies. Purpose: Investigate differences in oxygenated hemoglobin (HbO) concentration, measured with fNIRS, in the left and right frontal and parietal cortices during a voluntary attention task, comparing groups with and without clinical signs of ADHD. Method: Forty-eight right-handed Brazilian young adults (Mean Age = 22.7, SD = 6.77) participated in the study. ADHD symptoms were assessed using the Adult ADHD Self-Report Scale (ASRS-18), that classified participants into Control (n = 18) and Clinical (n = 30) groups using a 21-point cutoff. Participants completed a cue-target paradigm with centrally presented predictive cues under valid and invalid conditions in a block-design. Brain activation was recorded from 26 channels covering bilateral frontal and parietal cortices. Group comparisons were made using the Mann-Whitney test. Results: The Clinical group showed significantly lower HbO activity (Mean = -0.01167) in the right prefrontal cortex (U = 165, p = 0.025, r = -0.39) compared to the Control group (Mean = 0.04045), suggesting reduced recruitment of this region, particularly in the right hemisphere, during voluntary attention. No significant differences were observed in the other monitored regions. Conclusions: The observed pattern of right prefrontal hypoactivity supports previous findings that link ADHD to deficits in inhibitory control, voluntary attention, and executive functions. These results suggest that right frontal activity could serve as a potential neural marker for ADHD, highlighting the value of fNIRS as a reliable tool for investigating and monitoring neurofunctional differences associated with clinical symptoms.

Abstract 1869

PERCEPTIONS OF HIV/AIDS STIGMA AMONG FUTURE PSYCHOLOGISTS IN PUERTO RICO

González--Colón J.*, Pérez--Pedrogo C., Matos--Moreno A.

Carlos Albizu University ~ San Juan ~ Puerto Rico

This study aims to measure HIV/AIDS-related stigma and community PrEP-related stigma among graduate psychology students in Puerto Rico. Stigma toward persons living with HIV/AIDS (PLWHA) continues to be a significant barrier to health, well-being, and equitable treatment, particularly in contexts such as Puerto Rico, where prevalence remains among the highest in the Caribbean. As future mental health professionals, psychology students' perceptions may directly influence the quality of care provided to PLWHA.

A non-experimental, cross-sectional design will be employed with a convenience sample of approximately 100 participants recruited through snowball sampling. Data will be collected using three instruments: a sociodemographic questionnaire, the Puerto Rico–developed HIV/AIDS Stigma Scale, and the Community PrEP-Related Stigma Scale, which has been translated into Spanish using the Brislin method to ensure semantic and conceptual equivalence.

If this abstract is accepted, at the time of the conference, descriptive statistics will be provided summarizing sample characteristics and item responses. Reliability analyses will be conducted, followed by bivariate correlations between HIV/AIDS stigma and PrEP stigma. Multivariate regression models will examine whether demographic variables such as gender, sexual orientation, academic level, and prior HIV/AIDS-related training significantly predict stigma levels, while controlling for age and religious affiliation. It is expected that students will report above-neutral levels of stigma, with significant associations between the two scales and predictive contributions of key demographics. Findings will be discussed in terms of their implications for studies of stigma impact and intervention.

Abstract 1673

VALUING WOMEN'S PERSPECTIVES IN WOMEN'S HEART VALVE DISEASE CARE: A GLOBAL CONSENSUS APPROACH

Costa Pereira A.[1], Padilla K.[2], Glynn T.[2], Johnson N.[2], Graffigna G.*[3]

[1]Università Cattolica del Sacro Cuore ~ Cremona ~ Italy, [2]Global Heart Hub ~ Galway ~ Ireland, [3]Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Introduction

Women with Heart Valve Disease (HVD) remain under-recognised, under-diagnosed, and under-treated worldwide. Clinical guidelines and care pathways have historically reflected male-centric data, overlooking the biological, reproductive, and social factors influencing women's health.

Purpose

The aim was to build a global consensus by integrating patients voices with multidisciplinary expertise to identify gaps and solutions for improving the healthcare pathway for women with HVD.

Methods

A mixed qualitative approach was applied, combining semi-structured interviews with patients, patient organisations, healthcare professionals and researchers. Insights were further refined during an in-person international roundtable. The recruitment was done by Global Heart Hub and involved 22 experts from 13 countries. Discussions focused on challenges and opportunities to advance awareness, detection, diagnosis, treatment, and follow-up for women with HVD and the findings were synthesised into a consensus report.

Results

Among all participants, 40.9% (n=9) were patients or patient representatives. By integrating their perspective, stakeholders were able to discuss the gaps and develop six targeted actions to promote education, empowerment and engagement across the HVD care pathway in women. A roadmap was grounded in women's lived challenges, and the recommendations were designed to be adaptable to diverse cultural and socioeconomic contexts, ensuring global impact. To facilitate implemention, the key stakeholders for each action were identified, and the recommendations were organized whithin a multilevel framework (micro, meso and macro), aligned with healthcare system design.

Conclusions

This consensus report highlights the importance of women's education, empowerment and engagement, calling for collaborative action to advance person-centred care, reduce inequities, and ensure women with HVD are recognised, represented, and

supported throughout their care journey.

THE WEIGHT OF CARE: A PHENOMENOLOGICAL EXPLORATION OF EMOTIONAL LABOR IN PHILIPPINE HIV ADVOCACY

Melgarejo C.M.*, Ganibe M.G.

Jose Rizal University ~ Mandaluyong City ~ Philippines

The Philippines faces the fastest-growing HIV epidemic in the Asia-Pacific region. As of early 2025, over 139,000 Filipinos have been diagnosed with HIV, with about 57 new cases reported daily. Young people aged 15 to 24 remain disproportionately affected. While public health efforts have focused on prevention and treatment, little is known about the lived experiences of those providing HIV care on the ground. This study explores the emotional labor and advocacy work of 11 participants, including healthcare workers and community advocates, some of whom may be living with HIV. Using Interpretative Phenomenological Analysis and guided by Jean Watson's Theory of Human Caring and Erving Goffman's Stigma Theory, the study identified four themes: the invisibility and burden of emotional labor, institutional gaps requiring care providers to exceed formal roles, experiences of secondary stigma, and advocacy as a transformative space for healing and resistance. Findings emphasize the need for institutional reforms that recognize and support the mental health and emotional labor of care providers. Anti-stigma initiatives should target not only clients but also those who care for them. Finally, the study underscores the value of community-led, lived-experience- based models of care as central to sustaining both the HIV response and the well-being of its frontliners.

Abstract 2095

BETWEEN RHETORIC AND PRACTICE: EXPLORING THE TENSIONS OF COMMUNITY-BASED CARE IN PRIMARY SETTINGS

Ivaldi S.*, Negri A.

Università degli Studi di Bergamo ~ Bergamo ~ Italy

In recent years, “community” has become a central term in healthcare reform discourses, encouraging psychology and health professions to move beyond traditional models toward practices rooted in local, interinstitutional, and interprofessional contexts. However, such references often remain at a normative or ideal level, with limited translation into real professional practices. In Italy, “Community Health Centers” (Case della Comunità) exemplify this tension, sometimes struggling to become genuine spaces of shared care and risking the reduction of “community” to a rhetorical device.This contribution explores the tensions and contradictions experienced by professionals involved in community-oriented care, focusing on the challenges of implementing new models in everyday work contexts. The analysis is based on semi-structured interviews with five pairs of general practitioners and psychologists who participated in Medico&PsicologoInsieme, a project launched in 2014 and promoted by the University of Bergamo. The initiative structurally integrates medical and psychological care within primary healthcare, adopting a community-based approach. Professionals work jointly to respond to citizens’ needs and promote local health activation. Findings highlight the slow and complex construction of a new intervention device—still socially unrecognized—that combines distinct disciplines, identities, and epistemologies. For both doctors and psychologists, this process demanded significant redefinition of roles, boundaries, and reference frameworks. Citizens, in turn, experienced a shift in their role within care, feeling more holistically received and actively engaged. The interviews also point to long-term benefits of this integrated model for both users and professionals.In line with the ICAP framework, this study invites Work and Organizational Psychology to engage with the contradictions of community-based care. Rather than a predefined model, “community” may emerge as a negotiated, fragile, yet generative space of shared meaning and transformation.

Abstract 2364

UNDER ATTACK, BUT NOT DEFENSELESS: DOMAIN-SPECIFIC SELF-EFFICACY AS A PSYCHOLOGICAL RESOURCE AMONG HEALTHCARE PROFESSIONALS FACING USER MISTREATMENT

Cavallari E.*[1], Setti I.[1], Sommovigo V.[2]

[1]Department of Brain and Behavioral Sciences, University of Pavia ~ Pavia ~ Italy, [2]Department of Psychology, Faculty of Medicine and Psychology, Sapienza, University of Rome ~ Rome ~ Italy

Introduction. Self-efficacy may protect healthcare professionals from the negative effects of user mistreatment. However, its role depends on the specific domain and may weaken under prolonged exposure to aggression. Moreover, little is known about how this resource can be strengthened through targeted interventions.

Purpose. This study examined the role of domain-specific forms of self-efficacy in healthcare professionals' responses to mistreatment from users, aiming to clarify whether these resources can be affected by exposure, buffer the impact of mistreatment, and be strengthened through targeted intervention.

Method. A total of 2,219 healthcare professionals completed an online survey. Latent Profile Analysis identified exposure patterns, and Structural Equation Modeling tested a moderated mediation model linking verbal aggression to job satisfaction via mental distancing, moderated by Regulatory Emotional Self-Efficacy (RESE-NE) and workload. Additionally, 23 professionals participated in a brief experiential training course, with self-efficacy in managing aggression measured before and after the intervention. The program included three interactive modules: (1) de-escalation techniques for high-tension situations, (2) assertive communication and perspective-taking for conflict management, and (3) post-incident stress recovery and relaxation strategies. Each session combined brief lectures, group discussions, and role-plays based on real clinical scenarios.

Results. Professionals in the moderate-to-high mistreatment profile reported lower trauma-related coping self-efficacy than those in the low-exposure group. Mental distancing mediated the link between verbal aggression and job satisfaction, and this indirect effect was weaker among professionals with higher RESE-NE, even under heavy workload. The training increased short-term self-efficacy in managing aggressive users.

Conclusions. User mistreatment at work does not affect all healthcare professionals equally. RESE-NE acts as a psychological shield, mitigating the impact of mistreatment on mental distancing and dissatisfaction, even under high workload conditions. Investing in brief, experiential training represents a crucial step toward building safer, more resilient healthcare environments, as such programs can strengthen

professionals' aggression-management self-efficacy.

Abstract 2405

FROM CONCEPTUAL CONFUSION TO CONCRETE ACTION: DEFINING SENSORY OVERLOAD FOR OCCUPATIONAL HEALTH PRACTICE

Colombet K.*, Weijters B., Vlerick P.

Ghent University ~ Ghent ~ Belgium

Sensory overload is increasingly recognised as a relevant phenomenon in many workplaces. Employees and occupational health professionals use the term to describe daily experiences, yet it lacks a clear and consistent scientific definition. Existing research approaches the concept mainly from clinical or personality perspectives, leading to conceptual ambiguity and confusion with related constructs such as work stress or cognitive overload.

This study aims to define sensory overload at the workplace and clarify how and when it occurs, building on the Job Demands–Resources (JD–R) framework. A scoping review (PRISMA, JBI) of 45 definitions revealed substantial variation across disciplines and highlighted the need for a coherent framework applicable to work settings. To examine the phenomenon in practice, semi-structured interviews were conducted with experts (occupational physicians, job coaches, prevention advisors) and employees from diverse sectors (healthcare, education, administration, laboratories, and telework). Thematic analysis of 101 interviews showed that sensory overload is a recognisable yet subjective experience, differing by type of stimuli (e.g., noise, light, scent), context (e.g., telework vs. open offices), and personal sensitivity. Social stimuli also emerged as a distinct and frequent source of overload.

Combining both studies, we propose a new, unified definition with defining features and identify influencing factors regarding sensory overload at the workplace and highlight research gaps. To further refine our findings, a new group of experts was subsequently engaged to co-develop concrete and practice-oriented recommendations and practical implications. Our results provide researchers and practitioners with a shared language and solid basis for developing tailored interventions, education, and workplace design to better prevent and manage sensory overload.

Abstract 2451

WHEN MANAGERS STEP IN: HOW MANAGERIAL INTERVENTIONS FOR CUSTOMER MISTREATMENT INFLUENCE SHAPE THIRD PARTY EMPLOYEES' FELT EMPATHY AND INNOVATIVE SERVICE BEHAVIOR

Hu X.*[1], Yan H.[2], Sheng Z.[3]

[1]Manchester University ~ Manchester ~ United Kingdom, [2]University of New South Wales ~ Canberra ~ Australia, [3]Deakin University ~ Melbourne ~ Australia

Customer mistreatment is a pervasive workplace stressor with well-documented negative effects on employee well-being. Emerging research suggests that third-party observers, employees who witness but are not directly involved in such incidents, can also experience emotional and behavioural consequences, such as empathy toward the mistreated coworker and subsequent helping behaviour. However, this literature often overlooks a key practical reality: observers are not the only third party. To mitigate the impact of customer mistreatment, many organizations now mandate managerial intervention. Yet little is known about how such interventions shape observers' interpretations and responses.

Drawing on deontic justice theory and Affective Events Theory (AET), this research examines how two forms of managerial intervention, instrumental support (e.g., addressing the customer conflict) and emotional support (e.g., affirming the employee's experience), influence observers' empathic responses. We argue that these supports serve distinct yet complementary signalling functions: instrumental support highlights the severity of the mistreatment, while emotional support validates the employee's suffering. Together, they enhance empathetic responses among third-party employees, which in turn promote innovative service behaviour: proactive efforts to improve service delivery and prevent future mistreatment. We found empirical support of our hypotheses across an experimental vignette study (Study 1) and a multi-wave field study (Study 2). This research advances the literature on workplace mistreatment by positioning managerial intervention as a key driver of third-party outcomes. It also identifies empathy as a mechanism linking intervention to constructive behaviour aimed at improving service quality, offering practical insights for organizations seeking to foster resilience and service improvement in customer-facing roles.

Abstract 2453

FROM LEADERS TO SELF: THE ROLE OF ATTACHMENT IN THE WORKPLACE AND ITS IMPLICATIONS FOR MENTAL HEALTH AND PERFORMANCE

Lisa E.*

Comenius University Bratislava ~ Bratislava ~ Slovakia

Attachment theory, originally formulated to explain emotional bonds in close relationships, has become a robust framework for understanding interpersonal and self-regulatory processes in work settings. The presentation integrates findings from our four empirical studies investigating how attachment mechanisms operate in organizational contexts, both toward leaders and within the self, across normal and stressful periods. Study 1 demonstrated that perceiving one's leader as an attachment figure mediates the relationship between work engagement and performance outcomes, highlighting leadership's role in providing a secure base at work. Study 2 extended these findings by distinguishing between transformational leadership effects and showing that leader attachment mediates their impact on task and contextual performance differently at the individual and organizational levels. Study 3 proposed a multidimensional model of workplace attachment, arguing for domain- and relationship-specific attachment representations that jointly predict well-being and work functioning. Finally, Study 4 provided experimental evidence that secure attachment priming produces long-term improvements in mental health among adults during stressful work periods. Together, these studies suggest that attachment security, whether derived from leaders or self-activation, enhances engagement and performance while buffering against stress and burnout. The presentation discusses theoretical and practical implications for applied psychology, including interventions that cultivate secure workplace climates and leadership behaviors that function as a psychological secure base. The integrative perspective supports applied psychology's mission to foster sustainable, healthy, and productive work environments by grounding its understanding of human connection in evidence. The presentation is part of the Vega grant 1/0112/24.

INTEGRATED APPROACH TO ENHANCING PSYCHOLOGICAL WELL-BEING AND HEALTH OF STUDENTS IN SPECIAL MEDICAL GROUPS: THE HEALTH MODEL

Doszhanova G.*, Abduldayeva A.

Astana Medical University ~ Astana ~ Kazakhstan

Background: Physical activity and psychological well-being are fundamental to the UN Sustainable Development Goals. In Kazakhstan, 67.6% of youth fail to meet recommended activity levels, and the prevalence of sub-optimal mental well-being rises to 21.8% by age 15. This study addresses the critical intersection of Health Psychology and Educational Psychology by focusing on students in Special Medical Groups (SMG) — individuals with chronic health conditions requiring medically-adapted physical workloads. Current pedagogical approaches often remain formalistic, failing to address the psychological barriers inherent in chronic health limitations.

Objective: This research aims to develop and evaluate the "Health Model", an innovative system designed to transition from conventional physical education to a psychologically-grounded, health-saving environment that fosters long-term health competencies.

Methods: A cross-sectional design was utilized, involving 286 adolescents (aged 15–19) within the SMG category. The methodology operationalized Psychological Assessment and Expertise through validated sociological surveys, retrospective medical record analysis, and a structured pedagogical experiment. Structural-functional modeling was employed to synthesize these multi-dimensional data points into a scalable intervention.

Results: Analysis identified significant systemic barriers: low intrinsic motivation, inadequate psychological support, and a lack of differentiated curricula. The "Health Model" addresses these through four integrated components: diagnostic (psychological profiling), goal-oriented (individualized trajectories), procedural (adapted interventions), and reflexive-evaluative (self-regulation monitoring). The model utilizes interdisciplinary synergy to mitigate the impact of chronic illness on students' self-efficacy and psychological health.

Conclusion: The scientific novelty lies in the shift from biometric-focused metrics to the "Physical Culture of Personality" — an integrative psychological quality promoting resilience. This research contributes to Educational and School Psychology by providing a validated framework for inclusive environments, ensuring that students with health limitations develop the psychological and physical readiness for sustainable professional life.

NEW DIRECTIONS FOR VAPING PREVENTION: MAIN OUTCOMES FROM A CLUSTER RANDOMISED CONTROLLED TRIAL OF THE OURFUTURES VAPING PROGRAM

Egan L.*[1], Gardner L.[1], Rowe A.[1], Stockings E.[1], Champion K.[1], Hides L.[2], Mcbride N.[3], Steve A.[3], O"Dean S.[1], Sunderland M.[1], Lee Y.Y.[4], Mihalopoulos C.[4], Becky F.[1], Leung J.[2], Mcrobbie H.[5], Stapinski L.[1], Lee N.[3], Thornton L.[1], Birrell L.[1], Teesson M.[1], Newton N.[1]

[1]The University of Sydney ~ Sydney ~ Australia, [2]University of Queensland ~ Brisbane ~ Australia, [3]Curtin University ~ Perth ~ Australia, [4]Monash University ~ Melbourne ~ Australia, [5]University of New South Wales ~ Sydney ~ Australia

Introduction

E-cigarette use ('vaping') is prevalent among adolescents, with emerging evidence of adverse physical and mental health effects. Effective behaviour change interventions are urgently needed, and school is an ideal setting for delivery. This study evaluated the efficacy of the digital OurFutures Vaping Program; a universal school-based preventive intervention targeting e-cigarette use.

Method

A cluster randomised controlled trial (RCT) was conducted in 40 secondary schools across three Australian states. Schools were randomised to either receive the OurFutures Vaping Program or Year 7/8 health education as usual. The primary outcome was e-cigarette use at 12-months, measured via self-report surveys. Secondary outcomes were tobacco cigarette use, intentions to use e-cigarettes/tobacco cigarettes, knowledge about e-cigarettes/tobacco cigarettes, motives and attitudes relating to e-cigarettes, self-efficacy to resist peer pressure and refuse e-cigarettes, mental health, quality of life, and resource utilisation. Generalised mixed-effects regression analyses investigated whether the intervention reduced the likelihood of primary and secondary outcomes.

Results

A total of 5,157 Year 7/8 students (Mage=13.3yrs, SD=0.6; 46% female) participated. At baseline, the prevalence of lifetime e-cigarette use was 8.3%, and past 30-day use was 1.97%. Compared to the control group, intervention group participants had lower odds of reporting vaping uptake at both 6-months (OR=0.48, 95%CI=0.24-0.95, p=0.035) and 12-months (OR=0.35, 95%CI=0.18-0.66, p<0.001). Full analysis findings will be presented at ICAP 2026.

Conclusions

This is the first rigorous evaluation of a school-based digital program targeting e-

cigarette use among Australian adolescents. The OurFutures Vaping Program has the potential to make a substantial health and economic impact in Australia and worldwide.

Abstract 2368

THE USE OF AUDIT-C IN THE COMMUNITY-BASED STRATEGIES FOR REDUCING UNHEALTHY ALCOHOL USE IN SOUTH AFRICA

Langa M.*

Wits University ~ Johannesburg ~ South Africa

Background:
Globally, unhealthy alcohol use remains a major public health concern, contributing significantly to premature death and disability. The World Health Organization ranks South Africa among the countries with the riskiest patterns of alcohol consumption. Given these trends, there is a growing need for scalable, community-based strategies to prevent and reduce alcohol-related harm.

Methods:
This study explored a two-pronged, community-centred approach that combined screening and early intervention. Using the Alcohol Use Disorders Identification Test–Consumption (AUDIT-C), lay counsellors identified individuals with moderate-risk (scores 5–7) and high-risk (scores 8+) drinking patterns. The intervention incorporated screening, brief advice, and referral pathways to assess their potential in reducing alcohol-related risk.

Results:
Among 54,187 participants screened, 42.97% reported moderate-risk and 22.11% high-risk alcohol consumption. While screening successfully identified individuals at risk, the uptake of further support remained limited. Fewer than 10% of high-risk participants accepted referrals, and men were significantly less likely to engage with treatment options despite higher rates of risky drinking. Participants who accepted brief advice often showed limited motivation to modify their behaviour.

Conclusions:
These findings highlight the challenges of shifting entrenched alcohol-use behaviours in low-resource settings. While community-based screening and brief interventions offer valuable entry points for prevention, sustainable impact requires addressing structural, gendered, and motivational barriers. Strengthening the role of community networks and integrating trauma-informed, culturally grounded interventions could enhance future

Abstract 2397

EFFECTIVENESS OF DYADIC PHYSICAL ACTIVITY PLANNING FOR WEIGHT LOSS: A LONGITUDINAL RANDOMIZED CONTROLLED TRIAL

Palacz--Poborczyk I.*, Misiakowska J., Banik A., Boberska M., Kulis--Stefanczyk E., Kornafel A., Krzywicka P., Kuzminska J., Paduszynska N., Szczuka Z., Siwa M., Sorsa G., Wietrzykowska D., Zaleskiewicz H., Luszczynska A.

SWPS University ~ Wroclaw ~ Poland

Introduction: Dyadic physical activity planning is an effective strategy for reducing sedentary behaviour and promoting moderate-to-vigorous physical activity. Furthermore, while action planning-based interventions are frequently employed for weight management in overweight and obese populations, the existing evidence regarding their efficacy remains inconsistent.

Purpose: The primary objective of this study was to evaluate the efficacy of dyadic physical activity planning across three distinct conditions (individual, collaborative, and dyadic) as a strategy contributing to weight loss among individuals with overweight or obesity.

Methods: 144 dyads (288 adult participants aged 18-90) with a target person with overweight or obesity person took part in a randomized controlled trial. Eligibility required the target persons to report predominantly sedentary lifestyle, failing to meet the WHO physical activity recommendations, and an intention to increase physical activity. The partner provided support for behavioural change. The control condition was compared with three intervention conditions: individual planning (“I-for-me”), collaborative planning (“We-for-us”), dyadic planning (“We-for-me”). Body weight of target person was measured at four time points: baseline (T0), 2-month (T1), 8-month (T3), and 14-month (T4) follow-up.

Results: Among the target persons significant overall effect of time on body weight ($p=0.029$) was identified. We also observed a statistically significant Time X Condition interaction, $p=0.025$, indicating differential effects of the intervention conditions. In particular, the target persons in the individual (“I-for-me”) planning intervention condition achieved weight reduction across 14 months (2.81kg), whereas target persons in the control condition maintained their weight (0.16kg).

Conclusions: The strategy of individual planning (“I-for-me”), successfully bridged the intention-to-behaviour gap, resulting in a small but a relevant weight loss. These findings substantiate the need to incorporate structured social support and action

planning components into future behavioural interventions targeting overweight and obesity.

Abstract 2204

APPLYING SOCIAL PENETRATION THEORY TO IMPROVE SAFETY PERFORMANCE ON MINING INDUSTRY

Quezada L.*

Universidad Adolfo Ibanez ~ Vina del Mar ~ Chile

In world-class mining, safety and control of fatality risks are a primary concern, which has led to a reduction in the number of deaths in mining operations (ICMM, 2015).
To improve safety, the focus is on strengthening proactive safety practices, in which the reporting of conditions and behaviors that meet expected standards plays a central role. In this way, near-misses can be made visible and accident prevention measures can be improved. However, despite the importance of reporting, its occurrence is often low because it is unpopular among workers. Indeed, those who report are often perceived as traitors to their teammates, making it difficult to implement.
The theory of social penetration (Altman & Taylor, 1973) establishes that when people manage to establish deeper interpersonal relationships, their attraction to others increases, as well as their ability to exchange information and are more willing to do things for others. By applying this theory to a 240-minute group program to promote safety and increase reportability, the impact of the measure on standard safety indicators such as the LTIF and the reportability of substandard safety behaviors and conditions, as well as on pretrial arrests, is evaluated.
The results show a sustained decrease in the LTIF indicator in the months following the program, as well as an increase in proactive safety indicators measured by reportability and arrests.
These results suggest that the intentional promotion of deeper, more intimate, and respectful interpersonal relationships is associated with improved safety performance, which in turn generates a higher quality of work life and, consequently, improvements in productivity and corporate reputation.

RESOLUTION OF A PARENT`S DISEASE: ATTACHMENT AND WELL-BEING IN OFFSPRING OF PARENTS DIAGNOSED WITH PARKINSON'S DISEASE

Goldberg A.*

Tel-Hai Academic College ~ Kiryat-Shmona ~ Israel

BACKGROUND: Parkinson's Disease (PD) is one of the most common chronic, progressive neurodegenerative diseases, with well-developed research focusing on the caregiver-spouse showing low well-being along with predeath grief and feelings of loss among caregivers. However, offspring of a parent diagnosed with PD may also suffer predeath grief and loss even if they are not their parent`s main caregiver. Yet, this research is not well developed.

OBJECTIVE: The objective of the current study was to examine offspring's coming to terms with their parent's PD and the well-being of the offspring, within the conceptual framework of attachment theory.

METHODS: Seventy-one Israeli adult children of parents with PD participated in the study and completed self-report questionnaires assessing their resolution of their parent`s PD, attachment, well-being, and the severity of the PD symptoms.

RESULTS: Results showed that attachment anxiety negatively associated with higher resolution of the parent's disease, beyond the effect of the PD symptoms' severity. In addition, resolution of the parent's disease was positively associated with the offspring`s well-being.

CONCLUSIONS: Resolution of a parent`s PD is highly challenging for offspring with attachment anxiety. Therefore, targeting these individuals within the offspring of parents diagnosed with PD may assist them with coping during this challenging period. This may be especially impactful, as research shows that those offspring who resolve their parent`s PD also have higher well-being.

Abstract 2290

THE CONFIDENCE TO BE FUNNY: VALIDATING A HUMOR BEHAVIOR SELF-EFFICACY SCALE FOR WELL-BEING

Korotkov D.*

St. Thomas University ~ Fredericton ~ Canada

Introduction:
Humor functions as a flexible psychosocial resource that influences emotion regulation, stress recovery, social cohesion, and connectedness (Dunbar et al., 2021). Through laughter and play, individuals may broaden their thought–action repertoires and build lasting interpersonal resources (Fredrickson, 2004). The capacity to use humor adaptively depends on self-efficacy beliefs about one's ability to generate humor across contexts, an underexplored mechanism linking personality, coping, and well-being (Bandura, 1997).
Purpose:
This study assessed the validity of the Production of Humorous Behavior Self-Efficacy Scale (PHUBSS-1), conceptualizing humor behavior self-efficacy as a positive, self-regulatory strength reflecting the social-cognitive underpinnings of humorous behavior.
Method:
A sample of 183 adults completed the PHUBSS-1 along with measures of humor styles, self-regulation, fun, cheerfulness, past humor use, Big Five personality traits, life satisfaction, affect, and physical symptoms. Correlational and hierarchical principal components analyses were used to test the scale's structure and theoretical positioning.
Results:
An initial PCA identified four humor behavior self-efficacy components—performative humor, verbal wit, written/pictorial humor, and nonverbal/expressive humor, partially corresponding to nonverbal, verbal, written, and visual communication modalities. Hierarchical PCA revealed an integrative structure within a general humor behavior self-efficacy factor. When the personality, humor, well-being, and social-cognitive variables were analyzed together, the PHUBSS-1 loaded primarily with the humor-related constructs, while diverging from the hedonic and personality variables, suggesting humor behavior self-efficacy represents a distinct, socially grounded strength.
Conclusions:
The findings support humor behavior self-efficacy as a measurable construct that bridges personality, coping, and positive functioning. Although its cross-sectional design limits causal inference, the PHUBSS-1 contributes to an emerging applied psychology research literature by operationalizing humor as a health-related self-efficacy belief. As a practical tool, it can inform societal applications aimed at promoting sustainable well-being, long-term social harmony, stress resilience, and adaptive communication across

individual and collective settings (e.g., Bandura, 2000).

Abstract 2174

CULTIVATING ACCEPTANCE OF CULTURED MEAT: THE ROLE OF PERSUASIVE COMMUNICATION

Pasquariello R.*[1], Serpe D.[1], Capasso M.[2], Caso D.[1]

[1]University of Naples Federico II ~ Naples ~ Italy, [2]University of International Studies of Rome ~ Rome ~ Italy

Introduction. Cultured meat—produced by proliferating animal cells in vitro within bioreactors—represents an emerging frontier in food technology. Its potential benefits include substantial reductions in greenhouse gas emissions, water use, and land exploitation, while sterile, controlled production environments may lower the risk of bacterial or viral contamination. Despite these advantages, public debate remains intense, particularly in Italy, where commercial production is currently prohibited due to regulatory, safety, and ethical concerns.

Purpose. This study examined whether persuasive messages emphasizing consumer-oriented benefits or moral obligations toward the environment influence attitudes and moral norms, thereby shaping the intention to consume cultured meat.

Method. In July 2024, 729 Italian adults (50.5% men; M = 46.31 years, SD = 14.45, range = 19–81) completed baseline measures of psychological and sociodemographic variables (T0). In September 2024 (T1), 565 participants (52.7% men; M = 46.28 years, SD = 14.29) were randomly assigned to one of four conditions: (1) message highlighting positive attitudes toward cultured meat, (2) message stressing moral duty to protect the environment, (3) combined message, or (4) control group.

Results. ANOVA revealed a significant intervention effect on consumption intention. Bonferroni post-hoc comparisons showed that the attitude-focused message significantly increased intention compared with both the combined and control conditions. No other significant differences emerged among the remaining groups.

Conclusions. Findings indicate that communication strategies emphasizing direct consumer benefits—such as food safety and the controlled nature of production—are more effective in fostering openness to cultured meat than appeals to moral obligation or combined messaging. Although cultured meat is not yet authorized in Italy, these insights can guide stakeholders in designing evidence-based campaigns that highlight tangible, consumer-relevant advantages, potentially enhancing acceptance of this innovative food technology once regulatory conditions allow.

Abstract 2155

A PSYCHOSOCIAL APPROACH FOR PROMOTING COLORECTAL CANCER SCREENING IN ITALY: TARGETED VS TAILORED INTERVENTION PROTOCOL

Caso D.[1], Donizzetti A.R.[1], Curcio C.[1], Pasquariello R.*[1], Capasso M.[2], Bianchi M.[3]

[1]University of Naples Federico II ~ Naples ~ Italy, [2]Università internazionale di Roma ~ Roma ~ Italy, [3]Charité – Universitätsmedizin Berlin ~ Berlin ~ Germany

Background: Despite public health initiatives, colorectal cancer screening (CRCS) adherence remains suboptimal in South-Italy. This study presents the protocol for T1 and T2 of an intervention designed to enhance CRCS participation through tailored and targeted communication. The intervention builds on baseline (T0) data, which identified psychosocial subgroups within the eligible population to enable message personalization.

Methods: A sample of participants eligible for CRCS in South-Italy with irregular past participation was engaged in a three-wave survey. T0 data (N=1089, aged 50-74) were analyzed using Reduced k-means clustering on psychosocial predictors of adherence (attitude, subjective norms, perceived behavioral control, action planning, coping planning, anticipated regret, self-identity) for classifying participants into three stable sub-groups. The intervention (T1) involves a randomized controlled trial (RCT) comparing tailored messaging, targeted messaging, and usual care. In the targeted condition, participants receive a persuasive message based on their cluster. The tailored condition combines cluster membership with individual motivation-based customization. Outcomes include intention post-intervention and behavior at six-month follow-up (T2).

Findings: Preliminary cluster analyses identified three profiles: (1) average levels on most predictors but low action planning, (2) high scores across all predictors, and (3) generally low scores with attitude lowest. These findings inform the intervention structure to maximize message relevance and impact.

Discussion: This study proposes a psychosocial approach to employing targeted and tailored persuasive messages for CRCS promotion. The proposed approach could be adapted to promote other health behaviors. The innovative intervention strategy may reduce health disparities by optimizing engagement strategies in healthcare programs.

Abstract 2208

MENTAL AND PHYSICAL HEALTH: DETERMINANTS OF FEAR DURING THE COVID-19 PANDEMIC

Reséndiz Rodríguez A.*, Armenta_hurtarte C., Dominguez A., Cruz Del Castillo C.

Universidad Iberoamericana CDMX ~ CDMX ~ Mexico

This study investigates the determinants influencing fear related to COVID-19 and assesses the mediating roles of trust in hospitals, access to healthcare, and government capacity. Using secondary data from the 2020 Latinobarómetro, a sample of 6,816 participants was analyzed through structural equation modeling.

Sociodemographic predictors included sex, age, indigenous language use, discrimination, inequality, and religious practice. Findings indicate that female sex and older age correlate with higher levels of COVID-19 fear, while indigenous language speakers report lower fear levels. Discrimination and social inequality show complex relationships, generally increasing fear experiences.

Trust in hospitals emerged as a significant protective factor, reducing fear, whereas greater access to healthcare was unexpectedly associated with increased fear. Government capacity did not significantly mediate fear responses. Religious practice influenced mediating variables but had no direct effect on fear.

These results align with existing literature on the impact of gender and age on mental health during pandemics and underscore the importance of institutional trust in mitigating anxiety. The study also highlights the nuanced effects of health access and social inequalities on psychological responses.

Practical implications include the need for gender-sensitive mental health interventions, targeted support for older adults, and strategies to enhance public trust in health institutions. Addressing discrimination and delivering culturally adapted communication —particularly for indigenous communities—are essential for effective health promotion.

Limitations relate to the cross-sectional design, which restricts causal interpretations, and the reliance on self-reported data.

Overall, this research provides a multifaceted model explaining fear of COVID-19 through sociodemographic and institutional factors, offering actionable insights for public health policy and mental health services in crisis contexts.

Abstract 2370

INTERRELATIONS BETWEEN SELF-REGULATION, PHYSICAL ENVIRONMENT PERCEPTIONS, AND PHYSICAL ACTIVITY IN METROPOLITAN, RURAL AND URBAN CONTEXTS

Wietrzykowska D.*, Zaleskiewicz H., Banik A., Szczuka Z., Krzywicka P., Misiakowska J., Kuzminska J., Paduszynska N., Siwa M., Sorsa G., Luszczynska A.

SWPS University ~ Wroclaw ~ Poland

1. Research aims and objectives
The study investigates how self-regulation indicators (awareness of standards, self-regulatory effort, and self-monitoring) and perceived physical environment (at home, in the local neighbourhood, and availability of health promotion programs) operate together in explaining moderate-to-vigorous physical activity (MVPA). It is also examined whether these associations are moderated by an 'objective' physical environmental indicator, comparing towns/rural areas with fewer MVPA facilities with a large city with more MVPA facilities.

2. Theoretical background
In line with socio-ecological models, perceptions of the environment influence self-regulatory processes, which in turn may predict MVPA. A reciprocal relationship is also possible: lower self-regulation may bias individuals towards perceiving the environment as less MVPA-promoting and, via this path, predict lower MVPA.

3. Method
593 adolescents, adults, and older adults (aged 11-86 years; M = 33.79, SD = 16.78; 65.1% women) provided their data twice, spanning 8 months between T1 and T2. Two-group mediation models were tested with path analyses.

4. Results
The associations representing mediating effects, encompassing perceived neighbourhood environment → awareness of standards → MVPA, were significant and positive in the city (with more PA facilities), but no mediation effects were found among the subsample from towns/rural areas (with fewer PA facilities).

5. Conclusions
Different perceived environmental characteristics and self-regulatory action control facets may directly and indirectly predict MVPA, depending on whether individuals live in towns/rural areas versus in a larger city.

Abstract 1974

THE ASSOCIATION BETWEEN SOCIAL MEDIA USE AND BODY IMAGE ACCEPTANCE AMONG YOUTH: COGNITIVE FLEXIBILITY AS A MODERATOR

Wu Y.Z.*, Wang Y.L.

Ming Chuan University ~ Taoyuan City ~ Taiwan

The present study aimed to examine the association between social media use and body image acceptance, and to test the role of cognitive flexibility as a moderator. Previous research has shown that adolescents often experience heightened body image anxiety due to extensive social media use, highlighting the need to clarify protective and risk factors in this context.

Participants were youth aged 18–25 including 4 males and 21 females,who completed the Social Media Use Scale (SMUS), the Body Image Acceptance and Action Questionnaire (BI-AAQ), and the Cognitive Flexibility Inventory (CFI). Correlation analyses and multiple regression analyses were conducted to assess the relationships among variables.

Results indicated that social media use was positively associated with body image acceptance. In contrast, the total score of cognitive flexibility and its subscales were negatively related to body image acceptance, with the Control subscale serving as a significant predictor ($p < .05$), whereas the Alternatives subscale was not significant. Furthermore, the interaction between cognitive flexibility and social media use did not have a significant moderating effect on body image acceptance.

Overall, these findings suggest that both social media use and individual psychological traits are related to body image acceptance, but cognitive flexibility does not moderate this relationship. This study provides insights into the factors influencing body image among youth and offers empirical implications for mental health promotion and clinical interventions.

Abstract 2293

MAPPING THE DETERMINANTS OF THE ALTERNATIVE PROTEIN INTAKE ACROSS 13 EUROPEAN COUNTRIES: THE FOOD SYSTEM STAKEHOLDERS' PERSPECTIVE

Zaleskiewicz H.*, Siwa M., Szczuka Z., Kulis--Stefanczyk E., Banik A., Kornafel A., Misiakowska J., Paduszynska N., Krzywicka P., Wietrzykowska D., Kuzminska J., Palacz--Poborczyk I., Boberska M., Sorsa G., Luszczynska A.

SWPS University ~ Wroclaw ~ Poland

Introduction

Across Europe, animal-based proteins remain dominant but environmentally unsustainable dietary choice. Replacing them with alternative protein foods—including plant-based, insect-based, or microbial sources—could substantially reduce environmental impacts. Consumers' dietary behaviors, shaped by individual, social, and environmental factors, can influence other stakeholders in food system and drive systemic transformations toward sustainability.

Purpose

This study applied system mapping approach to explore the determinants perceived by the food system stakeholders as key determinants of an inclusion of alternative proteins in daily diets of European consumers. The aim was to identify key leverage points—determinants most interconnected with others within the system, and respective cross-European similarities and differences.

Methods

Seventeen participatory system mapping workshops were conducted across 13 European countries, involving N = 166 food system stakeholders (e.g., food producers, policymakers, nutritionists, and consumers). Using group model building methods, participants collaboratively developed 17 system maps illustrating determinants of inclusion of alternative proteins into a daily diet. Centrality indices were computed to identify key leverage points, and feedback loops were analyzed to explore system dynamics and cross-country patterns.

Results

Common leverage points identified across six to eight national maps included consumer education and knowledge about alternative protein food, social norms and encouragement, and the influence of advertising and social media. Additional leverage points, present in at least three system maps, involved health perceptions, curiosity or neophobia, national food culture, and views on ultra-processing, sustainability, and animal welfare. Stakeholders emphasized consumers' beliefs and behaviors as central to shaping food system change.

Conclusions

This study provides new insights into complex, interconnected determinants shaping European food systems and the inclusion of alternative protein foods into daily diets of European consumers. Identifying leverage points and feedback loops offers guidance for policymakers and other stakeholders aiming to design interventions that accelerate transition toward more sustainable, protein-diverse diets.

Abstract 1896

REDEFINING WELL-BEING: INSIGHTS FROM MAINLAND CHINA

Mao Y.*, St Jean N.

Northwestern University ~ Chicago ~ United States of America

Introduction: Most research on subjective well-being (SWB) has been shaped by Western frameworks such as PERMA (Positive emotions, Engagement, Relationships, Meaning, Accomplishment), which emphasize autonomy, achievement, and hedonic pleasure. In contrast, Chinese perspectives draw on Confucian and Taoist traditions, prioritizing harmony, family connectedness, and security. To ensure constructs are valid across contexts, surveying local populations to self-identify well-being values is essential.

Purpose: This study examines how PERMA constructs resonate compared to Confucian values among adults in mainland China. Findings aim to open a cross-cultural dialogue and provide an evidence base of contemporary Chinese perspectives on well-being.

Methods: A survey was conducted with 105 Chinese adults who rated nine well-being constructs—five from PERMA and four from Confucian philosophy (sense of security, family love, aesthetic appreciation, rational happiness)—on a 1–5 Likert scale.

Results: The PERMA model was rated slightly lower on average than the Confucian model, but this difference was not statistically significant (Wilcoxon test, $p = 0.1953$). Friedman's test, however, revealed significant variation across the nine constructs ($\chi^2 = 108.98$, $df = 8$, $p < 2.2e\text{-}16$). Positive emotions, family love, and sense of security received the highest median ratings, while accomplishment and other achievement-oriented constructs were rated lower. These patterns suggest that modern Chinese participants draw on both Western positive psychology concepts and traditional Chinese values, effectively "picking and mixing" to define their own well-being.

Conclusion: These findings show that well-being in China cannot be captured by Western frameworks alone. While PERMA constructs remain relevant, Confucian values such as family love and security carry equal or greater weight. This blend underscores the need for culturally grounded models of well-being. By integrating both universal and culturally specific dimensions, psychologists can develop more accurate assessments that reflect local realities and reduce cultural blind spots in global research.

Abstract 1270

FROM DATA TO DIALOGUE: USING PSYCHOLOGICAL INSIGHTS TO SHAPE COMMUNICATION TRAININGS

Schmid--Küpke N.K.*[1], Wulkotte E.[1], Schmitz J.[2], Takla A.[1]

[1]Robert Koch Institute, Department for Infectious Disease Epidemiology, Immunization Unit/STIKO ~ Berlin ~ Germany, [2]Institute for Planetary Health Behaviour, University of Erfurt ~ Erfurt ~ Germany

Introduction: Communication between Health Care Workers (HCWs) and patients is critical in vaccination decisions, particularly for the underutilized Human Papillomavirus (HPV) vaccination. Evidence-based training can enhance communication, especially when tailored to HCWs' and patients' needs.

Purpose: This study aimed to identify these needs using a taxonomy of anti-vaccination arguments - the attitude roots (Fasce et al., 2023) - alongside other psychological constructs.

Methods: In 2023, we conducted two representative nationwide telephone surveys with parents of children aged 9-14 (n=1508) and HCWs in paediatric practices (n=503) in Germany. The surveys assessed vaccination/recommendation behaviour, psychological determinants, HPV-related knowledge, and communication behaviours. Additionally, ten anti-vaccination statements representing the most relevant attitude roots regarding HPV vaccination were included. We used t-tests/ANOVA for group differences and linear regression models to analyze associations between attitude roots and HPV vaccination attitudes. A follow-up parent survey is planned for 2026 to assess possible changes at population-level.

Findings: Parents were more willing to vaccinate daughters than sons (t=-4.70, p=<.001), and perceived HPV vaccination as more important for girls (t=-5.76, p<.001). HCWs showed a similar pattern, expressing more positive attitudes toward vaccinating girls (t=4.54, p≤ .001). Among parents, the most prevalent attitude roots were unwarranted beliefs, distrust, and fears/phobia. Distorted risk perception showed the strongest association with parental vaccination attitudes (ß=-0.30, t=-9.90, p<.001). The attitude roots HCW found most difficult to address were unwarranted beliefs and fears/phobia. Both groups demonstrated notable knowledge gaps and uncertainties regarding HPV and the vaccination.

Conclusion: Survey results informed two training interventions conducted in 2024 in Germany. These emphasized, among others aspects, that HPV vaccination is equally important for all children and that parental fears must be addressed. The identified attitude roots will also be used to assess training impact, providing insights into how a demand-driven approach can improve HCWs' ability to counter anti-vaccination arguments.

Abstract 626

OPTIMISING MEN'S SURGICAL TREATMENT DECISION MAKING IN BENIGN PROSTATIC HYPERPLASIA

Husted M.*[1], Gray D.[2], Hollands C.[1], Hindley R.[3]

[1]University of Winchester ~ Winchester ~ United Kingdom, [2]University of Kingston ~ Kingston-Upon-Thames ~ United Kingdom, [3]Hampshire Hospitals NHS Foundation Trust ~ Basingstoke ~ United Kingdom

Introduction: Benign Prostatic Hyperplasia (BPH) affects approximately 25% of men in their 50's rising to over 50% of men in their 80's. The impact of BPH is physical, social, and psychological. Men with similar clinical presentations face a variety of treatment options with varying degrees of risk and projected outcomes. Although symptomology and clinical presentation is well understood, there is a lack of knowledge and consideration of how patient values and priorities influence treatment choices and shared decision making (SDM) alongside variation in clinical consultation processes.

Purpose: The aim of the project is to develop an intervention for use in clinical practice to improve patient experience and support treatment decision-making for BPH

Method: Drawing on the Person-based approach, the project has used a mixed-methods approach. Qualitative interviews, a systematic review, a multi-site observational study and stakeholder workshops have been undertaken.

Results: Findings show that existing interventions lack the focus on patient needs and values required for patient-centred care, with behavioural theory and behaviour change techniques not explicitly referenced. Patients, pre- and post-operatively, indicate that social and psychological factors are more impactful in terms of both driving individuals to seek treatment, and viewing surgical outcomes as "good". Observations of clinical practice demonstrate SDM occurs inconsistently both within and across hospital sites with clinicians focusing on clinical symptoms and lacking acknowledgement of patient preferences and priorities. Patient and stakeholder contributions demonstrate the value of collaborative approaches to improve intervention design.

Conclusions: Our findings indicate areas for improvement in patient experience and treatment decision-making for BPH. By adopting a theory and evidence-informed collaborative approach our goal is that the subsequent intervention will provide a simple, but effective, means to improve patient and clinician SDM and help optimise patient treatment experience.

Abstract 1485

PSYCHOLOGICAL EMERGENCY SERVICE: A PSYCHOLOGICAL CARE PRACTICE WITHIN BRAZIL'S PUBLIC HEALTH SYSTEM

Rocha T.*

Uscs ~ São Paulo ~ Brazil

This study presents an experience of a psychological emergency service implemented in a public health facility in São Paulo, Brazil, highlighting its innovative nature by operating outside university training clinics, where such practice is more common. Unlike traditional psychotherapy, this service offers immediate care and qualified listening in situations of psychic urgency, without requiring prior appointments or formal referrals. Grounded in a qualitative approach and Analytical Psychology, the service has been offered for over a decade, shaped by the specificities of the territory, population served, and the attending psychologist. Users accessed care spontaneously and were seen on a walk-in basis, following order of arrival the same day. The experience demonstrated that this emergency service has established itself as a viable and humanized mental health care strategy within the public health system (SUS), promoting relief from psychic suffering, expanded self-awareness, and better understanding of relational dynamics, thus fostering reflective processes and recognition of personal desires. Secondary effects include reduced waiting lists, alleviation of anxiety among family members and professionals, and reflective engagement by other psychologists in the network, who revisited their clinical practices. The service differs from traditional models by not adhering to fixed, chronological time (Kronos), instead privileging significant, relational time (Kairós). It has proven effective in addressing grief, symbolic losses, relational crises, and internal conflicts, constituting a symbolic space of refuge and understanding of lived experiences. In conclusion, the psychological emergency service, by providing immediate and humanized care at the moment of demand, consolidates itself as a relevant alternative for mental health care in public health.

Abstract 1383

PREVENTIVE CARE FOR CAREGIVERS: EVALUATION OF A LOW-THRESHOLD SUPPORT PROGRAM

Smetaczek C.*[1], Soukup K.[1], Kovacovsky Z.[1], Hohenegger J.[1], Knoll L.[1], Frühwirth K.[2], Stetina B.U.[1]

[1]Sigmund Freud University ~ Vienna ~ Austria, [2]Austrian Veterinary Chamber ~ Vienna ~ Austria

Introduction: Veterinarians are exposed to considerable psychosocial stressors, including high workload, emotionally demanding client interactions, and ethically challenging decisions. These stressors are reflected in above-average rates of psychological strain, depressive symptoms, and suicidal ideation compared to the general population. Stigma, lack of time, and limited awareness of psychological services represent additional barriers to help-seeking.

Purpose: This study evaluates the effectiveness and acceptance of a structured, low-threshold counselling program for Austrian veterinarians. The program was designed to provide psychosocial relief, reduce mental health burden, and strengthen resilience in a profession at high risk for stress-related illnesses.

Method: Between February 2022 and May 2025, 90 veterinarians participated in a total of 591 counselling sessions at the Psychological Outpatient Clinic of Sigmund Freud University. Data were collected using standardized questionnaires (WHOQOL-BREF, SCL-90-R) at two measurement points, supplemented by qualitative interviews.

Results: The main topics in counselling included stress management (38%), boundary setting (35%), crisis management (18%), and affect regulation (9%). Quantitative analyses showed significant improvements in bio-psycho-social health ($t(19)=–2.23, p=.025, d=-.67$), as measured by WHOQoL-BREF, alongside reductions in multiple symptom domains like somatization ($t(12)=2.00, p=.034, d=0.56$), compulsivity ($t(12)=1.97, p=.036, d=0.55$) and overall psychological distress ($t(12)=2.14, p=.027, d=0.59$ (SCL-90-R). Qualitative findings highlighted reduced stigma and increased openness toward psychological support. Notably, 17% of participants continued counselling beyond the provided contingent, indicating sustained perceived benefit.

Conclusions: The program demonstrates that targeted counselling is an effective intervention to reduce psychological burden and improve well-being among veterinarians. Its low-threshold design addresses key barriers such as stigma and time constraints. Future efforts should focus on broadening access, particularly for underrepresented groups such as male veterinarians and those in western regions of Austria. The results underscore the necessity of embedding structured psychosocial support within the veterinary profession to promote long-term mental health and sustainable work engagement.

Abstract 2356

CO-CREATING A MODEL OF TRAUMA-INFORMED CARE FOR A MATERNITY SETTING

Maiorano N.*[1], Doyle J.[2], Duffy R.[2], Ryan M.[1]

[1]Trinity College Dublin, The University of Dublin ~ Dublin ~ Ireland, [2]The Rotunda Hospital ~ Dublin ~ Ireland

Introduction

Trauma-informed care (TIC) developed from decades of research demonstrating the global prevalence and long-term adverse health effects of psychological trauma. TIC's organisational approach to reducing the impact of existing traumas and preventing new traumas has the potential to support service-users and providers alike. However, TIC is a largely developing approach that requires clear and adaptable methods to support organisations in designing TIC specific to their organisational and cultural context.

Purpose

The current presentation is based on a collaboration between academic researchers and mental health providers in a maternity hospital in Dublin, Ireland. The project highlights the potential for diverse psychology professionals to work with communities in co-creating TIC specific to their needs. The proposed presentation will detail the project's plan, implementation, and initial results with the aim of offering a pathway and a message of hope to psychology professionals aiming to embed TIC within their organisations.

Method

Grounded in participatory methodologies, the research team developed advisory groups with institutional leaders and representatives from organisations who support the identities and experiences of hospital service-users and providers. Engagement with both groups is central to supporting the accessibility and realism of the project's methods and results. The project combines diverse methods including a systematic review of organisational policies, service-user and provider surveys, and focus group discussions.

Results

A systems approach is applied to consider the multiple, interacting factors that support or hinder TIC within the hospital. Initial project progress and findings will be presented including policy review and survey results.

Conclusion

Psychology researchers and practitioners are uniquely placed to lead the emerging work of TIC. With expertise in trauma, systems thinking, and reflective practice, psychology professionals bring valuable insight into applying this framework. Through utilising co-creation methods, psychology professionals can work with communities to co-create trauma-informed organisations.

Abstract 1445

STRENGTHENING HEALTHCARE WORKERS' VACCINATION COMMUNICATION IN GERMANY: DEVELOPING, IMPLEMENTING AND EVALUATING TWO DEMAND-DRIVEN TRAINING INTERVENTIONS

Wulkotte E.*[1], Schmid--Küpke N.K.[1], Schmid P.[2], Schmitz J.[3], Takla A.[1], Wilhelm J.[1]

[1]Robert Koch Institute, Department for Infectious Disease Epidemiology, Immunization Unit/STIKO ~ Berlin ~ Germany, [2]Radboud University ~ Nijmegen ~ Netherlands, [3]University of Erfurt, Institute for Planetary Health Behaviour ~ Erfurt ~ Germany

Introduction: Factual knowledge is essential for vaccination counselling. In addition, evidence shows that Motivational Interviewing (MI) –a psychology-based communication style– is more effective than traditional counselling in improving vaccination attitudes, and improves parents' vaccination intention and their children's vaccination coverage.

Purpose: This study evaluates two needs-oriented and psychology-informed trainings on (1) HPV knowledge and (2) MI conversation techniques to support healthcare workers (HCWs) in addressing HPV vaccine hesitancy among parents.

Method: We quasi-randomly assigned 36 pediatric practices in Germany to either traditional HPV information training (n=15), MI-training (n=11), or no training (n=10). Both trainings were informed by two representative German-wide surveys. Trainings were conducted in spring/summer 2024. Pediatricians and medical assistants were trained separately. We evaluated both trainings using questionnaires completed before, immediately after, and three months post-training. Primary outcome measures were HCWs' knowledge on HPV and MI, self-efficacy in vaccination conversations and perceived difficulties in addressing statements against HPV vaccination. Group differences were tested using ANOVA models (alpha=.05), and follow-up planned contrasts.

Results: Data were collected from n=301 participants across the 36 practices. Trainees showed a greater increase (before vs. after training) in knowledge regarding HPV (HPV-trainees) and MI (MI-trainees) than participants of the control group ($p<.001$). Increase in self-efficacy three months after the training was significantly higher in both trainee-groups compared to the control group ($p<.001$). Training effects on addressing anti-vaccination attitude roots varied by statement, training, and time: HPV-trainees reported less difficulty immediately post-training, MI-trainees after three months, while neither training group differed from the control group ($p>.05$).

Conclusion: First results suggest that both trainings can strengthen HCWs' vaccination communication in Germany, and that combining factual knowledge training with an MI communication style may be even more effective. A potential increase in practice-level vaccination rates will be further evaluated, contributing to an overall-assessment of the intervention.

THE ROLE OF ANGER AND EMOTIONAL REGULATION IN THE MANAGEMENT OF CHRONIC PAIN: RESULTS FROM PAIN DRAWING TESTS

Nemes--Farle L.*[1], Tajti J.[1], Csabai M.[2], Szok D.[1]

[1]University of Szeged, Albert Szent-Györgyi Health Centre, Department of Neurology ~ Szeged ~ Hungary, [2]Károli Gáspár University of the Reformed Church in Hungary, Faculty of Humanities and Social Sciences, Institute of Psychology ~ Budapest ~ Hungary

Background and Purpose: Difficulties in emotional expression can contribute to somatisation and reduced quality of life in chronic pain. This pilot study aimed to explore the relationship between the bodily representations of pain and emotions, and to examine how the characteristics and difficulties of emotional expression are reflected visually.

Methods: Total of 32 patients (70% female; 30% male with mean age of 51.3 years (23-77 years; SD = 16.4) diagnosed with chronic headache (n = 20) and chronic musculoskeletal pain (n = 12) followed-up at a Chronic pain and Headache Outpatient Care, Department of Neurology, Szeged, Hungary completed psychological self-report questionnaires (Toronto Alexithymia Scale, Spielberger State-Trait Anxiety Inventory, Beck Depression Inventory) and drawing-based tests (Pain Drawing Test, Bodily Maps of Emotions, Pictorial Representation of Illness and Self Measure Drawing Test). Both qualitative and quantitative statistical analyses were applied.

Results: Qualitative results suggest that the visual representation of ‘pain’ shows greatest similarity to the representation of the emotion ‘anger’. ‘Anger’ was also represented most often as an out-of-body experience compared to other emotions (n = 20; 60.6% of patients). Depicting emotions in the head region showed a significant but weak correlation with the ‘pragmatic thinking’ dimension of alexithymia (r = 0.35; p = 0.046). Based on the results of one-way ANOVA analysis, chronic headache patients represented ‘happiness’ (p = 0.02), ‘sadness’ (p = 0.04), ‘fear’ (p = 0.01) and ‘anger’ (p = 0.05) in larger areas within the Bodily Maps of Emotions compared to chronic musculoskeletal pain patients.

Conclusion: Our findings highlight the connection between pain and anger, as well as its potential importance in pain management. The role of emotional regulation and anger can be further explained within the Anger-Brain-Nociplastic Pain Model, with implications for multimodal pain treatment.

Abstract 1552

THE “NON-DIAGNOSIS” DIAGNOSIS: EXPERIENCES AND NEEDS OF PATIENTS WITH CHRONIC GRAFT-VERSUS-HOST DISEASE AND THEIR CAREGIVERS

Savarese M.R.*[1], Graffigna G.[2]

[1]Università Cattolica del Sacro Cuore ~ milano ~ Italy, [2]Università Cattolica del Sacro Cuore ~ Cremona ~ Italy

Introduction:
Allogeneic stem cell transplantation is a key therapeutic option for hematologic diseases such as leukemia and lymphoma. However, chronic Graft-versus-Host Disease (cGVHD) affects up to 50% of transplant recipients, significantly impacting their quality of life. Despite its clinical relevance, the psychological and social dimensions of cGVHD remain underexplored.
Purpose:
This study aimed to investigate the lived experience of individuals affected by cGVHD and their caregivers, focusing on the psychological, relational, and existential implications of living with a complex and chronic condition.
Method:
We conducted six in-depth interviews with cGVHD patients (4 males, ranging from 25 to 60 years) and one online focus group their six caregivers. The research followed the Interpretative Phenomenological Analysis framework, using semi-structured interviews to explore illness narratives, coping strategies, and unmet needs. The session with caregivers was conducted online.
Results:
Living with chronic Graft-versus-Host Disease entails identity ambiguity and an elusive diagnostic moment, experienced as a persistent emotional strain. Fragmented care pathways force patients into exhausting mediation roles, amplifying anxiety and practical as well as financial burdens. Daily management revolves around invisible rituals that sustain a precarious balance between illness and normality, while time perception and professional identity are profoundly disrupted. Caregivers, though central to care, remain unsupported and often invisible in their suffering. Meaningful relationships with healthcare professionals and peers emerge as crucial resources to reduce isolation and promote psychological resilience.
Conclusions:
This study highlights the need for integrated psychosocial care within the management of cGVHD. Health psychologists can support both patients and caregivers through interventions aimed at emotional regulation, identity reconstruction, and engagement. Promoting continuity of care, peer support networks, and caregiver inclusion are crucial

to enhancing resilience, autonomy, and overall well-being in chronic illness contexts.

Abstract 1786

ILLNESS PERCEPTIONS AND SELF-MANAGEMENT IN TYPE 2 DIABETES: HOW COGNITIVE AND EMOTIONAL PROCESSES SHAPE BEHAVIOUR

Visagie E.*[1], Deacon E.[2]

[1]University of Pretoria ~ Pretoria ~ South Africa, [2]Optentia, North-West University ~ Potchefstroom ~ South Africa

Introduction: Managing type 2 diabetes is essential for preventing complications and maintaining quality of life, but sticking to a management plan is often difficult. The Common-Sense Model (CSM) of illness representations provides a helpful framework for understanding how people's thoughts and feelings influence their health behaviours.
Purpose: This study aimed to explore how illness perceptions influence self-management behaviours in adults with type 2 diabetes.
Methods: Semi-structured interviews were conducted with 17 adults who have type 2 diabetes. Nine participants managed their condition well, while eight struggled with self-management. The researchers analysed the data thematically.
Results: Among participants who effectively managed their diabetes, key areas of the CSM included identity integration, perceived control, and coherence. The combination of a strong sense of identity, a clear understanding, and structured control created a support system for ongoing self-management and emotional regulation. Acceptance was essential in linking cognitive understanding with action, allowing insights into consequences and causes to become consistent self-management practices. On the other hand, those with less effective management were very aware of the timeline and consequences of their condition but showed low identity integration and coherence. Their emotions often felt overwhelming and demotivating, which led to inadequate processing. This lack of processing disrupted their control behaviours and coherence. It was concluded that awareness of the chronic nature and consequences of the condition was not enough for continuous self-management.
Conclusion: Programmes and interventions that focus on identity integration, enhanced control and improved coherence through learning about bodily responses, establishing routines, and encouraging emotional acceptance may facilitate self-management. Focusing on these areas could assist individuals who find it hard to turn their knowledge of the chronic nature and consequences of diabetes into ongoing behavioural control.

Abstract 1630

FROM STIGMA TO STRENGTH: HOW PEER SUPPORT TRANSFORMS PSYCHOLOGICAL WELLBEING AMONG PEOPLE LIVING WITH HIV IN INDONESIA AND DENMARK

Yunanto T.A.R.*, Dammeyer J.

University of Copenhagen ~ Copenhagen ~ Denmark

People living with HIV (PLWH) continue to face psychological burdens linked to stigma, disrupted identity, and emotional isolation. Peer-led support groups have emerged as community-based strategies to address these challenges, yet their mental health benefits remain under-explored within psychological research. This study offers a cross-cultural qualitative comparison of how peer support groups function as informal therapeutic spaces for PLWH in Indonesia and Denmark, highlighting shared psychological benefits and culturally distinct coping strategies. The study aimed to explore how peer-led support groups reduce HIV-related stigma and enhance psychological quality of life in two culturally different contexts. Framed within health psychology and social development perspectives, it examined how peer networks facilitate emotional support, self-advocacy, and cultural adaptation of HIV care beyond clinical settings. We conducted 40 in-depth, semi-structured interviews with PLWH (20 in each country) who had participated in peer support groups for at least six months. Participants were purposively selected to reflect diversity in gender, age, and treatment experience. Thematic analysis was applied using a psychological lens, focusing on emotional expression, meaning-making, and interpersonal processes. Three core psychological functions of peer support groups were identified: emotional relief and regulation, identity reconstruction, and empowerment. Participants described groups as safe spaces to express emotions, reframe their HIV identity from shame to resilience, and build confidence in managing care. Cultural differences shaped these processes: Indonesian participants emphasized collective identity and spirituality, while Danish participants highlighted autonomy and self-affirmation. Across both settings, peer support enhanced motivation, psychological clarity, and sustained care engagement. Peer-led support groups offer low-cost, culturally adaptable, and psychologically meaningful interventions. Their integration into HIV care systems may help close mental health gaps, reduce stigma, and improve quality of life for PLWH globally.

IMPLEMENTING THE HEALTH PROMOTING SCHOOL APPROACH: A LATENT ANALYSIS FROM THE LOMBARDY REGION, ITALY

Delbosq S.*[3], Branda M.[3], Celata C.[1], Chinelli S.[2], Velasco V.[3]

[1]Regione Lombardia, Direzione Generale Welfare ~ Milano ~ Italy, [2]Ufficio Scolastico Regionale per la Lombardia, Ufficio V ~ Milano ~ Italy, [3]Università degli Studi di Milano-Bicocca, Dipartimento di Psicologia ~ Milano ~ Italy

Introduction
School is a fundamental setting for the growth and development of students and school staff, influencing their health and lifestyles. At the international level, the World Health Organization (WHO) promotes the “Health-Promoting School” (HPS) approach. A HPS adopts a whole-school approach, comprising all aspects of the life of a school. The literature highlights the importance of the quality of the implementation of the HPS approach for its effectiveness. Adopting the HPS approach implies several changes and activities, which are challenging for schools. Furthermore, schools can implement the HPS approach according to their context-specific values, needs, resources, and characteristics. Therefore, identifying different ways in which schools can implement the model as it is recommended by international guidelines and local needs is vital to further research with respect to the effectiveness of the HPS approach.

Purpose
In the Lombardy Region (Italy), the HPS approach is well-established and 14 provincial and sub-provincial HPS Networks operate, totaling over 500 schools. The purpose of the study is to identify different implementation typologies within the HPS Networks of Lombardy.

Method
A latent analysis (LCA/LPA) will be performed based on a series of health promotion practices listed in a regional document. These will be used to create indicators based on the HPS characteristics and components. A survey investigating the implementation status of these practices was administered to schools from April to September 2025. The survey was sent by the School Regional Office, and participation was promoted by the leading schools, the school provincial offices’ staff, and the local healthcare units’ staff.

Results
A total of 405 schools responded to the survey, yielding a high response rate from the

schools within the Networks (79%). The results of the analysis will provide insights on the status of HPS within Lombardy.

EFFECTS OF HEALTH AND ENVIRONMENTAL MESSAGES IN THE CONTEXT OF INCREASING WHOLE GRAIN CONSUMPTION: A RANDOMISED CONTROLLED TRIAL

Kollmann J.*[1], Kolkmann S.M.[2], Keller J.[3]

[1]Eawag: Swiss Federal Institute of Aquatic Science and Technology ~ Dübendorf ~ Switzerland, [2]Freie Universität Berlin ~ Berlin ~ Germany, [3]Heidelberg University ~ Heidelberg ~ Germany

Multiple ecological crises present significant health threats to humans and require behaviour change that offers co-benefits for both human health and environmental sustainability. A behaviour offering these co-benefits is the consumption of whole grain products, which has significant health benefits and relieves the food industry's strain on the environment. Providing information on benefits of a behaviour has shown to be effective in promoting behaviour change in both the health and environmental context, but research on the mechanisms and effectiveness is inconclusive. Specifically, it is unclear whether framing the information (health vs. environmental benefits) differs in its effectiveness and whether this depends on individual cognitive or affective differences. To gain a better understanding of the effectiveness of information framing and its underlying mechanisms in the context of increasing whole grain consumption, we conducted a randomised controlled trial with a convenience sample of 123 individuals. Two intervention groups received an information framing (health or environmental benefits), an active control group received neutral facts on whole grain products. In a three-week Ecological Momentary Assessment study, we assessed daily intention and behaviour as well as risk perception and motivational orientation, both separately for health and environment. After a one-week baseline phase, participants received daily messages (health benefits vs. environmental benefits vs. neutral facts). The analyses showed that across all groups, participants increased their intended and actual whole grain consumption, indicating an effect of information but not framing. Potentially, any information increased the salience of whole-grain consumption and thus intentions and consumption. Interestingly, health motivational orientation significantly moderated the effect of messages on intention in the control group, with higher individual health motivational orientation at baseline being related to higher intention, but not consumption, at the later measurement points. No other significant moderations were found. Implications for further research and intervention designs will be discussed.

A FEASIBILITY STUDY ON A STOP SMOKING IN SCHOOLS TRIAL: THE CASE FOR THE PHILIPPINES

Salanga M.G., Mateo N.J.*

De La Salle University ~ Manila ~ Philippines

The A Stop Smoking in Schools Training (ASSIST) is a peer-led, school-based adolescent smoking prevention intervention proven to be effective not only in preventing smoking but also in promoting well-being and leadership skills among students. It uses the diffusion of innovation theory to address issues about smoking uptake in 13- to 14-year-olds. As this program has initially been tested in the United Kingdom, a study was conducted by the University of Glasgow (UK), De La Salle University (Philippines), and Gadjah Mada University (Indonesia) to test its feasibility in culturally different middle-income countries. This paper presents the results of a feasibility study conducted in the Philippines. The feasibility study examined whether ASSIST can be adapted in culturally different low- and middle-income countries and the extent to which it will be feasible. This presentation focuses on the process evaluation of ASSIST, examining the issues related to the acceptability of the intervention, from the consent process to the various data collection phases, and the training program

Abstract 1435

BEHAVIOURAL INTERVENTIONS FOR THE PREVENTION AND MANAGEMENT OF CARDIOVASCULAR DISEASE AND DIABETES MELLITUS: A SYSTEMATIC REVIEW OF REVIEWS

Mcaleese A.M.*, Ahern L., O"Shea D., Gallagher S.

University of Limerick ~ Limerick ~ Ireland

Cardiovascular disease (CVD) and type 2 diabetes mellitus (T2DM) are leading causes of global morbidity and mortality, with prevalence projected to rise substantially by 2050. Behavioural risk factors, including poor diet, physical inactivity, tobacco use, and harmful alcohol consumption, are major contributors. A range of behavioural interventions, including digital health strategies, have shown potential in improving outcomes, but evidence remains fragmented.

This review synthesised findings from previous systematic reviews on the effectiveness of behavioural interventions for adults with, or at risk of, CVD and T2DM. A systematic search of PubMed, PsycINFO, Cochrane Library, Embase, CINAHL, Scopus, and Web of Science identified reviews published between 2000 and 2025. Eligible studies evaluated interventions focused on diet, physical activity, medication adherence, or multi-component lifestyle change in adults with CVD, T2DM, or those at risk. From 3,334 records, 161 papers progressed to full-text review, with 74 still under review.

Studies meeting the inclusion criteria are being reviewed narratively, with findings organised by intervention type and health outcomes. Evidence indicates that lifestyle interventions effectively reduce T2DM incidence and improve CVD risk factors, including glycaemic control, blood pressure, and lipid profiles. Digital and mobile health tools enhance medication adherence and support sustained behaviour change. However, heterogeneity in study design, duration, and measured outcomes limits comparability, and few reviews address long-term sustainability.

These findings underscore the importance of multi-component, digitally enabled behavioural strategies to reduce the burden of CVD and T2DM. Insights will directly inform the development of the SHIELD mobile application, which leverages an AI-powered chatbot to deliver personalised behavioural interventions for prevention and self-management at scale.

This research is supported by the Horizon Europe–funded SHIELD project, co-funded by the Swiss State Secretariat for Education, Research and Innovation (SERI; Grant Nº 101156751).

STRESS, SPACE, AND SPECIALIZATION: RESILIENCE STRATEGIES IN NUCLEAR MEDICINE PRACTICE

Singh J.*[1], Harleen K.[2]

[1]Jaipur National University Institute for Medical Sciences and Research Centre, [2]O.P. JINDAL GLOBAL UNIVERSITY ~ HARYANA ~ India

Nuclear medicine professionals face exceptional workplace demands characterized by high-stakes precision requirements, prolonged work in confined spaces, and the need to maintain specialized technical expertise. These unique stressors—cognitive load from precision tasks, physical workspace constraints, and constant upskilling pressures—create significant challenges for practitioners' well-being and patient safety. The field's distinctive nature, involving complex radiation safety protocols and advanced imaging/therapeutic procedures, compounds these pressures beyond typical healthcare stressors. This review synthesizes evidence on resilience-building approaches tailored for nuclear medicine practice, drawing from occupational health, human factors engineering, and radiology literature. We analyze three key intervention domains: cognitive-behavioral strategies for precision-related stress, ergonomic adaptations for confined workspaces, and support systems for technical skill maintenance. Findings reveal that effective resilience requires integrated individual, team, and institutional approaches, with notable gaps in practical implementation within nuclear medicine workflows.We propose a multi-level resilience framework addressing: (1) individual techniques for decision fatigue management, (2) workspace innovations like modular equipment redesign, and (3) institutional policies including structured microbreaks and peer support systems. The framework aligns with Sustainable Development Goals by enhancing worker well-being (SDG-3), promoting decent work conditions (SDG-8), and advancing medical technology (SDG-9).

Critical research priorities include developing nuclear medicine-specific resilience metrics and evaluating workspace intervention cost-effectiveness. This review bridges theory and practice, offering actionable insights for healthcare leaders and practitioners to address the field's unique challenges while maintaining high-quality patient care.

Abstract 575

SELF-COMPASSION AND ACHIEVEMENT PURSUIT IN PILOTS: BURNOUT AS A PSYCHOLOGICAL BRIDGE

Bhatia N.*, Dhiman S., Kaur S.A., Choubisa R.

Birla Institute of Technology and Science, Pilani ~ Pilani ~ India

'Self-compassion' defined as being kind to oneself during challenging situations act as a direct
driver of achievement motivation. This statement oversimplifies the relationship but may not be
the case in high-stakes, performance-driven environments. One such environment is being a
pilot in the aviation industry. Pilots typically face unique demands which include intensive
training schedules, high cognitive load, strict performance standards, and constant evaluation.
All these activities impact their sustained motivation, performance consistency and can elevate
burnout risk. To explore these dynamics, we pooled a sample of n=157 trainee pilots from
different training phases through stratified random sampling. Participants completed validated
questionnaires measuring self-compassion, burnout, and achievement motivation. We tested the
hypothesized research model and intervening mechanisms through Structural Equation Modeling
approach. The results present little evidence that self-compassion directly increases
achievement motivation. Instead, we obtained an indirect effect highlighting that pilots who
scored higher in self-compassion tended to report lower levels of burnout whereas those with
less burnout showed stronger motivation to achieve. This indicates that self-compassion acts
mainly as a protective shield and reduces the harmful effects of exhaustion and cynicism, which
in turn, redefines their motivation. Our results challenge overly optimistic assertions that
self-compassion alone powers achievement and contrarily suggests that self-compassion
safeguards psychological resources by lowering strain rather than directly energizing

goal-pursuit. We recommend that this idea may be incorporated in their training and development programs as it may enhance their capabilities in reducing burnout, workload and
overall stress-management.

Abstract 711

SUFFICIENT SLEEP AND PHYSICAL ACTIVITY CAN RELIEVE THE EFFECTS OF LONG-TERM EXPOSURE TO PARTICULATE MATTER ON DEPRESSIVE SYMPTOMS

Yuan W.*[1], Dong Y.[2], Ma J.[2]

[1]Central China Normal University ~ Wuhan ~ China, [2]Peking University ~ Beijing ~ China

Background: Although long-term exposures to air pollutants have been linked to mental disorders, existing studies remain limited and inconsistent. We investigated the relationship between exposure to particulate matter (PM) and depressive symptoms, as well as the potential role of sleep duration and physical activity. Method: Using the surveillance data (2019 to 2022) of common diseases and risk factors among 312,390 students aged 10–25 years, logistic regression, generalized liner model (GLM) and restricted cubic spline (RCS) were employed to investigate the relationship between long-term exposure to PM and depressive symptoms. Result: Significant associations were found between PM1 (OR = 1.21, 95 % CI: 1.12–1.32), PM2.5 (OR = 1.24, 95 % CI: 1.19–1.38), and PM10 (OR = 1.87, 95 % CI: 1.69–2.07) and increased risks of depressive symptoms. Sleep duration and physical activity relieved these associations. The odds ratios (ORs) of PM1, PM2.5, and PM10 on depressive symptoms were lower in group with sufficient sleep (1.02 vs. 1.49, 1.20 vs. 1.80, 2.15 vs. 2.23), lower in group with high level MVPA (1.13 vs. 1.48, 1.14 vs. 1.58, 1.85 vs. 2.38), and lower in group with high level outdoor activity (1.19 vs. 1.55, 1.23 vs. 1.63, 1.83 vs. 2.72). Conclusion: Sufficient sleep duration and outdoor activity may mitigate the decline in mental health among adults in developing countries caused by long-term exposure to PM. This contribution enhanced our understanding of the mechanisms linking air pollution to mental health.

Abstract 798

ENVIRONMENTAL SENSITIVITY PREDICTS BURNOUT IN HEALTHCARE STUDENTS AND THE ROLE OF COPING STRATEGIES

Boyle E., Connery T., O"Reilly A., Setti A.*

School of Applied Psychology ~ Cork ~ Ireland

Background: Healthcare students (HCS) experience high rates of burnout, negatively impacting their well-being. Sensory processing sensitivity (SPS), a trait that reflects differential susceptibility to positive and negative environments, has been associated with negative psychological outcomes in healthcare professionals and university students and well as poorer wellbeing in the general population and higher disposition to mental health issues. However, SPS has not been explored in HCS.

Purpose: This study examined the association between SPS and burnout among HCS and tested whether time in nature, social support, and meaning-centred coping moderated this relationship, with the goal of informing interventions for high-SPS HCS. The study adopted a survey design and two open questions for context.

Methods: 345 participants completed an online survey that included measures of SPS, burnout, meaning-centred coping, social support, and time in nature and two open-ended questions regarding their coping strategies for stress. Quantitative data were analysed using hierarchical multiple regression and moderation analyses. Qualitative data were analysed using thematic analysis.

Results: SPS and neuroticism predicted burnout, while higher mean centred coping predicted lower burnout. Time in nature did not predict lower burnout. Neither social support nor meaning-centred coping moderated the association between SPS and burnout. The thematic analysis generated four themes: Navigating Stress through Action; Maintaining Well-Being and Balance; Finding Strength in Connections; and Barriers to Effective Coping and elucidated barriers and enablers to coping depending on the level of sensitivity.

Conclusion: SPS is associated with burnout in HCS, highlighting the importance of recognising SPS as a contributing factor to burnout. While social support, meaning-centred coping, and time in nature did not moderate the association between SPS and burnout, the qualitative data demonstrated that HCS employ diverse coping strategies, such as exercise, planning, and cognitive reframing, which future research should examine in relation to students' burnout and sensitivity levels.

Abstract 904

LONG-TERM PHYSIOLOGICAL STRESS IS RELATED TO REDUCED PERCEIVED STRESS AS MEASURED BY OURA RING BIOMETRIC DATA AND ECOLOGICAL MOMENTARY ASSESSMENT

Gardner F.*, Moore Z.

Touro University ~ New York City ~ United States of America

Stress is a multidimensional construct encompassing physiological responses such as changes in heart rate, heart rate variability, body temperature, and motion; and psychological experiences, including perceived tension and coping abilities. Physiological aspects of stress can be objectively quantified via wearable technology such as the Oura ring, which assesses several variables of bodily stress. Perceived stress, measured through self-reports such as the Perceived Stress Scale (PSS-10), is an individual's subjective appraisal of life as stressful, uncontrollable, or unpredictable. Although physiological and perceived stress significantly impact psychological health and well-being, their relationship and interaction warrant further exploration. Understanding how individuals interpret their physiological stress responses and evaluate their coping capacity helps inform interventions that address discrepancies between physiological stress indicators and subjective experiences. This study evaluated physiological stress and perceived stress to identify potential discrepancies and explore practice implications. Twenty graduate and 16 undergraduate students from two universities in the Unites States wore an Oura ring for 40 days to gather biometric data and to assess bidirectionality of participants' physiological and emotional arousal. Participants completed the PSS-10 through a smartphone application utilized for Ecological Momentary Assessment and Experience Sampling Methodology data collection. A linear mixed model analysis revealed the average time in physiological stress was significantly negatively correlated with perceived stress ($r=-.28$, $p=.03$), indicating that individuals with higher average stress exposure over 40 days reported lower perceived stress. Individual differences accounted for more variation in PSS-10 than within-person changes over time ($r=-.28$, $p=.03$); thus, individuals who typically experience more physiological stress report lower perceived stress. Findings reveal that physiological stress and psychological perceptions may be capturing different aspects of the stress experience. Future research should investigate a potential stress adaptation effect, such that chronically stressed individuals may develop coping mechanisms or adjust stress perception.

Abstract 4271

IDENTIFYING THE CRITICAL PERIOD OF ACADEMIC BURNOUT: A COMPUTATIONAL SIMULATION APPROACH BASED ON LARGE-SCALE ASSESSMENT DATA

Tang X.*

Tallinn University & University of Helsinki

Understanding student motivation has long been a central concern in educational research. While prior studies have extensively examined levels and correlates of motivation, far less is known about the timing at which students transition into a state of complete motivational disengagement. In present study, based on Cox proportional hazards modeling and using large-scale data from the Programme for International Student Assessment (PISA), we develop a computational simulation model to infer individual- and group-level distributions of academic burnout onset across study weeks. Results demonstrate systematic variation in the timing of academic burnout onset as a function of weekly study time, with longer study hours associated with an earlier increase in burnout risk. To facilitate practical application, we further implement an interactive ShinyApp that allows users to estimate academic burnout onset periods at the individual, classroom, and school levels. This study contributes a novel methodological framework for temporally locating motivational breakdown and offers a scalable tool for translating large-scale assessment data into actionable educational insights.

Abstract 2456

NO REST, NO DAYS OFF": A MULTIROLE PERSPECTIVE ON CAREGIVER BURDEN IN PARENTS OF CHILDREN WITH CHRONIC HEALTH CONDITIONS

Daquila S.*, Swords L.

Trinity College Dublin ~ Dublin ~ Ireland

Introduction: Caregiver burden has emerged as an important area of research within the health sciences, as it seeks to understand how the responsibilities associated with providing care can become overwhelming for the individual in this role. Recent studies have also begun to explore how individuals balance caregiving with other significant life roles, such as employment, to better understand how managing multiple responsibilities affects their well-being. Despite these developments, relatively little is known about how individuals navigate and balance multiple roles simultaneously, a reality that is particularly salient for parents caring for a child with a chronic health condition. Parental informal caregivers are unique in that they exist at the intersection of several roles, including those of parent, caregiver, employee, and spouse. Purpose: Grounded in over 100 perspectives of parental caregivers all over the world, this research aims to further contextualize the lived experience of this population in order to improve our understanding of caregiver burden and improve existing interventions. Method: This research employed mixed methodology, using a combination of validated quantitative measures assessing parental quality of life, work-life satisfaction, and spousal support, which was supported by open-ended questions in which the individual could expand on their experience. Results: Results illuminated the relationship between the various roles and responsibilities parental caregivers must navigate simultaneously and provide context for where additional areas of support would be beneficial. This research has implications for developments in both formal and social support.

Abstract 4562

INTEGRATIVE PHYSICAL EDUCATION AS A BIOPSYCHOSOCIAL MECHANISM FOR MITIGATING ANXIETY AND DEPRESSION IN STUDENTS WITH CHRONIC HEALTH CONDITIONS

Abduldayeva A., Doszhanova G.*

Scientific research institute of preventive medicine named after Academician Y.D. Dalenov, Astana Medical University ~ Astana ~ Kazakhstan

Background: Students assigned to Special Medical Groups (SMG) due to their health status are at high risk of psychological maladaptation. The synergy of chronic somatic conditions and intense academic pressure creates a fertile ground for emotional burnout and social deprivation. Preliminary screening of this cohort revealed anxiety levels exceeding normative thresholds, with 26.3% of respondents exhibiting moderate depressive symptoms.

Objective: This study aims to evaluate the effectiveness of an innovative integrative model of physical education in optimizing the psycho-emotional status and enhancing the adaptive potential of students with health limitations.

Methods: A 12-week experimental program based on the biopsychosocial approach was implemented. The model integrated regulated physical activity with psychological techniques, including mindfulness breathing, progressive muscle relaxation, body-oriented practices, and visualization. Assessment was conducted using the Spielberger-Hanin State-Trait Anxiety Inventory (STAI) and the Beck Depression Inventory (BDI) (n=186).

Results: Post-intervention data demonstrated a statistically significant ($p < 0.001$) reduction across all psychological markers. State anxiety decreased by 14.5%, and trait anxiety fell by 10.2%, indicating improved emotional regulation and self-efficacy. Notably, depressive symptoms saw a 22.4% reduction. Participants reported a decrease in apathy, improved sleep quality, and a shift from avoidant coping mechanisms to active social engagement. Gender-based analysis revealed that female students showed more pronounced improvements in emotional stability, while male students demonstrated superior physiological recovery.

Conclusions: The integrative physical education model serves as an effective tool for psychological intervention within the educational process. The program facilitates the development of an internal locus of control and fosters a supportive environment, transforming physical education from a general curriculum subject into a robust resource for psychophysical rehabilitation and academic adaptation.

Abstract 2504

EFFECT OF ATTITUDE AND STIGMA TOWARDS HELP SEEKING ON MENTAL HEALTH ISSUES: A CROSS-CULTURAL STUDY OF MIGRANT DOMESTIC WORKERS IN ASIA

Liem A.[2], Dubey A.[3], Erkol E.*[1]

[1]Sabanci University ~ Istanbul ~ Turkey, [2]Universitas Sebelas Maret ~ Surakarta ~ Indonesia, [3]Birla Institute of Technology and Science, ~ Pilani ~ India

Background: Migrant domestic workers (MDWs) face multiple challenges, including language barriers, cultural adaptation, exploitation risks, and social isolation that can impact their mental health. These experiences shape their attitudes toward help-seeking and self-stigma regarding mental health services. Understanding these factors across different cultural contexts is crucial for developing culturally sensitive interventions.

Aim and Hypothesis: This study investigated the relationships between self-stigma of seeking help (SS), attitudes toward seeking professional psychological help (AT), and perceived devaluation and discrimination (PDD) among MDWs across four Asian countries. We hypothesized that AT would negatively predict PDD, while SS would positively predict PDD, and that these relationships would differ significantly across cultural contexts.

Methods: A total of 277 MDWs (89.2% male, 10.8% female; mean age 36.6 years) from Indonesia, Malaysia, India, and Vietnam completed measures including the ATSPPH-SF, SSOSH, and RPDD scales. Data were analyzed using correlational analysis, multiple regression, ANOVA with post hoc Tukey tests, and Random Forest Regression machine learning models. Harman's one-factor test confirmed no significant common method bias (31.7%).

Results: Multiple regression revealed that AT negatively predicted PDD ($\beta = -0.074$, $p = 0.028$), while SS demonstrated a strong positive effect ($\beta = 0.845$, $p < 0.001$). The Random Forest model confirmed robust predictability (Training $R^2 = 0.87$; Test $R^2 = 0.84$). ANOVA results showed significant cross-cultural differences in AT ($\omega^2 = 0.051$), SS ($\omega^2 = 0.463$), and PDD ($\omega^2 = 0.406$), with the largest differences observed between Indonesia-Malaysia and Indonesia-Vietnam pairs.

Conclusion: Self-stigma emerged as the strongest predictor of perceived discrimination among MDWs, substantially outweighing attitudes toward help-seeking. Significant cross-cultural variations highlight the necessity for culturally tailored interventions. Findings emphasize the importance of reducing self-stigma and promoting mental health service utilization through culturally sensitive approaches that acknowledge country-specific contextual factors affecting MDWs' mental health help-seeking behaviors.

Abstract 2722

SLEEP STATE MISPERCEPTION: A LARGE-SCALE ANALYSIS OF THE DISCREPANCY BETWEEN SUBJECTIVE AND OBJECTIVE SLEEP PARAMETERS

Kim H.J.*

Ajou University School of Medicine ~ Suwon ~ Korea, Republic of

• Introduction: Patients with sleep disorders often report sleep difficulties that contradict physiological data. This phenomenon, known as "sleep state misperception" or "paradoxical insomnia," reflects significant cognitive distortion regarding one's own sleep health and can exacerbate sleep-related anxiety.
• Methods: We conducted a retrospective analysis of 2,133 patients who underwent diagnostic PSG at the Sleep Center of the Department of Otorhinolaryngology (2019–2023). Subjective sleep parameters were collected via a post-sleep questionnaire administered the morning after the PSG. We compared subjective reports with objective data across key variables: Total Sleep Time (TST), Sleep Onset Latency (SOL), and the frequency of apnea/hypopnea events.
• Results: The analysis revealed significant discrepancies between perception and reality. Patients consistently demonstrated a negative bias regarding sleep continuity; they perceived their sleep duration as significantly shorter and sleep onset as taking longer compared to objective recordings. In contrast, a profound lack of awareness (anosognosia) was observed regarding sleep breathing disorders. While objective data indicated frequent apnea/hypopnea events (mean approx. 100/night), patients' subjective reports showed minimal awareness of these disruptions.
• Conclusions: Patients tend to "catastrophize" insomnia symptoms while remaining unaware of physical disruptions like sleep apnea. These findings suggest that sleep disorders involve not only physiological mechanisms but also significant cognitive distortions. Consequently, providing objective feedback based on PSG data is essential to correct patients' misperceptions and improve therapeutic outcomes.

Abstract 2688

WITHIN- AND ACROSS-PERSONS ASSOCIATIONS BETWEEN POSITIVE EMOTIONS AND SEDENTARY BEHAVIOR IN DYADS ADOPTING AN ACTIVE LIFESTYLE.

Misiakowska J.*, Banik A., Kulis--Stefanczyk E., Szczuka Z., Siwa M., Wietrzykowska D., Zaleskiewicz H., Kornafel A., Krzywicka P., Paduszynska N., Kuzminska J., Palacz--Poborczyk I., Sorsa G., Luszczynska A.

SWPS University ~ Wroclaw ~ Poland

Introduction:
Both physical activity (PA) and sedentary behavior (SB) may evoke positive emotions. Previous research has mostly examined these emotions within respective individuals (e.g., SB enjoyment predicting SB of the same person), and SB was considered to be predicted by SB-specific emotions.
Purpose:
This study investigated within-person and across-person associations between positive emotions (PA enjoyment and SB enjoyment) and sedentary time.
Method:
Data were merged from two longitudinal studies including 544 dyads (1,089 participants) aged 9–90 years. In each dyad, one person (the target) reported: (a) spending most waking hours sitting and/or not meeting WHO physical activity recommendations at baseline, and (b) aimed to reduce sedentary time. The other person (the partner) supported respective behavioral change. Enjoyment of PA and SB was measured using the Groningen Enjoyment Questionnaire. Sedentary time was objectively assessed via accelerometers at baseline (T1) and at 8-month follow-up (T2). Regression analyses controlled for baseline sedentary time.
Results:
Several within- and across-dyad associations emerged. Among target persons, higher PA enjoyment (T1) predicted lower sedentary time (T2). Greater SB enjoyment (T1) was related to higher sedentary time at T1 for both dyad members. Across-person effects were also found: partners' SB enjoyment (T1) was associated with higher sedentary time in target persons at T1, suggesting shared behavioral tendencies. Conversely, partners' PA enjoyment (T1) predicted lower sedentary time among target persons at T2, indicating a potential protective interpersonal effect.
Conclusions:
The findings emphasize the dual role of enjoyment—PA enjoyment helps reduce sedentary time, while SB enjoyment maintains inactivity. Interpersonal influences underline the importance of dyadic interventions that enhance PA enjoyment in both members to facilitate long-term reductions in sedentary behavior.

Abstract 2683

MMPI-2 AND MMSE-2 ASSESSMENT OF BREAST PATHOLOGY

Munteanu C.*

Prof. Dr. Agrippa Ionescu" Clinical Emergency Hospital ~ Bucharest ~ Romania

Introduction

Emotional disturbances in response to breast pathology (MP) can affect a person's physical health and psychological well-being. Previous research has shown that a large proportion of people with PM experience multiple concurrent psychological symptoms during the care trajectory, such as stress, anxiety, depression and cognitive impairment. The current study expands on existing research and aims to assess psychological resource levels and cognitive impairment by using coping indicators of the Minnesota Multiphasic Personality Inventory®-2 (MMPI®-2) and the tasks of the Mini-Mental State Examination, 2nd Edition™ (MMSE-2®).

Method

The clinical sample consisted of 12 women with a mean age of 43.75 years (SD = 6.77 years; range: 33-52 years). The normative MMPI-2 (n = 1115) and MMSE-2 (n = 677) samples of the female population of Romania were analyzed for comparison of means.

The psychological instruments used included the MMPI-2 and the extended version of the MMSE-2. Cut-off scores for clinically significant increases were set at different T-score levels according to the MMPI-2 scales analyzed: Demoralization (RCd), Anxiety (A), Ego Strength (Es) and mean scores on clinical scales 1-4 and 6-9. MMSE-2 reported impaired cognitive areas.

Results

MMPI-2 scores showed moderate-intensity psychological symptoms (mean of scales 1-4 and 6-9, T = 67) and moderate-severe unhappiness, demoralization (RCd, T = 69). Mid-level scores on the A (T = 41) and Es (T = 53) scales suggested a favorable prognosis for psychotherapy, with a good adaptive psychological response to the disease condition.

The most commonly impaired cognitive function was attention, followed by short-term memory and impaired verbal learning ability.

Conclusions

The results were consistent with the study purpose. The study provides support for future research on larger PM samples.

Division 8: Health Psychology SDG 3: Good Health and Well-being

Abstract 2438

MULTILEVEL DETERMINANTS OF PARENTAL ENGAGEMENT IN PAEDIATRIC SCREENING PROGRAMMES: A SYSTEMATIC REVIEW

Werner A.*, Graffigna G., Savarese M.R.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Introduction:
Paediatric screening programmes are essential for the early detection of physical diseases that may appear during childhood or later in life, improving children's health outcomes. However, while clinical benefits are often indisputable, from a psychological perspective prevention is not always an easy choice, as it can cause anxiety and stress in parents who must make health decisions for their children. Understanding the psychological and social factors that influence these decisions is crucial to developing effective strategies to increase participation in screening programmes.
Purpose:
This systematic review aims to synthesise evidence on barriers, facilitators, and decision-making processes that influence parental adherence to preventive paediatric screening programmes for various physical health conditions.
Method:
The review is pre-registered in PROSPERO (CRD420251058370). A systematic search was conducted in PubMed, PsycInfo, Scopus, and the Science Citation Index, with no time limits, including studies in English and Italian. Quantitative, qualitative, and mixed-methods studies on caregiver participation in preventive paediatric screening for physical conditions (e.g., type 1 diabetes, congenital hypothyroidism, hearing loss, metabolic disorders) were included. Screening and data extraction are ongoing, and preliminary analyses are based on studies meeting inclusion criteria to date.
Preliminary results:
Three macro-categories of factors emerged.
Cognitive and informational: understanding the preventive purpose and benefits of screening motivates participation, though uncertainty about non-symptomatic positivity creates ambivalence and demand for clearer communication.
Emotional-relational: anxiety and responsibility may cause hesitation, but trust in professionals and relational support promote engagement.
Contextual and organisational: simplicity, free access, and active invitation increase participation, which is generally high. Overall, parents show strong preventive motivation but ambivalent feelings balancing reassurance and fear of early knowledge.
Conclusions:
Adherence to paediatric screening is generally good but shaped by emotional ambivalence. Recognising these dynamics can guide communication and

psychoeducational strategies to promote informed and supported parental participation.

Abstract 2712

SELF-CRITICAL RUMINATION AND SLEEP QUALITY IN UNIVERSITY STUDENTS: THE MEDIATING ROLE OF POSITIVE AND NEGATIVE AFFECT

Wu L.*, Zhu L.

Shaanxi Normal Univeristy ~ Xi'an ~ China

Introduction: Impaired sleep quality is prevalent among university students. While rumination disrupts sleep, the daily mechanisms of Self-Critical Rumination (SCR) and its interaction with affective states remain underexplored. Purpose: This study utilized a diary method to investigate the mediating mechanisms of Positive Affect (PA) and Negative Affect (NA) in the relationship between pre-sleep SCR and sleep quality at both within- and between-person levels. Method: A sample of 177 Chinese university students (Mage = 20.56) completed baseline surveys and daily questionnaires for 14 consecutive days (N = 2,478 observations). Multilevel modeling with Bayesian estimation was conducted. Results: At the within-person level, elevated daily pre-sleep SCR predicted poorer sleep quality, heightened NA, and diminished PA. Both daily affective states significantly influenced sleep, suggesting SCR impairs sleep by concurrently downregulating PA and upregulating NA. In contrast, between-person findings diverged, revealing that although trait SCR directly predicted worse sleep, it unexpectedly associated with higher trait PA. This elevated PA exerted a positive indirect effect, buffering SCR's overall detrimental impact. Notably, while daily NA disrupted sleep, trait NA showed no such association, underscoring that sleep regulation mechanisms differ fundamentally across timeframes. Conclusions: Our findings demonstrate that the mechanisms linking SCR to sleep differ significantly between intra-individual and inter-individual levels. While daily SCR harms sleep through immediate affective dysregulation, trait-level dynamics involve a compensatory mechanism where PA serves as a protective buffer. Interventions should therefore distinguish between managing daily emotional fluctuations and addressing habitual traits to effectively improve youth sleep health.

08 - Division 8: Health Psychology

STRESS MITIGATION AT THE MACRO, MESO, AND MICRO LEVELS

Thursday 23 July 2026 from 11:30 to 13:00

(L-Lorenese)

Efrat Neter (Ruppin Academic Center ~ Haifa ~ Israel), Chair and Discussant

The proposed symposium, "Stress Mitigation at the Macro, Meso, and Micro Levels", offers a timely and multidisciplinary exploration of stress as a pervasive health challenge across societal layers. Each presentation introduces a novel lens—from evolutionary theory to immunological biomarkers—highlighting innovative approaches to understanding and addressing stress.

The symposium begins with a foundational perspective on chronic stress as a mismatch between human evolution and modern environments (#1, Orbán), setting the stage for applied solutions: from policy-level interventions in health crises (#2, Roussel & Van den Broucke) and migration (#3, Rajan, Eugene & Coen), to developmental health in early childhood (#4, Kolopaking & Dockrell), and frontline resilience in wartime healthcare (#5, Blum and Kushnir). Together, these contributions and the discussion (#6, Neter) form a cohesive narrative that bridges theory, policy, and practice, offering actionable insights for researchers, clinicians, and policymakers alike.

The titles of the proposed abstracts are:

1. Evolutionary Mismatch and Modern Maladaptation: An Evolutionary Health Psychology Perspective on Chronic Stress and Disease. From Fiji.
2. Building New Imaginaries in Health Crisis Management: Psychology to the Rescue of Health Policies. From Belgium.
3. Im/migration: Global health crisis & politics. From the US and UK
4. Integrating Whole-Child and One-Health Perspectives in Early Development: A Health Psychology Lens. From Indonesia and UK.
5. Wartime Workability and pro-inflammatory cytokines in a group of hospital healthcare professionals. From Israel.
6. Discussion. Neter (proposer, from Israel).

Abstract 3884

BUILDING NEW IMAGINARIES IN HEALTH CRISIS MANAGEMENT: PSYCHOLOGY TO THE RESCUE OF HEALTH POLICIES

Roussel S.*, Van Den Broucke S.

Université Catholique de Louvain ~ Louvain ~ Belgium

Introduction.
The number of health crises is increasing, making it imperative to draw lessons from past pandemics. These insights can help strengthen the resilience of societies and individuals, to deal with similar stressful events in the future. Building on the experience with the SARS-CoV-2 pandemic in the Brussels-Capital Region of Belgium, the prospective participatory research, PANDORIX, envisioned developing crisis exit scenarios for future crises.
Methodology.
An exploratory mixed-method approach was used. First, semi-structured interviews were held with citizens including 'specific' groups, organisations, and experts, to explore their representations of the management of the Covid-19 pandemic as well as their representations of potential future crisis management. Next, a quantitative questionnaire study with cluster analysis was performed to investigate citizens' preferences for the crisis management strategies derived from the qualitative study.
Results.
While most participants agreed that humans were responsible for the factors causing pandemics, opinions diverged regarding how crises should be governed, particularly the participation of citizens in the decision-making process for health policies. The study highlighted crisis management preferences associated with behavioural intentions to follow governmental recommendations. Beyond data collection, citizens were involved at various key moments of the study, such as validating scenarios, improving the questionnaire and coauthoring an article. Participants reported that their involvement in a supportive research environment, the exploration of various representations in a non-judgemental atmosphere, helped them to cope with the current situation and to restore their confidence.
Conclusions.
This study underscores the complexity of managing a health crisis and illustrates the fact that there is no single universal solution to deal with such crises, even in a limited territory. Addressing a crisis required an open dialogue considering different scenarios, setting a timeframe that allows for trust to be built. PANDORIX also advocates the implementation of research that reflects the values it promotes.

Abstract 3885

IM/MIGRATION: GLOBAL HEALTH CRISIS & POLITICS

Rajan I.[1], Eugene D.*[2]

[1]The Conscious Life Psychological Services in USA ~ Beverly Hills ~ United States of America, [2]Stellenbosch University ~ Cape Town ~ South Africa

According to The Office of the United Nations High Commissioner for Refugees (UNHCR), an estimated 117.3 million people were forcibly displaced worldwide in 2023. This number roughly breaks down into 68.3 million internally displaced persons; 31.6 million refugees under the UNHCR mandate; 6.9 million asylum seekers; 6 million refugees under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East; and 5.8 million of others in need of international protection. Shifts in migration patterns, change in climate, social inequities compounded by health disparities, and overall environments marked by poverty and violence greatly impact the health of immigrants. Im/migrants tend to face a range of mental health and physical challenges. They are at heightened risk of isolation discrimination, exclusion, exploitation, trafficking, detention and deportation.

Globally, we are living in a time of great division and turmoil with regard to the plight of immigrants and refugees. Politics of fear and xenophobia bring great distortion to our communities, and make even the most basic acts of humanity more of an exception than the norm. Regardless of an immigrant's particular path into the host county, all of this as well as fear for personal safety, loss of control over their circumstances, and uncertainty about the future can contribute to anxiety, depression, post-traumatic stress disorder (PTSD), and other mental health symptoms—often persisting long after their arrival. This presentation will illuminate ways clinicians and advocates can work to provide care that focuses on cultural adaptation, trauma-informed care, and accessibility.

Abstract 3886

INTEGRATING WHOLE-CHILD AND ONE-HEALTH PERSPECTIVES IN EARLY DEVELOPMENT: A HEALTH PSYCHOLOGY LENS

Kolopaking R.*[1], Dockrell J.[2]

[1]Universitas Indonesia ~ Jakarta ~ Indonesia, [2]University College London ~ London ~ United Kingdom

Introduction

The Whole-Child and One-Health perspectives open new angles for understanding how children's development is shaped by the interaction of biological, nutritional, and psychosocial systems. Within the UKRI–GCRF Action Against Stunting Hub (AASH), psychologists collaborate with nutritionists, health scientists, and educators to explore how maternal well-being, caregiving, and learning environments influence early growth and learning in India, Indonesia, and Senegal. This interdisciplinary work advances SDG 3 (Good Health and Well-being) and SDG 4 (Quality Education) by promoting a holistic view of early development.

Purpose

This study investigates how maternal mental health, home and preschool learning environments, and early stimulation interact with biological and nutritional risks to shape children's cognitive, language, and motor outcomes.

Method

The AASH is a longitudinal, multisector study that follows mothers from pregnancy through their children's first two years, integrating biological, nutritional, and psychosocial data. Using a Whole-Child framework, data across the three countries were harmonised to link child growth, maternal well-being, home stimulation, and learning contexts. Psychologists contributed to construct mapping, tool adaptation (Bayley-4, IDELA, HOME, MELE), and integration of caregiver and educational indicators. Indonesia, presented as a case example, included 633 mother–child pairs and illustrates how maternal mental health, food environment, and caregiver stimulation relate to child cognition, language, and motor development.

Results and Implications

Across countries, children of mothers with better mental health and richer learning environments achieved higher developmental scores. In Indonesia, preschool participation enhanced school readiness, especially in socio-emotional, motor, and executive-function domains.

Conclusion

Expanding the One-Health framework to include the child's developmental ecosystem highlights how biological and psychosocial risks combine to create a "double disadvantage" for stunted children. By strengthening maternal mental health, caregiver–child engagement, and access to quality early education, Health Psychology can play a

vital role in advancing equitable, Whole-Child development

Abstract 3887

WARTIME WORKABILITY, STRESS AND PRO-INFLAMMATORY CYTOKINES IN A GROUP OF HOSPITAL HEALTHCARE PROFESSIONALS

Blum A.*, Kushnir T.

Ariel University ~ Ariel ~ Israel

Background:
Existing literature has demonstrated a connection between exposure to natural disasters and specific collective traumatic events such as wars, and mental health. Healthcare professionals in hospitals working in intense conclict zones are exposed to threats to their life while coping with the burden of responsibility to patients' health. These circumstances may affect their psychological wellbeing as well as their workability, i.e. their capacity to meet the physical, functional and mental demands of their job. There have been no investigations of wartime threats and workability among healthcare professionals in hospitals, nor on the associated biologic mechanisms in this group of employees.
Method:
Healthy healthcare professionals (n=90) who worked in a hospital located in Israel were assessed for perceived workability, perceived stress, life satisfaction and the concentrations of the pro-inflammatory cytokines interleukin-1 (IL-1), interleukin-6 (IL-6), and tumor necrosis factor alpha (TNF-α).
Results:
We found significant inverse correlations between workability and pro-inflammatory cytokines IL-1 IL-6. Workability was significantly and positively associated with life satisfaction (.375, $p<.05$) and negatively with perceived stress (-.447, $p<.01$). Surprisingly, almost 70% of the healthcare professionals had a high score of workability i.e. they believed they could successfully handle the stressful demands under the pervasive danger to provide medical care and empathic compassion to patients. It could be that maintaining high levels of perceived workability is a marker of psychological and physical resilience in times of intense war threats.
Discussion:
This is the first study that examined workability and the biological profiles of hospital-healthcare professionals who worked under constant threat of missile attacks during wartime.

HARNESSING BEHAVIORAL INSIGHTS FOR MORE IMPACTFUL HEALTH INTERVENTIONS ACROSS POPULATIONS

Thursday 23 July 2026 from 11:30 to 13:00

(E- Spadolini)

Konstadina Griva (Nanyang Technological University of Sing), Chair and Presenter

Behavioral insights are essential in disease prevention and health promotion. The dynamic process of adapting to and managing chronic diseases or health risks is influenced by illness characteristics, life stages, and social relationships. This symposium highlights innovative research on adaptation to chronic conditions and health risks, showcasing diverse methodologies, from observational studies of dyads to experimental and randomized controlled trials (RCTs) of various interventions (digital, blended, group) across populations. The first presentation employs advanced network analysis to examine dynamic relationships between outcomes in cardiovascular patients and their spouses. Using data from two prospective dyadic studies, it identifies key intervention targets, such as control perceptions, by mapping outcome clusters and network parameters. The second presentation evaluates the GET intervention, an RCT for young males with cancer. Rooted in self-regulation theory, the study shows benefits for clinical and emotional adjustment outcomes, combining patient-reported data with clinical biomarkers. The third presentation discusses a blended mHealth intervention to prevent non-communicable diseases (NCDs) in at-risk young adults. This Sequential, Multiple Assignment, Randomized Controlled Trial (SMART) uses step-up care and re-randomization for non-responders, focusing on mental health, diet, physical activity, and sleep among 650 participants. Another presentation explores the role of mindfulness in preventive health behaviors, highlighting experimental evidence on its effectiveness for sleep health and health screening acceptance, an innovative yet underused public health approach. Finally, the last presentation evaluates an RCT pairing functional electrical stimulation (FES) with behavioral strategies for stroke rehabilitation. It emphasizes how behavioral techniques can enhance the acceptability and use of rehabilitative devices, facilitating home-based recovery and bridging the gap between intervention and routine care. This symposium offers a comprehensive exploration of behavioral health research, featuring novel methods and practical applications across diverse populations and conditions.

Abstract 4369

MAPPING DYADIC ADAPTATION TO CARDIOVASCULAR DISEASE: A NETWORK ANALYSIS OF ILLNESS PERCEPTIONS AND WELL-BEING IN PATIENTS AND PARTNERS

Karademas E.*

University Of Crete ~ Crete ~ Greece

Adaptation to a chronic illness is a complex dyadic process for couples, as illness impacts both partners and involves shared management efforts. This study presents findings from two prospective studies that utilized network analysis to explore this intricate process. Network analysis is a powerful methodological approach for examining the complex relationships between interconnected variables. It visualizes these relationships, providing valuable insights into the dynamic links among multiple factors. Both studies focused on illness perceptions and well-being in patients with cardiovascular disease and their spouses. Study 1 investigated the relationships among three illness cognitions —illness acceptance, helplessness, and benefit-finding— and symptoms of anxiety and depression in 75 couples (69 male patients; mean patient age = 60.03 years, SD = 9.44; mean spouse age = 56 years, SD = 8.92). Study 2 explored the interconnections between three illness representations —personal control, treatment control, and illness consequences— and physical and psychological well-being in 104 couples (79 male patients; mean patient age = 64.36 years, SD = 11.75; mean spouse age = 60.04 years, SD = 13.94). The results revealed distinct clusters: patient and partner illness perceptions grouped together, while patient and partner well-being formed a separate cluster. These clusters were interconnected by patient depressive symptoms in Study 1 and by spouse emotional well-being and patient personal control in Study 2. Furthermore, illness perceptions in both patients and partners were linked to well-being through a rich network of indirect connections. The variables most critical to these connections related to perceived control over illness and its impact. Overall, the findings provide a comprehensive understanding of dyadic adaptation to illness, highlighting key factors and processes —such as emotional responses to illness, perceived illness impact, and sense of control— that can inform interventions aiming at improving adaptation for patients and their partners.

Abstract 4370

A BIOBEHAVIORAL INTERVENTION MODEL TO ADDRESS ADVERSE OUTCOMES IN YOUNG ADULT MEN AFTER CANCER

Hoyt M.*

University of California Irvine ~ Irvine ~ United States of America

Cancer diagnosis and treatment can disrupt the pursuit of life goals that are hallmarks of young adulthood and enhance risk for immediate and longer-term physical and psychological adverse outcomes. Goal navigation skills, including the ability to clarify values and identify new and existing goals, might play a role in regulation of stress-sensitive biobehavioral factors, including inflammatory processes that are often associated with a host of physical and psychological symptoms. We developed Goal-focused Emotion-regulation Therapy (GET) to improve distress symptoms, emotion regulation, and goal navigation skills. GET is designed to improve distress symptoms, emotion regulation, and goal navigation skills, which would be expected to improve regulation of stress-sensitive biomarkers. This talk will present a series of studies to develop and establish the feasibility of GET in young adult men with testicular cancer, with a focus on a randomized trial evaluating the impact of GET on psychological, biological, and clinical outcomes relative to a time-matched control group. In this study, young adult men with testicular cancer who had undergone chemotherapy within the last two years were randomized to GET or individual supportive therapy (ISP) delivered over 8 weeks. Assessments were taken at baseline, post-intervention, and again 3-months later. This included stress and immune biomarker measurement. Then, results from a follow-up open trial with young adult Hispanic men with testicular will be presented with a focus on impact on psychological adjustment, inflammatory biomarkers, and epigenetic markers of self-regulation. Finally, future directions and current work, including studies of GET in other populations will be discussed. Despite the substantial adverse psychological impact of testicular cancer, few interventions have sought to improve psychosocial functioning and stress-related biomarkers in young adult survivors. GET, an intervention designed to promote goal-related and emotion-focused self-regulation, has potential to mitigate stress-related processes and inflammation in this young adult survivor group.

Abstract 4371

THE LVL UP TRIAL: A SEQUENTIAL, MULTIPLE ASSIGNMENT, RANDOMIZED CONTROLLED TRIAL TO ASSESS THE EFFECTIVENESS OF A BLENDED MOBILE LIFESTYLE INTERVENTION

Griva K.*

Lee Kong Chian School of Medicine Nanyang Technological University ~ Singapore ~ Singapore

Background: Blended mobile health (mHealth) interventions – combining self-guided and human support components – could play a major role in preventing non-communicable diseases (NCDs) and common mental disorders (CMDs). This sequential, multiple assignment, randomised trial aimed to (i) evaluate the effectiveness and cost-effectiveness of LvL UP, an mHealth lifestyle intervention for the prevention of NCDs and CMDs, and (ii) establish the optimal blended approach in LvL UP for effective personalised lifestyle support and scalability.

Methods: LvL UP is a 6-month mHealth holistic intervention targeting physical activity, diet, and emotional regulation. A total of 640 adults at risk of developing NCDs were randomly allocated to LvL UP' or 'comparison'. At 4 weeks, non-responders were e re-randomised into (i) continuing with the initial intervention (LvL UP) or (ii) additional motivational interviewing (MI) coaching sessions). Assessments were taken at baseline and 6-and 12-months post intervention. These included The primary outcome is mental well-being (primary outcome) and anthropometric measurements, resting blood pressure, blood metabolic profile, health status, and health behaviours (physical activity, diet) (secondary outcomes).

The analyses will follow the intention-to-treat principle. Several process indicators (e.g., engagement) will also be assessed. The findings will have strong implications for the further development of psychosocial adaptive interventions to support mental and physical health outcomes in at risk interventions.

In addition to evaluating the effectiveness of LvL UP, the proposed study design will contribute to increasing evidence on how to introduce human support in mHealth interventions to maximise their effectiveness while remaining scalable

Abstract 4373

INTEGRATING BEHAVIORAL MEDICINE WITH PHYSIOTHERAPY TO IMPROVE TREATMENT ADHERENCE AND PERFORMANCE: A RANDOMIZED CONTROLLED TRIAL FOR PHYSICAL REHABILITATION OF STROKE PATIENTS

She R.*

The Hong Kong Polytechnic University ~ Hong Kong ~ China

Background: Stroke often leads to motor function impairment, necessitating long-term rehabilitation. Functional electrical stimulation (FES) is a promising treatment for foot drop and can be effectively utilized in home settings with wearable devices. This study evaluated the feasibility and acceptability of a home-based FES intervention, both alone and integrated with a behavioral implementation intention (II) intervention, in enhancing physical function among stroke patients, compared to a control group.

Method: Stroke patients, within 5 years post-stroke and with impaired ankle voluntary movement, were randomly assigned to one of three groups: (1) home-based FES training with walking for at least 1 hour per day for 2 months; (2) FES combined with II, which involved forming specific if-then action and coping plans for daily FES training, developed through focus groups and reinforced with two follow-up phone calls; (3) a control group receiving upper limb exercise training. Recruitment, randomization, and retention rates were documented. Secondary outcomes, including walking speed, balance, and adherence, were measured at baseline, and 0, 2, and 4 months post intervention. Qualitative interviews were conducted at the end of the trial.

Results: The study successfully recruited and retained 16 participants within two months, with no major issues in intervention delivery and no baseline differences across groups. Generalized estimating equations will be used to assess the preliminary efficacy of the interventions.

Conclusions: The feasibility of this three-arm trial was preliminarily supported, and the results will inform the design of a larger trial. Both the combined intervention group and the home-based FES intervention alone group are expected to demonstrate superior physical function outcomes compared to the control group.

GENDER DIFFERENCE IN BIDIRECTIONAL RELATIONSHIP BETWEEN MATERNAL AND ADOLESCENT ANXIETY: A CROSS-LAGGED PANEL NETWORK ANALYSIS

Liu M.*

Beijing Normal University ~ Beijing ~ China

Maternal and adolescent anxiety are known to be interrelated, yet little is known about how specific symptoms influence each other over time. This study adopted a symptom-level approach to explore the dynamic, bidirectional relationship of anxiety between mothers and adolescents, focusing on gender differences. A total of 924 Chinese adolescents (58.4% girls; Mage = 15.08 years, SD = 1.83) and their mothers (Mage = 42.23 years, SD = 4.49) were participated in a two-wave longitudinal study with a six-month interval. At both time points, participants completed the questionnaires assessing for anxiety. Cross-lagged panel network (CLPN) analysis was conducted to examine the directional links between maternal and adolescent anxiety symptoms. The analysis revealed that M7 (feeling afraid) was found to negatively predict adolescent symptoms such as C1 (nervousness) and C2 (uncontrollable worry). C2 (uncontrollable worry) negatively, while C5 (restlessness) positively, predicted M4 (trouble relaxing). Additionally, C2 (uncontrollable worry) is more likely to predict subsequent symptoms while C3 (excessive worry) is more frequently activated by other symptoms. Additionally, girls exhibited different bidirectional associations with their mothers compared to boys. Worry-related symptoms in adolescents appear particularly central and may serve as effective targets for family-focused intervention.

Abstract 1148

REVEALING THE LONGITUDINAL PATHWAY FROM COPING STYLES TO SLEEP QUALITY IN HIGH SCHOOL STUDENTS: THE PERSPECTIVE FROM SLEEP COMPETING ACTIVITIES

Zhang B.*

School of Psychology, Shaanxi Normal University ~ Xi'an ~ China

This study examined the longitudinal relationship between coping styles and sleep quality, as well as the underlying mechanism from the perspective of sleep-competing activities among high school students. We used three-wave longitudinal data collected over one academic semester (representing a complete learning cycle) from a sample of 515 Chinese adolescents aged 14 to 18. Cross-lagged panel model (CLPM) revealed that baseline negative coping style (T1) was associated with subsequent changes in sleep quality (T3), and positive coping style (T1) was associated with better sleep quality (T1) subsequently. Longitudinal mediation analysis revealed that sleep competing activities at T2 mediated the relationship between negative coping style at T1 and sleep quality at T3, as well as the relationship between positive coping style at T1 and sleep quality at T3. These findings may have implications for developing targeted interventions to improve adolescent sleep quality, particularly through coping skills training and sleep hygiene education.

Abstract 1200

EXPLORING THE PATHWAYS FROM STRESS TO POSITIVE PSYCHOLOGICAL FUNCTION THROUGH NATURAL EXPOSURE: A LONGITUDINAL MEDIATION APPROACH

Ding X.*, Liu J., Gan Y.

Peking University ~ Beijing ~ China

Introduction: Adolescence is a key stage of physical and psychological development, during which academic, social, and identity-related pressures significantly affect mental health. Understanding how stress can foster positive growth is vital for promoting well-being. Attention restoration theory indicates that natural environments reduce mental fatigue and enhance positive emotions, yet the mediating role of nature exposure in the stress-growth pathway remains underexplored longitudinally.

Purpose: This study examines whether adolescents' perceived stress fosters positive psychological functions (e.g., engagement, optimism, and perseverance) through the mediating role of natural exposure, revealing a potential "stress-nature-mental growth" pathway.

Method: A three-wave longitudinal study was conducted at three time points from April 2024 to September 2025 with 2663 adolescents in China. Participants completed the Perceived Stress Scale, Nature Exposure Scale, and Chinese EPOCH Measure of Adolescent Well-being. Longitudinal mediation analysis tested nature exposure (T2) as a mediator between perceived stress (T1) and positive psychological function (T3).

Results: The mean age was 14.32 years (SD=1.31), and 53.4% were male and 46.6% female. Longitudinal mediation analysis showed that perceived stress (T1) negatively predicted positive psychological function (T3) (β=-0.35, P<0.0001) and nature exposure (T2) (β=-0.04, P=0.0001). Nature exposure (T2) positively predicted positive psychological function (T3) (β=0.46, P<0.0001). Moreover, nature exposure (T2) significantly mediated the association between perceived stress (T1) and positive psychological function (T3), with an indirect coefficient of -0.0174 and a 95% confidence interval of [-0.0321, -0.0060].

Conclusions: Findings highlight that adolescents adapt to stress by engaging with natural environments, which fosters positive psychological function. Natural exposure mediated stress into growth, underscoring the need for educators and parents to promote nature immersion as a strategy for stress management and mental health.

Abstract 1857

THE JOURNEY AFTER DONATION: ASSOCIATING FACTORS OF PSYCHOLOGICAL HEALTH IN LIVING ORGAN DONORS

Bayram--Gülaçtı H.*[1], Bulut B.P.[1], Hazar D.[1], Dogan B.[1], Bostanci E.B.[2]

[1]Ankara Haci Bayram Veli University ~ Ankara ~ Turkey, [2]Ankara Bilkent City Hospital, Clinic of Gastroenterology Surgery ~ Ankara ~ Turkey

There has been a rise in the number of living organ transplants in Türkiye. However, the majority of studies on living organ donation mainly focus on recipients. Research has linked various structural, individual, and environmental factors to psychological health of living organ donors. However, the lack of consensus and limited number of studies regarding the psychological health of donors after transplantation highlight the importance of this study. The current study aimed to examine how demographic, relational, and protective factors predict stress, anxiety, and depression levels of living donors after organ transplant surgery after controlling for pre-surgery psychological health. A total of 51 (n= 18 kidney, n= 33 liver) adult donors (M= 36.5, SD= 11.5) completed the questionnaires of stress, anxiety, and depression pre-surgery and post-surgery. Demographic variables, relational, protective (social support, secure attachment, resilience), and risk factors (sensory processing sensitivity, neuroticism) were taken as predictors and data for those variables were collected in the pre-surgery period. Three hierarchical regression analyses were conducted for each psychological outcome (depression, anxiety, and stress). After controlling for control variables, the regression models provided significant results for all outcomes[F(9, 82)= 2.367, p= .020, F(9, 82)= 3.907, p< .00, F(9, 82)= 4.262, p< .00, respectively]. Sensory processing sensitivity in pre-surgery was positively associated with post-surgery anxiety (β = .254, p = .028). In addition, pre-surgery depression was associated with the post-surgery depression (β = .352, p = .025); pre-surgery stress was associated with the post-surgery stress (β = .250, p < .001). Other variables in pre-surgery did not predict post-surgery anxiety, depression, and stress. The findings indicated that high sensitivity as an individual difference is a significant factor for the psychological health of donors. Intervention programs targeting this characteristic during surgery preparation period may be crucial for donors' psychological health after surgery.

ASPECTS OF LIVING A GOOD LIFE IN EAST ASIA

Thursday 23 July 2026 from 14:00 to 15:30

(E- Spadolini)

Hoon-Seok Choi (Sungkyunkwan University ~ Seoul ~ Korea,), Chair and Presenter
Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Discussant

In this symposium, we discuss various issues related to individual well-being in East Asia. Choi argues that a simple dichotomy between individualism and collectivism does not adequately capture the dynamic changes in highly industrialized Asian countries, where people must negotiate their experiences between traditional collectivistic values and the Western notion of independence. Along these lines, Choi proposes that a combination of collectivistic values and independent self-views promotes individuals' functioning in the social world, thereby positively affecting their mental and physical health in Korea. Ohtaka examines the link between place attachment and well-being in Japan and introduces empirical data showing that enhancing the natural environment in urban areas and improving convenience in rural areas may increase people's place attachment, promote their well-being, trust in society, and active community participation. Hashimoto examines how online communication—especially the rise of social media—shapes our everyday moral life and sense of well-being. He introduces a study with Japanese participants, showing that individuals' praise-seeking motives predict their willingness to engage in online shaming, but this effect is moderated by whether the situational norm supports or discourages shaming. From these, he discusses how online spaces affect how people "live a good life" by simultaneously satisfying and threatening the psychological needs of belonging and moral standing. Cho argues that cultural contexts shape how individuals engage cognitive resources across the lifespan. She introduces cross-cultural behavioral and neuroimaging data indicating that the interplay of age and culture in memory depends on cognitive load and processing demands rather than reflecting fixed differences between cultural groups. She argues that for aging societies such as Korea and Japan, this finding highlights the importance of examining when and how culture shapes cognition across adulthood.

Abstract 3877

THE COMBINED ROLE OF COLLECTIVISTIC VALUES AND INDEPENDENT SELF-VIEWS IN CONSTRUCTING A HEALTHY LIFE

Choi H.*

Sungkyunkwan University ~ Seoul ~ Korea, Republic of

We are all social animals, and thus, a well-lived life cannot be separated from the cultural context in which individuals define and accomplish a good life. Reflecting this, attempts have been made to understand the link between culture and flourishing (broadly defined). Much of this work relied on individualism-collectivism (I-C) as an analytic tool. It produced descriptive knowledge on how I-C is associated with various indices of flourishing across nations. Though informative, this sort of comparative study suffers from inconsistent findings, suggesting that asking whether one form of culture is better than the other may be too simplistic and even dangerous. Indeed, an emerging conclusion from previous research on the culture-flourishing link is that, in an extreme form, neither individualism nor collectivism is desirable. More importantly, a simple dichotomy between I-C does not adequately capture the dynamic changes in highly industrialized Asian countries where people must negotiate their experiences between the traditional collectivistic values and the Western notion of independence. Building on a synergy model of I-C (Choi, 2016; Choi, Seo, Cho, & Bechtoldt, 2017), we propose that a combination of collectivistic values and independent self-views promotes individuals' functioning in the social world, thereby having a positive impact on their mental and physical health. We present data from organizational surveys involving Korean employees and specify the underlying psychological mechanisms of the proposed combinatorial effect. We also present our analyses of the World Values Survey (Wave 6, 2010-2014), which tested our predictions across clusters of individualistic and collectivistic countries. We discuss the implications of our findings in promoting conditions for individual and collective flourishing. We also discuss directions for future research in health psychology and other related fields.

Abstract 3878

DIFFERENCES IN FACTORS CONTRIBUTING TO PLACE ATTACHMENT BASED ON POPULATION DENSITY IN JAPAN

Ohtaka M.*

Toyo University ~ Tokyo ~ Japan

Place attachment refers to 'the bonding that occurs between individuals and their meaningful environments', and its association with community participation and well-being has been clearly demonstrated. It has two aspects: social (e.g. social capital) and physical (e.g. nature and convenience). A previous study shows that the social aspect contributes more robustly to place attachment than does the physical aspect. Furthermore, although previous studies suggest that factors contributing to place attachment differ between urban and rural areas, this has not yet been empirically demonstrated. This study, therefore, examined whether these factors vary with population density, conducting a secondary analysis of large-scale survey data in Japan. It analysed 1,394 Japanese adults (764 men; 630 women), who answered all items and responded correctly to the satisficing items. Average participant age was 43.47 years (range 18–75, SD = 10.62). Participants were divided into four groups considering the population density of their municipality of residence. Structural equation modelling was used to conduct a simultaneous multigroup analysis for each group (CFI =.97, RMSEA =.02). Moreover, an ANOVA was conducted with four groups based on population density as the independent variable. The results indicated that areas with higher population density exhibited stronger place attachment and greater convenience but had less nature and social capital. Based on the ANOVA results, the findings from the multigroup analysis suggest that social capital substantially contributes to place attachment, regardless of whether an area is rich in it. However, nature contributes to place attachment in high-density areas where nature is not rich, whereas convenience contributes to place attachment in low-density areas where convenience is lacking. Therefore, enhancing the natural environment in urban areas and improving convenience in rural areas may increase people's place attachment, promote their well-being, trust in society, and active community participation.

Abstract 3879

LIVING WELL IN THE DIGITAL AGE: THE SOCIAL-PSYCHOLOGICAL DYNAMICS OF ONLINE COMMUNICATION AND SHAMING

Hashimoto T.*

Toyo University ~ Tokyo ~ Japan

This talk examines how online communication—especially the rise of social media—shapes our everyday moral life and sense of well-being. Digital platforms have become indispensable spaces for social interaction, self-expression, and moral discourse. While these technologies enable connection and collective action, they also generate new psychological and social challenges. As an empirical illustration, I will introduce recent research on online shaming, in which individuals publicly condemn moral transgressions via social media. In a study based on Japanese participants, we found that individuals' praise-seeking motives predict their willingness to engage in online shaming, but this effect was moderated by whether the situational norm supported or discouraged shaming. The findings highlight the powerful roles of both the individual motives and the social context in guiding online moral behaviors. By situating these results within the broader cultural frameworks of East Asia, characterized by strong interdependence and sensitivity to social evaluation, I will discuss how online spaces affect how people "live a good life" by simultaneously satisfying and threatening psychological needs of belonging and moral standing.

Abstract 3880

AGING, CULTURE, AND MEMORY: TASK-DEPENDENT INTERACTIONS AND COGNITIVE RESOURCES IN LATER LIFE

Cho I.*

Sungkyunkwan University ~ Seoul ~ Korea, Republic of

Most research on cognitive aging has emphasized universal mechanisms of decline, but cultural contexts shape how individuals engage cognitive resources across the lifespan. In this talk, some recent theoretical and empirical works that highlight the important joint effects of age and culture on cognition, with these effects depending on task demands and the availability of cognitive resources will be reviewed. A lifespan perspective suggests that culture-specific cognitive tendencies may be expressed when resources are sufficient but diminish when tasks place high demands on processing. Supporting this view, cross-cultural behavioral and neuroimaging findings reveal that cultural differences in memory performance are maintained for less cognitive-demanding memory retrieval but are reduced for relatively greater cognitive-demanding memory retrieval. These results indicate that the interplay of age and culture in memory depends on cognitive load and processing demands rather than reflecting fixed differences between cultural groups. For aging societies such as Korea and Japan, this perspective highlights the importance of examining when and how culture shapes cognition across adulthood. Although direct implications for well-being or intervention remain to be tested, understanding these conditional patterns can guide future work on sustaining meaningful cognitive engagement in diverse older populations.

PERSONALITY TRAITS AND CO-DEPENDENCE: VARIABLE CORRELATIONS ACROSS SEVERITY LEVELS

Ershova R.*[1], Sokolova A.[2]

[1]People friendship University of Russia named after Patrice Lumumba ~ Moscow ~ Russian Federation, [2]CBT-terapist, private practice ~ Volgograd ~ Russian Federation

The study of co-dependence in relation with the personality traits is important due to its negative impact on mental and health, and well-being. The objective of the present study was to examine the relationships between co-dependence and personality traits at different levels of co-dependence severity.

The Multi-factor Co-dependency Scale (Ershova & Sokolova) and the Big Five Questionnaire (Caprara et al., 2007) were utilised. 279 respondents between 19 and 39 years (68 males, M= 21.7 years; 211 females, M= 24.3 years) completed the online forms under anonymous conditions.

The findings indicated a non-linear correlation between variables of co-dependence and personality traits: the strongest association at moderate levels of codependence. The cognitive and regulatory factors of co-dependence are most closely associated with personality traits. Correlation between the BFQ-2 subscale 'Impulse Control' and 'Emotional Control' with codependence confirmed the hypotheses concerning the emotional sphere of co-dependents: their propensity to suppress, and disregard emotions.

Abstract 4542

THE COSTS AND CONSEQUENCES OF BEING A MAXIMIZER

Hertel M.*[1], Cheek N.[2], Shiner R.[3], Wolff H.[1]

[1]University of Cologne ~ Cologne ~ Germany, [2]University of Maryland ~ College Park ~ United States of America, [3]Colgate University ~ New York ~ United States of America

Over the past two decades, research on interindividual differences in decision-making has often focused on the distinction between maximizers, who (over)invest effort to find the best possible option, and satisficers, who select an option they consider good enough (Cheek & Schwartz, 2016). Although these constructs have been applied to various contexts such as consumer behavior, relationships, or job searches, there has been little consensus on their conceptualization and measurement, leading to inconsistencies in assessment and outcomes (Cheek & Schwartz, 2016; Misuraca et al., 2018). To address this issue, we positioned maximizing within a nomological network of personality and decision-making constructs and developed a new scale using exploratory and confirmatory factor analyses. Using a daily diary study, we examined the costs associated with maximizing in daily life and its effects on mental health, including depression, anankastia, and anxiety.

SPONTANEOUS SELF-AFFIRMATION IN RELATION TO BODY SATISFACTION AND NEGATIVE EATING ATTITUDES

Okta Z.N., Ceylan C., Kaynak Malatyali M.*

Çanakkale Onsekiz Mart University ~ Çanakkale ~ Turkey

Spontaneous self-affirmation refers to the natural tendency to reflect on one's strengths, values, or social relationships when encountering everyday psychological threats. Previous research has identified spontaneous self-affirmation as a personal resource linked to adaptive outcomes, including enhanced well-being. The present study aimed to extend this literature by examining whether spontaneous self-affirmation is associated with positive body perceptions and eating attitudes among university students. Specifically, it investigated the associations among spontaneous self-affirmation, body satisfaction, and negative eating attitudes, as well as the mediating role of body satisfaction in the relationship between spontaneous self-affirmation and negative eating attitudes. Participants were 285 university students (185 women, 100 men). They completed self-report measures assessing spontaneous self-affirmation, body satisfaction, and negative eating attitudes. Results revealed that spontaneous self-affirmation was associated with increased body satisfaction, whereas body satisfaction was related to decreased negative eating attitudes. Moreover, mediation analysis indicated that body satisfaction mediated the association between spontaneous self-affirmation and negative eating attitudes. Specifically, higher levels of spontaneous self-affirmation were associated with greater body satisfaction, which, in turn, was linked to fewer negative eating attitudes. In conclusion, these findings highlight the potential of spontaneous self-affirmation as a psychological resource related to more positive body perceptions and healthier eating attitudes among young adults.

Abstract 999

THE BRIDGE OF DYSREGULATION: HOW EMOTION REGULATION DIFFICULTIES CONNECT SOMATIC SYMPTOMS WITH ANXIETY AND DEPRESSION

Wu X.*, Liu J., Huang H., Gan Y.

Peking University ~ Beijing ~ China

Introduction: The frequent comorbidity of somatic symptoms, anxiety, and depression in adolescence is well-documented, yet underlying mechanisms remain under-investigated. Emotion regulation difficulties (ERD; comprising awareness, clarity, non-acceptance, goals, impulse, and strategies) are hypothesized to be a critical transdiagnostic process linking these symptoms.

Purpose: Guided by the theory of constructed emotion, this three-wave longitudinal study examined bidirectional relationships between somatic symptoms, anxiety, depression, and ERD in Chinese adolescents. We tested the mediating role of ERD, explored potential gender differences, and investigated the dynamic contributions of specific ERD domains.

Method: A sample of 1,687 adolescents (M_age = 14.46, SD = 1.34; 51.2% female) completed surveys at three time points. We employed a random intercept cross-lagged panel model (RI-CLPM) to disentangle within-person dynamics from stable between-person differences, followed by longitudinal mediation analyses. Cross-Lagged Panel Network Analysis (CLNA) was then used to identify temporal dynamics among ERD domains.

Results: RI-CLPM showed distinct pathways: somatic symptoms predicted ERD, which in turn predicted anxiety, indicating indirect-only effects. Depression demonstrated reciprocal links with both ERD and somatic symptoms, with ERD mediating these associations. Gender differences emerged in the stable, trait-level associations for depression: these constructs were largely independent in males but showed significant covariance in females. CLNA revealed that certain domains, notably clarity and strategies, were contemporaneously tied to both symptoms, with clarity prospectively predicting anxiety.

Conclusions: Emotion regulation difficulties function as a crucial mechanistic bridge between somatic and internalizing symptoms in adolescents, although its architecture differs for anxiety and depression. These findings underscore ERD as a key transdiagnostic target for interventions, and suggesting that targeting emotional clarity may be particularly effective in preventing the maintenance of anxiety among adolescents with somatic symptoms.

Abstract 2610

DO INDIVIDUALS WITH HIGH ALEXITHYMIA TRULY EXPERIENCE STRONG EMOTIONS IN THEIR DREAMS?

Yoshioka Y.*

Kwansei Gakuin University ~ Nisinomiya ~ Japan

Alexithymia, characterized by difficulty identifying and describing feelings (DIF, DDF) and an externally oriented thinking style, has been linked to intensified negative emotions in dreams. However, it remains unclear whether individuals with high alexithymia truly experience stronger dream emotions, or whether this reflects a bias in emotional recognition after awakening. To address this question, 282 Japanese adults completed the 20-item Toronto Alexithymia Scale (TAS-20) and the Mannheim Dream Questionnaire (MADRE), and rated eight emotions (four positive, four negative) experienced in their most recent dream. Correlational and regression analyses showed that the Difficulty Identifying Feelings (DIF) subscale consistently predicted stronger overall dream emotion, a more negative tone, and greater nightmare frequency and distress. No significant associations were observed between alexithymia and positive emotions. To further verify whether these intense reports reflected actual experience, a supplementary analysis compared subjective and objective ratings based on the same dream texts (N = 278). The two ratings were moderately to highly correlated (r = .59–.82), yet subjective scores were systematically higher than objective ones. Moreover, higher DIF predicted larger discrepancies between subjective and objective ratings of negative emotions ($\beta = .20$, $p < .05$). These findings suggest that individuals with high alexithymia, particularly those with high DIF, may not necessarily experience stronger emotions during dreaming, but rather overestimate their emotional intensity due to difficulties in identifying and labeling affective states. Together, the results highlight how emotional awareness influences dream experience and underscore the importance of combining subjective and objective approaches to understanding emotion in dreams.

THE FUTURE OF HEALTH PSYCHOLOGY: STRENGTHS, LIMITS, CHALLENGES AND DIRECTIONS

Thursday 23 July 2026 from 15:30 to 17:00

(G-Spadolini)

Veronica Velasco (Milano-Bicocca University ~ Milan ~ Ital), Chair and Discussant

Health psychology has numerous areas of application and requires consideration of the complexity of individuals, groups, organizations, and communities. Moreover, the continuous changes in our society and social contexts demand constant adaptation and progress.
The symposium aims to discuss the strengths, limitations, challenges, and future directions of health psychology. It will involve several international scientific societies related to health psychology and its applications, with the goal of comparing different perspectives and approaches.
The symposium will feature:
- The International Union for Health Promotion and Education (IUHPE), an intersectoral society focused on health promotion, individuals and communities empowerment and health equity;
- The European Network for Positive Psychology (ENPP), a European non-profit organization committed to sharing knowledge and research on positive psychology and improving wellbeing;
- The Practical Health Psychology (PHP), a blog affiliated with the European Health Psychology Society dedicated to sharing the latest health psychology research and how to apply it in real-world practice. Its mission is to translate high-quality health psychology research into clear, actionable insights for healthcare professionals, public health workers, and intervention designers;
- The International Association of Applied Psychology – Division Health Psychology (IAAP 8) aimed at connecting health psychologists around the world. It is currently the second largest division of IAAP, our members come from all parts of the world.

The discussion will help identify future directions for both researches and practitioners. It will also provide an opportunity to integrate diverse perspectives within health psychology and foster connections among international societies in this field.

Abstract 3761

THE PLACE OF BEHAVIOUR AND PSYCHOLOGY IN HEALTH PROMOTION

Van Den Broucke S.*

Université catholique de Louvain ~ Louvain-la-Neuve ~ Belgium

Health promotion has an ambivalent relationship with behaviour and behaviour change. While the emergence of health promotion and its place within public health is rooted in the recognition of lifestyle factors as leading causes of chronic illnesses and injuries, health promotion has distanced itself from a narrow focus on individual behaviour change, by empowering people and communities to address the environmental, social and political factors that determine health. This 'paradigm shift' laid a basis for the criticism that actions aimed at changing individual health lifestyles are ineffective, as they do not sufficiently account for the interdependencies of behaviours, and unethical, as they blame individuals for being unsuccessful in adopting healthy lifestyles largely shaped by the social and physical context.

However, health promotion should not abandon the concept of behaviour change. While health and illness are indeed linked to broader social and environmental determinants such as education, SES, gender or ethnic background, these moderate the exposure to conditions with immediate effects, including behaviour. Abandoning behaviour would also mean a loss of the potential to apply new developments and insights from behavioural research, such as compensatory beliefs, goal achievement or nudging into public health practice. Applying behaviour change theory allows investigating the interactions between structural and policy changes, community empowerment, behaviour, and health. Although behaviour change principles are mostly used in 'downstream' interventions aimed at influencing the behaviour of the population, they can also be used to achieve structural change through 'midstream' or 'upstream' interventions.

In this presentation, we will argue why behaviour remains an important concept for health promotion, and how health psychology and 'behavioural insight' can help to further develop the theory and practice of health promotion by exploring new theoretical developments, applying and testing state-of-the art knowledge, and integrating these to address the complexity of health and behaviour change.

Abstract 3762

THE FUTURE OF HEALTH PSYCHOLOGY: STRENGTHS, LIMITS, CHALLENGES AND DIRECTIONS - HOW CAN POSITIVE PSYCHOLOGY CONTRIBUTE?

Martin--Krumm C.*

Ecole de Psychologues Praticiens de Paris - affiliated UMR 1319 INSPIIRE; Lorraine University ~ Paris ~ France

The uncertainty of the international context and the difficulties encountered by populations in different countries are giving rise to new health issues and psychological distress. The conflict in Ukraine, the COVID pandemic, and more broadly the context in which populations live on a daily basis are likely to make the most vulnerable even more exposed to the expression of various disorders. Among the consequences observed are a 63% increase in suicide attempts among 11-14 year olds and a 42% increase among 15-19 year olds, as well as a 37% increase in November 2024 in the number of psychiatric consultations among children under 18. Anxiety and mood disorders, as well as suicidal thoughts, are on the rise. These are just examples of the situation in France. Other populations are also heavily impacted, including certain professions and age groups, with differences between men and women. Of the approximately 85,000 people hospitalised at least once in connection with self-harm in 2022, 64% are women. How can we understand these observations? Above all, how can we address these different issues? A three-stage approach seems essential: first, prevention; second, treatment; and finally, evaluation of the effectiveness of the measures put in place.

Certain approaches in the field of positive psychology can contribute significantly to this timeframe, both through a strengths-based approach and a ‘positive psychotherapy’ approach. However, rather than viewing it as a ‘revolution’, it should be seen as part of a process of integration into the existing system. This potential contribution of positive psychology will be discussed during this symposium.

Abstract 3763

TRANSLATING EVIDENCE INTO PRACTICE: THE ROLE OF PRACTICAL HEALTH PSYCHOLOGY IN BRIDGING RESEARCH AND REAL-WORLD APPLICATION IN HEALTHCARE PRACTICE

Kwasnicka D.*

University of Melbourne ~ Melbourne, Victoria ~ Australia

Despite the rapid advancement of health psychology research, a persistent gap remains between scientific evidence and its application in everyday health practice. The Practical Health Psychology (PHP) blog, affiliated with the European Health Psychology Society, was created to address this translational challenge. It aims to make cutting-edge health psychology research accessible, actionable, and relevant for practitioners, policymakers, public health professionals, and intervention designers across the world.

This presentation will introduce the PHP initiative, its international scope, and its editorial approach to knowledge translation. By distilling peer-reviewed research into concise, practice-oriented blog posts written by leading health psychology researchers, PHP enhances the uptake of psychological science in applied settings. The blog is available in 30 languages and disseminated across 45 countries by a network of 65 National Editors, reflecting its commitment to equity, accessibility, and global dissemination.

A recent evaluation demonstrated that PHP is accessed by over 200,000 readers worldwide, highlighting the need for practical and applied resources that are contextually relevant and available in local languages. We also published a free eBook, which has been downloaded over 180,000 times across various language options, further demonstrating the demand for high-quality resources for healthcare professionals.

We will discuss how PHP contributes to the broader goals of health psychology, empowering individuals, informing interventions, and supporting evidence-based health promotion. Challenges in bridging research and practice will also be explored, along with strategies to foster collaboration between researchers and practitioners. Finally, the role of platforms like PHP in the future of health psychology will be considered, particularly in terms of strengthening international networks and increasing the societal impact of psychological science.

Abstract 3764

THE FUTURE OF HEALTH PSYCHOLOGY IN TOMORROW'S HEALTH-TECH LANDSCAPE

Gan Y.*

Peking University ~ Beijing ~ China

As president of the IAAP's Health Psychology Division, I will emphasize the importance of a theory-driven, algorithmically embedded, and culturally attuned pathway to well-being. Interdisciplinary collaboration and robust ethical frameworks are essential to guide the responsible integration of health technologies. We will also examine diverse international approaches to clinical validation and cultural adaptation of technology-driven solutions—our paradigm reaffirms these priorities.

Health psychology fundamentally operates along two axes: assessment and intervention. Modern technology now enhances both dimensions simultaneously. For assessment, we employ multimodal measures to capture biomarkers such as heart rate variability, sleep-related micro-movements, and gait rhythms at scale. This generates a continuous stream of objective physiological data, going beyond subjective self-reporting. On the intervention front, mobile health platforms and LLM-powered chatbots deliver micro-cognitive reappraisals and facilitate socio-emotional dialogues. Crucially, data from both domains integrate seamlessly within a unified system. Our approach emphasizes truly personalized intervention matching. By incorporating individual genetic profiles, biomarker baselines, and personal history—thus forming a rich multidimensional user profile—the system identifies and delivers the most appropriate type, timing, intensity, and content of support for each individual. These tools have been effectively deployed to provide just-in-time support for conditions such as loneliness among older adults and for smoking cessation. All these technology-assisted products must be mutually energized with expert knowledge and undergo multiple rounds of iteration to achieve optimal effectiveness.

Ethically, we must confront challenges related to data privacy, algorithmic bias, and the potential dehumanization of care. Moreover, while technology promises greater accessibility, it also risks exacerbating the digital divide. Through cross-society dialogue, this roundtable aims to identify shared priorities, articulate key challenges, and outline a collaborative roadmap for psychology's future in a technology-enabled world—one that harnesses innovation while safeguarding human dignity and scientific integrity.

UNIVERSAL KNOWLEDGE, UNEQUAL VOICE: INTERNATIONALLY EDUCATED HEALTHCARE PROFESSIONALS, VACCINE HESITANCY, AND STRUCTURAL CONSTRAINTS

Hakem Zadeh F.*[1], Neiterman E.[2]

[1]York University ~ Toronto ~ Canada, [2]University of Waterloo ~ Waterloo ~ Canada

Introduction: The recent pandemic has highlighted the need to fast-track the integration of Internationally Educated Healthcare Professionals (IEHPs) into local healthcare systems. Therefore, it is necessary to advance our understanding of how psychological and contextual determinants (i.e. identity, migration history, discrimination, and professional norms) impact IEHPs' health beliefs and behavioural dispositions.

Purpose: This study critically examines how IEHPs navigate vaccine-related decisions, considering their intersecting identities in the context of transitioning between different healthcare systems. It also investigates the role IEHPs perceive themselves as having in shaping the vaccination decisions of others, particularly where patient-provider concordance in culture, language, or migration history enhances their potential influence.

Method: The study draws on 22 qualitative interviews with IEHPs across a range of ethnic, gender, and professional backgrounds currently practicing in Canada. Transcripts were coded using NVivo 2012, following a multi-level intersectional approach. Efforts were made to remain sensitive to power dynamics within healthcare systems and social hierarchies.

Results: Generally, participants expressed pro-vaccine attitudes. Some participants expressed dissatisfaction with the study's questions, arguing that medical knowledge is universal and IEHPs' positions on vaccinations would align with those of individuals trained in Canada. While IEHPs acknowledged the influence of intersecting identities (i.e. sex/gender, race/ethnicity, religion, profession, migration history) on vaccine attitudes, they suggested that IEHPs might be reluctant to voice their vaccine hesitancy due to economic necessity and employment precarity. They believed they could play a crucial role in promoting future public health initiatives among communities with whom they shared language, culture, and migration background.

Conclusions: This study challenges the dominant deficit-based framing of IEHPs and highlights their unique capacity to contribute to culturally aligned health promotion interventions. However, the influence of structural marginalization and employment

precarity on IEHPs' professional autonomy and voice is a potential constraint that requires further investigation.

Abstract 1492

MEN'S CONDOM USE RESISTANCE: THE ROLES OF ADVERSARIAL HETEROSEXUAL BELIEFS, EMOTION REGULATION DIFFICULTIES, AND SEXUAL MOTIVES

Davis K.*[1], Chen W.[2], Bahrami R.[1], Juwadi K.[1], Hammett J.[1]

[1]Arizona State University ~ Phoenix ~ United States of America, [2]University of Wisconsin ~ Madison ~ United States of America

Introduction: Research demonstrates that most young men report having resisted condom use with their female partners. Condom use resistance (CUR) is associated with stronger negative beliefs about women, greater emotion dysregulation, and specific sexual motives. To date, however, no research has examined how these associations may operate at the event level.

Purpose: The purpose of the present study was to assess the role of adversarial heterosexual beliefs (AHB), emotion modulation difficulties, and sexual motives in young men's CUR engagement through an examination of event-level data.

Method: Men aged 21-30 living in the southwestern United States (N = 420) were screened for eligibility, then attended an in-person baseline survey session. They then completed 32 days of online daily surveys assessing their sexual behaviors including CUR, emotion modulation difficulties, and sexual motives.

Results: A total of 1317 daily diaries from the 291 participants (Mage = 25.15, SDage = 2.75) who engaged in vaginal sex over the 32 days were included in a multilevel logistic regression analysis. Results showed that higher AHB (b = 0.74, p < .01) and daily sex motives for power (b = 0.35, p = < .01) were associated with greater daily CUR likelihood. Daily difficulties in emotion modulation increased daily CUR likelihood among men with higher AHB (b = 0.31, p = .02). Daily sex to cope motives increased daily CUR likelihood among men with lower AHB (b = 0.39, p = .02).

Conclusions: Findings indicate that young men's beliefs about women may serve as a key indicator regarding which men may benefit from CUR prevention efforts. Moreover, interventions that target improvements in emotion regulation skills, as well as address reasons for engaging in sexual activity, may also yield CUR reductions. Given CUR's association with sexually transmitted infections and unplanned pregnancies, effective evidence-based CUR interventions are warranted.

Abstract 317

ILLNESS PERCEPTION AMONG CANCER PATIENTS IN INDIA: A PHENOMENOLOGICAL STUDY

Kohli N.*

University of Allahabad ~ Prayagraj ~ India

The objective of this phenomenological study was to investigate the perceptions of illness among cancer patients. The sample consisted of 15 individuals (7 males and eight females) ranging in age from 19 to 80 years, who were recruited through a snowball sampling technique. Multiple interview sessions were conducted using an unstructured interview schedule. The analysis yielded five superordinate themes.

Illness cognition encompassed all five dimensions: identity, consequences, treatment control, personal control, timeline, and causes. However, contrary to Leventhal's (1980) timeline concept, which posits that individuals categorize their illness as acute or chronic based on the perceived duration of the illness, patients in our study perceived their cancer as a condition that has shortened their lives. The findings indicated that some participants were unaware of their diagnosis, leading to a vague and confusing identification or labeling of their symptoms.

In addition to treatment and personal control, participants expressed perceptions of divine control, believing that their recovery rested in the hands of a Supreme Being. A significant consequence of cancer, as revealed in the findings, was the stigma associated with breast and oral cancers, resulting in social discrimination and isolation. Even patients who had completed their treatment remained haunted by the fear of recurrence. The perceptions regarding the causes of cancer, specific to Indian culture, highlighted a belief that the severity of cancer worsened due to the negligence of the treating physician, whom they considered a quack. This underscores the importance of cultural competence in healthcare, shedding light on the diverse beliefs and perceptions of illness.

PSYCHOLOGY, GENDER EQUALITY AND PUBLIC HEALTH IN URUGUAY: SCIENTIFIC KNOWLEDGE IN PUBLIC POLICY DEVELOPMENT

López--Gómez A.*

Universidad de la República ~ Montevideo ~ Uruguay

Introduction: The agenda of health, gender equality, and sexual and reproductive rights constitutes a fundamental pillar for the well-being of contemporary societies. Subjective attitudes, gender norms, and sexual behaviors profoundly impact health and quality of life, making their understanding essential for researchers, decision-makers, and professionals. This global agenda encompasses diverse research topics, methodological approaches, and technical and professional intervention models.
Purpose: This study examines the role of psychology in shaping the public agenda on access to health and gender equality in Uruguay over the past 25 years.
Method: A qualitative study was conducted using semi-structured interviews and focus groups with decision-makers, researchers, health professionals, civil society representatives, and United Nations technical staff. A documentary analysis was conducted as a complementary approach.
Results: Since 1999, the Psychology department at the Uruguayan public university has incorporated a transformative gender approach into its professional training, research and community interventions through the Gender, Sexuality and Reproductive Health Programme at the Institute of Health Psychology. The programme maintains strong regional and international ties with academic institutions and United Nations agencies. The interviewees recognise this academic programme as a key player in policies addressing gender equality, mental health, the prevention of unintended adolescent pregnancy, care for victims of sexual and gender-based violence, and the protection of minors in digital environments.
Conclusions: The consolidation of this academic space at the Universidad de la República has positioned Psychology both professionally and academically within intersectoral and interdisciplinary dialogue on health and well-being policies in Uruguay. This has enabled the provision of quality scientific evidence to inform citizens and the design and evaluation of public policy. This model demonstrates the importance of combining national academic expertise with international frameworks and partnerships to promote gender equality and public health agendas.

Abstract 339

SOCIAL DETERMINANTS OF HEALTH RISK PERCEPTION AT A MASS GATHERING EVENT

Tewari S.*

Indian Institute of Management Indore ~ Indore ~ India

Mass gatherings(MGs) are crowded events that attract millions of people to exceed the capacity of routine health and public safety measures. WHO defines MGs as 'events attended by a sufficient number of people to strain the planning and response resources of a community, state or nation. For effective public health management, the role of psycho-social factors in managing the health-related behaviour of attendees needs to be investigated. Previous research suggests that health risk perception plays a crucial role in shaping individuals' responses to hygiene, sanitation and crowd dynamics. These responses shape health-related behaviour in special reference to infectious diseases. This paper explored the general health-related behaviour among the attendees of one of India's largest religious mass gatherings held post-COVID outbreak, the Kumbh Mela 2021. It examined the role of shared identity among attendees and its impact on health-related behaviour through perceived health risk perception within the special context of Kumbh Mela. The study adopted a mixed-methods approach. 30+ on-spot in-depth interviews were conducted with health professionals who were appointed at the Kumbh Mela to understand their experience of dealing with patients. A survey on a sample of 400 attendees was conducted to assess social determinants of health risk perception, such as shared identity, disgust sensitivity, positive experience and perceived health and wellbeing. Thematic analysis of interviews and a multivariate analysis of the survey reflect that shared social identification leads to better-perceived health and well-being through undermining health risk perceptions in mass gatherings. These findings have important implications for understanding how crowd dynamics may aggravate health risk behaviours in mass gatherings. The present research should contribute to efforts to understand the nature and scope of social identity processes in aggravating and mitigating health behaviour in mass gatherings.

Abstract 1367

DECOLONISING PSYCHOLOGY AND WELLBEING: A RELATIONAL APPROACH TO WORKING WITH FIRST NATIONS YOUTH

Kealey J.*, Scott R., Schaffer K., Burton L.*, Pocock C., Ward R.

University of Southern Queensland ~ Toowoomba ~ Australia

Decolonising psychology in Australia requires a sustained commitment to reshaping research and practice through genuine partnerships with First Nations peoples. Central to this shift is recognition of Social and Emotional Wellbeing (SEWB) as a holistic, culturally grounded framework reflecting First Nations ways of knowing, being, and doing. This presentation examines how psychologists can centre First Nations voices and SEWB frameworks to deliver youth-focused services that are impactful and sustainable, while highlighting the role of allyship in research and service delivery.

This presentation will outline strategies for embedding First Nations leadership and governance across the research-practice continuum. Specifically, we present the development of a culturally sensitive scoping review protocol and literature search. This approach was informed by Indigenous research principles and grounded in the experiences of a regional community-led initiative: the Whaddup Youth Group of Toowoomba, Queensland, Australia. For over 20 years, Whaddup fostered SEWB among Aboriginal and Torres Strait Islander youth - providing a safe, activity-based space for cultural learning and leadership, community connectedness, and developing cultural identity. Despite its community value, Whaddup closed in its previous form due to systemic and organisational constraints. Its closure represents a profound loss for the community and highlights the ongoing need to understand how SEWB programs impact First Nations youth. Findings from the scoping review will be mapped onto Whaddup's impacts and success factors from the community perspective in this presentation, creating a framework to inform future research and practice.

This presentation builds on foundations laid by leading First Nations scholars and the Australian Indigenous Education and Psychology Project (AIEPP), led by Professor Pat Dudgeon. Together, the Whaddup case study and scoping review highlight the importance of privileging Indigenous methodologies, fostering relational accountability, allyship, and resisting deficit-based narratives. This presentation offers a call to move beyond inclusion toward transformation in psychology research and practice.

PSYCHOSOCIAL DRIVERS OF STRESS-RELATED EATING AND DIETARY PATTERNS: A CROSS-COUNTRY STUDY OF PSYCHOLOGICAL FOOD INVOLVEMENT AND HEALTH ENGAGEMENT IN EUROPE

Usta D.*[2], Acampora M.[1], Costa Pereira A.[2], Savarese M.R.[1], Graffigna G.[2]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Università Cattolica del Sacro Cuore ~ Cremona ~ Italy

Background: Psychosocial stress and emotional coping are known to influence dietary behaviors, yet little is known about how these patterns vary across populations or interact with psychological food involvement and health engagement. This study investigates how stress-related eating, food involvement, and health engagement shape dietary behaviors and digestion-related quality of life (DQoL) across five European countries.

Methods: A cross-sectional survey was conducted with 2,324 adults from Denmark, Germany, Italy, Lithuania, and the Netherlands. Measures included Perceived Stress Scale, Salzburg Stress Eating Scale, Altarum Consumer Engagement Scale, Psychological Food Involvement Scale, and Digestion-Associated Quality of Life Questionnaire. Ad hoc items assessed comfort food consumption under stress and its perceived importance. ANOVA, Pearson correlations, and Chi-square tests assessed associations and cross-country differences.

Results: Perceived stress was strongly associated with poorer DQoL ($r=0.510$), while health engagement negatively correlated with stress ($r=-0.115$). Psychological food involvement was positively associated with both health engagement ($r=0.368$) and stress-eating ($r=0.100$). Higher health engagement was more common among women, older adults, and those with higher education. Individuals with greater food involvement were also more likely to value food as a stress-regulation tool. Cross-country comparisons revealed significant psychosocial and behavioral variation. Italians showed the highest engagement and food involvement levels ($p<0.001$) and reported the lowest intake of fast food and sweetened beverages, even under stress. In contrast, Danes reported low engagement and food involvement, and high habitual consumption of sugary snacks and drinks, particularly during stress. Germans and Lithuanians showed more reactive eating patterns, especially for fast food and alcohol. Dutch participants reported high fast-food intake but moderate stress-related eating changes.

Conclusion: The findings reveal psychosocial and cultural variability in stress-eating, health engagement, and food involvement across five European countries. These insights suggest the need for context-sensitive dietary interventions that account for both emotional drivers of eating and national patterns of health orientation.

BEING ALS PATIENT'S FORMAL OR INFORMAL CAREGIVER: PRELIMINARY RESULTS ON HEALTHCARE WORKERS' AND FAMILIAR' PSYCHOLOGICAL WELL-BEING

Zambetti E.*[1], Baronchelli I.[2], Belli S.[3], Mucci C.[1], Greco A.[1]

[1]Università degli Studi di Bergamo ~ Bergamo ~ Italy, [2]Villa Dei Cedri, Residenza Sanitaria Assistenziale ~ Merate (Lecco) ~ Italy, [3]Universidad Complutense de Madrid ~ Madrid ~ Spain

Background: Amyotrophic Lateral Sclerosis (ALS) is a rare neurodegenerative disease affecting about 6,000 people in Italy. Caring for ALS patients impacts the quality of life and psychological well-being of both informal and formal caregivers, yet few studies address this. Purpose: This research aims to analyze various aspects of caregiving for ALS patients among informal (family) and formal (healthcare) caregivers, focusing on psychological well-being, burden, and burnout. Methods: Nine formal caregivers (8 women) and 11 informal caregivers (9 women) participated, recruited from a nursing home in Italy. Formal caregivers' average age is 49.29 years (SD=3.86) with 6.58 means of service (SD=5.98); informal caregivers' average age is 48.30 years (SD=13.50), caring for relatives for 3.29 years (SD=2.50). Psychological well-being, burnout in formal caregivers, and burden in informal caregivers were evaluated, alongside testimonies about their experiences. Mixed-method analyses were employed using nonparametric techniques, Emotional Text Mining using T-Lab Software, discourse analysis, and discourse positioning analysis. Results: Both caregiver groups report high psychological well-being (Mfc=85.86; SDfc=9.03; Mifc=83.10; SDifc=11.44). Formal caregivers exhibit low emotional exhaustion (M=16.67; SD=10.087) and depersonalization (M=2.56; SD=2.19), with moderate personal gratification (M=29.11; SD=11.67; M=27.43; SD=11.29). Informal caregivers report a higher burden related to past situations (M=41.89, SD=18.25) when patients lived at home compared to present circumstances (M=29.09, SD=17.89) in which ALS patients reside in nursing home. Generally, formal caregivers discuss ALS patients' and families' challenges and coping strategies, emphasizing the need for more research. Informal caregivers focus on social and emotional support needs, seeing their role as necessity-based. Discussion: Results indicate a strong impact on the well-being of both caregiver groups, highlighting qualitative differences between formal caregivers and informal caregivers. Future analysis should explore these differences further. The findings provide valuable insights for designing interventions addressing the psychological challenges of both family members and healthcare workers in caregiving contexts.

Abstract 2114

UNDERSTANDING ANTIBIOTIC CONSUMPTION BEHAVIOURS THROUGH THE COM-B MODEL: EVIDENCE FROM ITALIAN CITIZENS

Acampora M.*[1], Graffigna G.[2]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Università Cattolica del Sacro Cuore ~ Cremona ~ Italy

Introduction: Psychology plays a pivotal role in understanding and changing health behaviours. In antimicrobial resistance (AMR), inappropriate consumption and non-adherence are key behavioural drivers. To address AMR it therefore is essential to investigate psychological factors that shape antibiotic-related behaviours.
Purpose: This study applies the COM-B model (Capability, Opportunity, Motivation – Behaviour) to explore psychological factors influencing antibiotic-related behaviours among Italian citizens.
Method: A web-based survey was administered to a representative sample (n=500). The questionnaire included ad hoc items and validated scales. After testing the reliability and factorial structure, linear regression models were performed to examine the associations between COM-B components and self-reported behaviours of antibiotic consumption.
Results: The EFA identified two behavioural domains: adherence to treatment and inappropriate consumption. The regression model for adherence was significant ($F(9,487) = 48.63$, $p < .001$, $R2=.47$). Adherence was positively associated with perceived capability ($\beta = .33$, $p < .001$) and knowledge ($\beta = .23$, $p < .001$), and negatively associated with memory, attention and decision processes ($\beta = –.40$, $p < .001$). The model for inappropriate consumption was also significant ($F(9,487) = 28.11$, $p < .001$; $R^2 = .34$). Inappropriate use was positively associated with social pressure ($\beta = .24$, $p < .001$) and misconceptions ($\beta = .32$, $p < .001$) and negatively associated with knowledge ($\beta = –.09$, $p = .038$) and risk perception ($\beta = –.09$, $p = .019$).
Conclusions: Findings show that antibiotic consumption is not only a matter of knowledge but also of cognitive resources, risk appraisal, and social influence. By mapping these determinants, the COM-B model provides actionable insights for designing interventions that go beyond information campaigns, addressing misconceptions, reducing social pressure, and supporting citizens' capacity to adhere to treatment. Such evidence is critical to inform public health strategies aimed at tackling AMR.

Abstract 870

MEANING OF LIFE: HEADS OF HOUSEHOLD MOTHERS WORKING IN THE HEALTH CARE SECTOR AT A HOSPITAL NETWORK

Bejarano--Castro D.*[1], Enriquez--Guzman S.[1], Velosa J.[2], Forero L.[1], Castro I.[1]

[1]Unisanitas ~ Bogotá ~ Colombia, [2]Subred Centro Oriente Hospital Santa Clara ESE ~ Bogotá ~ Colombia

Objective: Colombia has 23 million women, 50% of them are head of household mothers with vulnerabilities related to work access and an overload of work and family responsibilities. Thus, it is proposed to comprehend the head of the household mothers' meaning of life and self-fulfillment, who currently work in the health care sector at Subred Integrada de Servicios de Salud Centro Oriente (hospital network) of Bogotá, Colombia. Method: The biographical methods were used to obtain the life trajectories of seven participants regarding motherhood, being head of the household mothers, working in the health care sector and meaning of life. There were applied three biographical interviews per participant for a total of 21 interviews. The coding and interpretative analysis were triangulated among the researchers and external experts. Results: The participants acknowledged their motherhood reliant on being head of the household mothers regardless their family's composition. It is also reaffirmed that the motivations, objectives and projections of the participants' meaning of life change according to their vital cycles and courses. As an emerging result, it is found that caring is a continuity in their trajectories. This builds their meaning of life and allows a feeling of self-fulfillment. Conclusions: The findings suggest that the participants' meaning of life is built on caring for others and for themselves in family and work. Furthermore, being a head of household mother is a self-decision and does not make the participants vulnerable as it is perceived by society and Colombian legislation. Finally, working in the healthcare sector is a paradox because its precariousness, but is also an asset to learning and face difficulties in life situations. Thereby, the participants' permanence in a health care work allows for care as a structuring dimension of their meaning of life and self-fulfillment.

ROLE OF CLINICAL HEALTH PSYCHOLOGY IN HEALTHCARE TRANSFORMATION

Ip L.S.L.*

West London NHS Trust ~ London ~ United Kingdom

Background: England's new NHS Ten-Year Plan aims to tackle "wicked" healthcare problems through promoting three major shifts: from hospital to community, from analogue to digital, and from treatment to prevention. Clinical Health Psychology (CHP) plays a critical enabling role across all three shifts. This paper illustrates that role and its impact through the experience of the CHP Service within Ealing Community Partners, West London. Approach: The CHP Service embedded psychologists across physical-health pathways (chronic pain/MSK, diabetes, respiratory, and heart failure). The service model positioned psychologists as: a) Expert clinicians within multidisciplinary teams b) Trainers promoting psychologically informed care c) Facilitators of reflective practice to promote staff wellbeing amidst change d) System leaders driving prevention and quality improvement. Mixed-methods evaluation combined routine outcome measures, service-utilisation data across the care pathway, and qualitative feedback from staff and patients collected through surveys and interviews. Results: Across the four specialty pathways, patients receiving CHP input demonstrated improvement in depression, anxiety, quality of life and specific physical functioning outcomes. Comparing 12months data pre and post first attendance to CHP, there is a 22.2% reduction in A&E attendance, 33.3% reduction in emergency admissions and a 57% reduction in the average length of hospital stay. In addition, staff survey showed positive shift in attitudes and confidence in offering psychologically informed care. Qualitative feedback from patients and staff were positive, highlighting the elements that make care truly integrated such as bio-psycho-social formulation, leveraging psychological expertise in treatment adherence, and to improve communication especially earlier in the care pathway. Implications: Psychology plays a significant role in healthcare transformation beyond individual clinical input. The CHP model in Ealing demonstrates a transferrable framework for integrated services internationally to consider how they might optimize their psychological workforce to achieve the best value.

Abstract 594

UNDERSTANDING SUICIDAL BEHAVIOUR IN EMERGING ADULTS: ROLE OF PARENTAL INVOLVEMENT, SOCIAL SUPPORT AND PEER EXPERIENCES

Shashwati S.*

Patna University ~ Patna ~ India

In the recent past the cases of suicide among emerging adults in India have been a major concern. According to National Crime Record Bureau (NCRB), India there have been persistently elevated rate of suicide among emerging adults over the years 2017–2022, with numbers remaining consistently high (7.6% in 2017, 8.2% in 2020, 8% in 2021, and 7.6% in 2022). As per the NCRB data various causes of adult suicide are professional/career problems, sense of isolation, abuse, violence, family problems, mental disorders, addiction to alcohol, financial loss, chronic pain etc. Researchers also reported that mental pain, social challenges and need for love and belonging are some of the prominent reasons for adult suicide. Considering the recent increase in suicide cases among emerging adults in India, the present study was undertaken to explore the role of Parental Involvement, Social Support and Peer Experiences in suicide behaviour and ideation among emerging adults. A total of 50 emerging adults were administered measures of suicidal ideation and behaviour, parental involvement, social support and peer experiences. It was found that parental involvement, especially parent- teacher coordination is a major predictor of suicide ideation among emerging adults. Peer experience of suicide ideation/attempt was also found to be significantly associated with suicide behaviour among emerging adults. It was also observed that social support, especially family support is a factor that works as a protective factors against suicidal thoughts and actions. These findings are important as they indicate that providing parental support through sharing, giving support at times of difficulties and peer support are some of the important factors to consider while developing interventions to support young adults with suicidal tendencies and also in the reduction of factors in their day to day life that leads to suicide ideation/attempts.

Abstract 903

UNDERSTANDING SUICIDE RISK: THE CONTRIBUTION OF PSYCHOSOCIAL PREDICTORS IN FOUR COUNTRIES

Núñez C.[1], Muñoz A.*[2]

[1]Universidad de Medellín ~ Medellín ~ Colombia, [2]Corporación Psicológica Iberoamericana de Clínica y Salud -APICSA- Colombia ~ Medellín ~ Colombia

Suicide is a major public health concern and a multidimensional phenomenon whose incidence has been steadily increasing among young populations worldwide. Psychosocial, cognitive, and biological factors play a central role in suicidal behavior. A deeper understanding of these risk and protective factors is essential to generate early alerts and guide the design of preventive interventions. This study aimed to analyze the effect of selected psychosocial and family-related variables on suicide risk in university students, as part of the project Risk factors and psychosocial predictors related to suicidal behavior in university students: a multicenter comparative study. A total of 2392 subjects from four countries (Colombia, Spain, Mexico, and Bolivia) participated in the study. Data were analyzed using multinomial logistic regression to evaluate three psychosocial variables—family history of mental illness, family history of suicide, and self-perceived health status—and one family-related psychological variable: family functioning. Suicide risk was categorized into low, medium, and high levels. Odds ratios (OR) and 95% confidence intervals (CI) were calculated. Family history of suicide emerged as the strongest predictor, increasing the probability of belonging to the high-risk group more than threefold and to the medium-risk group more than tenfold, compared to the low-risk group. In contrast, both positive self-perception of health and higher family functioning were significantly associated with lower probabilities of medium and high suicide risk, highlighting their protective effect. Family history of mental illness did not show a statistically significant association with suicide risk in this model. The findings emphasize the need for preventive strategies that include psychosocial support for relatives of suicide victims and interventions focused on strengthening family dynamics. Promoting positive health perceptions and enhancing family functioning may help reduce suicide risk in young populations. These results contribute valuable evidence for the design of targeted public health and university-based suicide prevention programs.

ATTITUDES TOWARDS DEATH IN NURSING STAFF: THE ROLE OF RESILIENCE

Arribas--García S.*[1], Doval Moreno S.[1], Morales Gil I.[1], Jaureguizar Albonigamayor J.[2], SÁnchez--Gutierrez T.[3], Petkari E.[4]

[1]INTERNATIONAL UNIVERSITY OF LA RIOJA (UNIR) ~ LOGROÑO ~ Spain, [2]UNIVERSITY OF THE BASQUE COUNTRY (UPV) ~ LEIOA ~ Spain, [3]UNIVERSITY OF CORDOBA ~ CORDOBA ~ Spain, [4]UNIVERSITY OF MALAGA ~ MALAGA ~ Spain

Background: Nurses working in high-emotional healthcare settings frequently confront death, requiring not only technical competencies but also adaptive emotional responses. This study examined the relationship between resilience and attitudes towards death among nursing professionals before the COVID-19 pandemic impact.

Methods: This cross-sectional observational study included 743 nursing professionals from Intensive Care, Palliative Care, and Oncology units across seven Spanish public hospitals. Data were collected between June 2018 and April 2019 using the Death Attitude Profile-Revised Scale, Connor-Davidson Resilience Scale, and sociodemographic questionnaires. Statistical analyses included MANOVA, correlation analyses, and mediation analyses.

Results: Neutral-Acceptance was the predominant death attitude (M=5.68, SD=0.90), followed by Death-Avoidance (M=4.54, SD=1.79). Resilience showed significant negative correlations with Fear-of-Death (r=-.20, p<.01) and Death-Avoidance (r=-.13, p<.01), and positive correlation with Neutral-Acceptance (r=.11, p<.01). High-resilience professionals demonstrated significantly lower Fear-of-Death and Death-Avoidance, and higher Neutral-Acceptance than low-medium resilience colleagues. Mediation analyses revealed that resilience completely mediated relationships between professional factors and key death attitudes. Prior death training and professional level significantly influenced attitudes towards death.

Conclusions: Resilience serves as a protective mechanism enabling nurses to develop more adaptive death attitudes. Both resilience-building interventions and specific death education should be prioritized in nursing curricula and ongoing professional development to enhance care quality and protect healthcare workers' psychological well-being.

PSYCHOLOGICAL REFLECTIONS OF ORGAN SURGERY ON LIVING DONORS: PRE-POST TEST EVIDENCE FROM DONOR AND CONTROL GROUPS

Bulut B.P.*[1], Bayram--Gülaçtı H.[1], Akyalçin R.[1], Kadioglu E.[1], Özsoy M.[2], Isiktas Sayilar E.[2]

[1]Ankara Haci Bayram Veli University ~ Ankara ~ Turkey, [2]Etlik City Hospital ~ Ankara ~ Turkey

Organ transplantation, the process of replacing a failing organ with one from a voluntary donor, has primarily focused on recipients, leading to a gap in research concerning donors' psychological well-being. Existing studies suggest living organ donors may experience post-operative stress, depression, and anxiety. This study aimed to address this by the psychological impact of organ donation surgery on donors. We compared the pre- and post-test psychological health of actual donors with a control group of potential transplant volunteers who had not undergone surgery. A 2 (pre-test/post-test) x 2 (control group/actual donor group) mixed-design repeated measures ANOVA was conducted for depression, anxiety, and stress levels, separately. The findings revealed a statistically significant increase in “stress” levels from pre-test (M=.57, SD=.46) to post-test (M=.72, SD=.54) [F(1, 90)=5.586, p=.020]. Moreover, groups differed significantly in pre-test stress scores [F(1, 90)=9.267, p=.003], with the actual donor group (M=.44, SD=.38) indicating significantly lower preoperative stress compared to the control group (M=.75, SD=.51) (t=-3.337, p<.001). For “depression”, pre-test scores showed the actual donor group (M=.38, SD=.33) had significantly lower depression than the control group (M=.64, SD=.49) (t=-2.96, p=.004). A significant time by group interaction effect for depression [F(1, 90)=7.072, p=.009, ηp^2=.073] suggested differing depression trajectories between groups over time. “Anxiety” levels significantly increased from pre-test (M=.39, SD=.40) to post-test (M=.61, SD=.54) across all participants [F(1, 90)=12.983, p=.001]. Preoperative anxiety levels were significantly lower in the actual donor group (M=.30, SD=.35) compared to the control group (M=.50, SD=.43) (t=-2.441, p=.017). A significant time by group interaction effect was also observed for anxiety scores [F(1, 90)=10.455, p=.002, ηp^2=.104]. Although actual living organ donors exhibit lower psychological symptoms prior to surgery, it is obvious that the surgical process is exhausting for them and that their psychological symptoms increase to a certain extent.

Abstract 2125

RESPONSE SURFACE ANALYSIS OF STRESS MINDSETS AND WELL-BEING AMONG JAPANESE UNIVERSITY STUDENTS

Tani K.[3], Tsuda A.*[1], Yoneda K.[2], Ishibashi K.[1], Nagano E.[1]

[1]Teikyo University of Science ~ Tokyo ~ Japan, [2]Japan Society for the Promotion of Science, Hiroshima University ~ Hiroshima ~ Japan, [3]Kurume University ~ Fukuoka ~ Japan

Background

Japanese cultural psychology often anticipates a “middle way,” implying optimal outcomes when Stress-is-Enhancing (SEM) and Stress-is-Debilitating (SDM) beliefs are balanced. We contrasted this dialectical view with a graded resource account in which outcomes chiefly improve as SEM increases.

Methods

Three cohorts of Japanese university students (N=1,406) completed the SMM-J and measures of stress exposure, appraisal (PSS total, distress, “eustress”), coping (problem-, emotion-, avoidance-focused), and well-being (positivity, positive affect, mental health). CFA (WLSMV) tested factor structure and multigroup invariance. Outcomes were modeled as quadratic functions of cohort-centered SEM and SDM using response surface analysis (RSA), estimating a1–a4 and ΔR^2; cross-cohort shape equivalence was assessed.

Results

CFA supported a correlated two-factor structure with strong invariance; SEM and SDM were inversely related. Bivariate patterns replicated prior work. RSA indicated chiefly linear gradients: higher SEM predicted better adaptation (positive a1 and/or a3), and a concave “middle-is-best” along the LOC (a2<0) did not emerge. LOI curvature (a4) was modest and outcome-dependent: mismatch related to higher perceived distress, whereas some adaptive indices (e.g., positive affect, coping mobilization) increased with mismatch. ΔR^2 effects were small yet non-trivial.

Discussion and Conclusion

The linear SEM advantage accords with evidence that mindsets bias appraisal toward challenge and energize approach-oriented coping, whereas SDM aligns with avoidance and distress. Weak LOC/LOI curvature likely reflects attenuation of higher-order effects by measurement error, mid-range and partly controllable academic stressors that yield quasi-linear functions, and East-Asian dialecticism that tolerates contradiction without privileging a fixed “middle.” Outcome-specific a4 echoes response-surface findings on affect mixtures: ambivalence can elevate distress yet coincide with greater activation or coping mobilization. Overall, results support a graded resource account; SEM appears

to operate as an upstream regulator of appraisal and coping across domains.

Abstract 2130

SECONDARY TRAUMATIC STRESS AND INSOMNIA IN HONG KONG NURSES: PARALLEL MEDIATION BY PSYCHOLOGICAL DISTRESS AND WORK IMPAIRMENT

Yang J.*, Yeung N.

The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong

Introduction. Frontline nurses who care for trauma-exposed patients face indirect exposure and heightened risk for secondary traumatic stress (STS). STS has been linked to sleep problems and broader functional impairment in Western settings, however, relevant studies in Asian contexts is still limited. Specifically, the mechanisms underlying the STS–sleep relationship remain unclear among Hong Kong nurses.

Purpose. To estimate the strength of the STS–insomnia association in Hong Kong nurses and identify two main mechanisms— emotional distress (psyhological distress) and work functioning (work impairment).

Methods. Hong Kong nurses (N=427) who cared for trauma-exposed patients were recruited to complete an online survey (Dec 2024–Feb 2025). Measures included 20-item Secondary Traumatic Stress Scale(STSS), insomnia (Insomnia Severity Index-3) and two primary mediators— psychological distress and work impairment. Age and gender were included as covaraties.

Results. STS was positively associated with insomnia (β_total = .42, p < .001). Parallel mediation indicated a sizable total indirect effect (β = .30; 95% CI [0.31, 0.58]), carried primarily by psychological distress (β = .23; [0.20, 0.49]) and secondarily by work impairment (β = .07; [0.05, 0.16]). After accounting for mediators and covariates (age, gender), the direct effect remained significant (β_c′ = .12; 95% CI [0.02, 0.34]). The model explained 36% of the variance in insomnia (R^2 = .36). Covariates showed no significant direct associations with insomnia.

Conclusions. Among Hong Kong nurses caring for trauma-exposed patients, the link between STS and insomnia appears to operate primarily through emotional distress, with additional contributions from work functioning. These pathways can guide targeted sleep interventions for healthcare workers experiencing STS. Future work should test and refine this model in longitudinal or intervention studies.

BRIDGING PSYCHOLOGICAL, SOCIAL, AND CULTURAL PERSPECTIVES ON HEALTH AND WELL-BEING: FROM LONELINESS PREVENTION TO BEHAVIORAL SELF-REGULATION

Thursday 23 July 2026 from 17:30 to 19:00

(A - Spadolini)

Rolando Diaz-Loving (National Autonomous University of Mexico), Chair and Discussant

Health and well-being arise from complex interactions among biological, psychological, social, and cultural systems. This symposium brings together researchers from Europe, North America, and Latin America to explore integrative frameworks that reduce health disparities and promote inclusion across populations. Sonia Lippke and colleagues (Hamburg University of Applied Sciences; Constructor University Bremen) present findings on loneliness as a mediator between health, financial sufficiency, and life satisfaction in vulnerable groups, highlighting the intervention “Loneliness Prevention and Connectedness” designed to foster belonging and equality in university settings. Héctor Betancourt and Patricia Flynn (Loma Linda University) apply the Integrative Model of Culture, Psychology, and Health Behavior, demonstrating how cultural beliefs and provider biases influence healthcare access, continuity, and quality in multicultural contexts. Gabrielle Oettingen and Peter Gollwitzer (New York University) discuss motivational self-regulation strategies—mental contrasting, WOOP (Wish–Outcome–Obstacle–Plan), and implementation intentions—that enhance health behavior, emotion regulation, and goal attainment. Chris Stephens (Imperial College London and National Autonomous University of Mexico) and Sofía Rivera Aragón (National Autonomous University of Mexico) introduce The Conductome, a hybrid intelligence approach using machine learning to model multifactorial predictors of lifestyle-related diseases such as obesity. By integrating psychological, demographic, economic, and physiological variables, they demonstrate how artificial and human intelligence can jointly identify causal pathways and guide targeted interventions.

As discussant, Rolando Díaz-Loving (National Autonomous University of Mexico) synthesizes these contributions within a cross-cultural framework, underscoring the need for culturally grounded, evidence-based strategies to bridge global health inequalities and promote inclusive well-being.

Abstract 3806

FROM LONELINESS TO INCLUSION: HOW PSYCHOLOGICAL, SOCIAL, AND CULTURAL PERSPECTIVES CAN BRIDGE HEALTH INEQUALITIES

Lippke S.*[1], Schutzle E.[2], Gaida L.[2], Arias Soriano G.N.[3], Hielscher N.[3], Koenig S.[4]

[1]Hamburg University of Applied Sciences Constructor University Bremen ~ Hamburg, Bremen ~ Germany, [2]Hamburg Univercity of Appied Sciences ~ Hamburg ~ Germany, [3]Constructor University ~ Bremen ~ Germany, [4]Techniker Krankenkasse ~ Hamburg ~ Germany

Many vulnerable groups, such as students and individuals receiving reduced earning capacity pensions, are at risk of disadvantage due to limited financial resources and poor health: they face reduced equality of opportunity, loneliness, and lower life satisfaction. Previous research has examined the relationships between health impairments, self-reported household income (available financial resources), financial sufficiency (making ends meet), loneliness, and life satisfaction (Lippke et al., 2020). It was found that perceived loneliness and life satisfaction among individuals receiving reduced earning capacity pensions were not directly related to their financial situation. However, greater loneliness was associated with lower perceived financial sufficiency, which in turn was linked to lower life satisfaction. Loneliness plays a mediating role: the poorer the health status, the higher the loneliness, and the lower the life satisfaction.

This finding can currently be replicated with 373 students: health and loneliness are correlated at r = .56, and loneliness and life satisfaction are correlated at r = –.33. Students should receive more support to overcome loneliness and improve equality of opportunity. How such support can be designed and further developed for students is discussed and presented using the pilot project by HAW Hamburg and the Techniker Krankenkasse titled “Loneliness Prevention and Connectedness – Understanding and sustainably reducing loneliness at universities.” Furthermore, the findings are examined through psychological, social, and cultural lenses of equality. This includes reviewing evidence across different cultural backgrounds and exploring how psychological and social interventions can be informed by these insights to effectively address loneliness and improve well-being.

Abstract 3808

BEYOND POSITIVE THINKING: MENTAL CONTRASTING AS A TOOL FOR SELF-REGULATION OF PHYSICAL AND MENTAL HEALTH

Oettingen G.*

New York University ~ New York ~ United States of America

Popular culture encourages us to “think positive,” yet research shows that merely indulging in positive future fantasies can undermine effort and achievement. How, then, can people pursue their desired outcomes without falling into the trap of wishful thinking? Mental contrasting, a self-regulation strategy that juxtaposes desired futures with critical obstacles that may impede them, offers an empirically-grounded answer. By activating nonconscious cognitive and motivational processes, mental contrasting helps individuals commit to feasible goals and disengage from unrealistic ones. Empirical evidence demonstrates its broad effectiveness: Sedentary men who were introduced to mental contrasting exercised more over seven months, students improved their eating habits, and diabetes patients managed daily challenges more effectively. When combined with implementation intentions (“if–then” plans), mental contrasting, now known as MCII or WOOP (Wish, Outcome, Obstacle, Plan), becomes particularly effective for overcoming impulsive barriers to behavior change. Teaching WOOP to chronic back-pain patients increased physical capacity, giving it to spousal caregivers of Alzheimer’s patients reduced stress and depression and introducing it to stroke survivors enhanced exercise adherence and weight loss. Together, these findings show that WOOP is a simple, autonomous, and cost-effective mental strategy that strengthens self-regulation and promotes physical and mental well-being across diverse populations.

Abstract 3809

THE SELF-REGULATION OF THE PURSUIT OF HEALTH GOALS BY PLANNING

Gollwitzer P.*

New York University ~ New York ~ United States of America

This presentation looks at the planning process through the lens of motivation science, and asks the question of what kind of planning can help people to reach their health goals? I will focus on the strategy of making if-then plans (aka forming implementation intentions) and discuss what kinds of related cognitive performance can be enhanced by if-then planning (e.g., attention control, prospective memory, executive functions, and decision making), and whether if-then planning may also benefit health-related emotion control, behavior change, and social interactions. I will also point to moderators such as the features of the goals and if-then plans themselves, as well as sample characteristics. Finally, the underlying processes of if-then planning effects are delineated in the hope of better understanding what kind of if-then plans might work particularly well when it comes to facilitating flexible but tenacious pursuit of health goals.

Abstract 3810

THE CONDUCTOME: PREDICTING HEALTH-RELATED BEHAVIORS USING MACHINE LEARNING

Stephens C.*[1], Rivera--Aragon S.[2]

[1]National Autonomous University of Mexico & Imperial College, London ~ Mexico City ~ Mexico, [2]National Autonomous University of Mexico ~ Mexico City ~ Mexico

Lifestyle-related diseases such as obesity are highly multifactorial/multiclausal. The full set of factors that both predict and explain a particular behavior we term the “Conductome”. Although psychological variables can play an important role in the Conductome, they should be compared and contrasted with other variable types, associated with other disciplines, to evaluate their ability to predict and explain those behaviors that lead to such diseases, as well as aid in the search for interventions to mitigate them. In this talk I will introduce the Conductome and show the necessity of using “Hybrid Intelligence” – an optimal combination of Artificial and Human Intelligence - to construct it. I will use several highly multifactorial data sets that combine information from a set of well-known psychological constructs with demographic, epidemiologic, social, economic and physiological information in order to better understand the etiology of unhealthy behaviors and their consequences, such as obesity, as well as to understand the role and relative importance of psychological factors when compared to other variable types.

Abstract 2426

HYPNOSIS AND ONCOLOGY : MUTATIONS AND CELLULAR INSUBORDINATION

Di Segni F.*[3], Di Pomponio I.[3], La Mesa A.[1], Simongini E.[2]

[1]Lecturer in a Postgraduate School of Psychotherapy. ~ Roma ~ Italy, [2]Doctor ~ Roma ~ Italy, [3]Uninettuno University ~ Roma ~ Italy

The work Hypnosis and Oncological Pathologies explores the potential of clinical hypnosis as an integrated tool within cancer therapy, with a particular focus on its immunomodulatory effects documented in scientific literature. Within the model of integrative oncology—which combines conventional treatments with evidence-based complementary interventions—hypnosis emerges as a method capable of influencing the psychoneuroimmunological mechanisms underlying the body's response to cancer.

Research findings (Zachariae et al., 1991; Ruzyla-Smith et al., 1995; Gruzelier et al., 2002; Spiegel et al., 2007; Banyai & Varga, 2012) demonstrate that hypnotic induction can increase NK cell and T-helper activity, reduce cortisol levels, and enhance the production of immunoglobulin A (IgA), thus promoting a more efficient immune regulation. These effects are mediated by the reduction of psychological stress and the restoration of neuroendocrine balance—key elements in the mind–body connection.

The Ericksonian approach, centered on rapport, indirect communication, and therapeutic tailoring, encourages the patient's active involvement in the healing process, transforming hypnotic suggestion into a physiological stimulus for cellular self-regulation. Hypnotic visualizations—aimed at perceiving immune cells as "allies" in the body's defense—show a significant impact on psychological well-being, sleep quality, pain management, and overall quality of life in cancer patients.

Particular emphasis is placed on the contributions of Eva Bányai, who integrates clinical evidence and personal experience, highlighting the ethical responsibility of professionals to convey positive and conscious suggestions in contexts of vulnerability. Hypnosis, conceived as a dynamic interface between the mind and the immune system, thus emerges as a powerful psychobiological tool capable of enhancing the efficacy of oncological treatments and fostering the patient's integrated resilience.

Abstract 4551

RETREAT-BASED INTERVENTIONS AS SUPPORT FOR UKRAINIAN PSYCHOLOGISTS AND PSYCHOTHERAPISTS WORKING UNDER ONGOING WAR-RELATED STRESS

Kolisnyk L.*[1], Lubanski V.[2]

[1]Sumy State University ~ Sumy ~ Ukraine, [2]Danish Psychotherapists Association ~ Copenhagen ~ Denmark

Introduction

Mental health professionals working in war-affected regions of Ukraine are exposed to sustained secondary traumatic stress, emotional overload, and compassion fatigue. Their psycho-emotional well-being directly affects both the quality of psychological care provided to war-affected populations and professionals' capacity to remain in practice under prolonged crisis conditions. Identifying effective forms of support for these professionals is therefore an urgent priority.

Purpose

This presentation reports findings from a pilot study examining the impact of retreat-based interventions on the psycho-emotional well-being of Ukrainian psychologists and psychotherapists during the ongoing war. The study evaluates retreats as a targeted support format for professionals working under chronic war-related stress and explores the resource components and mechanisms through which such interventions foster psychological resilience and recovery.

Method

A mixed-methods design was applied, combining a sociodemographic questionnaire, standardized measures (WHO-5, CORE-10, BSI, HAAS), and semi-structured interviews. Quantitative data were collected at pre-, post-, and follow-up time points from an experimental (n = 34) and a control group (n = 31). Qualitative data consisted of 14 interviews with retreat participants, conducted in 2025 in Denmark, Poland, and France.

Results

Multivariate analysis using Pillai's Trace demonstrated significant Time × Group interactions for anxiety ($p = .003$), psychological distress ($p = .002$), well-being ($p < .001$), positive emotions ($p < .001$), and negative emotions ($p = .011$). Somatization and interpersonal sensitivity showed no significant interactions. Qualitative findings converged with quantitative results, indicating increased resilience, inner stability, and access to psychological resources. Key resource components included participation with children, an experienced sense of care, contact with nature, and voluntary engagement in group activities.

Conclusions

Retreat-based interventions represent a powerful form of support for psychologists and psychotherapists working under prolonged war-related stress. These findings highlight the need to implement retreats as a regular, preventative strategy in crisis settings globally.

Abstract 4756

Therapeutic photography, Photovoice and Expressive Writing in cardiovascular rare diseases: a pilot study for psychological well-being in Marfan Syndrome

Spina A.*[1], Udugampolage N.[1], Caruso R.[2], Pini A.[1], Saita E.[3], Vagnini D.[3], Callus E.[2]

[1]IRCCS Policlinico San Donato, San Donato Milanese ~ Milano ~ Italy, [2]Università degli Studi di Milano; IRCCS Policlinico San Donato, San Donato Milanese ~ Milano ~ Italy, [3]Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Background: Therapeutic photography (TP), Photovoice (PV) and expressive writing (EW) are creative practices that leverage visual imagery and narrative disclosure, supporting the expression of emotions through low-cost and scalable interventions. These psychologists-guided approaches assist patients' expressive processing of psychological distress, stigma, and disease identity in chronic conditions. Marfan syndrome (MFS), an autosomal-dominant connective tissue disorder with cardiovascular, ocular, and skeletal manifestations, profoundly impacts health-related quality of life (HRQoL).

Purpose: This pilot study evaluates the feasibility of implementing TP, PV and EW in the clinical pathway of MSF patients and their impact on psychological well-being, emphasizing patients' experiences of disease expressivity in multidisciplinary care.

Methods: In a mixed-methods sequential exploratory design, 10 MFS patients (>13 years) from a rare diseases reference center in Milan participated in 11 monthly 120-minute theoretical and practical sessions (in-person/online), facilitated by a psychologist and a nurse, exploring photography-based activities and expressive writing techniques. Psychological well-being was assessed pre/post via Psychological General Well-Being Index questionnaire (PGWBI), while semi-structured interviews and User Experience Questionnaire (EUQ) detected changes in the expression of illness-related emotions and thoughts.

Results: Patients reported transformative experiences: novices discovered TP, PV, EW as novel tools to visually/narratively express disease embodiment, emotions, and identity, overcoming reluctance via guided reflection. Thematic analysis revealed enhanced emotional granularity, sharing of "invisible" burdens, and reframed self-perception. PGWBI improved significantly across domains ($p=0.034$, Cohen's $d=1.08$, large effect; Mann-Whitney U); EUQ indicated high efficiency (mean=-1.25 on satisfaction scale; others neutral).

Conclusion: TP, PV and EW empower MFS patients to articulate and process unique disease experiences, fostering self-care, empowerment and coping. Larger trials in rare diseases are warranted to validate this patient-centered approach for improving HRQoL.

Abstract 1650

LONELINESS AND HEALTH THROUGH AN INTERSECTIONAL LENS: UNEQUAL BURDENS, SHARED RISKS

Warren A.*

The George Washington University School of Medicine and Health Sciences; Harvard University Extension School ~ District of Columbia; Boston ~ United States of America

Loneliness has emerged as a pressing determinant of health, yet much of the literature treats it as a universal experience, obscuring the ways intersecting identities and social positions shape vulnerability and resilience. An intersectional approach reframes loneliness not only as an individual state but also as the outcome of overlapping systems of disadvantage, offering crucial insights for applied psychology.

This presentation examines the health consequences of loneliness across lines of gender, race, socioeconomic status, disability, age, and sexual orientation. Synthesizing epidemiological, clinical, and qualitative research, it highlights how loneliness operates differently for marginalized groups, including LGBTQ+ youth, racial minorities, migrants, caregivers, and older adults with disabilities. Evidence shows that loneliness magnifies health inequities: adolescents facing stigma report higher loneliness alongside disproportionate depression and suicidality; minorities experience loneliness compounded by discrimination; and older adults with functional impairments face isolation intensified by accessibility barriers.

Intersectional vulnerabilities amplify stress physiology, immune dysfunction, and cardiovascular risk, reinforcing disparities in health outcomes. Recognizing loneliness through this lens reframes it as a systemic equity issue rather than a uniform psychological condition. The presentation argues for the integration of intersectional considerations in health assessments and for interventions that address not only coping strategies but also structural drivers of exclusion. By centering lived experience within broader systems, applied psychology can contribute to reducing loneliness-related health inequities and advancing global commitments to health and justice.

THE NEW PARADIGM SHIFTING EVIDENCE-BASED UNIVERSAL WELLBEING MODEL(UWM): TRANSDISCIPLINARY, HOLISTIC, INCLUSIVE, AND PRACTICE ADVANCING

Stevenson S.*

Freedom Wellbeing Institute & New Zealand Curriculum Design Institute ~ Hamilton ~ New Zealand

Introduction

The Universal Wellbeing Model emerged from a fifteen-year research programme conducted in higher education/therapeutic contexts in New Zealand. Initially the research programme purpose was to improve student programme completions through the implementation of indigenous support models. Data was gathered from students, teacher/researchers, and pastoral care/wellbeing clinician groups to assess the two models selected.

Purpose

Post the two investigations, a Case Study Impact Evaluation was conducted all participants from both investigations. The intended and unintended outcomes of the impact evaluation significantly changed the purpose of the research programme; the purpose became answering these questions i) what is wellbeing ii) how it is influenced iii) how wellbeing can be measured, and iv) how wellbeing can be improved over time.

Method

The wellbeing research programme has employed diverse methods: themed literature and theoretical reviews, quantitative, qualitative, multi-phased mixed, practice-based, grounded theory, appreciative inquiry, and impact evaluation methods. Analytical methods have included: statistical for quantitative data, thematic/discourse for qualitative data, and alignment, testability, and logic for theoretical works.

Results

New complexities, and ethical dilemmas for wellbeing practitioners have emerged for those providing supports to higher education students. The impact evaluation findings located harms related to the models implemented and urged the researchers to develop a new evidence-based, transdisciplinary, inclusive, and authentically holistic theoretical 'universal wellbeing' model. The results of this phase of the research programme are: a new testable definition of Universal Wellbeing, the Universal Wellbeing Model, the Determinants of Universal Wellbeing and subsequently the Universal Wellbeing Evaluation Tool.

Conclusions

Supporting the new innovative territory that has emerged is a theory of change which includes the concept of impenetrability, and transformative learning. The research programme has revealed a new paradigm not focussed on diagnosis and treatment, but

on individual empowerment, and the realisation of human potential, flourishing and freedom.

Abstract 4755

Feasibility and Preliminary Effectiveness of a Sleep Regularity and Circadian Alignment Intervention in Female Athletes: A Pilot Study

Walsh E.*[1], Leota J.[2], Mascaro L.[1], Crick Benjamin J.[1], Liddle S.[1], Drummond S.P.A.[1], Facer--Childs Elise R.[1]

[1]School of Psychological Sciences, Faculty of Medicine, Nursing and Health Sciences, Monash University, 18 Innovation Walk ~ Clayton, Victoria, 3800 ~ Australia, [2]Division of Sleep and Circadian Disorders, Departments of Medicine and Neurology, Brigham and Women's Hospital ~ Boston, MA 02115 ~ USA

Introduction:
Sleep, circadian rhythms, and mental health are tightly coupled, yet most sleep programs still prioritise generic sleep hygiene over targeting the internal circadian clock. We developed a novel, co-designed intervention that integrates Cognitive Behavioural Therapy for Insomnia with circadian science to promote regular, phase-aligned sleep-wake schedules as a pathway to better mental health.
Purpose:
To examine the feasibility, acceptability, and preliminary effectiveness of this sleep regularity and circadian alignment intervention in female athletes.
Method:
Thirty-one female sub-elite athletes completed a single-arm 3-week baseline and 4-week intervention pilot. Athletes wore a wrist-worn biometric device to monitor objective rest-activity patterns and completed daily journals assessing light exposure, mood, and recovery. Sleep, dim light melatonin onset (DLMO), and mental health outcomes were assessed pre- and post-intervention.
Results:
Recruitment (96.9%) and retention (100%) were excellent, with no adverse events. Coaching attendance was high (93.6%). Despite improvements in alignment to prescribed targets, objective adherence to the combined sleep-onset and wake-time coaching window was achieved on only 22.3% of nights during the intervention; when outside targets, deviations could be substantial (up to ~5 hours). Sleep regularity indices did not change at the group level. Sleep duration (+13 min) and efficiency (+4%) improved, with reductions in wake after sleep onset (-19 min), sleep disturbances, and sleep debt (all $p \leq .01$). Phase angle reduced during the intervention ($p < .001$) indicating better circadian alignment and insomnia severity and pre-sleep arousal decreased ($p \leq .03$). Mental health improvements were observed among athletes who maintained more regular sleep ($p \leq .05$).
Conclusions:
The intervention was feasible, acceptable, and deliverable within a real-world preseason training environment. Sleep and circadian alignment improved, and mental health benefits were most evident among athletes who maintained more regular sleep. These

findings support a shift toward precision circadian optimisation rather than generic sleep hygiene.

Abstract 2255

PROMOTING MATERNAL WELL-BEING UNDER PROLONGED AND CUMULATIVE STRESS: THE ROLES OF PERCEIVED CHILDBIRTH RISK, SELF-COMPASSION, AND INTOLERANCE OF UNCERTAINTY

Kestler--Peleg M.*

School of Social Work, Ariel University ~ Ariel ~ Israel

Introduction:
Childbirth under conditions of prolonged and cumulative stress presents a unique psychological challenge. When uncertainty and perceived danger are heightened, mothers' internal coping resources may be strained, increasing vulnerability to reduced psychological well-being. However, the mechanisms linking perceived childbirth risk to postpartum adjustment and mental health remain insufficiently understood.
Purpose:
This study examined how perceived risk during childbirth, self-compassion, and intolerance of uncertainty (IU) interact to predict postpartum psychological well-being among mothers exposed to prolonged and cumulative stress.
Method:
Ninety-six women who gave birth while temporarily displaced under crisis-related conditions completed validated measures of perceived childbirth risk, self-compassion, IU, and current psychological well-being. A moderated mediation model (PROCESS Model 7) was tested, controlling for maternal age, income, and objective obstetric risk.
Results:
Higher perceived childbirth risk was associated with lower self-compassion, which in turn predicted lower psychological well-being. Self-compassion fully mediated the link between perceived risk and well-being. This indirect pathway was significant only among women with high IU levels, indicating that IU intensified the relationship between perceived childbirth risk and psychological well-being. Among women with low or moderate IU, perceived risk was not associated with well-being, suggesting greater resilience.
Conclusions and implications:
Self-compassion emerged as a key internal resource supporting maternal well-being under prolonged stress, while IU functioned as a personality-based vulnerability factor determining when perceived risk translates into distress. Screening for high IU during pregnancy may help identify women at greater risk for postpartum difficulties. Preventive interventions that cultivate self-compassion and tolerance for uncertainty could promote psychological resilience and adaptive adjustment among mothers in adverse environments.

Abstract 2496

BIDIRECTIONAL RELATIONSHIPS BETWEEN INTERNET ADDICTION AND ANXIETY IN CHINESE ADOLESCENTS: A SEX-DISAGGREGATED CROSS-LAGGED NETWORK ANALYSIS

Feng X.*, Lyu M., Ren P.

Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University ~ Beijing ~ China

Internet addiction (IA) and anxiety frequently co-occur in adolescence, but the characteristics of these associations, particularly the bidirectional symptom-level dynamics and patterns across genders, remain insufficiently explored. This study aimed to explore longitudinal interactions between IA and three anxiety subtypes (i.e., generalized anxiety, social phobia, and school phobia) among Chinese adolescents, while focusing on gender-specific patterns. The sample included 3,002 ninth-grade students (47.9% girls at T1; Mage = 14.60). Data were collected at two time points at six-month intervals. Cross-lagged panel network analysis was employed to investigate the longitudinal associations between IA and anxiety subtypes. The results revealed that the symptom “preoccupied with the internet” was the most influential node across overall and gender-specific networks. Gender-specific bridge symptoms emerged: “social phobia” in boys and “school phobia” in girls bridged IA and anxiety subtypes. Additionally, negative predictive pathways were identified in the boys’ network, yet none were observed in the girls’ network. These findings underscore the central role of cognitive preoccupation in comorbidity networks and highlight the gender-specific mechanisms linking anxiety and internet use. Targeting key transdiagnostic and bridge symptoms, especially school-related anxiety in girls and interpersonal avoidance in boys, can enhance tailored prevention and intervention strategies for anxiety occurring as a comorbidity in adolescents.

Abstract 2626

DO RESOURCE LOSS AND GAIN MEDIATE THE RELATIONSHIP BETWEEN INTOLERANCE OF UNCERTAINTY AND MENTAL HEALTH AMONG ISRAELI WAR EVACUEES?

Reeves K.*, Oren L.

Ariel University ~ Ariel ~ Israel

Introduction: The prolonged evacuation of northern Israeli residents during the "Iron Swords" war created a rare context of chronic uncertainty, community disruption, and resource loss. Grounded in Hobfoll's Conservation of Resources (COR) theory and the construct of Intolerance of Uncertainty (IU), this study examined psychological distress among evacuees experiencing extended displacement and insecurity.

Purpose: The study aimed to test whether resource loss and resource gain mediate the relationship between IU and mental health (anxiety and depression), and whether perceived social support moderates this indirect relationship.

Method: A total of 148 evacuees (60.8% women, M = 42.07 years) completed measures of IU (IUS-12), perceived social support (MSPSS), resource loss and gain (COR-E), and anxiety and depression (SCL-ANX4/DEP6). Analyses were performed using SPSS 29 and PROCESS Models 4 and 14 (Hayes, 2022).

Results: IU correlated positively with both anxiety ($r = .35$, $p < .001$) and depression ($r = .20$, $p = .007$), confirming the main hypothesis. Mediation analyses showed that resource loss – but not gain – significantly mediated the link between IU and both anxiety (95% CI [0.01, 0.15]) and depression (95% CI [0.01, 0.16]). The moderating role of social support was not significant, indicating no conditional indirect effects. Exploratory findings revealed that participants who had not yet returned home reported greater social support but also higher anxiety ($p < .05$) while Kibbutz members reported higher loss and lower gain compared to non-Kibbutz members ($F(1,145)=7.36$, $p = .007$).

Conclusions: Results underscore resource loss as a central pathway linking intolerance of uncertainty to mental-health deterioration among the evacuees, supporting the COR theory's emphasis on the primacy of loss over gain. The non-significant moderation by social support and the significant disparity in resource loss experienced by Kibbutz members highlight the persistent and unique psychological vulnerability of this population during prolonged displacement

Abstract 2704

AILY SELF-CRITICAL RUMINATION AND SLEEP QUALITY IN UNIVERSITY STUDENTS: THE MEDIATING ROLE OF POSITIVE AND NEGATIVE AFFECT

Wu L.*, Zhu L.

Shaanxi Normal University ~ Xi'an ~ China

Introduction: Impaired sleep quality is prevalent among university students. While rumination disrupts sleep, the daily mechanisms of Self-Critical Rumination (SCR) and its interaction with affective states remain underexplored.

Purpose: This study utilized a diary method to investigate the mediating mechanisms of Positive Affect (PA) and Negative Affect (NA) in the relationship between pre-sleep SCR and sleep quality at both within- and between-person levels.

Method: A sample of 177 Chinese university students (Mage = 20.56) completed baseline surveys and daily questionnaires for 14 consecutive days (N = 2,478 observations). Multilevel modeling with Bayesian estimation was conducted.

Results: At the within-person level, elevated daily pre-sleep SCR predicted poorer sleep quality, heightened NA, and diminished PA. Both daily affective states significantly influenced sleep, suggesting SCR impairs sleep by concurrently downregulating PA and upregulating NA. In contrast, between-person findings diverged, revealing that although trait SCR directly predicted worse sleep, it unexpectedly associated with higher trait PA. This elevated PA exerted a positive indirect effect, buffering SCR's overall detrimental impact. Notably, while daily NA disrupted sleep, trait NA showed no such association, underscoring that sleep regulation mechanisms differ fundamentally across timeframes.

Conclusions: Our findings demonstrate that the mechanisms linking SCR to sleep differ significantly between intra-individual and inter-individual levels. While daily SCR harms sleep through immediate affective dysregulation, trait-level dynamics involve a compensatory mechanism where PA serves as a protective buffer. Interventions should therefore distinguish between managing daily emotional fluctuations and addressing habitual traits to effectively improve youth sleep health.

Abstract 54

YOUTH SUICIDE: UNCOVERING THE ATTITUDE, CHALLENGES, AND COPING STRATEGIES AMONG SUICIDE SURVIVERS AND NORMAL ADOLSCENTS

Singh T.*

Banaras Hindu University ~ Varanasi ~ India

Suicide among emerging adults in India has emerged as a major challenge for the public health policy. According to the recent (August 28, 2024) data presented by The National Crime Records Bureau, India, suicide cases among emerging adults have increased annually by 4% which is much higher than the previous annual increase of 2% despite a likely “under reporting”. This alarming increase in suicide rates among emerging adults which surpasses country’s population growth is alarming and thus needs through investigation of the causes behind suicide among this population and possible intervention. It is expected that a comprehensive understanding of the issues is crucial in Indian context to design targeted interventions.

Using a semi-structured interviews of 6 suicide survivors and 12 normal emerging adults having similar psycho-social characteristics, the present study aimed an in-depth exploration of their experiences, capturing the essence of their challenges, coping strategies, attitudes, awareness and the continuum of emotions they navigate in their lives and how all these affect their mental health.

Adopting Braun and Clarke method, the for thematic analysis of the interviews highlighted key themes of increasing expectations from family and society, educational challenges, lack of informational and social support, cognitive and emotional barriers, lack of awareness about mental health issues, and systemic barriers in accessing mental health support. Coping mechanism and help seeking behaviour were two important themes highlighted by non-suicidal emerging adults in dealing with suicidal thoughts.

These results are important as highlight the importance of the oscillations between societal expectation, academic challenges, and pressure to perform well in recognising and addressing suicidal issues among emerging adults and highlights a critical gap in mental health support system tailored to their needs. These results also underscore the urgent need for a multifaceted approach to cater to the problems of suicide among Indian emerging adults.

Abstract 1033

IMBALANCE IN EMOTIONAL REACTIVITY AND INHIBITORY CONTROL DRIVES ADOLESCENT REPETITIVE SELF-INJURY: EVIDENCE FROM LONGITUDINAL AND ERP STUDIES

Liu J.*

Department of Psychology, School of Sociology and Psychology, Central University of Finance and Economics ~ Beijing ~ China

Background: Repetitive nonsuicidal self-injury (R-NSSI) is a serious public health issue prevalent in adolescence. However, the key factors and mechanisms driving the repetition and addiction of self-injurious behavior remain unclear. This study aims to understand R-NSSI by examining the significant developmental characteristics of adolescence, specifically focusing on the imbalance between emotional reactivity and cognitive control through longitudinal and ERP evidence.

Methods: In Study 1, data from 2,998 adolescents (aged 10-16 years, 57% male) were collected over two survey waves. Polynomial regression and response surface analysis estimated the imbalance between emotional reactivity and cognitive control among R-NSSI. In Study 2, 55 adolescents (aged 12-15 years, 45.6% male) with R-NSSI and without NSSI completed a two-choice emotional oddball task while ERP data were recorded. A follow-up survey on NSSI was conducted

Results: In Study 1, The prevalence of R-NSSI was 2.37%, with 371 adolescents meeting the criteria (NSSI scores ≥5; 55.3% female; mean age 13.05 ± 0.87 years). Among adolescents with R-NSSI, greater discrepancies between emotional reactivity and cognitive control predicted higher NSSI frequency (95% CI: 0.004–0.30) and stronger addictive features (95% CI: 0.04–0.27) nine months later. In Study 2, adolescents with R-NSSI exhibited blunted P3d responses to both negative and positive emotions compared to those without NSSI, indicating greater discrepancies between emotional reactivity and cognitive control. Additionally, baseline P3d was negatively correlated with R-NSSI outcomes six months later.

Conclusions: The findings suggest that an imbalance between emotional reactivity and cognitive control play an important role in the progression of R-NSSI. Adolescents with R-NSSI demonstrate deficits in controlling emotional reactivity, suggesting that P3d may be a psychophysiological marker of risk for R-NSSI. Thus, therapeutic targeting of emotional inhibition may help to reduce R-NSSI during adolescence.

Abstract 1224

FINANCIAL LITERACY AND PROBLEM GAMBLING: A CROSS-CULTURAL QUANTITATIVE STUDY BETWEEN ITALY AND THE UK

Barone C.*[2], Graffigna G.[3], De Vita S.[1], Attisani V.[1], Cesti B.[1], Losi R.[1]

[1]Sisal S.p.A ~ Milano ~ Italy, [2]Department of Psychology, Catholic University of Sacred Heart, Milan, 20123, Italy ~ Milan ~ Italy, [3]Faculty of Agriculture, Food and Environmental Sciences, Catholic University of Sacred Heart, Cremona, 26100, Italy and EngageMinds HUB– Consumer, Food and Health Engagement Research Center, Catholic University of Sacred Heart, Cremona, 26100, Italy and D

Problem gambling represents a major global challenge with serious economic, social, and psychological consequences. While risk factors have been extensively investigated, protective factors remain less explored. Among them, financial literacy has been suggested as a potential buffer, improving decision-making and reducing financial anxiety, yet evidence of its protective role in gambling disorder is still scarce. Grounded in the Health Belief Model, this study aims to investigate whether higher financial literacy can mitigate problem gambling by influencing perceived severity, benefits, barriers, and self-efficacy. The purpose is to clarify the relationship between financial literacy and gambling behaviours, to test the predictive value of Health Belief Model constructs, and to compare Italian and UK contexts, where educational policies on financial literacy differ substantially. The research adopts a quantitative cross-cultural design using a Computer-Assisted Web Interviewing survey administered to two representative samples of 1,000 adult gamblers each. The questionnaire integrates validated measures of financial literacy, financial anxiety, and gambling severity, together with HBM-based items specifically developed for this study. Data collection is ongoing and results are not yet available, but it is expected that higher financial literacy will be associated with lower levels of problem gambling, partly mediated by reduced financial anxiety and stronger self-efficacy. Differences are also anticipated between the UK, where financial literacy has been embedded in the school curriculum since 2014, and Italy, where such education is less structured. By addressing these questions, the study seeks to provide evidence for an explanatory model of the protective role of financial literacy, with important implications for designing culturally informed preventive interventions.

Abstract 1251

DEVELOPMENTAL TRAJECTORIES AND PREDICTORS OF NON-SUICIDAL SELF-INJURY IN ADOLESCENTS: A MACHINE LEARNING STUDY

Zhang C.[1], Zhang Z.*[1], Wang Y.[2], Lei H.[1], Ling F.[1], Chen F.[1]

[1]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]Faculty of Psychology, Beijing Normal University ~ Beijing ~ China

Non-suicidal self-injury (NSSI) refers to the deliberate and direct harm to one's body without suicidal intent. A person-centered approach to tracing the developmental trajectories of NSSI ideation and behavior in early adolescence offers valuable insights into their progression and heterogeneity, thereby enhancing our understanding of the underlying mechanisms. Moreover, as previous research has shown that NSSI is influenced by a combination of individual and environmental factors, this study aims to identify predictors of distinct developmental trajectories in order to improve early detection and enable targeted interventions.

This study followed 11,366 adolescents in Beijing (Mage = 10.72±0.29 years; 48.60% female) from Grade 5 over four years, with annual assessments of NSSI ideation and behavior. Baseline measures included learning attitudes, positive psychological traits, emotional states, and behavioral problems, which were used as predictors. Latent Class Growth Analysis (LCGA) was employed to assess the developmental trajectories of NSSI. Baseline variables were entered into an XGBoost machine learning model, with SHAP values used to evaluate their relative importance.

Five NSSI trajectories were identified: consistently no ideation (58.90%), persistent ideation without behavior (27.04%), transition from ideation to no ideation (10.44%), transition from ideation with behavior to without behavior (2.21%), and transition from ideation without behavior to with behavior (1.41%). The XGBoost model highlighted low mood, self-blame, and family pressure as the strongest predictors of trajectory classification, followed by emotion regulation and self-esteem. Gender differences were also significant, underscoring its importance as a factor. SHAP analysis indicated that predictor importance varied across groups and revealed nonlinear effects. Notably, low mood was the most influential predictor in most of the groups.

This study identified distinct developmental trajectories of adolescent NSSI and key predictors, highlighting the need for early, targeted school and family interventions, and providing a reference for subtype-based early warning models to guide mental health promotion.

Abstract 1333

IMPACT PSYCHOLOGIQUE SUR LA SANTÉ DES PARIEURS SPORTIFS : CAS DES PARIEURS EN RÉPUBLIQUE DU CONGO

Nguiambo Ondze A.P.L.*

NGUIAMBO ONDZE Aristide Patrick Lee ~ Brazzaville ~ Congo

Résumé N° 1

L'essor des paris sportifs, notamment les paris urbains mutuels et les paris sur paris, en République du Congo suscite de sérieuses inquiétudes liées à la santé mentale des parieurs. Ces activités de jeu exposent les joueurs à un risque élevé de détresse psychologique, caractérisé par une augmentation de l'anxiété, de la dépression et des troubles de stress. Les parieurs présentent souvent une impulsivité élevée et des difficultés à réguler leurs émotions, facteurs qui favorisent le développement d'une dépendance comportementale grave pouvant entraîner de graves conséquences psychologiques, sociales et économiques.

Les comorbidités psychiatriques sont fréquentes chez les parieurs, avec des niveaux d'anxiété quadruplés et des risques élevés de troubles de l'humeur et d'épisodes maniaques. Ces risques sont souvent aggravés par la consommation problématique d'alcool ou de drogues. L'illusion de contrôle sur les résultats conduit les joueurs à sous-estimer les dangers réels, renforçant ainsi le cycle addictif. Socialement, le jeu problématique entraîne de lourdes répercussions telles que des problèmes familiaux, l'isolement social, la et dans les cas extrêmes, le suicide.

Au Congo, où les cadres réglementaires et les mesures de prévention restent limités, ces risques sont particulièrement accrus. Les témoignages révèlent que les jeunes, y compris les mineurs malgré la prohibition, sont largement exposés, souvent au prix du surendettement et de difficultés scolaires. Le jeu devient alors une source majeure d'anxiété, de dépression et parfois de violence.

Il est crucial de comprendre les mécanismes psychologiques de cette addiction pour développer des stratégies préventives appropriées, renforcer le soutien aux joueurs en difficulté et sensibiliser aux risques. En résumé, les paris urbains mutuels et les paris ont un impact profond et multifactoriel sur la santé mentale des parieurs du monde entier en général, et des parieurs congolais en particulier, avec des implications psychosociales importantes à considérer pour une meilleure gestion du phénomène.

Abstract 1376

WHY PEOPLE USE: EXPLORING MOTIVES AND TRENDS IN RECREATIONAL DRUG USE

Uhl J.*, Stetina B.U.

Sigmund Freud University Vienna, Faculty of Psychology ~ Vienna ~ Austria

Introduction: Trends in recreational drug use indicate a steady increase in prevalence rates, as well as changing trends in use, such as the use of diverse psychoactive substances or alternative modes of consumption (e.g. mixed use)[1-5]. To understand development trends and changes in recreational drug use comprehensive knowledge of this hidden population[6] is required to derive consumer-oriented harm-reduction strategies which should be the fundamental aims in recreational drug use[7].

Purpose: The aim of the study is to research recreational drug users with a particular focus on their underlying individual motive as an influencing factor for the respective substance use.

Method: Using a cross-sectional design, recreational drug users were surveyed online regarding their use patterns and motives.
Results: 716 volunteers (52.7% male, 44.7% female, 0.1% intersex, 2% non-binary) aged 18 – 68 (M= 30.85;SD= 9.14) using different substance groups (uppers, downers, hallucinogens, mixed-use) took part in the study. Relevant differences in the reported motives for use, e.g. in relation to the motive 'use to party/at parties' ($(\chi^2(6)=18.76, p=.005)$), were found, which was reported significantly less (7.5%) by users of the substance group downers, whereas it was reported significantly more (25.7%) by users of the mixed-use group uppers + hallucinogens.

Conclusions: Motives differ based on substances. For example, the significantly higher importance of 'use to party/at parties' among users with a mixed-use of upper + hallucinogens suggest a trend towards the use of hallucinogenic substances such as 2C-B or 1cP-LSD in nightlife for party use. The results underline the importance of including key aspects such as underlying motives, reasons for substance choice and individual use patterns to understand ongoing changes in the world of recreational drug use and derive consumer-orientated harm reduction strategies and health promotion.

HEALTH AND WELL-BEING: RECENT ADVANCES RELATING TO INDIVIDUAL AND PLANETARY HEALTH

Friday 24 July 2026 from 09:30 to 11:00

(E- Spadolini)

This symposium showcases the significance of the research relating to Health and Well-Being, recent Advances Relating to individual and planetary health

Sonia Lippke's study from Germany, using a mixed-methods design, assesses the interconnected benefits of physical activity (community gardening and other physical activities) and social engagement in reducing loneliness and improving mental health in students. Quantitative measures examine the adoption rates, perceived value, and mental health outcomes of community gardening and other activities, while qualitative insights provide depth to the understanding of students' experiences. By bridging physical activity, social connection, and nature, this study offers a holistic approach to improving student mental health.

Cong Zhang presents a study with participants from China and Germany, who underwent stress induction and/or self-regulation training (ROC-T) in a 2×2 design, with outcomes assessed via behavioral measures and drift-diffusion modeling. ROC-T reduced unhealthy food choices in China, while effects in Germany were subtler and emerged mainly under stress. Cognitive modeling revealed Chinese participants integrating health information more slowly and those in Germany accelerating evidence accumulation under intervention —highlighting a moderation of intervention effects under stress.

Claudio Nigg's study from Switzerland explores a positive global urban health concept which posits that climate action, biodiversity conservation, preserving the environment and human well-being is all connected to sustainable physical activity. Sustainable physical activity is conceptualized as both a determinant and an outcome in the promotion of these global issues. What implications this concept has on interventions across social ecological levels are discussed. This is presented in the context of an EU project incorporating 4 mid-sized cities (GoGreenNext).

Giovanna Calogiuri explored how the seasonal theme and timing of exposure to Immersive Virtual Nature (IVN) affect psychological outcomes in university students. While IVN generally improved well-being and nature connectedness regardless of the season depicted, stress reduction was significantly greater in early spring than in early autumn, suggesting some seasonal variation in response.

Finally, a general discussion is collectively reflecting on the different studies and new directions in applied psychology that integrate theory, innovation, and practice to address complex challenges in individual and planetary health, and technology and connectedness.

Abstract 4913

BRIDGING PHYSICAL ACTIVITY, SOCIAL ENGAGEMENT, AND NATURE: A HOLISTIC APPROACH REDUCING LONELINESS AND IMPROVING MENTAL HEALTH IN STUDENTS

Lippke S.*

Department of Health Sciences, Hamburg University of Applied Sciences ~ Hamburg ~ Germany

Loneliness and mental health challenges are increasingly prevalent among students, highlighting the urgent need for effective interventions. This study explores the role of physical activity and social engagement in combating loneliness and improving mental health, focusing specifically on community gardening and other physical activities. Using a mixed-methods design, we assess the interconnected benefits of these activities among a diverse sample of divers students. Central to this investigation is the mediating role of Connectedness to Nature, which may enhance the psychological benefits of physical exercise. By fostering a sense of belonging and purpose, community gardening offers a dual benefit of promoting physical health and social interaction. Quantitative measures examine the adoption rates, perceived value, and mental health outcomes of community gardening and other activities, while qualitative insights provide depth to the understanding of students' experiences. The findings aim to illuminate pathways through which nature-oriented and socially engaging physical activities mitigate loneliness and promote mental well-being. This study contributes to evidence-based strategies for universities and communities to support students, emphasizing the integration of accessible, nature-based, and socially engaging practices in mental health interventions. By bridging physical activity, social connection, and nature, this research offers a holistic approach to improving student mental health.

Abstract 4914

FROM SELF TO SUSTAINABILITY: RECALIBRATING HEALTH BEHAVIORS UNDER STRESS

Zhang C.*

PKU ~ Beijing ~ China

Introduction: Individual health behaviors affect both personal health and planetary sustainability. Environmental stress can disrupt rational trade-offs between personal health and ecological concerns, while interventions may recalibrate decision processes. Prior work shows that stress impairs reflective control and amplifies impulsivity, whereas targeted training can restore self-regulation. However, little empirical evidence has examined how Regulation of Craving Training (ROC-T) can simultaneously optimize behaviors that benefit both personal and planetary health.

Methods: Participants recruited in China (N = 103) and Germany (N = 64) were assigned to a 2×2 between-subjects design (stress: present/absent×intervention: present/absent). Stress induction and ROC-T were applied, and outcomes were analyzed using both traditional behavioral measures (two-way ANOVA) and drift-diffusion modeling (DDM).

Results: (1) Behavioral outcomes: In China, intervention significantly reduced high-calorie food selection ($p < .001$), with a significant stress×intervention interaction on low-calorie food reaction time ($p = .041$). In Germany, only stress exerted a significant main effect on negative choice reaction times ($p = .01$). (2) Cognitive mechanisms: Decision thresholds (a) decreased in both samples, reflecting greater decisiveness, consistent with the "stress-impairment—intervention-compensation" framework. However, drift rates (v) diverged: participants in China showed slower accumulation of health-relevant evidence under intervention (v↓), whereas participants in Germany accelerated evidence integration (v↑). Non-decision times decreased in China (enhanced efficiency) but increased in Germany (reflecting added task demands). Starting bias (z) remained stable. These divergences may relate to differences in the specific health decision tasks targeted in ROC-T (e.g., dietary choices vs. physical activity choices).

Conclusion: This study elucidates the dynamic mechanisms through which stress and intervention shape health behavior decisions, offering critical empirical support for interventions that advance both individual and planetary health.

Abstract 4915

THE POTENTIAL OF A GLOBAL URBAN HEALTH CONCEPT EMPHASIZING SUSTAINABLE PHYSICAL ACTIVITY FOR TRANSFORMATIVE HEALTH INTERVENTIONS

Nigg C.*

Department of Health Science, Institute of Sport Science, University of Bern ~ Bern ~ Switzerland

Currently, global health faces critical challenges, particularly in urban environments where over half of the global population resides. As urbanization intensifies, the pressures of climate change, environmental degradation, and biodiversity loss threaten both human health and nature. This paper introduces a novel concept of global urban health, grounded in socio-ecological theory, with an emphasis on sustainable physical activity and its potential for transformative health interventions.

Building on established frameworks such as Eco-Health, One Health, Planetary Health, and the Biodiversity-Climate-Health Nexus, this multi-dimensional perspective positions human agency as central to addressing urban health challenges. The concept situates individuals within their dynamic social and physical surroundings. Social surroundings encompass close relationships (e.g., family, peers) and broader communities (e.g., neighborhoods, organizations), while physical surroundings include the built environment, natural spaces, and local climate zones. These surroundings are further shaped by urban policies, which influence behaviors and opportunities for sustainable practices, including physical activity.

This integrated framework recognizes the critical role of sustainable physical activity in enhancing resilience to global health challenges. Urban green spaces, walking paths, and cycling infrastructure, for example, offer nature-based solutions that promote physical activity while simultaneously addressing environmental goals such as carbon reduction, biodiversity preservation, and climate adaptation. Human agency, with individual and collective actions, is identified as pivotal in transforming urban environments into healthier, more sustainable ecosystems.

The global urban health concept redefines urban settings as hubs for health innovation, integrating sustainable physical activity into broader strategies for ecological and public health. By leveraging nature-based solutions (e.g., green infrastructure) and emerging technologies (e.g., artificial intelligence), interventions can be designed to promote physical activity in ways that benefit both human and ecological health. These approaches mitigate the adverse effects of urbanization and climate change while fostering sustainable behaviors and systemic resilience.

Abstract 4917

GENERAL DISCUSSION AND AUDIENCE ENGAGEMENT ACTIVITY

Schwarzer R.*

Freie Universität Berlin ~ Berlin ~ Germany

Join us for a general discussion that brings together diverse perspectives from cutting-edge research in applied psychology. This part will reflect on the symposium's contributions to understanding and promoting both individual and planetary health, highlighting how theory, innovation, and practice can be integrated to address today's complex challenges. From mental health interventions and sustainable physical activity to immersive virtual nature and cognitive modeling under stress, the studies presented offer rich insights into how connectedness—to self, others, and the environment—can foster well-being.

Participants will be invited to engage in an interactive dialogue exploring the implications of these findings for future psychological research, dissemination and policy implications, and practice. How can psychological science contribute to climate action, social cohesion, and healthier lifestyles? What role does technology play in shaping our connection to nature and each other? This closing discussion aims to spark new ideas, collaborations, and directions for applied psychology in a rapidly changing world.

Abstract 729

THE IMPACT OF SEASONAL THEME AND TIME OF YEAR ON OUTCOMES OF VIRTUAL NATURE EXPOSURE: A RANDOMIZED TRIAL

Litleskare S., Brambilla E., Calogiuri G.*

University of South-Eastern Norway ~ Drammen ~ Norway

Introduction. Immersive Virtual Nature (IVN) has emerged as a promising tool to promote well-being and nature connectedness. However, little is known about potential seasonal influences, either in relation to the theme of the virtual scenario or the time of year when exposure occurs.

Purpose. This study investigated the extent to which seasonal theme and timing of exposure can influence the psychological outcomes of a brief IVN experience.

Methods. A total of 108 university students (64% female; age = 25.7±7.3 years) were recruited in early spring (March 18 – April 9) or early autumn (September 28 – October 17), periods characterized by comparable environmental conditions and academic workload. Within each period, participants viewed a 3-minute 360° video of a local urban forest, presented in either a summer ("green") or winter ("white") version. Outcomes included measurements of affect (positive affect, negative affect, tranquillity, and fatigue), perceived stress, nature connectedness, intention to perform green exercise, and intention to visit the location. Two-way ANOVA with post hoc analysis was used to test for possible pre-post changes and their interactions with theme (green vs. white) and period (spring vs. autumn).

Results. Significant pre-post improvements were found for all outcomes except positive affect and intention to perform green exercise. No significant pre-post by theme interactions were observed. A significant pre-post by period interaction was found for perceived stress ($F(1,104) = 7.32$; $p = 0.008$), with greater reductions in early spring compared to early autumn. No other significant pre-post by period interaction was found.

Conclusions. A brief IVN experience can elicit beneficial psychological responses regardless of the seasonal theme depicted. However, the magnitude of some responses may vary across the year. Further research is needed to clarify patterns of seasonal variation in IVN experiences. This study advances the understanding of IVN as a medium for promoting well-being and nature connectedness.

Abstract 776

SHARING EXPERIENCES ONLINE: THE INFLUENCE OF SUPPORTIVE VERSUS NON-SUPPORTIVE PEERS

Wang Q.*, Bilgin E.

Cornell University ~ Ithaca ~ United States of America

Social media, as an integral part of everyday life especially for young people, plays a significant role in influencing sense of self and well-being. Research suggests that given its interactive nature, sharing personal experiences online often involves a meaning-making process that can have positive impact on how individuals understand themselves and connect with others and further facilitate well-being. Importantly, the engagement of other social media users with online posts may affect individuals' memory-sharing behavior and, in turn, mental health. The present study is the first to examine the effect of peer responsiveness on meaning making in social media posts and well-being.

A sample of 200 college students participated. They were randomly assigned to a high peer-support (HP) or low peer-support condition (LP). In HP, participants were asked to recall a time when their social media friends responded to their posts in a supportive and caring way. In LP, participants were asked to recall a time when their social media friends responded to their posts in a non-supportive or indifferent way. They then completed an online peer responsiveness scale (OPRS) for a manipulation check. Next, participants were directed to Me&MyFriends, a simulated social media platform created for this study. They were asked to make posts about a challenging event and a joyous event on Me&MyFriends. Finally, participants completed state well-being measures (i.e., current mood, state self-esteem, state loneliness).

Participants' memory narratives are being content coded for adaptive meaning making. It is expected that HP participants will report greater peer responsiveness, engage more in adaptative meaning making (i.e., recalling memories with more details, more emotional expressions, and greater themes of redemption and agency), and exhibit better state well-being than LP participants. These original findings will shed light on the impact of the dynamic social media context on individuals' meaning making and well-being.

Abstract 100

PRO EATING DISORDERS POSTS ON X: A CONTENT ANALYSIS APPROACH

Meza Peña C.*[1], Roldán Barrios D.[1], Burgos Rivera I.E.[2]

[1]Universidad Autonoma de Nuevo Leon ~ Monterrey ~ Mexico, [2]Alfa Fundación ~ San Pedro Garza García ~ Mexico

Social networks are the dominant socialization platforms that promote beauty canons and constant content consumption that promotes a culture of dieting, the thin body ideal and vainglory of youth, aspects that can trigger body dissatisfaction and risky eating behaviors (ED). In addition, there is content within these networks that promotes “Pro-Ana and Pro-Mia” behaviors, reaching all corners of the world just by scrolling.

Objective. In this study we explore the social network X (formerly twitter), to identify the type of content young people with ED behaviors share, the hashtags that they use for communication, and to investigate the reach of these posts on other users of the platform.

Methods. We used a qualitative methodology centered in content analysis, to identify posts made on platform X regarding the dissemination of info that promotes ED. Different hashtags were proposed to search for content around the main objective. A group of young researchers first identify the posts and then classify the images according to the categories that emerge from the analysis.

Results. In this study, 38 posts were observed (19 as original content, 18 as reshared content, and 1 as a posted profile) with 38 different hashtags, with #edtwt and #thinspo being the most mentioned. In general, the content mentions topics related to weight, comments that encourage food restriction, thinspiration, self-harm, among others. Regarding interaction with the posts, there is an average of 2,018 likes per post, 65,590 views, 434 reshared posts, 310 saved items, and 72 quotes.

Conclusions. The lack of regulations on the platform “X” allows a high and risky interaction of content that promotes ED. People with ED may use this platform inappropriately, hindering their recovery and encouraging the development of ED in other young people who show body concerns.

VIRTUAL REALITY TO IMPROVE PAIN MANAGEMENT AND MENTAL HEALTH IN STROKE SURVIVORS WITH CHRONIC PAIN: THE VR-ACT FEASIBILITY STUDY

Carvalho S.*[1], Menezes P.[2], Duarte C.[3], Skvarc D.[4], Sousa E Silva A.R.[1], Valentim A.[5], Diogo J.E.[6], Sargento Freitas J.[7], A Trindade I.[8], Castilho P.[1], Lapa T.[9], Andersson G.[10], Castelo--Branco M.[3]

[1]University of Coimbra, Center for Research in Neuropsychology and Cognitive and Behavioral Intervention (CINEICC), Portugal ~ Coimbra ~ Portugal, [2]Institute of Systems and Robotics (ISR), Faculty of Sciences and Technology, University of Coimbra ~ Coimbra ~ Portugal, [3]Coimbra Institute for Biomedical Imaging and Translational Research (CIBIT), Institute of Nuclear Sciences Applied to Health (ICNAS) ~ Coimbra ~ Portugal, [4]School of Psychology, Faculty of Health, Deakin University ~ Geelong ~ Australia, [5]Department of Anesthesiology, Hospitais da Universidade de Coim ~ Coimbra ~ Portugal, [6]Center for Classical and Humanistic Studies (CECH) ~ Coimbra ~ Portugal, [7]Department of Neurology, Universidade de Coimbra Faculdade de Medicina, Coimbra ~ Coimbra ~ Portugal, [8]Center for Health and Medical Psychology, School of Behavioural, Social and Legal Sciences, University of Örebro ~ Örebro ~ Sweden, [9]Faculty of Health Sciences, Universidade da Beira Interior ~ Covilhã ~ Portugal, [10]Department of Behavioural Sciences and Learning, Department of Biomedical and Clinical Sciences, Linköping University, Linköping ~ Linköping ~ Sweden

BACKGROUND: Chronic post-stroke pain affects 40%-65% of stroke survivors, and increases the likelihood of functional dependence and cognitive decline, the risk of depression, anxiety, fatigue, and the risk of suicidality. Acceptance and Commitment Therapy (ACT) promotes awareness and acceptance of internal experiences, and engagement with valued activities through mindfulness and behavioural exercises, and is especially helpful in chronic health conditions, as its primary focus is not on changing symptoms, but rather on promoting acceptance of difficult internal experiences and behavioural changes towards a valued and meaningful life. Nonetheless, its feasibility and efficacy via immersive human–digital interaction technologies are underexplored.

METHOD: This funded pilot (2023.13402.PEX) has two objectives: to develop and test the feasibility and acceptability of an 8-week virtual reality (VR) ACT program (VR-ACT) in a sample of CPSP patients; to pilot test the efficacy of VR-ACT in improving pain, mental health, and adaptive psychological processes and skills, and in reducing the functional connectivity of the Triple Network (DMN, SN, and FPN), by comparing the experimental condition (VR-ACT) to a sham 2D non-immersive distracting video-animations control condition (Sham VR) pre- to post-intervention. The trial will start in December 2025.

EXPECTED RESULTS: the implementation of VR-ACT will be feasible, measured by adherence (i.e., attrition rate), engagement (number of VR usage; completion), and acceptability (qualitative post-intervention assessment); the VR-ACT program will be significantly more effective in reducing pain intensity and disability, and psychopathological symptoms, and in increasing quality of life and well-being (self-

report measures), as well as in reducing functional connectivity of the triple network (fMRI), than the Sham VR.
CONCLUSION: The project will potentially open a new avenue of research in CPSP (i.e., the development of self-regulatory skills through digital solutions in CPSP rehabilitation) and reinforce the need for biopsychosocial multi-modal approaches to CPSP.

TRAINING SOCIAL AND EMOTIONAL INTELLIGENCE USING VR

Karimi L.*

Leila Karimi ~ Melbourne ~ Australia

This project introduces an innovative Emotional Intelligence (EI) training program designed for adults utilising Virtual Reality (VR) technology to create immersive and interactive learning experiences. The training aims to support the development of emotional recognition, regulation, and social communication skills by exposing participants to realistic social scenarios in a controlled virtual environment. Through guided VR sessions, participants engage in activities that help them identify emotions, practice appropriate responses, and navigate common social interactions. The program is currently being piloted, with the intention of exploring its feasibility, acceptability, and potential benefits for enhancing emotional and social competencies. This VR-based approach may offer a scalable and accessible tool for clinicians, educators, and families, and could contribute valuable insights into the use of immersive technologies to improve EI and social skills.

THE ASSESSMENT OF A DIGITAL PATIENT DECISION AID LUNG CANCER PATIENTS: AN EYE-TRACKING STUDY

Sebri V.*[1], Dorangricchia P.[1], Monzani D.[1], Prelaj A.[2], Provenzano L.[3], Dumitrascu A.D.[2], Grasso R.[1], Pravettoni G.[1]

[1]European Institute of Oncology IRCCS ~ Milan ~ Italy, [2]Thoracic Oncology Unit, Medical Oncology Department 1, Fondazione IRCCS Istituto Nazionale Tumori ~ Milan ~ Italy, [3]Medical Oncology Department, Fondazione IRCCS Istituto Nazionale dei Tumori di Milano ~ Milan ~ Italy

Objective: Shared decision-making is challenging for patients with lung cancer, who often struggle to understand clinical information and make informed choices. Patient Decision Aids (PDAs) are effective tools for educating patients about available treatments and reducing decisional regret. To evaluate their feasibility, eye tracking is one possible methodology. Determining the position of the eyes to track a person's gaze direction at a given time and the sequence in which eyes move allows for providing an objective source to understand visual and display-based information processing. In the present study, conducted within the I3LUNG European project, we developed and assessed a digital PDA to make it more suitable for lung cancer patients. Methods: Six experts in lung cancer psychology participated in measuring attentive focus and engagement with the PDA using eye tracking. Results: participants focused more on detailed information about treatment options and survivorship. Visual attention was higher on text than on images. Moreover, understanding of treatment efficacy and symptoms was a key concern. Lastly, psycho-oncologists showed less interest in the contents about "who can attend to a specific cancer treatment" and their related procedure. Specifically, low scores related to fixation and saccade-based metrics were collected. Conclusions: This digital PDA may serve as a valuable tool for facilitating illness information sharing, aiming to promote shared decision-making. The results helped improve the PDA clarity, scientific accuracy, and layout appeal, making it a feasible support for lung cancer patients during their cancer journey.

Psychosocial and other modifiable factors influence the development and course of non-communicable diseases (NCDs). Addressing these factors may improve outcomes.
PSYCHONIC (Psychosomatic Medicine in Oncologic and Cardiac Disease; NCT03437642) is an ongoing retrospective–prospective observational study. Its aims are to: (1) characterise psychological profiles in patients with acute myocardial infarction (AMI), Takotsubo syndrome (TTS), and non-metastatic breast cancer (BC), and in age- and sex-matched healthy subjects; (2) examine associations between psychological characteristics and clinical outcomes; and (3) evaluate the effect of short-term ontopsychological psychotherapy (STP) on NCD severity in real-world practice.
Assessments include psychometric and quality-of-life instruments, a body-perception questionnaire, a dream questionnaire, and the Six Drawing Test (6DT). Baseline and follow-up evaluations are planned. Medical endpoints (e.g., recurrent AMI and BC relapse) are also collected.
Patients receiving STP will also receive guideline-based standard care for their condition.
Recruitment began in 2017, paused during the COVID-19 pandemic, and resumed in June 2023. We aim to enrol 140 patients (recent AMI, TTS, or non-metastatic BC) and 140 healthy controls. To date, 19 AMI, 22 TTS, 27 BC patients, and 41 healthy subjects have been enrolled.
This presentation summarises enrolment and assessment tools, outlines the ontopsychological STP approach, and describes strategies to strengthen patient alliance throughout the study. A focus on the preliminary data analysis of the study is shown.

EXTENDING MENTALIZATION BEYOND SESSIONS: A PERSONALISED, PRIVACY-SAFE AI TOOL FOR ECOLOGICAL MENTALIZATION INTERVENTIONS

Pizzoli S.F.M.*[1], Vilone G.[2]

[1]Laboratory for Advanced Human-Technology Interaction, Department of Psychology and Health Sciences, Pegaso University, ~ Napoli ~ Italy, [2]Analog Devices International ~ Limerick ~ Ireland

Background and aim. Mentalization-Based Therapy (MBT) is a manualized psychodynamic treatment that fosters reflective functioning and affect regulation. A key clinical challenge is sustaining patients' mentalization capacity in daily life, particularly in emotionally charged contexts where breakdowns are most likely to occur. The aim of this work is to critically describe an AI-assisted reflective tool (Mentora) designed to deliver ecological momentary interventions grounded in MBT principles and strengthen patients' capacity for mentalization outside sessions.

Methods and Results. Mentora operationalises MBT techniques in everyday contexts through: (1) reflective prompts to support self–other understanding, (2) feedback on recurrent emotional-linguistic patterns, (3) mood and event journaling integrated with daily routines, and (4) psychoeducational micro-interventions aligned with the MBT manual. Importantly, the system is configured by the therapist, who sets clinical objectives and calibrates functions, while patients regulate its intensity and scope. Mentora guarantees rigorous privacy, granting patients full control over what is shared with the therapist. Its design emphasises personalisation, scalability, and therapist–patient co-regulation. To ground the model, we conducted a systematic comparison of four large language models to establish criteria of adequacy for functioning as trainers of mentalization. In addition, simulated cases of Mentora use, developed under the supervision of a psychotherapist, show how reflective material can emerge between sessions and later be elaborated upon in therapy.

Discussion. This study demonstrates how ecological digital tools can expand the therapeutic scope of MBT while maintaining the centrality of the therapeutic relationship. Future directions include integrating wearable devices for psychophysiological monitoring (e.g., heart rate variability, sleep quality, stress markers), thereby enriching ecological momentary interventions and tailoring them to patients' mentalizing capacities and well-being.

Conclusions. Mentora illustrates how a manualized, theory-driven approach can guide the ethical and effective use of AI in psychotherapy, enhancing mentalization in real-world contexts while safeguarding patient agency and privacy.

Abstract 900

READING PEOPLE'S MINDS? CAN WE PREDICT AMERICANS' COVID VACCINATION INTENTIONS JUST FROM THEIR GOOGLE SEARCHES?

Eirich G.*

Columbia University ~ New York City ~ United States of America

INTRODUCTION: Applied psychologists have long relied on surveys and experiments to study intentions, but these are often slow, costly, and potentially biased. Online search data promises a cheap, always-on, and accurate alternative: Could we know what people are thinking without asking them? Could we predict their behavior, just by knowing what they search for? Using the COVID-19 pandemic as a case study, we find that Google searches for "vaccine" strongly predicted actual U.S. vaccination rates, while state-level differences in specific search terms correlated with differences in vaccine uptake. PURPOSE: This study uses COVID-19 vaccination to test how digital traces reveal motivational dynamics, offering psychologists a new tool for anticipating health-seeking behavior. METHOD: We analyzed weekly U.S. Google search volumes at the national and state levels for "vaccine" alongside CDC vaccination data (Dec 2020–Jun 2022). Study 1 asks: Do search patterns predict vaccination? Study 2 asks: Is online search a weaker indicator of vaccination intention in states with lower vaccine uptake? We estimated correlations, geographic models, and time-series models, considering lags and stationarity concerns. RESULTS: Study 1 finds: Online search for "vaccine" predicted vaccination with near-perfect correlation (rho= 0.97, when search volume was lagged by 3 weeks) in the early rollout phase. Study 2 finds: Online search meant different things across states, signaling vaccine readiness in high-vaccinating states but highlighting side-effect concerns in lower-vaccinating states. CONCLUSIONS: Online search can serve as a powerful proxy for intention formation, predicting behavior with remarkable accuracy in specific contexts. For applied psychology, these findings show how Big Data can complement surveys and experiments by capturing cognitive, motivational, and societal processes in real-world settings. This approach is especially valuable for health psychology, societal development, and applied cognitive psychology, offering practical insights for interventions and reducing disparities in health behavior.

Abstract 1117

PROBLEMATIC GENERATIVE ARTIFICIAL INTELLIGENCE CHATBOT USE: MOTIVATIONS AND USE INTENSITY AS PREDICTORS

Chang Liao C.Y.*, Liu Y.

National Yang Ming Chiao Tung University ~ Hsinchu ~ Taiwan

Introduction: The rapid proliferation of generative artificial intelligence (AI) chatbots, such as ChatGPT and Gemini, has made them essential tools in modern society; however, the psychological factors contributing to problematic chatbot use remain largely unexplored. This study addresses this critical gap by extending the behavioral addiction model (Griffiths, 2005) and the Compensatory Internet Use Theory (Kardefelt-Winther, 2014) to problematic generative AI chatbot use.

Purpose: This research aims to investigate the predictive effects of user demographics, motivations, and usage frequency on five distinct constructs of problematic use of generative AI chatbots. We hypothesized that specific motivations and usage patterns would emerge as significant predictors across these constructs.

Method: A cross-sectional survey was conducted on a sample of 257 individuals from Taiwan (68 and 189 for males and females, average age 29). Participants completed online questionnaires including demographic information, usage frequency, user motivations (e.g., learning, entertainment, and emotion regulation), and the five constructs of problematic AI chatbot use behavior (salience, mood modification, tolerance, withdrawal, and conflict). Multiple regression analysis with robust standard errors was employed to test the predictive power of these factors.

Result: The results show that, among the five constructs of problematic chatbot use, emotionally regulated motivations consistently emerged as a significant predictor. Notably, emotional regulation use was the strongest and most stable predictor across constructs. Furthermore, a higher usage frequency also significantly predicted problematic chatbot use, while demographic factors did not show a consistent effect.

Conclusion: The findings provide initial evidence on psychological mechanisms underlying problematic generative AI chatbot use. Targeting emotion regulation motives and heavy use patterns may help AI developers, educators, and clinicians mitigate the risks associated with this emerging technology.

Abstract 1176

CYBERBULLYING VICTIMIZATION IDENTIFICATION AND LARGE LANGUAGE MODEL-ASSISTED ASSESSMENT: A STUDY OF CYBERBULLYING VICTIMIZATION LEXICON CONSTRUCTION AND VALIDATION

Liu X.*[1], Liao Y.[1], Kang X.[1], Liu M.[1], Han N.[2]

[1]Central China Normal University ~ Wuhan ~ China, [2]Beijing Normal University at Zhuhai ~ Zhuhai ~ China

Cyberbullying, as a global psychological health threat, faces challenges in accurate identification due to the biases of traditional self-report methods and obstacles to help-seeking.

This study constructs a Chinese cyberbullying victim dictionary based on social media big data, psychological feature dictionaries, and cyberbullying questionnaires to enhance the accuracy of victim identification, providing the possibility for timely intervention. The dictionary's validity was confirmed through a correlation analysis between word frequency statistics of 500 Weibo posts and expert ratings (n=3). To assess whether DeepSeek-R1 and GPT-4o could aid in the dictionary compilation process, the study replicated the manual creation process and compared their performance to expert evaluations using Kappa consistency coefficients, intraclass correlation coefficients (ICC), recall rates, and precision rates under both simple and complex instructions.Results showed that: (1) The dictionary, consisting of 442 words across three dimensions—cyberbullying methods, harm perception, and coping strategies—demonstrated high validity in identifying cyberbullying victimization expressions ($r = 0.870$, $p < 0.001$) and assessing victimization severity ($r = 0.533$, $p < 0.001$); (2) In text classification, DeepSeek-R1 performed well on small samples (Kappa = 0.775–0.781), but its performance dropped with a large dataset of 12,600 posts. Both models showed discrepancies in vocabulary selection and weight assignment (lowest Kappa = -1); however, DeepSeek-R1 showed moderate consistency in dimensional categorization (Kappa = 0.659–0.660) and outperformed GPT-4o. This

study is the
first to develop a Chinese cyberbullying victim dictionary, highlighting AI's potential in dictionary construction and suggesting human-AI collaboration for large-scale data tasks.

PATHWAYS TO WELL-BEING: UNRAVELING STRUCTURAL, INTERPERSONAL, AND INTRAPERSONAL MECHANISMS THROUGH INNOVATIVE METHODS

Saturday 25 July 2026 from 08:00 to 09:00

(P -Arsenale)

Yiqun Gan, Chair and Discussant

This symposium integrates cutting-edge research to explore multidimensional pathways to mental health, addressing structural stigma, prosocial behavior, empathy, and nature-based interventions. The topic is highly relevant to the IAAP Congress, as it bridges macro-level social determinants with micro-level psychological processes using innovative methodologies—including network analysis, ecological momentary assessment, and machine learning causal inference—to advance health psychology in a complex world.

Qiao et al. open with a structural perspective, using psychometric network analysis to reveal how intersectional stigma among sexual and gender minorities is organized around racial and cultural domains. Their findings underscore the need for identity-specific public health interventions.

Deng introduces an intrapersonal lens, disentangling cognitive and emotional empathy within adolescent well-being networks. Their longitudinal network analysis reveals empathy's dual role, with cognitive empathy fostering vitality and emotional empathy posing potential risks—offering nuanced guidance for youth mental health promotion.

Gruszczyńska et al. shift to the interpersonal sphere, demonstrating through intensive longitudinal data that providing social support enhances affective well-being by satisfying basic psychological needs—challenging the conventional focus on support costs and highlighting sustained emotional benefits.

Chen concludes with an experiential and environmental approach, testing a nature-based photography intervention. Using machine learning causal forests, they show how meaning in life mediates well-being gains, especially among vulnerable groups—providing a scalable, non-stigmatizing mental health intervention aligned with global sustainability goals.

Together, these presentations offer a cohesive yet diverse exploration of well-being across social, relational, individual, and environmental dimensions.

Abstract 4919

UNPACKING INTERSECTIONAL STIGMA AND ITS PSYCHOLOGICAL IMPLICATIONS AMONG SEXUAL AND GENDER MINORITIES: A NETWORK ANALYSIS USING THE ALL OF US COHORT

Qiao S.*

Arnold School of Public Health ~ Columbia SC 29208 ~ USA

Sexual and gender minorities (SGM) experience disproportionately high rates of mental and physical health challenges driven largely by stigma and discrimination embedded within social and structural systems. Intersectional stigma, where multiple stigmatized identities intersect, offers a useful lens, but is difficult to study quantitatively because individuals vary widely in both the number and types of stigmas they report, requiring large, diverse samples to identify meaningful patterns. Although intersectional experiences are often idiosyncratic, people who share identities may also share intersecting stigma profiles (e.g., gender and sexual-orientation stigma). However, many large-scale studies have collapsed cisgender sexual minorities (CSM) and gender-diverse sexual minorities (GDSM) into a single category, potentially obscuring subgroup-specific mechanisms and limiting intervention precision. To assess whether shared, group-level stigma configurations exist and whether they differ between CSM and GDSM, we used psychometric network analysis on 20,682 sexual minority participants from the All of Us Research Program (1,816 GDSM; 18,866 CSM), modeling 11 stigma domains (e.g., gender, race, sexual orientation, and appearance). Gender- and sexual-orientation-based stigma was the most frequently reported stigma, especially among the GDSM; however, network centrality analyses indicated that racialized and cultural domains (race, ancestry, religion) were structurally the most influential across groups. The network comparison test results showed a significant difference in the configuration of stigma profiles between GDSM and CSM participants ($M = 1.32$, $p < 0.001$), whereas global network strength did not differ ($S = 3.22$, $p = 0.973$). This indicates that there are different organizational patterns of intersectional stigma, despite their similar overall interconnectedness. These findings suggest that experiences of intersectional stigma among SGMs is organized by broader systems of racialized and cultural marginalization and that disaggregating sexual minorities by gender identity can reveal distinct network structures relevant for targeted clinical and public-health interventions.

Abstract 4921

WHEN HELPING FEELS GOOD: AFFECTIVE WELL-BEING AND BASIC PSYCHOLOGICAL NEEDS SATISFACTION AFTER SUPPORT PROVISION IN DAILY LIFE

Gruszczynska E.*

Institute of Psychology, SWPS University ~ Warsaw ~ Poland

Introduction. Although the benefits of receiving social support are well documented, research on support providers has largely emphasized costs such as resource depletion. Drawing on self-determination theory, we propose that providing support can enhance affective well-being when it satisfies the needs for autonomy, competence, and relatedness.

Purpose. We aimed (1) to test whether providing support is associated with momentary changes in affective well-being, (2) to examine whether these changes are strongest when accompanied by the momentary satisfaction of autonomy, competence, and relatedness needs, and (3) to explore how long these changes persist over time.

Method. Using a measurement-burst design, we conducted four ecological momentary assessment studies, spaced three months apart, with 373 adults (55% women). Participants received prompts three times daily for seven days to report affective states and whether they had provided support in the past 60 minutes. After providing support, they also rated momentary need fulfillment.

Results. Across 26,692 assessments, spontaneous support was reported in 23% of cases, with no gender differences. Within-person analyses indicated that fulfillment of autonomy, competence, and relatedness needs predicted increases in positive affect, controlling for autoregression. Decreases in negative affect were associated with fulfillment of autonomy and competence needs, but not relatedness need. These patterns replicated across all four studies. Increases in positive affect persisted for 20–22 hours when support provision was followed by another act within 12 hours, compared to 16–18 hours without such follow-up. In contrast, negative affect returned to baseline more quickly (9–11 hours) and was less sensitive to the cumulative effect of repeated support provision.

Conclusions. Providing support is associated with enhanced affective well-being, particularly when accompanied by the satisfaction of basic psychological needs. This beneficial effect extends beyond momentary experiences and demonstrates substantial temporal persistence. Replication across four bursts underscores the robustness of the findings.

Abstract 4922

NATURE-BASED PHOTOGRAPHY INTERVENTION ENHANCES SUBJECTIVE WELL-BEING: A THREE-ARM RANDOMIZED CONTROLLED STUDY BASED ON MACHINE LEARNING

Chen Y.*

School of Humanities and Social Sciences, Beijing Forestry University ~ Beijing ~ China

Introduction: It has been widely demonstrated that nature contact can contribute to human well-being. Meaning in life is also embedded in nature, yet previous research has less frequently used a meaning in life as a mediating mechanism to explain the role of nature contact in promoting subjective well-being from that perspective.

Purpose: The current study developed a 7-day online nature-based photography intervention to validate the use of meaning photography based on nature for promoting well-being, and the study will contribute to the joint realization of the United Nations SDG3 and SDG13 goals. Traditional photography interventions for meaning in life have been used to enhance well-being, and integration with nature meaning acquisition will facilitate the development of this intervention approach.

Method: A pre-registered three-arm randomized controlled trial (meaning-writing group vs meaning-photography group vs waiting list) was conducted with 219 college students. In the meaning-writing group, participants captured nature scenes and wrote 100-word reflections. The photography group only took nature photos. A conservative Bayesian causal forest analysis based on machine learning was used to detect both treatment and heterogeneous intervention effects.

Results: Participants who combined photography with reflective writing showed notable improvements in their meaning in life, well-being, and life satisfaction compared to waiting list, which can be also found in the meaning-photography group. However, these effects were not sustained after one month. The intervention was especially beneficial for participants from lower socioeconomic backgrounds, with limited prior nature exposure, or lower baseline psychological well-being.

Conclusion: Importantly, enhanced meaning in life helped explain how nature contact improved well-being and life satisfaction. This study also demonstrated that combining nature-based photography and reflective writing can improve well-being.

CONNECTUP: CITIZEN SCIENCE INFORMED ONLINE PLATFORM TO INCREASE SOCIAL CONNECTION, PHYSICAL HEALTH, AND MENTAL WELLBEING IN PEOPLE WITH DISABILITY AND CARERS.

Kwasnicka D.*[1], Naccarella L.[1], Rawstorn J.[2], Quested E.[3], Thompson C.[3], Mcveigh J.[3], Sinnott R.[1], Robinson S.[2], O''Halloran P.[4], Wadley G.[1], Lau A.[5], Tiedemann A.[6], Maddison R.[2]

[1]Univversity of Melbourne ~ Melbourne ~ Australia, [2]Deakin University ~ Melbourne ~ Australia, [3]Curtin University ~ Perth ~ Australia, [4]La Trobe University ~ Melbourne ~ Australia, [5]Macquarie University ~ Sydney ~ Australia, [6]University of Sydney ~ Sydney ~ Australia

Introduction
ConnectUp is a digital platform co-designed to support people with disabilities and carers in forming social connections and engaging in community-based physical activity. The platform enables users to find local activity partners, connect online, and meet in their local area to participate in physical activity sessions. Users can also share reviews of accessible locations.

Purpose
This study aimed to develop a platform that responds directly to users' needs and preferences.

Method
We conducted 12 iterative co-design workshops with 15 participants (people with disabilities and carers), facilitated by researchers with lived experience of disability. Participatory techniques included paper prototyping, app interface critique, prioritisation tasks, and guided discussions. All sessions were video recorded, transcribed verbatim, and analysed using thematic analysis across multiple data sources, including transcripts, participant drawings, and session notes.

Results
Three interconnected central themes emerged:
(1) Accessibility by design – ensuring usability for a broad range of abilities;
(2) Genuine inclusion – participants emphasised the importance of being involved not only in design but also in ongoing platform governance and implementation; and
(3) Citizen science potential – participants saw value in contributing localised knowledge to build a living database of accessible, enjoyable spaces, fostering both research engagement and health promotion.

Conclusions
This co-designed platform is currently being trialled in Western Australia and will be

scaled nationally. Preliminary feedback highlights its potential to enhance social connection, physical activity participation, and mental wellbeing. ConnectUp also offers a transferable model for developing inclusive digital health interventions in collaboration with other marginalised communities, including culturally and linguistically diverse populations. This work illustrates how participatory digital tools can advance applied psychology goals by addressing systemic barriers to health equity, social inclusion, and community engagement.

Abstract 2469

PSYCHOLOGY OF ADVANCED USERS OF INFORMATION TECHNOLOGIES AS A NEW AVENUE OF APPLIED RESEARCH

Vynoslavska O.*, Kononets M.

National Technical University of Ukraine "Igor Sikorsky Kyiv Polytechnic Institute" ~ Kyiv ~ Ukraine

Introduction. The unprecedented spread of information technologies (IT) into various spheres of human life has led to the emergence of many specialists who work online. Therefore, the current task of applied psychology is to study the impact of IT on the development of cognitive processes and behavior of advanced IT-users.
Purpose. To highlight the dynamics of Ukrainian IT-users' attitudes towards the advantages and disadvantages of working online.
Methods. The questionnaire "Advantages and disadvantages of using IT in the educational process" developed by author was used.
Results. The dynamics of the attitudes of technical university teachers and graduate students as advanced IT-users to advantages and disadvantages of working online are presented. It is shown that during period from 2013 to 2017 the users' euphoria of owning computers or having unlimited access to IT began to gradually decline due to understanding that not all desired tasks can be quickly solved with their help. Many users have experienced the harmful effects of online work on human health. Over the next four years (2018-2021), a large number of people with moderate or no experience using IT began working online due to COVID-19. Thanks to the opportunity to work and study remotely, the number of advantages mentioned by respondents has increased significantly. Under war conditions in Ukraine (2022-2025), the number of advantages of working online mentioned by respondents remains at the same high level, but the number of disadvantages has increased significantly: in addition to the harmful effects on human health, technical factors such as lack of or limited access to the network, lack of equipment, and power outages have been added.
Conclusions. Despite constant improvement of IT, the number of problems regarding its negative impact on human physical and mental health will not decrease, and the psychology of IT-users should study these problems.

Abstract 2492

REIMAGINING PREVENTIVE CARE THROUGH DIGITAL INNOVATION: BUILDING SOCIAL CONNECTION AND INCLUSION FOR CARERS AND PEOPLE WITH DISABILITY

Kwasnicka D.*

University of Melbourne ~ Melbourne ~ Australia

Introduction: People with disability and unpaid carers experience disproportionately high rates of social isolation, stress, and poorer physical and mental health. These challenges are compounded by barriers to community participation and limited access to inclusive health-promoting environments. Digital health interventions grounded in psychological theory and participatory design offer new opportunities to enhance social connection and wellbeing in this population.

Purpose: This study aimed to co-design and evaluate ConnectUp, an online platform developed to foster social connectedness, local engagement, and physical activity among people with disability and carers. The project sought to identify how principles of accessibility, inclusion, and empowerment can inform digital intervention design and implementation.

Method: Twelve iterative co-design sessions were conducted with fifteen participants (people with disability and carers), led by individuals with lived experience. Sessions included paper prototyping, design critique, ranking exercises, and facilitated discussions. All data were video recorded, transcribed verbatim, and analysed thematically using an inductive approach. Thematic synthesis was triangulated with user engagement analytics from the platform's Minimum Viable Product (MVP) phase.

Results: Three central themes emerged: (1) Accessibility as a psychological and design foundation—ensuring usability and trust; (2) Meaningful inclusion—embedding co-production and lived experience across all design phases; and (3) Citizen science and empowerment—supporting users to create, share, and use local wellbeing knowledge. Preliminary user feedback suggests ConnectUp enhances perceived social connection, confidence, and community belonging.

Conclusions: Co-designing digital interventions with end users fosters psychological ownership, inclusion, and empowerment—key mechanisms underpinning sustained wellbeing. ConnectUp demonstrates how participatory design can translate psychological principles into scalable, inclusive digital health solutions that promote social participation and mental health.

Abstract 1966

DIGITAL SELF–HARM: A SCOPING REVIEW OF PREVALENCE, MEASUREMENTS, AND RISK FACTORS

Wang Y.*[1], Lu J.[2], Xu C.[3], Zhang T.[1], Zhu S.[1]

[1]Department of Applied Social Sciences, The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong, [2]Department of Outpatient, Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University ~ Hangzhou ~ China, [3]Department of Psychiatry, Wuhan Mental Health Center ~ Wuhan ~ China

Introduction

Digital self–harm (DiSH) has recently emerged as a concerning phenomenon, exacerbated by advances in digital technology. Although DiSH can trigger psychological distress and potentially contribute to more severe outcomes, evidence on its prevalence, measurement approaches, and underlying risk factors remains fragmented and insufficiently synthesized, limiting the development of research, prevention, and intervention strategies.

Purpose

To consolidate evidence by systematically mapping relevant literature on these three key aspects.

Methods

The review followed PRISMA–ScR checklist. PubMed, Web of Science, PsycINFO, and ProQuest Dissertations & Theses databases were searched from inception to March 23, 2025. Prevalence data were summarized using medians and interquartile ranges (IQR). Measurement tools were examined descriptively, and thematic analysis was used to identify and categorize risk factors based on the biopsychosocial–ecological framework.

Results

Of 5,587 identified records, 25 studies met the eligibility criteria. Overall prevalence of DiSH was 9.2% (IQR 6.1–13.1). School–based samples were most frequently investigated, with lifetime prevalence (8.8%, IQR 5.3–11.1) lower than that in community samples (16.3%, IQR 12.2–29.8). Early studies primarily relied on single–item measures, whereas novel tools have recently been developed, requiring further validation. A total of 23 risk themes were synthesized, with the most commonly reported specific factors including racial/ethnic minority, younger age, shorter sleep duration, self–harm and suicidal risks, depressive symptoms, dysfunctional parenting, lower education, bullying victimization, and temporal context (late night).

Conclusions

This scoping review provides a comprehensive landscape of DiSH, highlighting prevalence trends, measurement approaches, and key risk factors, and underscores the need for greater attention, standardized tools, and early intervention strategies.

Abstract 2649

EXPLORING THE DETERMINANTS OF NON-SUICIDAL SELF-INJURY AMONG UNIVERSITY STUDENTS IN JORDAN: A CROSS-SECTIONAL STUDY

Taha H.*

Department of Family and Community Medicine, School of Medicine, The University of Jordan ~ Amman ~ Jordan

Background: Deliberate bodily harm without suicidal intent, has become a growing concern among young adults and adolescents. This study aims to explore the determinants of non-suicidal self-injury ((NSSI) and its correlation with psychological distress and mobile phone addiction (MPA) among university students in Jordan.

Methods: A quantitative cross-sectional study targeting university students in Jordan. The data was collected using a semi-structured online questionnaire that assessed sociodemographic characteristics, mobile phone addiction, depression, anxiety, suicidal thoughts and NSSI. SPSS 30 was used for descriptive and multivariate analysis. Spearman's correlation, Chi-square, Kruskal- Wallis and Man-Whitney U were applied. Binary logistic regression was conducted to identify the predictors of significant NSSI.

Results: Out of 394 students, 63.2% reported at least one self-harm behavior, while the remaining students scored zero on the Self Harm Inventory (SHI). Significant self-harm, defined as SHI > 5, was reported by 20.56% of participants. Higher levels of anxiety and depression were strongly associated with increased NSSI severity ($p < .001$). Depression was a strong predictor of significant self-harm ($p < .001$, OR = 1.209). Participants who reported experiencing negative or traumatic events during childhood, or having a family member with a psychological disorder, were significantly more likely to fall into the higher-risk NSSI category ($p < .001$).

Conclusion: This study demonstrated a high prevalence of NSSI among the study participants which was strongly associated with psychological distress and dysfunctional family environment, which may provide insight into its etiology and has implications for early identification and intervention.

Abstract 2435

THE AVATAR WITHIN: HOW THE METAVERSE REWRITES WHO WE ARE

Srivastava D.*, Nath P.

Indian Institute Of Management–Tiruchirappalli (IIM–Tiruchirappalli) ~ Tiruchirappalli ~ India

"You are who you pretend to be. And the mask becomes the face."
- Sherry Turkle (Life on the Screen, 1995)

The changing technological landscape is making the metaverse a new normal, where users immerse themselves in the virtual world, projecting themselves through their own customised avatars. These avatars redefine the user's identity, either complementing or conflicting with the user's real-world identity. The work offers insight into how individuals balance their virtual and real-world identities, and how this affects their psychological well-being. Grounded in Social Identity Theory, the study presents an 'Integration-Fragmentation-Adaption' identity model to illustrate how individuals experience identity fragmentation or adaptation while navigating the metaverse and the real world, ultimately influencing their psychological well-being. The proposed model is built on three propositions. First, users with high avatar identification and low self-concept clarity are more prone to identity fragmentation. Second, participation in metaverse groups that are more congruent with an individual's real-world norms predicts identity integration. Third, users who demonstrate psychological flexibility are more likely to experience identity adaptation and maintain meta-identity coherence.

This is a foundational study of the metaverse and identity, adding to the existing literature on identity within the context of a rapidly evolving technological landscape. Metaverse is slowly becoming an integral part of one's life, especially for future generations. Further studies can be built upon this work to extend the scope and realise the greater psychological implications of the metaverse.

THE POWER OF SCENT AND SIGHT FROM LAB TO FIELD RESEARCH: EXPLORING "HEALTHY" SENSORY NUDGES IN VENDING MACHINES

Brivio E.*[1], Casiraghi C.[1], Chiarelli S.[1], Gifuni G.[1], Fici A.[1], Bilucaglia M.[1], Jacomuzzi A.C.[2], Micheletto V.[1], Russo V.[1], Zito M.[1]

[1]Department of Business, Law, Economics and Consumer Behaviour "Carlo A. Ricciardi", Università IULM ~ Milan ~ Italy, [2]Department of Philosophy and Cultural Heritage, Ca' Foscari University of Venice ~ Venice ~ Italy

Introduction. Nudge interventions have proven effective in supporting healthier eating, yet their application in vending machines remains limited, with few studies exploring the underlying emotional and cognitive mechanisms behind these effects.

Purpose. This research aimed to examine how visual and olfactory nudges, individually and in combination, influence healthier snack choices and related cognitive and emotional consumer responses.

Method. Two complementary studies were carried out. In a first laboratory experiment, participants interacted with a vending machine under different nudge conditions: a neutral baseline, a visual nudge (nature-themed image), an olfactory nudge (jasmine scent), or a combined condition. During the task, we assessed snack choices (behavioral), emotional and cognitive responses (skin conductance and electroencephalography), and visual attention (eye-tracking). A second field study took place in a real university setting, where the interventions were tested again across three conditions: neutral baseline, visual nudge, and olfactory nudge.

Results. In the lab, visual and olfactory nudges independently significantly increased healthy choices, while their combination did not enhance the effect. Skin conductance suggested a relaxation effect underlying the olfactory and combined nudge interventions, EEG revealed reduced approach in the combined condition, and eye-tracking showed greater attention to snacks placed at eye level. In the field, sales data demonstrated that the olfactory nudge significantly increased healthy snack purchases compared with both neutral and visual weeks, confirming its effectiveness in a naturalistic context.

Conclusions. These findings indicate that visual and olfactory nudges can promote healthier vending choices, through their combined use may reduce impact, with olfactory cues confirming the strongest effect even in real contexts. Overall, the studies highlight the emotional, cognitive, and attentional mechanisms driving consumer responses to nudges and provide practical strategies for supporting healthier eating in everyday environments while using simple sensory cues.

Abstract 116

SMOKING BEHAVIOR AND WELL-BEING OF YOUTH IN RELATION TO FAMILY ENVIRONMENT AND PEER INFLUENCE

Pandey R.P.*[1], Awasthi Purnima S.[2]

[1]Department of Psychology, Central University of Haryana ~ Mahendragarh ~ India, [2]Department of Psychology, Banaras Hindu University ~ Varanasi ~ India

Smoking among youth worldwide is a growing public health issue, influenced by factors such as peer pressure and family environment. This leads to various health risks and long-term psychological and physiological repercussions. The present study aims to examine the associations of family environment and peer influence with smoking behavior and well-being of youth. The study was conducted on 392 youth smokers representing different socioeconomic statuses from Eastern Uttar Pradesh, India, by applying a convenient sampling method. The participants ranged from 17 to 30 years, with a mean age of 22.73 (SD 2.85). The study utilized the mental health continuum (short form), smoking urges measure, scale of family environment, and a peer influence measure to assess the variables under study. Analysis revealed peer influence dimensions, i.e., peer conformity and misconduct, were positively associated with smoking behavior and negatively with well-being. In contrast, family cohesion was negatively associated with smoking behavior and positively with well-being, while family conflict showed the opposite pattern. Peer conformity, misconduct, cohesion, and conflict significantly predicted smoking behavior and well-being. The findings highlight the critical links of peer influence and family environments with smoking behavior and well-being, emphasizing the importance of changing negative family environment and peer norms, promoting healthy peer relationships, and reinforcing parental disapproval of smoking to reduce smoking behavior and enhance well-being amongst youth.

Abstract 4385

SUICIDE PREVENTION PRACTICE IN NEPAL

Singh T.N.*

Padma Kanya Campus Tribhuwan University ~ Bhaktpur ~ Nepal

If Discussant,
abstract not required

Introduction:
Suicide is a growing public health concern globally and a leading cause of death among adolescents and young adults. In Nepal, suicide and related behaviors—such as ideation,
planning, and attempts—are alarmingly prevalent. Early intervention, improved mental health awareness, and culturally sensitive strategies are essential. Addressing stigma and
involving communities through informed media reporting and grassroots engagement are also crucial to sustainable suicide prevention.
Method:
The Suicide Prevention Facilitation Training (SPFT): Lifeline Saving Lives was developed as a two-day (12-hour) interactive program. It trains participants to identify suicide risk, provide crisis support, and establish collaborative safety plans. Rooted in psychological best practices, it draws on contextualized versions of ASIST, Gatekeeper Training, Lifeline: Saving Lives, and Crisis Supporter models, tailored to South Asian cultural contexts.
Results:
SPFT improves participants' crisis intervention skills, enhances emotional intelligence, and strengthens community support networks. The program promotes a grassroots, stigma-reducing approach. It incorporates the GRACE model—gratitude, Respect, Accountability, Courage, and Engagement—to support self-leadership and emotional resilience, ultimately contributing to long-term mental well-being.
Conclusion:
A culturally adapted, community-centered approach is vital for effective suicide prevention in Nepal. Through applied psychology, SPFT and the GRACE model offer scalable solutions that build life-saving capacity, emotional strength, and public ownership in suicide prevention efforts.

Abstract 1227

FROM INDIVIDUAL HEALTH TO SUSTAINABILITY: PSYCHOLOGICAL MECHANISMS OF CROSS-DOMAIN BEHAVIORS BASED ON THE CAPABILITY,OPPORTUNITY,MOTIVATION-BEHAVIOR (COM-B) MODEL

Zhang C.*, Gan Y.

School of Psychological and Cognitive Sciences, Peking University ~ Beijing ~ China

Introduction: Health behaviors and environmentally relevant behaviors influence both individual well-being and planetary sustainability. Although their immediate goals differ, they may share underlying psychological mechanisms. The COM-B model provides a framework for understanding and intervening in behavior, yet its cross-domain applicability remains insufficiently tested, limiting interventions that simultaneously target health and environmental behaviors. Identifying shared mechanisms is therefore essential to design integrated strategies that achieve a “win–win” for personal health and planetary sustainability.

Methods: Using ISSP data from over 30 countries (health modules 2011 & 2021; environment module 2020), we selected four outcomes: fruit and vegetable intake and physical activity (personal health), and red meat consumption and outdoor recreation (environmental behaviors). These indicators capture typical health-promoting actions and environmental pathways: reducing red meat mitigates carbon emissions, while outdoor activities enhance nature engagement and pro-environmental awareness, enabling a test of COM-B’s cross-domain generalizability. Using machine learning methods, predictors were first identified with random forests to select the 30 most important variables, followed by eight supervised models, with SHAP values aggregating predictors into COM-B dimensions. Logistic regression tested significance, and East–West subgroup analyses assessed cultural moderation.

Results: Models showed moderate predictive performance. Capability consistently emerged as the strongest predictor, followed by Motivation, with Opportunity contributing least. Eastern samples relied more on Capability for health behaviors, Western samples on Motivation. For environmental behaviors, Eastern samples showed higher contributions across all dimensions, with Capability driving meat reduction and Capability and Motivation supporting outdoor recreation; Western participants relied more on Motivation. Mann–Whitney U tests and interaction regressions confirmed cultural moderation.

Conclusion: These findings indicate that individual health and environmental behaviors share a core Capability-driven mechanism, while Motivation and Opportunity effects are domain- and culture-specific. COM-B’s cross-domain applicability is empirically supported, informing integrated interventions that strengthen Capability and contextually mobilize Motivation to advance both personal and planetary health.

A LONGITUDINAL STUDY ON MENTAL HEALTH AND RELATIONAL OUTCOMES OF PARENTAL COUPLES: RESULTS FROM THE PARENTAL COUPLES PROJECT

Paradis A.*, Godbout N., Villeneuve É., Rassart C., Carle--Trouillard M.

Université du Québec à Montréal ~ Montreal ~ Canada

The arrival of a new child brings joy and purpose, yet it is also a pivotal life event that can significantly impact parents' mental health and couple functioning. Although parental mental health has garnered increasing empirical attention, further research is warranted to document the psychological and relational adjustment of both mothers and fathers across the postpartum period and into early parenthood. The Parental Couples Project is a longitudinal cohort study examining how psychological well-being and couple adjustment evolve over time after the birth of a new child. As part of this project, the current presentation draws on data from 1,142 parental couples randomly selected across the province of Quebec through a partnership with the provincial Parental Insurance Plan. Both mothers and fathers were assessed across four waves spanning 30 months (child's age at T1: 3 months; T2: 9 months; T3: 18 months; T4: 30 months) using validated self-report measures of parenting stress, psychological distress, postpartum depression, and life, relationship, and sexual satisfaction. Two-way repeated ANOVAs revealed significant gender differences at all timepoints: Mothers consistently reported higher levels of postpartum depression and psychological distress, while fathers reported higher parenting stress and lower life satisfaction. In terms of relational outcomes, mothers reported greater relationship satisfaction, while fathers reported greater sexual satisfaction. Significant time effects were also observed, with both parents reporting increased parenting stress and declines in life, relationship and sexual satisfaction over time. Notably, the proportion of parents meeting criteria for clinically significant relationship distress nearly tripled from T1 to T4 (mothers: 5.2% to 15.4%; fathers: 5.4% to 17.1%). No gender x time interactions were found. These findings highlight the evolving nature of well-being during early parenthood and support the need for tailored strategies to address the distinct challenges faced by both parents through this critical period.

O. Specialistica di Riabilitazione Cardiovascolare ~ Seriate (Bergamo) ~ Italy

Introduction: The relationship between psychological factors and cardiovascular disease (CVD) has been extensively studied, particularly concerning predictive factors and patients' responses during both the acute and chronic phases. However, there is less understanding of how specific psychological treatments affect the psychological well-being of patients in cardiovascular rehabilitation. Purpose: This study aims to test the effectiveness of psychological interventions in improving the mental health of patients undergoing cardiac rehabilitation programs. Specifically, this study aims to compare the effect of three different types of psychological interventions: the (a) psychoeducational intervention group, (b) progressive muscle relaxation training integrated with Jacobson's technique and imaginative stabilization techniques, and (c) individual counseling on the levels of anxiety, depression and illness perception of patients suffering from CVDs at the beginning (T0), at the end (T1), and 3 months after a cardiac rehabilitation program (T2).

Methods: One hundred and eighty-one patients in cardiovascular rehabilitation participated in three psychological treatments: psychoeducational intervention group, progressive muscle relaxation training with Jacobson's technique and imaginative stabilization techniques, and individual counseling. The study included patients with Acute Coronary Syndrome (ACS), heart failure (HF), or undergoing cardiac surgery (CS) undergoing cardiovascular rehabilitation. HADS and Brief-IPQ measured levels of anxiety, depression, and illness perception. Results: Significant differences were observed between different time points in the three psychological treatments, with individual counseling showing the most significant improvements in anxiety, depression, and illness perception. Conclusion: The study shows that individual counseling significantly reduces the levels of depression and anxiety, while promoting a healthier perception of the disease in comparison with the other two psychological treatments offered. These findings have important implications for healthcare policies, as they provide evidence for the effectiveness of individual counseling in improving the psychological well-being of patients.

Abstract 226

INFORMAL CAREGIVER EXHAUSTION: AN INTEGRATIVE CONCEPTUAL REVIEW

Zhang X.*, Xu X., Hao S.

Peking University ~ Beijing ~ China

While informal caregivers provide essential support, this vital role often subjects them to substantial demands, which can culminate in adverse outcomes for their own well-being. Conceptual ambiguity and the limitations of existing frameworks, particularly the application of occupational burnout models, hinder a clear understanding of caregiver distress. This integrative conceptual review addresses these gaps by proposing "informal caregiver exhaustion" as a distinct construct tailored to the unique context of informal caregiving. We define informal caregiver exhaustion as a multidimensional (physical, emotional, cognitive, social dysfunction/withdrawal), chronic state of resource depletion resulting from prolonged exposure to cumulative caregiving demands exceeding replenishment capacity. Informal caregiver exhaustion is differentiated from related concepts like job burnout, subjective burden, general fatigue, and stress. We propose an integrative theoretical framework based on an adapted Input-Process-Output (IPO) systems model. This framework conceptualizes informal caregiver exhaustion as an output emerging from the dynamic interplay of baseline inputs (e.g., caregiver characteristics, recipient needs, external supports) and caregiving processes (e.g., tasks, interactions, appraisals, coping), explicitly differentiating these components to address methodological challenges like confounding and selection bias. The review outlines pathways leading to informal caregiver exhaustion and details its consequences for caregiver well-being across the proposed dimensions. This conceptualization provides a robust foundation for future empirical research, including construct validation, longitudinal studies testing the IPO model, and the development of targeted measurement tools and interventions to better support informal caregivers.

Abstract 1042

ECOLOGICAL FRAMING AND FEWER RECOMMENDATIONS IMPROVE ADHERENCE TO PROTECTIVE BEHAVIORS AGAINST ENDOCRINE-DISRUPTING CHEMICALS

Meyer T.*[3], Kergoat M.[1], Toussard L.[2]

[1]Univ Lyon, UJM-Saint-Etienne, Coactis ~ Saint-Etienne ~ France, [2]Institut Catholique de Lille, 3. PSyCOS - ETHICS ~ Lille ~ France, [3]Univ Paris Nanterre ~ Nanterre ~ France

Introduction. Health recommendations aimed at reducing exposure to endocrine-disrupting chemicals (EDCs) seek to facilitate understanding of a complex topic involving multiple behavioral recommendations across various domains.
Purpose. However, presenting too many recommendations may exceed attentional and memory resources, thereby reducing comprehension and adherence. This study tested whether an integrative warning message combining human and ecological health arguments ("One Health–One Planet" framing) would enhance adherence to behavioral recommendations compared with a message focusing solely on personal health risks.
Method. In a two-wave online study, French participants (N = 381) received a general message about EDCs that was framed either ecologically or personally. The message was followed by three, nine, or fifteen behavioral recommendations spanning food, cosmetics, and indoor air. Message fatigue was statistically controlled.
Results. Behavioral intention increased one month after message exposure. For self-reported behaviors, participants receiving three recommendations reported the highest behavioral engagement (M = 5.45, SD = 1.84), followed by those receiving nine (M = 4.90, SD = 1.93) and fifteen recommendations (M = 4.18, SD = 1.87), $F(2, 363) = 6.23$, $p = .002$, $\eta^2p = .033$. A significant framing effect also emerged, $F(1, 363) = 8.76$, $p = .003$, $\eta^2p = .024$, with ecologically framed messages (M = 5.21, SD = 1.96) producing higher behavioral scores than self-focused messages (M = 4.61, SD = 1.88).
Conclusion. Contrary to prior research emphasizing the benefits of multiple recommendations, fewer recommendations optimized behavioral engagement in the complex context of EDCs. Ecologically framed messages were more persuasive than self-focused messages; however, framing did not moderate the detrimental impact of excessive recommendations. These findings suggest that global understanding of EDCs may rely on different motivational and cognitive processes than those underlying domain-specific health behavior change.

GROUPS FOR BELONGING: A NOVEL LONELINESS INTERVENTION FOR PEOPLE ATTENDING TREATMENT FOR SUBSTANCE USE DISORDERS

Ingram I.[1], Dingle G.[2], Larance B.[1], Baker A.[3], Deane F.[1], Robinson L.[1], Beck A.[1], Coleman E.[1], Degan T.[1], Kelly P.*[1]

[1]School of Psychology, University of Wollongong ~ Wollongong ~ Australia, [2]School of Psychology, University of Queensland ~ Brisbane ~ Australia, [3]National Drug and Alcohol Research Centre, University of New South Wales ~ Sydney ~ Australia

Introduction: Loneliness is detrimental to physical and mental health and is now considered a major public health concern by the World Health Organization. People with substance use disorder experience high rates of loneliness. An Australian study found that people with substance use disorders were seven times lonelier than the general population and were five times more likely to deem loneliness a serious concern.
Purpose: This presentation details a series of studies, led by a clinical psychologist and early-career researcher, that address loneliness among people with substance use disorder. These studies led to the development of Groups for Belonging, a 6-session (12-hour) group-based therapeutic intervention that addresses loneliness. The presentation also details a current Nation-wide trial of Groups for Belonging for people accessing treatment for substance use disorder that is being funded by the Australian National Health and Medical Research Council.
Method: Participants in the trial are attending community based or residential alcohol and other drug treatment services across Australia. The trial is being conducted as a parallel cluster randomised controlled trial involving 26 clusters (13 treatment, 13 control, N = 520), with randomisation occurring at the service level. Participants will complete either treatment as usual (i.e., treatment for substance use provided by participating services) or Groups for Belonging + treatment as usual.
Results: The intervention is theory and consumer informed, and a pilot study revealed high satisfaction with the intervention, and feasibility to deliver the intervention in treatment settings.
Conclusions: This project aims to determine the effectiveness of a loneliness intervention for people accessing treatment for substance use disorders. The intervention adopts elements of cognitive behavioural therapy and acceptance and commitment therapy to address key barriers to belonging. The research has potential to influence the treatment sector and improve belonging for a population that experiences high rates of loneliness.

Abstract 668

THE REASONS OF BATTERED AND NON-BATTERED WOMEN TO STAY IN ABUSIVE RELATIONSHIPS

Mehlhausen--Hassoen D.*, Winstok Z.

University of Haifa, Faculty of Social Welfare and Health Sciences ~ Haifa ~ Israel

This study examines the factors that influence women's decisions to stay in abusive relationships, drawing from two main theoretical frameworks: Learned Helplessness and Exchange Theory. Learned Helplessness suggests that prolonged abuse leads to feelings of lost control, hopelessness, and limited options, while Exchange Theory focuses on decision-making within the constraints of life circumstances. While these theories differ in emphasis—one highlighting the absence of possibilities and the other the presence of limited ones—they collectively offer valuable insights into why women may stay in abusive relationships, encompassing both positive and negative reasons.

The study explores these reasons across three groups of women: those who have never been battered, those who were battered but not in the past year, and those who were battered within the last year. A 36-item scale was developed, based on theoretical and empirical research, to assess both positive and negative reasons for staying in abusive relationships.

A sample of 926 Israeli women, from a WEIRD (Western, Educated, Industrialized, Rich, and Democratic) society, was used. The findings revealed that: (1) Positive reasons for staying form a single-factor construct, while negative reasons consist of three factors: fear of failure, terrorism, and captivity (actual inability to leave); (2) Positive reasons are highest among women who were never battered and lowest among those battered in the last year; (3) Negative reasons are highest among recently battered women and lowest among those who were never battered; (4) A negative correlation exists between the level of positive reasons for staying and the level of negative reasons preventing leaving.

The study concludes with a discussion of its theoretical and practical implications.

Abstract 359

THE ROLE OF PROLONGED GRIEF ON PERCEIVED MENTAL AND PHYSICAL HEALTH: THE MEDIATING EFFECT OF MEANING IN LIFE

Sarper E.*[1], Luís S.[2], Rodrigues D.L.[1]

[1]Iscte-Instituto Universitário de Lisboa, CIS-Iscte ~ Lisbon ~ Portugal, [2]Universidade Lusófona, HEI-Lab ~ Lisbon ~ Portugal

Past studies showed that bereaved people with higher levels of prolonged grief symptoms tend to report poorer mental and physical health. However, research addressing the downstream consequences of prolonged grief to perceived physical health, and its potential underlying mechanisms, is still limited. This study aimed to explore whether meaning in life explained the associations between prolonged grief symptoms and mental and physical health outcomes. In a cross-sectional study (N = 332), participants who experienced the loss of a family member, a romantic partner, or a close friend at least 12 months prior to the study were asked to complete an online survey. Results from the mediation models showed that higher levels of prolonged grief symptoms were associated with more depression symptoms, higher perceived loneliness, and lower perceived physical health. These associations occurred because participants who reported higher levels of prolonged grief symptoms also reported less meaning in life. Our findings offer insights for researchers and mental health professionals that can contribute to developing intervention programs and improving mental and physical health among bereaved adults. Implications and suggestions for future research are discussed.

Abstract 250

A SYSTEMATIC REVIEW OF DATING VIOLENCE: AN EXPLORATION FOR HEALTH IMPACTS, SOCIO-CULTURAL INFLUENCE AND RESEARCH GAP

Shree S.*, Bharti D.A.

Central University of South Bihar, Gaya, Bihar ~ Gaya ~ India

Dating Violence (DV) among youth is a growing global concern, yet it remains under-researched in India. This systematic literature review aims to address three key questions:

Q1. What are the mental health impacts of DV on Indian youth compared to Western youth?

Q2. How do socio-cultural elements like patriarchal norms, family honour, and societal expectations influence DV in India?

Q3. What research gaps exist in the current literature on DV among Indian youth?

Following PRISMA methodology, a comprehensive search was conducted across PubMed, Scopus, Google Scholar, and a random Google search for studies published between January 2014 and December 2024. Out of 1,186 identified studies, only 20 met the inclusion criteria. The protocol was registered on PROSPERO (CRD42025642260A), and study quality was evaluated with risk-of-bias using 'Robvis' software.

Western literature consistently links DV with mental health issues such as depression and low self-esteem. Risk factors include exposure to domestic violence, childhood abuse, poor family dynamics, peer pressure, and gender-inequitable attitudes. Girls are particularly vulnerable, while adolescents from more supportive families face less violence. Validated tools to assess DV and relationship quality are primarily developed for Western populations. The Incremental Theory of Personality offers an intervention to reduce hostile behavior, though it does not directly lower victimization.

Indian studies show that DV can be both one-sided and mutual, with emotional and social abuse being most common. Many participants misunderstood less visible forms like economic or cultural abuse, often normalizing violence due to gender norms, peer pressure, and media. These findings underscore the need for culturally sensitive interventions and individual skill development.

This review highlights major gaps in Indian DV research, particularly regarding mental health impacts and cultural influences. It calls for more empirical studies, increased awareness, and support systems, supporting SDG 3 (Good Health and Well-being) and SDG 5 (Gender Equality).

Abstract 4931

FINANCIAL DEPENDENCY AND SEXUAL COMPLIANCE: ECONOMIC VULNERABILITY AND INTIMATE SILENCE AMONG LOW-INCOME MARRIED WOMEN IN INDIA

Kaur S.*

Department of Psychology IILM University, Gurugram ~ Haryana ~ India

Economic vulnerability is an important yet underexplored factor influencing women's sexual agency and communication within marriage, particularly in rural India. While previous research has documented gender inequality and reproductive coercion among low-income women, limited qualitative work has examined how financial dependency shapes women's lived experiences of marital intimacy, sexual compliance, and emotional wellbeing. This study explores the relationship between economic dependency, communicative silence, and psychological coping among low-income married women in rural northern India.

Grounded in Cognitive Appraisal Theory (Lazarus & Folkman, 1984), feminist psychology, and Kandiyoti's concept of bargaining with patriarchy, this qualitative study employed semi-structured in-depth interviews with 20 purposively selected married women aged 18 to 30 years. Interviews were conducted in Hindi and translated using a systematic back-translation procedure to ensure linguistic and cultural accuracy. Data were analysed using Braun and Clarke's six-phase thematic analysis.

Findings revealed that financial dependency strongly shaped women's experiences of marital intimacy and communication. Many participants described sexual compliance as linked to household stability and economic survival rather than personal desire or mutual intimacy. Fear of conflict, abandonment, and financial insecurity often prevented women from expressing discomfort or discussing sexual and emotional needs openly. Participants also reported limited autonomy regarding contraception and reproductive decisions, reinforcing experiences of restricted agency within marriage.

The study highlights how economic vulnerability and patriarchal gender norms interact to sustain intimate silence and limit women's sexual agency. The findings emphasise the need for culturally sensitive sexual education, women's financial empowerment initiatives, and accessible mental health support services within rural Indian communities.

IMPACT OF MESSAGE FRAMING ON SUSTAINABLE CONSUMER INTENTIONS AND BEHAVIORS: A SYSTEMATIC REVIEW

Harriet P.[1], Acampora M.[1], Campese D.*[2], Castellini G.[3], Castiglioni C.[1]

[1]Department of Psychology, Università Cattolica Del Sacro Cuore ~ Milano ~ Italy, [2]Faculty of Psychology ~ Milano ~ Italy, [3]EngageMinds HUB – Consumer, Food & Health Engagement Research Center, Università Cattolica Del Sacro Cuore ~ Milano ~ Italy

Consumer behaviors play a significant role in driving climate change, making the adoption of sustainable consumption practices essential for mitigating environmental impact and promoting planetary well-being. In this scenario, the framing effect has been increasingly used as a form of nudging to encourage sustainable consumption choices. Accordingly, the present study seeks to evaluate the available evidence on the effectiveness of framing in shaping sustainable consumer intentions and behaviors. The articles selection process was conducted according to the PRISMA guidelines and led to the inclusion of 56 articles. Results show an increasing number of studies in the field, mirroring a stronger interest over the years. Overall, framing proved to be effective, with gain and normative frames being the most successful, and highlighting a promising impact of their combination. Furthermore, energy-efficient consumption and sustainable waste management were the most explored domains. However, most research relied on self-reported measures and/or behavioral intentions rather than actual behaviors, hindering the understanding of real-world effects. This systematic review provides a comprehensive overview of the role of framing effects in promoting sustainable consumption, also revealing research gaps and offering practical implications for marketing strategies and interventions aimed at fostering responsible consumer behavior.

Abstract 1142

SUSTAINABLE CONSUMPTION: THE CHALLENGE OF MARKETING THE ABSTRACT

Frank L.*, Otto S.

University of Hohenheim ~ Stuttgart ~ Germany

Consumer decision-making plays a crucial role in addressing today's sustainability challenges. Products can vary widely in their sustainability with attributes that serve ecological or social dimensions. These product attributes can be perceived and valued differently by consumers, influencing their decision-making. This project aims to understand, from a psychological perspective, how the dimensions of sustainability impact consumer choices. To investigate this, conjoint studies were conducted in the areas of fashion and food, involving n=380 and n=400 consumers, respectively. In these two separate studies, participants chose either between t-shirts or eggs which varied in their social and ecological sustainability-related attributes. For the t-shirts, participants had to decide between three products that differed in water and CO_2 consumption, as well as wage levels and maximum working hours per day in the manufacturing country. For the eggs, the distinguishing attributes included the type of housing system, the handling of male chicks, CO_2 emissions, and regionality. The results reveal that consumers do not prioritize any single sustainability dimension above the other; rather, they place greater importance on sustainable attributes that are tangible, comparable, and familiar – always in relation to the specific product. As attributes become more abstract, their perceived importance declines significantly. This suggests that this perception of the abstractness of sustainability characteristics plays a crucial role in shaping consumer choices.

This research contributes to a deeper understanding of sustainable consumption behaviors and aims to support the development of marketing strategies and policies that better communicate sustainability benefits in ways that resonate with consumers, helping to accelerate the transition toward more conscious and sustainable consumption patterns.

Abstract 271

NUDGING HUMAN BEHAVIOR TOWARDS SUSTAINABILITY: THE ROLE OF PERSONALITY TRAITS AND LOCUS- OF- CONTROL

Mohanty A.*, Suresh D., Mohanty A.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Introduction

Nudges can be defined as any factor that will make changes in behavior of an individual in a predictable way, without removing the choices available for the individual. There are different kinds of nudges. Using these nudges to increase sustainable behaviors in individuals are widely explored in contemporary studies.

Purpose

This study investigates whether various personal factors like personality traits, locus of control and gender could influence the human behavior. In this study we tried to explore whether Big-five personality traits like openness, conscientiousness, extraversion, agreeableness, and neuroticism as well as internal versus external locus of control do have any relationship with nudge effectiveness for promoting sustainable behaviour among youngsters ; if there is any gender difference in nudging for sustainability.

Method

Data were collected from 450 individuals currently enrolled in IIT Kharagpur using Personal demographic sheet, Big- five Personality questionnaire, Rotter's Locus of control scale and a questionnaire to check nudge effectiveness. For half of the sample no nudge questions were given whereas for other half social nudge-based questions were administered; these were given randomly.

Results

Data collection was done in online mode using google forms and statistical analysis was done using SPSS. Findings revealed that there is no significant relationship between personality traits, locus of control and nudge effectiveness. The results also indicated that there is no significant gender difference in nudge effectiveness.

Conclusions

These results tentatively support the idea that nudging impact can be observed irrespective of individual personality factors. Future study has been planned on the basis of this finding with larger and more diverse sample to examine the generalizability of these conclusions. This study contributes to the growing body of literature exploring how individual differences moderate the effectiveness of behavioural interventions such as nudges for sustainable behaviour.

Abstract 2337

DOES VOLUNTARY CONSUMPTION REDUCTION CHALLENGE OR UPHOLD THE SYSTEM?

Mundi López L.*, Ruiz Romero J., Willis G.

University of Granada ~ Granada ~ Spain

Consumption reduction can have positive environmental and social consequences. In fact, the United Nations advocates for this in the Sustainable Development Goals: 12. Responsible Consumption and Reduction. In addition, other organizations, such as the Environmental European Agency, argue that consumption reduction is the most effective and rapid way to achieve this goal. In this context, Voluntary Consumption Reduction lifestyles are becoming more popular (e.g., minimalism or voluntary simplicity). However, no study has investigated the relationship between voluntary consumption reduction lifestyles and the justification of the social and economic system yet. The literature shows that “voluntary simplifiers” could be defined as people whose consumption is politically motivated, or at least not focused on personal causes, but the motivations behind minimalism have not been researched to date. Minimalism, based on Wilson and Bellezza (2022) definition, has three dimensions: number of possessions that one has, aesthetic motivation and mindful curated consumption. Even though both types of lifestyles seem to have a positive impact on personal wellbeing, we investigated whether people pursuing these lifestyles have differences in how they oppose or justify the system. Taking this into account, through 4 correlational studies (total N = 1379) and an experimental study (N = 121), we investigated the relationship between Voluntary Consumption Reduction lifestyles and social and economic system justification. Our results show that Voluntary Simplicity is negatively related, but minimalism is positively related, to system justification.

THE ROLE OF ENERGY EFFICIENCY LABELING ON CONSUMER BUYING BEHAVIOR

Ozdemir O.*[1], Yilmaz N.E.[2], Dinc Cavlak O.[3]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Drexel University ~ Philadelphia ~ United States of America, [3]Haci Bayram Veli University ~ Ankara ~ Turkey

The cost reduction in energy usage for individuals leads to less global warming for society. Studies show that there is underinvestment in energy efficiency, which could be the result of imperfect information regarding costs and benefits and/or customers failing to understand certain attributes. This informational failure can be reduced by the information on the labels. Individuals tend to make decisions based only on available and accessible information (Daniel Kahneman, 2011, “What You See Is All There Is.”). The current experimental study aims to investigate the effect of the information given about the attributes of an appliance, especially the energy efficiency level, on the valuations of the consumers. For that purpose, the choice experiment based on the Random Utility Theory is conducted which individuals make trade-offs between different attributes and attribute levels. As for the appliance, refrigerator is chosen with attributes of energy class, volume, sound, price, and energy consumption. Full factorial design is used where participants are asked to make sixteen scenario-based choices for refrigerators with different attributes. In addition, a framing effect question is asked with gain and loss frame when the amount of money paid is the same for the particular refrigerator. Individuals are expected to be loss averse. A pilot experiment is conducted to twenty-four individuals, and the Multinomial Logit Model analysis conclude that energy consumption, energy class, and volume seem to be the significant attributes (most important to least), whereas sound being the insignificant attribute. Further, participants are willing to pay twice more for the energy class D compared to E and almost the average price in the market just for the lowest energy consumption attribute. Lastly, framing the labels as the gain instead of loss of money creates positive effect on the individuals’ choice of energy efficient appliance.

Abstract 1165

REPUTATION AND TRUST IN COALITION FORMATION: VISIBILITY SHAPES INCLUSION AND OUTCOMES

Timurogullari M.*, Breugelmans S., Cruijssen F., Erle T.

Tilburg University ~ Tilburg ~ Netherlands

Coalitions play a central role in achieving both individual gains and common goals, such as advancing sustainability and reducing CO_2 emissions. This study examined how reputation, operationalized via Social Value Orientation (SVO), influences trust and coalition behavior. Using a real-time negotiation experiment, we combined pre-survey data with interactive group decision-making in a simulated transport setting. Participants (N = 681; 227 triads) first completed an incentivized SVO measure two weeks prior, indicating their prosocial or individualistic orientation. They were then matched in triads to play an incentivized weighted majority game simulating coalition formation among transport companies. Coalitions required at least two players, who negotiated how to divide a monetary incentive. In the experimental condition, participants saw counterparts' SVO scores via a simplified gauge as a reputation signal; the control condition included only company information. Trust was measured with a two-dimensional scale we developed, capturing predictability (reliability) and benevolence (prosociality), assessed at three stages (pre, post-manipulation, post-negotiation). Contrary to expectations, not all players were equally affected by the reputation manipulation. Player A, the strongest actor, was more often included in coalitions, contributing to a significantly higher frequency of grand coalitions (ABC) when reputation was visible, attenuating the classic Strength-is-Weakness effect. Player A was also perceived as more benevolent at the second trust measurement, when reputation was revealed. Exploratory analyses showed that prosocial participants were more often included, especially when their reputation was visible. They proposed less self-serving offers, formed more inclusive coalitions, and earned more. The unexpectedly high proportion of prosocials (78.6%) likely amplified trust and collaboration under visible reputation. Exploratory analyses further showed that trust—specifically predictability—shaped coalition inclusion and payoffs. Taken together, the results show how early social information shapes trust and negotiation in multi-party decision-making, with implications for organizational collaboration and sustainable resource-sharing.

Abstract 2128

EMPOWERING FRANCHISEES - APPLYING BEHAVIOURAL SCIENCE, ECONOMICS AND PSYCHOLOGY FOR MEASURABLE BUSINESS IMPACT

Evans N.*

NEC Advisory ~ Stroud ~ United Kingdom

This paper illustrates how applied psychology, behavioural science, and behavioural economics can be combined to improve decision making and operational efficiency for franchisees managing their own outlets. Through priority stakeholder engagement and analysis, an assessment tool was designed to help franchise owners identify employee strengths and training readiness, prioritise development actions, and optimise business decisions.

Behavioural economics principles included choice architecture and structured incentives guided the tool design to reduce cognitive biases in decision making. Applied psychology methodology drawn from in-situ data capture and realistic job simulation ensured assessments were reliable, valid and engaging. Behavioural science provided an evidence based framework for shaping tool insights into practical business support.

The tool was first trialled in the UK (n=2100), then scaled to Europe, and subsequently implemented in the Middle East. Trial evaluation showed that the tool gave franchisees back an average of 21% of their time previously spent on operational decisions. Qualitative feedback confirmed increased confidence in managing outlets and clearer prioritisation of activities for business growth.

The study shows the value of interdisciplinary approaches in empowering business owners, offering a replicable model for using behavioural insights to deliver practical, measurable impact. The successful regional roll out further demonstrates combined behavioural science, economics and psychology informed interventions can scale across markets, helping franchise networks optimise performance while maintaining consistent, evidence based support for their business owners.

FINANCIAL WELL-BEING – WEALTH OR LIFE PHILOSOPHY?

Wednesday 22 July 2026 from 10:00 to 11:30

(K-Spadolini)

Leonore Riitsalu (University of Tartu, Johan Skytte instit), Chair and Presenter

There is a groundswell of research into financial well-being in academic and grey literature, and the financial sector is focusing on financial health instead of financial literacy initiatives these days. Yet much of it is based on assumptions, such as the belief that higher financial literacy and availability of financial services automatically leads to its improvement. Much of the existing research is based on uni-dimensional measures developed in English-speaking countries and tested in developed countries only. In this session, we present studies that use multi-dimensional measures validated in several languages and in samples from developed and developing countries. We prompt to think of what the psychological antecedents and influencers of financial well-being are and expand the current discussions that tend to focus solely on financial factors. We also discuss the role of gender in financial well-being assessment and the complexity of pension decisions.

Abstract 4516

ONE (FINANCIAL WELL-BEING) MODEL FITS ALL? MOVING FROM DEVELOPED TO DEVELOPING ECONOMIES

Sorgente A.*

Università Cattolica del Sacro Cuore ~ Milan ~ Italy

Financial well-being (FWB) includes both objective (e.g., income, savings) and subjective (SFWB) components, with increasing research attention on the latter due to its holistic perspective on financial perceptions (Bashir & Qureshi, 2023). While early studies treated SFWB as unidimensional, contemporary approaches recognize its multidimensional nature. The Multidimensional Subjective Financial Well-Being Scale (MSFWBS) (Sorgente & Lanz, 2019) is considered “the most complete instrument” to measure SFWB (de Oliveira Cardoso et al., 2023, p. 2913), assessing five dimensions across various countries.

Originally developed in Italy for emerging adults, the MSFWBS has been validated in multiple nations, confirming its structure except in India. Researchers suggest that cultural and economic factors may influence how individuals evaluate their FWB. However, recent findings challenge the notion that the MSFWBS may be unsuitable for developing countries, as its structure was confirmed in Brazil (de Oliveira Cardoso et al., 2024).

To further test its applicability, we examined the MSFWBS in Iranian emerging adults (N = 356). Results supported its validity: the five-factor model fit the data well (CFI = .950, RMSEA = .045), internal consistency was strong (ω > .70 for all dimensions), and the scale was invariant across gender, age, employment, and living arrangements. Convergent and criterion validity were also supported.

These findings reinforce the MSFWBS’s cross-cultural relevance, suggesting a universal SFWB model may be viable. However, the lack of model fit in India remains an open question. To address this, ongoing research is expanding to additional developing countries (e.g., Bangladesh, Malaysia, Pakistan, Philippines) to determine whether a global SFWB framework is achievable or culturally specific adaptations are needed.

Abstract 4517

MONEY, VALUES, AND WELL-BEING: DOES YOUR WALLET AGREE WITH YOUR LIFE PHILOSOPHY

Gasiorowska A.*

SWPS University ~ Warsaw ~ Poland

This study examines the relationship between financial well-being (FWB)—defined as current money management stress and future financial security—and Schwartz's basic human values using data from the European Social Survey (ESS) and the Cronos-2 Panel. We hypothesize that: (1) individuals prioritizing security and conformity values will report lower money management stress and higher future financial security; (2) those emphasizing hedonism and stimulation will experience higher stress and lower financial security; (3) self-direction and achievement values will be associated with proactive financial behaviors, enhancing FWB. These hypotheses aim to clarify how personal values shape financial attitudes and well-being.

Abstract 4518

THE MANY FACES OF MONEY: EXPLORING MONETARY STYLES AND THEIR LINK WITH FINANCIAL WELL-BEING

Sesini G.*

Università Cattolica del Sacro Cuore ~ Milan ~ Italy

Financial well-being has been the focus of extensive research across disciplines, with growing consensus that it should be understood as a multidimensional construct encompassing not only objective financial indicators but also subjective experiences and psychological factors. This qualitative study investigates the relationship between financial well-being and monetary styles, focusing on the symbolic meanings that individuals attribute to money. In fact, a monetary style corresponds to a way to relate with money stemming from subconscious fixations on its symbolic meanings, which subsequently manifest in distinct behaviors and values. These meanings shape financial attitudes and behaviors, influencing spending, saving, and financial stress. Through in-depth interviews and thematic analysis, the research uncovers recurring patterns that contribute to either financial satisfaction or distress by examining different ways individuals relate to money. The findings underscore the psychological and social dimensions of money, offering valuable insights for financial education and counseling programs. By addressing the symbolic aspects of money and their impact on behavior, such interventions can promote healthier financial relationships and enhance overall well-being.

Abstract 4520

SECURITY, ASSETS AND MALE GENDER – THE KEYS TO HIGHER SUBJECTIVE FINANCIAL WELL-BEING. EVIDENCE FROM BANK DATA

Riitsalu L.*

University of Tartu, Johan Skytte institute of Political studies ~ Tartu ~ Estonia

Financial well-being (FWB) research is growing rapidly, despite the lack of consensus on its definition, conceptualisation, and operationalisation. Little is known about the relationship between subjective FWB and objective financial data. We contribute to it by developing a three-dimensional, human-centric conceptualisation of FWB, comprising of security, freedom, and pleasure, developing and testing its scale, and conducting the first longitudinal analysis of the relationship between subjective FWB and objective financial situation and behaviours.

Our validated measure was used for data collection in a bank in Czechia in two waves, in February and September 2024. Confirmatory factor analysis and structural equation modelling confirmed the reliability and construct validity of the scale. Pseudonymised transactional data from 14 months was linked to the survey responses (n=6182 in wave 1 and n=1704 in wave 2), and analysed using models and methods such as LightGBM, random forest, and regression models.

We find that security is fundamental - one cannot have high freedom or higher pleasure without having average or higher security. The relationship between freedom and pleasure is more nuanced. The most significant gap lies in the freedom to change course in life without worrying about money. The second key fact is that men report higher FWB than women with equivalent assets or liabilities. Third, we observe that assets play a more evident role in FWB than liabilities. Importantly, the predictors of the FWB elements partly differ, highlighting its multi-dimensional and multifaceted nature. We are the first to observe gender differences in assessing the elements of subjective FWB while controlling for objective transactional bank data.

09 - Division 9: Economic Psychology

PREDICTORS AND CONSEQUENCES OF MARKET MINDSET

Wednesday 22 July 2026 from 11:30 to 13:00

(K-Spadolini)

Agata Gasiorowska (SWPS University ~ Wroclaw, ~ Poland), Chair

The pervasive influence of market-oriented thinking on interpersonal relationships represents one of the
most significant social transformations in contemporary society. This symposium explores the
psychological antecedents and consequences of the adoption of market mindset relational contexts, from
intimate relationships to digital platforms and investment behaviour.
While previous research has examined market relationships in isolation, this symposium uniquely
integrates individual difference factors (attachment styles, materialism), cognitive-emotional mechanisms
(Theory of Mind, empathy), and contextual moderators (control, payment models) to provide a
comprehensive understanding of when and why people shift from communal to market-oriented relational
frameworks. This multi-level approach addresses a critical gap in understanding the psychological
foundations of economic behavior in social contexts.
Raguso first lays out the basic psychological mechanisms, showing how attachment avoidance predisposes people to objectification through reduced theory of mind and empathy — the cognitive-emotional pathways
that facilitate market-oriented thinking.Gasiorowska then examines how control affects trust differently in
communal and market relationships,noting that formal control mechanisms damage communal bonds
while they are acceptable in market contexts.Kuzminska analyses how different payment models in sharing
economy platforms can either reinforce or weaken market-oriented perceptions and shows that the structure
of economic exchange influences the formation of relationships.Otterbring and Nyhus examine how
preferences for alternative financing options (cryptocurrency vs. crowdfunding)predict action or
community orientations, and show that financial decisions reflect underlying relational orientations.
Finally, Moldes Andrés examines how materialistic values selectively influence relationship quality in
different social roles,challenging assumptions about uniformly negative social effects of materialism.
This symposium addresses the pressing contemporary issues of how economic thinking intrudes into social
relationships, affecting social cohesion, trust and psychological well-being.The findings serve as a basis
for action to promote authentic human relationships in an increasingly commodified social

environment
and contribute to the understanding of behavioural economics in relational contexts.
Taken together,these presentations provide a comprehensive framework for understanding market mindset
as a psychological phenomenon and as a social force, offering insights into the maintenance of communal
bonds inmarketized societies.

Abstract 4089

UNCOVERING THE LINK BETWEEN ATTACHMENT AND INTERPERSONAL OBJECTIFICATION: THE ROLE OF THEORY OF MIND AND EMPATHY

Ecer E.*

SWPS University ~ Poland

This presentation examines the psychological mechanisms linking attachment insecurity to interpersonal objectification — the tendency to view and treat others as mere instruments rather than as full human beings. Drawing on attachment theory and empirical findings from three European countries (Poland, the UK and Italy; N = 1,222), we present evidence for a systematic link between attachment insecurity and the tendency to objectify others.

In three correlational studies, individuals with higher levels of attachment avoidance consistently showed a stronger tendency towards interpersonal objectification. This relationship was mediated by two critical psychological processes: diminished theory of mind skills and diminished empathy skills. Attachment avoidance—characterized by emotional distancing, self-reliance and discomfort with intimacy—creates a psychological framework that facilitates viewing others through a transactional lens.

Results show that individuals who have difficulty understanding the mental states of others (Theory of Mind deficits) and experience lower emotional resonance with others' experiences (Empathy deficits) are more likely to engage in market-like exchanges that priorities utility over humanity. Sequential mediation analyses showed that attachment avoidance predicts objectification via both cognitive (theory of mind) and affective (empathy) pathways, with these mechanisms acting both independently and sequentially.

These findings are of great importance for understanding how individual psychological differences influence susceptibility to market thinking in interpersonal relationships. The research findings suggest that attachment insecurities, particularly avoidance behaviors, may predispose individuals to adopt transactional approaches that treat social relationships as cost-benefit exchanges rather than meaningful human relationships.

The presentation will discuss intervention strategies that focus on promoting attachment security, enhancing perspective-taking skills, and promoting empathic skills as potential ways to reduce objectifying tendencies. These findings offer insights for developing targeted interventions to promote more compassionate and authentic human relationships and contribute to our broader understanding of the psychological factors underlying marketized social dynamics.

Abstract 4090

ON THE LINK BETWEEN CONTROL AND TRUST: AN EXPERIMENTAL EVIDENCE OF COMMUNAL VS. MARKET RELATIONSHIPS

Khan M.*

SWPS University ~ Wroclaw ~ Poland

We investigate how control shapes trust in different interpersonal relationship contexts, particularly in communal sharing (CS) and market pricing (MP) relations. Drawing on Fiske's (1992) relational modes theory, we propose that trust plays different roles in different types of relationships. In CS relationships, which are characterized by interdependence and long-term cooperation, trust is essential and irreplaceable. In MP relationships, which are transactional and contractual, trust is useful but not essential, as formal control mechanisms can partially replace it. We hypothesize that control mechanisms are more acceptable in market relationships, where they enhance rather than undermine interactions. Conversely, imposed control in communal relationships may damage rather than strengthen trust, as it contradicts the fundamental nature of these relationships, which are based on mutual vulnerability and informal reciprocity.

We conducted six preregistered experiments with over 4,000 participants in three countries (USA, South Africa and Australia). In E1, participants considered control as more appropriate in MP situations than in CS situations. In E2a-2b, the introduction of control made CS situations appear less communal and more market-like, while it had minimal impact on the perception of MP situations. E3 showed that the introduction of control affected trust in CS relationships more than in MP relationships, especially from the perspective of the controlled party. E4 confirmed that participants in low trust situations were more willing to accept control in market relationships than in communal relationships. E5 replicated the results of E1 using a modified "cheap talk" game.

The results suggest that in CS relationships, formal attempts at control undermine trust and lack social acceptance, whereas in MP relationships, control can partially replace trust without significantly affecting the relationship itself. These findings shed light on how control acts as a "regulator" in social relationships and shapes both the boundaries and stability of trust across different interaction types.

Abstract 4091

SHARING ECONOMY PAYMENT MODELS: EFFECTS ON RELATIONAL PERCEPTIONS AND PLATFORM ADOPTION INTENTIONS

Gasiorowska A.*

SWPS University ~ Poland

Prior studies demonstrated that nonmonetary transactions in peer-to-peer sharing economy exchanges positively influence social capital formation between strangers, primarily by fostering perceptions of communal sharing (Fiske, 1991) and interpersonal closeness. In contrast, monetary transactions have been shown to reinforce market-oriented relational perceptions and lack positive social effects. The current project investigates whether using money on sharing economy platforms invariably leads to market pricing relationships or if certain monetary models could foster the emergence of communal sharing relations and positively impact platform engagement. The answer to this question could help platform creators balance operational sustainability with fostering social capital in the communities they affect. Across three experiments, we explore the consequences of payment models differing in forms of monetary involvement. In Experiment 1 (N = 251), three payment models were examined: Direct Peer-to-Peer Payment, Free Borrowing, and Subscription with Free Borrowing. Results confirmed that direct monetary exchanges reinforced MP perceptions, while nonmonetary interactions were linked to higher CS perceptions. Interestingly, indirect monetary involvement (i.e., platform fee) evoked a relational framing similar to the Free Borrowing condition. Experiment 2 (N = 300) extended these findings by testing four payment models: Subscription with Free Borrowing, Voluntary Donation, Subscription with Lender Compensation, and Direct Peer-to-Peer Payment. Direct payments again strengthened MP perceptions, while free borrowing was associated with the CS relational mode. Surprisingly, direct payment and free borrowing models both positively influenced adoption intentions, mediated respectively by MP and CS perceptions, suggesting that while user motivations are shaped by how payment types frame social interactions, preferences for the type of interaction differ between individuals. Experiment 3 (N=768) investigates whether these diverse routes for user engagement depend on individual differences. Specifically, we are examining whether a person's social value orientation serves as a moderator of the observed effects.

Abstract 4092

SELF-CENTERED CRYPTO CONSUMERS AND COMMUNAL CROWDFUNDING COMPANIONS: ALTERNATIVE FINANCE PREFERENCES AS PREDICTORS OF AGENCY AND COMMUNION

Otterbring T.*

School of Business and Law, Department of Management and Innovation ~ Agder ~ Norway

Some studies have identified certain personality predictors of consumers' investment intentions in cryptocurrency and crowdfunding, respectively. For example, consumers with "crypto cravings" have been shown to score lower in the Big Five personality traits of agreeableness and conscientiousness (Honold & Oh, 2025), while higher in openness (Nyhus et al., 2024; for a review, see Frank et al., 2024). In contrast, people who successfully engage in crowdfunding initiatives appear to be associated with higher conscientiousness (Bernardo & Santos, 2016) and lower openness scores (Isaak et al., 2021), although the literature is inconclusive (for a review, see Neuhaus et al., 2022). In the current research, we start in the opposite direction, testing whether consumers' investment intentions in any of these alternative finance formats might predict personality indicators related to agency (i.e., "More public tasks should be carried out by private companies") and communion (i.e., "The problems of developing countries concern us all"). Based on a large, nationally representative sample of the adult Norwegian population (N > 2,000), we find converging evidence for the notion that crypto consumers are agentic rather than communal, whereas crowdfunding consumers are communal rather than agentic, even after controlling for their scores on the Big Five personality traits and numerous demographic variables. At the general level, we identify only a moderate relationship between consumers' investment intentions in cryptocurrencies and crowdfunding initiatives ($r = .30$, $p < .001$), with 11 (cryptocurrencies) to 12 (crowdfunding) percent of the sample seeing these alternative finance formats as feasible investment options. We plan to draw on these results in the development of another well-powered replication study using more psychometrically sound measurements of agency and communion. The findings from this latter study will be presented at the conference.

NEW AVENUES IN TAX RESEARCH

Wednesday 22 July 2026 from 14:00 to 15:30

(K-Spadolini)

Christoph Kogler (Tilburg University ~ Tilburg ~ Netherlan), Chair and Presenter

As acknowledged for instance by the agenda of the European Commission, tax fraud and tax evasion represent a complex challenge for European countries. The scale of lost revenue due to tax evasion is staggering, and this has serious negative consequences for the fight against inequalities. Unpaid taxes limit the capacity to invest in social and economic policies, as well as social protection systems. Thus, research on tax compliance and evasion has been highly relevant in the last decades and is likely to become even more prominent, representing a prime example of interdisciplinary and applied research, often offering important contributions to policy making and the design of public institutions. This symposium will present a selection of new topics, methods, and approaches in studying tax behavior. The symposium will consist of 5 speakers from 4 different countries/institutions: 1. Nina Serdarevic & Karl Solbue Vika (Norwegian Tax Administration): Escalating Enforcement: The Effects of Prompts, Audits, and Penalties on Tax Compliance and Attitudes; 2. Sandro Casal (University of Trento, Italy): Social Dynamics in Tax Compliance: The Indirect Echo Effect of Observing Others' Tax Behavior 3. Paul Nachtwey (Tilburg University, the Netherlands): A Social Exchange Perspective on Tax Compliance; 4. Lilith Burgstaller (Walter Eucken Institute Freiburg, Germany): How to ask about undeclared work: Triangulating Survey Methods to Estimate Prevalence in Germany; 5. Christoph Kogler (Tilburg University, the Netherlands): Process Tracing as a Tool to Study Tax Compliance. The session will present new and exciting avenues in studying tax compliance and the discussion will address future challenges and possibilities in order to develop the field of tax research further.

Abstract 3259

ESCALATING ENFORCEMENT: THE EFFECTS OF PROMPTS, AUDITS, AND PENALTIES ON TAX COMPLIANCE AND ATTITUDES

Solbue Vika K.*, Serdarevic N.

Norwegian Tax Administration ~ Oslo ~ Norway

This study investigates the causal effects of proactive and reactive enforcement strategies employed by the Norwegian Tax Administration to improve the accuracy of wage income reporting. Using a large-scale field experiment targeting wage earners and pensioners who reduced their reported income—despite high-quality third-party reporting from employers—we examine the impact of behavioral prompts, audits, and penalties (added tax). A key strength of the design is the random assignment of all enforcement tools: Taxpayers were randomly assigned to receive a behavioral prompt or not during the tax return process. Those who continued to moderately underreport were randomized to immediate or delayed audits, while substantial underreporters were all audited but randomly assigned to immediate or delayed penalty assessments. Importantly, the experimental variation in audit and penalty timing was maintained into the subsequent tax year, allowing us to study the persistence of effects. While we estimate compliance effects using administrative data, an important contribution of the project lies in its use of survey data to study broader attitudinal outcomes. The survey, conducted before the next filing deadline, measures trust in the administration, tax morale, fairness concerns, and perceived detection probability. These softer outcomes offer rare insights into how enforcement strategies are perceived by taxpayers and how they may shape long-term compliance behavior.

Abstract 3261

THE APE THAT HAS TO PAY TAXES: A SOCIAL EXCHANGE PERSPECTIVE ON TAX COMPLIANCE

Nachtwey P.*

Tilburg University ~ Tilburg ~ Netherlands

Because tax revenue is crucial for modern societies, understanding tax compliance is essential. Existing theories offer only partial explanations. The most influential economic models make precise predictions about enforcement but ignore relevant psychological factors, while psychological theories lack specific predictions about tax compliance and especially conditions that foster trust. To overcome these limitations, we introduce a theory of tax compliance based on cognitive mechanisms for social exchange, including cheater-detection, revenge, and forgiveness. States collect taxes and in return provide goods and services. The theory predicts that when people attribute failures to provide goods and services to neglect (i.e., cheating, rather than unfortunate circumstances or incompetence), they feel exploited, lose trust, and reduce compliance. If they believe the state is non-valuable and likely to exploit them, this should trigger revenge or avoidance rather than forgiveness, resulting in lowered willingness to comply. Results from a cross-sectional survey of a representative UK sample (N = 300) are largely consisted with predictions. Confirmatory Factor Analysis revealed that respondents distinguished between active and passive neglect, circumstances, and incompetence as reasons for failures to provide goods or services. These reasons had distinct correlations with trust in the tax authorities. Trust in the tax authorities was negatively correlated with both active and passive neglect, and incompetence, while the correlation with circumstances was positive. Voluntary tax compliance was associated with lower motivation to avoid the state and greater willingness to forgive the state. These findings preliminarily suggest that interactions of taxpayers with the state are governed by the same psychological mechanisms that regulate social exchange between individuals. They further highlight the importance of designing tax institutions that are transparent and signal goodwill.

Abstract 3262

HOW TO ASK ABOUT UNDECLARED WORK: TRIANGULATING SURVEY METHODS TO ESTIMATE PREVALENCE IN GERMANY

Burgstaller L.*

Walter Eucken Institute ~ Freiburg ~ Germany

As the most recent comprehensive survey evidence of undeclared work stems from the 2019 Eurobarometer, there is a significant gap in current knowledge about the prevalence and characteristics of undeclared work in Germany. Estimating the true prevalence of undeclared work is complicated, as individuals' responses may be distorted by social desirability bias when asked directly. To address this challenge, this study employs a triangulation of survey-experimental methods, combining a list experiment, a variant of the Randomized Response Technique (the Crosswise model), and direct questioning. Drawing on a quota-based sample of approximately 4,000 individuals balanced by gender, age, and income, the study aims to generate robust prevalence estimates for both the supply and demand sides of undeclared work. Moreover, it investigates the characteristics of undeclared work, such as work hours, hourly wages, and the extent to which labor laws are adhered to, as well as the role of social norms. By systematically comparing results across direct and indirect questioning techniques, the study provides the first large-scale update on undeclared work in Germany in over five years and advances methodological approaches for reducing bias in the study of sensitive economic behaviors more broadly.

Abstract 3263

PROCESS TRACING AS A TOOL TO STUDY TAX COMPLIANCE

Kogler C.*

Tilburg University ~ Tilburg ~ Netherlands

Previous studies (Kogler et al., 2016; Muehlbacher et al., 2012) suggest that delaying feedback on communicating the outcome of tax audits results in higher levels of tax compliance compared to immediate feedback. This is especially relevant since in experimental research on tax compliance audits occur typically directly after filing taxes, and feedback on the consequences of an audit is usually given immediately. In reality, however, audits happen within a much longer period of time. This difference in time lags between filing and audit (feedback) may play a crucial role with regard to the external validity of experimental results. In three incentivized lab experiments, we investigated the stability of the effect of delayed audit feedback on tax compliance by varying tax rates, audit probabilities, and fine rates, as these factors are known to have a strong influence on tax compliance. In addition, the process of information acquisition was recorded via decision times (Experiment 1), MouselabWeb (Experiment 2), and eye-tracking (Experiment 3). The results of all three experiments reveal that compliance in delayed feedback conditions was considerably higher than in case of immediate feedback. In addition, lower tax rates, higher audit probabilities, and higher fine levels resulted in higher tax compliance. Analysis of decision times showed that participants in conditions of delayed feedback took longer to decide, especially when they chose to evade. Concerning information acquisition, delayed feedback resulted in more frequent and longer acquisition of information on audit probability and fine rate compared to immediate feedback, both in the MouselabWeb as well as in the eye-tracking study. In combination with perceiving delayed feedback as more unfair - as indicated in post-experimental questionnaires - this pattern of results can be interpreted as an indication of “aversive uncertainty”. Implications for tax research and policy-making will be discussed.

INVESTIGATING CONSUMER CHOICES AND EXPERIENCE IN AN AR STORE ENRICHED WITH BIOPHILIC ELEMENTS: AN EXPERIMENTAL STUDY

Campanini M.L.*, Orso V., Bettelli A., Pluchino P., Gamberini L.

Dipartimento di Psicologia Generale, Human Inspired Technology Research Centre, Università degli Studi di Padova ~ Padova ~ Italy

Introduction:
The amount of product-related information available that consumers can access for making purchases can be overwhelming, fostering the risk of unable consumers to make aware decisions. Augmented Reality (AR) technology represents a promising solution for reducing information overload, allowing consumers to actively select the information to consult. Additionally, AR-based shops can easily embed atmospheric qualities typical of physical stores, which are known to impact on the overall experience and on the final consumer choice. Specifically, biophilic design, which integrates natural elements into built environments, has been shown to enhance well-being and foster sustainable consumption. However, whether and how these effects can be replicated in immersive digital contexts remains uncertain.
Purpose:
This study examines how an AR-enhanced biophilic atmosphere affects consumer engagement, decision-making, and purchase choices in grocery shopping.
Method: The experimental setting encompassed an AR shop featuring a physical shelf on which interactive AR products were displayed. Thirty participants completed two sessions with Microsoft HoloLens 2: one enriched with biophilic cues (virtual plants, natural sounds) and one without additional atmospheric features. Each store offered organic and non-organic grocery products at individual prices. Participants received a €10 budget and were told they would obtain their chosen product(s) and any unspent money. Behavioural measures included shopping time, number of items purchased, and product choice. Eye-tracking recorded dwell time on product labels. Self-reports assessed store appeal, restorativeness, and revisit intention.
Results:
The biophilic environment increased shopping time, overall expenditure, and the selection of organic products. Eye-tracking data showed longer dwell time on product labels. Participants also reported higher store appeal, greater restorativeness, and stronger revisit intention.
Conclusions:
AR-driven biophilic design makes in-store shopping more engaging, while helping consumers make more informed and sustainable decisions. These findings are also promising for retailers, providing a real-time atmosphere of personalisation and

supporting permanent retail spaces and temporary installations such as trade fairs.

Abstract 1029

THE PRICE OF COMFORT: ANXIETY COPING AND THE MONETIZING OF PARASOCIAL RELATIONSHIPS IN K-POP

Bland E.*, Camire M.

Husson University ~ Bangor ~ United States of America

Anxiety is a widespread psychological concern, with more than 4.4 million people diagnosed around the world as of 2021, that often leads individuals to seek accessible strategies for emotional regulation. One common way individuals may attempt to achieve this control of their emotional state is by turning to a familiar television program or musical group, which can provide a sense of stability and respite. Anxiety has been widely studied; however, research related to the use of parasocial relationships and the economic considerations is dearth. Meanwhile, the Korean popular music industry (K-pop) has been involved in heightening feelings of celebrity worship and the parasocial relationships that can be prevalent with the consumer/artist interaction. One of the ways this is achieved in the K-pop industry is to have certain artists in a group appear to be more “emotionally safe” for fans than other personalities in the group. This may come across as someone that is more open-minded than others, or sometimes one member that states that they, themselves, suffer from anxiety and other mental health diagnoses. The feeling of trust that is then established within a fan’s parasocial feelings leads them to more closely follow that artist and their music group. This study aims to bridge the gap between the psychological factors which lend themselves to the practice of consuming comforting media and how K-pop has been able to monetize these feelings while highlighting their best marketing strategy: the parasocial connection. This study will be conducted through a mixed method approach where study participants will be asked about their anxiety levels and coping mechanisms and if having a “Comfort Idol” in the K-pop genre is something that has led them to spending extra time and money to help alleviate emotional dysregulation.

Abstract 2414

WHEN RETAILING MEETS THE EYE: HOW EYE–HAND COORDINATION SHAPES VIRTUAL SHOPPING

Frank D.*[1], Dipalma J.[1], Østergaard S.[1], Ken P.[1], Buder F.[2]

[1]Aarhus University ~ Aarhus ~ Denmark, [2]Nuremberg Institute for Market Decisions ~ Nuremberg ~ Germany

Virtual shopping increasingly relies on interaction modalities that bind perception to action. We test how coupling gaze with manual action ("eye+hand") versus hand-only selection shapes consumer behavior in immersive retail. In a controlled laboratory experiment (N = 171) set in a VR supermarket, participants completed standard shopping tasks under one of the two modalities. The eye+hand condition elicited greater exploratory behavior (higher variety seeking) and stronger approach outcomes (greater spending), alongside more favorable subjective evaluations (higher satisfaction and loyalty intentions) than hand-only control. Mediation analyses indicate a sequential mechanism: eye+hand input increases perceived interactivity—a sense that the environment is responsive to one's moment-to-moment intentions—which in turn heightens perceived ease of use, and these experiential states translate into downstream behavioral and evaluative outcomes. Framed within perception–action coupling and embodied cognition accounts, results suggest that aligning oculomotor attention with action affordances reduces friction, amplifies agency, and encourages exploratory choice in virtual environments. The findings advance consumer and cognitive psychology by isolating how an interaction primitive (gaze-contingent control) reshapes attentional engagement and decision dynamics in VR, with implications for theories of fluency, autonomy, and reward-driven exploration in digitally mediated shopping.

Abstract 1252

EXPLORING CONSUMER ACCEPTANCE OF FOOD FROM NEW GENOMIC TECHNIQUES (NGT)

Krumm L.*[1], Guerrero L.[2], Badia C.[2], Claret A.[2], Gwozdz W.[1]

[1]Justus-Liebig-University ~ Giessen ~ Germany, [2]Institute of Agrifood Research and Technology ~ Girona ~ Spain

This study examines consumer acceptance of plant-based foods produced using New Genomic Techniques (NGT) in Germany and Spain, exploring how perceptions, knowledge, and heuristics shape public attitudes toward emerging food biotechnologies. Understanding consumer perspectives is essential, as they can influence policy development, regulation, and market uptake, while also contributing to trust in science and policy.

A representative online survey (N = 1,000 per country, plus n = 100 per country with a life science background) was conducted in November 2024. The sample was stratified by age, gender, education, and region of residence. Participants assessed their general acceptance of NGT food and their attitudes using standardized Likert scales. Additional measures captured perceived risks and benefits, as well as objective and subjective knowledge of genetic techniques, and heuristic factors such as affective responses, perceived naturalness, and trust in institutions.

Results indicate a moderate overall level of acceptance (M = 3.99 on a 7-point scale) and attitude (M = 3.95), with slightly higher acceptance and more positive attitudes observed in Spain than in Germany ($p < .001$). Perceived benefits were more strongly associated with acceptance and positive attitudes than perceived risks. Both subjective and objective knowledge showed positive correlations with acceptance and attitudes, although subjective knowledge was more influential. Among the heuristic factors, higher perceived naturalness of NGT food, more positive than negative emotional responses, and greater trust in institutional competence and social trust were all positively associated with acceptance and attitudes.

These findings suggest that consumers may be ambivalent or undecided about NGT food, underscoring the importance of clear communication and effective regulatory strategies. Increasing consumer knowledge and building institutional trust could foster informed consumer choices. This research contributes to understanding public perceptions of NGTs and provides insights for policymakers and stakeholders seeking to promote trust-based governance of novel food technologies.

Abstract 1170

FRAMING SECURITY: HOW MESSAGE DESIGN INFLUENCES PUBLIC ACCEPTANCE OF CYBERSECURITY TECHNOLOGIES

Lee C.*

Monetary Authority of Singapore ~ Singapore ~ Singapore

Global trends of increasing malware and phishing scams threaten individuals, businesses and critical infrastructures worldwide. As financial authorities look to roll out new security technologies to combat scams, public perception and acceptance of these measures are dependent on whether they are easy, trustworthy and clearly beneficial.

Behavioural research suggests that gain-framed messages and loss-framed messages differentially influence attitudes and behaviours. This study examines whether gain or loss message framing affects public perceptions and acceptance of Fast Identity Online-compliant (FIDO) hardware token (FHT) for high-value internet banking transfers.

A randomised controlled trial (n = 1060) assigned participants to receive either gain-framed messages emphasising enhanced protection benefits or loss-framed messages emphasising negative consequences of phishing or malware scams.

Participants then completed questions assessing 5 adoption drivers of understanding, perceived efficacy, convenience, costs, security; and 1 outcome measure of support for the adoption of FHT. Three factors of cost, security and convenience affected overall FHT support, with less digitally savvy individuals and females showing greater support.

The Gain-frame led to significantly higher confidence in FHT activation and improved perceptions that FHT cost is worth the added security. Gain-framed participants also achieved significantly higher scores on knowledge comprehension tests.

However, substantial barriers still emerged regardless of framing. Only 28% of participants found the FHT convenient, while 68% of participants cited unwillingness to pay. Lower-educated groups showed consistently poorer understanding, highlighting equity concerns that could undermine universal adoption.

These findings suggest that communication can enhance acceptance of security technology on key dimensions but may not overcome fundamental barriers of convenience and costs that threaten adoption of FHT. Successful implementation requires not only positive messaging but also targeted interventions addressing practical concerns relating to cost, security and convenience to improve acceptance of the hardware token which is necessary for enhanced security against malware and phishing scams.

Abstract 894

UNCOVERING THE POWER BEHIND CHOICE: HOW ONLINE TACTICS LEVERAGE SCARCITY AND TIME PRESSURE

Lo H.*

National Chung Hsing University ~ Taichung City ~ Taiwan

Introduction:
Online retailers often use scarcity and time pressure tactics—such as "limited-time offers" or "buy one, get one free"—to influence consumer behavior. While these strategies are common, it's unclear whether they effectively drive purchasing decisions. This study explores how scarcity and time pressure affect consumers' choices, focusing on emotional responses and decision-making processes.
Method:
Two experiments were conducted. Experiment 1 examined how product scarcity (limited vs. abundant availability) impacted consumers' attractiveness ratings, emotions (happiness, desire), and decision-making. It also tested for the endowment effect, where ownership increases perceived value. Experiment 2 explored how time pressure influenced purchasing decisions, regret, and emotional responses by asking participants to make choices within time constraints.
Results:
The results supported existing psychological theories explaining consumer preference for scarce products, highlighting that scarcity, especially in customizable items, significantly enhanced product attractiveness. Time pressure was found to speed up purchasing decisions but also led to increased regret, particularly when a previously scarce product became abundant. Notably, participants showed stronger emotional responses to scarcity and time pressure, with some experiencing dissatisfaction once a limited product was made available in greater quantity. The endowment effect was observed in both experiments, indicating that participants valued products more highly once they felt ownership.
Conclusion:
This study confirms that scarcity and time pressure play crucial roles in shaping online shopping behaviors. Scarcity appeals effectively increase product attractiveness and consumer desire, particularly when customization is involved. However, while these tactics drive sales, they also generate emotional responses like regret and dissatisfaction, which can negatively impact long-term consumer loyalty and satisfaction.
Impacts:
While scarcity and time pressure tactics are effective for short-term sales boosts, online retailers should consider the potential for negative emotional consequences, such as

regret and frustration. Understanding these psychological dynamics can help retailers design promotions that balance urgency and satisfaction, ultimately fostering better customer retention and positive brand experiences.

Abstract 1169

I CAN DO IT, SO I WILL? CONSUMERS' SELF-EFFICACY AND THEIR INTENTION TO PATRONIZE CHECKOUT-FREE STORES.

Wingen S.*

Faculty of Management, Economics and Social Sciences, University of Cologne ~ Cologne ~ Germany

Retailers worldwide are implementing checkout-free technology in their stores to improve the customer experience, save on labor costs, and collect valuable data. Despite these hopes, consumer adoption remains below expectations, calling into question the actual potential of checkout-free shopping. It is therefore crucial for retailers to understand what influences consumers' intentions to patronize checkout-free stores. I hypothesize that consumers' self-efficacy, that is, the belief in their ability to use checkout-free shopping successfully, influences their intentions to patronize these stores.

In Study 1 (N = 197), I assessed the relationship between participants' self-efficacy and their patronage intentions for checkout-free stores in a cross-sectional survey. In Study 2 (N = 401), I conducted a between-subject online experiment to test whether the salience of different characteristics of checkout-free stores influences participants' self-efficacy and patronage intentions. In Study 3 (N = 307), I conducted a between-subject online experiment where participants replied to either simple or complicated questions regarding checkout-free shopping to manipulate their self-efficacy. The aim was to show a causal effect on patronage intentions.

Participants' self-efficacy was positively related to their patronage intentions (Study 1). This relationship was replicated in Study 2, although the salience of different characteristics of checkout-free shopping did not influence participants' self-efficacy or their patronage intentions. In Study 3, answering complicated questions (compared to simple questions) decreased participants' self-efficacy; however, the effect on patronage intentions was only marginally significant. All three studies consistently showed a positive relationship between participants' self-efficacy and their intentions to patronize checkout-free stores.

In conclusion, consumers' self-efficacy seems to be a motivator for their intentions to patronize checkout-free stores. Self-efficacy is not so much influenced by the salience of different characteristics of the stores, but rather by the personal experience of a lack of knowledge about checkout-free shopping.

REACTANCE TO FINANCIAL CONSTRAINTS: HOW POVERTY LIMITS FREEDOM AND DRIVES ECONOMIC CHOICES

Drazkowski D.*, Radoslaw T.

Adam Mickiewicz University ~ Poznan ~ Poland

Introduction
Psychological reactance theory (Brehm & Brehm, 1981) posits that threats to freedom trigger reactance—a motivational state aimed at restoring autonomy through restricted behaviors. For individuals in poverty, limited economic freedom may drive spending-oriented decisions, an untested mechanism that could explain why low-income groups often favor such choices. Empirical research has largely overlooked how financial constraints are perceived as autonomy threats and how they shape behaviors.
Purpose
This study investigates whether poverty induces perceptions of restricted freedom, drawing on reactance theory to explain responses to financial constraints. It examines links between these perceptions and economic decisions, such as borrowing and saving, while identifying personality moderators.
Method
Study 1 (n=300, online) used surveys to assess perceptions of poverty as a freedom restriction. Study 2 (n=1,069, online) analyzed relationships between income, financial reactance, personality traits, and economic preferences via regression and moderation analyses. Study 3 (n=120, laboratory) experimentally induced poverty through a scarcity paradigm to test causal effects on reactance and decisions.
Results
Study 1 revealed that 85% of participants viewed poverty as highly limiting freedom. In Study 2, lower income correlated with higher financial reactance, which in turn drove greater preferences for loans and installment purchases while reducing saving tendencies—though not luxury goods consumption. Key personality predictors of reactance included elevated trait reactance, materialism, autonomy needs, and internal locus of control. Moderation analyses indicated that materialism intensified the income-reactance link, while trait reactance and internal locus of control strengthened the reactance-loan preference relationship, underscoring how individual differences amplify reactance-driven behaviors amid financial hardship. Study 3 established causality, showing that induced poverty heightened reactance, thereby increasing borrowing intentions and decreasing saving.
Conclusions
Reactance theory illuminates how poverty threatens freedom, fueling decisions that may worsen hardship. Applied implications encompass interventions like gratitude exercises

or materialism reduction to reframe perceptions and foster sustainable choices. Policymakers could develop freedom-enhancing aids to avert debt cycles.

INSPIRING OR INDULGING? FRAMING EFFECT ON RECIPIENTS' POVERTY ALLEVIATION BEHAVIORS

Hongchuan Z.*, Ran S., Hegeng X., Jieyu L., Aihe Y.

Central University of Finance and Economics ~ Beijing ~ China

Traditional poverty aid programs often overemphasize beneficiaries' disadvantaged status, inadvertently reinforcing dependency and weakening their willingness to pursue self-reliant development. This study systematically investigates how different aid narrative frames—poverty-status framing versus growth-development framing—influence recipients' poverty alleviation behaviors, and further examines the mediating role of perceived poverty stigma. Study 1 employed a natural grouping design (N = 361) to compare participants in registration-based poverty relief projects, skill-training programs, and non-participant groups. Results showed that skill-training narratives, consistent with a growth-development frame, significantly enhanced poverty alleviation behaviors through reducing their perceived stigma. Study 2 (N = 144) directly manipulated narrative framing and found that individuals exposed to growth-development narratives reported higher willingness to engage in poverty alleviation activities and lower stigma perceptions compared with both poverty-status and control groups. Mediation analyses confirmed that perceived poverty stigma fully explained the positive effect of growth-development framing. Study 3 (N = 112) simulated real aid program scenarios and employed a behavioral task to measure poverty alleviation behaviors. Again, the growth-development frame promoted higher poverty alleviation behaviors, compared with the poverty-status frame. Bootstrap analyses verified the mediating role of poverty stigma.

Taken together, consistent evidence demonstrates that narrative framing is a critical psychological context shaping beneficiaries' self-perceptions and behavioral preferences. Specifically, poverty-status framing tends to reinforce stigmatized identities, increasing shame and self-devaluation, thereby undermining self-efficacy and willingness to pursue poverty alleviation. In contrast, growth-development framing emphasizes potential, agency, and future possibilities, reducing stigma perceptions, strengthening confidence, and fostering proactive intentions. These findings integrate stigma and framing theory with the poverty alleviation domain, extending the application of framing effects to the intersection of social policy and psychology. Practically, the results highlight the importance of language in aid program design: low-cost adjustments in narratives can serve as effective "light-touch" interventions to cultivate internal motivation and support sustainable rural revitalization.

HONEY, MONEY MATTERS! THE CHANGING DYNAMICS OF GENDER ROLES AND ROMANTIC RELATIONSHIPS IN INDIAN YOUTH

Biswas U.N.*

University of Delhi ~ Delhi ~ India

Women in India have become major stakeholders in the country's rapidly growing economy. As more women enter the workforce, engage in family businesses, or start their own enterprises, their financial independence leads to increased empowerment regarding decision-making and personal choices. This shift has influenced the dynamics of romantic relationships, particularly marriage. This paper presents findings from a series of studies that examine narratives surrounding gender socialisation in contemporary India. It investigates how norms and stereotypes related to gender roles and romantic partnerships, including marriages, are evolving. The first study involved five focus group discussions with young college students, focusing on gender socialisation in India today. The discussions highlighted changing life goals, financial aspirations, and expectations for romantic partners. The second study was based on a survey of 100 young adults, exploring how financial self-worth and financial self-efficacy impact relationship satisfaction and harmony among these individuals. The third study utilised a co-design workshop to identify strategies that could help reduce conflicts and break-ups among romantic partners stemming from mismatched financial behaviours. The findings from these three studies together illustrate the evolving gender norms and roles of Indian women in the context of changing gender socialisation, financial independence, and the complexities of relationship dynamics.

Abstract 114

ECONOMIC VIOLENCE: PREVALENCE, RISK PROFILES AND SOCIAL REPRESENTATIONS IN ITALY

Castiglioni C.*, Sesini G., Crapolicchio E., Manzi C., Lozza E.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Introduction: Economic violence represents a significant yet often overlooked form of interpersonal abuse. This phenomenon manifests through behaviors aimed at controlling, limiting, or exploiting another person's economic resources, ultimately establishing power imbalances and dependency relationships that undermine victims' autonomy and well-being.

Purpose: This study aimed to systematically review and define the characteristic features of economic violence, investigate how this phenomenon is socially represented among the Italian population, estimate its prevalence, and identify high-risk profiles and protective factors that could inform preventive interventions.

Method: A two-phase methodological approach was employed. First, a systematic literature review was conducted to define and delineate the phenomenon of economic violence, identifying its distinctive characteristics and contextual variables. Second, a cross-sectional survey was administered to a representative sample of the Italian population (N=2000) to assess social representations of economic violence, estimate its prevalence, and identify demographic and psychosocial factors associated with increased vulnerability or protection.

Results: The systematic review revealed complex interactions between individual, relational and socio-economic factors that play significant roles in increasing economic violence vulnerability. Survey results indicated the perceived severity of the phenomenon and identified various psycho-demographic profiles of potentially at-risk categories based on gender, age, education level, and socioeconomic status. Beyond risk elements, several protective factors also emerged, including financial literacy, that can guide future intervention actions.

Conclusions: This research provides a comprehensive picture of economic violence in the Italian context, bridging theoretical conceptualizations with empirical evidence of prevalence and risk profiles. Findings highlight the need for targeted prevention strategies and awareness campaigns addressing the specific manifestations and social representations of economic violence identified in the Italian population.

TALL POPPIES AND LONG NAILS: DIFFERENCES BETWEEN AUSTRALIAN AND JAPANESE ATTITUDES TOWARDS INEQUALITY

Mardyla G.*[1], Peryman J.[2]

[1]Kindai University ~ Osaka ~ Japan, [2]RMIT University ~ Melbourne ~ Australia

Egalitarian social norms are part of what shapes culture and socio-economic behaviour in many countries. Two examples of such norms are the “Tall Poppy Syndrome” in Australia and a similar “Nail that Sticks Out” phenomenon in Japan, both referring to an apparent social animosity toward particularly successful individuals. We run a two-stage lab experiment separately at an Australian and a Japanese university to compare the strategies used by student participants in this context across both cultures. In the first stage participants solve a series of timed non-trivial cognitive tasks (the Knapsack problem) after which the best performer in a group of 5-7 gets a substantial bonus payoff. In the second stage participants are given an option to subtract from (“cut down a tall poppy” / “hammer down a nail that sticks out”) or add to the payoffs of others, at a cost to their own. Our preliminary findings confirm the apparent animosity toward “tall poppies” / “sticking out nails” across both cultures, but we also find some significant differences. On average, participants in Australia take away from all other players in their group more than their counterparts in Japan. The opposite is true when giving points away: Japanese students tend to award extra payoff to others comparatively more than Australian students, particularly to the “middle earners”. Overall, inequality within groups is reduced after the second stage in Japan but not in Australia.

Abstract 1097

FROM RESTRICTION TO EMPOWERMENT: HOW SUPERVISED BANK ACCOUNTS SUPPORT THE WELL-BEING OF FINANCIALLY VULNERABLE INDIVIDUALS

Koch T.*[1], Spitzer F.[2], Penz E.[3], Hartl B.[2], Abstiens K.[2], Gangl K.[2]

[1]University of Vienna ~ Vienna ~ Austria, [2]Institute for Advanced Studies ~ Vienna ~ Austria, [3]WU Vienna University of Economics and Business ~ Vienna ~ Austria

Individuals who struggle to regularly pay rent and are at risk of homelessness can use a supervised bank account provided by the Vienna Social Fund (FSW), Austria. The account secures the amount needed for rent and other essential payments before making the remaining balance available to the user. The present study examined whether using this account improves users' well-being, by supporting the basic psychological needs of autonomy, competence and relatedness in their financial matters. Self-determination and respectful treatment of social service users are generally regarded as important for their well-being. Qualitative evidence indicated that the supervised bank account is, overall, perceived very positively, despite restricting users' access to their money.

The study aimed to identify mechanisms of the supervised bank account that contribute to positive outcomes, including enhanced well-being, reduced stress, and lower financial anxiety, despite the restrictions it imposes on users' money.

An online survey was conducted among all users of the supervised bank account, recruiting 431 participants. The results showed that longer use duration of the account related to reduced stress in managing life and personal problems. With increasing use duration, competence satisfaction increased and competence frustration decreased, which in turn predicted higher well-being, lower perceived stress and lower financial anxiety. By contrast, autonomy and relatedness were not associated with use duration but remained significant predictors of well-being as expected.

Overall, despite restricting users' financial freedom, with longer use duration the account appeared to foster perceived competence in financial matters, which in turn contributed to improved well-being. While autonomy and relatedness still related to some well-being outcomes, their influence was independent of use duration.

This study examined a specific and often overlooked population, offering valuable insight into mechanisms supporting vulnerable individuals in finance management. By providing support structures, the bank account fosters financial competence, enhancing overall well-being.

SUSTAINABILITY: A HOLLOW TERM? CRITICAL PERSPECTIVES AND THE ROLE OF PSYCHOLOGY IN ADDRESSING THE CLIMATE CRISIS

Thursday 23 July 2026 from 09:30 to 11:00

(K-Spadolini)

Luca VECCHIO (Department of psychology, University of), Chair and Discussant

“Sustainability” risks becoming (if it has not already) an empty word, devoid of meaning, lacking a clear reference to the concrete reality of human life and the practices in which it is realized. Initially, the term could evoke a project of possible transformation – social, economic, and even political – aimed at improving “new” ways of life. Now, however, it increasingly seems to serve as a mere label, used to reassure those who read it and to placate the (bad) conscience of those who use it, ensuring the perpetuation of the current socio-economic development model with only superficial and cosmetic adaptations. This development model continues to expand its global dominance and appears unstoppable, despite its recognized unsustainability, as demonstrated by the continuous rise in pollution and the growing inequalities, both reaching unprecedented levels.In response to this dynamic, some have proposed a distinction between “true” and “false” sustainability (Galdo, 2025).

Starting from these considerations, this symposium proposes a critical discussion on the perspectives of sustainability, with particular reference to environmental sustainability and the climate crisis.The symposium is conceived as an opportunity for discussion to reflect on what the role of psychology could/should be in promoting true sustainability in this area, supporting actions and initiatives genuinely capable of fostering the real transformation required to address complex socio-ecological challenges.

A fundamental assumption is that, given the complexity of the issue,psychology must engage in dialogue with other research and study perspectives.For this reason,the symposium seeks to involve even scholars from disciplines other than psychology (sociology, organizational sciences, political science).The various contributions,both empirical and theoretical,aim to highlight,from a critical perspective, the difficulties and contradictions characterizing the most widespread approaches to promoting eco-sustainable behaviours.Two contributions (Hornung and Böhm) in particular discuss how environmental sustainability strategies and behaviours can be negatively influenced by ideological beliefs.The challengesofeducationforenvironmentalsustainabilitywhentakingpsychology'sindividual-levelperspectivearediscussedby a thirdcontributor(Kössler).Thelastcontribution(Dal Gobbo)alsocriticallyaddressesthisindividual-centredness.

Abstract 4415

CONTRADICTORY IDEOLOGICAL AND INDIVIDUAL ANTECEDENTS OF CLIMATE-PROTECTIVE BEHAVIOR: A PSYCHOLOGICAL SYSTEM-JUSTIFICATION PERSPECTIVE

Hornung S.*, Höge T., Unterrainer C.

University of Innsbruck ~ Innsbruck ~ Austria

This study empirically examines contradictory socio-ideological and individual antecedents of climate-protective behaviour and its impact on the personal carbon footprint. Established as a form of political-economic system justification, internalized neoliberal ideological beliefs were hypothesized to relate negatively, environmental consciousness positively to behavior aimed at reducing one's detrimental ecological impact. Hypotheses were tested by analyzing data obtained through an online survey among N=344 students and employed persons in Austria and Germany using multiple regression, bootstrapping, and structural equation modeling. Validated self-report scales measured system justification, neoliberal ideological beliefs, and climate-protective behavior (housing, energy,mobility, consumption, nutrition, activism). Environmental consciousness included scales on ecological attitudes, knowledge, and connection with nature. Carbon footprint was estimated based on self-reports with a simplified model by the German Environment Agency. Controls were age, gender, education, income, and social status. Results confirmed a chain of serial mediation effects, linking system justification, neoliberal ideological beliefs, climate-protective behavior, and carbon footprint. Aspects of environmental consciousness showed partly differential effects. Additionally, income level predicted personal carbon emissions. Limitations arise from non-representative sampling and self-report measures. Market-based consumer societies evidently subject individuals to contradictory messages concerning climate protection. System-justifying neoliberal ideologies and disposable income for consumption are undermining transformational intentions of environmental consciousness. Emphasizing the role of societal ideologies, the perspective of system justification theory offers an alternative framework to overcome the predominant individualistic focus on sustainability in psychology.

Abstract 4416

TEACHING CRITICAL PERSPECTIVES ON SUSTAINABILITY IN OCCUPATIONAL HEALTH PSYCHOLOGY

Kössler F.*

Leuphana University Lüneburg ~ Lüneburg Lower Saxony, ~ Germany

Climate change and sustainability have been addressed by various scientific disciplines, including applied psychology. Studying this novel research topic typically occurs within the boundaries of the respective discipline, and has generated a myriad of studies on constructs, such as employee green behavior, green transformational leadership, sustainability coaching, green organizational citizenship behavior, and green crafting. These constructs reflect psychology's individual-level perspective as a study of human cognition, emotions, and behavior. However, individual-level sustainability research that fails to address the societal and organizational level risks individualizing sustainability - similar to health, where, for example, alcohol abuse is recognized as an individual choice rather than a matter of a profit-driven industry. Navigating the complexities of addressing climate change is a challenging endeavor that affects scholars in research and teaching. However, in teaching, this challenge is even more pronounced due to varying student expectations, communication challenges, and conflicts between one's own socialization as a psychologist and the most fundamental drivers of climate change. Critical theoretical perspectives offer a lens that allows scholars to understand the complex relationships between psychology, sustainability, and economic and structural challenges. This contribution first introduces a curriculum that integrates critical occupational health psychology into a graduate lecture on psychology and sustainability. Then the author shares her teaching experiences in that context, and finally reflects on them.

Abstract 4418

ECOLOGICAL CRISIS, SUBJECTIVITY AND TRANSFORMATION. FOR AN ECOLOGY OF AFFECTS

Dal Gobbo A.*

University of Trento ~ Trento ~ Italy

When we speak of perceptions, behaviours and attitudes towards the current ecological crisis, we often refer to the individual, an abstract and self-consistent subject who seems to exist independently of its own material and symbolic relationships. Often the problem of responding to crisis situations is resolved in an equally individualised intervention on the subject's "mind" to change his/her behaviour. Drawing on empirical material from the ethnographic study of everyday life and climate justice movements, in this presentation I problematise this reductive approach to subjectivity and the psyche in the context of the climate crisis. I propose to rethink and re-enact the subject as a complex entity that is constructed in the encounter of multiple planes - corporeal, affective, emotional, cognitive... - and always in relation to an "outside" that co-constitutes it: from social relations to the physical environment, from the existing social order to everyday practices. Within this framework, affect and desire are central issues in the relationship between subject and ecologies (near and far), and mark relationalities that move beyond the experience of the individual to connect to spaces, objects and living bodies within the subjective field of life. This suggests the importance of conceiving subjective change within a broader and more complex process of collective, ecological, sociomaterial transformation.

REWAKING A DORMANT LEGACY: APPLIED PSYCHOLOGY IN THE SERVICE OF GLOBAL CHALLENGES

Thursday 23 July 2026 from 11:00 to 13:00

(K-Spadolini)

Raymond Saner (University of Basel ~ Basel ~ Switzerlan), Chair and Discussant

Applied psychology was born from the conviction that scientific knowledge could serve societal development and human progress. A century ago, the International Association of Applied Psychology was founded in Geneva on precisely this vision: psychology as a bridge between rigorous inquiry and collective well-being. Yet over time, the field's scope has narrowed, too often confined to clinical settings and individualized interventions. This panel aims to reawaken psychology's broader legacy by highlighting its relevance to the most pressing global challenges of our time.

Drawing on cases ranging from health diplomacy, labour policy, and conflict mediation to pandemic preparedness, climate adaptation, and migration, panellists will demonstrate how psychological insights inform policy, organizational change, and multilateral negotiations. These interventions illustrate the potential of psychology not only to alleviate individual distress but also to strengthen institutions, support humanitarian response, and contribute to sustainable development.

By revisiting both historical roots and contemporary applications, this session aims to provoke fresh thinking about psychology's role as an applied social science. It will explore what it means to practice psychology responsibly and impactfully in times of turbulence, and how the discipline can reclaim its relevance by engaging with public policy, institutional reform, and global cooperation

Abstract 3793

UNDERSTANDING AND ADDRESSING SOCIAL INEQUITIES IN HEALTH AND WELLBEING: LEVERAGING AND REORIENTING PSYCHOLOGICAL INSIGHTS FOR SOCIAL JUSTICE

De Wit J.*

Department of Interdisciplinary Social Science, Utrecht University ~ Utrecht ~ Netherlands

Social inequities in health within and between countries remain a persistent social injustice. Psychological insights hold great promise for addressing this global problem, yet psychology's engagement with health inequities has been limited. While specialist areas within psychology have contributed significantly to understanding the experiences of disadvantaged, stigmatized, and minoritized communities, mainstream psychological theory and research have been less involved. Engaging with health inequities offers psychology an important opportunity to demonstrate its relevance to societal issues.

Extensive research in social epidemiology and public health has shown large and enduring inequities in physical and mental health, quality of life, and longevity across social groups. These inequities stem from avoidable and unjust differences in the social conditions in which people are born, grow, live, work, and age. Such conditions shape health-related behaviors, stress experiences, and material circumstances that vary between social groups.

Psychology can play a vital role in explaining the behavioral and stress pathways underlying these inequities. However, its contribution remains constrained by a predominant focus on individual differences and a lack of theories addressing group-level disparities. Likewise, psychologically informed interventions often target individuals rather than the broader social structures that sustain inequality.

This presentation will outline several ways psychology can contribute to improving health and wellbeing for all. Addressing social inequities in health presents unique opportunities for psychology to develop and test theories linking societal factors to individual experiences. It also allows psychological insights to inform strategies for social change. A socio-ecological approach to psychology—integrating individual, community, and structural levels—can enhance understanding of health inequities and strengthen the field's impact on social policy, contributing to solutions for major contemporary challenges.

Abstract 3794

APPLIED PSYCHOLOGY FOR BETTER HUMAN-ENVIRONMENT INTERACTIONS

Pahl S.*

University of Vienna ~ Vienna ~ Austria

Environmental Psychology has a long tradition of investigating the interplay between humans and natural as well as built environments. Here I will selectively review recent trends in environmental psychology to highlight the important role applied psychology can play for planetary health drawing on perspectives related to research as well as the science-policy interface. I will illustrate with three examples related to climate change activism, emerging pollutants and nature and health. First, I will highlight work investigating barriers and facilitators of climate activism. Second, I will briefly review findings on risk perception and policy support surrounding microplastics and so-called forever chemicals. Finally, I will turn to the benefits of nature in the context of nature-based therapies. These three examples serve to highlight diverse aspects of the growing area of environmental psychology for the benefit of humans and the natural environment.

Abstract 3795

PLURALITY, COMPLEXITY, AND UNDERSTANDING: BRIDGING POLITICAL THEORY AND APPLIED PSYCHOLOGY”

Zirkler M.*

Zurich University of Applied Sciences, School of Applied Psychology ~ Zurich ~ Switzerland

“The meaning of politics is freedom.” This oft-cited and central statement by Hannah Arendt encapsulates her understanding of politics as grounded in human plurality and heterogeneity. Politics, in her view, does not concern isolated individuals but emerges in the in-between—a relational space that arises through interaction and communication. Freedom is a necessary condition for the creation and maintenance of this space.

Today, we can observe an ongoing pluralization of plurality, resulting in increasing social complexity. At the same time, there is a lack of discursive formats capable of adequately representing, connecting, and meaningfully reducing this complexity. The tension between increasing diversity and the need for pragmatic reduction constitutes one of the central challenges in everyday politics—not only within nation-states but also in all organizations where human differences must be negotiated constructively.

Applied psychology has made significant contributions to the development of communicative formats for understanding and dialogue, particularly through humanistic approaches. However, these formats have received little attention in the area of public or political discourse; their application remains largely confined to dyadic or small-group contexts.

This contrubution therefore examines the extent to which Arendt's political theory provides impetus for Applied Psychology – and, conversely, how psychological approaches to communication might contribute to understanding-oriented and pluralism-sensitive discourse.

In line with the symposium’s theme of re-awakening, the contribution proposes ways in which applied psychology could help to revitalize public spaces of dialogue and foster renewed forms of political understanding.

Abstract 3796

APPLICATION OF DECISION MAKING SCIENCE TO THE GLOBAL PUBLIC HEALTH GOVERNANCE NEGOTIATION: THE CASE OF PABS

Saner Yiu L.*

Centre for Socio-Eco-Nomic Development ~ Geneva ~ Switzerland

In global health governance, the ongoing negotiations over the Pathogen Access and Benefit-Sharing (PABS) mechanism under the WHO illustrate how psychological dynamics could shape cooperation as much as institutional design or legal drafting. Yet, psychology rarely applied in such circumstances.

Since the World Development Report 2015: Mind, Society, and Behavior, psychology's insights into cognitive bias, framing, and motivation have gained limited recognition in the public policy sphere. Yet, their application to international treaty-making remains rare. Negotiators' behavior often reflects bounded rationality, loss aversion, and status-quo bias, while group identity and perceived fairness influence how coalitions form and dissolve. Drawing on decision-making science, social identity theory, and conflict-resolution psychology, this presentation examines how cognitive and affective factors condition negotiation strategies within the PABS process.

Importantly, PABS deliberations extend beyond state representatives. Non-state actors —scientific networks, research institutions, philanthropic foundations, and civil-society organizations—play increasingly visible roles in shaping expectations, framing benefit-sharing norms, and influencing perceptions of trust and legitimacy. Their participation introduces additional motivational layers, including reputational concerns, moral reasoning, and the pursuit of epistemic authority. Understanding these dynamics through psychological theories of cooperation and social influence helps explain how consensus or stalemate emerges in multi-actor negotiations.

Positioned within the panel "Rewaking a Dormant Legacy: Applied Psychology in Service of Global Challenges," this contribution discusses and suggest how psychology can illuminate and improve the micro-processes of collective decision-making in global governance. It reclaims psychology's original mission as an applied social science—one that not only understands individual minds but also facilitates cooperative action among diverse actors in the pursuit of global public goods.

Abstract 3797

BRIDGING LEVELS FOR GLOBAL IMPACT: PSYCHOLOGY'S ROLE IN WORK ACROSS SOCIETAL, ORGANIZATIONAL, AND INDIVIDUAL CONTEXTS

Deller J.*

Leuphana University Lüneburg ~ Lüneburg ~ Germany

Background and Objectives:
Applied psychology can meaningfully address global challenges only by integrating three interconnected levels of analysis: macro (societal, political, and cultural systems), meso (organizational structures and practices), and micro (individual behaviors and experiences). Reclaiming this multi-level perspective is essential for psychology to contribute effectively to future development and human well-being.
Approach:
At the macro level, psychological science can inform labor market and social policy, particularly in aging societies where equitable participation in work is a pressing concern. At the meso level, psychology provides organizations with evidence-based tools to implement inclusive practices. The Later Life Workplace Index (LLWI) exemplifies this approach. The LLWI measures nine domains of age-inclusive organizational practices and is currently validated in over 30 countries through a global research consortium.
Findings and Collaboration:
At the micro level, psychological research links individual motivation, health, and work ability with organizational and societal conditions. Networks such as COST Action CA22120 – A European Network to Leverage the Multi-Age Workforce (LeverAge) enhance this integration by fostering interdisciplinary, cross-national collaboration to advance age-diverse and sustainable workforces.
Conclusions and Implications:
Together, these efforts illustrate psychology's capacity to bridge individual, organizational, and societal levels—contributing to the UN Sustainable Development Goals, especially SDG 3 (Good Health and Well-Being), SDG 8 (Decent Work and Economic Growth), and SDG 10 (Reduced Inequalities). Revitalizing psychology's applied, multi-level mission strengthens its global relevance and repositions it as a discipline capable of advancing equitable and sustainable societies.

Abstract 3798

ANALYZING AND CONTAINING THE „SOFT“ CAUSES OF CRISES

Bardy R.*

BardyConsult ~ Mannheim ~ Germany

Crisis management can – often quite successfully – deal with the man-made and natural causes of rises. But crises management is often hampered by psychological factors that may prolong or even cause a crisis. These are psychic interventions that just happen by contagion (spread by one influential group that is fearsome), or which are provoked intentionally (by a group that is interested that a crisis is maintained). Both types then would find their way into the opinions and attitudes of people. One instrument to analyze and contain the psychological factors of crises - and conflicts - is sociological surveys that ask for the differences in opinions between societal groups. Surveys of this kind, when produced among conflicting groups about a specific crisis - or groups that feel differently (= are psychically affected in a different way) can help to elucidate ways to find solutions. One example is the Social Capital Monitor (https://commons.ch/wp-content/uploads/Common_Ground_2022_World_Social_Capital_Monitor.pdf). It was developed by the Basel Institute of Commons and Economics (www.commons.ch) and confronts various sets of respondents with questions that range from their acceptance of government measures, their willingness to invest in their community to their opinion on trust in their community etc. The answers would reflect the social climate and whether or not it is favorable to manage crises collectively – as well as, if it is not, what can be done to improve that. Solutions suggested by the Monitor have helped in conflicts between hostile groups in Cambodia and in Ghana, and the Monitor is now being applied to a series of initiatives that could help to facilitate sustainable solutions for the Gaza conflict by way of a huge collective effort to build a “Mediterranean Peace Railway” from Alexandra in Egypt to the Northern border of Lebanon (https://commons.ch/mediterranean-peace-railway/).

GENDER AND MONEY: BREAKING STEREOTYPES TO SHAPE FINANCIAL EQUALITY

Thursday 23 July 2026 from 14:00 to 15:30

(K-Spadolini)

Claudia Manzi (Catholic University of Milan ~ Milan ~ I), Chair
Valeria Amata Giannella (Catholic University of Milan ~ Milan ~ I), Co-Chair
Henriette Prast, Discussant

The persistent gender gap in financial matters — from literacy and investment to access to capital — not only limits women's economic autonomy but also increases their long-term risk of financial insecurity and poverty. This symposium brings together a series of contributions that examine the pervasive role of gender stereotypes in financial contexts, highlighting their impact on behavior, decision-making, and access to economic resources. Drawing on empirical studies across diverse settings — from financial advisory and female entrepreneurship to financial literacy and investment behavior — the presentations reveal how gender shape interactions and outcomes in financial matters. The findings show that gender stereotypes can hinder women's financial autonomy and contribute to systemic inequalities. At the same time, promising insights emerge: greater exposure to female clients, the presence of female investors and female financial advisors, and targeted interventions focusing on confidence and awareness can help reduce bias and foster change. This symposium offers a critical and multidimensional reflection on the invisible barriers that limit women's full participation in the financial world, while proposing pathways to overcome them and advance toward a more inclusive, equitable, and informed financial landscape

Abstract 4001

WHEN GENDER HOMOPHILY PREFERENCE IS ACTIVATED IN FUNDING REQUESTS? INSIGHTS FROM A VIGNETTE EXPERIMENT OF EARLY-STAGE INVESTMENT

Li J., Rossi C.*

Politecnico di Milano ~ Milan ~ Italy

Research shows that female entrepreneurs receive only a small fraction of early-stage investments due to investors' biases. However, little is known about female entrepreneurs' perceptions and behaviors in the funding search process. Leveraging gender homophily, we assume that female entrepreneurs would be facilitated in the funding research process by having more females in the investors' environment. We developed an internet experiment to gain insights. Our results indicate that female entrepreneurs strongly prefer female investors when seeking or accepting investments, even after controlling for their perception of investors' warmth and competence. All in all, these results show that the gender gap in entrepreneurship is also due to the lack of female investors in the field.

Abstract 4002

GENDERED UNCERTAINTY IN FINANCIAL LITERACY: THE PARADOX OF GREATER EQUALITY AND THE MEANING OF 'I DON'T KNOW

Gasiorowska A.*

SWPS University, Wroclaw ~ Warsaw ~ Poland

This study examines gender differences in financial literacy using data from the Eurobarometer 2023 survey in 27 European countries. Significant differences were found in the tendency to answer "I don't know" to financial literacy questions, with women consistently giving more uncertain answers compared to men. A Poisson regression analysis identified gender, education level and gender equality at country level as significant predictors. Remarkably, the gender difference in uncertain responses was greatest in countries with high gender equality, paradoxically suggesting that higher gender equality favors conditions in which women are more likely to be reluctant to express their financial knowledge.

Further analyzes examined whether "I don't know" responses predict financial behavior independently of financial literacy and incorrect responses. Mixed-effects models showed that "I don't know" responses significantly predicted subjective financial insecurity and lower ownership of financial products, such as retirement savings plans, even when traditional measures of financial literacy were controlled for. These results suggest that self-perceived financial ignorance uniquely captures dimensions of financial insecurity and financial engagement that go beyond standard literacy tests. Consequently, interventions to improve financial capability should target not only factual knowledge but also confidence and commitment, particularly among women in socially advanced contexts.

BUILT IT, LOVED IT? NOT QUITE: RETHINKING THE IKEA EFFECT

Burböck B.*, Liebl H., Franco Paqualin L., Rieger K.

FH JOANNEUM ~ Graz ~ Austria

Introduction:
The IKEA effect describes a cognitive bias in which individuals attribute disproportionately higher value to self-made products. While well-established, the boundary conditions and moderating variables of the effect—particularly gender and self-esteem—remain insufficiently understood.

Purpose:
This study aims to replicate the IKEA effect in a higher education setting and to examine the influence of product interaction (observation vs. self-assembly), gender, and self-esteem on willingness to pay (WTP).
Method:
A within-subject quasi-experimental design was conducted with 58 undergraduate participants. Each subject evaluated a standardized product—an origami heart—under two conditions: viewing a completed item and assembling one themselves. WTP was measured using an incentive-compatible Becker-DeGroot-Marschak (BDM) procedure. The Rosenberg Self-Esteem Scale (RSES) was used to assess self-esteem. Data were analyzed using paired and independent samples t-tests, two-way ANOVA, linear regression, and non-parametric tests to ensure robustness.

Results:
No significant difference in WTP emerged between the observed and self-made conditions, indicating that the IKEA effect could not be statistically replicated. However, gender had a significant main effect: women demonstrated higher WTP across both conditions ($p < .001$; Cohen's $d = .84$). Self-esteem did not significantly affect WTP, nor did it moderate the gender or condition effects.

Conclusions:
These findings challenge the generalizability of the IKEA effect in symbolic product contexts and highlight gender as a consistent determinant in consumer valuation. The study underscores the methodological importance of incentive-compatible procedures and suggests that further research should systematically address the role of gender in behavioral economics paradigms.

THE INFLUENCE OF FIVE-FACTOR MODEL PERSONALITY TRAITS ON CONSUMER RESPONSES TO HUMOROUS ADVERTISING: A PREREGISTERED SYSTEMATIC REVIEW

Sterlecchini A.*, Iliescu D.

University of Bucharest ~ Bucharest ~ Romania

This preregistered systematic review examines how personality traits, organized within the Five-Factor Model (FFM) dimensions, influence consumer responses to humorous advertising. We reviewed empirical studies assessing either the predictive or moderating role of personality in shaping affective, cognitive, attitudinal, intentional, or behavioral responses to humorous ads. A comprehensive literature search yielded 1,357 records, from which 32 full-text articles, comprising 43 independent studies (N = 9,662), were included. Although a meta-analysis was planned, substantial heterogeneity in trait operationalizations, outcome definitions, and insufficient statistical reporting prevented quantitative synthesis. Findings were narratively synthesized. Traits associated with Openness and Extraversion emerged as more consistent moderators of humor effects, while predictive effects across all dimensions were generally weak and inconsistent. The review identifies critical conceptual and methodological limitations, including inconsistent outcome constructs, trait misclassification, the use of intuitive humor typologies, and weakness in designs. By organizing findings within a validated personality framework, this review provides a clearer theoretical foundation and practical insights for personality-based targeting in humorous advertising. Implications are discussed for advancing field research.

Abstract 1027

PAPER VERSUS DIGITAL MANUALS: IMPACT ON SATISFACTION IN CREATIVE EXPERIENCES

Iseki S.*

Chukyo University ~ Nagoya ~ Japan

We often create or assemble objects by following instructions or manuals. In recent years, such manuals have increasingly been accessed in digital form through devices such as smartphones or tablets. However, little is known about how the medium of a manual (paper vs. digital) influences satisfaction with the creative experience. This study investigated the effects of manual format on psychological ownership of the manual, attachment to the created product, and satisfaction with the creative process. A between-participants design was employed with manual format (paper, digital) as the independent variable. A total of 156 undergraduate students (94 men, 60 women, 2 undisclosed; M = 19.43 years, SD = 1.11) participated. Participants were instructed to create an origami (traditional Japanese paper-folding) work for 15 minutes using either a paper or a digital manual. Afterward, they evaluated the manual's ease of understanding, their psychological ownership of the manual, their attachment to the product, and their satisfaction with the creative experience. Satisfaction was also assessed one week later. Results indicated that, while no difference emerged in perceived ease of understanding between formats, the paper manual fostered stronger psychological ownership of the manual, greater attachment to the product, and higher satisfaction with the creative experience. Importantly, this effect persisted one week later. Although digitization has accelerated in recent years due to convenience and environmental concerns, these findings underscore the enduring positive role of physical media in enriching creative experiences.

Abstract 1539

PSYCHOLOGICAL DETERMINANTS OF INTENTION TO PURCHASE CRUELTY-FREE PERSONAL CARE PRODUCTS: A PRELIMINARY STUDY

Kivanç S.*[1], Güler M.[2]

[1]Mersin University ~ Mersin ~ Turkey, [2]Çukurova University ~ Adana ~ Turkey

Introduction

While sustainable consumption and ethical product choice have been broadly studied, the psychological determinants of intentions to purchase cruelty-free personal care products remain underexplored. Prior literature tends to focus on general ethical consumption or environmental behaviors (e.g. Magano et al., 2022) rather than cruelty-free products specifically. Drawing on Ajzen's Theory of Planned Behavior (1991), the present study integrates values, knowledge, and animal welfare concerns to fill this gap.

Purpose

This preliminary study aimed to test whether consumer knowledge, health-related values, and animal welfare concerns predict intentions to purchase cruelty-free products, while accounting for social desirability.

Method

Data were collected online from 201 Turkish adults (57.7% women; Mage = 35.8, SD = 11.3). Participants completed validated measures of knowledge, health values, animal welfare concerns, social desirability, and purchase intention. Multiple regression analyses were conducted.

Results

The model explained 75% of the variance in purchase intention (adj R^2 = .75). Knowledge emerged as the strongest predictor (β = .72, $p < .001$), followed by health values (β = .16, $p < .001$). Unexpectedly, animal welfare concerns were negatively associated with purchase intention (β = –.10, p = .012). Social desirability was non-significant.

Conclusions

These preliminary findings suggest that knowledge-based interventions and health-related appeals may be effective strategies to promote cruelty-free consumption. At the same time, the paradoxical negative role of animal welfare concerns highlights the need for further research into value conflicts in sustainable consumer behavior. This work contributes to applied psychology by addressing an underexplored area at the intersection of health, environmental, and economic psychology.

Abstract 1021

FROM ECONOMIC STRESS TO RISKY BEHAVIOR: PSYCHOLOGICAL DRIVERS OF PROBLEMATIC CRYPTOCURRENCY TRADING

Koç Y.Z.*

Marmara University ~ Istanbul ~ Turkey

Cryptocurrency trading has become an increasingly prominent financial activity, yet its psychological risks remain underexamined. Individuals facing financial stress may engage in impulsive and compulsive trading behaviors that resemble gambling addiction, often driven by emotional urgency and distorted future expectations (Johnson et al., 2023; Mumcu, 2025; Şentürk et al., 2023). Understanding the cognitive and emotional mechanisms behind such behaviors is critical for informing applied psychological responses.

This study aims to examine how perceived financial pressure contributes to problematic cryptocurrency trading, focusing on the psychological roles of negative future orientation and financial literacy in this relationship. Previous research has shown that negative expectations about the future often conceptualized through hopelessness and future anxiety—can impair self-regulation and increase the likelihood of short-term, high-risk decisions (Liang et al., 2025; Hirsch et al., 2019). Conversely, financial literacy has been associated with more adaptive financial behavior and emotional resilience under economic strain (Białowolski et al., 2024; Alshebami & Murad, 2022).

The study will be conducted in Türkiye, a country that ranks third globally in cryptocurrency ownership relative to population, with 19.3% of its population involved in crypto investments (Triple-A, 2024). Data will be collected from adults currently engaged in cryptocurrency trading. Participants will complete validated self-report measures including the Family Economic Strain Scale (Hilton & Devall, 1997; Gürel & Çopur, 2021), the Dark Future Scale (Zaleski et al., 2019; Yakın & Temeloğlu Şen, 2023), the Beck Hopelessness Inventory (Beck et al., 1974; Seber et al., 1991), the Financial Literacy Attitude and Behavior Scale (Sarıgül, 2015), and the Problematic Cryptocurrency Trading Scale (Menteş et al., 2021).

By exploring how these variables interact, this study is expected to illuminate the psychological processes underlying risky financial behavior and offer insights into targeted interventions that promote financial and emotional well-being.

Abstract 712

EFFECT OF ACADEMIC GROUP SIZE ON COOPERATION

López Salas J.S.*[1], Pedroza Cabrera F.J.[1], López Salas J.S.[1], Santoyo Velasco C.[2]

[1]Autonomous University of Aguascalientes ~ Aguascalientes ~ Mexico, [2]National Autonomous University of Mexico ~ Mexico City ~ Mexico

Experimental designs based on decision-making allow researchers to analyze how participants prioritize individual interests over collective benefits. Previous studies have shown that cooperation tends to decline as group size increases. This study aimed to experimentally examine the influence of group size on adolescents' cooperative behavior.

The sample included 112 students from three educational institutions in Mexico, each with a distinct class size: Group 1 (n = 45), Group 2 (n = 39), and Group 3 (n = 28). From each cohort, three subgroups of four students were randomly selected (total: 9 subgroups, 36 students) to complete a one-time Public Goods Dilemma task over 10 experimental rounds. Additionally, interviews using the Composite Socio-Cognitive Maps (CSCM) instrument were conducted to map the social networks within each group.

ANOVA results revealed statistically significant differences in cooperation levels among the groups ($F(2,114) = 24.16$, $p < .001$). These findings provide empirical evidence that overall group size influences cooperative dynamics, even when the task involves the same number of participants over the same duration. The study highlights the importance of reducing classroom sizes in Mexico—where the average group includes 45 students—as a strategy not only to enhance learning outcomes but also to improve social cohesion and cooperative behavior.

Abstract 2432

THE INFLUENCE OF MOBILE PAYMENT TIMING ON CONSUMERS' WILLINGNESS TO PAY: EVIDENCE FROM A JAPANESE SURVEY

Mori K.*

Kwansei Gakuin University ~ Nishinomiya ~ Japan

Introduction
The global mobile payments market has been expanding rapidly, fueled by the widespread adoption of smartphones. Previous studies suggest that the convenience of mobile payments enhances consumers' willingness to pay (WTP). However, the timing of payment settlement differs across systems. In Japan, for instance, mobile payments can be categorized into three types: pre-loaded systems (requiring cash top-ups), direct debit systems (with immediate withdrawal from bank accounts), and postpaid systems (with later withdrawal via credit cards). Differences in payment timing may influence consumers' WTP by altering the psychological pain associated with spending. Understanding how payment method variations affect payment behavior can help promote responsible consumption and sustainable economic growth.

Purpose
This study examines how different mobile payment methods—pre-loaded, direct debit, and postpaid—affect consumers' WTP. It is hypothesized that WTP increases as the actual payment timing is delayed.

Method
An online survey was conducted among 376 participants (168 males, 207 females) recruited via a crowdsourcing platform. Respondents were randomly assigned to one of three payment conditions and asked to indicate their WTP in four shopping scenarios varying in price level (high/low) and product type (practical/indulgent). Participants also reported their prior experience with each payment method.

Results
Analyses of covariance were conducted with WTP as the dependent variable, payment method and prior experience as independent variables, and age and gender as covariates. Except for low-priced indulgent items, WTP was higher among those familiar with the payment method. The effect of payment method was significant only for high-priced indulgent items, where WTP was higher for postpaid systems than for pre-loaded ones.

Conclusion

These findings indicate that consumers' WTP varies according to payment timing, even within mobile payment systems, suggesting that the reduction in the pain of payment depends partly on when the actual payment occurs.

Abstract 427

THE POWER OF FRAMING IN LIFE-OR-DEATH DECISIONS - HOW WORDS SHAPE RISKY CHOICES IN A CRISIS

Burböck B.*, Liebl H., Franco Pasqualin L., Leitner L.

FH JOANNEUM ~ Graz ~ Austria

Introduction

Decision-making under conditions of risk and uncertainty is a central concern in behavioral science, particularly during public health crises. This study examines how framing and contextual scale influence individual choices in life-or-death scenarios, drawing on Prospect Theory. Specifically, it compares decision behavior in a hypothetical setting—the Asian Disease Problem (Tversky & Kahneman, 1981)—with responses in a real-world context, the COVID-19 pandemic.

Purpose

The research aims to evaluate (1) the effect of gain versus loss framing on risk preferences and (2) the influence of varying population sizes on choice behavior, thereby testing the principle of diminishing sensitivity.

Method

A quantitative, between-subjects online experiment was conducted with 371 university students. Participants were exposed to ten randomized scenarios involving escalating population sizes (600 to 6,000,000) and framed either positively or negatively. Scenarios were embedded in both a hypothetical disease context and a COVID-19 setting. Statistical analyses were performed using chi-square tests of independence and goodness-of-fit.

Results

Framing had a statistically significant effect on decision outcomes. Participants demonstrated risk-averse behavior under gain framing and risk-seeking behavior under loss framing, aligning with the predictions of Prospect Theory. In contrast, population size did not significantly influence decision behavior, providing no empirical support for diminishing sensitivity. The magnitude of the framing effect was greater in the hypothetical context than in the COVID-19 scenarios.

Conclusions

The findings underscore the robustness of framing effects in crisis-related decision-making, while calling into question the relevance of scale-based sensitivity under conditions of high emotional and cognitive load. The study contributes to the empirical

foundation of Prospect Theory and offers practical implications for the design of risk communication strategies in public health contexts.

Abstract 2254

MAXIMIZING PROMOTES THE ZERO-SUM MINDSET

Chen Y.*[1], Qiao Z.[2], Liang Z.[3], Lu J.[2]

[1]Renmin University of China ~ Beijing ~ China, [2]East China Normal University ~ Shanghai ~ China, [3]Institute of Psychology ~ Beijing ~ China

INTRODUCTION:
Maximizing, the aspiration to pursue the best choice, shapes people's decisions and feelings. However, its influence on social interactions remains underexplored. Only a small body of research suggests that maximizers care about social comparison and undermine the interests of others. An important unanswered question is whether a single, fundamental psychological process underlies maximizers' social behaviors.

PURPOSE:
This research identifies a fundamental psychological process underlying maximizers' social interactions. We investigate whether and why maximizing promotes a zero-sum mindset, the generalized belief that one party's success comes at the expense of another. We hypothesize that maximizing induces the belief that the pursued resources are limited, which in turn promotes a zero-sum mindset.

METHOD:
Study 1 measured participants' maximizing tendencies and zero-sum mindset. Study 2 manipulated maximizing and assessed its effect on zero-sum mindset. Study 3 manipulated maximizing and measured perceived scarcity of the options pursued and the zero-sum mindset. Study 4 manipulated the extent to which the options maximizers pursued were scarce and measured the zero-sum mindset.

RESULTS:
First, maximizing positively correlates with a zero-sum mindset. Second, priming maximizing increases zero-sum mindset. Third, perceived scarcity mediates the relationship between maximizing and zero-sum mindset. Fourth, imposing the belief that the best option is abundant attenuates the effect of maximizing on the zero-sum mindset.

CONCLUSIONS:
Maximizing promotes the zero-sum mindset because it induces the belief that pursued resources are scarce.

CONTRIBUTION

Our findings contribute to the literature on maximizing by proposing a basic psychological process underlying maximizers' social behaviors, and to the literature on the zero-sum mindset by demonstrating a novel motivational antecedent. Practically, we provide a viable approach to help maximizers reduce their zero-sum mindset.

Abstract 767

THE INFLUENCE OF ENHANCED DELIBERATION ON DECISION PERFORMANCE

Mondal S.*, Traczyk J.

SWPS Univeristy ~ Wroclaw ~ Poland

Numerous studies have shown that numeracy is the most reliable predictor of superior financial outcomes, even after controlling for demographics, cognitive, and emotional factors. A key meta-cognitive factor explaining the difference in performance between highly and less numerate people is deliberation. Highly numerate individuals spend significantly more time than less numerate individuals to achieve significantly superior choice performance.

This study examined the impact of deliberation on decision outcomes. Specifically, the goal was to persuade decision-makers to engage in more deliberate thinking and to create a more accurate representation of the choice problem, leading to superior decisions. We manipulated the deliberation on three levels (High, Moderate, and Low) for each participant. Furthermore, we presented mixed domain binary choice problems using the Decision from Experience (DfE) task to monitor changes in decision performance as a function of different deliberation levels. In the DfE task, participants can explore outcomes by drawing random samples from each distribution. We created a numerical model that predicts the sufficient number of samples (a proxy for the deliberation period) necessary for decision makers to create distinct levels of accurate representation of the choice problem, depending on the deliberation condition.

We found that decision makers' performance (i.e., decision accuracy from a normative perspective) improved significantly with increased deliberation. In other words, the mean EV consistency in the High deliberation condition was significantly higher than in both the Moderate and Low deliberation conditions. This result remains consistent even after controlling for fluid intelligence, numeracy, or individuals with high cognitive reflection. This result conclusively demonstrates that more skilled decision makers make superior decisions primarily due to the time they spend on each problem. This result also highlights that interventions designed to motivate less numerate individuals to engage in an energy-intensive deliberate decision process will significantly improve their decision quality.

Abstract 686

DYNAMIC PRICING: A STRESS TEST FOR CONSUMERS?

Schenk L.*, Hoelzl E.

University of Cologne ~ Cologne ~ Germany

Dynamic pricing refers to flexible price adjustments based on, for example, supply and demand or individual customer data. Previous research has shown that consumer reactions to dynamic pricing are mostly negative, including lower fairness perceptions and (re-)purchase intentions. We contribute to this literature by examining consumer stress as a further psychological response, as price changes can lead to feelings of being overwhelmed, reduced control, and emotional tension. We propose that two components of dynamic prices are relevant for stress: mere price fluctuation and different directions of price changes.

We conducted a preregistered, between-subjects online experiment. Participants (N = 389) read a purchase scenario where they observed the price of a laptop over seven days. Price development varied by experimental condition: Prices either remained static or fluctuated with no trend (starting price = final price), a decreasing trend (starting price > final price), or an increasing trend (starting price < final price). Prices were based on real-world price developments, keeping the final price constant across conditions to measure reactions to price development rather than absolute price level. After seeing all prices, participants indicated their current stress on an adapted version of the 10-item Perceived Stress Scale.

As expected, dynamic prices with an increasing trend led to higher perceived stress than dynamic prices with no trend and with a decreasing trend. Contrary to our expectations, dynamic prices with no trend did not lead to higher perceived stress than dynamic prices with a decreasing trend or static prices.

Our results indicate that the direction of price changes, specifically an increasing trend, appears to be the key driver of perceived stress. Thus, managers should consider potential negative business consequences of high consumer stress (e.g., reduced trust). For consumers, awareness of how price developments affect stress can be helpful to improve their purchase decisions.

Abstract 1540

APPLYING AN ORGANIMETRIC APPROACH FOR ORGANISATIONAL TRANSFORMATION AND SCALABLE GROWTH

Mervyn--Smith J.*[1], Evans N.[2]

[1]GC Index ~ London ~ United Kingdom, [2]NEC Advisory ~ Stoud ~ United Kingdom

Introduction: This paper presents the innovative development of an Organimetric Index that measures and describes energy for impact through proclivity, rather than personality. The language and concept of the Organimetric approach is shown to be practical and scalable, as it applies and integrates at individual, team and organisational levels.

Purpose: Organisational growth requires effective transformation, particularly identifying people who 'think differently'. Responding to a funded corporate client request, researchers were able to scientifically investigate what makes a ‘game changer’ from organisational field study.

Methods: Research followed 3 main phases over three years: Phase 1 was an initial exploration of the characteristics of ‘Game Changers’ using Repertory Grid interviews which yielded 180 distinct observations. Phase2 built on phase 1, with pilot item analysis suggesting defining characteristics for Game Changers under two broad constructs - Imagination and Obsession. Phase 3 expanded the Game Changer self-perception data. Factor analysis of confirmed item constructs was completed on a working population sample (n=7,880) to explore the meaning of different responses to the questionnaire.

Results: The research yielded reliable and valid measures of ‘Game Changers’ alongside four additional distinct proclivities when it came to making an impact at work. These were identified behaviourally as Strategist, Implementer, Polisher, and Play Maker. These differences are now represented as an Organimetric Index identifying both the individual and collective impact of how people contribute to achieving transformational change.

Conclusions: The results and scalable application case studies show the Index provides a clear framework that can be used to inform key business decisions in transformational organisational change. This is conducted in an inclusive way by acknowledging the diversity of thought and action that come from different proclivities. International sampling has found very few differences in the proclivity scores, however more data is being gathered to confirm.

Abstract 2233

INVESTOR OPTIMISM, REPRESENTATIVENESS BIAS, AND IPO LONG-TERM PERFORMANCE: EVIDENCE FROM THAI STOCK MARKET

Ungphakorn T.*[1], Lerskullawat P.[2]

[1]Mahasarakham Business School ~ Maha Sarakham ~ Thailand, [2]Kasetsart University ~ Bangkok ~ Thailand

This study examines long-term performance of initial public offering (IPOs) in Thai stock market emphasizing on investor overly optimism and representative bias. While extensive global research has documented that IPOs underperform the market, limited evidence exists on whether such anomalies persist in emerging markets. Emerging markets are transition economies typically characterized by rapid growth, immature financial systems, high volatility and greater degree of information asymmetry compared with developed markets. Subsequently, this study employs the Thai stock market as a representative case of an emerging market to explore investor behavior in such environments.

A total of 243 IPO issued between 2010 and 2016 are analyzed, and their long-term performance are evaluated over three- and five-year horizons using three approaches: cumulative abnormal return (CAR), buy-and-hold abnormal return (BHAR) and Fama-French six- factor model (6FF). The Fama-French model which control systematic risks which incorporates a momentum factor is employed capture optimism and representativeness bias

Results reveal significant negative long-term abnormal returns across all measurement methods. Even after adjusting risk factors, the negative abnormal performance remains robust, with the SMB (size) factor remaining strongly significant This pattern suggests that optimistic investors in emerging markets tend to overvalue small and speculative IPOs, extrapolating recent success stories into future expectations. As fundamentals become clearer over time, prices revert downward, leading to persistent underperformance.

The findings contribute to behavioral asset pricing literature by showing that IPO mispricing in emerging markets is not solely a risk-based phenomenon but also a consequence of psychological biases. The results imply that improving disclosure quality and promoting investor education could mitigate optimism-driven mispricing and enhance market efficiency.

ADVANCEMENT IN CONSUMER NEUROSCIENCE AND NEURMARKETING: WHICH FUTURE PERSPECTIVES AND POTENTIAL FOR APPLIED PSYCHOLOGY?

Friday 24 July 2026 from 11:30 to 13:00

(K-Spadolini)

Alessandro Fici, Chair and Discussant

The use of neuroscience and of the experimental methodology became more attractive in several fields, including
marketing and consumer psychology. The study of consumer behavior has gained a lot of attention and interest for
several years now and the psychology of everyday behaviors is a dynamic and evolving field. Consumption behavior
is a central lens through which we can understand daily decision-making, habit formation, and emotional engagement.
Knowledge in this area has also grown thanks to the increasingly frequent application of neuroscientific techniques to
marketing. In particular, the development of neuroscientific tools, of the knowledge on brain functioning and on the
unconscious dimension of brain activation, allowed the growth of neuromarketing techniques and of consumer
neuroscience. If on one hand neuromarketing shows scientific advancement, methodologies, applications and data
analyses, on the other hand consumer neuroscience developed the set of basic knowledge of consumption processes analyzed also thanks to basic neurological processes. In fact, innovations in neuroscientific tools, such as brain
imaging and biometric sensors, combined with advancements in artificial intelligence, machine learning, and big data
analytics, have enabled researchers to study behavior with unprecedented precision. These technologies allow for
deeper insights into the interplay between cognitive, emotional, and social factors, providing a more comprehensive
understanding of how people engage with their environments and make decisions.
Consumer neuroscience, indeed, allow to understand how to valorize, in an integrative logic with traditional
marketing and classical consumer psychology this new knowledge, and this symposium explores how the mentioned
advancements are reshaping the study of everyday behaviors, focusing on consumption neuroscience as a central
activity in modern life.
As this discipline is more and more attracting scientific interest and, as scientific publications are more and more
growing, touching several aspects of consumer behaviour, the aim of this symposium is to share advancements in
theories, perspective, applications, methodology,tools, data analyses and, in general, research in this field.
Considering the increase of studies in this sectoritisimportanttoevaluatethestateoftheartandreflectonthenext
developmentswiththeaimofimprovingtheapplicationandstudyofconsumerneuroscience.

Abstract 4227

CONSUMER NEUROSCIENCE AND NEUROSCIENTIFIC MEASUREMENT OF THE GASTRONOMIC EXPERIENCE: THE CONTRIBUTION OF NEUROMARKETING TO THE STUDY OF CONSUMPTION

Russo V., Fici A.*

IULM University ~ Milan ~ Italy

Food evokes emotions and memories, and taste is considered a construct of the brain rather than an inherent property of food. Therefore, to understand our eating experiences
in depth, we must delve into their cognitive and neurophysiological foundations. This study investigates the cognitive and emotional mechanisms underlying the eating experience, aiming at unraveling these dynamics at different eating stages (sight, taste, and savouring). Using neuroscientific techniques (electroencephalography, heart rate, and skin conductance) as well as self-report measures (SAM), we explored the emotional and cognitive correlates of eating. 31 healthy participants (18 males, 18 females) aged 25-55 years were asked to consume four pasta dishes with different flavors (tomato, pesto, ragù, and plain pasta as benchmark). Our results shed light on how neurophysiological variables can help delineate the cognitive processes associated with each distinct phase of eating. In particular, heightened cognitive engagement was registered during plate viewing and tasting, memorization peaked during the tasting phase, while emotional involvement was highest during the tasting and savouring phase.
However, neurophysiological metrics did not reveal differences in pasta flavour, which instead emerge when emotions are self-reported. Finally, correlations between neurophysiological indicators and self-reported emotions suggest a connection between memorization during the concluding savouring phase and self-reported emotions. These findings underscore the importance of integrating neuroscientific and self-report measures to fully understand the complex interplay between cognitive, sensory, and emotional processes during the eating experience. Furthermore, by delineating sequential cognitive processes at different stages of eating, this research provides valuable insights into understanding the dynamics associated with food consumption.

Abstract 4228

GENAI AND NEUROMARKETING TOOLS FOR SOCIAL MEDIA MARKETING: WHAT'S NEXT

Vaiciukynaite E.*

Kaunas University of Technology - St. Ignatius of Loyola College ~ Kaunas ~ Lithuania

Recent developments in Generative AI (GenAI) tools and platforms have fundamentally altered the social media marketing landscape. These cuttingedge technologies enable marketers to produce a wide variety of media and content types while ensuring a cohesive brand voice. They facilitate personalized content creation, amplify emotional engagement, and forecast customer reactions across social media platforms. Furthermore, machine learning-driven neuromarketing tools, including eye-tracking and emotion measurement technologies, can be leveraged through smartphones to analyze the factors that drive customer engagement with brand posts, stories, and advertisements. Despite the expanding array of GenAI and neuromarketing tools accessible today, emerging marketing AI platforms rooted in neuroscience offer marketers an unprecedented chance to view brand content from their audience's perspective. While various forms of static and dynamic brand content are currently being evaluated, the potential of innovative content generated using Meta AI glasses has yet to be thoroughly investigated. Notably, the introduction of surface electromyography (sEMG) technology at the wrist marks a revolutionary advancement, enabling users to seamlessly control devices throughout the day. This pioneering technology allows social media users to intuitively swipe, click, and scroll through content on their Meta AI glasses. Therefore, this research seeks to examine the existing capabilities of GenAI and neuromarketing tools and platforms in understanding and measuring user behavior on social media and the future opportunities they present. The research unfolds in two phases: the first involves a thorough literature review, both manual and AI-assisted, while the second phase incorporates interviews with experts in the field. The findings offer a comprehensive overview of the various GenAI and neuromarketing tools, culminating in a proposed taxonomy for measuring customer behavior on social media. Importantly, this research identifies gaps in the current landscape, particularly related to the integration of GenAI and neuromarketing tools and addresses essential performance indicators (KPIs) vital for businesses, such as impressions, clicks, and advertising spend. This research contributes to the existing body of academic knowledge and provides valuable insights for researchers and marketing practitioners.

Abstract 4229

NEUROTURISM AND DESTINATION EXPERIENCE: A NEUROSCIENTIFIC APPROACH TO TOURIST INTENTION TO REVISIT

Menezes K.*

Instituto Politécnico de Setúbal - School of Business Administration ~ Setúbal ~ Portugal

The study of tourist behavior has evolved with the integration of neuroscience, providing deeper insights into how travelers emotionally and cognitively engage with destinations. This research explores the intersection between neuromarketing, destination experience, and the intention to revisit, applying a mixed-methods approach that combines quantitative and qualitative techniques. Using eye tracking, facial recognition, and EEG, the study captures real-time neural and physiological responses as participants watch institutional videos of three of the most visited European cities: Barcelona, Rome, and Paris. In parallel, a semiotic analysis of these videos allows for a comparative assessment of how audiovisual narratives influence cognitive and emotional perceptions.
Additionally, a survey and focus groups provide further insights into the subjective experiences of travelers, enhancing the understanding of affective and cognitive drivers of destination loyalty.
Findings from this study will contribute to neurotourism by identifying the key neural and psychological factors shaping tourists' emotional connections with destinations. Furthermore, this research underscores the role of immersive experiences and destination branding in influencing revisit intentions. By bridging consumer neuroscience and tourism studies, this work aims to inform strategic decision-making in tourism marketing, leveraging neuromarketing techniques to optimize promotional content and enhance destination appeal.

Abstract 4230

THE NEUROSCIENCE OF DECEPTION: UNDERSTANDING CONSUMER TRUST AND ETHICAL MARKETING

Alvino L.*

University of Twente - HBE Department ~ Twente ~ Netherlands

Unethical marketing relies on deceptive advertising, where companies use false or misleading claims to exaggerate product benefits. This includes omitting crucial details, misrepresenting information sources, and making exaggerated performance claims. Regulatory bodies such as the Federal Trade Commission and EU authorities enforce penalties to protect consumers from such practices. However, despite these regulations, deceptive marketing persists, making it difficult for consumers to differentiate between genuine and misleading claims, ultimately leading to a loss of trust when brands fail to meet expectations. Understanding the effects of unethical marketing is essential in addressing misinformation. Traditional marketing approaches have largely ignored this issue, but neuroscience offers valuable insights. By studying human decision-making, neuroscience can predict behaviour at both individual and group levels.

This research examines two critical areas: the emotional and neurophysiological responses to deception in advertising and their influence on consumer trust. By analysing these reactions, we aim to uncover the psychological mechanisms shaping consumer perceptions of deceptive marketing. Additionally, we utilize neuroscience tools to help brands promote authenticity and transparent communication. Understanding consumer responses at emotional and cognitive levels provides valuable insights into building trust and enhancing brand loyalty. Through neurophysiological methods, we can evaluate how ethical messaging strengthens consumer confidence, encouraging responsible marketing practices. Our objective is to bridge the gap between marketing and neuroscience, offering a deeper understanding of how deception in advertising influences trust and how brands can establish authenticity to build stronger consumer relationships.

INFORMATION, TRUST AND DISHONESTY

Friday 24 July 2026 from 13:30 to 15:00

(K-Spadolini)

Jonathan Tan (Nanyang Technological University ~ Singa), Chair and Presenter
Erik Holzl (University of Cologne ~ Cologne ~ German), Discussant

The social capital of trust has served as a behavioral foundation of cooperation in societies through the ages. On the flipside, dishonesty and the failure to comply can likewise undermine such efforts. Indeed, trust can be invested not only in pecuniary terms but also in the domain of information, such as that of advice. In this symposium, we consider five diverse but related perspectives and applications on information, trust and dishonesty. We begin our journey with understanding trust in AI advisors versus humans in investment choices (Riyanto), mirrored by how the incentive mis/alignment shape the lies of advisors (Li), with motivated reasoning as the cognitive basis of dishonesty (Tan), and rounded up with evidence on the sheer power of authority over garnering compliance (Zizzo).

Abstract 3786

TRUSTING THE MESSENGER: THE ROLE OF HUMAN VS AI ADVISORS IN RISKY INVESTMENT CHOICES

Riyanto Y.E.*, Yan M.

Nanyang Technological University ~ Singapore ~ Singapore

This study investigates how people respond to human versus AI financial advice in a state-dependent investment context. In a laboratory experiment, participants are given the choice between two assets with equal expected returns but differing risk levels. Advisors, informed of the true state of the world, provide open-ended recommendations. The AI advisor (ChatGPT) is trained in human-generated messages to ensure comparable content and delivery style. The design features a 2*2 between-subjects design, varying whether participants are informed about the advisor's financial incentives and the advisor's identity, along with the within-subject variation in the type of advisor. Participants take on more risk when advice is provided, particularly when advisor incentives are undisclosed. AI advice is more persuasive than human advice, but only when the advisor is explicitly identified as AI. These findings reveal a context-sensitive trust premium for AI-generated advice, highlighting the behavioral relevance of transparency in advisory interactions and implications for the design and regulation of algorithmic decision aids.

Abstract 3788

FAIRNESS AS AN EXCUSE: DISHONESTY THROUGH MOTIVATED REASONING

Li X., Tan J.*

Nanyang Technological University ~ Singapore ~ Singapore

This study explores the role of fairness perceptions in driving dishonesty in workplace-like environments. Using a real-effort ball-catching task with systematic variation in task difficulty and opportunity, the study creates both objective unfairness and subjective unfairness, where participants are disadvantaged in one dimension but advantaged in another. The findings show that unfairness substantially increases misreporting, as individuals use perceived disadvantage to justify lying even when the unfairness is subjective and compensated in another dimension. Participants systematically exaggerate their perceived disadvantage, consistent with motivated reasoning that lowers the psychological cost of dishonesty. We also find that highlighting the counting requirement narrows moral wiggle room and significantly curbs cheating in low-opportunity tasks, showing that reducing room for self-serving belief distortion can limit dishonesty. When participants later self-select tasks, dishonest behavior falls sharply as the justification of unfairness disappears, reinforcing the role of perceived disadvantage as a license to lie.

Abstract 3787

PERSUASIVE LIES: AN EXPERIMENT ON MULTIDIMENSIONAL COMMUNICATION

Li X.*, Tan J.

Nanyang Technological University ~ Singapore ~ Singapore

Asymmetric information is prevalent in many economic settings and often leads to issues such as market inefficiency and adverse selection. In this study, we investigate information transmission in a sender–receiver game with a partially informed third-party sender whose interests may align with or conflict with those of the receiver. The experiment compares three communication formats: 1) state only (Baseline), in which only the state is communicated; 2) probability addition, in which the sender also reports his/her subjective probability that the state is truthful; and 3) text addition, in which the baseline recommendation is supplemented by a structured text message. The findings demonstrate that message format significantly affects both lying behavior and persuasion outcomes. Lying is most prevalent under structured text messages, followed by probability messages, and least under simple state messages, with these treatment differences emerging after a brief learning phase. Text messages elicit the highest rate of receivers following favorable messages, while probability messages increase following rate only when reported probability is moderate rather than extreme. Moreover, allowing senders to self-select richer message formats in a later stage unexpectedly reduces lying in the Baseline, suggesting that the presence of alternative communication channels can function as a commitment device against self-serving dishonesty.

Abstract 1394

BRIGHT OUTLOOK, BETTER BUDGETS: HOW OPTIMISM SHAPES FINANCIAL PLANNING BEHAVIOR

Capecchi S.*[1], Paladino G.[2], Piccolo D.[1]

[1]Università di Napoli Federico II ~ Naple ~ Italy, [2]InntesaSanpaolo-Museo delRispamio ~ Turin ~ Italy

This paper investigates the role of dispositional optimism in shaping individuals' financial planning and money management behaviors. Drawing on a nationally representative CAWI survey of 2,064 Italian adults, the study integrates psychological and economic perspectives to explore how optimism—conceptualized as a generalized expectation of positive outcomes—relates to budgeting, planning, and self-perceived financial competence. Composite indices of optimism were constructed and analyzed using CUB (Combination of Uniform and shifted Binomial) models, which allow for nuanced treatment of ordinal data and self-reported assessments.

The findings reveal that higher levels of optimism are associated with more proactive and organized financial practices, including the adoption of planning tools, and greater confidence in money management. Optimism appears to act as a motivational resource that fosters future-oriented thinking, reduces the perceived burden of financial uncertainty, and enhances individuals' engagement with long-term financial goals. At the same time, the study acknowledges potential risks, as excessive optimism can encourage overconfidence and risk-seeking behaviors, echoing concerns in behavioral economics about the "double-edged" nature of optimistic outlooks.

By focusing on an Italian context, the research expands the geographic and cultural scope of existing studies, which have predominantly examined Anglo-Saxon populations. In Southern Europe, where informal support networks and economic volatility shape financial decision-making, optimism emerges as a particularly relevant psychological factor. The results suggest that financial capability should be understood not solely as a matter of knowledge or income, but also as a mindset shaped by psychological well-being.

The study contributes to interdisciplinary debates on financial behavior and offers practical implications: integrating optimism-enhancing strategies into financial education and policy may improve individuals' financial resilience. Promoting psychological resources alongside informational interventions could therefore represent a more holistic approach to fostering effective money management.

Abstract 2196

AGE AND GENDER DIFFERENCES IN MOTIVATIONS FOR SUSTAINABLE FASHION: COMPARING SECOND-HAND PLATFORMS AND GREEN BRANDS

Cortini M.*, Balducci C., Santoriello M., Galanti T.

Università G. d'Annunzio of Chieti - Pescara ~ Chieti ~ Italy

Introduction: Sustainable fashion is increasingly central to consumer psychology, reflecting both environmental concerns and identity-driven choices. While resale platforms such as Vinted encourage circular fashion through reuse, sustainable brands emphasize ethical production and eco-friendly materials. Research has highlighted the role of identity, social norms, and affordability in shaping sustainable consumption, yet little is known about demographic differences in motivations toward these two pathways of “green fashion.”

Purpose: This study investigates the socio-psychological drivers of sustainable fashion engagement, exploring how motivations differ by age and gender when consumers approach second-hand platforms versus sustainable brands.

Method: A cross-sectional survey has been administered to a diverse consumer sample. Measures have assessed demographic characteristics, shopping habits, environmental awareness, identity expression, perceived affordability, along with allo and etero centric personality. Comparative analyses have examined whether motivational patterns vary across age cohorts and gender.

Results: Preliminary expectations suggest that age and gender differences emerge, particularly regarding identity expression and environmental concern.

Conclusions: By contrasting consumer motivations across second-hand and brand-driven approaches to sustainable fashion, this study contributes to understanding the role of demographics in shaping sustainable consumption. Findings are expected to inform both academic research and industry strategies aligned with the Sustainable Development Goals.

Abstract 1785

A MISSING LINK IN CORPORATE TAX AGGRESSIVENESS: SMALL BUSINESS ENTREPRENEURS' NON-INCOME TAX OWNERSHIP PERCEPTIONS

Daems W.*, Corten M., Lybaert N., Steijvers T.

Hasselt University ~ Hasselt ~ Belgium

Following Dyreng et al.'s (2010) pioneering study, researchers have investigated how executives' personal characteristics drive corporate tax aggressiveness. This matters particularly for SMEs given their typically narrow upper echelons (Hambrick & Mason, 1984). One unexamined characteristic is the executives' perception of non-income tax (NIT) ownership. Based on Muehlbacher & Kirchler's (2013) findings that self-employed taxpayers differ in mentally claiming income tax ownership, affecting tax attitudes, we argue that this extends to SMEs' NIT contributions and SME tax aggressiveness as well.

Tax authorities worldwide have externalised much of the tax administration to businesses, requiring them to collect and remit various NIT contributions like VAT, payroll withholdings, and social security contributions on behalf of customers or employees (Christensen et al., 2001). Since all these contributions pass through business accounts, SME entrepreneurs' behavioural responses may foster perceptions of ownership, for reasons such as tax law misperceptions, mental accounting or personal beliefs.

As a first research objective we explore whether SME tax aggressiveness directly relates to SME entrepreneurs' perceived NIT ownership. Drawing on Reactance Theory (Brehm, 1966) and Prospect Theory (Kahneman & Tversky, 1979), we suggest that stronger ownership perceptions intensify feelings of lost freedom or financial loss, fostering tax aggressiveness. Our second research objective examines whether NIT ownership perceptions indirectly influence tax behaviour through exchange equity—the perceived balance between tax payments and public goods received (Mason & Calvin, 1978). Stronger NIT ownership perceptions may elevate subjective tax contributions, lowering exchange equity and promoting tax aggressiveness.

By extending tax ownership perceptions of corporate tax decision makers to NIT contributions, this study contributes to understanding psychological mechanisms underlying SME tax behaviour. Outsourcing tax administration to businesses may carry hidden costs, by triggering behavioural responses that increase tax aggressiveness. The potential consequences for tax revenue might be substantial, offsetting gains of externalising administrative costs.

DISTORTIONS IN TIME PERCEPTION: A NOVEL MEASURE OF NON-PECUNIARY UTILITY

Gerhardt H., Jagelka T.*

University of Bonn ~ Bonn ~ Germany

Compensating wage differentials that employees demand for doing a particular job depend on the job's characteristics. Via a series of experiments, we demonstrate that compensating wage differentials can be predicted by individuals' subjective time perceptions: the shorter participants perceive time spent on a task to be relative to objective time -- the subjective/objective time ratio, or "SOT" -- the lower is the wage that they demand for that task and the more productive they are at performing the task. By varying task enjoyment exogenously within-subject while holding all other task characteristics constant, we establish that task enjoyment causes the variation in SOT and compensating wage differentials. We interpret this as evidence that SOT constitutes an objective measure of non-pecuniary utility derived from a task. We show that SOT correlates with self-reported task enjoyment and predicts compensating differentials better than self-reports. This suggests that SOT captures components of wage demands that are not readily accessible by conscious introspection. Importantly, because the passage of time has a well-defined objective scale, unlike self-reported task enjoyment, it is not impacted by scale use differences between respondents. Our findings establish subjective time measurements as a novel indicator relevant to economists and psychologists, which provides an alternative way for measuring preferences and enriches our understanding of task utility. An intriguing implication is that when performing a task, individuals make wage demands per unit of "felt", rather than per unit of objective, time. Our results open up avenues for improving worker–job matchings by personalizing work environments so that individuals can become more productive. Finally, distortions in time perception help explain certain types of addictive behavior, such as excessive social-media consumption, because they distort the perceived opportunity costs entailed by these behaviors.

CHOOSING NARROW-APPEAL OPTIONS SIGNALS A STRONGER PREFERENCE

Xu A.*[1], Chen Y.[2], Lu J.[1]

[1]East China Normal University ~ Shanghai ~ China, [2]Renmin University of China ~ Beijing ~ China

INTRODUCTION:
In the marketplace, products are often categorized by their appeal, with broad-appeal options catering to mainstream tastes, while narrow-appeal options targeting niche segments. Prior research has focused on consumers by examining when and why they prefer broad- or narrow-appeal options. However, little is known about how observers interpret consumers' preferences based on such choices.

PURPOSE:
This research focuses on observers, investigating how and why they infer consumer preference strength based on choices of broad- or narrow-appeal options. We hypothesize that choosing narrow-appeal (vs. broad-appeal) options signals a stronger preference for those options because consumers who choose narrow-appeal options are considered to be less susceptible to informational influence.

METHOD:
We conducted six scenario-based experiments. In the basic paradigm, participants were randomly assigned to either the broad- or narrow-appeal condition. Knowing that a target had chosen a broad- or narrow-appeal option, participants rated how much the target liked their chosen option (1 = not at all, 9 = very much) and how much they resisted informational influence (1 = not at all, 9 = very much).

RESULTS:
First, the inferred preference was stronger in the narrow-appeal condition than in the broad-appeal condition. Second, the target was considered to resist informational influence more in the narrow-appeal condition than in the broad-appeal condition. Third, informational influence resistance mediated the effect of choice on preference inference.

CONCLUSIONS:
Choosing narrow-appeal options signals a stronger preference for those options than choosing broad-appeal options. This occurs because people believe that someone who chooses a narrow-appeal option resists informational influence to a greater extent.

Abstract 141

AN INVESTIGATION OF THE PSYCHOLOGICAL DRIVERS BEHIND SUSTAINABLE INVESTMENTS

Sesini G.*, Castiglioni C., Iannello P., Miccoli M.R., Robba M., Lozza E.

Department of Psychology, Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Introduction: Recently there has been a significant increase in the number of investors who decided to build their portfolios by including sustainable investments. This kind of investments has the dual goal of supporting positive social and environmental changes while generating economic returns. From an economic perspective, investors should be guided solely by the profit perspective. However, psychological studies suggest that investment decisions are driven not only by financial goals, but also by investors' desire to generate positive impacts for society and the environment.
Purpose: This study aims to explore the main determinants behind individual investors' choice of socially responsible investing through a comprehensive model including psychological variables, such as attitudes, values, trust, and cognitive factors.
Methods: A quantitative survey was conducted on a representative sample of 500 Italian investors, including both validated scales and ad hoc items. The theoretical model was based on the Theory of Planned Behavior, distinguishing attitudes, values, and perceived behavioral control as main determinants. Separate SEM models were tested for each latent factor, followed by a full SEM with all latent variables.
Results: Taken independently, each latent factor had a significant influence on ESG intentions. In the full model, only attitudes maintained a significant path in determining ESG intentions. The findings show that psychological determinants are key to explain why people invest in sustainable assets beyond purely economic motivations. Values, attitudes, and opinions shaping investment decisions can support the development of communications and interventions that encourage informed choices, ultimately advancing sustainability in the financial sector.
Conclusions: To date, research on the psychology of ESG investors remains limited. This study helps to fill this gap by providing insights into how to promote ESG investments through a better understanding of the psychological drivers that hinder or facilitate such choices.

RETHINKING FINANCIAL LITERACY: FROM CONCEPTUAL FOUNDATIONS TO BEHAVIORAL AND EDUCATIONAL APPLICATIONS

Friday 24 July 2026 from 16:30 to 18:00

(K-Spadolini)

Paola Iannello (Department of Psychology – Università Ca), Chair

This symposium explores the critical connections between financial literacy, financial behavior, and financial wellbeing, offering a comprehensive overview of the theoretical, empirical, and practical dimensions of these constructs. Financial literacy - defined as the set of knowledge, skills, attitudes, and behaviors that enable informed and effective financial decisions - serves as the foundation for understanding how individuals navigate increasingly complex financial landscapes.

The contributions span diverse yet interconnected themes. One contribution proposes a revised conceptual and measurement framework for financial literacy, highlighting key inconsistencies in

current tools and bridging the gap between its theoretical definition and empirical measurement. Other presentations examine financial literacy's protective role in high-risk contexts, such as adolescent and young adult gambling, demonstrating how greater financial knowledge reduces vulnerability to cognitive distortions and debt-related harm, while enhancing long-term financial wellbeing. The symposium also introduces a multidimensional framework of financial resilience that integrates personal, relational, and contextual factors. This approach underscores that financial wellbeing is not determined solely by material resources, but also by psychological and social supports that help individuals cope with adversity. Finally, a learner-centered perspective on financial education is proposed, stressing the importance of psychological constructs in designing effective, personalized interventions. Through gamified and experiential formats, financial education can go beyond knowledge transmission to promote enduring behavioral change. Together, these contributions illustrate the multifaceted nature of financial literacy, calling for a rethinking of financial literacy as both a protective asset and a resource that demands active cultivation across the life course. This symposium aims to foster an interdisciplinary dialogue that connects theory, empirical evidence, and real-world interventions, emphasizing financial literacy's central role in shaping positive financial outcomes.

Abstract 4095

MEASURING FINANCIAL LITERACY: GAPS, CHALLENGES, AND A PROPOSAL FOR A REVISED FRAMEWORK

Sorgente A.*

Department of Psychology - Università Cattolica del Sacro Cuore ~ Milan ~ Italy

Financial literacy may be broadly defined as the ability to understand and effectively use financial information. This presentation offers a comprehensive review of current approaches to measuring financial literacy and proposes a revised conceptual framework aimed at bridging the gap between its theoretical definition and empirical measurement.

Financial literacy is a multidimensional construct comprising five distinct dimensions, as identified by the OECD (2022): objective financial knowledge, subjective financial knowledge, financial attitudes, financial behaviours, and financial skills. Ideally, each of these dimensions should be assessed across nine key content domains, as proposed by Yakoboski et al. (2024): earning, consuming, saving, investing, borrowing/managing debt, insuring, comprehending risk, go-to information sources, and retirement fluency.

This paper systematically reviews how each dimension has been conceptualized and operationalized in the academic literature, examining whether existing instruments adequately capture the full spectrum of content domains. The analysis reveals significant gaps and inconsistencies: some dimensions are better represented than others, and few tools succeed in encompassing the breadth of relevant financial topics.

In response to these findings, we propose a revised conceptual framework for financial literacy. The updated model retains four of the five OECD dimensions—excluding financial skills, which are considered transversal rather than finance-specific—and focuses on seven of the nine content areas. The two excluded domains (comprehending risk and go-to information sources) are reclassified as general skills rather than strictly financial components.

This revised framework contributes to the development of more precise, balanced, and conceptually aligned tools for measuring financial literacy, with implications for both academic research and policy design.

Abstract 4096

FINANCIAL LITERACY AND GAMBLING IN ADOLESCENTS: FROM UNDERSTANDING TO INTERVENTION.

Donati M.A.*

NEUROFARBA Department ~ Florence ~ Italy

Gambling poses significant financial as well as psychological and behavioral risks. Nevertheless, research on the relationship between Financial Literacy and gambling is relatively scant, with few attentions paid to adolescents (Barone & Graffigna, 2025). This contribution investigates the role of financial literacy on gambling-related cognitive distortions, that play a key role in the development of problem gambling in adolescence (Study 1). Once verified its role, we tested the efficacy of educational activities aimed at increasing financial literacy (Study 2). In Study 1, participants were 1,256 Italian adolescents (55% boys; Mage = 16.7). Financial literacy was measured through an ad-hoc test. Adolescents were classified in two groups based on low or high performance. Based on the effect of financial literacy and impulsivity on debt burden in adults (Ottaviani & Vandone, 2018), we tested a mediation model in which financial literacy had an indirect effect on gambling-related cognitive distortions through impulsivity. This model was confirmed, indicating that adolescents more capable in terms of financial literacy were less likely to develop gambling-related cognitive distortions through impulsivity. Findings persisted after the introduction of sex and age as covariates. In Study 2, participants were 197 Italian adolescents (81% males, Mage = 16.9). Financial Literacy was measured through some items of the Financial Literacy Test (Ranyard et al., 2009). To foster financial literacy, educational activities based on facilitating the comprehension of basic financial concepts and terms and incentivizing the awareness of the meaning of money were developed. The conceptual change model was employed. The activities were verified with experimental and a control group and pre-test and post-test measurement sessions. A significant interaction effect was obtained, indicating that only adolescents in the experimental group significantly improve financial literacy. This contribution will allow researchers to better understand the financial literacy in adolescent gambling.

Abstract 4097

PROBLEMATIC GAMBLING, FINANCIAL LITERACY, AND FINANCIAL WELLBEING OF YOUNG PEOPLE: RESULTS FROM A NATIONAL SURVEY IN FINLAND

Ranta M.*

University of Helsinki, Finland; National Legal Services Authority ~ Helsinki, ~ Finland

The global gambling industry is rapidly growing due to liberal deregulation and digital transformation. Estimates are that the net losses of consumers will be US$700 billion by 2028 (Wardle et al., 2024). Also in Finland, the gambling system is transitioning from a monopoly to a liberated multi-license model in 2027. This change is expected to increase the availability and advertising of high-risk online gambling, raising concerns about increasing gambling-related harms. In 2023, over 1.2 million people experienced various degrees of harm due to their own gambling or of a close one.

Previous research indicates that the risk of developing harmful gambling behaviour is increased by factors such as sociodemographic characteristics (male gender, younger age, low SES) or psychological traits (e.g., impulsivity). The association between financial literacy and financial wellbeing with gambling and gambling-related harms has not been extensively studied, despite money being a central aspect of gambling (Swanton et al., 2019). With less possibilities to regulate companies, individuals need financial skills to resist the luring of gambling companies. Young people at the verge of financial independence are particularly vulnerable and at risk of developing gambling problems as young gamers are attracted by gaming-like gambling products which involve digital or gaming formats (Delfabbro et al., 2020; Oksanen et al., 2024).

In this study, we examine how young people's financial literacy is related to their regular gambling and gambling problems, and conversely, how gambling predicts financial well-being. We utilize survey data of Finnish 15-29-year-olds (N = 1,578) (Wilska et al., 2024). Results suggest that financial knowledge protects young people against gambling. Additionally, gambling may lead to indebtedness and thus impair financial well-being. The results emphasize the importance of financial education in preventing gambling-related harms in a novel gambling context.

Abstract 4098

A COMPREHENSIVE FRAMEWORK FOR FINANCIAL RESILIENCE: THE ROLE OF INDIVIDUAL, RELATIONAL, AND CONTEXTUAL FACTORS

Robba M.*

Università Cattolica del Sacro Cuore ~ Milan ~ Italy

Financial resilience could be defined as individuals' ability to successfully overcome financial shocks and navigate periods of financial adversity. However, literature still does not recognize financial resilience as a multidimensional phenomenon, which depends on factors that are either internal or external to the individual. Indeed, in addition to economic resources, psychological or social factors could also shape how individuals face financial challenges. Building on this gap, a multidimensional framework of financial resilience is proposed, recognizing that personal (e.g., ego-resiliency), relational (e.g., social capital), and contextual (e.g., access to emergency funds) factors jointly influence how people react and adapt to financial hardships. For research purposes, a Latent Profile Analysis (LPA) was performed to explore how dynamic interactions and configurations of the three systems can differently influence financial worries and psychological well-being. A sample of German financially vulnerable households was considered (N = 999; 48.5% females; Mage = 48.22 years, SDage = 10.50). Subsequently, once the clusters were identified, a multivariate general linear model was run to identify which profile(s) reported higher financial worry and psychological well-being. Four clusters were identified through the LPA, representing different configurations of the resilience resources considered in the analysis. Significant differences among profiles for both financial worry and psychological well-being were also found. Specifically, regardless of access to financial resources, individuals who can rely on personal or relational resources generally report higher well-being and lower worry about their financial situation. Our results suggest that financial resilience is not solely a matter of households' material aspects (i.e., financial resources). Different types of resources can impact how individuals react to financial shocks. These findings underscore the importance of adopting a systemic perspective of financial resilience to understand how individuals face financial adversities.

Abstract 4099

DESIGNING LEARNER-CENTRED FINANCIAL EDUCATION PROGRAMMES: THE ROLE OF PSYCHOLOGICAL FACTORS

Aprea C.*

University of Mannheim & Mannheim Institute for Financial Education ~ Mannheim ~ Germany

In an increasingly complex financial landscape, the ability to make sound financial decisions is a critical life skill. Traditional financial education often adopts a one-size-fits-all approach that emphasizes knowledge transmission over behavioural change. However, this approach is rather ineffective, as it does not sufficiently consider participants' specific needs, strengths or difficulties (e.g., Aprea, 2021). This paper argues for a paradigm shift toward learner-centred financial education that takes into account the psychological factors influencing financial behaviour. The paper explores how constructs such as financial self-efficacy, motivation, cognitive biases, emotional regulation, and risk perception shape individuals' financial decisions. Drawing from economics education, behavioural economics, educational psychology, and financial literacy research, it presents a framework for integrating these factors into the design of effective financial education programmes. Emphasis is placed on the importance of tailoring interventions to the learner's developmental stage, context, and prior experiences. Through case studies and evidence from experimental and field research, the paper illustrates how gamification, experiential learning, and game-based approaches can be employed to foster deeper engagement and long-term behavioural change (e.g. Schultheis & Aprea, 2021). Additionally, it discusses how psychological profiling and learner segmentation can enhance the personalization of content and instructional formats. The paper also examines challenges such as overcoming overconfidence, addressing financial anxiety, and avoiding paternalism in program design. It calls for an interdisciplinary approach that combines insights from psychology, education, and finance, and highlights the need for robust evaluation frameworks that go beyond knowledge gains to assess attitudes, behaviours, and long-term outcomes

UNWINDING AFTER WORK: LEISURE SATISFACTION, RECOVERY EXPERIENCES, AND WELL-BEING IN SHIFT-BASED EMPLOYMENT

Cheng Y.*, Lin S.

National Kaohsiung University of Science and Technology ~ Kaohsiung ~ Taiwan

In shift-based work environments, maintaining recovery from job demands is crucial for employees' well-being and sustained performance. While prior studies have confirmed the importance of recovery experiences, most research has focused on day-shift employees and applied cross-sectional designs, limiting insights into dynamic recovery processes across multiple time points. Drawing on the Conservation of Resources (COR) theory and the Effort–Recovery model, this study examines how shift employees' leisure satisfaction and leisure activities from the previous day influence their recovery outcomes. Specifically, we investigate the role of recovery experiences—psychological detachment, relaxation, mastery, and control—in shaping work–life balance, well-being, and emotional exhaustion. Using an experience sampling method (ESM) over a three- to four-week period, data were collected from shift employees at an Electronics Company to capture within-person fluctuations and short-term dynamics in leisure and recovery. Results are expected to extend existing research by addressing gaps in the recovery literature on shift work, highlighting differential effects of recovery experiences, and demonstrating the utility of repeated-measures designs for capturing episodic recovery phenomena. Practically, the findings may inform organizational interventions, such as designing supportive leisure resources and promoting autonomy in recovery opportunities, to help employees sustain health and effectiveness under fixed shift schedules.

CAN NUDGES PROMOTE SUSTAINABLE BEHAVIORAL CHANGE IN WORKPLACES?

Harriet P.*[1], Morabito A.[2], Lozza E.[1]

[1]Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Baker Hughes Nuovo Pignone ~ Florence ~ Italy

The relevance of the UN Agenda 2030, rising energy costs, and the need to integrate sustainable routines into corporate strategies have brought renewed attention to behavioral interventions as tools for promoting energy savings and reducing CO_2 emissions. In a manufacturing setting, the monitoring of production lines revealed recurrent energy waste, highlighting both a need and an opportunity for behavioral change to support environmental, economic, and operational goals.

One key target behavior identified was the failure to de-energize machinery during unscheduled shifts. This study investigates whether a nudge can increase the de-energization of shop machines when not in use.

A mixed-method approach was adopted. A qualitative phase was first conducted to map the decision-making processes related to the target behavior. Based on the resulting insights and the implementation opportunities offered by the company, the nudge intervention was designed. A subsequent quantitative phase tested its effectiveness through a quasi-experimental study. Additionally, an autoethnography was conducted to explore the challenges of applying nudges in complex organizational environments from the researcher's perspective.

Findings show that the nudge was partially effective in reducing energy waste in the short term, though it left room for improvement. The autoethnography highlighted several process-related dynamics, obstacles, and unexpected events that shaped the intervention's implementation and outcomes.

In conclusion, while nudges remain promising within applied psychology, their application in organizational contexts prompts a critical question: are we still speaking of "nudges" in the traditional sense, if their design and implementation require deep contextual and systemic understanding?

THE LOVE OF MONEY ATTITUDES TRICKLE DOWN FROM LEADERS TO MEMBERS: OUTCOMES ACROSS 12 NATIONS

Tang T.*[1], Li Z.[2], Cheng B.[3], Chou L.[4], Chou W.[5], Garber I.E.[6], Hung M.[7], Kim K.[8], Lin T.[9], Málovics É.[10], Özbek M.F.[18], Popaitoon P.[11], Sato Y.[12], Sun J.J.[13], Tsai C.[17], Vlerick P.[14], Vynoslavska O.[15], Yokota E.[12], Yoneyama S.[16]

[1]Middle Tennessee State University ~ Murfreesboro, Tennessee ~ United States of America, [2]Texas Woman's University ~ Denton, Texas ~ United States of America, [3]National Taiwan University ~ Taipei ~ Taiwan, [4]National Cheng Kung University ~ Tainan ~ Taiwan, [5]Chung Yuan Christian University ~ Chung Li ~ Taiwan, [6]Saratov State University ~ Saratov ~ Russian Federation, [7]Yuan Ze University ~ Taoyuan City ~ Taiwan, [8]Sogang University ~ Seoul ~ Korea, Republic of, [9]National Chengchi University ~ Taipei ~ Taiwan, [10]University of Szeged ~ Szeged ~ Hungary, [11]Chulalongkorn University ~ Bangkok ~ Thailand, [12]Keio University ~ Tokyo ~ Japan, [13]Renmin University of China ~ Beijing ~ China, [14]Ghent University ~ Ghent ~ Belgium, [15]National Technical University of Ukraine, Igor Sikorsky Kyiv Polytechnic Institute ~ Kyiv ~ Ukraine, [16]Gakushuin University ~ Tokyo ~ Japan, [17]Binghamton University ~ Binghamton ~ United States of America, [18]Gumushane University, Gumushane, Turkey, and Baruch College, City University of New York, New York, United States of America

Corruption reflects greed, money, and risky decision-making. Top-level executives, mostly males, consciously and unconsciously emit their deep-rooted love of money attitudes (avaricious monetary aspirations) via their thoughts, non-verbal cues, perceived demand characteristics, words, and actions to their subordinates, creating value congruence and potential corruption in organizations. This study explores an under-researched topic in economic psychology and work and organizational psychology across cultures. Following social learning theory, leader-member exchange (LMX), and person-supervisor fit, we explore leader-member's value congruence in the love of money attitudes (avaricious monetary aspirations) across 12 nations. We theorize that avaricious monetary aspirations trickle down from leaders to members. Leader-member value congruence in monetary aspirations impacts two organizational outcomes: member creativity (leader-rated) and leader integrity (member-rated). We treat leader/member genders and the Corruption Perceptions Index (CPI) as two moderators. Our data (4,034 leader-member dyads across 12 countries) demonstrate that the trickle-down effect exists across cultures. Interestingly, member creativity is the highest in in male-leader/male-member dyads and the lowest in female-leader/female-member dyads. Leaders' aspirations impact members' creativity directly and indirectly via members' aspirations. This pattern exists among male-leader/male-member dyads and low CPI nations only but not their counterparts. Our cross-level analyses produce two significant three-way interaction effects. We classify 12 countries into high-low CPI groups and use MATLAB to plot three-dimensional visualizations. When leader-member dyads have both high (low) aspirations, we label them as high (low) value congruence.

Our findings suggest that with a low leader-member value congruence, member creativity is higher in high-CPI countries than in low-CPI countries. With a high leader-member value congruence, leader integrity is higher in high-CPI countries than in low-CPI countries. These discoveries reveal the intricate mechanisms of potential corruption across cultures. We offer theoretical and practical implications to prospect theory, Monetary Wisdom, LMX, value congruence, genders, cultures, and economic psychology globally.

Abstract 4935

WHY DO "DECENT PEOPLE" ENGAGE IN ILLICIT TRADE? NEUTRALIZATION AND MORAL DISENGAGEMENT MECHANISMS

Versal N.*[1], Brodzka A.[2], Balytska M.[1]

[1]Taras Shevchenko National University of Kyiv, Ukraine, [2]Wroclaw University of Economics and Business, Poland

RESEARCH PUZZLE AND OBJECTIVE

Economic utility alone cannot explain how "decent people" come to see illicit conduct as acceptable, necessary, or defensible. Many participants do not perceive themselves as criminals. The key question, therefore, is how "decent people" reconcile rule-breaking with a positive moral self-image

---

IDEA

"Decent people" do not necessarily reject moral norms; they make them flexible enough to accommodate illicit conduct

---

THEORETICAL APPROACH

This poster builds on a broader mapping of theories used to explain participation in illicit trade. The initial review grouped theories into two motivational logics: utility-and-opportunity and normative-affective, using a targeted search strategy ("theory name" AND ("illicit" OR "crim*")).

For the purposes of this poster, the focus is narrowed to the psychological mechanisms of self-justification that help explain how actors preserve a positive self-concept while engaging in illicit trade

CONCLUSION

Illicit trade persists not only because it can be profitable, but also because neutralization and moral disengagement make participation morally acceptable to otherwise "decent" people

THE ROLE OF PERSONAL ORGANIZATION AND CRIMINAL ATTITUDES IN INDIVIDUALS' PARAPHILIC TENDENCIES

Akay Z.B.*, Deniz D.

Istanbul Ticaret University ~ Istanbul ~ Turkey

When reviewing the global literature, paraphilia, personality organization, and attitudes toward crime have been central research topics. However, most studies have treated paraphilia as a disorder and focused on clinical or forensic populations. Yet, both paraphilia and criminal tendencies extend beyond clinical and forensic contexts and represent social phenomena. Accordingly, this study aimed to examine the role of personality organization and criminal attitudes in individuals' paraphilic tendencies.

The study included 114 volunteer participants aged 18 and above, the majority of whom resided in Istanbul. Participants completed the Demographic Information Form, the Sexual Sensation Seeking Scale, the Personality Organization Inventory, and the Measures of Criminal Attitudes and Associates. Additionally, the Paraphilia Assessment Form, developed by the researcher, was used to evaluate participants' cognitive and emotional responses to ten different paraphilic scenarios. To minimize carryover effects, neutral scenes were presented between paraphilic scenes. Data were collected both face-to-face in a university laboratory (n = 56) and online (n = 58). In the laboratory sessions, participants' behaviors were observed, and brief interviews were conducted.

Primitive Defenses were found to differ significantly in relation to pedophilic and necrophilic emotions, and a significant association was observed between frotteurism and negative emotions. Reality Testing and Identity Diffusion did not show strong associations with paraphilic emotions; however, Identity Diffusion was positively related to the liking and acceptance of masochism. Criminal Attitudes were significantly associated with emotions toward zoophilia, with negative emotions linked to zoophilia and positive emotions linked to exhibitionism. Antisocial Intent demonstrated positive associations with the liking and acceptance of fetishism and sadism. Sexual Sensation Seeking showed significant differentiation in emotions toward masochism and fetishism, exhibiting positive associations with positive emotions toward masochism and with the liking and acceptance levels across all paraphilias.

Abstract 710

AN OVERVIEW OF FORENSIC INTERVIEWS IN TURKIYE: CHALLENGES AND RECOMMENDATIONS

Bozkurt M.*

Bingol University ~ Bingol ~ Turkey

Forensic interviews are structured processes in which victims or suspects provide information about an incident under scientific and ethical principles, and the collected data are analyzed from both psychological and legal perspectives. In some cases, these interviews serve as the sole source of evidence, making memory the critical evidence base. However, memory is inherently vulnerable to distortions caused by repeated questioning, suggestive techniques, and interviews conducted by non-experts. Vulnerable populations, such as children, women exposed to violence, or refugees, face additional disadvantages in terms of accuracy, consistency, and resistance to memory errors.

To address these concerns, Turkiye established Child Advocacy Centers in 2010 and Forensic Interview Rooms in 2017. Child Advocacy Centers aim to obtain the testimony of abused children as quickly as possible, in a single session, by a psychologist or social worker to reduce potential memory errors and contradictory statements. Forensic Interview Rooms were developed to extend structured interviewing to other vulnerable groups, such as juveniles pushed to crime and women subjected to violence. Despite their widespread establishment, these institutions have been criticized for underperforming.

One major challenge is the insufficient academic foundation of interviewers. Personnel are often trained through short in-service programs provided by ministries rather than through specialized graduate education in forensic psychology. Currently, only two of Turkiye's 209 universities offer graduate programs in forensic psychology, while one provides postgraduate education in forensic social sciences. Furthermore, limited staffing and the employment of professionals without advanced training reduce the quality and comprehensiveness of interviews.

In conclusion, while the establishment of these institutions represents an important milestone in the development of forensic practices in Turkiye, strengthening graduate-level education in forensic psychology and ensuring adequate personnel capacity remain essential. Improving these areas will enhance the protection of victims' rights and support the healthy functioning of the justice system from a psycho-legal perspective.

Abstract 1832

SYSTEMIC MODEL OF MODERN METHODS IN FORENSIC PSYCHOLOGICAL EXAMINATION IN CRIMINAL CASES

Mehrabyan M.*

Psychological center "Zhesture" ~ Yerevan ~ Armenia

Introduction: Forensic psychological examination plays a crucial role in criminal justice proceedings, requiring comprehensive assessment of mental state, competency, and psychological factors influencing criminal behavior. Contemporary criminal cases demand standardized psychological evaluation methods that integrate evidence-based assessment tools with clinical expertise to provide reliable expert testimony and inform judicial decision-making.

Purpose: This study aims to develop and implement a systemic model for modern forensic psychological examination in criminal cases, establishing standardized protocols for psychological assessment and enhancing the validity and reliability of expert psychological opinions in legal contexts.

Method: A systematic analysis of current forensic psychological practices was conducted through examination of assessment methodologies, validation of psychological testing instruments, and evaluation of expert testimony standards. The research incorporated cognitive assessment batteries, personality evaluations, risk assessment tools, competency examinations, and sanity evaluations. Data collection involved review of case outcomes, inter-examiner reliability studies, and collaboration with forensic psychologists, legal professionals, and correctional institutions.

Results: The systemic model demonstrated improved consistency in psychological evaluations, enhanced diagnostic accuracy, and increased judicial acceptance of expert testimony. Implementation showed reduced assessment variability between examiners and strengthened correlation between psychological findings and case outcomes. The model successfully addressed challenges in cultural bias, malingering detection, and standardization of competency evaluations.

Conclusions: The systematic approach to forensic psychological examination provides a robust framework for criminal case evaluations, ensuring scientific rigor and legal reliability. This model enhances the quality of psychological expert testimony and strengthens the integration of mental health considerations in criminal justice proceedings.

Abstract 540

FORGOTTEN AND FATAL: EXPERT TESTIMONY ON PROSPECTIVE MEMORY FAILURE REDUCES GUILTY VERDICTS RELATED TO A HOT CAR DEATH

Ruva C.*, Helmerichs A., Kendall S., Sykes E.

University of South Florida ~ Tampa ~ United States of America

Introduction

This paper presents preliminary data exploring the effects of expert testimony (present/absent), timing of this testimony (before/after the defendant's testimony), and how strongly the case facts support prospective memory failure (PMF; weak/strong) in a case of vehicular heatstroke involving the death of a child by his mother. Importantly, there are disparities in the handling and outcomes of such cases in the criminal justice system (Breitfeld, 2020). Decision makers (e.g., State, triers of fact) need to understand the cognitive mechanisms involved in PMF to appropriately evaluate evidence as it pertains to the standard of proof for aggravated manslaughter. Specifically, the emotional, physiological, and cognitive processes that could lead to PMF including forgetting to do something you planned to do (e.g., dropping a child off). Thus, expert testimony on PMF is needed to educate jurors on how such memory failures could occur.

Method, Results, and Conclusion

Jury-eligible participants (N = 247) read trial transcripts, provided verdicts, and completed an anger measure. While there was no effect of case strength of PMF, findings revealed that mock-jurors exposed to expert testimony were less likely to find the defendant guilty of aggravated manslaughter (22% vs. 35% guilty). Additionally, the timing of the expert testimony affected the proposed sentence length. Mock-jurors who received the expert testimony before (vs. after) the defendant testified provided shorter sentences. Expert testimony also led to lower ratings of mock-juror anger. Finally, PROCESS Model 4 (Hayes, 2021) was used to test the following mediation model: Expert Testimony (X) ☾ Anger (M) ☾ Aggravated Manslaughter Verdict (Y). Anger mediated the effect of expert testimony on verdicts: anger was greatest when expert testimony was absent, contributing to a greater likelihood of guilt. Findings suggest that juror education through expert testimony could result in better decision-making in such cases by reducing juror anger.

Abstract 99

JUSTICE JUMBLED: INTERSECTING IDENTITIES RESULT IN DIFFERING JUROR BIAS

Ruva C.*[1], Helmerichs A.[2], Kendall S.[2]

[1]University of South Florida ~ Sarasota ~ United States of America, [2]University of South Florida ~ Tampa ~ United States of America

This study examines how defendant age (25/65 years), gender (man/woman), and race (Black/White) influence mock-jurors' verdicts in a domestic homicide trial, and whether defendant credibility and other-condemning emotions (OCE) mediate these effects. Jury-eligible participants (N=1146) read trial transcripts, provided murder and tampering verdicts, and completed measures assessing credibility and OCE. The three-way interaction revealed divergent verdict patterns by defendant race. Among White defendants, verdict trends were consistent across murder and tampering charges. Specifically, age x gender effects were observed with gender effects appearing only for young defendants (men: greater likelihood of guilt), and age effects found only for female defendants (older: greater likelihood of guilt). For Black defendants, the pattern differed by charge. For murder verdicts, age effects emerged only for men—young (vs. older) men were more likely to be found guilty. For tampering verdicts an age x gender effect was observed. Specifically, gender effects appeared only for young defendants (women: greater likelihood of guilt), and age effects emerged only for women (young: greater likelihood of guilt). Contrary to young White women, young Black women were treated more harshly than their young male or older female counterparts. Additionally, older Black defendants received greater leniency than older White defendants across both charges. Mediational analyses (Process Models 10 and 12, respectively) indicated that credibility and OCE explained race effects for older male defendants in murder trials, while credibility mediated race effects for young female defendants. For tampering verdicts, OCE mediated age × gender effects at all levels, but only for young defendants did race influence outcomes. Specifically, young Black women elicited higher levels of OCE, increasing their probability of guilt, whereas young White men elicited higher OCE levels, resulting in greater punitiveness. Findings underscore the complexity of juror decision-making, emphasizing the importance of intersectional analyses in examining bias within legal contexts.

Abstract 976

THINK TRAUMA LEGAL: AN INTERDISCIPLINARY ADAPTATION OF THINK TRAUMA TRAINING FOR UNACCOMPANIED MINOR LEGAL PROVIDERS

St Jean N.*

Northwestern University, Feinberg School of Medicine ~ Chicago ~ United States of America

Introduction: Forcibly displaced persons rates rose to more than 123 million in 2024 due to growing, complex global challenges (i.e., political unrest, climate change, discrimination). Fifty million are youth under 18 years who are not accompanied by a legal guardian to a new country (i.e., unaccompanied minor (UM)). Legal support for UMs seeking asylum is crucial to wellbeing. Globally, 85% of UM's who have legal representation obtain asylum compared to 15% who do not; but the number of UMs needing representation far exceeds capacity. Interdisciplinary collaborations between psychologists and attorneys to train legal providers on key trauma tenets and its impact has the potential to expand legal workforce capacity and more effectively represent UMs in courts.

Purpose: Clinical researchers at Northwestern University and the National Immigrant Justice Center (NIJC), a Chicago-based immigration law firm, partnered to adapt an evidenced-based, trauma training curriculum, Think Trauma, to meet the unique professional needs of UM legal providers.

Methods: Between 2022-2024, a team of psychologists and legal providers convened. An initial needs assessment of the legal partners was followed by monthly meetings to identify and adapt core training components, iteratively refine content, and identify facilitators and barriers of implementation for Think Trauma Legal (TTL). Using the Dynamic Adaptation Process (DAP) implementation science framework, post hoc qualitative, thematic analyses from feedback of pro-bono, immigration lawyers, and the iterative work processes were conducted.

Results: Results suggest 1) attorneys involved in immigration proceedings report understanding trauma is essential, and 2) following early TTL training efforts, they report increased understanding about the impact of trauma and enhanced ability to utilize this knowledge in their work.

Conclusion: Interdisciplinary efforts to train legal providers on the impact of trauma can expand global workforce capacity and open opportunities for greater number of UMs to have effective, trauma-informed legal representation in court.

Abstract 2186

FROM JUSTICE TO JUDGMENT: A NATIONAL ANALYSIS OF JUVENILE REGISTRATION AND NOTIFICATION POLICIES IN THE UNITED STATES

Wettstein J.*

Columbia University ~ New York City ~ United States of America

This study examines the evolution and current state of juvenile sex offender registration and notification (JSORN) laws in the United States, focusing on adolescents adjudicated for illegal sexual behavior (AISB). Originally designed to rehabilitate rather than punish, the juvenile justice system has increasingly adopted adult-oriented practices, with sex offender registration being one of the most significant shifts. While the federal Sex Offender Registration and Notification Act (SORNA) established minimum requirements, states retain broad discretion, resulting in wide variation in qualifying offenses, minimum registration age, duration, removal mechanisms, community notification, and collateral restrictions. Evidence shows these policies rarely reduce recidivism, while creating significant barriers to reentry and contributing to psychological distress, housing and employment instability, and social isolation, especially among minoritized youth. Building on the Juvenile Law Center's 2020 review, this project will provide the first nationwide, up-to-date analysis of JSORN provisions from 2020 to 2025. Using a mixed-methods approach, state statutes and regulations will be systematically coded across multiple variables using Thomas Reuter's Westlaw database, with results compared longitudinally to identify changes over time. These findings will be contextualized with current research in adolescent development, criminology, and therapeutic jurisprudence to assess alignment with developmental science and evidence on recidivism. Anticipated outcomes include a comprehensive dataset and comparative profiles that highlight legislative patterns, persistent inconsistencies, and the broader impacts of these laws on youth development and public safety. By integrating empirical research with legal analysis, this study seeks to inform reforms that balance accountability with rehabilitation, promote equitable treatment of youth, and guide policymakers toward developmentally appropriate, evidence-based approaches to managing AISB.

Abstract 1656

ARTIFICIAL INTELLIGENCE AND PSYCHOLOGY: TOWARD GLOBAL PRINCIPLES FOR ETHICAL AND INCLUSIVE PRACTICE

Elgier A.*, Clinton A., Leader J.F., Humphrey M.E., Rovira A., Jindal K., Ho D.

Global Psychology Alliance - American Psychological Association ~ Washington DC ~ United States of America

Artificial Intelligence (AI) is rapidly transforming the landscape of psychology, influencing research, clinical practice, education, and policy. While significant progress has been made in outlining ethical frameworks, there remains a critical gap in developing principles that reflect diverse international contexts. The Global Psychology Alliance (GPA) Working Group on Digitalization and Psychology was created to address this challenge by bringing together professionals from multiple regions, including Latin America, Africa, Asia, Europe, and North America. The purpose of this presentation is to share the initial outcomes of this collaborative effort: the drafting of global principles for the responsible use of AI in psychology. These principles cover key areas such as ethical foundations, professional competence, human oversight, privacy and security, accessibility and inclusion, and training and education. Importantly, they are designed not only to ensure ethical and evidence-based practice but also to be adaptable to the realities of different cultural and regulatory environments. The method guiding this work has been a participatory, consensus-building process involving psychologists from over 80 countries. Survey, group discussions, and iterative drafting have been used to integrate perspectives and identify both common priorities and region-specific concerns. Preliminary results indicate broad agreement on the need for transparency, human oversight, and validation of AI tools, while also highlighting challenges such as inequitable access to technology and risks of algorithmic bias. In conclusion, this presentation emphasizes the importance of advancing globally informed principles that can guide psychology in leveraging AI responsibly. By incorporating diverse perspectives, this initiative aims to contribute to an international framework that supports innovation, protects rights, and promotes equity.

Abstract 1653

IMPLEMENTING THE NEW PSYCHOLOGIST CODE OF CONDUCT IN AUSTRALIA

Phillips R.*

Psychology Board of Australia ~ Melbourne ~ Australia

The Psychology Board of Australia Code of Conduct (the Code) sets out the standards of conduct the Board expects from psychologists. The Board's paramount consideration is public protection and public confidence in the safety of the services psychologists provide in Australia. The Board's first Code of Conduct came into effect in 2025 after 6 years of development, thus implementing a regulatory code and moving away from the traditional Code of Ethics. The preparatory work included researching tribunal decisions and coronial recommendations, complaint themes, the scientific literature, and codes of conduct of other jurisdictions. An expert advisory group undertook a gap analysis to prepare a draft code for consultation.

The new Code has moved from general high-level principles that are complemented by ethical guidelines towards a single document of expectations that describes behaviours that are required or prohibited in practice. The Code deliberately embeds cultural safety as a core requirement for safe and effective practice, including expanded guidance on Aboriginal and Torres Strait Islander health and cultural safety. The Code also includes revised expectations for professional boundaries to highlight that the power imbalance and risk of exploitation, the extent of the relationship, and vulnerability of the client are the most relevant factors.

The presentation will provide an overview of the development of the new Code, the process of consultation and implementation, and key learnings that have supported a safe transition for the Psychology profession.

Abstract 2525

SAFEGUARDING RESEARCH MATTERS: LOW DISTRESS AND STRONG SUPPORT FROM CHILDREN AND ADOLESCENTS

Russell D.*

Australian Catholic University ~ Melbourne ~ Australia

Background: Ethical concerns about involving young people in research on sensitive topics such as abuse prevention often centre on potential distress. Yet, little empirical evidence exists on how children and adolescents experience such participation and whether they perceive it as valuable.

Method: Data were drawn from a national survey of 4,952 children and adolescents aged 10–18 years (M = 13.9) across youth-focused settings (schools ~90%, sports clubs, religious ministry programs). Participants reported on safeguarding in the organisation that invited them to participate, perceived importance of research, willingness to participate after seeing the questions, and whether and how much the survey upset them. Predictors included age group, gender, Indigenous status, confidence in adults to respond to safety concerns, perceived barriers to help-seeking, and organisational safety climate.

Results: Most participants (89.7%) reported no distress; 10.3% indicated being upset. Despite this, 87.6% would participate again, and 64.8% rated participation as “quite” or “extremely” important. Logistic regression showed distress was less likely among older students (OR = 0.70) and those perceiving stronger safety climate (OR = 0.39) and fewer barriers (OR = 0.56). Gender and Indigenous status predicted higher odds of distress. Ordinal regression indicated perceived importance was positively associated with confidence in adults (β = .24), fewer barriers (β = .40), and stronger safety climate (β = .32), but not age. Males were less likely to rate participation as highly important.

Conclusions: Findings challenge assumptions that sensitive research is broadly harmful. While a minority experience distress, most endorse its importance and would participate again. Ethical practice should include safeguards for vulnerable groups and strengthen approaches that respect children’s rights to be heard. Results highlight opportunities for meaningful child and adolescent participation, including co-design of sensitive research, ensuring safeguarding studies reflect young people’s perspectives and priorities.

MEDICALLY ASSISTED DYING (MAID) FOR PSYCHIATRIC CONDITIONS—ETHICAL ANALYSIS AND THE ROLE OF PSYCHOLOGISTS

Searight R.*, Lamma S., Anderson M.

Lake Superior State University ~ Sault Sainte Marie ~ United States of America

Medical Assistance in Dying (MAID) has become an evolving issue in law, medicine, and ethics across multiple countries. First introduced in Oregon in 1997 under the Death with Dignity Act, physician-assisted death has since been legalized in 11 U.S. states and in Canada. While originally restricted to patients with terminal medical conditions, some jurisdictions have extended eligibility to individuals with severe psychiatric disorders. This expansion has generated significant ethical, clinical, and cultural debate.

A widely publicized 2024 debate in the Canadian Parliament regarding MAID for mental health conditions drew close attention from U.S. mental health professionals. Although Canada legalized MAID in 2016, implementation of psychiatric-only eligibility has been postponed until 2027, reflecting the complexity of the issue.

Available data suggest that psychiatric-only MAID cases remain rare but are gradually increasing, particularly in Belgium and the Netherlands. Patients most frequently present with mood disorders, personality disorders, and histories of suicidality, with comorbidity common. Psychologists can play a critical role in evaluating decisional capacity, yet concerns remain, as psychiatric illness may impair judgment, concentration, or stability of preferences. Frameworks such as the Appelbaum and Grisso model emphasize communication, understanding, appreciation, and reasoning, but many evaluations lack systematic application of these criteria.

Treatment efficacy further complicates the debate: while some psychiatric conditions are treatment-resistant, evidence-based therapies are often underutilized or inaccessible due to systemic barriers, raising justice-related concerns. Ethical discussions highlight tension between autonomy and mental health professionals' duty to prevent suicide. From a principlist perspective, autonomy is frequently prioritized, yet beneficence and nonmaleficence caution against premature death when effective treatments may exist. Religious and cultural perspectives overwhelmingly oppose MAID, emphasizing divine sovereignty and the inherent value of life.

The Canadian debate underscores unresolved questions about the irreversibility of suffering, treatment access, safeguards, and the societal implications of psychiatric MAID.

Abstract 160

ETHICAL PRACTICE IN THE MAJORITY WORLD: A FRAMEWORK FOR PSYCHOTHERAPISTS TRAINED IN THE MINORITY WORLD.

Zhou Y.*

University of Iowa ~ Iowa City ~ United States of America

Therapists trained in the minority world with Western psychological models often face significant ethical dilemmas when returning to practice in the majority world contexts, where cultural norms and systemic conditions may differ significantly from their training environments. Without a critical lens and intentional decolonization efforts, well-intentioned practices can inadvertently reimpose colonial power dynamics in mental health care. This presentation will build on a recent article, which has been accepted for American Psychologist, that critiques the implicit universality of Western ethical standards and proposes a culturally responsive ethical framework tailored to majority world contexts. Key principles include cultural contextualization, relational ethics, social justice advocacy, integration of Indigenous practices, and reflective practice. Through a detailed case study adapted from a real-life event, the article illustrates the application of this framework for therapists in navigating complex dilemmas that arise at the intersection of cultural dissonance, systemic inequities, and global power dynamics. Recommendations for training programs are provided, emphasizing the integration of international competence, decolonial approaches, and community-based learning to better prepare therapists for culturally attuned and ethically sound practice.

MALE CULTURAL HEGEMONY LOSS AND THE FAR-RIGHT SUCCESS

Altungy P.*[1], Liébana S.[1], Velo C.[2]

[1]*Universidad Europea de Madrid ~ Madrid ~ Spain,* [2]*Universidad Europea de Valencia ~ Valencia ~ Spain*

One of the defining features of the 21st century may well be the growing polarization that societies—particularly in the West—are experiencing. While this polarization is often framed within the political arena, it extends far beyond, permeating other social domains such as culture, economics, generational divides, and gender dynamics. Concerning the latter, recent years have seen a rise in voices pointing to a widening gender gap, not only in economic terms but also in matters of identity. Increasingly, more men, including those from younger generations, report feeling "socially rejected" simply for being men.

Simultaneously, support for right-wing and far-right ideologies has grown across Western societies. Could these phenomena be interconnected? This article seeks to integrate insights from political science and philosophy within a psychological framework to explore the underlying causes of this social, political, and gender polarization. It examines the decline of male social hegemony as an example of significance loss—an experience that fuels heightened uncertainty and, in turn, drives increased support for conservative and far-right policies, particularly among men.

SOCIAL PSYCHOLOGY EXPERIENCES FROM CONSULTATIONS WITH INDIGENOUS COMMUNITIES FOR THE DEVELOPMENT OF ROAD PROJECTS IN GUANAJUATO

García Y Barragán L.F.*, Correa Romero F.E., Espinoza Romo A.V.

Universidad de Guanajuato ~ León ~ Mexico

Expanding road infrastructure in territories with indigenous communities requires an approach that guarantees respect for their collective rights and self-determination. In Guanajuato, Mexico, this process involves establishing consultation procedures with indigenous peoples and communities in accordance with international standards, particularly Convention 169 of the International Labour Organisation (ILO). This poster outlines the outcomes of consultations conducted in 2024 for two road projects involving 13 indigenous communities. Our aim is to highlight the related psychological procedures, challenges and lessons learned.

The right to free, prior and informed consultation is a fundamental collective human right for indigenous peoples. It is recognised nationally in the Political Constitution of the United Mexican States and internationally in ILO Convention 169 and the United Nations Declaration on the Rights of Indigenous Peoples. In Guanajuato, these processes are based on the 'Protocol for the Implementation of Consultations with Indigenous Peoples and Communities', and the guiding principles of these consultations include good faith, freedom of participation, the cultural relevance of methodologies, the provision of complete and impartial information (including social, cultural, and environmental impact studies), and the active pursuit of agreements. The absence or defect of any of these elements may invalidate the procedure.

Identified needs for these processes include including training on human rights and indigenous rights in a preparatory phase, and establishing ongoing dialogue between ejido leaders, indigenous authorities, and state government authorities.

These experiences demonstrate that consultations with indigenous communities can lead to agreements and prevent conflicts. However, they also highlight a disconnect between the communities' needs and the government's proposals, which, while it may be positive for the state, does not necessarily result in direct benefits for the communities.

PREDICTING FERTILITY INTENTIONS WITH THE THEORY OF PLANNED BEHAVIOUR: A THREE-LEVEL META-ANALYSIS

He N.*, Liang Y.

Shaanxi Normal University ~ Xi'an ~ China

Fertility intentions serve as a critical predictor of fertility behaviors. While numerous studies
have examined the predictive utility of the Theory of Planned Behavior (TPB) in predicting fertility
intentions, empirical findings remain inconsistent. To systematically assess the explanatory power of the
TPB in explaining fertility intentions, this study employed a three-level meta-analysis approach using
random effects model, synthesizing data from 33 studies encompassing 128 effect sizes and 47, 923
participants. Results revealed significant associations between TPB components and fertility intentions, with
attitude demonstrating the strongest correlation (r+ = 0.41), followed by subjective norms (r+ = 0.30) and
perceived behavioral control (r+ = 0.23). Moderator analyses indicated that gender, childbearing history, and
GDP per capita significantly influenced the strength of these relationships, but not by individualistcollectivist cultural background or temporal framing. These findings elucidates the relationship between
TPB variables and fertility intentions, providing theoretical support for future interventions aimed at
enhancing fertility intentions and the construction of a fertility-friendly society.

Abstract 2336

PSYCHOLOGICAL DYNAMICS OF FAKE ACCOUNT USE: THE RELATIONSHIP BETWEEN CYBER DISSOCIATION, PSYCHOLOGICAL TRAUMA, OBSESSIVE BEHAVIORS, AND TENDENCY TO VIOLENCE

Yilmaz Gürten N.[1], Türkmen Z.[1], Bozkurt M.*[2]

[1]Istanbul University-Cerrahpasa ~ Istanbul ~ Turkey, [2]Bingöl University ~ Bingöl ~ Turkey

The use of fake accounts is increasing on social media platforms, which are particularly prevalent among young people. The purpose of this study is to examine the psychological dynamics of fake account use in the context of obsessive behaviors, childhood traumas, dissociative experiences, and tendency to violence. The study sample consisted of 102 university students aged 18-30 and 51 of the participants used fake accounts, while 51 did not. Participants were administered a Demographic Information Form, Childhood Trauma Questionnaire, Dissociative Experiences Scale, Violence Tendency Scale, and Maudsley Obsessive-Compulsive Inventory. Questions related to cyber dissociation were included in the Demographic Information Form. These questions include: “How much time do you spend on social media?”, “When presenting yourself to others on social media, do you project a personality that differs from your real-world self?”, “After spending time on social media, do you feel difficulty readjusting to the real world?”, “Do you clearly perceive a distinction between the online world and the real world?”, and “Are there times when you feel lost in your online identity and detached from the real world?"

Analyses revealed that individuals who used fake accounts had significantly higher childhood trauma scores than those who did not. These participants also scored higher on subscales related to emotional and physical abuse and neglect. Furthermore, significant and positive correlation was found between childhood trauma, dissociative experiences, obsessive-compulsive symptoms, and tendency to violence in participants using fake accounts. Additional analyses conducted regarding cyber dissociation also revealed significant differences between participants using fake accounts. Consequently, the relationships between these variables suggest that fake account use is not merely a digital act but also a behavioral pattern that may have psychological roots.

Abstract 1183

THE ANTECEDENTS OF UNETHICAL PRO-ORGANIZATIONAL BEHAVIOR: THE ROLES OF PERSONALITY, INDIVIDUALISM, AND THE BRAZILIAN JEITINHO

Porto J.B.*[1], Kwantes C.T.[2]

[1]University of Brasilia ~ Brasilia ~ Brazil, [2]University of Windsor ~ Windsor ~ Canada

Unethical behaviors exploit others for personal or organizational gain. When benefiting a company, they are termed pro-organizational unethical behaviors, often encouraged for competitive advantage. However, research shows that they harm stakeholders, such as customers, highlighting their unethical nature. Studying unethical behavior presents multiple challenges, including the analysis of cultural differences. The objective of this research was to examine the antecedents of unethical pro-organizational behavior. Individual personality variables, such as propensity to trust and extroversion, were considered, as well as the universal cultural dimensions of individualism and collectivism, and the emic dimension of Jeitinho. The concept of Jeitinho was developed in Brazil and reflects a problem-solving mechanism that involves creativity and amiability, often involving deception, cunning, and norm violations to overcome adverse situations and achieve a goal. The concept has two dimensions: Jeitinho simpático involves creativity and amiability to promote positive social interactions, and Jeitinho Malandro, which involves deception and cunning. A sample of 323 Brazilian university students answered the questionnaire. A hierarchical multiple regression analysis indicated that the variables did not explain the variance of unethical pro-organizational behavior, except Jeitinho Simpatico (beta=-.06, p<.01) and Jeitinho Malandro (beta=.25, p<.01) (R2=.11, R2Adj=.08, p<.001). The results indicate that the dimensions of jeitinho have opposite effects on behavior, challenging the notion that this concept is inherently harmful. This study underscores the importance of tailoring explanatory models to the local context to develop effective strategies for mitigating inappropriate behaviors.

THE IMPACT OF POLICE TREATMENT, LACK OF TRUST IN THE LEGAL SYSTEM AND HAVING A VOICE IN THE LEGAL PROCESS ON REVENGE DESIRE IN VICTIMS OF CRIME

Mcgaughey K.*[1], Mcglinchey E.[2], Hanna D.[1], Armour C.[1]

[1]Queen's University Belfast ~ Belfast ~ United Kingdom, [2]University of Ulster ~ Coleraine ~ United Kingdom

Criminal victimization is linked to an increased risk of violent offending, often driven by revenge (Heber, 2014). Long-term revenge desire can also harm victims' wellbeing (Stuckless, 1997). To mitigate revenge's harmful effects, researchers have explored the psychosocial and contextual predictors of individual differences in revenge desire. For example, how revenge desire is impacted by criminal justice. While past research has focused on outcome justice, little is known about how procedural justice impacts revenge desire. This study used a cross-sectional survey (N = 236) to examine whether poor treatment by legal personnel and reduced trust in the legal system were associated with greater revenge desire among crime victims. It also investigated whether having a voice in the process reduced revenge desire. ANOVA results showed that victims who experienced the worst treatment and the greatest decline in trust exhibited significantly higher revenge desire. However, having a voice in the process was not significantly related to revenge desire. Both crime type and time since the crime affected revenge desire. These findings suggest that respectful treatment by legal personnel and efforts to build trust in the justice system may help reduce victims' desire for revenge, which could lower violence and support victims' mental health.

Abstract 71

CAUSAL JUDGMENTS AND THE MORAL VALENCE EFFECT: THE ROLE OF AMBIGUITY AND MORAL FEATURES

Passemar A.*[1], Trémolière B.[1], Verkampt F.[2]

[1]Laboratoire CLLE, Université Toulouse Jean Jaurès ~ Toulouse ~ France, [2]Laboratoire LAPCOS, Université Côte d'Azur ~ Nice ~ France

In criminal cases, jurors are expected to evaluate evidence rationally, make objective causal inferences, and reach fair decisions that can profoundly affect the lives of both victims and defendants. However, psychological research suggests that this is not necessarily the case: when judging whether someone has caused a harmful outcome, individuals appear to be influenced, under certain conditions, by the moral valence assigned to the agent's motivations (i.e., whether these motivations are praiseworthy or blameworthy). The present research examines whether the moral valence effect on causal judgments is more likely to emerge under causal ambiguity, that is, when the agent's action is a necessary condition (but for the event) but not the most direct cause of the harm due to the presence of an intervening factor with a stronger causal link. In two pre-registered studies (N = 425), participants read short scenarios in which the moral valence of the agent's motivations (Studies 1 and 2) and that of the victim (Study 2) were orthogonally manipulated. They were then asked to judge the extent to which the agent was the cause of the negative outcome. Although the agent's action was not the actual cause of the outcome, the blameworthy (vs. praiseworthy) agent was more selected as the cause of the harm. However, a negative (vs. positive) evaluation of the victim reduced causal attributions to the agent, regardless of the agent's moral valence. Moreover, exploratory analyses may have revealed a "black sheep effect": men were less likely than women to attribute causality to a blameworthy agent. These findings deepen our understanding of how agent and victim evaluations shape causal judgments. They also reflect critical issues in legal contexts, where moral evaluations may implicitly influence causal attributions and blame, even in the absence of clear causal links.

UNITED STATES AND INTERNATIONAL PERSPECTIVES ON THE UPCOMING AMERICAN PSYCHOLOGICAL ASSOCIATION ETHICS CODE

Wednesday 22 July 2026 from 13:30 to 15:00

(L-Lorenese)

Lindsay Childress-beatty (American Psychological Association ~ Wa), Chair and Discussant

The American Psychological Association (APA) is revising its 2002 Ethical Principles of Psychologists and Code of Conduct (Ethics Code or Code) to be a transformational new Code that guides psychologists into the future. This symposium will provide a comprehensive overview of the draft Code from a global perspective. Presenters will highlight the new draft Code's expanded scope that more accurately reflects the wide variety of work activities and settings in which psychologists are engaged as well as the resulting necessity for mental health professionals to develop new competencies. The dynamic nature of ethics and emerging ethical issues such as those related to technology (e.g., artificial intelligence, telepsychology, big data), competencies, confidentiality, testing, and informed consent, as well as human rights. Presenters include several ethics experts involved in the drafting of the new Code as well as international ethicists with expertise regarding ethical principles and the Universal Declaration of Ethical Principles for Psychologists (UDEP). All will bring their unique national, as well as global, perspectives. By engaging in a critical examination of the ethical principles under revision in the new draft, the tension between the national characteristics of Ethics Codes and global ethical connections will be illuminated. Congress attendees will be able to reflect on their own national ethics codes, the current pressing issues in ethics globally, and the commonalities with the UDEP and the APA Ethics Code.

Abstract 3300

NEW AND UPDATED ETHICS STANDARDS OF THE REVISED APA ETHICS CODE

Leach M.*

University of Louisville ~ Louisville, Kentucky ~ United States of America

The American Psychological Association's Ethics Code Task Force has been developing the next iteration of its ethics code. The current code was developed almost a quarter-century ago and the psychological landscape has changed significantly in that time. Because of these changes, its ethics code must be evaluated and updated to better reflect current thinking and practices. Standards of practice have changed, and the revision not only reflects these changes but also considers future developments. The code is structured differently but maintains important components needed to guide psychologists toward ethical work. It has also expanded its scope to more accurately reflect the vast work activities and settings in which psychologists are engaged. Included in this revision is new language and intent to existing standards but also the inclusion of new standards. These standards are incorporated into every category and include areas related to multiple relationships, technologies, public presentations and accountability, informed consent, confidentiality, interdisciplinary settings, international research, data sharing teaching and supervision, sexualized relationships, and third-party testing observations, among others. The new version attempts to delineate health and non-health service providers when appropriate. Overall, the Ethics Code Task Force, comprised of individuals representing a range of diverse backgrounds and professional expertise, is developing a code that has reconsidered each section of the current code, with an eye on current and future ethical behaviors.

Abstract 3301

USING THE UNIVERSAL DECLARATION OF ETHICAL PRINCIPLES FOR PSYCHOLOGISTS TO REFLECT ON THE NEWLY REVISED VERSION OF APA'S ETHICS CODE

Gauthier J.*

Laval University ~ Quebec City, Quebec ~ Canada

The American Psychological Association (APA) has been in the process of revising its Ethical Principles of Psychologists and Code of Conduct (also known as the APA Ethics Code) since 2018. A first draft of the revised code was released for public consultation in December 2024, which yielded more than 2,650 comments from a broad range of contributors, including psychologists, graduate students, professional organizations, and members of the public. A new draft is anticipated to be available for public comment in early 2026. A final version of the revised Code will be submitted to the APA Council of Representatives for adoption upon the completion of the work. The purpose of this presentation is to reflect on the newly revised version of the APA Ethics Code from a global perspective, using the Universal Declaration of Ethical Principles for Psychologists (2008) as a reference. Comments will focus on: (a) the structure of the Code; (b) the ethical principles to be considered and balanced in ethical decision making; (c) the ethical standards defining the rules of conduct to adhere to; and (d) the potential of the Code to become an effective educational and training tool to learn to think ethically and develop global thinking about ethics. Let it be noted that the Universal Declaration of Ethical Principles for Psychologists describes ethical principles that are based on shared human values. It was developed under the auspices of the International Union of Psychological Science and the International Association of Applied Psychology and unanimously adopted by both organizations in 2008.

Abstract 3302

THE APA CODE OF ETHICS: AN ITALIAN PERSPECTIVE FOR A STRONGER PSYCHOLOGY

Zara G.*

Department of Law, University of Turin ~ Turin ~ Italy

Psychology as a science and as a profession works in the service of humanity. Psychologists are therefore directly involved in promoting the well-being and self-determination of individuals and their communities (beneficence), promoting social justice, respecting persons and peoples (fairness), advocating for human and civil rights, preventing harm (non-maleficence), and developing a scientific mindedness. The APA Code of Ethics is a source of inspiration, guidance and information for many countries in Europe and Italy in particular. The APA Code of Ethics is currently being revised, and a second new draft is in preparation, which is expected to be made available to the public in 2026. In a society that is constantly changing and challenged by numerous individual, social, cultural and technological problems, mental health and interpersonal relationships are exposed to various forms of stress. Therefore, it is of utmost importance that psychologists act not only competently but also with integrity and responsibility in their daily practice and understand the ethical implications of their professional behaviour. The APA Code of Ethics is designed to ensure that these goals are not only achieved but also strengthened. Because of the complexity of the APA Code of Ethics, the focus here is on a critical examination of some of the ethical principles under revision, such as fostering personhood, acting from social justice, encouraging participation, and supporting scientific research, but also examining the ethical use of AI, which are crucial for making psychology a profession that builds ethical bridges between America and Italy and with the rest of the world.

10 - Division 10: Psychology, Law, and Ethics

PSYCHOLOGY, LAW, AND ETHICS: RECENT DEVELOPMENTS AND EMERGING ISSUES

Wednesday 22 July 2026 from 15:00 to 16:30

(L-Lorenese)

Janel Gauthier (Laval University ~ Quebec ~ Canada), Chair and Discussant

The connection between psychology, law, and ethics is a complex and multifaceted relationship that influences the functioning of legal systems. Psychology offers insights into human behavior, which can be applied to enhance understanding of legal processes, such as criminal responsibility and courtroom dynamics. Legal principles and psychological theories interact to shape legal decision-making and policy formulation. This intersection raises critical questions about ethical practices and the implications of psychological insights in legal frameworks. By exploring this dynamic relationship, we can enhance our understanding of justice and human behavior, and improve legal outcomes and ensure ethical practices. The purpose of this symposium is to highlight recent developments and emerging issues in psychology, law, and ethics, and the interplay between these fields. It involves four speakers and a chair/moderator from four different countries (Canada, Italy, the United Kingdom, and the United States). The first paper demonstrates how research has informed ethical investigative policies and practices worldwide. The second paper focuses on the ethical issues involved in the evaluation of parental conflict and decisions regarding child custody, with special attention to the specifics of assessment in transcultural families and same-sex families. The third paper highlights commonalities and differences in ethical standards for psychologists across countries and cultural interpretations of these standards. The fourth paper aims to show how restorative justice offers an ethic capable of moving beyond punitive logic, instead fostering a generative responsibility grounded in listening, mutual recognition, and the co-construction of shared solutions. The presentation of these papers will be followed by remarks from the Chair and a question and answer period during which the audience will have the opportunity to comment and ask questions.

Abstract 3251

ETHIC TOPIC ON EVALUATION ABOUT CHILD CUSTODY AND PARENTAL CONFLICT

Pajardi D.*

University of Urbino ~ Urbino ~ Italy

One of the judicial contexts in which judges appoint psychologists as legal experts is that of parental conflict and decisions regarding minor children. Insight into family dynamics, assessing their characteristics and potential impact on children's health, and providing the judge with information to decide on child custody is a professional activity with strong ethical, as well as scientific and methodological, value. Observation, interviews, and any psychodiagnosis of adults and minors must be conducted not only in accordance with the methodology indicated by scientific literature and ethical guidelines, but also taking into account the impact this assessment and the resulting decisions have on people's lives, especially on the protection of minors and their needs in relation to their stage of development. Psychologists must have specific training in forensic psychology that allows them to operate in accordance with the laws and practices of the judicial context and to maintain the scientific and methodological independence of their discipline. Meeting and assessing individuals in this context requires ethical behavior that is respectful toward those being assessed, with attention to identifying both critical issues and resources, and proper positioning in one's professional role, both as a judge's expert and as a lawyer's expert. Some particularly important or timely points will be analyzed, such as the promotion of interventions for families and minors (mediation, parental coordination), and the specifics of assessment in transcultural families and same-sex families.

Abstract 3252

COMMONALITIES AND DIFFERENCES AMONG NATIONAL CODES OF ETHICS IN PROFESSIONAL PSYCHOLOGY

Leach M.*

University of Louisville ~ Louisville ~ United States of America

As the profession of psychology continues to gain greater acceptance across the globe it is prudent for psychologists to evaluate common ethical components that comprise ethical behaviors. Documents such as the EFPA Meta-Code and the Universal Declaration of Ethical Principles for Psychologists help develop common ethical principles across countries, acting as foundations from which to develop codes of ethics. Recently there have been research efforts to identify common ethical standards across national codes of ethics. Identifying these standards establishes common features of expected ethical practices across countries. However, though common standards may be found across different codes, the interpretation of these standards is likely to differ due to cultural contexts. The purpose of this presentation is to highlight some ethics code standards found to be common across countries, cultural interpretations of these standards when possible, and discussion of differences found among codes. A presentation of trends across code development will be included. These research efforts can assist psychological associations with developing and refining their codes of ethics.

Abstract 3253

RESTORATIVE JUSTICE AS RELATIONAL ETHICS: TRANSFORMING INJUSTICE, FOSTERING COEXISTENCE, AND PROMOTING WELL-BEING OF PEOPLE AND COMMUNITIES

Patrizi P.*

University of Sassari ~ Sassari ~ Italy

Restorative justice can be understood as an ethical and cultural paradigm that addresses not only interpersonal conflicts but, above all, injustices in their multiple forms, including systemic and structural ones. At its core lies the recognition of harm and the commitment to address it through dialogical and transformative processes, capable of alleviating consequences and opening new possibilities for justice.

This paradigm rests on a solid value framework—dignity, responsibility and accountability, solidarity, and non-domination—that guides practices and distinguishes them from a mere set of tools. Restorative practices embody a relational ethic that restores voice and power to individuals and communities, making justice a process of shared truth-seeking through dialogue. The contribution aims to show how restorative justice offers an ethic capable of moving beyond punitive logic, instead fostering a generative responsibility grounded in listening, mutual recognition, and the co-construction of shared solutions. Special attention will be given to the value of “non-domination” (Braithwaite) and to the conception of responsibility as an ecological and relational process (De Leo), which highlight the paradigmatic difference from the ethics of retributive justice. These perspectives also show strong affinities with psychological ethics and practice, united by the commitment to human dignity, the building of healthy relationships, and the promotion of well-being. Finally, some implications for contemporary culture will be discussed: How can restorative ethics guide institutions, communities, and professional practices toward more inclusive and just models? What challenges emerge in translating restorative values into norms, policies, and organizations? Starting from these questions, the presentation will propose restorative justice as an ethical horizon able to transform not only responses to harm but also our very idea of democratic coexistence.

GENDER, CRIME AND LEGAL EDUCATION: EXPLORING PERCEPTIONS FEMALE CRIMINALITY THROUGH THE LENS OF LL.M. STUDENTS

Kriti C.*

Manipal Academy of Higher Education ~ Manipal ~ India

The academic conversation around female criminality in India has always focused on the causation of offending. The research in the field has been quite oblivious of human perceptual biases. This unobserved gap forms the cornerstone of the current research. The primary goal was to look at the female criminality landscape through the lens of legal professionals. The study interviewed senior law students of leading private universities in India. Criminality has been shaped by socio-economic, cultural, and legal factors. The indispensable rationale of the research was to analyse the Indian criminal justice system's approach to female offenders. The investigation raised questions of intellectual, preference, choice, and causation of offensive behaviour among women in the country. Theoretically, female criminality in India has been linked to factors like stress of mismanaging work-life balance, distrust in social systems, and oppression beyond human conditions. The present research was conducted to corroborate these claims from the perspective of future law professionals in the country. The data from the interview reveals a multitude of causal and attributive factors assigned to female criminality beyond stress and distrust, with great emphasis on choice, disregard of the law, and a blatant opposition to normative behaviour. The analysis that ensued highlights hesitance to acknowledge any deviance from expected social roles, thereby unveiling an implicit prejudicial treatment of female offenders. The study was conceptualised on the premise that there exists a systemic disparity in dispensing gender-sensitive justice, and the results of the research have reiterated a similar treatment. The results also help in explaining the latent perceptual biases for the disparity. The objective of the research is to provide a holistic overview of perceptions of female offenders in the country, which would lead to targeted interventions that would aid an equitable and fairer criminal justice system.

Abstract 1091

THE ROLE OF OF VOLUNTEER PROBATION OFFICERS IN FACILITATING SOCIAL REHABILITATION

Tsai W., Lin S.*

National Kaohsiung University of Science and Technology ~ Kaohsiung ~ Taiwan

In the judicial system, probation officers play a crucial role in safeguarding the rights and safety of individuals under protective supervision, as well as serving as a bridge between these individuals and society. The origin of the probation system can be traced back to volunteer work in the United States, with a history of only 200 years, and it has been developed for less than 50 years in our country. Despite this, it has received relatively little attention and related research within the judicial system, while the roles of probation officers and volunteer probation officers are relatively unknown in society in Taiwan. This study aims to explore the roles played by volunteer probation officers in assisting individuals with social rehabilitation. Through this research, the aim is to enhance societal awareness of the work of volunteer probation officers, understand their significance within the judicial system, and provide an empirical basis for future policy development. The subjects of this study are divided into three categories: individuals under protective supervision, former cases, and volunteer probation officers. Through interviews, insights are gained into their views on volunteer probation officers and various experiences and perspectives during this process are shared.

This study adopts the interview method, conducting in-depth interviews with current probationers under protective supervision, individuals whose cases have been closed, and those serving as volunteer probation officers. Through the self-reports of those under protective supervision, the study delves into their perceptions and feelings about volunteer probation officers, as well as the impact and benefits of these officers on their social rehabilitation journey. The findings reveal that volunteer probation officers provide necessary support and resources during the social rehabilitation process, with their impact and benefits being recognized by those under supervision.

Abstract 882

BEHIND BARS, BEYOND MOTHERHOOD: NARRATIVES OF INCARCERATED WOMEN IN INDIA

Mathur S., Mittal S.*

Bennett University ~ Greater Noida ~ India

Motherhood is a central axis of identity for women. Incarceration profoundly disrupts women's maternal roles, yet little is known about how incarcerated mothers in India experience and narrate motherhood. This study explores how incarcerated women in India narrate their maternal experiences while negotiating prison life. Based on thematic analysis of open-ended interviews with 30 incarcerated mothers in India, this study examined three questions: (1) What emotional experiences do incarcerated women report in relation to their role as mothers? (2) What concerns do they express about their children's well-being and future during imprisonment? and (3) How does incarceration affect the way women perceive and narrate their maternal identity? The findings reveal that guilt, sadness, and longing dominate women's emotional landscapes, rooted in separation from their children and uncertainty about their maternal capacities. Mothers frequently expressed anxiety about their children's treatment, safety, and future prospects, underscoring the persistent bond between maternal identity and caregiving despite physical absence. Incarceration also reshaped maternal identity, as women struggled with disrupted motherhood, fear of rejection by spouses, and the stigma of being simultaneously labelled "prisoner" and "mother."

An intersectional lens highlights how caste, class, poverty, and patriarchy compound this vulnerability amplifying both maternal distress and institutional neglect. Women from marginalized communities faced compounded vulnerabilities: economic precarity, social stigma, and institutional neglect amplified the harms of maternal incarceration. This study contributes to feminist criminology and psychology by foregrounding incarcerated women's voices in India, a context often overlooked in global prison research. It argues for gender-sensitive prison policies that safeguard maternal roles, provide psychological support, and address the intersecting inequalities shaping women's incarceration.

Abstract 1186

THE IMPACT OF NEUTRALIZATION TECHNIQUES ON THIRD-PARTY EVALUATIONS OF COERCIVE CONTROL

Lavédrine M.*[1], Meyer T.[1], Testé B.[2]

[1]Univ. Paris Nanterre ~ Nanterre ~ France, [2]Univ. Rennes 2 ~ Rennes ~ France

Introduction: Neutralization techniques encompass a set of justifications intended to excuse or conceal transgressive behavior. The two major forms are denial of responsibility and denial of behavior. Such techniques are frequently employed by perpetrators of coercive control, an insidious form of Intimate Partner Violence (IPV). Purpose: This research examines the effect of neutralization on third-party judgments in situations involving coercive control. Method: Participants (N = 561) first read a victim's testimony of coercive control before being randomly assigned to one of three conditions. In the control condition, participants completed the questionnaires directly. In the two experimental conditions, they were additionally exposed to a perpetrator testimony containing either denial of responsibility (victim-blaming) or denial of behavior (minimization). Measures assessed perceived responsibility, moral judgment, social judgment, and approval of sanctions. Results: Although the victim was consistently evaluated more favorably than the perpetrator, neutralization techniques significantly influenced third-party evaluations by reducing the responsibility of the perpetrator and increasing the perceived acceptability of his behavior. Both forms of denial decreased approval for sanctions against the perpetrator. However, denial of responsibility had a broader and stronger impact than denial of behavior, including higher attribution of responsibility to the victim. Conclusions: Neutralization techniques shape evaluations of coercive control, potentially increasing passivity in the face of allegations. Third parties play a critical role in contexts of deprivation of liberty such as coercive control, not only by detecting the abuse or providing social support, but also by contributing to the victim's protection from the perpetrator. A better understanding of the impact of neutralization could help mitigate these risks and strengthen interventions in support of victims.

Abstract 506

FAMILY SUPPORT AS A PROTECTIVE OR RISK FACTOR? A PSYCHOSOCIAL ANALYSIS OF FEMALE OFFENDERS

Şeker F.D.*

Trabzon University ~ Trabzon ~ Turkey

This study investigates the relationship between perceived family support and criminal behavior among incarcerated women, adopting a psychosocial perspective. Recognizing that criminal behavior emerges from a complex interplay of individual vulnerabilities, environmental stressors, and social dynamics, this research places particular emphasis on the role of family support as a potential protective factor in the lives of female offenders.

The study was conducted with 191 female inmates incarcerated at the İzmir Women's Closed Penal Institution in 2024. A descriptive and correlational research design was employed. Data were collected through the Personal Information Form, the Multidimensional Scale of Perceived Social Support (MSPSS), and the Fagerström Test for Nicotine Dependence (FTND). The analyses were conducted using SPSS 25, including descriptive statistics, correlation analysis, MANOVA.

The findings revealed significant negative correlations between perceived total social support scores and various risk indicators: criminal recidivism ($r = –.178$, $p < .05$), lifetime substance use ($r = –.148$, $p < .05$), cigarette use ($r = –.170$, $p < .05$), and having a family history of criminal behavior ($r = –.190$, $p < .01$). Furthermore, family support levels were found to be significantly associated with nicotine dependence levels ($F(4,157) = 3.850$, $p < .005$), suggesting that low perceived support may increase vulnerability to addictive behaviors.

These results highlight the critical importance of strengthening familial bonds and enhancing psychosocial support systems for incarcerated women. Such efforts may contribute to reducing recidivism, promoting rehabilitation, and fostering reintegration. Additionally, the study emphasizes the need for gender-responsive policies in the criminal justice system that account for the distinct psychosocial experiences and needs of women offenders.

Abstract 2572

CHARACTERIZING INCARCERATION-RELATED MORAL INJURY

Thomas K.*

Yale School of Medicine ~ New Haven ~ United States of America

The United States has one of the highest rates of incarceration in the world, with over 10 million people released from U.S. prisons and jails each year. People with histories of incarceration have high rates of posttraumatic stress disorder (PTSD), likely due, in part, to exposure to violence and abuse during incarceration. Untreated PTSD symptoms are associated with poor emotional regulation, impulsivity, substance use, and risk taking, all of which increase one's risk of recidivism. Despite the high rates of trauma exposure and PTSD in formerly incarcerated people, there are currently no evidence-based treatments for PTSD for people returning home from incarceration. One construct that may hold promise as a point of intervention for PTSD treatment in people with histories of incarceration is moral injury. Originally studied in combat veterans, moral injury refers to perpetrating or witnessing acts of transgression that violate deeply held moral beliefs and expectations. While it has been posited that experiences of moral injury are likely common in people with histories of incarceration, little research has examined experiences of moral injury as a potential population-specific risk factor for PTSD. Thus, the goal of this study is to collect survey data and conduct qualitative interviews with people who are formerly incarcerated to characterize experiences of incarceration-related moral injury. Preliminary analyses of survey data reveal high rates of reported moral injury exposure (94.5%) and a strong association between experiences of moral injury and severity of PTSD symptoms. Qualitative interviews are ongoing and will be analyzed with the goal of creating a conceptual framework of incarceration-related moral injury. Clinical implications and areas for future research will be discussed.

Abstract 2357

A PSYCHOSOCIAL LENS ON THE JUSTICE SEEKING PROCESS FOR DOMESTIC VIOLENCE VICTIM-SURVIVORS: A MULTI-SITED QUALITATIVE STUDY FROM NORTH INDIA

Rathore M.*, Sharma A.

Indian Institute of Technology, Jodhpur ~ Jodhpur ~ India

Psychology is increasingly being applied to address real world problems of violence, systemic marginalization and gender equality. In this light, the aim of this paper is to discover and highlight the role of psychosocial aspects of the court in journeys of Domestic Violence (DV) victims- survivors from India. This paper employs 6 months of courtroom ethnography, semi-structured interviews and focused group discussions to understand the psychosocial aspects of the justice seeking process. The participants included a diverse mix of DV victim-survivors, lawyers, judges and crisis support workers. A multi-sited approach included two districts from a North-Indian state. Some of the sites were: courtrooms, waiting areas in courts, parking lots, canteens and domestic violence support centers.

The thematic findings of the study showcases: 1. Lived experiences of courtroom trials: DV victim-survivors where they narrate their in-depth emotions and thoughts on navigating the court and its psychological impact. The informants describe battling multiple identities in the court i.e of a victim, survivor, mother and their own 'self' in the becoming. Dealing with the patriarchal court context also forms a trauma trigger detailed in the theme. 2. The making of a DV case detailed through ethnographic observations from lawyer- client interactions. A certain type of reframing of cases as a civil issue is witnessed which dilutes the 'violence' from the domestic violence case 3. The last theme explains the relevance of employing feminist and psychosocial principles through an example of crisis centers for domestic violence. The DV shelters integrate resilience and recovery with its crisis response to the victim-survivors. The study concludes the importance of addressing and applying psychosocial dimensions in the state's response to DV. This study holds potential for replication to address Violence against Women at a global level.

HOW ARTIFICIAL INTELLIGENCE IS CHANGING PSYCHOLOGICAL SCIENCE: ETHICAL AND METHODOLOGICAL CONSIDERATIONS

Thursday 23 July 2026 from 15:00 to 16:30

(L-Lorenese)

Dennis Stolle (American Psychological Association ~ Was), Chair and Presenter

This symposium will bring together psychological scientists from diverse subdisciplines and from three countries to explore how artificial intelligence is reshaping the research process in psychology. Panelists will address both current and future uses of AI in generating new psychological science, with emphasis on industrial-organizational, clinical, and social/personality psychology, as well as cross-cutting ethical issues.

The session will walk through the traditional steps of research—literature review, experimental design, development of stimulus materials, data collection, data analysis, and beyond—showing how AI can be implemented at each stage. Examples will illustrate how AI tools can increase efficiency and generate novel insights, while also raising important methodological and ethical questions.

Central to the discussion is the dual focus on feasibility and responsibility: not only can AI be used in these steps, but should it be used? Panelists will examine concerns such as bias in AI-generated materials, transparency in AI-driven analyses, and risks of overreliance on machine outputs in place of human judgment. By considering these issues alongside the opportunities, the symposium will help participants think critically about integrating AI into their own research practices.

The novelty of this symposium lies in its focus on emerging methodologies and the ethical dilemmas they create. While AI has begun to make inroads into psychological science, a comprehensive and systematic discussion of its role across the entire research cycle is rare. By explicitly pairing technical applications with ethical considerations, the session will offer a forward-looking perspective that is both innovative and practical.

The symposium is highly relevant to the Congress because research methods are foundational to nearly all areas of applied psychology. As AI expands the boundaries of what is possible, understanding its uses and limits will be critical for scholars, practitioners, and institutions alike.

Abstract 3361

ADVANCEMENTS AND ETHICAL CONSIDERATIONS IN AI-DRIVEN PSYCHOLOGICAL RESEARCH METHODS

Stolle D.*, Chan M.

American Psychological Association ~ Washington, DC ~ United States of America

As artificial intelligence reshapes the research landscape, psychology faces both unprecedented opportunities and pressing challenges in adapting its methods. This presentation, offered from the dual perspective of symposium chair and presenter, will provide a broad overview of the latest developments in AI-based research methods and their implications for the field. Drawing on a background that bridges social and personality psychology, applied research, and law, the session will highlight how emerging technologies are being integrated into consulting, organizational, and applied research contexts. Specific attention will be given to the ways in which AI is transforming methodological practices, from survey and experimental design to data analysis and real-time adaptation of research materials. The presentation will also address the likely directions in which these technologies are moving, including advances in large language models, predictive analytics, and human–AI interaction in research settings. Beyond individual applications, the discussion will consider the broader role of professional associations in shaping standards, fostering ethical practice, and developing best-practice guidelines to ensure validity, transparency, and equity in AI-driven research. Attendees will gain an understanding not only of the cutting-edge uses of AI in psychological research, but also of the institutional responsibilities and professional values that should guide its adoption. This integrative perspective situates AI not merely as a technical tool but as a transformative force that will require coordinated leadership and ethical foresight to shape the future of psychological science.

Abstract 3363

ARTIFICIAL INTELLIGENCE'S IMPACT ON CLINICAL RESEARCH AND PRACTICE

Leader J.F.*

European Federation of Psychologists' Associations ~ Brussels ~ Belgium

The integration of artificial intelligence into psychology is reshaping both research and clinical practice. This presentation will offer perspectives from a scholar–practitioner whose work bridges academic research and applied therapeutic settings. With a research background in mixed reality and augmented therapy, combined with ongoing clinical practice, this contribution highlights the dual opportunities and challenges of bringing AI into psychology. On the research side, AI enables new approaches to study design, data analysis, and the development of innovative therapeutic tools, yet also raises questions about validity, generalizability, and the role of human judgment in scientific inquiry. In the clinical realm, AI-driven technologies intersect with therapeutic practice in ways that can augment treatment, enhance accessibility, and support individualized care, but also demand careful attention to ethics, trust, and the preservation of the therapeutic relationship. The presentation will examine issues such as the transparency of AI systems, potential bias in training data, and the responsibility of psychologists to evaluate emerging technologies with scientific rigor and ethical sensitivity. Special emphasis will be placed on how AI tools can both enrich and complicate mixed reality and augmented therapy methods, providing new modes of engagement for clients while also introducing questions of autonomy, competence, and oversight. Attendees will gain an integrated understanding of how AI simultaneously advances psychological research and reshapes clinical practice, as well as strategies for responsibly adopting these technologies to ensure that innovation aligns with professional values and client well-being.

Abstract 3364

ETHICS IN PSYCHOLOGICAL SCIENCE IN THE AGE OF ARTIFICIAL INTELLIGENCE

Childress--Beatty L.*

American Psychological Association ~ Washington, DC ~ United States of America

Artificial intelligence (AI) is rapidly transforming psychological science, offering new tools for research design, data collection, and analysis. At the same time, these innovations raise complex ethical questions that require careful consideration by the field. This presentation will examine the ethical challenges and opportunities posed by the integration of AI into psychological research. Broad ethical considerations will be explored, including the potential bias in AI systems, global fairness and equity issues, deskilling and pipeline issues, and the possible impact on research integrity, as aspects of research are increasingly automated using AI. This presentation will also highlight how the APA's Ethical Principles of Psychologists and Code of Conduct provides guidance for the ethics of emerging research practices that involve AI. Particular attention will be paid to issues of transparency and informed consent, confidentiality and privacy, data security, and accountability when researchers employ AI-based tools such as large language models or machine learning algorithms. The responsibilities of psychologists to maintain competence as technology evolves will also be considered. Attendees will gain a clearer understanding of how psychologists can balance innovation with ethical responsibility, ensuring that the use of AI advances science while protecting participants and upholding public trust. This session will equip psychological scientists with the tools to navigate the ethical landscape of AI in research responsibly and effectively.

Abstract 3365

A DECISION FRAMEWORK FOR USE OF LLMS IN INDUSTRIAL-ORGANIZATIONAL PSYCHOLOGY AND BEYOND

Behrend T.*

Michigan State University ~ East Lansing ~ United States of America

The rapid growth of large language models (LLMs) has created new opportunities for developing materials in psychological surveys and experiments, yet systematic guidance on their effective use remains limited. This presentation discusses a decision-making framework outlining five distinct applications of LLMs in research contexts: (1) LLM as research assistant, (2) LLM as adaptive content creator, (3) LLM as external resource, (4) LLM as conversation partner, and (5) LLM as research confederate. Each use case highlights potential benefits as well as challenges for implementation, validity, and ethics. The presentation will include guidance, based on newly published research, on ensuring internal and external validity when incorporating LLMs, including considerations of prompt engineering, model selection, alpha and beta testing, study launch, and ongoing monitoring. The presentation will further address ethical issues such as transparency, participant consent, bias auditing, and responsible oversight in LLM-based research. While LLMs can substantially expand the methodological toolkit for psychological science, their value depends on careful research design and adherence to established ethical principles. Researchers must combine expertise in both experimental methodology and LLM functionality to ensure valid, reproducible, and ethical applications.

Adewoye S.E.*

University of South Africa ~ Pretoria ~ South Africa

Although the South African Constitution guarantees democracy, diversity and inclusion, there is no explicit legislation that regulates usage of digital platforms and social media where homophobic bullying behaviour could be perpetrated. Consequently, when laws or regulations guiding conduct in cyber space are lacking or weak, personal moral virtues tend to become cyber space users primary behavioural guidepost. Given the significance of virtue ethics as a set of ethical ideas that predispose people to comprehend what they should do in the face of an ethical dilemma and raise their possibility of acting on moral ideals, little is known about how virtue ethics approach can be conceptualized to inform the reduction of online moral concern such as homophobic bullying among adolescents in South Africa. In light of this, the purpose of this study is to conceptualised value ethics approach as an alternative measure to curb homophobic bullying behaviour among adolescent in the digital era. The risks surrounding online activity underlie the necessity to develop a non-punitive, yet effective, approach to reduce homophobic bullying behaviour amongst early adolescents in South Africa.

Abstract 558

PERCEPTION ON THE PODIUM: WITNESSES, EVIDENCE, AND JURY INSTRUCTIONS IMPACT GUILT AND CREDIBILITY PERCEPTIONS IN A MOCK DRUG TRIAL

Helmerichs A.*, Melei E., Usherenko A., Heffner A., Ruva C.

University of South Florida ~ Tampa ~ United States of America

Introduction:
This study assesses the effects of witness type (informant/police officer), jury instructions (no mention/mention witness' ulterior motives), and evidence type (drugs/cash) on mock jurors' verdicts and witness/defendant credibility ratings in a case of possession of crack cocaine with intent to distribute. Research has identified many possible ulterior motives that both police officer and civilian informant witnesses could have for testifying in trial (Thompson, 2012; e.g., maintaining public perception, monetary gain). In trial, jurors are instructed to consider a witness' potential vested interest in the trial outcome. However, this instruction is omitted when police witnesses testify (Johnson, 2017). This study analyzes whether including the same instruction for police officer witnesses would influence perceptions of witness/defendant credibility and ultimately trial outcomes.

Method, Results, and Conclusion:
Mock jurors (N = 355) read a trial transcript, provided verdicts, and completed defendant/witness credibility scales. With the police (vs. informant) witness, mock jurors had more confidence in the defendant's guilt and found the defendant to be more credible-- specifically when there were drugs in the defendant's system (vs. copious amounts of hidden cash). Regardless of witness type, witness credibility ratings were higher in the cash (vs. drug) evidence conditions but only when the jury instructions failed to tell participants to consider the witness' potential ulterior motives for testifying. Finally, the police officer (vs. informant) witness was seen as more credible when: (a) ulterior motive jury instructions were provided and (b) when presented with cash (vs. drug) evidence. These findings suggest that while the jury instructions may not impact juror perceptions in the way we expected, mock jurors perceive the credibility of police witnesses differently than civilian informants, which in turn can impact participants' perceptions of the defendant's guilt.

A MEDIATING MODERATION: THE ROLE OF IMPULSIVITY AND SELF-REGULATION ON THE RELATIONSHIP BETWEEN MENTAL TIME TRAVEL AND MORAL DECISIONS

Melinte G.*, Golu F.

University of Bucharest, Department of Psychology and Cognitive Science ~ Bucharest ~ Romania

Mental time travel (MTT) — the ability to mentally project oneself into the past or future — has been implicated in moral cognition through its role in anticipating the consequences of actions. Within a dual-process framework, involuntary MTT has been linked to intuitive moral judgments, whereas voluntary MTT may support deliberate reasoning, with impulsivity and self-regulation as plausible factors shaping this process. The present study examined whether self-regulation mediates, and impulsivity moderates, the relationship between MTT and moral judgments, testing whether voluntary MTT predicts self-regulation more strongly than involuntary MTT, and whether the indirect effect of MTT on moral judgments through self-regulation is attenuated at higher impulsivity.

A sample of 138 Romanian adults (aged 18–59; M = 23.37; 115 women) completed measures of voluntary and involuntary MTT, the impulsivity scale, a self-regulation scale, and 90 moral vignettes spanning six foundations (care, fairness, liberty, authority, loyalty, sanctity). A multivariate Bayesian moderated-mediation model was estimated in R (brms) across the six foundations. Both forms of MTT produced credibly null effects on self-regulation (involuntary b = 0.09; voluntary b = 0.10), and all 12 moderated-mediation indices fell within ±0.005 of zero. Higher self-regulation predicted lower acceptability of sanctity violations (b = −0.22, 95% CrI [−0.43, −0.01]).

In conclusion, MTT alone appears insufficient to account for moral judgments, consistent with the view that automatic cognitive processes exert limited influence on deliberate moral reasoning. Hence, other individual differences may better explain how recalled and simulated decisions shape daily moral choices.

PERSONALITY AND DIGITAL RISK: A STUDY ON CALLOUS-UNEMOTIONAL TRAITS AND AGGRAVATED SEXTING ACROSS 11 COUNTRIES

Ragona A.[1], Morelli M.[2], Ruggeri L.*[3], Cattelino E.[3], Chirumbolo A.[4]

[1]Department of Developmental and Social Psychology, Sapienza University of Rome ~ Rome ~ Italy, [2]Department of Dynamic and Clinical Psychology, and Health Studies, Sapienza University of Rome ~ Rome ~ Italy, [3]Department of Human and Social Sciences, University of Valle d'Aosta ~ Aosta ~ Italy, [4]Department of Psychology, Sapienza University of Rome ~ Rome ~ Italy

Introduction: Sexting, defined as the sharing of sexually suggestive or provocative content via new technologies, is widely considered as a common sexual behavior among adolescents and young adults. In the literature, two main types of sexting have been studied: experimental and aggravated. Experimental sexting is seen as a normal way of exploring sexuality during interactions with others and is considered part of normal developmental stages. Aggravated sexting, also known as non-consensual sexting, on the other hand, involves sharing someone's explicit content without their consent and has caught researchers' attention because of its possible negative consequences. Prevalence rates of non-consensual sexting vary between countries, influenced by gender and age. The present study examined the relationship between three facets of callous-unemotional traits (i.e., callousness, uncaring, unemotional) and the sharing of non-consensual sexts across different relationship contexts (i.e., acquaintances, strangers, partners).

Method: Data were collected in 11 countries: Belgium, China, Czech Republic, Ireland, Italy, Malaysia, Poland, Russia, Turkey, Uganda, and the USA. The final sample comprised 6093 young adults (3682 girls; 2401 boys), aged 13 to 30 (M = 20.35; SD = 3.63). The participants completed self-report questionnaires, including the Sexting Behavior Questionnaire and the Inventory of Callous Unemotional Traits, translated into the language of each country.

Results: The results from a logistic mixed-model show that callous-unemotional traits can predict non-consensual sexting. Specifically, people who are more callous and uncaring, but less unemotional, are more likely to share explicit content without consent, especially with partners and strangers. Additionally, younger people and women were more likely to take part in all types of non-consensual sexting compared to older people and men.

Conclusions: These results will hopefully help in the development of prevention and

intervention programs for young people, aimed at promoting healthy and conscious relationships, respect for others, and responsible use of technology.

PSYCHOLOGY AND HUMAN RIGHTS: SILENCE, COMPLICITY, AND ACCOUNTABILITY

Thursday 23 July 2026 from 17:30 to 19:00

(M-Lorenese)

Polli Hagenaars (Centre for Counseling C5 ~ Amsterdam ~ N), Chair

At the heart of the Universal Declaration of Human Rights (UDHR) lies the recognition of the inalienable and equal worth of every human being. A psychology that is truly grounded in human rights must internalize this principle—not only in its values but also in its epistemology, methodologies, and practices. This commitment is not a static one; it is a continuous and evolving endeavour.

Historically, psychology has fallen short of this ideal. The discipline has too often failed to serve all of humanity equitably. In some cases, psychologists have been complicit in human rights violations; in others, they have remained silent in the face of injustice. These failings demand not only reflection but action: a reparative psychology that acknowledges past wrongs and commits to standing up for human dignity in the present and future.

This symposium seeks to explore both the shadows and the strengths of psychology in relation to human rights. It is structured around four interconnected themes:

• Introduction and Epistemological Injustices

Unpacking how dominant ways of knowing in psychology have marginalized voices and experiences.

• Examples of Wrongdoings

Historical instances where psychologists actively participated in or justified harmful practices.

• Silence and Indifference

Situations where psychologists failed to speak out against societal abuses, perpetuating harm through inaction.

• Pathways towards Reparation

Highlighting initiatives, practices, and ethical commitments that embody the lessons learned—and charting a course for a more just psychology.

This symposium is a call for awareness – accountability and meaningful action. By confronting past and present injustices, psychology can move toward a future where it truly serves the dignity and rights of all.

Abstract 3435

PSYCHOLOGIES HARMS TO SEXUALLY DIVERSE INDIVIDUALS

Sinacore A.*

McGill University in the Department of Educational Counselling Psychology. ~ Montreal ~ Canada

Conversion therapy or reparative therapy is defined as any therapeutic attempt to change an individual's sexual orientation to heterosexual. That is, historical and presently around the world gay, lesbian and bisexual people have been subjected to conversion therapy or reparative therapy which can results in serious negative outcomes including anxiety, depression, suicidal ideation, relationships challenges, and sexual dysfunction (e.g., Haldeman, 2001; Shidlo & Schroeder, 2002; Beckstead & Morrow, 2004; Glassgold et al., 2009). According to the policy statement put forth by the Canadian Psychological Association (CPA), "There is no evidence that the negative effects of conversion or reparative therapy counterbalance any distress caused by the social stigma and prejudice these individuals may experience." As such, the CPA put forth a statement opposing the application of conversion and reparative therapies citing many of the harms this type of therapy causes to sexual minority individuals. Given the evidence of the dangers of conversion and reparative therapies and the fact that is continues to occur it is important for psychology as a discipline and psychologists as individuals to recognize that this form of treatment violates our codes of ethics. The codes clearly state to do no harm. As such, the presenter will review the historic and current research related to these types of therapies and will argue they need to be discontinued and deemed unethical. As well, recommendation for sexuality affirming care will be put forth.

Abstract 3442

PSYCHOLOGY, ETHICS, AND VIRTUE: REFLECTING ON THE ETHICAL RESPONSIBILITIES OF PSYCHOLOGISTS TO SOCIETY

Gauthier J.*

School of Psychology Laval University ~ Quebec City ~ Canada

Psychology functions as a discipline within the context of human society. As a science and a profession, it has ethical responsibilities to society. Most psychology ethics codes include the concept of responsibility to society, which involves a commitment to work in respectful ways to change aspects of society that can lead to serious ethical violations, and to encourage the development of social structures and policies that improve the condition of all individuals, groups, and communities in society. But how does psychology meet these responsibilities? Do these responsibilities include actively speaking out against injustice and societal abuses and opposing discriminatory policies and laws? If so, what does this mean for psychology, both collectively as a discipline and individually as psychologists? Must psychologists be accountable for the profession's failure to serve all of the members within a society equitably? If so, how does psychology, both collectively as a discipline and individually as psychologists, demonstrate ethical accountability for errors or acts that add to, rather than diminish, oppression? The purpose of this presentation is to reflect on the ethical responsibilities of psychologists to the societies in which they live and work. The Universal Declaration of Ethical Principles for Psychologists, which describes shared human values, will serve as a reference for commenting on these responsibilities. Examples of what an organization can do on behalf of a discipline to answer for unethical conduct and ensure that future conduct is ethical will be presented.

Abstract 3467

SILENCE, COMPLICITY, AND ACCOUNTABILITY: RESEARCHER ETHICS IN CONFLICT-AFFECTED SOCIETIES

Reeder D.L.*

Utrecht University ~ Utrecht ~ Netherlands

In conflict-affected societies, what researchers cannot say is shaped by safety, politics, and access. This presentation draws on fieldwork in the Nineveh Plains of Iraq after the ISIS occupation to examine both how communities endured and how the act of documenting that endurance surfaced ethical dilemmas of silence, complicity, and accountability.

Semi-structured interviews revealed practices such as faith-based coping and symbolic resistance. Documenting these everyday strategies required discretion, which in turn shaped the ethical challenges of the work. While the project was not intended as rights documentation, these survival strategies revealed human rights dimensions. Conversations often moved from experiences under ISIS occupation to the years that followed. These accounts revealed how laws and social norms continued to constrain rights and shape daily life, while also highlighting the tension between silence as protection and silence as complicity. All insights are presented in aggregated and anonymized form, with sensitive details withheld to safeguard participants, collaborators, and the researcher.

This protective stance raised difficult questions: how can researchers balance protective silences with accountability both to participants whose safety must be protected and to the integrity of the scholarly record? This presentation does not resolve these questions but argues that raising them openly is essential. Standard protocols do not anticipate such dilemmas, yet they shape both the practice of conflict-affected research and the knowledge it yields.

Abstract 3485

SILENCE IS NOT AN OPTION

Cooper S.*

University pf Pretoria ~ Johannesburg ~ South Africa

Recalling his own human rights abuses, including interaction with psychologists during apartheid, the presenter will critique current compromises and silences in psychology.
In a world increasingly engulfed by war, division, injustice, othering and sectarian narratives that imprison human potential and serve the few, ways to free the human spirit will be explored.

ATTITUDES TOWARD AI DATA-DRIVEN TOOLS IN POLICYMAKING: A SYSTEMATIC LITERATURE REVIEW

Barsanti A.*[1], Vacondio M.[1], Schiavo G.[2], Napolitano M.[2], Zancanaro M.[2], Esposito G.[1]

[1]Department of Cognitive Science, University of Trento ~ Trento ~ Italy, [2]Fondazione Bruno Kessler ~ Trento ~ Italy

Introduction: While existing research has largely emphasized technical and legal aspects of Artificial Intelligence (AI) applied to policymaking processes, the human dimension—attitudes, perceptions, and acceptance of relevant stakeholders —remains fragmented and underexplored.

Purpose: To synthesize empirical evidence on how data-driven AI tools are perceived, adopted, and evaluated by relevant stakeholders, such as citizens and policymakers, within public policy-making processes. Results will advance the understanding of psychological and social factors in AI data-driven policy making processes.

Methods: A PRISMA-compliant systematic literature on experimental, quasi-experimental, and qualitative studies retrieved from Scopus and Web of Science before 1st July 2025 (pre-registered (protocol: osf.io/zwgr7). From 1232 records screened, 58 studies met the inclusion criteria.

Results: Barriers such as limited digital skills, organizational constraints, inadequate algorithmic understanding, and concerns over privacy, security, and trust were identified. Facilitators included stakeholder involvement in design and decision-making, transparent communication of AI capabilities, and governance frameworks stressing fairness, accountability, and ethics. Psychological factors were central: trust emerged as the main predictor of acceptance, mediating the effects of transparency, perceived usefulness, and privacy, while fairness perceptions, resistance to change, and job insecurity also shaped attitudes.

Conclusions: These findings provide the first comprehensive synthesis of attitudes toward data-driven policy tools. Beyond the policy perspective, they offer applied psychology concrete entry points for intervention—such as designing training and change management programs, developing trust-building and communication strategies, and addressing job insecurity and resistance to change—to foster responsible and psychologically sustainable AI integration in the public sector.

Abstract 57

NEOLIBERAL IDEOLOGICAL BELIEFS, MORAL DISENGAGEMENT, AND EROSION OF CIVIC ENGAGEMENT FOR REFUGEES

Hornung S.*, Höge T., Unterrainer C.

University of Innsbruck ~ Innsbruck ~ Austria

Introduction: The so-called European refugee crisis is driven by people fleeing from the consequences of climate change, human rights violations, wars, and poverty. Changing migration patterns aggravate social tensions and hostility towards displaced people, instigated and exploited by political right-wing populism in many European host countries.

Purpose: This study examined the role of the political-economic ideology of neoliberalism in psychological processes of moral disengagement from inhumane treatment of refugees and the resulting erosion of civic engagement for human rights of migrants in Austria and Germany. Its core assumption was that the individualistic, competitive, instrumental logic of neoliberal capitalism justifies collective moral disengagement from the suffering of asylum seekers.

Methods: A purposive online survey among students and employed persons in Austria and Germany (N=276; mean age 29 years) was analyzed using multiple regression and bootstrapping. Neoliberal ideological beliefs were measured with a validated 24-item scale (subdimensions: individualism, competition, instrumentality). A 16-item scale initially developed in Australia was adapted to assess moral disengagement from the treatment of refugees in the European context. Civic engagement was captured with nine dichotomous items adapted from a feminist activism checklist, including influencing others, circulating petitions, attending protests, donating money, political volunteering. Included control variables were age, gender, education, income, and subjective social status.

Results: Moral disengagement from the treatment of refugees fully mediated the negative relationship between neoliberal ideological beliefs and civic engagement for the human rights of migrants. A significant positive interaction suggests an unexpected compensatory relationship of neoliberal ideology and moral disengagement. Limitations include a non-representative convenience sample and reliance on self-report measures.

Conclusions: Roots of politically lamented moral disengagement and lacking concern of citizens for the basic human rights of refugees are found in the socially corrosive ideology of free-market capitalism, emphasizing complete self-reliance, competition for resources, and instrumentality of humans for economic ends.

Abstract 176

HOW ACTIVISM MAY BE SIMILARLY OR DIFFERENTLY MOTIVATED: A CROSS-CULTURAL COMPARISON OF TAIWAN AND THE U.S.

Lee I.*[2], Kim H.S.[1]

[1]University of California, Santa Barbara ~ Santa Barbara ~ United States of America, [2]National Taiwan University ~ Taipei ~ Taiwan

Previous researchers have suggested that people in collectivistic societies are connected with others through relational ties and are intragroup-oriented (e.g., Yuki & Takemura, 2013). There have been virtually no studies focusing on how these individuals may view disadvantaged groups to which their significant others belong (i.e., extended disadvantaged group members). Applying the cultural analysis of intergroup dynamics in activism for disadvantaged groups, we investigated whether people engaged in past activism due to their direct and extended group membership with disadvantaged groups. According to a survey data (N = 743 adult participants in Taiwan and N = 717 adult participants in the U.S.) targeting activism for sexual minorities and mental patients, respectively, we separated people into four groups according to how they relate to sexual minorities or mental patients: Directly disadvantaged groups (those who consider sexual minorities or mental patients as their important ingroups), extended disadvantaged groups (those who have significant others who are sexual minorities or mental patients), other disadvantaged groups (those who have disadvantaged group memberships other than sexual minorities or mental illness), and advantaged group (those who report not having any disadvantaged group membership). We found that in comparison to other disadvantaged group members, directly disadvantaged group members are more likely to engage in past activism for their own groups. This tendency is much stronger in the U.S. than in Taiwan for sexual minorities. In addition, in comparison to those with other disadvantaged group memberships, extended disadvantaged group members are more likely to engage in past activism for sexual minorities and mental patients, respectively, in Taiwan, but not in the U.S. We plan to conduct another survey study refining some of our measures. We expect to explore potential mediators to shed light on how activism may be similarly or differentially motivated in Taiwan and the U.S..

ANTI-REFUGEE ATTITUDES IN TÜRKIYE: CONSIDERING THE ROLES OF ETHNIC AND POLITICAL IDENTIFICATIONS AND PERCEPTIONS OF REALISTIC AND SYMBOLIC BENEFITS

Ozdemir F.*[1], Saka N.[1], Gül E.[1], Tanriverdi A.[1], Kara H.N.[2]

[1]Bursa Uludag University ~ Bursa ~ Turkey, [2]Istanbul University ~ Istanbul ~ Turkey

Ongoing conflicts have made Türkiye both a refuge and, more often, a transit zone for various refugee groups. Research shows that examining the antecedents of negative attitudes towards refugees is crucial for promoting intergroup harmony. However, while most existing studies focus on perceptions of threat, relatively little attention has been paid to the potential benefits of the presence of refugees. This study aimed to investigate anti-refugee attitudes towards Syrian/Palestinian/Ukrainian people and to test the mediating role of Turkish people's perceptions of the realistic/symbolic benefits they derive from the presence of refugees in the relationship between ethnic/political identifications and anti-refugee attitudes. After obtaining ethical approval, 336 Turkish university students (186 women, 150 men, aged 18 to 44 years, M = 24.56, SD = 6.11) responded to the scales online. According to the main results, anti-refugee attitudes towards Syrians were stronger than those towards Palestinians and Ukrainians. Second, Turkish people's perceptions of realistic (economic) and symbolic (cultural) benefits were stronger for Ukrainians, Palestinians, and Syrians, respectively. Lastly, symbolic benefit perceptions were stronger than realistic benefit perceptions. Based on the multiple mediation models, people who were more strongly attached to Turkish identity were less likely to associate the presence of Syrian, Palestinian (excluding realistic benefit), and Ukrainian refugees with realistic and symbolic benefits. In turn, these people were more likely to express anti-refugee attitudes. Moreover, people who more strongly identified with right-wing political ideology were more likely to perceive the presence of Syrian and Palestinian refugees as realistic and symbolic benefits. In turn, these people were more likely to accept Syrian and Palestinian people. Lastly, people with right-wing political ideology were less likely to perceive Ukrainian refugees as a symbolic benefit and more likely to indicate anti-refugee attitudes. The study results are expected to be useful for researchers/professionals working on related topics.

Abstract 1189

HOW DOES THE STRUCTURAL EQUATION MODELING ADDRESS THE ROLE OF PERSONAL VALUES IN SHAPING POLITICAL TRUST AND PERCEIVED DISCRIMINATION?

Dindar N.*[2], Saraç M.[1]

[1]Hacettepe University Institute of Population Studies ~ Ankara ~ Turkey, [2]Middle East Technical University Department of Business Administration ~ Ankara ~ Turkey

Discrimination is a major social problem undermining individuals' well-being. This study examines how personal values influence political trust and, in turn, perceptions of discrimination. It focuses on three values of Schwartz's value framework: conformity, tradition, and security. Prior research has mainly investigated political trust as a consequence of discrimination. However, the current study presents a different perspective through examination of political trust as a possible antecedent of perceived discrimination. While most previous studies have concentrated on people's perceptions of their experiences of discrimination, this study addresses whether they define themselves as members of a group that has been discriminated against. Although some of the relationships between the constructs have been analyzed separately by previous research, analyzing them as a whole complex model by structural equation modeling (SEM), an appropriate way to analyze relationships between social constructs, is an important methodological contribution.

Data were derived from the European Social Survey Round 11, conducted in the United Kingdom in 2023 with a sample of 1684 individuals aged 15 and over. SEM was used to test the mediation model linking individual values, political trust, and perceived discrimination. These concepts can be evaluated as difficult to measure, and it is worth investigating the factors affecting them.

Findings show that conformity, tradition, and security positively affect political trust. Political trust also positively affects conformity, tradition, and security and negatively affects perceived discrimination. Using cross-sectional data from a single country may limit causality and cross-cultural generalizability. Self-administered questionnaires may have led to social desirability bias that could affect the survey responses. Observable variables were measured by one or two items, which may introduce measurement error. Despite these limitations, results provide important insights for policymakers to build trust by considering different personal values for the safety and well-being of people from different demographic groups.

A BUFFER AGAINST BACKLASH: HOW THE DESIRE FOR GOVERNMENTAL INTERVENTION MODERATES THE EFFECT OF REGULATORY DEPTH ON CLIMATE POLICY ACCEPTANCE

Grelle S.*, Hofmann W.

Ruhr University Bochum ~ bochum ~ Germany

Systemic climate policies are essential for addressing environmental crises, but often face public resistance due to their intrusiveness. Drawing on the Integrative Public Policy Acceptance (IPAC) framework, we examine how the Desire for Governmental Intervention (DGI) shapes climate policy acceptance as a function of regulatory depth. Across two online studies (NStudy1 = 565, Nobs = 11,300; NStudy2 = 971, Nobs = 11,652), participants evaluated climate policies across multiple environmental domains. As expected, higher regulatory depth reduced policy acceptance, while higher DGI increased it. Crucially, DGI buffered the negative effect of intrusiveness: individuals with a strong DGI were more likely to accept even highly intrusive measures such as taxes or bans. This buffering effect was consistently observed, with the evidence strongest at the between-person level. These findings highlight DGI as a key motivational factor for climate policy acceptance. Strengthening this desire may be crucial for increasing public support of ambitious yet necessary systemic climate interventions.

PUBLIC OPINION SURVEY ON GENDER EQUALITY IN A TOKYO SUBURB

Kobayashi A.*

Council for Gende Equality in Kawagoe City ~ Saitama ~ Japan

Many Japanese local governments have conducted public opinion surveys on gender equality. However, these data have not been analyzed sufficiently. This study examined whether Japanese people's thoughts on gender equality differ depending on their current situation to promote diversity more effectively. Data were drawn from respondents to a public opinion survey on gender equality (N = 1,296) conducted in a suburban city near Tokyo between June and July 2023. First, multiple correspondence analyses (MCAs) were conducted separately by participants' gender, focusing on responses regarding current gender role situations and perceptions of gender equality. MCA results were plotted two-dimensionally to illustrate relationships between items. Second, hierarchical cluster analysis using Ward's method classified respondents by gender into five groups based on the two-dimensional coordinates. Third, the study tested for differences in attitudes toward gender equality and experiences of harassment among these groups. Finally, the findings were used to discuss strategies for promoting gender equality effectively and addressing obstacles that hinder progress.

PERCEIVED STIGMA, IDENTITY MANAGEMENT STRATEGIES, AND PSYCHOLOGICAL WELL-BEING AMONG MAINLAND CHINESE STUDENTS IN HONG KONG

Lin S.*

Education University of Hong Kong ~ Tai Po ~ Hong Kong

Perceived stigma undermines mainland Chinese students' sociocultural adaptation in both university settings and the wider Hong Kong context (Mak & Cheung, 2010). While extensive research has demonstrated the adverse effects of stigma on student adjustment (e.g., Bhowmik et al., 2018), less is known about the identity-management processes underlying the long-term effect of perceived stigma on sociocultural adaptation. Self-group distancing (i.e., physically or psychologically distancing from one's stigmatized group) may offer short-term protection from stigma and negative evaluation, but this strategy ultimately hampers students' long-term adjustment. Perceived membership permeability—the belief that one can move from the stigmatized ingroup into the host majority—further shapes these responses by making individual mobility appear feasible and potentially incentivizing distancing. A two-wave longitudinal study of 190 mainland Chinese students in Hong Kong tested a process model with two aims: (1) to examine self–group distancing as a mediator between perceived stigma and subsequent sociocultural adaptation; and (2) to assess perceived membership permeability as a moderator of the stigma-to-distancing pathway. Students reported perceived stigma, self–group distancing, and baseline adaptation at the start of the 2024/25 academic year; sociocultural adaptation was reassessed six months later. We controlled for student age, gender, length of stay, Cantonese proficiency, and prior sociocultural adaptation. Results found that self–group distancing mediated the association between perceived stigma at Time 1 and sociocultural adaptation at Time 2. Both stigma and self-group distancing exerted unique, negative effects on sociocultural adaptation six months later. Notably, perceived membership permeability moderated the stigma-to-distancing link: higher stigma predicted greater self–group distancing primarily among students who perceived greater membership permeability. These findings indicate that both perceived stigma and perceived membership permeability interact to drive self-group distancing, which in turn negatively predicted sociocultural adaptation over time.

NARRATIVE ARGUMENTATION ANALYSIS ON SOCIAL MEDIA COMMENTS: THE CASE OF CECILIA SALA ITALIAN JOURNALIST'S ARREST

Magioglou T.*[1], Coen S.*[2], Magni G.[1]

[1]University of Westminster ~ London ~ United Kingdom, [2]University of Salford ~ Manchester ~ United Kingdom

The paper explores how anonymous commentators construct and negotiate social and political identities in the specific case of Cecilia Sala, Italian journalist who was arrested in Iran in December 2024 and liberated in January 2025. We discuss how a new methodological approach, Narrative Argumentation Analysis (Magioglou, forthcoming), offering an open structure, can be used to explore how social media users construct and negotiate political identities in three key moments of the case: the arrest, the beginning of the negotiations and the liberation of the journalist. The threads analysed were both in English and in Italian and they are compared for the type of controversies they put forward. By analysing discourses around ethnicity and immigration in the context of political ideological narratives, the study provides insights into the ideological identity construction processes in the digital age. The presentation highlights how the construction of political identities can become crystallised in a binary dynamic of “In” opposed to “Out” or become more flexible through a dialogical process.

Abstract 1856

SEEING GROUPS AS ESSENTIAL: INDISPENSABILITY, RACISM, AND COLLECTIVE ACTION

Pereira Da Costa L.*[1], Soro J.[1], Bierwiaczonek K.[2], Lopes R.[3], Hermano F.[3]

[1]HEI-Lab: Digital Human-Environment Interaction Labs, Lusófona University ~ Lisbon ~ Portugal, [2]Department of Psychology, University of Oslo ~ Oslo ~ Norway, [3]Escola de Psicologia e Ciências da Vida, Lusófona University ~ Lisbon ~ Portugal

Contemporary political polarization is often fuelled by narratives portraying minority groups as dispensable or undeserving, emphasizing their alleged lack of contribution to society. Such beliefs may foster negative attitudes and weaken support for social justice. Perceived indispensability, both functional (e.g., contributions to health, education, or culture) and identity based (as integral to national identity), may counteract these effects by framing minorities as essential members of society. This study examined whether perceptions of indispensability relate to different forms of collective action through modern racism. The study employed a correlational design with 269 White participants (Mage = 22.09, SD = 6.68; 81.4% female). Perceptions of indispensability were measured with the Functional and Identity Indispensability Scale, racism with an adaptation of the Modern Racism Scale, and collective action tendencies with items covering low-cost and high-cost action, working in solidarity, and raising ingroup awareness. Four mediation models were conducted, one for each form of collective action. Results indicated that functional indispensability consistently relates to collective action, though pathways differed by action type. For low-cost action and working in solidarity, effects were both direct and indirect via reduced racism, whereas for high-cost action and raising awareness, effects were mainly indirect. Identity indispensability showed no significant effects. These findings underscore the value of emphasizing minorities' indispensability in public policies and political discourse as a pathway to reduce prejudice and foster broader engagement in social justice initiatives.

Ruptures into societal trust: A case study on drivers to extremism and radicalization among youth

Petrescu C.*[1], Ignățoiu--Sora E.[1], Negut A.[1], Mihalache F.[1], Lambru M.[2]

[1]Research Institute for Quality of Life, Romanian Academy ~ Romania ~ Romania, [2]University of Bucharest - Faculty of Sociology and Social Work, Research Institute for Quality of Life, Romanian Academy ~ Bucharest ~ Romania

Introduction

The rise of radicalization and extremism across Europe necessitates nuanced, intersectional approaches to prevention and intervention. This paper explores the societal challenges landscape, focusing on the unique vulnerabilities, needs, and pathways of young women into extremism across four European nations: France, Greece, Italy, and Romania.

Background

The theoretical foundation of this research integrates several leading psychosocial explanations of extremism. Prominent scholars define extremism as “a vocal or active opposition to fundamental values, including democracy, the rule of law, individual liberty and mutual respect and tolerance of different faiths and beliefs” (Scarcella et al., 2016). Key frameworks include the influence of personality traits, core motivational drives such as the quest for significance, the need for belonging and identity, and the need for cognitive closure (Gruda and McCleskey, 2025; Doosje et al., 2016; Hogg, 2015; Kruglanski et al., 2021). Crucially, the theoretical baseline applies a distinct gendered lens, exploring how militancy can paradoxically act as a form of empowerment (Sunde et al., 2020), a means to escape familial constraints (Oppetit et al., 2019), or a mechanism for ideological protectionism (e.g., defending traditional family values or racial purity) (Pearson, 2023).

Purpose

The primary aim of this research is to establish a comprehensive societal baseline that informs human-centric, gender-aware prevention developments. Specific objectives include: (1) mapping the individual and structural push-and-pull drivers of radicalization, particularly for women and girls; and (2) deconstructing the intersectional dynamics (such as socio-economic background, age, and digital literacy) that shape extremist pathways.

Method

Developed under the Horizon project AMALTHEA between February and May 2026 , the study employs a robust, mixed-methods research design anchored in an intersectional perspective. The methodology includes a desk review, semi-structured expert interviews (8 experts), and co-creation workshops (4 participatory sessions with groups of 10-12 young people).

Results

The radicalization process is rarely linear or mono-causal; rather, it is the result of a complex interplay between individual vulnerabilities, structural grievances, and enabling environments. Findings indicate that a lack of trust in democracy and in the structures of society constitutes the first and major rupture from which a person engages in the process of extremism and possibly radicalization. Proposed outcomes of this case study include a refined mapping of gender-specific vulnerability typologies relevant to the four country context.

Abstract 1744

TESTING THE EFFECTS OF POLITICAL RHETORIC TOWARDS MUSLIMS AS A FACILITATOR AND BARRIER FOR INTERGROUP CONTACT

Shayegh J.*[1], Choma B.[2]

[1]Ulster University ~ Coleraine ~ United Kingdom, [2]Toronto Metropolitan University ~ Toronto ~ Canada

Introduction

Intergroup contact fosters positive social relations, yet political rhetoric is a key influence on intergroup attitudes. While research shows that rhetoric can shape prejudice, little is known about its impact on readiness for intergroup contact. We conceptualise rhetoric as a form of vicarious contact, investigating whether politicians' rhetoric facilitates or inhibits willingness to engage in future interactions with Muslims.

Purpose

We examined the effects of both positive and negative political rhetoric on contact readiness, measured through contact perceptions (how positive interactions are expected to be) and contact intentions (willingness to engage). We also tested intergroup trust, intergroup anxiety, and perceptions of authority norms as potential mediators.

Method

Two experimental studies were conducted with non-Muslim participants randomly assigned to one of three conditions: exposure to positive political rhetoric about Muslims, negative rhetoric, or a control condition. Study 1 (n = 435) employed a smaller sample, while Study 2 (n = 636) used a higher-powered design to replicate and extend findings.

Results

Across both studies, positive rhetoric consistently increased positive contact perceptions and intentions, largely explained by greater intergroup trust. In Study 1, negative rhetoric did not affect contact readiness. In Study 2, negative rhetoric showed conditional effects: participants with lower social dominance orientation (SDO) reported higher intergroup anxiety and less positive perceptions of contact, while those with average or higher SDO showed no significant differences from control.

Conclusions

Findings indicate that political rhetoric, operating as vicarious contact, shapes public willingness to engage with Muslims. Positive rhetoric reliably facilitated readiness for intergroup contact, whereas negative rhetoric produced conditional effects dependent

on ideological orientations. These results contribute to understanding both inhibitors and facilitators of contact and highlight political rhetoric as an underexplored avenue within contact theory, thereby opening new pathways for examining how different sources of rhetoric may impact intergroup relations.

Abstract 2594

THINKING RIGIDLY, BELIEVING STRONGLY: COGNITIVE PREDICTORS OF CONSPIRACY ENDORSEMENT

Amighetti E.*, Iannello P., Salvi C., Antonietti A., Cancer A.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

The 2024 U.S. presidential election campaign was marked by an assassination attempt on Donald Trump, which sparked intense public debate and fueled various alternative explanations, including claims that the attack was staged by Trump himself or orchestrated by his opponents.

Grounded in literature on individual differences in conspiratorial thinking, the present work investigated the psychological factors associated with adherence to such conspiracy-based explanations, with particular attention to features of psychological rigidity as captured by the construct of Socio-Cognitive Polarization (SCP). SCP is a multidimensional construct encompassing conservative political ideology, absolutistic thinking, and xenophobic attitudes, reflecting a higher level of inflexibility in processing complex or ambiguous information.

In Study 1, we investigated the cognitive underpinnings of socio-cognitive rigidity by administering a battery of cognitive measures (cognitive flexibility, fluid intelligence, field (in)dependence, generalized overconfidence) to evaluate their predictive role in accounting for individual differences in SCP. The goal was to identify a cognitive profile underlying higher levels of socio-cognitive rigidity.

In Study 2, we compared responses collected before and after the assassination attempt to assess whether beliefs in related conspiracy theories shifted following Trump's election as president. Participants were grouped into two clusters based on their levels of psychological rigidity. Those classified as less rigid demonstrated lower SCP, fewer conspiratorial tendencies, and better problem-solving abilities, whereas more rigid individuals showed the opposite pattern. Interestingly, even participants characterized by lower levels of rigidity were somewhat more inclined to endorse all kinds of conspiracy theories about the attack after the election results.

Findings from these studies advance our understanding of the ways in which socio-cognitive rigidity influences how individuals interpret complex socio-political events and emphasize the relevance of addressing cognitive mechanisms underlying biased reasoning to inform educational and psychological interventions aimed at promoting critical thinking and mitigating the spread of misinformation.

Abstract 2113

WOMEN AS RESOURCES: HOW ETHNIC THREAT INFLUENCES ATTITUDES TOWARDS WOMEN

Bacigalupo A.*[1], Sengupta N.[1], Sibley C.[2]

[1]University of Kent ~ Canterbury ~ United Kingdom, [2]University of Auckland ~ Auckland ~ New Zealand

Introduction: In recent years, the Western world has been characterized by policies reversals regarding women's issues. A prime example is the overturn of Roe v. Wade in the United States, which made abortion a right protected by the constitution. At same time, ethnonationalism and anti-immigration sentiments have been on the rise, causing a spike in hate crimes towards and harmful rhetoric aimed at ethnic minorities.

Purpose: In these two studies, we want to establish whether there is a connection between realistic and symbolic threats and attitudes towards women. In particular, we hypothesize that symbolic threat and realistic threat from non-native immigrant groups will lower support for workplace gender equity policies in the NZ European population, controlling for benevolent and hostile sexism. In the same way, we hypothesize that realistic threat from non-native immigrant groups and warmth towards immigrants will be significant predictors of lower support for elective abortions, controlling for benevolent and hostile sexism.

Methods & Results: In study 1 (N = 4,629) through a multiple regression we find that symbolic threat, but not realistic threat, significantly and negatively predicts support for policies benefitting women in the workplace. In study 2 (N = 8,729) through a multiple regression we find that realistic threat, but not warmth towards immigrants, significantly and negatively predicts of support for elective abortions.

Conclusions: These results demonstrate the interconnected nature of ethnic prejudice and attitudes towards women in a majority population perceiving either realistic or symbolic threat from immigrants. In particular, it appears that, under perceived threat, women may be seen as competitors or resources, to be controlled in their autonomy in order to maintain dominant ethnic hierarchies. Finally, these findings highlight the importance of citizens' attitudes towards policies supporting marginalized communities.

Abstract 2501

WHEN POWER SMILES: GENDERED FACIAL EXPRESSIONS AND POLITICAL ETHOS IN MEXICO

Garcia--Meraz M.*

Universidad Nacional Autónoma de México ~ Mexico ~ Mexico

Introduction:
Facial expressions are central to political communication, particularly for women leaders navigating the double bind between authority and warmth. This study investigates how President Claudia Sheinbaum's smiles function as multimodal resources in the construction of her political ethos across debates, speeches, and official messages.
Purpose:
To develop a bio-behavioral inventory of political smiles and analyze their emotional, rhetorical, and perceptual roles in Mexico's first female presidency.
Method:
A multimodal mixed-methods design integrated (1) automatic facial coding with FaceReader™ based on FACS, (2) inferential modeling of smile frequencies across communicative contexts, (3) text mining and sentiment analysis of speech transcripts, and (4) perceptual validation with 103 university students who rated authenticity, warmth, intensity, and threat.
Results:
Across 2,000+ video segments, five facial configurations were identified: open, isolated, Duchenne (+25), controlled, and special smiles. Open smiles dominated institutional and celebratory contexts (≈ 90%), whereas Duchenne smiles appeared more frequently in late-cycle debates, signaling authenticity and affective intensity. Regression models confirmed contextual modulation: isolated smiles increased toward the end of campaigns, and controlled smiles appeared mainly in recorded messages. Sentiment analyses revealed emotional shifts mobilization in mayoral debates (fear + trust), confrontation in presidential debates (anticipation + anger), celebration in public speeches (joy + trust), and solemnity in recorded messages (sadness + confidence). Perceptual ratings showed that Duchenne smiles were judged most authentic and warm, while controlled smiles elicited higher perceived threat.
Conclusions:
Smiles act as strategic performances balancing courtesy and authenticity within gendered expectations of leadership. By coupling facial coding, computational linguistics, and perceptual validation, this study provides an integrative model for understanding affective communication and symbolic power in contemporary political leadership.

Abstract 1111

TERROR-INDUCED CONSERVATISM IN A LIBERAL ELECTORATE IN THE U.S.: ISSUE-BASED SHIFTS WITHOUT IDEOLOGICAL TRANSFORMATION

Cheung V.*

University of San Francisco ~ San Francisco ~ United States of America

American voters' decade-long slide toward conservatism (Gallup, 2024) may be a result of migrant crises and even the COVID-19 pandemic. Terror Management Theory (TMT) considers threats a motivator for voters to seek stability and security, which conservative ideologies often provide. Although TMT enjoyed broad support from earlier studies, recent replications struggled to reproduce the conservative shift. This presentation starts by describing two published studies by the presenter to highlight specific difficulties of using four threats to shift participants toward conservatism in four countries. The presentation then describes two new experiments that found partial support for TMT by successfully shifting participants' policy stance but not their overall ideology toward conservatism.

Retail theft and mob robberies have been rampant in liberal cities in America in recent years. Among the possible culprits is legislation that curtailed how low-level offenders are punished. For example, California voters passed Proposition 47 in 2014 and downgraded many "nonviolent" offenses from felonies to misdemeanors if the dollar value involved was below $950. A TMT-informed hypothesis posits that reminders of retail crime would rally participants behind security policies and even make them embrace conservatism.

Two experiments were conducted by recruiting participants in San Francisco, California (206 adults; 98 college students). Participants viewed either a video of retail crimes or local tourist attractions. They were also asked to revise the $950 threshold in pre- and post-test (within subject), by proposing an ideal threshold and also the minimum and maximum thresholds that they would endorse in a fictitious ballot measure. Significant mixed-level interactions and simple comparisons, across both studies, on a majority of the thresholds, showed that the experimental group (not the control group) significantly reduced the thresholds and became tougher on crime. However similar analyses did not find sweeping ideological shifts toward conservatism due to the exposure to the crime video.

Abstract 264

BEYOND MONOLITHS: IDEOLOGICAL HETEROGENEITY AND THE DIVERSE EXPRESSIONS OF CONSERVATISM IN INDIA

Mishra S.*

Indian Institute of Management Indore ~ Indore ~ India

Scholars have widely documented ideological differences, usually in liberal-conservative terms. Political psychology and political science research increasingly shows that these models—especially the unidimensional left-right spectrum—may oversimplify political ideas, especially in diverse societies with unusual historical paths. This is especially true in non-Western countries where political conflicts may differ substantially from Western ones. This paper extends this line of research by arguing that conservatism's great intra-ideological heterogeneity is rooted in a interaction of many psychological motivations, socio-cultural value systems, and historical-contextual factors. Interactions with the socio-cultural and historical milieu shape psychological predispositions towards security, threat, and social hierarchy, challenging general conceptualisation of simply a unidimensional left-right placement. India's politics demonstrate such diverse conservatism. Moving beyond monolithic descriptions, Indian conservatism is a complex tapestry of pre-colonial traditions, 19th-century socio-religious reform movements that often became revivalism, reactions to colonial modernity, and post-independence political dynamics. These threads were shaped by a unique philosophical viewpoint on state-society relations, different religious worldviews, and social structures like the caste system, which prioritises communal solidarity over government power. The lack of a societal revolution like those in some Western nations and reform movements that reinterpreted or revived tradition rather than challenged it produced a fertile field for diverse conservative beliefs rather than a single political position. This historical route dependence means ideological growth may differ widely between states. This study shows that Indian conservatism has many ideological profiles that support distinct socio-cultural ideals, economic views, and state functions using latent class analysis based on a vignette questionnaire. Many emphasise societal agency and the limits of state involvement in social and religious affairs, decoupling "cultural" and "economic" conservatism, as current political psychology generally defines it. This can help develop theories anchored in diverse global realities, needed to better understand the motivational and psychological bases of ideological beliefs.

Abstract 2024

A SYSTEM DYNAMICS APPROACH TO SIMULATING THE EFFECTS OF PSYCHOLOGICAL FACTORS ON TERRORISM

Yeniceri Z.*[1], Ercil Y.[2], Gokmen Y.[2], Tonbul G.[3], Baserdem E.O.[1]

[1]Baskent University, Department of Psychology ~ Ankara ~ Turkey, [2]Baskent University, Department of Public Relations and Publicity ~ Ankara ~ Turkey, [3]Atilim University, Department of Software Engineering ~ Ankara ~ Turkey

A comprehensive understanding of the multifaceted phenomenon of terrorism requires a multidisciplinary approach integrating psychology, data science, and systems modeling. This study proposes a novel method for detecting psychological indicators of terrorism using a keyword categorization technique based on importance and semantic proximity, enabling user-defined subgroups. Another objective was to process large datasets with minimal resources, enhance keyword efficiency, and simplify literature analysis. To this end, a simulation-based application was designed to examine the effects of psychological dimensions on terrorism by combining large-scale literature analysis with system dynamics modeling.

An extensive corpus was compiled by collecting abstracts from 7,244 unique articles published between 1976 and 2023 (5,295 from Web of Science and 1,949 from Scopus). After preprocessing, the dataset consisted of 1,126,722 word tokens. In order to identify psychological indicators relevant to terrorism, 9,456 keywords were extracted using Shannon's entropy difference. A novel clustering score formula was then implemented, integrating entropy difference and cosine similarity scores, yielding four heterogeneous submatrices -experts, novices, public figures, and the general public- each containing 20-24 million keyword pairs and capturing symmetrical associations among psychological constructs.

Network analysis was conducted to identify main and sub-topics associated with terrorism. The results revealed clusters of psychological concepts strongly associated with terrorism, including social polarization, absolutism, threat orientation, hate, violence, and discrimination. These dimensions were treated as variables within a system dynamics framework. Based on these findings, an interactive simulation application was developed to model the influence of psychological factors and their interactions on terrorism.

The application contributes methodologically by linking text-mined constructs with dynamic simulation, offering a replicable and resource-efficient tool for analyzing complex phenomena. This study highlights the practical relevance of systematically

exploring psychological factors shaping terrorism and provides a platform for scenario-based training and policy analysis.

PERSPECTIVES OF POLITICAL PSYCHOLOGY

Friday 24 July 2026 from 10:00 to 11:30

(K-Spadolini)

Klaus BOEHNKE (Constructor University ~ Bremen ~ Germa), Chair

Political Psychology is a branch of Applied Psychology that deals with the psychological conditions and consequences of political events. Political Psychology conducts interdisciplinary research with political science, political sociology and other sciences on the personal factors of political behavior in groups and among individuals. The term was introduced in 1860 by Adolf Bastian. Modern Political Psychology deals with topics such as electoral politics, public policy design, leadership, elite decision-making, intergroup relations, personality and political ideology, political violence, and conflict resolution. Examples of research questions include the origins of racism, determinants of voting behavior, subjective determinants of wars, and the role of leaders. It is thus clear that political psychology is a theoretical, methodologically diverse, geographically widespread, and universally applicable discipline that also has the potential to understand better and address the urgent challenges of the modern world. The symposium offers distributions from different angles.

Abstract 4908

IS AUTHORITARIANISM AN INHIBITOR OF POLITICAL ACTIVISM IN DIFFERENT CENTRAL EUROPEAN COUNTRIES?

Boehnke K.*, Edis B.

Constructor University ~ Bremen ~ Germany

The presentation is based on representative samples from Poland, Hungary, Slovakia, the Czech Republic, and Germany (N > 1000 per country). The first focus is whether authoritarianism and political activism can be assessed validly across the five countries using identical instruments. Subsequently, MANOVAs are presented to show country differences in both authoritarianism and political activism. Slovakia exhibits the highest level of authoritarianism, whereas political activism is highest in Poland. The main question is to what degree authoritarianism curbs political activism. SEM analyses show that the relationship between authoritarianism and political activism is strongest in Germany and weakest in Slovakia. In summary, authoritarianism is a persistent yet weak negative predictor of political activism across all Central European countries, with the relationship significantly stronger in Germany than in Slovakia and the Czech Republic.

Abstract 3390

HOW SHOULD PUBLIC GOODS BE DISTRIBUTED -- POLITICAL CONSENSUS AND DISAGREEMENT

Simunovic D.*, Srivastava A.

Constructor University ~ Bremen ~ Germany

Public spending is a fundamental topic in any democracy, since the benefits and services which result from it (such as urban infrastructure, drinking water supply, the police, public healthcare and education) make communal life in complex modern societies possible. Yet, we are witnessing politicized disagreement about which public benefits and services deserve more, or less, funding. Movements such as Defund the Police on the left or calls to privatize the NHS on the right showcase this trend. Previous research found that individual support for public spending comes from various personal and (perceived) societal factors: demographic characteristics (e.g., socio-economic status), political orientation (e.g., neoliberalism), attitudes towards co-beneficiaries (e.g., prejudice against ethnic minority beneficiaries), and institutional (dis)trust. In this work, we examine how these factors affect the preferences for funding various public spending goals. We distinguish two such broad goals, as being both theoretically relevant and intuitive: universal and security resources. We show that preference for spending on one or the other type of resource is upheld by a different cluster of socio-political attitudes, where prejudice against potential outgroup beneficiaries and institutional trust play a key role.

Abstract 3392

COMPARING PREDICTIVE MODELS OF POLITICAL ENGAGEMENT AND RADICALIZATION AMONG ADOLESCENTS: A PRELIMINARY LOOK AT AN ONGOING LONGITUDINAL STUDY

Reiter J.*

Universität Wien ~ Vienna ~ Austria

As children enter adolescence, their understanding of society and their place in it begins to expand, and they develop political views and ideas about whether and how they might participate in shaping society. This decision process may lead to disengagement and political apathy, democratic engagement, or indeed radicalized engagement that is marked by support for undemocratic, violent means. Across disciplines (psychology, political science, and criminology), different theoretical frameworks are used to explain what turns adolescents towards versus away from radicalization – e.g., the quest for significance model, the uncertainty-identity-model, a justice seeking and unfairness judgement model, a criminological model based on general strain theory, and a gender-identification based model. This talk presents data from an ongoing longitudinal study running from 2024 – 2026 (6 waves total) in five Austrian states (Vienna, Upper Austria, Carinthia, Burgenland, and Salzburg). 1616 students in the 8th grade of different school types (Mage = 13.97 years, SD = .88 years, 49 % female / 48 % male / 4 % other) participated in the first wave of data collection in spring of 2024, with data collections taking place in the autumn and spring of each year. Using one lesson in school to participate in the study, students filled in a survey containing various age-adjusted measures of predictors pertaining to the above-mentioned explanatory models. This talk presents preliminary analyses of the distribution and prevalence of these predictors in the sample and their relations to different political attitudes and behavioural outcomes, such as voting intentions, attitudes towards voting, engagement in collective action, and support of radicalized and violent political means.

Abstract 3393

WAR, WHAT IS IT GOOD FOR? VALUE JUSTIFICATIONS OF WAR AND POLITICAL BEHAVIOR IN AUTHORITARIAN RUSSIA.

Ponizovskiy V.*

Durham University ~ Durham ~ United Kingdom

What role does propaganda play in shaping political action in authoritarian context? Drawing on the framework of value-instantiating beliefs, we examine how propaganda alters the motivational meaning of events by linking them to basic human values, using the Russian invasion of Ukraine as a case study. We surveyed 973 Russian citizens in August 2022 to assess how they construed the war in Ukraine in terms of consequences for their core values such as security, benevolence, and achievement. We show that individuals systematically vary in meanings they assign to the war. Cluster analysis revealed two dominant profiles of value construals, differentiated by perceived consequences for conservation values. The construal profiles explained substantial variance in behavioral intentions, beyond right-wing authoritarianism, social dominance orientation, and national identity. Mediation analyses confirmed that the value construals account for substantial proportion of the relationship between media exposure and intentions for political action. Our findings offer a novel cognitive-motivational mechanism for modelling the effects of propaganda on behavior, suggesting the power lies not only in persuasion or fear, but in shaping the people's perceptions of moral affordances and threats.

Abstract 3394

(UN)DEMOCRATIC CITIZENS? GERMANY AND THE VISEGRAD COUNTRIES COMPARED

Deutsch F.*

Constructor University ~ Bremen ~ Germany

It is a well-established finding that while people express support for democracy as a preferred way to govern their country, they increasingly voice dissatisfaction with the way their country is run. Populism, skepticism toward democratic institutions, and distrust in political elites are on the rise. However, this trend varies significantly across different countries. This presentation offers an overview of some findings from the project "Political culture, democratic values, and misinformation: Detecting democratic footholds & weaknesses", which explores the political culture in four Visegrad countries – Poland, Hungary, Czechia and Slovakia – along with Germany. We examine the extent to which people in these societies adhere to democratic values and how susceptible they are to misinformation or conspiracy theories. This research is situated within the context of a broader ‘crisis of democracy’. The data collection for this project was funded by the International Visegrad Fund and included an online survey with five representative national samples, totaling over 5.300 respondents.

PSYCHOLOGY IN THE WORLD OF RAPID GEOPOLITICAL CHANGE

Friday 24 July 2026 from 14:00 to 15:30

(S-Monumentale)

Prakash Padakannaya (Christ University ~ Bangalore ~ India), Chair
Anna Leybina (Lomonosov Moscow State University ~ Mosc), Co-Chair

The contemporary world is marked by rapid geopolitical, technological, and social transformations that directly affect the epistemology and practice of psychology. Traditional boundaries of psychological inquiry are increasingly blurred, as global challenges such as inequality, conflict, technological disruption, and shifting international alliances reshape both the conditions of human life and the contexts of psychological research. This symposium explores how psychology can respond to these changes by integrating diverse perspectives from across regions and traditions.

The presentations examine multiple dimensions of psychology's evolving role in a geopolitically dynamic world. Contributions from Africa and South Asia highlight psychology's entanglement with colonial histories, its complicity in systemic inequalities, and the urgent need for decolonial, liberation-oriented approaches. Other perspectives emphasize psychology's responsibility to address international cooperation, sustainable development, challenges, and emerging global identities such as those embodied by the Global South. Presentations from China and India also suggest reexamining the contemporary theories of self and identity. Finally, a unifying call is made to move beyond fragmentation toward dialogue and cooperation, ensuring that psychology can guide humanity through this period of uncertainty and transformation. By bringing together insights from Indonesia, Nigeria, South Africa, India, and Russia, the symposium underscores that psychology must not only adapt to rapid change but also play an active role in shaping a more just, inclusive, and progressive global future.

Abstract 3721

MOVING BEYOND NARROW IDENTITIES AND BORDERS: THE GEOPOLITICS OF BEHAVIOR

Siddiqui N R.*

Aligarh Muslim University ~ Aligarh ~ India

Human behaviour influenced by the “Others” and the “Social situation” is a basic tenet of social psychology, but we seldom come across research that incorporates the underpinnings of international relations when examining psychological outcomes. In fact, mainstream social psychology has been accused of being ahistorical, apolitical, and decontextualized. The neoliberal forces shaping the world's agenda, whether ideological, economic, or political, have impacted social order that is increasingly interconnected. What happens in a distant corner of the world gets communicated very fast and it mobilises people across the world on a sectarian basis. Thus, the social situations have undergone a conceptual shift in geopolitics, where psychological phenomena are less tied to fixed geographical boundaries. The evolving, diverse identities (e.g., the Global South) often share common interests, transcending traditional state groupings. The rising socio-economic and political power of the Global South, exemplified by the BRICS nations, is moving forward to safeguard its economic interests by strengthening its new identities, to face new challenges to the colonial and Cold War-era notions of national and regional superiority. Social psychology, and primarily its identity theories, facilitate a conceptual and practical understanding of contemporary geopolitics at both conceptual and practical levels. The paper addresses the challenging task of developing theoretical frameworks for understanding emerging national and regional identities, thereby enhancing their understanding of the contemporary dynamics of international interactions.

Abstract 3723

ROLE OF NATIONAL PSYCHOLOGICAL ORGANIZATIONS AT THE TIME OF GLOBAL CRISES

Matulessy A.*

Indonesian Association of Psychology, HIMPSI ~ Jakarta ~ Indonesia

Amid rapid changes and challenges at the global level, the National psychological organizations can play a vital role in reducing the severity of crises and promoting human welfare. They can address discord, inequality, and trauma linked to global tensions through research, advocacy, and collaboration with governments and international bodies. Upholding scientific integrity and neutrality, these organizations can bridge trust across cultural and political divides, fostering dialogue, reducing conflict, and advancing collective well being of humanity. In my presentation, I highlight how HIMPSI, Indonesia's professional psychology association, has incorporated this responsibility with vision and pragmatism to address national needs while engaging constructively in global dialogue.

Nationally, HIMPSI comes up with effective mental health initiatives during pandemics such as COVID 19, supports leadership selection across institutions, conducts psychological assessments for political candidates, and contributes to recruitment processes for the police, scholarship programs, and migrant worker placements. It has also partnered with over 100 psychology faculties and collaborated with the government and civil society to protect children and women. These efforts reflect psychology's role in strengthening governance and reducing social tensions.

Globally, HIMPSI is an active member of IUPsyS, APPA, ARUPS, GPA, and BRICS+ Psychology. Its participation reflects Indonesia's diplomatic stance of neutrality and harmony, while reinforcing psychology's role as a bridge across divides. Upholding academic freedom and scientific integrity, HIMPSI emphasizes collegial collaboration and mutual respect. In doing so, it contributes to reducing conflicts and advancing psychology as a discipline that supports both national resilience and global cooperation.

Abstract 3725

FANON'S EMANCIPATION WITHIN THE PSYCHOTHERAPY ROOM: TOWARDS DECOLONIAL THERAPEUTIC METHODS IN SOUTH AFRICA

Hollander Den D.*, Baig Q.

Psychological Society of South Africa (PsySSA), South Africa ~ Cape Town ~ South Africa

Psychology in South Africa has a conflicted history. It was once instrumentalised to justify colonialism and apartheid, as exemplified by Verwoerd's use of psychological knowledge to engineer systemic oppression. Yet psychology also contributed to liberation, through the voices of Sobukwe, Biko, Black Consciousness, the Truth and Reconciliation Commission, and the establishment of professional bodies such as PsySSA. Despite these advances, structural violence—manifest in economic inequality, poor public health and education, corruption, and disrupted family systems—continues to undermine the relevance and efficacy of psychotherapy. As Gordon Lewis observed, "there can be no hope for [mental health] efforts of normalisation in an abnormal society." This presentation applies Frantz Fanon's emancipatory framework to the South African therapy room, critically examining how decolonial methods can be developed within psychotherapeutic practice. It draws on socio-political analysis, clinical reflection, and liberation psychology to interrogate the conditions under which agency and psychological emancipation can occur. Mental health cannot be narrowly defined as the absence of symptoms but must also encompass freedom from structural violence. Fanon's insistence that emancipation is achieved through agency, not bestowed, necessitates therapeutic practices that foster liberation rather than compliance. In a context marked by poverty, gender-based violence, xenophobia, and failing public services, conventional Eurocentric approaches risk silencing rather than empowering clients. The paper argues for training and practice reforms that embed decolonial praxis within psychotherapy. It offers critical recommendations for developing "emancipatory therapeutic methods of liberation" that align clinical work with the broader project of social transformation in postcolonial South Africa.

Abstract 3727

FROM DIVISION TO DIALOGUE

Leybina A.*, Veraksa A., Leonov S.

Lomonosov Moscow State University, Moscow ~ Moscow ~ Russian Federation

The world is undergoing unprecedented geopolitical, technological, and social transformations. Psychology, as both a science and a practice, cannot remain untouched. The rapid rise of artificial intelligence and the forthcoming impact of quantum computing promise to reshape not only psychological research methods but also the very nature of human experience. To remain relevant, psychologists must stand together at the forefront of these changes, ensuring that our discipline evolves in step with the challenges/ opportunities of the new era. Yet, instead of uniting, our global community often faces fragmentation. Tensions rooted in politics, national origin, or ideological differences risk overshadowing our shared professional mission. Separation, negativity, and even exclusion undermine the very principles of psychology and divert energy away from addressing the profound issues before us. These challenges, if approached constructively, could become drivers of growth, forcing us to confront biases and reimagine collaboration in more inclusive ways. Countries historically positioned outside the traditional centers of psychological science have now accumulated substantial theoretical and practical potential. Their contributions must not be overlooked if we are to build a truly global psychology. As an illustration of this principle, recent research on digital childhood will be presented, demonstrating how nations can collaborate to address emerging challenges and contribute to the progress of humanity. It is time to move beyond stereotypes and divisions, and to embrace complexity as a source of strength. Only through inclusive dialogue and cooperation can we create a progressive psychology capable of guiding humanity in an era of rapid change.

11 - Division 11: Political Psychology

WALKING IN THE STEPS OF OUR ANCESTORS: REIMAGINING INDIGENOUS PSYCHOLOGY ACROSS THE GLOBE

Friday 24 July 2026 from 15:30 to 17:00

(S-Monumentale)

Michelle Johnson-Jennings (University of Washington ~ Seattle ~ Uni), Co-Chair

This international symposium brings together Indigenous psychologists and scholars from Aotearoa New Zealand, Australia, Turtle Island (Canada and the United States), the Pacific, and Asia to position Indigenous psychology as a distinct and vital discipline. It seeks to transform the structural and cultural conditions that continue to harm Indigenous peoples. Building on the foundational contributions of Distinguished Professor Linda Tuhiwai Smith and Professor Aileen Moreton-Robinson—whose work in Indigenous research and decolonising methodologies has reshaped how knowledge is produced and validated—this symposium highlights the leadership of Indigenous psychologists in driving systemic change across professional domains. These include:

• Reforming regulatory frameworks to incorporate Indigenous definitions of ethics, competence, and care

• Designing culturally-grounded training programmes and qualifications

• Advancing Indigenous research methodologies rooted in sovereignty, community voice, and place-based knowledge systems

Framed as a human rights imperative, the decolonisation of psychology is both urgent and necessary. Decolonial practice challenges the dominance of Western psychological traditions that are grounded in settler-colonial and white normative ideologies while drawing engaging in restorative practice. Drawing on research and practice, presenters will share Indigenous-led solutions that prioritise life promotion, land-based healing, and the restoration of mauri (life force). Across diverse contexts, Indigenous psychologists are implementing culturally grounded frameworks that affirm Indigenous strengths, identities, and worldviews.

Two core themes underpin the symposium: resistance to the racism embedded in psychology, and global Indigenous solidarity. Presenters will also explore the significance of movements such as land back and Indigenous ecologies of love as essential to decolonisation—reconnecting communities to language, land, cultural identity, and healing.

Abstract 3160

LOVE AS METHODOLOGY: RELATIONAL PRACTICE IN INDIGENOUS PSYCHOLOGY

Johnson--Jennings M.*, Evans--Campbell T.

University of Washington ~ Seattle ~ United States of America

This symposium, led by two Indigenous professors, explores love as a research approach within Indigenous psychology, highlighting how relationality, reciprocity, and care serve as both methodology and medicine. Rooted in decolonizing frameworks, this work examines how Indigenous knowledge systems disrupt dominant paradigms that often pathologize or marginalize Indigenous peoples. The presenters will underscore Indigenous contributions to psychology, demonstrating how frameworks of love, kinship, and cultural continuity expand and transform the discipline itself. By positioning research as an act of resistance, this symposium shows how Indigenous approaches counter erasure, reclaim voice, and advance sovereignty in the face of ongoing colonial structures. It also illustrates how Indigenous psychology fosters collective resilience and wellbeing, particularly during times of political turmoil when communities are confronted with intensified threats to justice, land, and life. Decolonizing and resistance are presented not only as tactics of survival but also as pathways toward healing, social justice, and the flourishing of future generations.

Abstract 3161

INDIGENOUS PSYCHOLOGY: VIEWING THE WORLD THROUGH THE LENS OF SPIRITUALITY AND RELATIONAL PRACTICE

Valentine H.*[1], Fitzpatrick M.[2]

[1]Massey University ~ Palmerston North ~ New Zealand, [2]University of Waikato ~ Hamilton ~ New Zealand

Māori, the Indigenous people of Aotearoa New Zealand, have long drawn on Māori ancestral knowledge systems—to engage with the world through language, relationships, and cultural rituals. Central to this worldview is Māori spirituality, which is inseparable from wellbeing. Research increasingly affirms the role of spirituality in psychological care, particularly for Indigenous communities whose healing practices are deeply relational and spiritually grounded. Psychology in Aotearoa has historically privileged Western frameworks, yet Indigenous psychologists are leading transformative change. Drawing on practice- and research-informed insights, this presentation highlights how Māori relational practices and cultural rituals—such as 'The Gateway - Te Tomokanga', the ceremonial process of entering a marae (Māori meeting place)—offer powerful models for psychological engagement. These rituals embody values of connection, respect, and collective wellbeing, and provide culturally grounded pathways for education, care, and healing. This presentation draws on three research projects: reclaiming Indigenous knowledge in psychology, spiritual care in health systems, and anti-racism in psychology. It affirms Indigenous psychology as a distinct and vital discipline—one that promotes sovereignty, cultural identity, and relational healing, and fosters global Indigenous solidarity

Abstract 3162

TRANSFORMING AUSTRALIAN PSYCHOLOGY THROUGH INDIGENOUS LEADERSHIP AND RELATIONALITY: EXAMPLES FROM THE AUSTRALIAN INDIGENOUS PSYCHOLOGY EDUCATION PROJECT

Dudgeon P., Selkirk B.*

University of Western Australia ~ Perth ~ Australia

Indigenous psychology is a global decolonising movement that challenges the dominance of Western paradigms by privileging Indigenous worldviews and knowledge systems. In Australia, this movement is being led by Aboriginal and Torres Strait Islander psychologists who are reshaping psychology education and practice as a matter of epistemic justice and health equity. Central to this transformation is the Australian Indigenous Psychology Education Project (AIPEP), an Indigenous-led initiative committed to increasing Indigenous representation in psychology higher education and the workforce. AIPEP applies culturally grounded methodologies and decolonising theory to practice, affirming Indigenous knowledge systems and relational values such as respect, reciprocity, and responsibility. AIPEP is influencing transformational change at all levels from national policy and regulation, to organisational and service delivery, to individual learning journeys. One key initiative that exemplifies multi-level transformational change is the AIPEP Community of Practice, a national collective of psychology university educators who share a commitment to decolonising and Indigenising psychology curricula, building cultural responsiveness, and supporting the success of Aboriginal and Torres Strait Islander psychology students. This presentation will outline the principles and practices underpinning AIPEP, highlight critical outcomes and innovations, and reflect on personal and professional experiences of facilitating this national movement. We also address ongoing challenges and future directions necessary for sustaining the momentum of decolonising psychology in Australia.

Abstract 3163

MĀORI APPROACHES TO RESHAPING PSYCHOLOGY CURRICULA

Masters--Awatere B.*[1], Valentine H.[3], Rowe L.[4], Waitoki M.[2]

[1]University of Waikato ~ Hamilton ~ New Zealand, [2]~ Hamilton ~ New Zealand, [3]Massey University ~ Palmerston North ~ New Zealand, [4]Te Whare Wananga o Raukawa ~ Otaki ~ New Zealand

Across Aotearoa New Zealand Māori psychologists affirm the strength of their knowledge traditions and call for psychology to be reshaped through Indigenous ways of knowing, being, and doing. The persistence of settler-colonial paradigms has limited the meaningful integration of Indigenous cultural knowledge, languages, and traditions within the discipline. The dominance of a monocultural framework continues to overlook the lived realities and specific needs of Indigenous communities, contributing to persistent inequities in health and wellbeing outcomes despite the global reach of Western psychological models. Central to Indigenous approaches to healing and wellbeing is a principle often overlooked in psychology—aroha, or love—as an interconnected and transformative force. Recognising this, there is an urgent need to design curricula that actively challenge the settler-colonial and racist foundations embedded within psychological practice. Our panel brings together senior Māori academics and practitioners who have long championed Indigenous content in psychology. We will describe the development of Kaupapa (Māori centered) Māori minor and major programmes and explore how curriculum design, informed by Indigenous ways of knowing, can serve as a powerful tool for decolonisation. This approach equips future psychologists to serve their communities while sustaining cultural identities, knowledge systems, and relational responsibilities. We draw on experiences of developing pedagogies that recenter Indigenous knowledge to reshape teaching and curriculum at the University of Waikato and Massey University. Both Universities offer training pathways to registration as a psychologist and are the only Universities with a dedicated Indigenous psychology unit or centre. We finish with a discussion of the implications for community-based practice.

Abstract 2072

RETHINKING THE LIBERAL–CONSERVATIVE DIMENSIONS OF MORAL CONCERNS: A PERSPECTIVE ON INDEPENDENCE-UNIFICATION (IU) VALUES IN TAIWAN

Sung C.T.*[1], Lin C.[2]

[1]London School of Economics and Political Science (LSE) ~ London ~ United Kingdom, [2]Norwegian School of Economics (NHH) ~ Bergen ~ Norway

Moral foundations theory (Haidt & Joseph, 2007)—care, fairness, ingroup loyalty, authority, and purity—has been widely used to examine conservative–liberal ideology. Research in Western contexts generally finds that liberals emphasise individualising values (care and fairness), whereas conservatives distribute endorsement more evenly across the five foundations. In Taiwan, however, political ideology is primarily framed around the Taiwan independence–China unification (IU) divide rather than the conservative–liberal spectrum. Some scholars suggest that independence can be regarded as liberal, while unification and status quo positions align with conservatism, but direct evidence remains limited. This study therefore investigates the intersection of moral foundations, IU attitudes, and liberal–conservative ideology in Taiwan.

Using survey data (N = 1,097), we find that the moral foundations of liberals and conservatives in Taiwan do not fully align with Western patterns. While liberals score significantly higher on care and fairness compared to conservatives—consistent with prior findings—they also score higher on ingroup loyalty, a result opposite to that observed in some Western studies. Moreover, self-identified liberals are strongly associated with Democratic Progressive Party (pro-independence) support and pro-independence attitudes, whereas conservatives are more closely tied to Kuomintang (pro-unification) support and status quo preferences.

We argue that the strong ingroup loyalty among Taiwanese liberals reflects solidarity to challenge the status quo and pursue independence. Thus, care and fairness appear to reflect bottom-up moral intuitions shaping liberal attitudes, while ingroup loyalty in Taiwan reflects a top-down force. Political elite messaging—such as discourse on the “China threat” or “resisting China, safeguarding Taiwan”—may reinforce these ingroup values, leading self-identified liberals to display stronger group solidarity.

Abstract 1556

PERCEIVING DEMOCRACY BEYOND POLITICS: DEMOCRATIC VALUES AS PSYCHOLOGICAL RESOURCES PREDICTING YOUNG ADULTS' WELL-BEING, HOPE, AND TRUST

Akin Sari B.*

Baskent University ~ Ankara ~ Turkey

Democratic values such as freedom, equality, and justice are fundamental to civic life and have traditionally been studied within political science. However, their role as psychological constructs remains underexplored. This study positions the perception of democratic values as an emerging field in applied psychology, framing it not only as a political orientation but also as a potential protective factor for psychological well-being. Exploring this perspective will provide insights into how sociocultural orientations contribute to mental health and resilience in young adults. By conceptualizing democracy as a psychological resource, the study will investigate how democratic value perception relates to well-being, future hope, and trust among young adults in Türkiye. The study aims to introduce democratic value perception as a novel construct in psychology, bridging social and political psychology with well-being research. A quantitative, cross-sectional design will be employed with a sample of young adults (a minimum of 300 participants aged 18–25). Data will be collected using validated scales measuring democratic values, well-being, hope, and trust. The research protocol is presently under ethics committee review. Correlational and regression analyses will be conducted to examine the relationship between democratic value perception and psychological well-being and its predictive role on well-being. Findings will be presented and critically discussed to highlight their implications for applied psychology. It is anticipated that democratic values may function as protective psychosocial resources, fostering resilience and psychological well-being. The study is expected to contribute to preventive mental health approaches and has practical implications for higher education policies, suggesting that value-based psychoeducational programs may enhance both democratic participation and well-being. By situating democratic value perception as a psychological construct, this research is presumed to provide a transdisciplinary contribution that underscores democracy not only as a political system but also as a source of psychological health and social sustainability.

Abstract 702

LEADER PERSONALITY TRAITS AND CROSS-NATIONAL EMPATHY: EXPERIMENTAL EVIDENCE FROM UKRAINE WAR COVERAGE

Balmas M.*

The Hebrew University of Jerusalem ~ Jerusalem ~ Israel

Contemporary politics has witnessed increasing personalization, with national leaders becoming dominant figures in international media coverage. This trend raises critical questions about how foreign leaders' perceived characteristics influence public attitudes toward their nations' citizens, particularly during crises requiring international support. This research investigates which specific personality traits of national leaders most effectively promote empathy and pro-social behavior toward their citizens among foreign publics. We examine whether communal traits (warmth, morality) versus agentic traits (competence, determination) differentially impact cross-national empathy and helping behavior. We conducted experimental studies in Israel (N=354) and the United States (N=386) shortly after Russia's invasion of Ukraine. Participants were randomly assigned to read fictitious news articles highlighting different personality traits of President Zelensky (warmth, morality, competence, or determination) or served as controls. We measured empathy toward Ukrainian families in distress, general empathy toward Ukrainians, willingness to help, and actual monetary donations. Across both countries, participants exposed to articles emphasizing Zelensky's warmth or morality demonstrated significantly higher levels of empathy toward Ukrainian citizens and greater pro-social behavior compared to those exposed to competence- or determination-focused coverage. In Israel, twice as many participants in the warmth condition made actual monetary donations compared to other conditions. No significant differences emerged between control groups and competence/determination conditions. National leaders seeking to cultivate international empathy and support should emphasize communal rather than agentic personality traits in their public communications. These findings have important implications for crisis communication, international relations, and understanding how media personalization affects cross-national solidarity during humanitarian crises.

Abstract 1641

PROMOTING COOPERATION AND SOCIAL CAPITAL THROUGH INTERMEDIATE PROCESSES

Mannarini T.*[1], Reho M.[2], Salvatore S.[1]

[1]University of Salento ~ Lecce ~ Italy, [2]University of Modena and Reggio Emilia ~ Modena ~ Italy

In the context of contemporary democracies, the decline of traditional forms of association requires a new understanding of the social mechanisms that generate trust and cooperation. This contribution presents a research program that investigates the role of intermediate processes (IPs) - defined as collective actions that combine identity motivations with supra-individual public normative goals - as catalysts of social capital. The central hypothesis is that IPs promote social capital by generating “semiotic capital,” that is, shared and high-dimensional systems of meaning (operationalized in terms of symbolic universes) that facilitate social coordination.

The research program consists of a number of complementary studies: (1) a territorial study analyzing the association between IPs, symbolic universes, and proxies of social capital in Italian regions; (2) a survey of a representative Italian sample measuring individual exposure to IPs, semiotic capital, and cooperative attitudes; (3) a simulation study that integrates an IP parameter to predict levels of cooperation; and (4) an experimental study using the prisoner dilemma, testing whether the introduction of a negotiated IP compared to a simulated norm increases cooperation in subsequent rounds.

The results demonstrate that active participation in IPs enhances the dimensionality of meaning, promotes cooperative behavior, and strengthens the semiotic space essential for social cohesion. This research seeks to provide an empirically grounded model of how new forms of collective action can effectively connect individuals, institutions, and the public good.

Abstract 1334

IDENTITY COMMITMENTS, APPRAISALS OF MODERNITY, AND PSYCHOLOGICAL WELL-BEING: EVIDENCE FROM TWO STUDIES

Stecko L.*

Wyzsza Szkola Ksztalcenia Zawodowego ~ Wroclaw ~ Poland

Understanding how identity commitments translate into psychological well-being is central to societal development in rapidly changing, globalized contexts. A promising account posits that attitudes toward modernity—how people appraise contemporary social change—constitute a proximal mechanism linking who one is (identity) to how one feels (well-being). Testing this identity → attitudes → well-being pathway clarifies when identity commitments foster resilience versus vulnerability at the population level.

Identity was assessed with the Sociocultural Identity Model (SIM), which captures three transversal dimensions—Fidelity (clarity and depth of commitments), Activity (goal-directed engagement), and Ideology (coherent value orientation)—each expressed across multiple life domains (e.g., work/education, social ties, personal development). Appraisals of modernity were modeled as perceived benefits and perceived threats; ambivalence was computed from these two components to index the co-occurrence of positive and negative evaluations (benefits–threats–based ambivalence index), rather than measured as a separate scale. Psychological well-being was indexed with established multidimensional measures. Two studies (combined N = 930, ages 18–60) employed path models with age and gender covariates, alternative scoring checks, and bootstrapped confidence intervals.

Stronger identity commitments showed moderate positive associations with well-being. Benefits of modernity related small-positively, whereas threats and computed ambivalence related small-negatively to well-being. Crucially, modernity appraisals partially mediated the identity–well-being link, indicating that the socio-cognitive framing of societal change helps explain why firmer commitments predict better psychological functioning. Effects were convergent across SIM facets and domains, with Fidelity and Activity yielding the most consistent patterns; results were robust across alternative specifications.

Findings embed identity development within globalization processes by demonstrating that evaluations of modernity are a tractable mechanism connecting commitments to well-being. Implications include screening for elevated ambivalence, psychoeducational strategies that recalibrate appraisals of societal change, and integrating identity-focused work with communication about modernity's opportunities and risks—actionable levers for counseling, community programs, and policy communication aimed at strengthening well-being in contemporary societies.

Abstract 1551

THE SEARCH FOR DEMOCRATIC VALUES IN TÜRKIYE: ANALYSIS OF GOOGLE TRENDS

Uyar Suiçmez T.*

Baskent University ~ Ankara ~ Turkey

Examining how citizens interact with democratic values on the World Wide Web would provide insight for applied areas of psychology. The current research aims to collect information about the popularity of democratic values, such as Freedom, Equality, and Justice in Türkiye, and uses the Google Trends tool, which is a public website that offers data based on Google Search that shows how frequently a particular search term is entered in comparison with all other search terms in different regions and languages. Parallel to the research aim, Türkiye was chosen as a region, and the years between 2020-2025 were selected as the time range to observe the flow. As a result, it is evident that in 2020, these three democratic values were viewed as distinct terms, with Justice being the most popular. Moreover, when examining the trends, it is evident that in 2023, all three terms started to be searched at the same level of popularity. Specifically, Freedom remained at a moderate level for five years, excluding interim periods. Additionally, Justice remained at a moderate to high level for five years, excluding interim periods. Equality, on the other hand, was the least popular search term until 2023, but its search popularity increased dramatically thereafter. Although there was a partial loss of popularity at the end of the approximately one-year period, it was observed that the three terms were still searched with very similar frequency. These changes, given importance to democratic values as seen in the flow of Google Trends, suggest a dynamic nature of them in Türkiye. These quantitative results, however, need to be evaluated in a context. To achieve this aim, all the results will be discussed by evaluating them in the context of data from news sources related to political perspectives and economic developments, thereby providing a contextual framework.

Abstract 2509

AN EXAMINATION OF EMOTIONAL CONTAGION THROUGH SPORTS VIDEO VIEWING

Aiba E.*[1], Matsuda K.[2]

[1]Yokohama National University ~ Yokohama ~ Japan, [2]Josai University ~ Sakado ~ Japan

Sports have the power to fascinate people, and emotions are considered one of the key factors underlying this appeal. This study examined the extent to which emotional contagion occurs when viewers watch a medal-winning scene in a track and field relay event. To assess emotional contagion, participants were asked to rate their own emotional states in terms of four affective dimensions—high-arousal positive, low-arousal positive, low-arousal negative, and high-arousal negative emotions—based on the scale developed by Ito et al. (2018). They then estimated the athletes' emotional states using the same scale. A higher correlation between these two sets of scores was interpreted as a stronger indication of emotional contagion. Participants' general susceptibility to emotional contagion was also assessed using the Emotion Contagion Scale (Doherty, 1997), and the results suggested that individuals who are generally more susceptible to others' emotions also tend to experience stronger emotional contagion during sports spectating. Furthermore, the cues—facial expressions, attitudes, or behaviors—that participants referred to when estimating the athletes' emotions were also examined. The results provided insights into the conditions under which emotional contagion occurs during sports spectating. These findings indicate that this method can serve as an effective approach for identifying emotional contagion phenomena in real sports contexts. Based on these results, future research will investigate how emotional contagion among teammates influences team performance in group sports.

Abstract 2079

"LET THEM PLAY … BUT NOT WITH ME": EXPLORING STUDENT-ATHLETES' ATTITUDES TOWARDS TRANSGENDER INDIVIDUALS' PARTICIPATION IN VARSITY SPORTS

Davis A.*[1], Whelton W.J.[1], Sharpe D.[2]

[1]University of Alberta ~ Edmonton ~ Canada, [2]University of Regina ~ Regina ~ Canada

A debate is raging over whether transgender athletes should be allowed to participate in elite sports. Perspectives on the issue of transgender individuals' participation in sports are influenced by societal attitudes towards gender identity and inclusivity. Knowledge of attitudes plays a key role in the effective implementation of interventions to reduce prejudice towards transgender people. The present study examined the attitudes of 118 varsity athletes from three universities in Western Canada towards transgender athletes' participation in varsity sports. Participants were supportive of transgender individuals generally and transgender athletes participating in sports specifically. That support for transgender individuals and athletes was especially true for those participants who knew someone transgender personally and those participants of a minoritized sexual orientation. There was less support for transgender athletes competing in the gender category of their choosing. Participants higher in religious fundamentalism and right-wing authoritarianism, and participants with a conservative political orientation, expressed more negative attitudes than other participants towards transgender individuals and transgender athletes. Surprisingly, self-compassion was unrelated to attitudes. The implications of these results are discussed for researchers studying attitudes towards transgender athletes and for psychologists treating and supporting transgender and cisgender varsity athletes.

Abstract 1034

NEW FORMS OF PHYSICAL ACTIVITY AND MENTAL HEALTH PREVENTION. THE EFFECTIVENESS OF A 4-WEEK CROSSFIT INTRO TRAINING IN REDUCING THE SEVERITY OF STRESS, ANXIETY, AND DEPRESSION SYMPTOMS – PRELIMINARY REPORT FROM A POLISH STUDY

Dębski P.*[1], Czyz K.[2], Debska--Janus M.[3], Meisner M.[2], Smolarczyk J.[1], Turska--Czyz D.[1], Piegza M.[1], Badura--Brzoza K.[1], Skalski--Bednarz S.B.[4]

[1]Medical University of Silesia ~ Katowice ~ Poland, [2]Humanitas University ~ Sosnowiec ~ Poland, [3]Jerzy Kukuczka Academy of Physical Education in Katowice ~ Katowice ~ Poland, [4]Catholic University of Eichstätt-Ingolstadt ~ Eichstätt ~ Germany

Introduction: CrossFit® – A Unique Functional Training Methodology is an innovative training program that combines strength, endurance, and gymnastics development. Its primary goal is the comprehensive development of motor skills, thereby contributing to improved physical fitness in participants. Preliminary reports also indicate that this type of training may be important in improving the psychological functioning of participants.
Objective: To evaluate the effectiveness of a 4-week CrossFit Intro training in reducing the severity of symptoms of stress, anxiety and depression.
Material: 84 mentally healthy Polish adults participated in the study. 40 individuals (52.5% men), participated in a 4-week CrossFit Intro training group, while 44 individuals (29.5% men), participated in a control group, not taking part in any functional training.
Methods: The experimental group underwent a 4-week CrossFit Intro training program. Both the experimental and control groups were measured twice (before and after the intervention) for the severity of stress, anxiety, and depression symptoms. PSS-10 and HADS scales were used. The paired t-test was used to examine the significance of changes in the both groups.
Results: In the experimental group participating in the 4-week CrossFit Intro training, a significant decrease in the severity of stress symptoms (mean I = 20.50; mean II = 13.28; $p < 0.001$), anxiety (mean I = 8.20; mean II = 5.28; $p < 0.001$) and depression (mean I = 7.13; mean II = 3.58; $p < 0.001$) was observed. In the control group, only a much less pronounced decrease in the severity of stress symptoms was observed (mean I = 16.02; mean II = 13.80; $p < 0.01$), while no significant changes were noted in the severity of anxiety and depression symptoms.
Conclusions: CrossFit Intro training can be an effective method of enhancing the psychological functioning of participants by supporting the reduction of the severity of psychopathological symptoms related to stress, anxiety and depression.

Abstract 2502

VIRTUAL REALITY-BASED COGNITIVE TRAINING TO ENHANCE DECISION-MAKING IN FOOTBALL ATHLETES

Gala F.C.R.*[1], Trapletti M.[2], Cè E.[2], Repetto C.[1]

[1]Department of Psychology, Università Cattolica del Sacro Cuore ~ Milano ~ Italy, [2]Department of Biomedical Sciences for Health, Università degli Studi di Milano ~ Milano ~ Italy

In team sports, success and failure often depend on athletes' decision-making skills, which rely on perceptual and cognitive abilities. Virtual reality (VR) can simulate realistic sporting scenarios, allowing athletes to practice reading the game, processing information, and making rapid, accurate decisions. Despite its promise, evidence on the effectiveness of VR training for enhancing perceptual-cognitive skills remains limited. This study investigates whether VR training improves decision-making accuracy and whether these improvements transfer to underlying cognitive functions.

Twenty-eight youth football players from a professional club participate in a within-subjects study during the competitive season. Participants are tested at baseline (T0), after four weeks of control (T1), and after four weeks of VR-based cognitive training (T2). A total of 55 videos are recorded using a GoPro Max in HERO mode. These consist of variations of seven base formations, including passing, shooting, and dribbling. Training involves watching 15 videos via a Meta Quest headset, three times per week. Videos play up to a decision point, prompting players to verbalise their intended course of action, and then resume to show the optimal response. Players view the scenario from a first-person perspective, visualising themselves performing the action. Twenty unique videos are used for assessment at T0, T1, and T2. The primary outcome is decision-making accuracy within 1.5 seconds. At each time point, np-tests (TMT-L, Go/No-Go) from the Vienna Test System are administered to explore far-transfer effects on response inhibition, cognitive flexibility, and information processing speed. At T2, participants complete questionnaires assessing embodiment, sense of presence, and the perceived usefulness and ease of use of VR.

VR can be a valuable tool for off-field training, enhancing decision-making accuracy by providing immersive, safe, and repeatable scenarios. This study provides insights into designing effective VR-based cognitive training and explores its far-transfer effects on cognition.

Abstract 1897

STRESSORS AND EXPECTED PERFORMANCE OF SOCCER ATHLETES: THE ROLE OF SPORT CONFIDENCE AND COGNITIVE APPRAISAL

Gomes R.*[1], Fontes L.[2], Morais C.[3], Simães C.[4]

[1]University of Minho, Psychology Research Centre, School of Psychology. ~ Braga ~ Portugal, [2]University of Minho. Adaptation, Performance, and Human Development Research Group, School of Psychology. ~ Braga ~ Portugal, [3]Research Centre for Human Development, Faculty of Education and Psychology, Universidade Católica Portuguesa. ~ Porto ~ Portugal, [4]Health Sciences Research Unit: Nursing (UICISA: E), Nursing School of Coimbra (ESEnfC), Coimbra, Portugal. University of Minho, School of Nursing. ~ Braga ~ Portugal

Introduction: Youth sports are often viewed as a way for athletes to develop a healthy lifestyle and various skills. However, this is not always the case, and participation in sports can sometimes have a negative impact on young players' growth. To understand how athletes handle competition stress, it is essential to examine their perceptions of physical, emotional, behavioral, and cognitive stressors, as well as the coping strategies they employ to manage them.

Purpose: This study aimed to provide a framework for understanding how athletes evaluate stress before a competition and how stress relates to cognitive appraisal, sport confidence, and performance expectations.

Method: The participants were 327 male youth athletes, aged 15–19 years (M = 16.90; SD = 1.00), who competed in the Portuguese National Football League and completed a questionnaire 24 to 48 hours before their match, using the critical incident methodology. The evaluation protocol included the Questionnaire of Competitive Stressors in Sport, the Primary and Secondary Cognitive Appraisal Scale, the Sport Confidence Inventory, and the Sport Performance Perception Questionnaire. Path analysis was conducted to test the conceptually proposed mediation models.

Results: Results revealed that opponents were the main source of stress for athletes and that the more athletes stressed about their opponents, the more they tended to perceive the situation as threatening (and less challenging), the lower their perceptions of coping and sport confidence, which, in turn, predicted lower expectations of individual and collective performance.

Conclusions: Perceiving stress as a challenge or threat impacts the confidence and expected performance of young athletes. Our study supports previous findings on stress adaptation and offers insights for coaches and sports psychologists. Changing athletes' perceptions of competition through questioning and restructuring their thoughts can help them develop more adaptive thinking during high-pressure, stressful situations.

Abstract 1096

THE ROLE OF MOTIVATION AND SELF-DETERMINATION THEORY IN MINDFULNESS TRAINING OUTCOMES AMONG ADOLESCENT FOOTBALL PLAYERS

Mascarenhas D.A.M.*[1], Pai K K.[1], Rao R.[2], Narasimhan A.[2]

[1]Department of Psychiatry, Kasturba Medical College Mangalore, Manipal Academy of Higher Education ~ Manipal ~ India, [2]Department of Community Medicine, Kasturba Medical College Mangalore, Manipal Academy of Higher Education ~ Manipal ~ India

Background: Adolescence is a critical developmental phase. In sport context, these dynamics are intensified as athletes navigate both performance demands and developmental transitions. Self-Determination Theory (SDT) highlights autonomy, competence, and relatedness as its components and motivational orientations. Although mindfulness interventions are gaining prominence in applied sport psychology, their effectiveness among adolescent athletes remains uncertain. Furthermore, adolescent football players are exposed to mental pressure given the nature of the sport. Examining the predictive role of SDT and motivational factors may guide strategies to facilitate mindfulness outcomes among adolescent football players. Objective: This study aimed to evaluate the predictive role of SDT and motivational factors on the changes in flow and mindfulness following Mindful Sport Performance Enhancement (MSPE), a sport-specific mindfulness intervention among adolescent football players. Method: The study participants included 105 adolescent football players (Mean-age 14.4, 79% males). A pre-post interventional study was employed, obtaining self-reported measures on Physical Education Autonomy, Relatedness, Competence (PE-ARC), Physical Education Motivation (PEMS), Mindfulness (Mindful Attention Awareness Scale -MAAS), and Flow State Scale (FSS-2). The mean difference score was computed for mindfulness and flow as the dependent variable. Linear Regression was performed with PE-ARC, PEMS, and sub-dimensional scores as predictors. Results: Regression analysis indicated that motivation (PEMS) positively predicted improvements in flow state (B= -0.60, p=.013) while self-determination (PE-ARC) negatively predicted improvements (B= -0.49, p= <.001) with 21.4% variance. Amotivation (sub-dimension-PEMS) significantly predicted lower flow, explaining 30.5% variance (B= -3.18, p= .024). Conclusion: Findings indicate that motivational factors predict the effectiveness of mindfulness training on flow outcomes, which is essential for performance enhancement among adolescent football players. Implementation of motivational strategies alongside mindfulness may optimize outcomes. Integration of such tailored programs into coaching, school, and sports authority practices supports adolescent athlete well-being and performance, aligning with SDG 3 (Good Health and Well-being) and SDG-4 (Quality Education)

Abstract 2562

PSYCHOLOGICAL FACTORS ASSOCIATED WITH THE WORSENING OF THROWING YIPS SYMPTOMS

Matsuda K.*[2], Aiba E.[1]

[1]Yokohama National University ~ Yokohama ~ Japan, [2]Josai University ~ Sakado ~ Japan

Objective

This study sought to identify psychological factors associated with the severity of the yips. Although prior research has investigated antecedents of yips onset, the reasons why symptoms worsen or escalate have not been examined sufficiently, leaving an important gap for targeted assessment and intervention.

Methods

Ten collegiate baseball players affected by the yips completed 10 throws each from 45 ft and 90 ft. Psychological factors—reinvestment, perfectionism, competitive trait anxiety, and pre-throw state anxiety—were dichotomized at the sample mean (high ≥ mean; low < mean). Between-group differences in performance were evaluated using nonparametric tests (Mann–Whitney U test; where appropriate, Kruskal–Wallis test with tied-rank adjustment).

Results

At 45 ft, a significant group difference was observed for reinvestment (Mann–Whitney U = 2.5, z = −2.044, exact p = .038; asymptotic p = .041). Competitive trait anxiety was also significant (Kruskal–Wallis H = 7.257, df = 2, p = .027). Pre-throw state anxiety and perfectionism were not significant at 45 ft, and no comparisons at 90 ft reached significance (all p > .05).

Conclusions

These findings indicate that reinvestment and competitive trait anxiety may contribute to the worsening of yips symptoms. By contrast, although other psychological factors and the 90-ft condition did not yield statistically significant differences, several comparisons exhibited relatively large effect sizes, and insufficient statistical power cannot be ruled out. Future research should increase sample size and conduct analyses that consider relations among psychological factors (e.g., mediation and interaction) in order to more precisely identify the psychological determinants most closely linked to the aggravation and escalation of yips symptoms.

Abstract 198

MORE ACTIVE, MORE NATURE-CONNECTED? THE CARRY-OVER EFFECT OF PHYSICAL ACTIVITY IN PRO-ENVIRONMENTAL BEHAVIOR

Zhou H.*[1], Lippke S.[2], Miao M.[3], Yang G.[1], Lai Q.[1], Wang Y.[1], Jin C.[1], Chen Y.[1]

[1]Beijing Forestry University ~ Beijing ~ China, [2]Hamburg University of Applied Sciences/Hochschule für Angewandte Wissenschaften Hamburg ~ Hamburg ~ Germany, [3]Peking University ~ Beijing ~ China

Carry-over effects describe how one behavior, such as physical activity (PA), can influence another, like pro-environmental behavior (PEB), through psychological mechanisms and the transfer of resources. Three studies have examined the potential carry-over effect and its mechanism between PA and PEB, testing whether psychological mechanisms link the two behaviors and enable the transfer of resources. Study 1 used the China General Social Survey (n = 9,960) and found a significant positive correlation between PAB and PEB, providing preliminary evidence for their interrelation. In pre-registered Study 2, n = 228 college students were examined twice, one month apart, to test the longitudinal carry-over effect from PA to PEB. The results showed that the carry-over effect occurred through a mediating chain of PA intention – PA plans – pro-environmental intention PEB. In Study 3, a 2 (group: planning intervention group vs. active control group) × 3 (time: baseline vs. post-test vs. follow-up) pre-registered randomized controlled trial was conducted among n = 70 college students. Results showed a time effect with an increase in all dependent variables from baseline to post-test but no interaction effect between time and group. However, we found a significant mediating effect of change in pro-environmental intention between changes in physical activity planning and change in PEB (B = 0.17, 95 % CI [0.05, 0.30]). Overall, the results of these studies demonstrate that planning PA can promote PEB, supporting the hypothesized psychological mechanisms. However, the experimental results from Study 3 require further exploration owing to the absence of a significant interaction effect.

PROFESSIONAL PATHWAYS AND PSYCHOLOGICAL SUPPORT IN SPORT CONTEXTS: APPLIED PERSPECTIVES ACROSS ROLES AND SETTINGS

Friday 24 July 2026 from 15:00 to 16:30

(E- Spadolini)

Chiara D'Angelo (Università Cattolica del Sacro Cuore ~ M), Chair and Presenter
Caterina Gozzoli (Università Cattolica del Sacro Cuore ~ M), Discussant

This invited symposium addresses the evolving professional pathways and psychological support systems in sport, adopting applied and context-sensitive perspectives. By integrating contributions across different roles and settings, the symposium examines how athletes, coaches, and sport psychology practitioners navigate issues of precariousness, career development, identity, and cultural attitudes.

The first contribution introduces a psychosociological lens on precariousness in Italian professional football, highlighting how fragile institutional mediation reshapes the relationship between subjectivity, work, and society. The second examines a university-based Dual Career program, showing how process evaluation can illuminate relational dynamics, enablers, and future challenges of career assistance in higher education. The third is a reflective narrative of a trainee sport psychologist, illustrating how transnationalism, gender, and dual career experiences shape identity and professional philosophy. The fourth contribution investigates cultural attitudes toward sport psychology among Italian athletes and coaches, revealing generally positive perceptions yet significant demographic differences. Finally, the fifth presentation reflects on professional dilemmas at the French Institute of Sport (INSEP), where the boundary between performance enhancement and mental health care demands collaboration, ethical sensitivity, and role negotiation.

Taken together, these studies and reflections emphasize the multifaceted and dynamic nature of professional development in sport. They highlight the importance of culturally grounded, ethically reflective, and context-aware practices for sustaining both people and professions in applied sport psychology.

Abstract 3633

FORMS OF PRECARIOUSNESS – A PSYCHOSOCIOLOGICAL PERSPECTIVE ON PROFESSIONAL FOOTBALL

Palumbo M.*, Zanoli E., Gozzoli C.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

This contribution presents the experience of a doctoral research project on precariousness in Italian professional football, articulated through three studies within a Sequential Mixed Methods design.

In dialogue with the five propositions of the WOP agenda on precarious work, the project adopts a psychosociological perspective to explore precariousness in the relationship between subjectivity, work, and society. Precariousness is understood as the erosion of the bond between subjectivity and society, produced by weak institutional mediation of work. While professional football may appear distant from precariousness, the gap between its idealized institutional image and the fragility of lived professional experiences makes it an emblematic context for examining new forms of precariousness and resistance.

Study 1 (qualitative). A Grounded Theory based on 20 in-depth interviews offers both an interpretive contribution and a transversal evaluative model. It highlights multiple forms of precariousness and illuminates institutional transitions in work. The core category of institutional subjectivation shows how professionals assume institutional functions, with subjectivity becoming hypertrophic to compensate for fragile institutions. Social realization through work thus remains possible, yet precariously constrained and increasingly reliant on individual competences.

Study 2 (qualitative). An analysis of key competences described by professional coaches (n = 130) reveals how, in precarious contexts, the rhetoric of “adaptive learning” risks becoming collusive, reinforcing defensive and individualized counter-precarious strategies rather than fostering generative learning dynamics.

Study 3 (quantitative). A questionnaire (n = 150), conducted in collaboration with the Italian Football Coaches Association, corroborates the qualitative findings, validating the theoretical framework. This participatory research underlines the empirical and practical relevance of the project, institutionally confirming its urgency through evidence from the field.

Overall, the project contributes to understanding precariousness as a psychosocial phenomenon and to developing critical insights into professional pathways in sport and beyond.

Abstract 3634

APPLIED PERSPECTIVES ON DUAL CAREER SUPPORT: A PROCESS EVALUATION IN A UNIVERSITY SETTING

Ferraboli A.*, Morozzi C., D''Angelo C.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Dual Career (DC) refers to the combination of an athletic career with education or work (Stambulova & Wylleman, 2015). Although EU guidelines on DC exist, research still highlights gaps in the support offered to university student-athletes (Guidotti et al., 2023). Career Assistance Programs (CAPs) provide structured services to help athletes manage their careers both inside and outside sport (Stambulova, 2010; Wylleman, Theeboom & Lavallee, 2004).

Evaluating DC programs can reveal key enablers of success as well as areas for improvement, thereby guiding stakeholders (Herold et al., 2022; Morris et al., 2021). While CAPs across countries often share common features, their delivery is highly contextual and culturally grounded, as practitioners work closely with athletes' everyday realities.

This study examines the implementation of University and Sport: Dual Career at Università Cattolica, launched in 2018 to support student-athletes in balancing academic and athletic demands. Since its inception, the program has reached 223 student-athletes, with 101 graduates. Services include individualized orientation and academic monitoring, reflecting the preventive and supportive dimensions of CAPs.

Semi-structured interviews were conducted with 15 student-athletes and 4 DC tutors to explore lived experiences within the program. Findings highlight the value of context-sensitive support, the relational dimension between tutors and athletes, and the need for ongoing evaluation. The study underscores that CAPs should be both culturally informed and evidence-based, tailored to athletes' daily lives and local contexts. Future challenges include extending services to other sport stakeholders and fostering transnational collaboration in program development and practitioner training.

Abstract 3635

A TALE OF THREE STORIES: THE INFLUENCE OF TRANSNATIONALISM, GENDER, AND DUAL CAREER ON THE PROFESSIONAL DEVELOPMENT OF A TRAINEE SPORT PSYCHOLOGIST

Fossi L.*[1], Quartiroli A.[2], Wagstaff C.R.D.[1], Brown D.[3]

[1]University of Portsmouth ~ Portsmouth ~ United Kingdom, [2]University of Wisconsin ~ La Crosse ~ United States of America, [3]University of Bath ~ Bath ~ United Kingdom

The service delivery and philosophy of sport psychology practitioners is highly influenced by their life experiences, values, and personal beliefs. Nevertheless, accounts of such influences are limited within the professional development literature. In this article, the first author provides an analysis of how her experiences as a transnational female student-athlete and student-coach have shaped her identity and professional development as an applied sport psychology trainee. In so doing, the first author has reflected on the challenges and opportunities that she faced through these experiences. More specifically, her transnational experiences enabled her to realise the importance of love, empathy, and resilience as the foundations of her professional philosophy. Further, her experience as a female student-athlete enabled her to develop management skills and to overcome barriers resulting from her gender identity. We hope that by sharing the experiences of the first author in the present work, we create resonance and a sense of familiarity with some readers and provoke all practitioners to pause and reflect on how their experiences, values, and personal beliefs continue to influence their practice.

Abstract 3636

CULTURAL ATTITUDES TOWARD SPORT PSYCHOLOGY: INSIGHTS FROM ITALIAN ATHLETES AND COACHES

Simonti G.*[1], Kamphoff C.[2], Mcalarnen M.[2], Kratimenos P.[1], Quartiroli A.[3]

[1]George Washington University School of Medicine and Health Sciences ~ Washington, DC ~ United States of America, [2]Minnesota State University ~ Mankato ~ United States of America, [3]University of Wisconsin-La Crosse ~ La Crosse ~ United States of America

Introduction: Sport psychology (SP) examines the mental factors that influence athletic performance and well-being. Although the field has experienced substantial global growth over the past decade, much of the existing literature remains rooted in AngloSaxon cultural contexts, raising questions about its applicability in other cultural contexts.

Methods: This study explored context-specific perceptions of SP by examining the attitudes of two key sport stakeholders—Italian athletes (n = 298; 50.17%) and coaches (n = 296; 49.83%). Participants (male = 324; 54.45%; female = 270; 45.55%) represented both individual and team sports, across elite and non-elite competitive levels. An online survey assessed participants' perceptions and attitudes toward SP services and professionals. Using Brislin's back-translation method, we adapted the SPA-R and SPARC-2 into Italian.

Results: Confirmatory factor analysis confirmed the internal structure of the instruments in the Italian sample. We then examined differences in attitudes by stakeholder role, gender, age, and competitive level. Overall, both athletes and coaches reported low levels of stigma and high confidence in SP and its services. However, significant differences were observed across demographic groups

Discussion: This study provides a culturally grounded snapshot of the current sport psychology landscape in Italy, highlighting context-specific attitudes and offering valuable insights for enhancing the cultural relevance of SP services and advancing global understanding of the field.

Abstract 3637

WHEN PERFORMANCE MEETS HEALTH: PRACTICAL DILEMMAS IN SUPPORTING ELITE ATHLETES AND COACHES AT THE FRENCH INSTITUTE OF SPORT (INSEP)

Ruffault A.*

French Institute of Sport (INSEP) ~ Paris ~ France

Working as a researcher in applied sport psychology at the French Institute of Sport (INSEP) brings into focus the organizational and ethical challenges of professional identity in applied sport psychology. Within INSEP, psychologists in the medical department primarily address athletes' mental health needs, while mental performance consultants in the performance department focus on psychological skills training and performance optimization. Although my dual training as a clinical health psychologist and a mental performance consultant allows me to navigate both domains, my role is formally situated in the performance department.

This institutional structure generates a fine boundary between supporting athletes in performance-related issues (e.g., pre-competition stress regulation, attentional control) and recognizing mental health concerns (e.g., generalized anxiety, post-traumatic stress symptoms). The challenge lies not only in deciding when to refer athletes to medical services but also in how this referral is communicated to them in ways that preserve trust and continuity of care. Furthermore, effective collaboration between psychologists in the medical department and consultants in the performance department is essential, yet often requires negotiation of professional roles, responsibilities, and shared practices.

In this presentation, I will reflect on these dilemmas through applied cases involving elite athletes and national coaches. These cases illustrate how role boundaries are experienced in practice, how interdepartmental collaboration can be fostered, and how athletes perceive transitions and complementarity between performance-oriented support and mental health care.

By situating these reflections within the broader landscape of applied sport psychology, this contribution highlights the evolving nature of professional identities and the need for context-sensitive, ethically reflective, and collaborative approaches to supporting high-performance athletes.

Abstract 2206

FLOW INTO CHARACTER: HOW THEATRE ACTORS DEFINE FLOW STATE AND APPLY PERFORMANCE STRATEGIES TO ACHIEVE AND MAINTAIN IT ON STAGE

Brajković D.*

University of Limerick ~ Limerick ~ Ireland

Introduction. The flow state and peak performance have been researched over the last 50 years in different contexts, including musical performance Tan and Sin (2021), yet the research in theatre performers is scarce and methodologically uneven. Performance strategies are viewed as "[t]he groundwork for these transcendent experiences" (Williamon,
2004, p. 31). In the field of theatre actors, performance strategies are essential parts of acting techniques but have never been researched in the context of sport psychology. Purpose. This paper aims to explore the relationship between performance strategies use and flow experiences in rehearsals and during performances. Method. Eight theatre actors were recruited working in theatre organisations and collectives across six European countries. A mixed study approach with topical analysis was applied. Quantitative data was collected using the TOPS2 questionnaire (Test of Performance Strategies 2) with its terminology adapted to acting. Qualitative data from interviews yielded codes including eight performance strategies found in athletes and further expanded to other relevant strategies and flow in theatre performance contexts. Results. Actors' use of performance strategies is overall high, the conceptualisation of some is different. The most used are activation, emotional and attentional control, while imagery is applied least. Flow state differs in rehearsals and performances. During plays, it is deemed equivalent to successful acting and achieved by automaticity development during rehearsals, high level of concentration, awareness and trust in one's body and stage partner. Flow experiences carry a strong feeling of connection. Conclusions. Performance strategies are applied to enter the flow state on stage. Insights could be used to support strategies training and adapt TOPS2 to stage performing.

Abstract 632

REGULATORY FOCUS AND REGULATORY FIT IN SPORT PERFORMANCE: A NARRATIVE REVIEW

Dannerbo C.*[1], Durieux N.[2], Sanchez X.[1]

[1]Sport, Activité Physique, Rééducation et Motricité pour la Performance et Santé (SAPRéM), Université d'Orléans ~ Orléans ~ France, [2]Research Unit for a Life-Course Perspective on Health and Education – RUCHE, Faculty of Psychology, Speech and Language Therapy and Educational Sciences, University of Liège ~ Liège ~ Belgium

Introduction: Performing under pressure is one of the defining challenges of sport. While stress and anxiety have been extensively studied, less is known about the motivational mechanisms that explain why some athletes thrive while others falter. Regulatory Focus Theory distinguishes between promotion focus (growth and achievement) and prevention focus (safety and error avoidance). Regulatory Fit Theory further suggests that performance improves when athletes' motivational orientation matches the way tasks are framed.

Objective: This narrative review synthesises existing evidence on regulatory focus and regulatory fit in sport, highlighting their impact on individual performance, coaching practices, and team dynamics.

Methods: A structured search of APA Psycnet, PubMed, and Google Scholar up to April 2024 identified nineteen eligible publications. Studies were analysed using a narrative synthesis informed by SANRA quality criteria, with thematic clustering around athlete profiles, performance outcomes, coaching communication, and contextual moderators.

Results: Findings reveal consistent benefits of motivational fit: athletes perform with greater accuracy, decision-making efficiency, and emotional stability when orientation and task framing align. Promotion focus was typically observed in offensive roles and creative contexts, while prevention focus predominated in defensive positions and precision sports. Coaching communication emerged as a critical moderator, with aligned instructions amplifying engagement and performance. Contextual factors, including task difficulty, expertise level, anxiety, impostor tendencies, and social status, shaped whether fit effects were enhanced or diminished. Importantly, initial evidence suggests collective regulatory fit at the team level may foster cohesion and strategic responsiveness.

Conclusion: Regulatory focus and fit provide a powerful yet underexplored framework for understanding and enhancing sport performance. Practical applications include tailored coaching strategies, feedback adaptation, and motivationally aligned training design.

Abstract 1019

DEVELOPING SELECTIVE ATTENTION AND ATTENTION PERSISTENCE IN ADOLESCENT BASKETBALL PLAYERS AGED 14-17 IN AUGMENTED REALITY: INTERVENTION DEVELOPMENT

Dute A.*, Pleinica S.

Riga Stradins university ~ Riga ~ Latvia

Selective attention and sustained attention are important cognitive processes that influence athlete's performance in highly dynamic sports such as basketball. These two attention processes are important factors that influence athletes' achievements and can be trained. Insufficient attention function and development can hinder decision-making, working memory, and reaction speed during the game, thereby reducing the player's potential and effectiveness. In recent years, virtual reality technologies have been increasingly integrated into psychological interventions, including attention training. However, there are no interventions available that are designed for young basketball players and adolescents.

The aim of this study is to develop and evaluate an augmented reality intervention that develops selective attention and attention persistence in adolescent basketball players and to ascertain the opinions of potential users and experts on the developed intervention.

A theoretical framework was developed and, based on this, a prototype of the intervention was developed and integrated into augmented reality glasses. The content and technical suitability of the intervention were evaluated by three expert psychologists, three coaches, and 12 potential users (basketball players) using a structured questionnaire on a 5-point Likert scale.

The assessments of the expert psychologists indicate a high level of both content suitability (M=4; SD=0.5) and technical suitability (M=4.3; SD=0.47). The coaches' assessment indicates an average level of intervention content suitability (M=3.6; SD=0.48) and technical relevance (M=3.6; SD=0.53), while user assessments were significantly higher for both content (M=4.6; SD=0.17) and technical relevance (M=4.2; SD=0.23).

The results of this study indicate that the content of the intervention developed is appropriate and that augmented reality is important for developing attention functions in young basketball players. In the future, it would be necessary to conduct a study with a larger sample size and to conduct a study to determine the sustainability of the intervention over time.

Abstract 631

ROLE OF REGULATORY FOCUS IN THE SELF-EFFICACY–CREATIVITY RELATIONSHIP IN CLIMBING

Dannerbo C.*, Levillain G., Sanchez X.

Sport, Activité Physique, Rééducation et Motricité pour la Performance et Santé (SAPRéM), Université d'Orléans ~ Orléans ~ France

Introduction: Research examining psychological factors in climbing performance has developed significantly since the inclusion of climbing as an Olympic sport. Regulatory Focus Theory (Higgins, 1997, 2012) is a motivational framework that examines goal-pursuit strategies. It categorises individuals into chronic promotion focus (sensitive to the presence or absence of positive outcomes) and chronic prevention focus (sensitive to the presence or absence of negative outcomes).
Purpose: The present study aimed to investigate the role of regulatory focus in the relationship between self-efficacy and creativity among climbers.
Methods: 99 climbers (40 females, 1 non-binary; age M = 34.28 years, SD = 11.36; climbing experience M = 12.25 years, SD = 7.71; 27.3% regular competitors) answered an online survey that measured chronic regulatory focus (Semin et al., 2005), climbing self-efficacy (Llewellyn et al., 2008), and general creativity (Epstein et al., 2008).
Results: Correlation analysis revealed that promotion focus positively and significantly correlated with self-efficacy and creativity, while prevention focus correlated negatively and significantly with creativity but had no association with self-efficacy. Mediation analysis showed that promotion focus completely mediated the relationship between self-efficacy and creativity, while prevention focus did not.
Conclusions: Findings indicate that one's motivational focus is related to creativity in climbing. More precisely, our findings suggest that promotion-focused climbers would be best equipped to engage in exploratory and innovative behaviours, critical for successful climbing performance. Whereas prevention-focused individuals seem to rather prioritise risk avoidance over creative thinking, a tendency that may hinder performance in climbing, given the inherent uncertain and dynamic characteristics of the sport of climbing.

Abstract 925

OPTIMAL ACTION IN HIGH SPEED ENVIRONMENTS. EMPIRICAL APPROACH TO THE PSYCHOLOGICAL REGULATION OF ACTION OF JET PILOTS AND SPEED ATHLETES.

Weder G.*

Alpha2Lead KLG ~ Rorschacherberg ~ Switzerland

Introduction: This study examines the constitutive elements of optimal action through the lived experience of experts in jet aviation and speed sports. These domains, characterized by extreme velocity and risk, provide controlled “microworlds” that enable systematic investigation of cognitive, affective, and embodied regulation under acute temporal constraints.

Purpose: The objective is to identify strategies of action regulation and decision-making under high time pressure and life-threatening stakes. By analyzing how experts maintain performance in these contexts, the study aims to derive hypotheses with explanatory insights for psychological theory and applied settings.

Method: Twenty-four experts (jet and airline pilots, formula 1 drivers, motorcyclists, downhill skiers, bobsleigh and skeleton pilots) were interviewed. Their subjective theories of optimal action were reconstructed and systematized through grounded theory methodology. An iterative process of open, axial, and selective coding, supported by inductive and abductive reasoning, generated an in vivo category system. Reflexive consideration of the interpretative-constructivist paradigm, sampling criteria, and researcher involvement ensured methodological rigor.

Results: Eight hypotheses emerged, describing a tripartite regulatory cycle: preparation, realization, and interpretation. Preparation involves anticipatory visualization and affective evaluation of planned action to mobilize concentration and motivation. Realization under time pressure is dominated by automatized routines and intuitive judgments, reflecting long-term experiential consolidation and acceptance of physiological boundaries. Interpretation encompasses feedback integration, evaluation, and organismic adaptation, fostering cumulative meta-knowledge that guides future performance. This meta-knowledge constitutes an integrative model of optimal action.

Conclusions: The findings advance psychological understanding of expertise by elucidating how cognition, emotion, automatisms and embodied processes interact in extreme environments. Beyond sport and aviation, the model holds implications for training science, cognitive and developmental psychology, and organizational contexts marked by accelerated change and decision-making under pressure. Further research should examine transferability across professional and societal domains.

INTEGRATED PHYSICAL ACTIVITY AND MENTAL HEALTH INTERVENTIONS FOR UNDERSERVED YOUTH: A MIXED METHODS SYSTEMATIC REVIEW

Antonovic M.*, Perry B., Griffiths S.L.

University of Birmingham, Institute for Mental Health ~ Birmingham ~ United Kingdom

The increasing mental health issues among young people (YP), alongside increasing childhood obesity, are raising major public health concerns. This is particularly concerning as the poor physical health of people with mental illness is the primary driver of the 15–20-year mortality gap observed in underserved populations. Research suggests that regular physical activity (PA) reduces symptoms of mental health conditions and may lower the incidence of depression and psychosis. Despite its benefits, YP from underserved communities often face structural and social barriers that make it harder to be active, reflecting broader health inequalities.

This mixed methods systematic review will provide an overview of integrated PA interventions for underserved youth, evaluate their effectiveness, and identify barriers and facilitators related to feasibility, acceptability, and implementation within complex systems.

We will include empirical studies published in the last 30 years, using qualitative or quantitative methods, that focus on YP from underserved communities. Grey literature meeting these criteria will also be sought. Eligible interventions must combine PA with a mental health component, such as emotional literacy education, psychosocial support or similar approaches, and may be delivered in schools, community settings, or youth services.

Searches will cover seven multidisciplinary databases: Embase, APA PsycINFO, Scopus, MEDLINE, The Cochrane Library, Sport Medicine and Education Index, and Sport Discus. Records will be imported into Zotero, deduplicated, and then screened in Covidence. Titles and abstracts will be assessed independently by two reviewers, with disagreements resolved by discussion or a third reviewer. Full texts of eligible studies, data extraction and quality appraisal will undergo the same process.

Findings will be shared with a youth advisory group, who will support integration and synthesis. The review will generate a synthesis of evidence on integrated physical activity interventions for underserved youth. Completion and submission are planned by July 2026, with a preprint version potentially released earlier.

Abstract 2616

MINDFULNESS-INTEGRATED INTERVENTION TO PROMOTE PHYSICAL FITNESS PARTICIPATION AND OVERALL WELL-BEING IN CHINESE VOCATIONAL COLLEGE STUDENTS

Li M.*

Zhejiang Institute of Communications ~ Hangzhou ~ China

Vocational college students often exhibit low motivation and suboptimal performance in physical fitness activities, negatively affecting both physical health and psychological well-being. This study examines whether integrating a mindfulness-based intervention (MBI) into the physical education (PE) curriculum can enhance students' physical performance, intrinsic motivation, and emotional regulation during exercise. A mixed-methods empirical design was employed. First-year students from a vocational college in eastern China, facing mandatory physical fitness tests, were assigned to either a mindfulness-integrated group (MI, n = 300) or a waiting-list group (WL, n = 300) based on their classes. The MI group received an eight-week MBI, embedding mindfulness tasks such as mindful breathing, mindful stretching, and challenging exercises during and after PE classes. Pre- and post-intervention measures included standardized physical fitness tests, the Five Facet Mindfulness Questionnaire, the Intrinsic Motivation Inventory, the Distress Tolerance Scale, and the WHO-5 Well-Being Index. Compared to the WL group, the MI group was expected to show significant improvements in fitness test scores, mindfulness, intrinsic motivation, distress tolerance, and overall well-being. Interaction effects were anticipated, with students initially lower in mindfulness or intrinsic motivation showing greater gains in fitness performance and well-being. A pilot study using the same design (MI, n = 10; WL, n = 10) indicated overall improvements in fitness outcomes and more positive feedback about PE classes in the MI group. These preliminary findings highlight the potential value of integrating mind-body approaches into physical fitness activities. By enhancing intrinsic motivation and distress tolerance, embedding MBI in PE may be an effective strategy to simultaneously improve students' physical performance and psychological well-being. Future research should explore MBI effects across different majors and investigate mechanisms across various sports activities.

Abstract 492

GET SMART ABOUT SMARTPHONES – A CUSTOM INTERVENTION PROGRAM TO ADDRESS PROBLEMATIC SMARTPHONE USE IN YOUTH ATHLETES

Ong N.*

Singapore University of Social Sciences ~ Singapore ~ Singapore

"Get Smart About Smartphones" is a custom intervention program, informed by the Theory of Planned Behaviour, which aimed to help youth athletes reduce their smartphone addiction levels. The intervention program comprised of a group workshop, followed by a series of reminder messages to help reinforce the lessons learnt during the workshop. 23 Singaporean youth athletes (aged 13–19 years) participated in the intervention program, and were assessed at pre, post, and follow-up timepoints for their objective and subjective measures of smartphone use. After the intervention program had concluded, a smaller sample of eight participants were selected to participate in semi-structured interviews to get their views and feedback on the intervention program. The results showed that while there were no significant differences in the objective measures of smartphone use (i.e., duration and frequency) between the timepoints, there was a significant reduction in the subjective measure (i.e., SAS-SV) of smartphone addiction in both post and follow-up timepoints. This was supported by the multiple case study analysis, which found that participants were able to implement the various strategies that were taught during the intervention program, and that those strategies were able to help them reduce their level of smartphone addiction. Overall, participant feedback for the intervention program was positive, with participants stating that it was fun, interactive, relatable, and informative. There were still some barriers that prevented participants from reducing their smartphone addiction levels, and suggestions were given on how to improve the intervention program in future.

12 - Division 12: Sport Psychology

SAFEGUARDING IN SPORT FROM THE UN SUSTAINABLE DEVELOPMENT GOALS PERSPECTIVE: A REVIEW OF EXPERIENCES WORLDWIDE

Saturday 25 July 2026 from 08:00 to 09:30

(N-Lorenese)

Victor J. Rubio (University Autonoma Madrid ~ Madrid ~ Sp), Chair and Presenter

This symposium brings together international perspectives on safeguarding in sport, framed through the United Nations Sustainable Development Goals (SDGs), particularly SDG 3 (Good Health and Well-being), SDG 5 (Gender Equality), and Peace, Justice, and Strong Institutions (SDG 16). Contributions from the Philippines, Malaysia, Austria, Spain, and Canada showcase diverse approaches to promoting child protection, athlete well-being, and inclusive sport environments. Topics range from policy implementation and psychological interventions to community engagement and education strategies.

This symposium is both timely and relevant, addressing the urgent need to promote a safe, healthy, enjoyable and inclusive sport environments. Few initiatives explicitly connect safeguarding in sport to the SDGs. By showcasing experiences from five countries across three continents, this symposium fills that gap by demonstrating how psychology can advance sustainable development, equity, and child protection. By presenting experiences from five countries across three continents, the session fosters cross-cultural dialogue while illuminating both universal challenges and culturally grounded innovations.

• Prof. Gretchen Kerr (University of Toronto, Canada) will open the symposium by linking the SDG framework to safeguarding in sport, highlighting how it supports global efforts towards health, equity and justice.
• Prof. Maria Luisa M. Guinto (University of the Philippines) will present a culturally grounded reconceptualization of safe sport in the Philippines, with special attention to local cultural dynamics.
• Prof. Rosa Diketmuller (University of Vienna, Austria) will examine the role of coaches in safeguarding, focusing on risk assessment, as well as barriers and facilitators to implementation.
• Prof. Selina Khoo (University of Malaya, Malaysia) will analyze the psychological consequences of athletes' abuse and its prevention, reflecting on Malaysia’s recent adoption of a Safe Sport Code.
• Prof. Víctor J. Rubio (University Autonoma Madrid, Spain) , Spain) will introduce PSIDE, a sport psychology intervention designed to foster a culture of safeguarding and protection in Spanish football youth clubs.

Abstract 3254

SAFEGUARDING IN SPORT: A CATALYST FOR ACHIEVING HEALTH AND WELL-BEING, EQUITY, AND JUSTICE

Kerr G.*

University of Toronto ~ Toronto ~ Canada

Safeguarding in sport has emerged as a critical area of focus for researchers, policymakers, and practitioners alike, reflecting growing recognition of the potential for both harm and positive development within sporting environments. Effective safeguarding refers to the proactive measures that ensure that all members of the sport community - athletes, coaches, officials, administrators, parents and volunteers - are protected from abuse, neglect, exploitation, and discrimination. To-date, most safeguarding efforts have focussed on methods to prevent violence and harms to individuals. But, safeguarding extends beyond protection to include the establishment of environments in which individuals and communities can thrive. When designed and implemented in ways that respect human rights, safeguarding in sport is aligned with the United Nations Sustainable Development Goals (SDGs), particularly Good Health and Well-Being (SDG 3), Gender Equality (SDG 5), and Peace, Justice, and Strong Institutions (SDG 16). Safeguarding in sport can promote physical, mental, and social well-being, and opportunities for personal growth and development across the lifespan. At the community level, safeguarding can help ensure that healthier, more cohesive, inclusive communities are developed. By addressing power imbalances, dismantling systems of oppression, and ensuring equitable access, safeguarding plays a central role in tackling gender-based violence and inequality. A cornerstone of effective safeguarding is the establishment of just, accountable, and inclusive sport organizations that embody principles of good governance. This requires transparent safeguarding structures, including clear reporting mechanisms, independent oversight, and accountability measures. Using examples from the Canadian context, this presentation will explore how safeguarding in sport can advance the SDG agenda, and contribute meaningfully to global efforts toward health, equity, and justice.

Abstract 3255

SAFE ENOUGH TO THRIVE: PSYCHOLOGICAL SAFETY AND THE ETHICS OF CARE IN PHILIPPINE SPORT

Guinto M.L.*

University of the Philippines Dilliman ~ Manila ~ Philippines

Introduction. The global movement toward safe sport has focused primarily on preventing abuse, harassment, and exploitation through compliance-based frameworks rooted in Western legal and institutional traditions. While essential, these approaches often neglect the cultural realities of contexts such as the Philippines, where athletes navigate hierarchical coaching practices, gender norms, familial obligations, and colonial legacies. Within such environments, discipline is valorized, silence is expected, and resilience is conflated with enduring hardship, conditions that undermine athlete well-being and delay help-seeking.

Purpose. This presentation advances a culturally grounded reconceptualization of safe sport in the Philippines. It emphasises psychological safety and an ethics of care as essential to athlete well-being, thereby contributing to SDG 3 (good health and well-being), SDG 5 (gender equality), and SDG 16 (peace, justice, and strong institutions).

Method. Drawing from over two decades of applied sport psychology work, the analysis is informed by case-based insights and lived experiences of Filipino athletes. This approach highlights how local cultural dynamics shape both risks and opportunities in safeguarding, while also showcasing emerging athlete-centered interventions that resist harmful norms.

Results. Findings indicate that Filipino athletes highly value relational trust, emotional safety, and being recognized as whole persons rather than mere performers. Emerging practices—including athlete-centered consultations, reflective coaching, peer-led support circles, and values-based team-building—demonstrate how psychological safety can be cultivated.

Conclusions. Safe sport must move beyond compliance with external rules to embrace care-driven, culturally responsive practices. Psychological safety and ethics of care are not add-ons to performance programs but transformative acts that redefine what it means for athletes to be safe enough to thrive. By grounding safe sport in local contexts, this work calls practitioners and policymakers to shift from harm prevention to care promotion—from rules-based compliance to relationship-based safety, aligning with global goals for well-being, gender equity, and just institutions.

Abstract 3256

PREVALENCE OF INTERPERSONAL VIOLENCE AGAINST YOUNG ATHLETES AND ITS EFFECT ON SAFEGUARDING IN AUSTRIAN SPORTS

Diketmueller R.*

University of Vienna ~ Vienna ~ Austria

Introduction. The magnitude of the problem of interpersonal violence (IPV) against young athletes in sports is still understudied. The European project 'CASES' offered important and partly unexpected data for six countries (N=10.302). The results show high prevalence rates, different groups at high(er) risk, low reporting rates of the victims and peers as most frequently mentioned group of perpetrators.

Purpose. Prevalence data in this field is needed to base prevention efforts on empirical evidence and to convince public decision makers about the necessity to address this issue within sports federations and sports clubs. A successful implementation of adequate safeguarding strategies contributes to good health and wellness of the athletes (SDG3), to gender equity (SDG5) and to strong institutions (SDG16). Coaches play a significant role in identifying risks for IPV in the context of organization-specific risk analyzes and in implementing prevention measures in a culture of mindfulness.

Method. Through focus-group-discussions the attitudes of coaches on implementing safeguarding principles within sports organizations based on a resources- and risk-analyzes model were analyzed via grounded theory.

Results. Although coaches are convinced that prevention of IPV is an important task for sports clubs, the results show, that they do neither see any risk in the specific confidence relationship to their athletes, nor do they reflect their uncertainty regarding closeness and distance or physical contact institutionally. They also fear that a culture of awareness could be interpreted as mistrust of colleagues or of sport in general. Most of the coaches are not aware of groups at high risk or peer violence at all.

Conclusions.
Findings indicate there is a need for both – further research on the role of coaches and education of coaches dealing with the multiple challenges with regard to this topic based on prevalence data and a deeper understanding of safeguarding in a culture of mindfulness.

Abstract 3257

SAFE SPORT IN MALAYSIA: AN ANALYSIS OF THE SAFE SPORT CODE AND ITS IMPACT ON ATHLETE WELL-BEING

Khoo S.*

Universiti Malaya ~ Kuala Lumpur ~ Malaysia

Introduction

Malaysia transforming its approach to athlete welfare, demonstrating a heightened commitment to fostering a safe sport environment. This is reflected through multi-stakeholder initiatives and a growing culture of awareness.

Purpose

This presentation will discuss Malaysia's evolving safe sport landscape, focusing on the critical psychological dimensions of athlete abuse and its prevention. Psychological consequences of mistreatment and explore recent policy efforts will be also highlighted.

Method

A psychological perspective will be adopted to analyze Malaysia's safe sport movement. The presentation will examine the psychological consequences of abuse, using high-profile cases for illustration. This will be followed by a detailed analysis of the Safe Sport Code which was introduced in 2023. The Code's intended impact on psychological safety will be evaluated and its legal and psychological limitations examined.

Results

Although the Safe Sport Code is a positive step, its effectiveness is hindered by a lack of legal enforceability. This limitation can perpetuate a sense of vulnerability among athletes. This finding underscores the need for a more comprehensive approach with stronger legal safeguards to foster a mentally healthy sports community.

Conclusions

In conclusion, the Safe Sport Code is a commendable starting point, but not a definitive solution. To create a culture of safety and accountability, we must advocate for a more robust, legally enforceable framework. This is crucial for protecting athlete psychological well-being. Moving forward, we suggest key actions like legislative reforms and educational campaigns to create a sporting environment where every athlete feels secure, respected, and empowered.

Abstract 3258

PSIDE PROJECT: EMBEDDING KIDS' WELLBEING SPORT PSYCHOLOGY INTERVENTION INTO SOCCER CLUBS IN SPAIN

Rubio Victor J.*, Martín G., De La Torre C., Espinosa M.A., Gutierrez H., Romero M., Ruiz R., Sotillo M., Mesonero A.

University Autonoma Madrid ~ Madrid ~ Spain

Introduction

Play, leisure, and recreation are fundamental rights for all children. Sport is a key channel through which children engage in play and recreation, contributing positively to their physical health, motor and cognitive development, and socio-emotional growth. Despite its benefits, sport can also expose children to harmful experiences. Excessive competitiveness and pressure can lead to sports injuries, burnout, and mental health issues, while normalized interpersonal violence remains a persistent concern.

Purpose

This presentation introduces PSIDE, a sport psychology intervention program aimed at fostering a culture of protection and safeguarding for children and adolescents within football clubs. The program targets all key stakeholders—board members, technical staff, coaches, athletes, and families—with the goal of promoting the wellbeing of young athletes through safe and supportive sports practices.

Method

The implementation of PSIDE was evaluated through interviews with participants from all stakeholder groups and by monitoring the delivery of the program by sport psychologists. This approach allowed for an assessment of the program's acceptance and integration within soccer clubs across Spain.

Results

Although recent legislative developments in Spain mandate the active promotion of child safeguarding in sports, and awareness among sports federations and society is steadily increasing, a significant gap still remains in the cultural practices of many clubs and community sports associations. This highlights the need for structured interventions like PSIDE to bridge the divide between performance and wellbeing.

APPLIED SPORT PSYCHOLOGY IN ESPORTS: INSIGHTS INTO TRAINING, WELL-BEING, AND PROFESSIONAL DEVELOPMENT

Saturday 25 July 2026 from 09:00 to 10:30

(I-Spadolini)

Andrea Caputo (Psychology Department - University of Tu), Chair and Presenter
Claudio Giovanni Cortese (Psychology Department - University of Tu), Discussant

Esports has emerged as one of the fastest-growing performance domains, attracting increasing attention from psychology researchers and practitioners. Beyond technical and tactical skills, competitive gaming poses unique psychological challenges and opportunities to professional gamers, making it a fertile ground for the application of sport psychology themes. This symposium brings together five contributions exploring how applied psychological approaches can help both esports athletes' performance and well-being within this new and ever-expanding field.

The first presentation examines the phenomenon of tilt in League of Legends players, providing a qualitative understanding of its antecedents, impact on performance, and strategies for regulation. Building on this focus on individual performance, the second presentation reports preliminary findings from a psychological training program based on the S.F.E.R.A. model, adapted for esports athletes, aimed at enhancing mental skills and performance outcomes.

The third contribution expands the discussion by exploring holistic perspectives on self-care in elite esports, considering how players, coaches, managers, and practitioners conceptualize and enact self-care practices in a culturally relevant and sustainable way. The fourth presentation addresses career development and professional identity in esports by analyzing functional roles, engagement patterns, and the socio-professional positioning of esports participants.

Finally, the fifth presentation investigates the perceptions and experiences of esports players, coaches, and support staff regarding sport psychology practitioners, highlighting both the value and challenges of integrating psychological expertise in esports organizations.

Together, these contributions illustrate how applied psychology can inform not only individual performance enhancement but also broader issues of well-being, organizational practice, and career sustainability in esports. The symposium offers insights for researchers, practitioners, and stakeholders interested in advancing evidence-based approaches to support athletes and professionals in this rapidly evolving domain.

Abstract 3342

ESPORT PLAYERS, COACHES, AND SUPPORT STAFFERS' EXPERIENCE AND PERCEPTION OF ESPORT PSYCHOLOGISTS

Quartiroli A.*[1], Brain J.[2], Hoop R.[3]

[1]Department of Psychology - University of Wisconsin ~ La Crosse (USA) ~ United States of America, [2]Safeguarding Sport and Society, Centre of Expertise Care and Well-Being, Thomas More University of Applied Sciences ~ Antwerp ~ Belgium, [3]Universiteit Gent ~ Gand ~ Belgium

Sport psychology practitioners (SPPs) have increasingly expanded their services into performance domains beyond traditional sport, including corporate, military, and, most recently, esports. As esports grows rapidly into a global entertainment industry, players, coaches, support staff, and leadership face significant psychological demands related to training, performance, and well-being. While the benefits of sport psychology are well established in traditional sport, little is known about how members of the esports ecosystem perceive and experience the role of SPPs.

This study addresses this gap by examining the experiences and perceptions of esports players, coaches, and support staff regarding the integration of SPPs into the esports environment. The guiding research question is: How do these groups perceive the role, effectiveness, and key characteristics of sport psychology practitioners within training, competition, and the broader esports context?

A cross-sectional online survey was distributed internationally to collect quantitative data. The survey aimed to capture experiences with sport psychology services, attitudes toward effectiveness, and willingness to seek or recommend psychological support to enhance performance and well-being. Items included demographics, prior engagement with sport psychology at individual, team, and organizational levels, and perceptions of effectiveness. Participants also rated the potential of sport psychology to address esports-specific issues such as tilt, motivation, sleep regulation, and career transition. Depending on role, participants completed adapted versions of the Sport Psychology Attitudes–Revised (SPA-R; Martin et al., 2002) or the Sport Psychology Attitudes and Referral Confidence–Revised (SPARC-R; Zakrajsek et al., 2008).

Although data collection is ongoing, preliminary trends indicate mixed awareness and acceptance of SPPs. Members of the esports ecosystem value psychological support for performance enhancement but stress the need for practitioners with esports-specific knowledge, adaptability, and cultural credibility. These insights will inform recommendations for integrating psychological services in esports organizations to optimize both performance and well-being.

Abstract 3338

A QUALITATIVE EXAMINATION OF TILT IN LEAGUE OF LEGENDS E-SPORT PLAYERS

Fuentes R.[1], Sanchez X.*[2]

[1]AEP, Association of Esports Psychology ~ Malmö ~ Sweden, [2]SAPRéM, Université d'Orléans ~ Orléans ~ France

Competitive e-sport players manage performance pressure, negative emotions, and ultimately what it is known as tilt – a common phenomenon described in the game League of Legends (LoL) as frustration associated with performance decline. The purpose of the present study was to gain an understanding of factors and processes related to tilt in LoL e-sport players. A qualitative methodology, grounded in post-positivism, was applied to explore tilt antecedents, its effects on players, and the strategies used to manage tilt-inducing situations at emotional, cognitive, and behavioural levels. Male LoL players (N = 14), aged 19-28 (M = 23.7, SD = 2.3 years), were interviewed, and their responses analysed using reflexive thematic analysis. Tilt antecedents identified included: teammates failing to meet players' expectations; teammates' displaying toxic behaviours; players failing to meet their own expectations; and players experiencing negative emotions. Such tilt experiences were reported to result in players feeling discouraged, losing control, misplacing attention, and displaying toxic behaviours. Ultimately, players reported to manage tilt by muting the in-game chat, refocusing attention, accepting and letting go of tilt-inducing events, and taking breaks. Findings provide a process-based understanding of tilt in relation to antecedents to tilt, its impact on players, and how players ultimately manage such tilt experiences in the e-sport game of LoL.

Abstract 3339

THE EFFECTS OF PSYCHOLOGICAL TRAINING ON PERFORMANCE IN ESPORTS

Caputo A.*, Cortese C.G.

Psychology Department - University of Turin ~ Turin ~ Italy

The application of sport psychology to esports is a growing field of interest (Pedraza-Ramirez et al., 2020). Psychological training may enhance the experience and performance of professional esports athletes (Pedraza-Ramirez, 2019). This study aims to provide preliminary results on the outcomes of a mental training protocol based on the S.F.E.R.A. model (Vercelli, 2009), a theoretical and practical framework that has been successfully adopted by elite athletes in various traditional sports for years. Recently, this model has been adapted to the esports context (e.g., the e-S.F.E.R.A. questionnaire; Caputo et al., 2023). A video-based training protocol was developed, comprising two videos for each of the five S.F.E.R.A. components: Synchrony, Strengths, Energy, Rhythm, and Activation. Each video includes an explanation of the psychological construct, along with both written and practical exercises designed to facilitate reflection and skill development, with the goal of enhancing performance. In the study, participants in the experimental group engage with the training program over approximately two weeks, completing the e-S.F.E.R.A. questionnaire at three time points: baseline, after the first training session, and after the second. The control group completes the questionnaire during the same time period without training. The sample consists of professional esports players who train daily and compete in officially recognized esports tournaments in Italy. Data collection is currently in its final stages. This contribution aims to present the results of the study by comparing the experimental and control groups on both S.F.E.R.A. mental factors and other psychological (e.g., flow) and performance-related variables. It is expected to observe higher performance-related scores in the experimental group, as well as a more consistent development of psychological awareness compared to the control group. This research aims to highlight the relevance of sport psychology in the professional esports context, underscoring the role of sport psychologists as members supporting elite esports athletes.

Abstract 3341

UNDERSTANDING ESPORTS ENGAGEMENT: FUNCTIONAL ROLES AND CAREER PERCEPTIONS

Sanseverino D.*, Boldi A.

Psychology Department, University of Turin ~ Turin ~ Italy

Introduction

Participants in esports are not only tournament competitors. The ecosystem includes team formation and administration, community moderation, and content creation. Yet typologies of these actors remain unsettled, partly because no shared standard defines what counts as “professional” in a domain where digital labour is hard to delimit. Clarifying these categories matters: the scale of esports and its entanglement with evolving forms of digital entertainment and work make precise definitions consequential for research, policy, and industry practice.

Purpose

This study examines how individuals involved in esports define their roles and professional trajectories, and how they differ from casual gamers in terms of socioprofessional variables, gaming practices, digital competence, and career anchors.

Method

An online survey was conducted with 297 respondents, including both (self-identified) casual gamers and esports participants, recruited via esports-related channels. A descriptive-comparative approach was applied, using chi-square and Mann-Whitney U tests to assess intra-group differences among esports participants and between them and casual gamers.

Results

Emerging patterns suggest that esports participants diverge from non-participants primarily on indicators of gaming engagement and digital collaboration skills, while no consistent differences are observed for employment status or broad career orientations. Within the esports group, roles cluster into competitive, creative, organisational and hybrid configurations. While involvement was diverse, few viewed it as a full-time occupation, and economic sustainability is frequently questioned. In short, perceived professional involvement aligns with the role rather than behavioural patterns (e.g., frequency/intensity of play).

Conclusions

The findings contribute to ongoing debates about digital labour and identity by indicating that esports participation is fluid and precarious and likely situated on a continuum with casual gaming. In contrast with current practices in game-related research, professional identity seems shaped less by time-use metrics than by functional role and self-perceived commitment, with interesting implications for both research and industry.

ADDRESSING THE NEEDS OF VULNERABLE ROAD USERS TO CREATE SAFER AND MORE INCLUSIVE MOBILITY SYSTEMS

Thursday 23 July 2026 from 13:30 to 15:00

(N-Lorenese)

Federica Biassoni (Traffic Psychology Research Unit, Depart), Chair and Discussant

Vulnerable road users (VRUs) - including pedestrians, two-wheelers, child occupants, older adults, soft and micromobility
users, and professional riders - account for a significant proportion of road traffic injuries and fatalities
worldwide. These groups face distinct challenges and heightened risks in traffic environments, necessitating tailored
safety measures and policies. Addressing their needs is essential for the development of safer and more inclusive
mobility systems.
Innovative technologies, urban planning, and policy initiatives offer promising avenues for enhancing VRU safety.
Solutions such as advanced driver assistance systems (ADAS) specifically designed for VRUs, infrastructure
enhancements like dedicated bike lanes, and educational campaigns targeting both VRUs and drivers can significantly
mitigate risks. Furthermore, a nuanced understanding of the behaviors, vulnerabilities, and mobility patterns of each
VRU group is crucial for designing effective, targeted interventions.
This session will critically examine key topics, including but not limited to:
• Pedestrian behavior and risk factors in urban environments • Safety challenges for two-wheelers and strategies for risk mitigation
• Ensuring child occupant safety through vehicle design and restraint systems
• Enhancing professional rider safety through training, technology, and policy measures
• The role of emerging technologies in addressing VRU challenges
This symposium directly aligns with the conference themes of “Emerging Fields” (through the application of novel
technologies and approaches to VRU safety), “Transdisciplinary Approaches” (by integrating insights from human
factors, engineering, and public health), and “Societal Applications” (through a focus on reducing harm and
promoting equitable safety for vulnerable groups).
The symposium will be of particular interest to researchers, policymakers, urban planners, and safety professionals. It
aims to foster discussion on innovative solutions, collaborative strategies, and best practices to protect VRUs and
ensure safe mobility for all.

Abstract 3964

VISUAL EXPLORATION OF PEDESTRIAN CROSSINGS: A COMPARATIVE ANALYSIS OF STRATEGIES ACROSS ADULTS AND CHILDREN OF PRESCHOOL AND SCHOOL AGE

Biassoni F.*, Bina M.

Traffic Psychology Research Unit, Department of Psychology, Università Cattolica del Sacro Cuore ~ Milan ~ Italy

In pedestrian crossing scenarios, children exhibit a reduced capacity to engage in safe behaviors compared to adults, although their competencies improve with age. The present study aimed to examine the mechanisms and strategies underlying visual exploration in pedestrian crossing situations among both children and adults. Specifically, ocular behavior during simulated crossing scenarios was analyzed using eye-tracking technology.

The study recruited 60 participants, stratified into four age cohorts: first-grade children (5–6 years), fourth-grade children (8–9 years), fifth-grade children (10–11 years), and adults, with 20 participants per group. All participants underwent a brief eye-tracking session in which they were instructed to observe two static images depicting pedestrian crossings, simulating a decision-making process as if preparing to cross the road. Eye movement patterns were systematically compared across groups.

Findings revealed that adults engaged in a more systematic and adaptive exploration of the visual field, directing their gaze toward critical areas for safe crossing with greater frequency and prolonged fixation durations. In contrast, younger children exhibited a more restricted visual exploration strategy, allocating attentional resources to nonrelevant areas of the scene. Fourth- and fifth-grade children demonstrated a transitional pattern, exhibiting increased fixation durations on relevant areas to the right and left of the zebra crossing compared to younger children, though with lower fixation frequencies relative to adults. However, similar to younger children, they maintained prolonged fixations on extraneous environmental elements that were not directly pertinent to safe road-crossing decisions.

The findings of this study offer valuable insights for the design of training programs that consider the specific capabilities of pedestrians at different ages, as well as for the development of infrastructure tailored to facilitate road crossing for pedestrians with varying levels of perceptual development and of the ability to anticipate and assess risks in the context of street crossing.

Abstract 3965

DISTRACTION AND DRIVING PERFORMANCE: THE ROLE OF PERCEPTUAL LOAD AND INDIVIDUAL VULNERABILITY

Caffò A.*[1], Traficante S.[2], Tinella S.[3], Caffò A.[4]

[1]Department of Educational Sciences, Psychology, Communication, University of Studies of Bari ~ Bari ~ Italy, [2]Department of Educational Sciences, Psychology, Communication, University of Studies of Bari "Aldo Moro" ~ Bari ~ Italy, [3]Department of Human, Philosophical and Educational Sciences, University of Studies of Salerno, Fisciano, Italy ~ Salerno ~ Italy, [4]Department of Educational Sciences, Psychology, Communication, University of Studies of Bari "Aldo Moro", ~ Bari ~ Italy

Distracted driving is a leading cause of road accidents, significantly impairing vehicle control and driving performance. The impact of distraction can vary depending on both environmental and individual factors. The present study investigated the impact of a) perceptual load and b) susceptibility to distraction on simulated driving performance outcomes, namely velocity, lateral velocity, lateral position, and steering angle. Thirtyfour
young participants were engaged in two simulated driving scenarios, with high and low perceptual load, respectively. A mixed factors ANOVA was conducted, with Time (3min, 6min, 9min) and Perceptual load (High/Low) as within-subjects factors, and Gender (Males/Females) and Susceptibility to distraction (High/Low) as betweensubjects
factors. Only non-nested and highest order significant effects are reported.
Regarding velocity, two interaction effects for perceptual load, time, and gender ($p=0.014$, $\eta2p=0.133$) emerged, indicating an increased difference with respect to perceptual load over time favoring males, and for time, gender and susceptibility ($p=0.014$, $\eta2p =0.133$), indicating an increased difference with respect to susceptibility over time favoring females, emerged. For lateral velocity, an interaction between time, gender and susceptibility ($p=0.016$, $\eta2p =0.128$), indicating for males an increased difference with respect to susceptibility over time, was found. Two main effects of time ($p=0.016$, $\eta2p =0.129$), favoring second time block over the third, and gender ($p=0.038$, $\eta2p =0.136$), favoring males, were observed for lateral position. For steering angle, an interaction effect of perceptual load and time ($p<.001$, $\eta2p =0.311$) emerged, indicating increasing steering instability over time under a high perceptual load, along with a significant interaction between time, gender, and susceptibility ($p=0.047$, $\eta2p =0.097$), indicating that female gender and low susceptibility increased steering instability over time. These findings highlight the importance of considering both individual differences and environmental factors, in understanding distraction in driving performance. Interventions aimed at reducing distractions could benefit from being tailored to specific drivers' susceptibility and situational demands, enhancing road safety in diverse contexts.

Abstract 3968

VULNERABLE BY DEFINITION? EXPLORING THE ROLE OF WORKING CONDITIONS, TECHNOLOGICAL DYNAMICS, AND SOCIAL CONTEXT ON LAST-MILE RIDERS' SAFETY AND WELFARE

Useche S.A.*[1], Llamazaresb J.[2], Marin C.[2], Alonso F.[1]

[1]University of Valencia ~ Valencia ~ Spain, [2]ESIC University ~ Valencia ~ Spain

As social digitalization and gig economy continue to evolve and solidify as cornerstones of the modern economy, an increasing number of occupations within this sector are encountering collateral risks related to occupational health, safety, and well-being. This is particularly true for last-mile delivery riders, whose prolonged exposure to precarious working conditions, insufficient training, threats to personal security, and a high overlap with issues of justice and equity (e.g., legal, social, and migratory marginalization) is beginning to highlight them as a growing group of vulnerable road users.

The aim of this study was to evaluate the relationships between the working environment of two-wheeler last-mile delivery riders in Spain, their technological background, social context, and their safety, health, and welfare indicators. Methodologically, this study followed a mixed-methods approach, drawing information from complementary sources –namely, questionnaires, interviews, and focus groups– within a nationwide sample of last-mile delivery riders from all regions of Spain. The preliminary findings of this study provide interesting insights in both spheres:

On the quantitative side, the questionnaire data that delivery riders experience significant time pressure, insufficient pay, and ergonomic challenges associated with the technological tools required for their work, often resulting in cognitive distractions, technological stress, and reduced safety performance, regardless of their platform or delivering vehicle. Additionally, longer working hours were linked to poorer well-being outcomes, while riders who took more frequent breaks, especially during off-peak hours, reported higher levels of co-worker support and stronger social connections, likely fostered during shared break times.

On the qualitative side, thematic analysis of interviews and focus group data revealed three main analytical levels: safety, social identity, and equity. Regarding safety, participants frequently expressed concerns about ongoing safety risks. Intermsofsocial identity, riders often reported feeling like "outsiders" in shared spaceswithotherroad users. Ontheequity level,manyhighlightedimplicitmarginalizationeffectswithinthe industry,referencing lowpay,legalchallenges(often tied to immigration status),and limitedprospectsforcareerdevelopment.

Abstract 3966

THE HIGH RISK OF FATAL OR SERIOUS INJURY TRAFFIC ACCIDENTS INVOLVING ELDERLY PEDESTRIANS AND CYCLISTS: PROBLEM SIZE, CAUSES, AND INTERVENTIONS FOR A SAFE MOBILITY

Dorfer M.*

Department of Forensic Medicine, Traffic Psychology Section, South Tyrol Health Authority ~ Bolzano ~ Italy

In cars, on bicycles, or as pedestrians: globally, elderly individuals are becoming increasingly mobile and sometimes actively participate in road traffic in various ways well into old age. This is associated with a significantly higher risk of fatal or serious injury traffic accidents (MAIS3+) compared to younger individuals. Elderly people are particularly exposed to high accident risks, especially as pedestrians and cyclists or e-bike riders. The number of accidents where no other road users are involved is particularly high. This last aspect is strongly underestimated by statistical data.

Given the increased vulnerability with advancing age, due to reduced tolerance to injuries and greater fragility, there is a higher risk of suffering more serious or fatal injuries in the event of a traffic accident compared to younger individuals.

Problem size: about 30 percent of all road deaths in the EU in recent years have involved the age group over 65, and among pedestrians and cyclists, the elderly have accounted for about half of all road deaths. In the future, the situation could worsen further in some regions of the world. For example, by 2050, one in four inhabitants in Europe and North America will be 65 years or older.

However, mortality data alone do not adequately describe the problem. Data on the severity of injuries (MAIS) are needed.

Risk factors: Road accidents involving elderly pedestrians and cyclists are influenced by a variety of different factors. Therefore, in order to develop interventions to increase the road safety of elderly pedestrians and cyclists, a highly differentiated approach is necessary, taking these factors and their interactions into account.

Human factors play a significant role in traffic accidents involving elderly pedestrians and cyclists. An interdisciplinary approach involving the field of traffic psychology, engineering, traffic medicine and other fields is essential to effectively address and prevent these accidents. Combining insights from these fields can lead to more effective strategies to enhance safety for elderly pedestrians and cyclists.

If we want to tackle the problem of traffic accidents preventively, combining different approaches to solutions seems to be the most convenient way. Effective and efficient police controls, 30 km/h speed limits in urban areas, interventions in road infrastructure to make it elderly-friendly, traffic calming, specific driving assistance systems, as well as integrated mobility concepts and other interventions. The effectiveness of these interventions must be rigorously documented. To make the implementation of these interventions possible by policymakers, an appropriate road safety culture is necessary.

Without this, it will not be possible to implement unpopular measures such as 30 km/h speed limits. It is also important for the media to provide correct information about road traffic accidents in their complexity and not limited to a few spectacular road accidents. Otherwise, there is a risk that the population will lack the perception of a 'problem' that requires even unpopular interventions and, therefore, the pressure on policymakers to take action will be absent.

Abstract 1763

LESS FLIGHTS, MORE TRAINS

Estrada--Mejia C.*, Granato G., Hiemstra--Van Mastrigt S.

Delft University of Technology ~ Delft ~ Netherlands

Aviation is a major contributor to global greenhouse gas emissions, highlighting the urgent need for behavioral interventions that encourage a shift toward more sustainable modes of transportation, such as rail travel. This research investigates how ecolabels influence travel mode decisions by promoting trains over flights. In an online experiment with a fictitious booking travel platform, 330 participants indicated their purchase intention and actual selection between three travel options: a flight (high emissions), a bus (moderate emissions), and a train (low emissions), across four experimental conditions. These included a control condition (no label), an implicit color-coded label, an explicit label informing about the CO_2 emissions, and a combined label incorporating both the implicit and explicit formats. Results indicate that the implicit label significantly decreased participants' intention and actual selection of air travel and increased their intention and choice for train travel. No significant effects were observed on bus travel choices. Furthermore, the combined label did not yield additional benefits beyond those achieved by either label alone. These findings contribute to the research on behavioral economics and environmental psychology by addressing a critical gap in understanding how labeling interventions that are effective in low-impact, low-effort contexts (e.g., food choices) affect people's decisions regarding high-impact, high-effort behavior changes, such as rethinking travel behavior.

Abstract 1228

TIME PRESSURE AND PEDESTRIAN SIGNAL TIMING IN ROAD CROSSINGS WITH AUTOMATED VEHICLES: A VIRTUAL REALITY STUDY

Jacquet T.*, Sahaï A., Souliman N., Roger S., Métayer N.

VEDECOM ~ Versailles ~ France

With automated vehicles (AV) development, interactions between these vehicles and pedestrians, especially in road crossing situations, are increasingly investigated. Most studies focused on the design and effectiveness of external human-machine interfaces, intended to compensate for the lack of implicit communication (eye contact, gestures) between pedestrians and vehicles. However, factors shaping pedestrian decisions like time pressure and the timing of pedestrian signal activation, influencing road crossing in front of conventional vehicles remain unexplored in the context of AVs, despite their critical importance. In this context the present study aimed to investigate the effects of time pressure and the timing of pedestrian signal activation when pedestrians cross in front of AVs.

Forty participants, equally divided between young adults (20–35 years) and older adults (70-85 years), completed immersive virtual reality street-crossing tasks in the presence of two AVs. A fully crossed factorial design manipulated: (i) time pressure with cognitive time pressure (high versus low urgency), and/or informational time pressure (short versus long waiting time); and (ii) signal-timing (standard versus early activation). Behavioral outcomes include gap acceptance, initiation delay, and red-light violations. Eye-tracking analyzes gaze allocation, such as fixation duration on AVs, signals, or road zones, and scan paths. Subjective ratings evaluate perceived safety, confidence, and urgency.

We expect time pressure to shorten initiation delays, increase small-gap acceptance, and raise red-light violations, particularly among young adults. Early signal activation is anticipated to foster premature crossings and misplaced trust in AV yielding. Findings will clarify how time pressure and signal timing shape pedestrian decision-making, attention, and trust in AV interactions. Beyond applied implications for traffic signal design, the study advances psychological understanding of risk regulation and cognitive adaptation in AVs interaction context.

Abstract 433

THE FIVE-FACTOR MODEL OF PERSONALITY AS A PREDICTOR OF ELECTRIC VEHICLE ADOPTION

Roos J.M.*

University of Borås; Stockholm School of Economics. ~ Borås; Stockholm. ~ Sweden

Introduction: The transition to electric vehicles (EVs) is central to reducing carbon emissions and achieving sustainable transportation. While logistical, technological, and economic factors have been widely studied, less attention has been given to psychological determinants of adoption, such as personality traits.
Purpose: This study investigates whether personality, assessed using the Five-Factor Model (FFM), predicts electric vehicle ownership. The objective is to examine how individual differences may inform applied interventions aimed at promoting sustainable mobility choices.
Method: A nationally representative sample of Swedish car owners (N = 1,262) completed the Big Five Inventory–10 (BFI-10). Logistic regression analyses were performed with Openness, Conscientiousness, Extraversion, Agreeableness, and Neuroticism as predictors and EV ownership as a binary outcome. Income, age, and gender were included as control variables.
Results: Extraversion significantly ($p < .001$) increased the likelihood of EV ownership, whereas the other traits showed no substantial effects. Individuals with higher levels of extraversion may be more inclined toward visible, innovative, and socially oriented behaviors, facilitating engagement with sustainable technologies.
Conclusions: These findings highlight the role of personality in shaping pro-environmental behavior and emphasize the value of applied psychology in sustainability contexts. Understanding how traits such as extraversion influence adoption can guide targeted interventions, communication strategies, and policymaking.

Abstract 1717

THE ADOPTION OF ELECTRIC TRUCKS IN NORWEGIAN FREIGHT TRANSPORT: A UTAUT-BASED STUDY

Skriabin A.*, Kummeneje A.

Nord University ~ Stjørdal ~ Norway

The move toward electric trucks is becoming increasingly important for sustainable transport. However, the psychological and organizational factors influencing adoption are still not well understood, especially within Nordic freight operations. This study examines behavioral aspects that may affect how Norwegian freight companies decide to adopt electric trucks. The research is based on a framework inspired by the Unified Theory of Acceptance and Use of Technology (UTAUT).

A survey was designed to gather views on practical benefits, regulatory conditions, and environmental concerns. It was distributed among freight companies across Norway. The initial analysis focused on identifying general trends.

Preliminary responses suggest that several factors may shape the decision to adopt electric trucks, such as how useful they seem, how ready the infrastructure is, and how well the change fits with safety and environmental goals. Early findings show that the decision-making process is influenced by many different aspects. The results of the study indicate that performance expectancy is among the most important factors in adoption. These insights may help guide strategies that support the use of electric trucks and promote sustainability, and will be subject to discussion.

Abstract 1439

PERSUASIVE DESIGN IN MOBILITY-AS-A-SERVICE (MAAS) FOR BEHAVIOR CHANGE: IS GAMIFICATION THE MORE EFFECTIVE APPROACH?

Vancaemelbecke C.*, Lemercier C., Caroux L.

Université Toulouse Jean-Jaurès, CLLE, CNRS ~ Toulouse ~ France

Gamification (i.e., the use of game elements in non-game contexts) has been widely adopted as a persuasive design strategy in domains such as education, health, and environmental sustainability (Ahmad et al., 2021; Deterding et al., 2011; Wan Sze Cheng, 2020). In the mobility sector, findings are promising yet inconclusive, as many studies do not rigorously compare gamified interventions against non-gamified ones (Avril et al., 2024). This ongoing study addresses this gap by embedding gamification within the Stage Model of Self-Regulated Behavioral Change (SSBC) and testing it against a non-gamified SSBC condition (Bamberg, 2013). In a between-subjects experiment, participants recruited online will complete three weeks of fictional commuting decisions, choosing between bicycle, bus, or car. Both groups will receive identical onboarding and weekly performance feedback (modal share, car-use trend). Only the gamified condition will integrate game elements that structure goals and render progress salient (e.g., collecting “leaves,” level advancement, symbolic rewards), while the control condition will present neutral impact cues (directional arrows) without game mechanics. Pre- and post-measures will assess perceived social norms, perceived social recognition, personal norms, goal intention, behavioral intention, perceived goal feasibility, attitude toward alternatives, and action planning. We hypothesize that gamification moderates the relationship between perceived social norms and goal intention, such that the influence of perceived norms on goal intention is stronger in the gamified condition. We also propose several hypotheses to validate the model based on the SSBC. The study advances the field by integrating gamification with a stage-based model and clarifying mechanisms in mobility change, while offering design guidance for MaaS platforms (Hensher et al., 2021). Full results and implications for research and practice will be presented at the conference.

Abstract 1575

MOTORCYKLISTS BELIEFS ABOUT THE CAUSES OF CRASHES

Andersson J.*, Forward S., Forsman Å.

VTI ~ Linköping ~ Sweden

Background: Motorcyclists face a significantly higher risk of fatal traffic accidents—approximately 25 times higher—compared to car drivers. The purpose of this study was to examine motorcyclists' perceptions of the causes behind crashes. The study also aimed to evaluate whether the instrument used to measure both internal and external beliefs could be improved by including factors identified in the literature as important from a traffic safety perspective. Furthermore, the study investigated whether the experience of having been involved in a crash influenced these perceptions, and whether it mattered if the rider was at fault or not. Method: Motorcyclists with and without crash experience were recruited. Among those who had been involved in an crash, participants were further divided into two groups: those who were at fault and those who were not. All participants completed a web-based version of the T-LOC instrument, which was expanded with seven new questions focusing on reckless driving behavior, in addition to the original items. Results: Motorcyclists largely indicated that other road users, especially car drivers, are the primary cause of crashes. Those who had experienced an crash rated "Bad luck" as a stronger cause than those who had not been involved. When comparing those who were at fault with those who were not, "Other road users" was the only factor that showed a statistically significant difference. This suggests that the experience of being involved in an crash without being at fault increases the tendency to blame other road users. Conclusion: Motorcyclists perceive the causes of crashes differently than car drivers, with "Other road users" seen as the most decisive factor. The experience of having been in an crash, especially when not at fault, affects these perceptions. A deeper understanding of these beliefs can be used in the development of educational programs aimed at improving traffic safety.

Abstract 1482

ENGAGING STUDENTS IN TRAFFIC PSYCHOLOGY RESEARCH THROUGH CITIZEN SCIENCE

Bianchi A.*

Federal University of Paraná ~ Curitiba ~ Brazil

Citizen science has emerged as a valuable methodological approach across several scientific fields, offering cost-effective strategies to collect data in contexts or geographic regions that are difficult for researchers to access. In the field of traffic psychology, citizen science can be applied to investigate environmental factors that influence road safety, especially in areas where direct researcher presence is limited. Between 2021 and 2023, we developed a citizen science protocol specifically designed to support research in school settings. In 2024, this protocol was implemented in a study conducted in a state in southern Brazil, aiming to assess the traffic environment and the presence of safety-related signage around schools. A total of 562 students from 6th to 12th grades, supervised by their teachers, participated as citizen scientists and collected data on the surroundings of 67 schools. Among the results, 46.27% of the schools lacked speed limit signs on the street directly in front of them, 19.40% had posted limits of 40 km/h or higher, and 19.40% had no sidewalks in front of the school. This situation makes it difficult for drivers to understand what behavior is safest for that context and for children and adolescents to adopt protective behaviors, such as walking on sidewalks. These are some of the findings generated by this initiative, which also revealed other relevant issues regarding the safety of school surroundings. Overall, the project highlights two key contributions: (1) it provided children and adolescents with an opportunity to learn how to assess traffic safety conditions, and (2) it generated empirical evidence that can be used to advocate for decision-makers to implement structural changes to improve traffic safety around schools. These results can support the development of evidence-based public policies aimed at creating safer environments for children and adolescents in school areas.

Abstract 977

EXPLORING VISUAL EXPLORATION STRATEGIES THAT CONTRIBUTE TO SAFE ROAD CROSSING

Anic A.*[1], Mcguckian T.[1], Carrigan A.[3], Wilson P.[1], Greene D.[1], Duckworth J.[2], Thong L.P.[2], Eldridge R.[2], Michael P.[1], Mckinnon A.[4], Bennett J.[1]

[1]Australian Catholic University ~ Sydney ~ Australia, [2]The Royal Melbourne Institute of Technology ~ Melbourne ~ Australia, [3]The University of Sydney ~ Sydney ~ Australia, [4]Western Sydney University ~ Sydney ~ Australia

Introduction

As the global population continues to age, more older adults will navigate the roadway as pedestrians. Older pedestrians represent an increasing and overrepresented proportion of road fatality statistics (Australian Automobile Association [AAA], 2022). Understanding how decisions are made when crossing the road is vital in reducing pedestrian fatalities. Two decision making skills required to cross the road safely are hazard perception (HP; involves the identification and response to a potential hazard; Rosenbloom et al., 2015), and gap acceptance (GA; involves judging when a sufficient gap appears in traffic to cross safely; Cœugnet et al., 2019). This research used an established virtual reality (VR) protocol (see Bennett et al., 2025) to investigate HP and GA in older adult pedestrians.

Purpose

To understand the role of walking speed, visual perceptual and visual exploration factors in predicting key decision-making behaviours of GA and HP in older adult pedestrians.

Methods

100 healthy older adults were recruited (Mage = 68.83, SDage = 5.25). Participants completed a walking speed, visual acuity (VA) and contrast sensitivity (CSC) task. Participants completed a VR GA and HP task using a 360-degree roadway scene; head and eye movements were measured using VR. Response time (in seconds) was the outcome variable for HP and GA.

Results

Two separate hierarchical regressions were computed. For HP, the full model was significant (R^2 = .27, $p < .001$); total fixations (β = -.39) and CSC (β = -.24) predicted lower response times over and above walking speed. For GA, the full model was not

significant (R^2 = .09, p = .46).

Conclusion

Fixations – a marker of visual attention – and CSC predict better responses to HP but not GA. Training protocols could increase HP skills by incorporating fixation guides. Road infrastructure could implement sharper contrasts between light and dark to help HP.

Abstract 1374

CHALLENGES IN OBTAINING A DRIVER'S LICENSE FOR YOUTH WITH NEURODEVELOPMENTAL DISORDERS: A SWEDISH NATIONAL REGISTRY STUDY

Hertzberg L.*[1], Selander H.[2], Thorslund B.[1], Kjeldgård L.[3]

[1]Linköping University, Department of Computer and Information Science ~ Linköping ~ Sweden, [2]VTI, Swedish National Transport Research Institute and Department of Clinical Neuroscience, Sahlgrenska Academy, Institute of Neuroscience and Physiology ~ Gothenburg ~ Sweden, [3]VTI, Swedish National Transport Research Institute ~ Stockholm ~ Sweden

Introduction

Learning to drive is a key step in the transition to adulthood. However, driving is a complex task that depends on abilities such as attention, memory, and motor skills, all coordinated by executive functioning. Neurodevelopmental disorders (NDDs), such as ADHD or ASD, can make driving challenging, though the severity of difficulties varies, resulting in different challenges during the licensing process. However, it remains unclear how many individuals with NDDs obtain a driver's license and which factors may influence this outcome.

Purpose

The aim of the study is to examine how NDDs affect the ability to obtain a driver's license and how individuals with various NDDs perform on driving test. The specific research questions are:

• How prevalent are NDDs among young drivers?

• What differences are there in driving test outcomes between individuals with NDDs and those without?"

Method

The study is conducted as a retrospective design utilizing linked data from national registers. The data collection has ethical approval and includes information from the National Board of Health and Welfare's patient register, the Swedish Transport Administration's theory and practical driving tests, and background data from Statistics Sweden. The study population consists of individuals who, between 2000 and 2022, received a NDD diagnosis (ICD-10) before the age of 18. A control group is matched on year of birth, sex, and municipality of residence.

Results

Data collection is complete, encompassing over 300,000 individuals with NDDs and a matched control group. Data analyses are planned to commence shortly.

Conclusions

This study will highlight the challenges faced by young drivers with NDDs during the driver licensing process. The results will provide insights that can inform the development of driver education and assessment systems that are accessible and fair for all learners, as well as guide future research and policy to better support this growing population.

Abstract 1359

CHANGES IN COGNITIVE FUNCTIONING AND RISKY DRIVING AMONG HEALTHY OLDER DRIVERS OVER ONE YEAR

Marksaityte R.*, Seibokaite L., Endriulaitiene A., Morkevičiūtė M., Vadvilavicius T.

Vytautas Magnus University ~ Kaunas ~ Lithuania

Introduction. Driving-related cognitive abilities, as well as driving performance decline with age, especially among drivers at their 65 and over. However, studies usually involve older drivers, those with certain health issues that strongly impair driving and other daily life skills (like stroke, early stages of dementia, etc.). Purpose. This study aimed to assess how driving-related cognitive abilities and risky driving indicators of older drivers change over a one-year period. Method. The study included 170 healthy Lithuanian drivers aged 60 – 89 years (mean age = 68.2; 52.9% males). Mean driving experience was 39.5 years, 91.8% were driving a vehicle at least once per week. Up to 12% of drivers reported having been involved in a traffic accident or having received a fine in the past year. The five measures – Montreal Cognitive Assessment (MoCA), Trail Making Test (parts A and B), Lithuanian Hazard Prediction test, scales of Errors and Lapses from DBQ, Near-miss scale – were administered to the participants twice with a one-year interval. The study was funded by a grant No. S-VIS-23-12 from the Research Council of Lithuania (LMTLT). Results. Older drivers' scores on the MoCA memory subscale and performance of TMT part B improved and older drivers reported fewer driving errors and lapses in one year. The score of Near-miss accidents also slightly increased indicating more reported near-misses at the second measurement. The effect sizes were small (ranging from .12 to .33). No differences in other cognitive abilities or hazard prediction skills were observed at one-year follow-up. Conclusions. Improvements in some cognitive abilities might be due to repeated testing effect. In addition, one-year period might be too short to detect significant decline in driving-related cognitive functioning in healthy older drivers. A positive self-reported driving behaviour might be an indicator of overestimation of own skills in older drivers.

Abstract 1845

CONTINUOUS GLUCOSE MONITORING AND HYPOGLYCEMIA AWARENESS WHILE DRIVING: EVIDENCE FROM A NATIONAL SURVEY OF DRIVERS WITH DIABETES

Trawley S.*[1], Mcauley S.[2], Stephens A.[2]

[1]University of Melbourne ~ Melbourne ~ Australia, [2]Monash University ~ Melbourne ~ Australia

Introduction: Driving requires sustained attention, rapid decision-making, and motor coordination. For people with diabetes using glucose-lowering medications, hypoglycemia can impair these skills and increase crash risk. Continuous glucose monitoring (CGM) provides real-time glucose data and alerts that may enhance safety, yet little is known about how drivers actually use these devices on the road.

Purpose: To examine the relationship between CGM use and self-reported hypoglycemia while driving, and to explore drivers' perceptions of CGM features and barriers to use.

Method: A national cross-sectional online survey was conducted in Australia (June–August 2025). Eligible participants were adults with diabetes treated with glucose-lowering medication and holding a valid driver licence. The survey collected sociodemographic, clinical, and driving data, including hypoglycemia frequency, glucose monitoring methods, CGM usage patterns, and desired features. Logistic regression examined associations between CGM use and hypoglycemia while driving. Open-text responses were analysed for themes.

Results: A total of 1,209 drivers participated (mean age 55 years; 47% CGM users; 36% type 1 diabetes). In the past year, 28% reported at least one hypoglycemia episode while driving. Compared with non-users, CGM users had higher odds of reporting hypoglycemia (adjusted OR 4.22 [95% CI 2.72–6.55]), suggesting greater detection and awareness. Two-thirds relied on vibration or sound alerts, while fewer than one in five adjusted thresholds specifically for driving. The most common barrier was uncertainty about legal use of CGM (43%). Thematic analysis highlighted drivers' calls for in-car integration, clearer voice-based alerts, and legal clarity.

Conclusions: CGM use while driving was associated with increased awareness of hypoglycemia, reflecting improved detection. Drivers expressed a clear need for driving-specific CGM features and legal guidance to support safe, effective use.

Abstract 744

A MENTAL HEALTH PERSPECTIVE ON DRIVER BEHAVIOURS AND ROAD RAGE INCIDENTS OF MOTORCYCLE COURIERS IN TÜRKİYE

Aktas A.*

Sivas Cumhuriyet University ~ Sivas ~ Turkey

The growing number of delivery riders in urban areas is also becoming a major concern for traffic safety in Türkiye. A limited number of studies have examined the occupational challenges that these riders face in traffic and their impact on mental health, from the perspective of traffic and transport psychology. The purpose of this study was to examine in detail aberrant and positive behaviours of male motorcycle couriers in Türkiye, as well as their road rage incidents, from a mental health perspective (including the presence of psychopathological symptoms and consumption of tobacco, alcohol, and caffeine). Ethical approval was obtained. A total of 43 motorcycle couries with a mean age 28.53 (SD=7.15) years completed an online survey consisting of the Short Driver Behaviour Questionnaire (S-DBQ) and the Brief Symptom Inventory (BSI), as well as a questionnaire addressing demographic information, work experience, and tobacco, alcohol, and caffeine consumption. In this concurrent mixed-design, participants were also asked semi-structured questions to explore their experiences with road rage. Data collection process is ongoing. The collected data were transferred to SPSS 29 and MAXQDA, and analyses were conducted using quantitative and qualitative techniques. Preliminary findings suggest that 81.4% of participants smoking and 18.6% consume alcohol regularly. Significant correlations were found between BSI scores and frequency of caffeine consumption, and between S-DBQ ($p<.05$). Over the past six months, 32.6% of participants reported experiencing low-level road rage almost daily, while 16.3% admitted to being perpetrators. Furthermore, for both victims and perpetrators of high-level road rage, this rate was 18.6%. Thematic findings highlighted violations, verbal abuse, physical violence, traffic accidents, and legal incidents. The findings emphasize the need to evaluate motorcycle couriers' psychological symptoms and driver behaviours to enhance traffic safety, suggesting that in Türkiye they face substantial road risks and insufficient legal and occupational regulations.

Abstract 1121

FREQUENCY OF VISUAL EXPLORATION PREDICTS HAZARD PERCEPTION AND GAP ACCEPTANCE OF CHILD AND ADULT PEDESTRIANS

Anic A.*, Mcguckian T., Lucas R., Healy N., Lam N., Palmer K., Whyte--Ball T., Bennett J.

Australian Catholic University ~ Sydney ~ Australia

Introduction

Pedestrian fatalities and hospitalisations involving children 8-16 is increasing in Australia (Australian Institute of Health and Welfare [AIHW], 2021). Head turn frequency (HTF) and excursion (HTE) are important to investigate, because compared to adults, children are less likely to look left or right before crossing (Lee et al., 2025). Two skills are required to cross the road safely: hazard perception (HP; identification and response to a potential hazard; Rosenbloom et al., 2015), and gap acceptance (GA; judging when a sufficient gap appears in traffic to cross safely; Cœugnet et al., 2019). We used an established virtual reality (VR) protocol (see Bennett et al., 2025) to investigate HP and GA in adults and children.

Purpose

Understand how adults and children use visual exploration in GA and HP tasks. Develop training protocols that can increase GA and HP skills in children to reduce the incidence of roadway crashes.

Methods

30 children (Mage = 9.57, SDage = 1.25; 52.3% female) and 44 adults (Mage = 23.34, SDage = 3.46; 23.3% female) were recruited. Walking speed and VR GA and HP tasks were completed. Head movements were measured using VR. Response time (RT; in seconds) was the outcome variable.

Results

Separate hierarchical regressions were computed. For GA (adults), the full model was significant ($R^2 = .29$, $p < .05$); HTF ($\beta = 3.49$) predicted higher RTs; it was not significant for children ($R^2 = .35$, $p > .05$). For HP (adults), the full model was significant ($R^2 = .45$, $p < .001$); HTF ($\beta = -7.34$) and HTE ($\beta = -.17$) predicted lower RTs; for children the full model was significant ($R^2 = .50$, $p < .01$); HTF ($\beta = -10.59$) predicted lower RTs.

Conclusion

Training protocols on HP should involve head movements because children face more risk when crossing compared to adults.

Abstract 838

VISUAL PERCEPTION OF ADULT AND CHILD PEDESTRIANS IN A 360° VIRTUAL ROAD ENVIRONMENT.

Gramaje C.*[1], Simoes--Perlant A.[1], Lemercier C.[1], Saint Pierre G.[2]

[1]University of Toulouse Jean Jaurès, CLLE Laboratory ~ Toulouse ~ France, [2]Cerema - ITS research team ~ Toulouse ~ France

Pedestrian children are a highly vulnerable population due to ongoing cognitive development and limited traffic experience (Barton et al., 2012; Association Mondiale de la Route, 2017). Compared to adults, they adopt more restricted visual exploration strategies, often neglecting peripheral cues essential for safe decision-making (Biassoni et al., 2018). In dynamic urban environments, flexible scanning and hazard anticipation are critical to reducing accident risk (Dommes & Cavallo, 2011; Hollmann, 2015).

This study introduces an innovative paradigm combining immersive virtual reality (VR) and eye-tracking to investigate hazard perception in child pedestrians. Participants are exposed to 360° urban traffic videos displayed in a VR headset with integrated eye-tracking, enabling precise recording of gaze behavior (Deb et al., 2017). This approach overcomes the ecological limitations of traditional 2D paradigms (Rosenbloom et al., 2015; Biassoni et al., 2018), allowing detailed measurement of attention and scanning patterns.

We expect children aged 10–14 to show longer reaction times, lower hazard detection rates, and narrower visual exploration than adults, reflected in fewer peripheral fixations and reduced spatial coverage. Adults are anticipated to adopt more global and flexible strategies, integrating multiple cues and updating gaze dynamically. Following individualized intervention based on adult “expert” profiles, children are expected to improve detection performance and reaction times while diversifying gaze trajectories toward more adult-like strategies.

The study will involve 30 children and 20 adults. Children will perform the task twice, before and after intervention, while adults provide reference profiles. Participants will view 40 immersive scenes and indicate hazards via button press. Eye-tracking data and reaction times will be analyzed to assess age-related differences and the impact of VR-based visual feed-back.

Data collection is planned for 2025/2026, and results will highlight differences in hazard perception between children and adults as well as the effectiveness of immersive feedback interventions.

Abstract 1320

EXPERIMENTAL INVESTIGATION OF DRIVER BEHAVIOUR IN HIGHWAY WORK ZONES USING A DRIVING SIMULATOR: DRIVER TYPES AND PERCEPTION OF ROADWORKS ZONES

Gnerre M.*, Bina M., Perego P., Biassoni F.

Traffic Psychology Unit of Research UCSC ~ Milano ~ Italy

Introduction
Roadwork sites on high-speed roads represent complex environments where human, environmental, and infrastructural factors interact to influence driver behaviour. Perceptions of the characteristics of the roadwork zone and personality aspects related to driving can affect how drivers behave, more or less safely, within the roadwork zone.
Purpose
This study, commissioned by Autostrade per l'Italia, aims to assess personal characteristics of drivers, particularly risk propensity, and to compare the subjective perceptions of different types of roadwork sites in a simulated scenario.
Method
The sample included 80 participants of both genders, aged between 18 and 65 years, who drove in eight different scenarios on the simulator, representing three distinct types of motorway construction sites: lane closure with lane exchange, slow lane closure, and fast lane closure. Before testing, participants completed a questionnaire assessing risk propensity using three scales: the Driver Behaviour Questionnaire, the Sensation Seeking Scale, and the Risk Propensity Scale. Afterward, they completed a questionnaire evaluating their perception of the roadwork sites in terms of danger, clarity of signage, presence of distractions, and driving effort required.
Results
The findings indicate varying perceptions of the different site types, with lane closures involving lane exchanges perceived as the most dangerous, demanding, and difficult to traverse. Participants showed a preference for and perceived lower risk in scenarios with fewer signals, particularly visual signals, which require less cognitive effort to adapt driving behaviour. Two clusters of participants were identified based on risk propensity; such groups also proved different in the perception of the road environment.
Conclusions
Analyzing subjective evaluations of safety in roadwork sites represents a valuable method to understand how site features, designed to promote driver safety, are perceived. Results showed that, in addition, personality factors play a role in subjective evaluations of safety , highlighting the importance of considering individual differences in safety communication and site design.

Abstract 509

IDENTIFYING ACOUSTIC MARKERS OF STRESS IN AVIATION EMERGENCIES: A REAL-WORLD ANALYSIS OF PILOT-ATC COMMUNICATIONS

Gnerre M.*, Biassoni F.

UNIVERSITà CATTOLICA DEL SACRO CUORE ~ MILANO ~ Italy

Introduction: This study investigates real-world voice communication between pilots and air traffic controllers (ATCs) during emergencies to identify acoustic indicators of situational stress.

Method: We analyzed 75 recordings from LiveATC.net, manually annotated for speaker (pilot vs ATC) and flight phase (routine vs emergency). A total of 27 acoustic features were extracted using Parselmouth. Feature selection involved ANOVAs with FDR correction and collinearity checks. Speaker-specific Linear Discriminant Analyses (LDA) and Leave-One-Event-Out cross-validations were applied.

Results: Twenty-two features for ATCs and twenty for pilots significantly differed between the two flight phases. LDA models achieved cross-validated accuracy of 73.6% (ATCs) and 78.7% (pilots). Shared markers of stress included increase in F0 mean, F0 min, intensity max, utterance duration, jitter and shimmer, as well as decrease in HNR and CPP, indicating increased vocal effort and reduced voice quality during emergencies. Differences by role emerged: ATCs showed a substantial increase in RMS energy, number of pauses, and spectral tilt, while pilots exhibited higher articulation rate under stress.

Conclusions: This study highlights robust, role-specific acoustic markers of acute stress in real-world aviation emergencies. These findings may inform real-time voice-based stress monitoring tools to enhance aviation safety.

Abstract 63

DEVELOPMENT AND VALIDATION OF DRIVING-RELATED COGNITIVE LOAD AND RISK PERCEPTION SCALE

Sadia R.*, Kamal A., Ahmed F., Aslam I., Tabassum A.

Rawalpindi Women University ~ Rawalpindi ~ Pakistan

Driving is an intricate and demanding task with numerous distractions that divert the driver's focus away from significant events and elevate the demands on cognitive resources. Road accidents have significant social and economic impacts particularly for developing countries with highest number of road fatalities and minimal resources to minimize road risks. Therefore, the objective of the current study was to develop and validate indigenous scales to assess risks associated with traffic causalities. In the first qualitative phase, risk factors were examined qualitatively. Results of Thematic analysis identified risk perception and cognitive load as two of the risk factors. Therefore, an item pool was generated (for both scales) and validated by Subject Matter Experts (SMEs). Based on their feedback, six overlapping items were removed and an initial pool comprising of 30 items was finalized for Driving Related Cognitive Load Scale (DRCLS) while 36 items were finalized for Driving Related Risk Perception Scale (DRRPS). These were administered on drivers (N = 631) with an age range of 18-65 years (M = 37.90, SD = 11.15) in the second phase to establish construct validity through EFA; two factors for each scale were retained with minimum factor loading of .29. Explained variance of two factors of DRCLS (14-items) was 26.83% and 22.30%. However, explained variance of DRRPS (13-items) was 40.92% and 14.23%. Two factors of DRRPS were named as perceived risk of traffic (8 items) and perceived risk of weather (5 items). Moreover, the two factors of DRCLS are: external factors (7 items) and personal and professional factors (7 items). Additionally, Cronbach alphas and construct validity based on significant positive inter-subscale correlations and correlations with total score were satisfactory. The findings would be helpful to develop interventions that could help driver to effectively cope with their driving demands.

Abstract 1355

PERSPECTIVE-TAKING AND SITUATIONAL REFLECTION AS PREDICTORS OF SAFER DRIVING

Austers I.*, Dimdins G., Cinks R., Evelis K., Jaunzeme K., Muzikante I., Polanska E., Priedols M.

University of Latvia ~ Riga ~ Latvia

Traditional models of driving behavior often neglect the social-cognitive processes that underlie interactions in traffic. Drawing on a series of complementary studies, we propose that drivers' ability to reflect on traffic situations and adopt others' viewpoints—captured by the newly developed Driver Situational Reflection Scale (DSRS)—plays a critical role in predicting safe and prosocial driving. The DSRS, a two-factor measure (Caution and Perspective-Taking) was validated across multiple samples. Its factors reliably predicted fewer violations, errors, and lapses, as well as greater prosocial driving and self-reported driving skills, outperforming established empathy measures. Another study experimentally examined perspective-taking in dynamic traffic scenarios. Results revealed that dispositional perspective-taking correlates with perceiving traffic situations as riskier and with making more cautious predictions about other drivers' behaviors, while situational manipulations of perspective-taking produced subtler effects. Together, these findings highlight perspective-taking and situational reflection as distinct, measurable cognitive competencies shaping risk perception and driving behavior. They suggest promising directions for road-safety interventions, such as integrating perspective-taking exercises into driver education or simulator-based training, and open avenues for cross-cultural validation and application of DSRS.

Abstract 2223

INVESTIGATING THE RELATIONSHIP BETWEEN PEDESTRIAN RISK PERCEPTION AND BEHAVIORS: MODERATING EFFECTS OF ATTITUDES

Bedi M.K.*, Azik Özkan D., Öz B.

Middle East Technical University ~ Ankara ~ Turkey

Despite accounting for a substantial share of global road fatalities and being the most vulnerable road users, pedestrians remain underrepresented in psychological models of traffic safety. In particular, the interaction between risk perception and attitudes has rarely been examined, even though both constructs are central to understanding safety-related behavior. This study addresses this gap by introducing the Perception of Risky Situations Scale for Pedestrians (PRSS-P), a novel multi-factorial instrument designed to capture pedestrian-related, driver-related, and infrastructure-related risk perceptions.

A cross-sectional survey of 402 participants was conducted, in which they completed the PRSS-P (pedestrian-, driver-, and infrastructure-related risk perception) along with established measures of pedestrian behaviors (violations, lapses, aggressive, and positive behaviors) and attitudes (toward traffic rules and other road users). Moderation analyses (Hayes, PROCESS, Model 1) were performed to test the interaction effects.

Results revealed that the relationship between risk perception and pedestrian behavior is significantly moderated by attitudes. Critically, higher levels of perceived risk did not uniformly predict safer behavior. For pedestrians with sceptical attitudes toward traffic rules (higher scores), stronger perception of pedestrian and infrastructure-related risks was associated with increased violations, suggesting adaptive noncompliance. Conversely, the link between perceived risk and positive (safety-enhancing) behaviors was strongest among individuals who expressed greater trust in other road users (lower scores). Additionally, significant moderations were observed for lapses and aggressive behaviors, suggesting that these behaviors may be shaped by cognitive load and systemic frustration.

These findings demonstrate that risk perception does not operate in isolation; its behavioral impact is filtered through pedestrians' attitudinal orientations. By pairing a novel pedestrian-specific instrument (PRSS-P) with moderation analyses, this study highlights the potential attitude-focused strategies. These include campaigns to strengthen rule adherence and initiatives that promote respectful, cooperative interaction among road users, which can complement infrastructure and traffic-management improvements.

Abstract 1400

HOW "LAZY" HEAD MOVEMENTS CAN EXPLAIN DRIVERS' FAILURES IN PERIPHERAL VEHICLE DETECTION.

Chapman P., Stretton A.*

University of Nottingham ~ Nottingham ~ United Kingdom

There are many traffic situations where a driver has to decide whether a manoeuvre is safe to perform based on the information available to them in peripheral vision. Such information is surprisingly limited and people are routinely unaware of these limitations. In a series of experiments we asked drivers in a high-resolution driving simulator to decide whether oncoming vehicles were present. Vehicles could appear anywhere in an arc of 194 degrees of visual angle and were always clearly detectable using central vision. Even when drivers were free to make as many head movements as they wanted, we found that they made regular errors (failures to detect an oncoming vehicle). Most of these errors occurred when target vehicles initially appeared in the extreme periphery (beyond 60 degrees to the right or left). These errors were frequent when the oncoming vehicle was a motorcycle, and less common when the oncoming vehicle was a truck. Recordings of drivers' head and eye movements suggested that they typically perform this task by making only two or three head movements (similar to what a driver might do at a real junction) and they do not always need to fixate directly on a vehicle to know that it is there. The problem is that even after a head and eye movement to one side, extreme locations may still be viewed using peripheral vision. Such vision may be good enough to detect a large truck, but not a smaller motorcyclist. This is consistent with our finding that when drivers explicitly search for a motorcyclist these peripheral errors are dramatically reduced. This may be a major cause of real-world crashes where oncoming motorcyclists are involved and where the driver is an older one with potentially reduced neck mobility. We provide suggestions for interventions that might prevent these crashes.

Abstract 1362

COMPARING COGNITIVE FUNCTION AND STREET CROSSING BEHAVIOURS IN CHILDREN AND ADULTS

Whyte--Ball T.*[2], Mcguckian T.[1], Anic A.[2], Healy N.[2], Palmer K.[2], Lam N.[2], Lucas R.[2], Bennett J.[2]

[1]Healthy Brain and Mind Research Centre, School of Behavioural and Health Sciences, Australian Catholic University ~ Melbourbe ~ Australia, [2]School of Behavioural and Health Sciences, Australian Catholic University ~ Sydney ~ Australia

Introduction

To safely cross the street, pedestrians are required to process and attend to visual stimuli while making decisions (Schwebel et al., 2012). The information processing model highlights the role multiple cognitive domains in predicting pedestrian behaviours (IPM; Uc & Rizzo, 2008; Barton & Morrongiello, 2011). Children are vulnerable road users with road crashes being the leading cause of death for children aged 5-19 years (WHO, 2020). Underdeveloped cognitive function is a potential explanation for their increased risk (Barton & Schwebel, 2007). Given the importance of cognitive function for street-crossing behaviours, comparing adults and children could be useful because cognitive function should be fully developed by adulthood. Understanding in the role of cognitive function will help inform the development of interventions.

Purpose

This study compared the relationship between cognitive function and the street-crossing behaviours of Hazard Perception (HP) and Gap Acceptance (GA) in both children and adults to determine if cognition was a stronger predictor of street-crossing behaviours than age.

Method

32 children aged 7-11 years (M = 9.48, SD = 1.31, 75.2% male) and 44 adults 18 to 36 years (M = 9.48, SD = 1.31, 75.2% male) completed cognitive tests measuring domains in IMP. Participants completed a virtual reality pedestrian street-crossing task to measure their HP response time (HP-RT), HP accuracy, and GA response time (GA-RT).

Results

Cognitive function was a significant moderate predictor of HP-RT over and above age ($R^2 = .20$, $p < .01$) with memory a significant individual predictor. Cognitive function was not a significant predictor of HP accuracy ($R^2 = .17$, $p > .05$) or GA-RT ($R^2 = 08$, $p = .29$) over and above age.

Conclusion

To improve HP across age groups, interventions should incorporate upskilling cognitive function across the domains of the IPM. More research is needed to understand the predictors of GA.

Abstract 2044

ROAD OR ROSÉ: THE IMPACT OF ALCOHOL ON CHANGE DETECTION IN DRIVING SCENES

Wynne R.*[1], Little H.[1], Pammer K.[2]

[1]The University of Newcastle ~ Newcastle ~ Australia, [2]The University of Melbourne ~ Melbourne ~ Australia

Within our day-to-day lives, we are exposed to an ever-changing visual scene of objects and information, and from this scene, we try to construct an accurate representation of the world. However, particularly in complex scenes, the number of rapid changes can lead to missed information and errors. For instance, a driver may be looking right at a traffic light but miss it changing colour because of a brief distraction or glance towards a pedestrian. Such occasions of distraction can be amplified when alcohol has been consumed; with higher blood alcohol concentrations associated with more perceptual and cognitive failures. Theories indicate this is due to a narrowing of attention capture when alcohol concentration increases. This paper considers two studies exploring the impact of increasing blood alcohol concentration on performance in a flicker change detection task. Within Study 1, 52 participants identified central or peripheral changes in driving scenes with no significant difference in performance across change types. However, when a detection response task was incorporated into Study 2 (to more closely account for the cognitive demands of driving), increasing intoxication negatively impacted accuracy for peripheral changes. That is, participants performed worse at identifying changes when they occurred outside of the central attentional focal point. Participants appeared to 'trade off' performance on the peripheral change detections to maintain performance on the detection response task. With most participants falling within the legal limit of alcohol concentration for driving, this has implications for understanding how alcohol impacts our cognitive functions necessary for driving.

Abstract 1324

TRAINING VIGILANT MINDS: A PSYCHOLOGICAL INTERVENTION TO STRENGTHEN RISK AWARENESS AMONG TRAIN DRIVERS

Bina M.*, Perego P., Meinero C.A., Biassoni F.

Traffic Psychology Unit of Research UCSC ~ Milano ~ Italy

Introduction

Train driving is a cognitively demanding task that requires vigilance and attention to ensure safety; impairments in these processes contribute to operating incidents such as SPADs (Signal Pass at Danger) and station overruns.

Purpose

This study reports the evaluation of VigilMente, a psychological training designed to strengthen vigilance and risk awareness among train drivers of TPer (Italian railway company), and its effectiveness in improving knowledge relevant to safe train operation.

Method

The intervention consisted of a single 3-hour session delivered by traffic psychologists, utilizing brief theoretical inputs, guided discussions, multimedia demonstrations, and experiential tasks (e.g., selective attention and interference exercises). Content was tailored to drivers' work contexts under a just-culture framework, covering sustained, selective, and divided attention, attentional blindness, interference, automatism, and risk perception. Effectiveness was assessed with a pre–post design using a 7-item multiple-choice knowledge test. Anonymous responses were paired via participant codes. A total of 417 drivers provided matched data; repeated-measures ANOVA tested the change in total and item scores, with training site (Bologna, Ferrara, Piacenza, or Reggio Emilia) and instructor (the traffic psychologists) as control factors.

Results

Knowledge improved significantly from pre- to post-training on the total score ($F(1,415)=198.76$, $p<.001$), with no differences by site or instructor. Significant item-level gains were observed for attentional blindness ($F=195.24$, $p<.001$), interference ($F=59.78$, $p<.001$), sustained attention ($F=27.74$, $p<.001$), and selective attention ($F=7.17$, $p=.008$). The risk-perception item showed no improvement, likely due to a reversed instruction that many misread. Acceptability was high, with 92% of participants satisfied.

Conclusions

A concise, psychologically grounded intervention yielded robust gains in drivers' knowledge of attentional mechanisms relevant to rail safety. Future iterations should refine the assessment of risk perception, incorporate scenario-based decision training, and address emotional factors that influence attention under operational stress.

Abstract 389

EXPLORING PSYCHOPHYSIOLOGICAL FITNESS IN DRIVERS AFFECTED BY MOOD AND ANXIETY DISORDERS

Candida C.*, Daniel S., Antonia Pilar P., Maria Blasa S.

University of Granada ~ Granada ~ Spain

Anxiety, depression, and bipolar disorder can significantly impair driving ability. However, the specific impact of these conditions on traffic accidents—as well as their prevalence among drivers—is not always well documented or thoroughly studied in the scientific literature. This study aims to identify the relationship between these disorders and driving by examining the impact of depressive disorders on driver performance. It was undertaken a systematic search of literature databases and scientific registries, following the PRISMA guidelines. This search was conducted in March 2025 using the following electronic databases: CINAHL, MEDLINE, ProQuest, PsycINFO, PubMed, SCOPUS, and Web of Science. Key terms were adjusted to each database's specific search format. For each database, search filters were applied to return only peer-reviewed reviews published in scientific journals, written in English, and published between 2015 and 2025. The terms used included: TITLE ("anxiety disorder*" OR "generalized anxiety disorder*" OR "generalised anxiety disorder*" OR "bipolar disorder*" OR "mood disorder*" OR depress* OR "depressive disorder" OR "depressive syndrome*" OR "bipolar and related disorder*" OR anxiet*) AND TITLE-ABS-KEY ("automobile driving" OR "driving ability" OR "fitness to driv*" OR "driv* competence*" OR "driv* perform*" OR "driv* skill*" OR "driv* impairment*" OR "driv* decline*" OR "offend* driv*" OR "novice driver*" OR "learn* driv*" OR "profess* driver*" OR "unfit to driv*" OR "traffic safety" OR "highway safety"). A total of 288 articles were retrieved across platforms: WoS (n = 43), Scopus (n = 77), PubMed (n = 58), PsycINFO (n = 21), ProQuest (n = 52), and Medline/CINAHL (n = 37). After removing duplicates, 141 articles remained. Based on titles and abstracts, 51 were excluded. After full-text review, 25 relevant articles were selected. An additional five pertinent articles not identified in the initial search were added from the systematic reviews. It is also planned to assess the quality of the articles found. Finally, we will present the study's overall conclusions and general recommendations.

Abstract 1601

PERCEIVED RISK IN MICROMOBILITY: COMPARING BEHAVIORAL AND ENVIRONMENTAL HAZARDS IN E-SCOOTER USE

Hoarau R.*[1], Lemercier C.[1], Truillet P.[2]

[1]Université Toulouse Jean Jaurès ~ Toulouse ~ France, [2]Université de Toulouse ~ Toulouse ~ France

Introduction:
The rapid growth of electric scooter (e-scooter) use has introduced new challenges for road safety. While crash risk factors are increasingly documented, little is known about how riders subjectively evaluate risks in everyday traffic. Understanding these perceptions is crucial to designing effective prevention strategies.

Purpose:
This study aimed to compare perceived risk for behavioral hazards (e.g., speeding, intoxication) versus environmental hazards (e.g., poor visibility, dense traffic), and to examine whether risk perception varies by age, gender, and rider status (user vs. non-user).

Method:
A total of 100 participants (56 men, 44 women; 64 % under 35 years old) completed an online survey. Participants rated 36 short descriptions of traffic situations representing behavioral and environmental hazards on a 0–100 risk scale. Individual risk attitudes were measured using the Health/Safety and Recreational subscales of the DOSPERT questionnaire. Data were analyzed using repeated-measures ANOVA; additional nonparametric tests were used for robustness.

Results:
Behavioral hazards were rated as significantly riskier than environmental hazards. No effects of age, gender, or user status emerged. Exploratory analyses showed that participants with higher general health/safety risk sensitivity also reported higher risk perception overall.

Conclusions:
Findings suggest a consistent underestimation of environmental hazards, suggesting that riders may focus on risks they feel personally able to control. Interestingly, behavioral risks are judged as highly dangerous, yet previous research shows that many riders still engage in such practices (e.g., speeding, riding under the influence). This paradox highlights that awareness alone may not be sufficient to change behavior, and that prevention efforts must combine information campaigns with interventions

addressing social norms and infrastructure conditions.

Abstract 666

HOW PHYSIOLOGICAL AND PSYCHOLOGICAL FACTORS INFLUENCING SIMULATED FLIGHT PERFORMANCE IN CIVIL AVIATION PILOTS: ROLES OF SUBJECTIVE STRESS, TRAIT MINDFULNESS, AND FACIAL EXPRESSION INDICES

Huang J.*[2], Zhang C.[1], Xu W.[2]

[1]China Academy of Civil Aviation Science and Technology, Beijing, People's Republic of China ~ Beijing ~ China, [2]Beijing Key Laboratory of Applied Experimental Psychology, National Demonstration Center for Experimental Psychology Education (Beijing Normal University), Faculty of Psychology, Beijing Normal University, Beijing, People's Republic of China ~ Beijing ~ C

Introduction

Flight safety is crucial for protecting passengers, crew members, and the sustainable development of the aviation industry. Simulated flight, which can replicate real flight scenarios with high controllability and authenticity, effectively reflects pilots' actual flight capabilities. Exploring the relationship between physiological (e.g., facial expressions) and psychological indicators (e.g., mindfulness, stress) during simulated flight and pilots' simulated flight performance is essential for identifying factors that influence flight safety.

Purpose

To explore whether and how trait mindfulness, subjective stress, obsessive-compulsive symptom level, and facial expression indices affect civil aviation pilots' objective simulated flight performance.

Method

Participants were 56 pilots from Shandong Airlines. Self-reported trait mindfulness, stress, and obsessive-compulsive symptom level were surveyed. Each pilot underwent 9 simulated subjects, during which their facial expressions were recorded and their performance rated by professional tutors. Facial expression indices including means and SD of emotional valence and arousal, were analyzed and determined by the FaceReader software. Multilevel model with random intercept was built.

Results

Analysis indicated that subjective stress and the fluctuation of emotional arousal negatively predicted pilots' performance, and the subjective stress*mindfulness interaction was also significant, suggestion the buffering role of mindfulness during flight. No significant impact of obsessive-compulsive symptom level was found.

Conclusions

Subjective stress and emotional arousal variability are important factors in predicting pilots' flight performance, while mindfulness may buffer stress's negative effect. Findings offer suggestions for aviation's psychological support.

Abstract 1235

RISK BEHIND THE HANDLEBARS: MOTORCYCLE RIDER BEHAVIOUR AND CRASH RISK IN ARUSHA, TANZANIA

Perego P.*[1], Biassoni F.[1], Mashingo P.[2], Siebert F.[3]

[1]Traffic Psychology Unit of Research UCSC ~ Milano ~ Italy, [2]Arusha Technical College ~ Arusha ~ Tanzania, United Republic of, [3]Division of Transport, Human Behaviour Section, Technical University of Denmark ~ Copenhagen ~ Denmark

Abstract:

Introduction

Motorcycle use in Tanzania is rapidly expanding, particularly in urban areas. Alongside this growth, motorcyclists now account for approximately 23% of road traffic fatalities nationally (WHO, 2018). While infrastructural and regulatory deficits contribute to crash rates, rider behaviour remains a central factor in crash causation and severity.

Purpose

This study aimed to examine behavioural risk factors among motorcycle riders in Arusha, Tanzania, using a standardised psychological tool. The goal was to assess self-reported risky behaviours and their association with crash involvement, thereby providing empirical evidence to inform future enforcement and educational interventions.

Method

The Motorcycle Rider Behaviour Questionnaire (MRBQ; Elliott et al., 2007) was adapted to the Tanzanian context. Thirty-five items from the original MRBQ were selected based on cultural relevance and translated into Swahili through a forward–backwards translation process involving native speakers. The online survey was administered between January and April 2023. A total of 233 riders participated (230 male, three female), with an average age of 25.2 years and a mean driving experience of 2.4 years. Participants reported riding on average 88.7 hours per week.

Results

Self-reported crash involvement was high: riders experienced an average of 1.3 crashes in the past 12 months. Older riders reported more crashes than younger ones. Among the MRBQ dimensions, traffic errors and speed violations showed the highest frequency. Notably, traffic errors were significantly correlated with self-reported crash frequency, suggesting a strong behavioural component to crash risk.

Conclusions

This study demonstrates that specific rider behaviours, particularly errors in traffic judgment and speeding, are associated with increased crash involvement in urban Tanzania. The findings support the integration of behavioural assessment tools, such as the MRBQ, into national road safety monitoring systems and point to the urgent need for

targeted behavioural interventions for high-exposure groups, including young male riders.

Abstract 495

USING BEHAVIOURAL DATA AS LEVERAGE: THE CASE OF SAINT LUCIA'S SOCIALLY-INCLUSIVE AND GENDER-RESPONSIVE ROAD SAFETY CAMPAIGN

Perego P.*[1], Tripodi A.[2], Jones S.[2]

[1]Traffic Psychology Unit of Research UCSC ~ Milan ~ Italy, [2]Fred Engineering ~ Rome ~ Italy

Introduction
In Saint Lucia, road traffic crashes result in a fatality rate of 8.9 per 100,000 inhabitants, disproportionately affecting young men and vulnerable road users. Infrastructure upgrades along the Millennium Highway and West Coast Road may increase exposure unless accompanied by behavioural interventions.

Purpose
Funded by the Caribbean Development Bank, this project, implemented by FRED Engineering, aimed to develop a socially inclusive and Gender-Responsive Road Safety Awareness Communication Campaign using psychological data to inform message design. A key insight was the widespread presence of an external locus of control, which told the campaign's core message: "What are you doing to improve road safety in Saint Lucia?"

Method
The situational analysis adopted a multi-method behavioural approach:
– Naturalistic observations of 600+ road users revealed low compliance with seatbelt use (under 11% rear-seat use) and frequent distracted driving (16% using mobile phones).
– A School Travel Survey highlighted safety concerns and gendered perceptions of risk among 159 students.
– A KAP survey of 480 participants assessed knowledge, attitudes, and behaviours. Notably, 56% of respondents believed that the main reason for road crashes is "poor road condition", 51% replied to overspeed (often or always), and 52% reported having been involved in a crash or near-crash situation.

Results
Findings revealed the normalisation of risky behaviours (e.g., frequent speeding by 64% of young males) and limited personal responsibility. The campaign message reframed safety as a shared duty, prompting introspection and action, and was tailored to different audience segments using inclusive visual design and local language variants.

Conclusions
Psychological data, especially related to control beliefs and observed behaviours, can

be a strategic asset in public health communication. This campaign demonstrates how targeted messaging can emerge from applied psychological tools and contribute to a more accountable and safety-conscious road culture.

Abstract 1366

CO-DEVELOPING A CULTURALLY APPROPRIATE VIRTUAL REALITY HAZARD PERCEPTION TRAINING PROGRAM FOR A VULNERABLE COMMUNITY

Whyte--Ball T.*[1], Perry L.[3], Craven R.[2], Marsh H.[2], Greene D.[1], Jenny M.[2], Duckworth J.[4], Mcguckian T.[5], Gordon A.[6], Bennett J.[1]

[1]School of Behavioural and Health Sciences, Australian Catholic University ~ Sydney ~ Australia, [2]Institute for Positive Psychology and Education, Australian Catholic University ~ Sydney ~ Australia, [3]Wonnarua Nation Aboriginal Corporation ~ Sydney ~ Australia, [4]School of Design, College of Design and Social Context, RMIT University ~ Melbourne ~ Australia, [5]Healthy Brain and Mind Research Centre, School of Behavioural and Health Sciences, Australian Catholic University ~ Melbourne ~ Australia, [6]Gordon Driver Licensing Program ~ Sydney ~ Australia

Introduction

Vulnerable communities often face systemic barriers to accessing programs, and these programs are frequently designed without consideration for cultural values, lived experiences, or historical contexts (George et al., 2018). First Nations people in Australia experience systemic disadvantages in road safety (Currie & Senbergs, 2007). In Australia, they are less likely to have a licence and three times more likely to die in road crashes than other Australians (AIHW, 2018). Social and cultural barriers linked to inequitable access to driver licensing and road safety education may help explain these disparities (Pammer et al., 2021). There are limited culturally appropriate road safety programs and resources for this vulnerable population with limited research on developing these programs.

Purpose

A staged approach was used to develop a culturally appropriate training program to improve safety and licensing access for young First Nations drivers.

Method/results

Stage one: Identify community needs

First Nations peoples and researchers developed the program proposal in partnership. The research team supported the partners with developing a program based on community needs.

Stage two: Co-design

Consultation with First Nations partners facilitated co-designing a survey on barriers and facilitators to licence attainment. A pilot with First Nations youths highlighted survey language and comprehension limitations. Community driving instructors helped design culturally and environmentally appropriate training sessions. Overall, consultations resulted in developing more equitable, effective, and culturally grounded programs. One negative impact was scheduling-related project delays.

Stage three: Test program efficacy

This involved usability testing with First Nations youth during the training development to gain feedback and ensure engagement and feasibility.

Through partnership, we have revised research tools to reflect appropriateness around cultural sensitivity, environmental context and language use.

Conclusion

This project outlines stages taken to co-develop a road safety program. This staged approach could guide future researchers intending to develop interventions for vulnerable communities.

SUPPORTING SAFE DRIVING AND MOBILITY IN OLDER ADULTS

Friday 24 July 2026 from 11:00 to 12:30

(L-Lorenese)

JUDITH L CHARLTON (MONASH UNIVERSITY ACCIDENT RESEARCH CENT), Chair and Discussant

Independent mobility extends older adults' quality of life, however frailty and capacity declines may impact mobility and pose increased risk of crash-related injuries and death. Studies have highlighted reduced driving and changes in driving patterns and behaviours as drivers age. In-vehicle technologies (e.g. Advanced Driver Assistance Systems (ADAS), Driver Monitoring Systems) and autonomous vehicles (AVs) may offer mobility and safety benefits. Such benefits can be realised through human-machine interface design to accommodate older adults' diverse needs and abilities. User knowledge and acceptance also influences uptake, use and potential for misuse. The reframing ageing initiative1 challenges biases in design enabling inclusivity to support adults of all ages to be active community members.

Session content will critically explore:

• Ageing, functional capacities, and driving: implications for design/use of future vehicle technologies

• ADAS and AV technologies: User acceptance, safety benefits/disbenefits and future challenges

• Use of Driver Monitoring Systems to monitor and promote safe driving Inclusivity: safe, accessible and sustainable transport for all

This Symposium directly addresses conference themes of "Emerging fields" through emerging human-machine issues in driving; "Transdisciplinary Approaches" through application of human factors and engineering solutions for safe driving; and "Societal Applications" through consideration of driver perspectives and the relationships between driving and health.

The Symposium will be of interest to clinicians and researchers and will foster discussion on advanced technologies, minimizing harm, and benefits of emerging transport options to support older driver safety, extend driving independence and maintain safe mobility beyond driving.

1. https://www.reframingaging.org

Abstract 3950

ADVANCED VEHICLE FEATURES AND OLDER DRIVERS: BRIDGING GENERATIONS TO ENHANCE ROAD SAFETY

Vrkljan B.*

McMaster University ~ Hamilton, ~ Canada

University engineering students participate in the EcoCAR competition to design next-generation electric vehicles. The Equity in Mobility (EiM) subteam aims to advance inclusivity and accessibility within the EcoCAR team. As part of this multi-year competition, students hold community events with vulnerable road users to raise awareness about safety, design, and vehicle advancements. Traditionally, these events have been one-way exchanges where students 'teach' others, rather than bi-directional learning opportunities. This project used the EcoCAR competition to create an intergenerational educational platform where older adults, the fastest-growing segment of car users, learn about emerging in-vehicle technologies, including Advanced Driving Assistance Systems (ADAS). For students, this exchange provides an opportunity to understand lifelong mobility, identify normal age-related changes in functional status, and optimize person-vehicle fit to support out-of-home participation in later life. Interviews and data collected from both age groups during the 2023-2025 EcoCAR competition cycle highlight several key findings. Older adults show a high interest in ADAS technologies, particularly those enhancing safety, such as collision avoidance systems and lane-keeping assistance. However, concerns about the complexity and user-friendliness of these systems indicate a need for more intuitive designs and better user education. Through intergenerational activities, students gain valuable insights into the functional capacities of older adults and the challenges faced while driving. This understanding is crucial for designing vehicles that accommodate age-related changes in vision, reaction time, and cognition. Findings also underscore the importance of user acceptance in the successful implementation of ADAS technologies. By involving older adults in the design process, more effective transport solutions can be created. Future challenges include addressing the diverse needs of older drivers, ensuring ADAS technologies are inclusive across age and ability, and fostering a culture of continuous learning and adaptation in the evolving transportation landscape.

Abstract 3951

INTEGRATING DIGITAL AND BIOLOGICAL BIOMARKERS TO PREDICT COGNITIVE DECLINE AND ENHANCE OLDER DRIVER SAFETY

Rizzo M.*

University of Nebraska ~ Nebraska ~ United States of America

Maintaining safe mobility is essential for older adults' quality of life, but age-related cognitive and functional declines increase crash risks and impair independent driving. This presentation explores how integrating digital and biological biomarkers can inform predictive models of cognitive decline, enhancing both the early detection of Alzheimer's Disease (AD) progression and older driver safety.

Advanced technologies enable the capture of longitudinal data from diverse cohorts of older adults to identify early signs of cognitive decline. Passive sensor data capturing real-world behaviors—such as driving patterns, social interactions, and sleep—can be combined with biological markers (e.g., amyloid and tau proteins, inflammatory markers, and neuroimaging) to develop predictive models rooted in Digital Twin principles. These models simulate individual behavior and health trajectories, offering actionable insights for timely interventions.

Key aspects include:

Digital Biomarkers: Driving patterns and social connectedness as novel, validated predictors of cognitive decline.

Predictive Models: Integration of digital and biological biomarkers to assess AD progression and identify intervention points.

Implications for Driver Safety: Leveraging real-world data to design adaptive in-vehicle technologies (e.g., Advanced Driver Assistance Systems and Driver Monitoring Systems) that support older adults' diverse needs and abilities.

This research strategy contributes to the development of inclusive, human-centric mobility solutions that enable older adults to remain active community members while prioritizing safety. It demonstrates how human-machine interface design and personalized diagnostics can address cognitive challenges without compromising autonomy.

Aligned with ICAP's themes, this work addresses emerging fields in human-machine interaction, applies interdisciplinary approaches, and offers scalable, cost-effective solutions to improve mobility and health outcomes. By bridging the gap between research and real-world applications, it fosters meaningful dialogue among clinicians, researchers, and policymakers, driving a paradigm shift in aging, cognition, and transportation.

Abstract 3952

FOSTERING TRUST AND ACCEPTANCE OF ADVANCED DRIVER ASSISTANCE SYSTEMS AMONG OLDER ADULTS THROUGH HUMAN-CENTERED DESIGN AND TRAINING

St Louis R.M.*

University of Michigan Transportation Research Institute ~ Ann Arbor ~ United States of America

Research on advanced driver assistance systems (ADAS) among the older driver population has suggested the potential for ADAS to improve driving safety and extend safe mobility by helping older drivers overcome health and functional changes commonly experienced in later-life. However, attaining the anticipated benefits of these technologies is dependent upon older drivers' awareness, understanding, and effective use of ADAS within their own vehicles. A series of three studies were conducted that highlight the critical importance of trust and acceptance in vehicle technology adoption and well as the need for the inclusion of older adults in the design of ADAS and related training programs. The first study utilized Vehicle Technology Questionnaire data from the Longitudinal Research on Aging Drivers (LongROAD) Study. Results showed an increase in the prevalence of ADAS technologies in participants' vehicles across five years, but frequency of use of these technologies did not change over time. A two-phase qualitative study was then conducted using nominal and focus groups of older adults to identify benefits and barriers to using ADAS, as well as their learning preferences and methods for understanding how to use ADAS. Results emphasized the need for hands-on experiences to build trust and understanding of emerging technologies. A third study developed and tested a pilot training program which encompassed both a classroom session and practical demonstrations of ADAS features at an autonomous vehicle test track facility. Results showed increased trust and intentions to use ADAS following the training program. This line of research underscores the importance of human-centered design and inclusive training programs to enhance technology adoption among older adults and emphasizes the critical role of trust and acceptance for encouraging the adoption of new technologies.

Abstract 3954

SUPPORTING THE SAFE MOBILITY OF DRIVERS WITH DEMENTIA THROUGH INNOVATIVE IN-VEHICLE DRIVER MONITORING SYSTEMS

Oxley J.*

Monash University Accident Research Centre ~ Melbourne ~ Australia

Safe operation of a vehicle is complex and may be affected by functional impairments associated with dementia such as reduced attention, processing speed, executive function and visuospatial skills. A major challenge in fitness-to-drive (FTD) decisions for drivers with dementia is determining the point at which safety becomes compromised. Traditionally, the management of this group has fallen on licensing authorities and health practitioners. Current tools and approaches for assessing the safety of drivers with dementia are limited – there is no objective data on how driving performance changes as the disease progresses, and no criteria for determining at what point it is no longer safe to drive.

Consideration of alternative approaches to managing FTD for drivers with dementia is an urgent priority for licencing agencies. This research aims to examine the potential benefits of driver monitoring systems (DMS) that would be suitable for use with drivers with dementia. The study will describe characteristic performance parameters associated with driving behaviour of drivers with early stage dementia compared with healthy drivers without dementia, and will develop/trial a prototype DMS adapted for drivers with dementia.

A mixed methods approach is applied, including:

- Desktop review of best practice DMS applications for FTD,
- Simulator-based case-control study: monitoring driving in simulator and functional assessments,
- Naturalistic driving study [NDS]: a case-control study in drivers' own vehicles to monitor real-world driving,
- Identification of key risk factors through data mining of simulator and NDS driving data using AI techniques,
- Development/trial of prototype technologies.

This presentation will focus on the driving characteristics from the driving simulator component of the study and associated cognitive attributes. The findings of the project will be discussed in terms of implications for the management and support of safe mobility for drivers with dementia through DMS technology to enhance current FTD licensing processes.

Abstract 2224

THE MODERATING ROLE OF TRAFFIC CLIMATE ON THE RELATIONSHIP BETWEEN PEDESTRIAN ATTITUDE AND BEHAVIOR

Bedi M.K.*, Arslan Arisoy B., Öz B.

Middle East Technical University ~ Ankara ~ Turkey

While research often emphasizes driver error, pedestrian actions contribute to around 10% of accidents. In addition, over three-quarters of traffic injuries and fatalities occur in urban areas where pedestrians and drivers interact the most, underlining the urgent need to understand the factors shaping pedestrian behavior. This study investigates the complex relationship between pedestrians' attitudes, behaviors and traffic climate.

More specifically, we aimed to explore how pedestrians' attitudes (toward traffic rules and other road users) relate to their behaviors (violations, lapses, aggressive, and positive behaviors) under the moderating effects of traffic climate (external affective demands, internal requirements, and functionality).

A correlational study was conducted with 300 participants in Türkiye using an online survey. Standardized instruments, including the Pedestrian Behavior Scale, Pedestrian Attitudes Scale, and Mini-Traffic Climate Scale, were utilized. The data were analyzed using Bivariate Correlation and moderation analyses (Hayes, PROCESS, Model 1).

Findings revealed that demographic factors like age and socio-economic status were negatively with to violations and lapses. Sceptical attitudes towards traffic rules (high scores) were associated with higher frequencies of violations, lapses, and aggressive behaviors. Crucially, the 'internal requirements' dimension of traffic climate (a pedestrian's perceived ability to navigate traffic) significantly moderated the attitude-behavior link. Such that, at low levels of perceived internal requirements, sceptical attitudes towards rules predicted fewer positive behaviors. Whereas, at high levels of perceived internal requirements, critical attitudes towards other road users (high scores) predicted more aggressive behaviors.

The pattern of results suggests that pedestrian behavior is shaped by a dynamic interplay between individual attitudes and perceptions of the traffic system. Effective safety interventions should therefore adopt a multi-faceted approach considering context and culture specific issues, targeting attitude change campaigns that can foster rule adherence and promote communication and mutual consideration among road users to enhance safety for all road users.

SHAPING THE FUTURE: UNDERSTANDING PUBLIC ACCEPTANCE OF COOPERATIVE, CONNECTED, AND AUTOMATED MOBILITY (CCAM) THROUGH THE THEORY OF PLANNED BEHAVIOR

Graziani A.R.*[1], Scaglioni G.[1], Ringhand M.[2], Anke J.[3], Renzi G.[1]

[1]University of Modena and Reggio Emilia ~ Reggio Emilia ~ Italy, [2]German Road Safety Council (DVR) ~ Berlin ~ Germany, [3]Chair of Traffic and Transportation Psychology, Technische Universität Dresden ~ Dresden ~ Germany

Introduction

The rapid development of Connected, Cooperative, and Automated Mobility (CCAM) systems is reshaping the future of urban transportation. These innovations aim to improve transport efficiency, enhance road safety, and reduce environmental impact through advancements in automation, digitalization, and vehicle connectivity. CCAM is designed to benefit all user groups, particularly individuals facing mobility challenges, such as those with physical or cognitive impairments.

However, the successful implementation of CCAM depends heavily on public acceptance—a factor that remains a significant barrier. Research in indicates that certain populations, including residents of rural areas, older adults, individuals with mobility impairments, and those with limited digital literacy, often exhibit resistance toward these types of emerging technologies. Therefore, understanding the psychosocial factors underlying this reluctance is essential to foster inclusive and equitable adoption of CCAM systems.

Purpose and methods

Grounded in the Theory of Planned Behavior, the study examined how users' characteristics (i.e., increasing age, mobility impairment, low-tech savviness, rural living), personality traits (i.e., propensity to trust), and psychosocial factors (attitudes, subjective norms and perceived behavioral control) affect the intention to use CCAM. An online survey was developed as part of the EU project SINFONICA, and a sample of 4,331 individuals from different European countries completed the questionnaire.

Results

The results confirm the role of the variables in predicting the intention to use CCAM. Remarkably, propensity to trust emerged as a critical mediator, exerting substantial effects on the TPB dimensions, which in turn influenced the intention to use CCAM. Interesting effects emerged in relation to the users' characteristics.

Conclusions

The results highlight that to fully realize the benefits of CCAM public transport systems, it is essential to understand the psychosocial needs of potential users. This understanding can support more inclusive and effective strategies to foster acceptance and adoption of CCAM technologies.

Abstract 2493

FEAR ISN'T ENOUGH: PROMOTING PROTECTIVE ACTION TO PREVENT CHILDREN FROM FALLING INTO TRAIN PLATFORM GAPS

Hashimoto H.*[1], Maeda K.[2]

[1]Osaka Metropolitan University ~ Osaka ~ Japan, [2]Rikkyo University ~ Niiza ~ Japan

Background:
Falls into the gaps between trains and platforms while boarding or alighting are a leading cause of injuries among children in railway systems, yet psychological research on how to prevent these incidents remains scarce. Although fear-based safety messages are often assumed to effectively raise awareness, little is known about their long-term motivational and behavioral impacts. This study, guided by Protection Motivation Theory (PMT), examined whether fear appeals alone are insufficient and whether they enhance safety intentions only when combined with coping guidance.
Methods:
Three studies were conducted. Study 1, a web-based experiment, tested the effects of fear and coping cues on children's and parents' protective intentions. Study 2, which involved field observations at educational institutions, explored the effectiveness of combining fear appeals with concrete coping actions such as establishing a family "safety password" and providing hands-on practice. Study 3, a field experiment using a wearable eye-tracking device, examined whether coping-oriented messages increased attentional focus and reduced risky behaviors near platform gaps.
Results:
Across studies, fear appeals did not directly predict protective intentions. Instead, their influence was shown indirectly through perceived severity and vulnerability. Interventions that paired fear with coping guidance significantly increased safety intentions and attentional engagement, whereas fear-alone messages showed weaker or short-lived effects. Eye-tracking data supported the behavioral validity of these findings.
Conclusions:
Fear alone is not a sufficient motivator for railway safety behavior among children and parents. Integrating fear appeals with concrete, actionable coping strategies enhances both motivation and situational awareness, reducing risks near train–platform gaps. These findings highlight the importance of designing evidence-based safety education and risk communication that empower rather than frighten children in railway environments.

Abstract 1981

DRIVING INSTRUCTORS' EXPERIENCES OF THE GOALS FOR DRIVER EDUCATION MATRIX: CHALLENGES, USABILITY, AND OPPORTUNITIES FOR IMPROVEMENT

Kjellander D.*, Hertzberg L., Thorslund B.

Linköping University ~ Linköping ~ Sweden

The Swedish driving license syllabus is based on the Goals for Driver Education (GDE) matrix, which outlines the skills and knowledge required to become a safe driver. While the GDE matrix is essential to ensure high-quality training nationwide, traffic instructors often find it complex and difficult to explain. This conflict may be attributed to the fact that the GDE matrix was not originally designed as a practical tool for driving instruction, but rather as a tool for analysis. However, with revision and refinement, it has the potential to serve as a valuable resource for both instructors and learners.

The purpose of the study is to explore driving instructors' experiences of the GDE matrix and to examine why it may be difficult to understand and apply. The study also aims to improve its potential usability. The study is conducted in several steps.

Initially, driving instructors were invited to participate in a questionnaire, which was completed by 68 participants. The questions assessed knowledge and perceived usefulness of the GDE matrix. Further interviews are now planned, in which driving instructors are asked to describe the GDE matrix. These interviews will be recorded and analyzed to identify connections between the theoretical model and its application in driver education. Alternative explanatory texts will then be developed and compared to the original texts in tests involving a new group of participants. This final step aims to evaluate whether the findings may help make the GDE matrix more useful and effective.

Results from the questionnaire study revealed that respondents were generally familiar with the content and concept of the GDE matrix but were not confident in explaining it to others. Moreover, the perceived usefulness of the matrix was rated as moderate. Results from the latter stages of the study will also be presented at the conference.

Abstract 1526

MIND OVER MOOD: PROGRAMS TO SUPPORT SAFER DRIVING IN HIGH STRESS SITUATIONS

Stephens A.*

Monash University ~ Victoria ~ Australia

Australia, like many countries, has committed to the Vision Zero approach. This is an ambitious strategy aiming to eliminate road deaths and serious injuries. National and state road safety strategies now include interim targets to significantly reduce fatalities and serious injuries by 2030, with the ultimate goal of zero by 2050. Achieving these targets requires innovative, evidence-based approaches, including the application of psychological science to influence driver behaviour.

This presentation introduces two behaviour change programs that exemplify new directions in applied psychology, targeting two critical risk factors: aggressive driving and fatigued driving.

Both programs are grounded in psychological principles and use similar intervention methods to help drivers identify and manage situations that increase their risk of unsafe behaviour. The first, Reducing Aggressive Driving (RAD), funded by the ACT Road Safety Fund, was delivered to the general population and focused on helping participants recognise triggers of anger behind the wheel and develop constructive coping strategies. The second, Understanding and Managing Fatigue in the Workplace, funded by the Australian Automobile Association (AAA), addressed fatigue-related driving risks within a workplace context, where long hours and demanding schedules heighten vulnerability to fatigued driving.

Central to both interventions is a reflective process that encourages participants to explore personal risk scenarios and build tailored strategies for safer behaviour. Evaluation of RAD showed that participants self-reported reduced anger and aggressive driving following the program, with these improvements sustained at a three-month follow-up. In the fatigue program, participants demonstrated measurable changes in sleep patterns—specifically, longer sleep durations—and reported fewer signs of driving-related fatigue after completing the intervention.

These outcomes highlight the effectiveness of psychologically informed, context-sensitive behaviour change programs in reducing road safety risks.

Abstract 1294

CULTURAL DIFFERENCES IN ROAD USER COMMUNICATION AT JUNCTIONS

Miller K.*[1], Elizabeth S.[1], Yee Mun L.[2]

[1]School of Psychology, University of Nottingham ~ Nottingham ~ United Kingdom, [2]Institute for Transport Studies, University of Leeds ~ Leeds ~ United Kingdom

Introduction: Driving requires attention, decision-making, and coordination, particularly at intersections where drivers must judge if it is safe to enter the roadway. A key element in this process is the use of communicative cues between road users. Such cues can serve multiple functions at junctions, for example, signalling that another driver is yielding, indicating that one should wait, or expressing frustration. The use of these cues is often governed by unwritten rules and informal communication, however understanding these cues is especially important as misinterpretations can lead to collisions. Thus far, research has mostly explored how cues are used and interpreted in Western countries where driving is relatively safe.

Purpose: This study investigates how drivers from two countries (The UK and Malaysia) interpret communicative cues when deciding whether to cross at a junction.

Method: Participants completed a high-fidelity driving simulator task involving repeated junction crossings. In Phase 1, an adaptive staircasing procedure determined each participant's gap acceptance threshold. In Phase 2, participants encountered vehicles approaching at, below, or above their threshold, accompanied by cues: headlight flash, horn, or deceleration

Results: Results will report participants' likelihood of accepting gaps as a function of cue type. We hypothesise that UK drivers will accept smaller gaps in response to headlight flashes, reflecting their interpretation of this cue as an invitation to cross, whereas Malaysian drivers will interpret flashes as a warning not to cross. For horn cues, we expect both groups to treat this as a deterrent, resulting in larger accepted gaps. Preliminary self-report data are consistent with these expectations.

Conclusions: The study highlights the cultural specificity of road user communication at junctions. Findings have implications for road safety when driving abroad and for the design of autonomous vehicles, which may need to adapt to local communication norms to interact safely and effectively across countries.

Abstract 1361

HOW ADULT CHILDREN PERCEIVE DRIVING AND SAFETY ATTITUDES OF THEIR PARENTS: DESCRIPTIVE AND INJUNCTIVE NORMS

Marksaityte R.*, Vadvilavicius T., Endriulaitiene A., Seibokaite L., Morkevičiūtė M., Kiliute A., Skinkyte G.

Vytautas Magnus University ~ Kaunas ~ Lithuania

Introduction. Parental behaviour and attitudes may shape how a child behaves in the future. However, little is known about the role of parents' driving and safety attitudes in influencing risky driving behaviours in young adulthood. Purpose. This study aimed to examine how adult children perceive the descriptive and injunctive driving and safety norms of their parents. Method. The study included 102 Lithuanian participants aged 18–35 (mean age = 19.81, SD = 2.71), 81% of whom were women. Among them, 47 had a driving license, 25 were in driver training, and 30 did not have a license. Descriptive and injunctive norms were measured using two scales (8 items each) developed for the study. Participants were asked how often their parents engage in risky driving behaviours, e.g., no seat-belt use (descriptive norms) and how much would parents approve risky driving behaviours if the participants engaged in them, e.g., speeding (injunctive norms). The same driving behaviours were measured for descriptive and injunctive norms. The study was funded by a grant No. S-MIP-24-31 from the Research Council of Lithuania (LMTLT). Results. Results revealed that perceived parental descriptive norms of adult children were significantly higher than injunctive norms ($t(101) = 3.68$, $p < .001$). Additionally, there were differences between descriptive and injunctive norms for behaviours such as speeding, driving under the influence of marijuana, riding with a driver under the influence of marijuana, not using a seatbelt, phone use while driving, and general traffic rule compliance. Conclusion. The study found that youngsters perceive higher parental descriptive driving norms compared to injunctive driving norms. This suggests that parents may engage in riskier driving behaviours themselves than they would approve if their children engaged in similar behaviours. This discrepancy might play a significant role in modelling young adult children's driving behaviour and should be studied further.

Abstract 2235

ADOLESCENTS' SOCIAL RISKY DRIVING NORMS AND ATTITUDES TOWARDS RISKY DRIVING: LATENT PROFILE ANALYSIS

Seibokaite L.*, Vadvilavicius T., Endriulaitiene A., Marksaityte R., Morkevičiūtė M.

Vytautas Magnus University ~ Kaunas ~ Lithuania

Introduction. In the context of risky driving, studies rarely analyse all three reference groups that shape new drivers' social norms: parents, peers, and other drivers. This exploratory study seeks to find existing differences between adolescents based on their perceived social norms from three reference groups. Latent profile analysis is used for finding existing subgroups of future drivers. Attitudes towards risky driving is used for group comparison.

Method. 891 teenagers participated in the study (mean age was 16.21, SD = 0.57; 60.9% identified as women). In total, 11.3% had a driver's license. Three scales, developed by the research authors, were used for measuring injunctive parents', peers', and other drivers' risky driving norms (α = 0.80, 0.87, and 0.85, respectively; a lower score represents lower approval of risky behaviour by the group). Latent profile analysis was performed using scores of the social norms' scales. A modified attitudes towards risky driving (α = 0.70) scale was also used. The study was funded by grant No. S-MIP-24-31 from the Research Council of Lithuania (LMTLT).

Results. Only a two-profile solution was chosen as it best fit the data (AIC = 3415.47, BIC = 3463.39, BLRT < 0.01). Profile 1 (n = 66) was described by a lower approval for risky driving behaviour from parents, and average approval from peers and other drivers, while Profile 2 (n = 825) was described by low approval of risky driving behaviour from parents, peers, and other drivers. Profile 1 reported more positive attitudes towards risky driving ($t(889) = 6.05$, $p < 0.01$).

Conclusions. Findings suggest that while parents tend to disapprove of any kind of risky behaviour, perceived approval of peers and other drivers results in more positive attitudes towards risky driving. A deeper analysis of profiles is required.

THE INFLUENCE OF EMOTIONS ON ROAD USERS' BEHAVIOR

Friday 24 July 2026 from 14:00 to 15:30

(L-Lorenese)

Gunilla Björklund (VTI ~ Stockholm ~ Sweden), Chair and Presenter

The topic of this symposium is how emotions influence road users' behavior, with focus on driving anger. Emotions in general, and anger in particular, appear to influence what people pay attention to and the amount of cognitive effort they spend in processing different stimuli (Lerner & Tiedens, 2006). Driving anger has for the last decades been subjected to great interest in traffic safety research. This interest is well justified as anger while driving may interfere with cognitive and motor performance and in that way increase the likelihood of an accident (Deffenbacher, Oetting, & Lynch, 1994). An angry driver is also more disposed to perform what is called aggressive behaviors, such as weaving in and out of traffic, cutting in front of other drivers, tailgating, speeding, and running red traffic lights. Other aggressive behaviors, such as headlight flashing, may not, as such, be dangerous but may provoke other drivers and make them angry and behave aggressively as well.

In this symposium, different aspects of emotions, and particular anger, will be presented. Ibrahim Öztürk and Amanda Stephens start with talking about emotions in general, definitions, cross-cultural aspects, situational triggers, and give us a hint about the future regarding emotions and technology. Federica Biassoni will then talk about anger expression and emotion regulation. Mette Møller continues in the field of anger expression, including adaptive/constructive expressions, and show us a comparison between drivers and cyclists. Finally, Gunilla Björklund will talk about driving behavior under the influence of stress and irritation.

Abstract 3309

EMOTIONS IN MOTION: STATE-TRAIT DYNAMICS, CULTURE, AND TECHNOLOGY ON THE ROAD

Öztürk I.*

University of Leeds ~ Leeds ~ United Kingdom

The behaviours, attention, risk assessment, and decision-making processes of road users can be influenced by the emotions they experience in general and during their travels. This presentation will offer a synthesis of evidence concerning a broad spectrum of affective states-such as anger, frustration, stress, and boredom-and examine how state and trait factors interact within the cross-cultural context of road safety and driver behaviours. For instance, a recent study has demonstrated that positive and negative affect follow distinct pathways to both positive and aberrant driver behaviours. In this context, perceived stress and driving anger play a critical role, with perceived stress being positively associated with driving anger, which in turn leads to increased aberrant behaviours.

Through a cross-cultural perspective, it is evident that emotional experiences in traffic, such as driving-related anger and its association with driving behaviours, vary across different countries. Research utilising the Measure for Angry Driving in Türkiye and China has identified differences in the frequency of various anger triggers and their correlation with aberrant behaviours, while the overarching construct-level trends remain consistent.

The presentation will conclude with a discussion on the role of technology and its implications for emotions and road safety. Although modern vehicles are equipped with numerous safety features, research indicates that these features can also provoke anger and frustration among drivers. Additionally, the implementation of driver monitoring systems and automated driving systems presents new challenges in research, policy, and practice. We will conclude with a research agenda aimed at integrating state-trait modelling with technological and cultural contexts to achieve scalable and equitable safety improvements.

Abstract 3310

DRIVING ANGER: A 30-YEAR JOURNEY AND THE ROAD AHEAD

Stephens A.*

Monash University Accident Research Centre ~ Clayton, Victoria ~ Australia

Driving anger has been a recognized psychological construct for over three decades, shaping the understanding of emotional responses behind the wheel. At the 2014 International Conference of Applied Psychology, a symposium was held celebrating 20 years of driving anger research. As part of that symposium, a talk titled Driving Anger: A 20-Year Journey—Where Have We Been and Where Are We Going? was presented. This presentation revisits that milestone and extends the narrative by examining developments over the past decade.

The talk begins by revisiting foundational definitions of anger and tracing the trajectory of research since the concept's inception. Particular attention is given to situational triggers—those moments and contexts that provoke anger in drivers—and explores whether these triggers have evolved in response to shifting demands on modern drivers, such as increased congestion, technological distractions, and changing road cultures.

Recent Australian research is highlighted, including findings from an online program designed to support drivers recognise their anger while driving, and avoid or manage that before it becomes aggression (the Reducing Aggressive Driving Program). Insights are also drawn from a nationally representative survey using the Measure for Angry Driving—a contemporary scale developed to assess the prevalence and intensity of driving anger in today's transport landscape.

The presentation concludes by posing a forward-looking question: What will the next decade reveal about driving anger? Will it remain a persistent challenge within the transport system, or will new interventions and societal shifts reshape its impact?

Abstract 3311

ANGER EXPRESSION AND REGULATION IN DRIVING CONTEXTS: BEHAVIORAL, VERBAL AND ACOUSTIC EVIDENCE

Biassoni F.*

Catholic University of the Sacred Heart ~ Milano ~ Italy

Research in psychology has consistently highlighted the role of anger in shaping risky behaviors, yet relatively little is known about the processes through which anger is expressed and regulated in driving contexts. While models of emotion regulation (Gross, 1998; 2015) have demonstrated the effectiveness of strategies such as cognitive reappraisal across a range of situations, their impact on anger expression during driving remains underexplored. The present study was designed to investigate both the verbal and acoustic markers of driving anger, and to test whether cognitive reappraisal could attenuate its behavioral manifestations.

Forty-four participants completed two simulated driving scenarios: a neutral baseline and an anger-inducing task. Speech and driving behavior were recorded throughout. Participants were randomly assigned either to a reappraisal condition, in which they were instructed to cognitively reframe anger-provoking events, or to a control condition without regulation instructions.

Results showed that the anger-inducing scenario elicited increased traffic violations, horn-honking, and cursing. Vocal acoustic analyses revealed only minimal variation, consistent with the “cold anger” profile described in the literature, rather than the heightened arousal typical of “hot anger.” Importantly, cognitive reappraisal was found to reduce the number of traffic violations, though it had no significant impact on other behavioral or acoustic indicators.

These findings contribute to enrich our understanding of the expressive and regulatory components of anger in the driving context, and underscore the selective effectiveness of cognitive reappraisal. In addition, the results may inform the development of psychological training programs and digital tools designed to support drivers in managing driving anger and enhancing road safety.

Abstract 3312

A COMPARISON OF ANGER EXPRESSION BETWEEN DRIVERS AND CYCLISTS IN DENMARK

Møller M.*

Technical University of Denmark ~ Kgs. Lyngby ~ Denmark

Previous studies have identified both person and vehicle related differences in road user aggression. With increasing attempts to promote cycling knowledge on anger expression among cyclists and differences between anger expression between cyclists and drivers is increasingly relevant. Therefore, a study was conducted with the purpose to compare self-reported anger expression among drivers and cyclists in Denmark. This talk will present the main results.

The study was based on the short form of the driving anger expression inventory (DAX-short, 15-item) as well as an adapted version of the DAX for cyclists (CAX, 14 items). Data was collected via an online survey including 2000 inhabitants of Denmark. A principal component analysis confirmed the 4-factor solution for both the DAX and the CAX which differentiates between (1) personal physical aggressive expression, (2) use of a vehicle to express anger, (3) verbal aggressive expression and (4) adaptive/constructive expression. Results showed that drivers scored higher on verbal aggressive expression than cyclists did, while there was no significant difference in constructive expression. The subscales for drivers and cyclists showed significant relations to age, gender, self-reported aggressive behaviours and traffic fines. Thus, women scored lower on physical anger expression, while older people scored higher on constructive anger expression. The effect of age and gender on anger expression among drivers and cyclists remained significant when controlling for exposure and other factors in linear regression analyses. These analyses also showed a relationship between a positive attitude towards driving and higher levels of anger expression among drivers, while this was not the case for cyclists.

Abstract 3313

DRIVING BEHAVIOR UNDER THE INFLUENCE OF STRESS AND IRRITATION

Björklund G.*

VTI ~ Stockholm ~ Sweden

In a previous study, based on self-reports, we found that drivers who themselves exceed the speed limit become less irritated when they see other drivers driving recklessly. In this study, we investigated this phenomenon in more detail. Sixty drivers were asked to drive a 17-kilometer route in a driving simulator. Several irritation-provoking situations occurred during the drive where some of them were the same as the situations in the Driving Anger Scale (DAS), which the drivers also were asked to fill out. Some examples of situations that were presented: a driver in front passing a traffic signal when red, a driver is driving very slowly in front, and a driver is weaving in and out of traffic.

The participants were instructed that they were going to the airport. Half of the participants were told that they were delayed and therefore were in a hurry. These participants received economic incitement to drive fast to their destination whereas the participants not in a hurry received a fixed amount as compensation.

Not surprisingly, the results show that participants in the stressful condition had a higher average speed while driving at sections with speed limits of 70 and 90 km/h and kept a smaller distance to the car in front. Of greater interest was that drivers who reported being less irritated when other drivers drove recklessly actually tended to drive faster and also to keep a shorter distance to the vehicle in front. Similarly, drivers who reported being more irritated when others obstructed them tended to keep a shorter distance to the vehicle in front. However, the results were not entirely unambiguous, and the phenomenon requires further investigations to find the right measures to diminish speeding and reckless driving.

Abstract 1163

CULTURE, CLIMATE, AND SPEED: A CROSS-CULTURAL SIMULATOR STUDY OF DRIVING BEHAVIOUR

Budak N.*[1], Brijs K.[2], Brijs T.[2], Ozkan T.[1]

[1]Department of Psychology, Middle East Technical University ~ Ankara ~ Turkey, [2]School of Transportation Sciences, Transportation Research Institute, Hasselt University ~ Hasselt ~ Belgium

Speeding is a major contributor to road crashes worldwide, but its psychological determinants may vary across cultural contexts. Cultural values, such as individualism–collectivism, influence driver behaviours. Nevertheless, little is known about how these values combine with perceptions of the driving environment to influence speeding, especially across countries with contrasting cultural profiles such as Türkiye and Belgium. This study is the first to investigate this using driving simulators in a cross-cultural design.

The interaction between cultural orientations and perceived traffic climate to predict speeding, and how these interactions differ between Türkiye and Belgium, was investigated. Eighty-six drivers (42 Turkish, 44 Belgian) completed the vertical–horizontal individualism-collectivism scale and traffic climate scale to evaluate perceptions of their country's traffic climate. This scale includes three subfactors: internal requirements (skills and effort required by the driving task), functionality (safe, organised, efficient system), and external affective demands (emotional engagement required from road users). They performed a driving simulator task and reported perceptions regarding the traffic climate of the simulator's environment. Moderated moderation analyses were conducted in SPSS (PROCESS macro), using country as a moderator.

Country-related results showed that Turkish drivers high in horizontal-individualism drove slower when internal requirements were low, but faster when high. Moreover, drivers high in vertical-collectivism drove slower when they perceived the system as functional. These patterns did not emerge in Belgium. As Belgium is an individualistic country, most drivers might share individualistic orientation, making it less distinctive, whereas in more collectivistic Türkiye, individualistic tendencies stand out more strongly. Simulator-related results showed that horizontal-individualism predicted faster driving when emotional demands were perceived as low in Türkiye, while Belgian drivers tended to speed under high emotional demands.

These findings suggest that individualistic tendencies shape risky driving only under certain perceived environmental conditions, and these mechanisms are culture-specific. These findings will be discussed in light of existing literature.

Abstract 1214

EXPECT THE UNEXPECTED: DRIVERS' ANTICIPATIONS VS. LEGAL NORMS IN MOROCCAN TRAFFIC

Cherifi Z.*[2], Guillo D.[1]

[1]CNRS (French National Center for Scientific Research) ~ Paris ~ France, [2]Africa Institute for Research in Economics and Social Sciences, Mohammed VI Polytechnique University ~ Rabat ~ Morocco

Introduction. Driving a car requires anticipating how situations will unfold, making decisions under uncertainty, and respecting regulations. In Morocco, the road system includes a points-based license, visible police presence, and signage that largely follows international standards. Despite this formal framework, violations are widespread and often socially tolerated. This contrast highlights a paradox: drivers operate within a system designed around legal norms, yet their daily anticipations must also account for behaviors that routinely disregard them. This raises a central question: how do drivers' expectations of what is likely to happen align with their knowledge of what the law requires?

Purpose. This study examines the gap between Moroccan drivers' expectations of imminent traffic events and their knowledge of legal norms. It tests the hypothesis that drivers' anticipatory judgments diverge from their internalized knowledge of traffic laws.

Methods. The experiment will present licensed Moroccan drivers with dashcam clips paused before critical events. For each clip, participants will answer two questions: (1) what they expect to happen next, and (2) what the law requires. These tasks are embedded in a structured survey that also records sociodemographics, driving history, and exposure. Regression models will then test how experience predicts alignment or divergence between anticipations and legal knowledge.

Predicted Results. We predict systematic discrepancies between hazard anticipation and law knowledge, with driving experience playing a major role. We also expect to identify scenarios where normative violations are anticipated yet socially normalized.

Conclusion. By contrasting expectations with legal rules, this study shows how drivers adapt to a context where formal enforcement exists but violations remain routine. The results will inform road safety strategies aimed at narrowing the gap between what drivers expect and what the law requires, contributing to safer and more context-sensitive interventions.

Abstract 204

APPLYING AN EXTENDED THEORY OF PLANNED BEHAVIOR TO EXAMINE YOUNG DRIVERS' INTENTIONS TO WATCH VIDEO MESSAGES AND READ TEXT MESSAGES

Kaye S.*, Rodwell D., Lewis I.

Queensland University of Technology (QUT) ~ Brisbane ~ Australia

Introduction: Young adults (aged 17-25 years) are one group of drivers who commonly self-report using a handheld smartphone while driving. While previous research has focused on using a handheld smartphone to make or receive calls, or send and respond to text messages, smartphones have since evolved to support other features, such as video messaging. Purpose: This study extends upon previous research by applying an extended Theory of Planned Behavior (TPB), with additional predictors of moral norms, descriptive norms, and anticipated regret, to examine young drivers' intentions to use a handheld smartphone to watch video messages and read text messages while driving. Method: Young drivers (N=229, Mage=19.41, 78% female) who resided in Australia completed a 20-minute online questionnaire. Results: Reading text messages on a handheld smartphone while driving was more prevalent, with 29.7% of participants reporting sometimes to always reading a text message, and 4.4% reporting sometimes to very often watching a video message while driving. Two hierarchical multiple regressions assessed the extent to which the standard TPB constructs of attitudes, subjective norms, and perceived behavioral control (PBC; Step 1), and moral norms, descriptive norms, and anticipated regret (Step 2) predicted intentions to use a handheld smartphone to (i) watch video messages and (ii) read text messages while driving. The constructs significantly accounted for 50.8% and 45.2% of the variance in intentions to use a smartphone to watch video messages and read text messages while driving, respectively. Attitudes, subjective norms, PBC-capability, and moral norms were significant predictors of intentions to perform both behaviors. Anticipated regret was a significant predictor of intentions to watch a video message, and descriptive norms was a significant predictor of intentions to read a text message. Conclusions: Attitudes, subjective norms, PBC-capability and moral norms could be targeted by interventions to reduce handheld smartphone use while driving.

Abstract 1196

WHEN RULES MEET RISKS: HOW CYCLISTS' KNOWLEDGE, PERCEPTIONS AND CRASH INVOLVEMENT RELATE TO BEHAVIOUR

Öztürk I.*[1], O'hern S.[1], Useche S.A.[2]

[1]University of Leeds ~ Leeds ~ United Kingdom, [2]University of Valencia ~ Valencia ~ Spain

Despite multiple efforts to increase cyclists' awareness of traffic regulations, the way in which rule knowledge translates into safer behaviours remains insufficiently understood, as do the conditions under which these effects are stronger (e.g., Volgemute et al., 2024). This study examines whether risk perception mediates the relationship between cyclists' knowledge of traffic rules and their self-reported behaviours, and whether previous crash involvement moderates these effects. Data were drawn from 6845 cyclists from 19 countries (aged 18-83 years; M = 36.88, SD = 14.65), a dataset published by Useche et al. (2024). It includes the Cycling Behaviour Questionnaire (CBQ; measuring violations, errors, and positive behaviours) and the Risk Perception and Regulation Scale (RPRS; assessing cyclists' risk perception and their self-reported knowledge of traffic norms). A moderated mediation model was applied, controlling for age, gender, and country. Results suggest that cyclists with greater rule knowledge report higher risk perception, with this association stronger among those who had not experienced a crash. Rule knowledge was negatively related to violations only for previously crash-involved cyclists, whereas higher risk perception was consistently associated with fewer violations, slightly more strongly among those having suffered cycling crashes. Both rule knowledge and risk perception were associated with fewer errors and more positive behaviours. The effects on errors are more pronounced for those who have experienced at least one crash, whereas no interaction effects were observed on positive behaviours. The benefits of rule knowledge are more pronounced and direct on errors (negatively) and positive behaviours (positively). Overall, findings position risk perception as a proximal mechanism linking rule knowledge to actual riding behaviour and suggest pairing rule training with hazard perception to maximise safety gains.

Results suggest that cyclists with greater rule knowledge report higher risk perception, with this association stronger among those who had not experienced a crash

Abstract 1194

NAVIGATING THE COMMUTE: STRESS, TRAFFIC CLIMATE, AND TRAVEL SATISFACTION IN WEST YORKSHIRE

Öztürk I.*[1], Pitcher P.[2], Revell R.[3], Hudson N.[2], Lehtonen E.[4], Markkula G.[1], Jamson S.[1], Merat N.[1]

[1]University of Leeds ~ Leeds ~ United Kingdom, [2]West Yorkshire Combined Authority ~ Leeds ~ United Kingdom, [3]Leeds City Council ~ Leeds ~ United Kingdom, [4]VTT Technical Research Centre of Finland Ltd. ~ Helsinki ~ Finland

Commuting constitutes a routine aspect of daily life, exerting cumulative effects on both physical health and psychological well-being. This study explores variations in commuting stress and examines the relationship between commuting stress, traffic climate, and travel satisfaction among residents of West Yorkshire, United Kingdom. A cross-sectional survey of 935 adults was conducted, using Multimodal Commuting Stress Scale, Traffic Climate Scale, Scale for Travel Satisfaction, and detailed demographic and commuting characteristics. The analyses revealed distinct modal and socio-demographic patterns. Regular users of public transportation reported lower levels of satisfaction with their travel experiences and experienced greater psychophysical strain compared to regular drivers and pedestrians. Drivers encountered fewer issues related to physical safety and security than both public transport users and pedestrians. Pedestrians reported being less affected by travel hindrances and inefficiencies. In comparison to drivers, public transport users perceived the traffic system as less safe, characterised by reduced functionality and increased emotional demands. Men reported to experience greater travel satisfaction, along with lower psychophysical strains, safety and security concerns, and internal requirements than women. Older road users reported greater travel satisfaction and internal requirements, alongside reduced psychophysical strain, inefficiency, and inconvenience. Among the demographic factors and constructs associated with commuting stress and traffic climate, functionality and internal requirements were positively, and external affective demands, inefficiency and inconvenience, psychophysical strain, and travel hindrance were negatively associated with travel satisfaction. The findings indicate that higher commuting stress is associated with lower travel satisfaction and commuters who frequently use public transportation experience heightened safety concerns and psychological stress. The findings identify leverage points for reducing stress and enhancing the day-to-day travel experiences in West Yorkshire. Practically, the results support investments aimed at improving reliability of public transport and promoting active travel and courteous, rule-abiding behaviours among road users.

Abstract 807

EXAMINING COMMUNITY PERCEPTIONS ABOUT CANNABIS USE AND DRIVING USING AN EXTENDED PROTOTYPE/WILLINGNESS MODEL

Porter M.[1], Rodwell D.*[2]

[1]Queensland University of Technology ~ Brisbane ~ Australia, [2]MAIC-QUT Road Safety Research Collaboration ~ Brisbane ~ Australia

Introduction: Most research assumes driving under the influence of cannabis (DUIC) is the outcome of deliberate decision-making, neglecting the possibility that many DUIC episodes may be unplanned. The Prototype Willingness Model (PWM) conceptualises two decision-making pathways: a 'reasoned action' pathway that is conscious, rational and goal directed and a 'social reaction' pathway that is semi-conscious and primed by social and situational cues. Purpose: This study investigated the applicability of both PWM pathways, and subjective norms and Perceived Behavioural Control (PBC) from the Theory of Planned Behaviour, to DUIC decision making among cannabis users and non-users. Method: Australian drivers (N = 357, M = 24.54 years, SD = 11.01 years; 74.2% female; 44% never used) completed a 20-minute online questionnaire. Three hierarchical multiple regressions were conducted. These analyses tested theoretically deduced hypotheses as well as exploratory relationships between the predictors and dependent variables on different PWM pathways (intentions/expectations, willingness), and the influence of injunctive norms and PBC. Step 1 included control variables (gender, general attitudes towards cannabis use, and cannabis user group); steps 2 and 3 added the PWM constructs depending upon the pathway being examined (perceived vulnerability, descriptive norms, prototype favourability and similarity) and injunctive norms; PBC was entered in step 4. Results: The regressions accounted for between 14.8% and 17.9% of the variance in intentions, expectations and willingness to DUIC. Consistent significant positive predictors in each regression were descriptive norms and injunctive norms; counterintuitively, overall attitudes was a consistent negative predictor. Against theoretical expectations, perceived vulnerability predicted willingness only, and prototypes were not significant predictors in any analysis. Conclusion: Descriptive and injunctive norms may be important targets for interventions to prevent DUIC. Further research is needed to confirm if more positive general attitudes towards cannabis are predictive of lowered DUIC intentions, expectations and willingness.

EXAMINATION OF THE WELL-BEING OF INDIVIDUALS WHO DEVELOPED POST-TRAUMATIC STRESS DISORDER AFTER TRAFFIC ACCIDENTS

Bekçi Gökçeoglu N.*[1], Yilmaz S.[2], Öz B.[1]

[1]Middle East Technical University ~ Ankara ~ Turkey, [2]Department of Psychology, Faculty of Arts and Sciences, Ufuk University ~ Ankara ~ Türkiye

Abstract

Transportation is a fundamental component of social infrastructure, ensuring access to education, healthcare, employment, and social life. While safe and efficient systems protect mobility rights, support economic development, and foster social integration, traffic accidents remain a major public health concern with severe physical, psychological, social, and economic consequences. This study investigates factors influencing the well-being of individuals who developed Post-Traumatic Stress Disorder (PTSD) symptoms following traffic accidents. Eleven participants (5 men, 6 women; aged 25–69, M = 42.7) with 2–45 years of driving experience (M = 18.5) were interviewed using semi-structured questions based on Seligman's PERMA model. Thematic Analysis revealed that participants' accounts of well-being corresponded to PERMA dimensions—positive emotions, engagement, relationships, meaning, and accomplishment—while also reflecting the impact of accident severity and material/physical damage. The psychoanalytic interpretation, grounded in Lacanian theory, offered a deeper analytic reading of these themes. Positive emotions often functioned as counter-reactions, deployed defensively to manage traumatic affects. Engagement and accomplishment were linked to avoidance strategies, reflecting efforts to channel psychic energy away from the site of trauma. Narratives around relationships revealed processes of symbolization: by recounting their experiences, participants transformed the unspeakable real of the accident into the symbolic order, enabling meaning-making and partial integration. In this sense, well-being was not a simple restoration of balance but a reorganization of subjectivity, where traumatic growth occurred through symbolic mediation rather than the erasure of trauma. These findings highlight the analytic dimension of post-traumatic well-being following a traffic accident and emphasize the centrality of the symbolic in structuring responses to trauma. Future studies may examine how integrating positive psychology frameworks with psychoanalytic interpretations can inform intervention strategies, offering implications for both clinical practice and public health policies in the context of traffic or other relevant fields of application.

FRENCH DRIVERS' REHABILITATION PROGRAMS: GENDER DIFFERENCES IN PSYCHOLOGICAL RESOURCES AND VULNERABILITIES

Karras M.*[1], Delhomme P.[2], Csillik A.[3]

[1]Paris Nanterre University ~ Nanterre ~ France, [2]Gustave Eiffel University, Planning Mobilities Environment Department ~ Versailles ~ France, [3]Lorraine University ~ Metz ~ France

Background: Although driving risk taking appears to be mainly male, an increase in driving violations has been observed in recent years among French female drivers. The main objective of the present study was to explore the driving behaviors, psychological resources, and vulnerabilities of female and male driving offenders participating in a French driver rehabilitation program. The second aim was to examine to what extent females' and males' resources and vulnerabilities predicted their violations, engagement in distracting activities while driving, and prosocial driving behaviors.
Method: In the course of 110 rehabilitation programs, 1686 driving offenders (22.4% females) were asked to complete a self-assessment questionnaire on psychological resources and risk factors (empathy, primary psychopathy, impulsivity, driving related sensation seeking (DRSS), mindfulness and self-compassion), and driving behaviours. We controlled the mileage, driving experience, ticketed offences and crashes.
Results: Compared to male offenders, females were more likely to have received a higher education, be divorced, or separated, and drive fewer annual kilometers. They also had had fewer demerit points than males in the last three years. They were more empathetic but also more impulsive than their male counterparts and less self-compassionate and mindful. Regression and moderation analyses revealed that, across genders, certain psychological resources such as mindfulness can be considered as protective factors for driving offenders as they tend to decrease dangerous behaviors and increase prosocial ones, while vulnerabilities such as aggressive driving anger expression seem to have the opposite effect.
Conclusion: Our results provide a better understanding of driving offenders' behavior and the influence of personal dispositions. They also open new interesting research avenues in the prevention of dangerous behaviors among this high-risk population.

Abstract 1833

WHEN ANGER CHANGES LANES: ORIGIN OF ANGER AND PERSONALITY IN TRAFFIC AGGRESSION

Oker K.I.*, Budak N., Öz B.

Middle East Technical University ~ Ankara ~ Turkey

Aggressive driving is a public-safety threat that often reflects displaced aggression, anger redirected from its original source. In traffic, anger can originate inside the vehicle (e.g., passenger conflict) or outside it (e.g., congestion). Driving's cognitive load and anonymity may facilitate such redirection. Personality traits; Negative Valence (antagonistic style), Neuroticism (affective reactivity), Agreeableness, and Conscientiousness may differentially shape these behaviors. This study examined the role of basic personality traits in predicting displaced aggression in traffic, distinguishing between aggression due to anger generated inside the vehicle (InsideDA) and outside the vehicle (OutsideDA). A total of 520 drivers completed a two-subscale traffic displaced-aggression measure (InsideDA, OutsideDA) and the Basic Personality Traits Inventory assessing six sub-dimensions: Agreeableness, Extraversion, Openness-to-Experience, Conscientiousness, Neuroticism, and Negative Valence. Correlations, multiple regressions, and manual dominance analysis were conducted to determine the relative importance of personality predictors. For InsideDA, dominance analysis indicated that Negative Valence was the strongest predictor (47%), followed by Neuroticism (28%), Agreeableness (18%), and Conscientiousness (7%). For OutsideDA, Neuroticism (38%) emerged as most influential, followed by Negative Valence (34%), Agreeableness (17%), and Conscientiousness (12%). Regression analyses converged on Neuroticism and Negative Valence as key positive predictors, with smaller protective effects of Agreeableness and Conscientiousness. These findings demonstrate that the origin of anger modulates the personality–aggression link: when anger arises inside the vehicle, displaced aggression is primarily driven by hostile interpretative tendencies (Negative Valence), whereas when anger originates outside the vehicle, it is best explained by emotional instability (Neuroticism). Low Agreeableness and Conscientiousness consistently amplified aggression, though to a lesser extent. Overall, results contribute to theoretical understanding of displaced aggression in traffic contexts and emphasize the practical importance of integrating personality-based risk factors into driver education, anger management interventions, and traffic safety policies.

Abstract 1739

RETAINING SEAFARERS IN THEIR PROFESSION AT SEA

Wallen Warner H.*[1], Lundh M.[2]

[1]Swedish National Road and Transport Research Institute (VTI) ~ Linköping ~ Sweden, [2]Chalmers University of Technology ~ Gothenburg ~ Sweden

There is currently a global shortage of personnel in the shipping industry, and getting seafarers to remain in their professions at sea is one of the industry's major challenges. The aim of this study was therefore to increase the knowledge of the factors that facilitate, but also those that hinder, seafarers to pursue a lifelong career at sea.

A review of international literature and a web survey with Swedish maritime students were conducted. The literature review revealed a structure based on geography and ethnicity. While all seafarers are affected by factors such as separation from family/friends and poor working conditions, seafarers from low-wage Asian countries are also affected by poorer conditions in the form of unfair recruitment, lower salaries and fewer promotion opportunities.

As a negative mismatch between maritime students' expectations and the reality of their future careers at sea creates dissatisfaction and can lead to an early transfer to a job ashore, the web-survey focused on student's expectations. The results showed that we need to make sure that the students can be proud of their choice of work, give them opportunities for personal development and make sure their tasks at work are interesting to retain them in their professions at sea.

In summary, while some of the factors affecting seafarers' decision to pursue a lifelong career at sea are the same for everyone, others differ depending on geographic and ethnic origin. Furthermore, examining students' expectations of their future careers at sea is important to avoid dissatisfaction and an early transfer to a job ashore.

Abstract 366

POSITIVE DRIVER BEHAVIORS: INNATE DISPOSITION OR SHAPED THROUGH TRAINING?

Yilmaz S.*[1], Öz B.[2]

[1]Department of Psychology, Faculty of Arts and Sciences, Ufuk University ~ Ankara ~ Türkiye, [2]Middle East Technical University ~ Ankara ~ Turkey

Introduction: Positive driver behaviors—including smooth and proactive mobility, environmentally sustainable practices, and risk communication—play a crucial role in fostering safer and more responsible traffic environments. However, the extent to which these behaviors are influenced by stable personality traits versus learnable driver competencies remains insufficiently understood. Purpose: This study examined the relative predictive power of personality and driver skills across three dimensions of positive driver behavior. Method: A total of 525 licensed drivers (51% female; age range = 18–65) completed self-report measures, including the Basic Personality Traits Inventory (BPTI), the Driver Skills Inventory (DSI), and the three subscales of the Multidimensional Positive Driver Behavior Questionnaire (M-PDBQ): Smooth and Proactive Mobility (SPM), Environmentally Sustainable Behaviors (ESB), and Risk Communication (RC). For each outcome, hierarchical regression analyses were conducted in three steps: (1) demographic variables such as age, gender, annual mileage (2) personality traits, and (3) driver skills. Result: Results showed that personality traits significantly predicted all three types of positive driver behaviors (ΔR^2 = .204 for SPM, .111 for ESB, and .173 for RC; all ps < .001), underscoring the role of individual dispositions. Notably, driver skills explained additional variance beyond personality traits (ΔR^2 = .178 for SPM, .043 for ESB, and .062 for RC; all ps < .001), indicating that these behaviors are not entirely fixed but can be modified through training and experience. Conclusion: In conclusion, while positive driver behaviors are partly rooted in personality, they are also meaningfully associated with competencies that can be developed. These findings suggest that targeted driver education programs focusing on hazard anticipation, self-regulation, and eco-driving may effectively enhance prosocial and responsible driving across multiple behavioral domains.

CITIZENS, NOT EGOISTS: DIFFERENTIATED RESPONSIBILITY, COLLECTIVE EFFICACY AND POLICY LITERACY INFLUENCE TRANSPORT POLICY ACCEPTANCE IN AUSTRIA

Röderer K.[1], Seebauer S.*[2], Bartana I.B.[1], Molina C.[1]

[1]Environment Agency Austria, Vienna, Austria, [2]JOANNEUM RESEARCH Forschungsgesellschaft mbh, Graz, Austria

Ambitious transport policy is widely considered necessary but politically constrained by assumed public resistance. Moving beyond individualistic explanations of policy acceptance, this study investigates whether citizens adopt a civic-collectivistic perspective when evaluating transport policies and whether policy literacy shapes their support. Drawing on a representative online survey of 2,041 Austrian residents, we examine the determinants of acceptance for an overall policy package and eleven specific policies (e.g., speed limits, fuel tax, road pricing, public transport improvements). Controlling for established determinants (e.g. socio-economics, environmental attitudes, trust in government, effectiveness), we introduce three underexplored determinants: collective efficacy, differentiated responsibility, and policy literacy. Policy literacy is operationalized as the correspondence between respondents' subjective ranking of policy effectiveness and expert-based objective rankings. Socio-economic characteristics explain little variance in acceptance. Perceived co-benefits and effectiveness emerge as the strongest determinants, replicating previous acceptance research. Collective efficacy and differentiated responsibility exhibit small but significant unique effects, particularly for support of overall policy packages. Policy literacy varies substantially across individuals and is, on average, low: respondents produce near-random rankings of policy effectiveness. Nevertheless, higher policy literacy is consistently associated with higher policy acceptance. Citizens seem to consider public interests besides their private needs when evaluating transport policy. However, they hold widespread misconceptions about policy effectiveness. Their substantial deficiencies in policy literacy may lead to political frustration, when citizens demand policies that they believe to be effective, but these policies have little actual impact. Transport and climate policy should therefore communicate more explicitly in terms of common goods and should deploy educative formats that explain not only expected policy impacts but also underlying mechanisms.

Abstract 1212

"SEE BIKE, SAY BIKE": USING THE PHONOLOGICAL LOOP TO REDUCE JUNCTION CRASHES.

Chapman P.*

University of Nottingham ~ Nottingham ~ United Kingdom

Drivers often crash into oncoming motorcyclists after making what has been termed the "looked but failed to see" error. This is a major cause of fatalities on the roads worldwide. Recent research in an advanced driving simulator has suggested that some of these crashes may actually be caused by a failure of short-term memory rather than a failure of visual search. To explore this finding further the current study uses a simulated junction-crossing task where drivers have to repeatedly decide whether a junction is safe to cross while making head movements to the left, ahead, and to the right. Like everyday driving, this task requires the driver to make their crossing decisions based on a combination of the information they are looking at and their memory for information from their last two head movements. This task is surprisingly hard to do and drivers make potentially dangerous crossing errors (deciding the junction is safe to cross even though they have recently viewed an oncoming vehicle). Subsequent memory tests demonstrate that their memory for both the presence and details of recently inspected vehicles is remarkably poor. One possible way to prevent these crossing errors may thus be to improve drivers' short-term memory capacity for relevant visual information. The current paper explores an intervention where 60 drivers performing the crossing task say the word "bike" out loud every time they see an oncoming motorcycle. This simple intervention does indeed improve drivers' memory for oncoming vehicles compared to 60 drivers in a control condition. This is presumably because relevant information is still available in the phonological loop component of working memory even when the visuospatial system is overloaded. This may provide an easy way to reduce the very high rate of motorcycle casualties internationally.

Abstract 1321

OBSERVING TO INTERVENE: A NATURALISTIC STUDY OF RISKY ROAD USER BEHAVIOUR IN GREECE

Perego P.*[1], Danelly--Mylona V.[3], Athanasopoulos O.[3], Siebert F.[2]

[1]Traffic Psychology Unit of Research UCSC ~ Milano ~ Italy, [2]Division of Transport, Human Behaviour Section, Technical University of Denmark ~ Copenaghen ~ Denmark, [3]Road Safety Institute - R.S.I. "Panos Mylonas" ~ Athens ~ Greece

Introduction
Greece continues to report relatively high rates of serious road traffic injuries and fatalities compared to other European countries. Phone distraction, low seatbelt use in cars, and low helmet use for motorcyclists have been observed. A research gap exists for the role of road users' observed gender in these behaviours.
Purpose
In this study we use naturalistic observation to register safety-related behaviour of car occupants and motorcycle riders in Greece.
Method
Traffic was observed in Athens, Heraklion, and Psachna, between October 2024 and January 2025. A total of 15,288 road users were observed, 6,693 car occupants and 8,605 motorcyclists. Trained coders analysed the first 10 minutes of each daylight hour to capture seatbelt use of car occupants and helmet use of motorcycle riders (drivers and passengers). Observed gender for car occupants and motorcycle riders was registered. In addition, phone use was registered for car drivers and motorcycle drivers (but not for other occupants/passengers).
Results
Average seatbelt use was critically low at 56% and decreased further for front (51%) and rear-seat passengers (21%). Motorcycle driver helmet use varied from 98% (Heraklion) to 60% (Psachna), with an average 33% lower use among passengers. Mobile phone use was registered for 13% of car drivers, and considerably lower for motorcycle drivers (2.2%). Female road users had significantly higher helmet use and seatbelt use when controlling for their position in the car / motorcycle. Cars with female drivers had significantly higher seatbelt use among other occupants in the vehicle. However, average phone use did not differ significantly between female and male drivers.
Conclusions
Female road users in Greece behaved safer than male road users for crash severity related variables (helmet and seatbelt use). Increased female driver seatbelt use "transferred" to other car occupants. This gender-related effect was not found for distraction behaviour (phone use).

Abstract 124

VISITING TRAUMA CENTRE: DOES REDUCE THE ROAD TRAFFIC ACCIDENTS?

Tiwari R.*

Gandhi Shatabdi Smarak Post Graduate College, Koilsa, Azamgarh ~ Azamgarh ~ India

Road traffic accidents are one of the major causes of death of people in the world. This problem is increasing day by day at the global level. Low and middle income countries are most affected by road traffic accidents. Due to the dangerous and worrying situation of the problem road traffic accidents, United Nations has proclaimed a Decade of Action for Road Safety 2021-2030. Despite educating and making people aware, this problem still remains a matter of concern and major causes of death worldwide. Near about 10 percent increments in road traffic accidents are found in India and death rates have increased by more than 20 percent in Uttar Pradesh. This is a worrying trend for country like India. This experiment has been conducted to find a more effective way of awareness and promote safety equipment. The present study hypothesized that a real life experience (visiting trauma center) may reduce speeding, distracted driving and promote safety measures in young drivers. The data were collected from 120 young participants (80 male and 40 female drivers, average age 21.4 years) from Azamgarh (Uttar Pradesh). The participants were divided into two groups: control group and experimental group. A monitoring team was also used to monitor the driving behavior of participants after the experiment. Statistical tool t-test were used to test the hypothesis. Analysis revealed that participants who were visiting trauma center show significant change in speeding, distracted driving. Analysis also revealed that participants who were visiting trauma center increasing trend for using safety measures. The findings were discussed in the light of existing literature.

SPACES OF ACTION AND INTERACTIONS

Wednesday 22 July 2026 from 08:00 to 09:30

(N-Lorenese)

Valérie Gyselinck (univ. Gustave Eiffel ~ Versailles ~ Fran), Chair and Presenter

This symposium brings together leading researchers to discuss how humans perceive, represent, and adapt spatial boundaries across peripersonal, extrapersonal, and social contexts. By integrating perspectives from multisensory integration, motor control, memory, and navigation, the session highlights how space is not merely a physical dimension but a dynamic interface structuring both action and interaction.

Laurie Geers will present experimental evidence disentangling multisensory facilitation in peripersonal space from more general alertness effects, showing how looming stimuli differentially influence tactile versus auditory and visual detection. It challenges traditional assumptions about multisensory integration and point to new directions in clinical applications.

Yann Coello will extend this perspective by framing peripersonal space as a flexible interface between goal-directed action and social interaction. He will propose a model linking bodily space representation to social distance regulation, with implications for understanding atypical social processing in neuropathological populations.

Elena Gherri will examine how covert motor preparation, specifically lower-limb movements, influences spatial attention. Using ERP methods, she shows that preparing foot movements induces systematic attentional shifts toward effector and goal locations, revealing a close link between motor planning, spatial attention, and peripersonal space representation.

Valérie Gyselinck will explore how motor constraints shape spatial representations in memory, moving from reachable to navigable spaces. Her work highlights the differential contributions of upper- and lower-limb sensorimotor information in forming distance representations critical for environmental exploration and navigation.

Finally, Chiara Meneghetti will present evidence on individual differences in learning and navigating environments, focusing on the interplay of age, gender, cognitive abilities, and wayfinding preferences. These findings emphasize how navigation strategies and attitudes shape spatial learning in both real and virtual contexts.

Together, these contributions advance a unified perspective on how spatial representations bridge action and interaction. They underline the applied relevance of spatial cognition research for clinical assessment, rehabilitation, and urban design.

Abstract 3742

ANTICIPATING PHYSICAL CONTACT: DISENTANGLING MULTISENSORY INTEGRATION IN PERIPERSONAL SPACE FROM ALERTNESS EFFECTS

Geers L.*[1], Coello Y.[2]

[1]IPSY, UCLouvain ~ Leuven ~ Belgium, [2]SCALab, ULille ~ Lille ~ France

Being able to anticipate the impact of an external object on the body is crucial for generating the appropriate motor reaction. Accordingly, previous studies showed that looming visual or auditory stimuli near the body speed up responses to a tactile stimulation applied on body part targeted by the stimulus. The functional role of this facilitation implies that they should be exclusively visuo-tactile or auditory-tactile as the sensory consequences of the looming stimulus are predicted in relation to the expected impact on the body. The present study tested this assumption by comparing the facilitation effect of a looming visual stimulus on the detection of concurrent tactile, auditory, or visual stimulations. Participants were required to respond as fast as possible to a vibration on the chin, a sound or flash delivered at various moments of the trajectory of a visual ball looming towards them at eye level. Results showed that the closer the visual stimulus was, the faster stimulations were detected. This facilitation was similar for all types of stimulation whenever the visual stimulus was outside peripersonal space, i.e. further than 70 cm from the body, while it was greater for the tactile stimulation when the visual stimulus was within peripersonal space. Overall, these results indicate that a looming stimulus facilitates the detection of any event, possibly through increased alertness, with a special emphasis on tactile stimuli in peripersonal space, possibly through dedicated multisensory processes. Importantly, these results underscore the need to re-evaluate the facilitation effects induced by looming stimuli in clinical populations such as individuals with autism spectrum disorder or schizophrenia, to determine whether the alterations observed in these populations reflect atypical multisensory processing within peripersonal space, as previously assumed, or instead arise from differences in attentional modulation.

Abstract 3743

PERIPERSONAL SPACE AS A DYNAMIC INTERFACE BETWEEN ACTION AND SOCIAL INTERACTION

Coello Y.*

SCALab, ULille ~ Lille ~ France

Peripersonal space—the region immediately surrounding the body—has traditionally been conceived as a multisensory buffer supporting the control of goal-directed actions toward actionable objects. Recent advances, however, reveal its highly dynamic and adaptive nature, particularly in social contexts. I will argue that peripersonal space also plays a fundamental role in shaping social interaction, providing the bodily framework through which individuals regulate interpersonal distance, coordinate engagement, and adjust relational dynamics. Specifically, I will present a model that links peripersonal space representation with social space adjustment, highlighting the modulatory influence of emotional context. This framework will be further examined in relation to neuropathological conditions, where alterations in processing social cues may disrupt the alignment between peripersonal and social spaces.

Abstract 3744

EXPLORING THE LINKS BETWEEN COVERT RESPONSE PREPARATION AND SPATIAL ATTENTION: THE CASE OF LOWER LIMB MOVEMENTS

Gherri E.*

University of Bologna, Dipartimento di Filosofia ~ Bologna ~ Italy

Initial evidence suggests that the intention to execute a spatially-directed foot-movement can strongly modulate the representation of peri-personal space (PPS), as suggested by a weakened multisensory representation of the space around the initial foot location before movement onset. However, before concluding that PPS is directly modulated by the intention to execute a lower limb movement it is essential to evaluate the role of motor attention.

Purpose: Motor-induced shifts of attention have been consistently observed during the covert preparation of hand movements, as shown by spatially-specific modulations of visual and tactile processing close to the hand and to the movement goal. However, no study to date has investigated whether analogous sensory processing modulations can be found during the covert preparation of goal-directed foot movements. Here, we assess whether attention shifts occur also during the preparation of a lower limb movement and whether attention shifts are directed towards the movement effector, the goal location or both.

Method: We recorded event related brain potentials (ERPs) to task-irrelevant visual probes presented near the cued effector or goal location while participants covertly prepared a lower-limb movement as instructed by a response cues presented at the beginning of each trial. These cues specified the effector as well as the goal location of an upcoming movement.

Results should reveal systematic modulations of early visual components elicited by task-irrelevant probes presented near the cued effector and the cued goal-location. This study helps demonstrating that the covert preparation of a goal-directed foot movement induced shifts of attention able to modulate sensory processing close to movement-relevant locations. Analogously to hand movements, a close link between covert response preparation and attention shifts should be also present for lower limb movements. Motor-induced shifts of attention can potentially play a role in PPS modulations by lower limb movement planning.

Abstract 3745

FROM REACHABLE TO NAVIGABLE: MOTOR INFLUENCES ON SPATIAL REPRESENTATIONS IN MEMORY

Gyselinck V.*, Dutay J.

univ. Gustave Eiffel ~ Versailles ~ France

A number of studies have used interference paradigms to examine the impact of motor constraints on the perception of peri-personal space. They highlight the deleterious effects of manual or upper limb constraints on the perception of distances in this space, sometimes also referred to as reachable space, but not in the space just beyond. However, there has been less research on the exploration of extra-personal space requiring physical movement. The aim of this study is to examine different forms of extra-personal space, in particular extra-personal action space requiring motor movement, in order to highlight the role of sensorimotor information from the lower limbs. It will help inform which specific sensorimotor information contributes to the spatial representations present in memory, depending on whether we consider peripersonal or extrapersonal space, and identify the common processes involved. This work should shed light on our understanding of the perception and formation of distance representations in environmental exploration, navigation, and mobility situations.

Abstract 3746

NAVIGATING AND LEARNING THE ENVIRONMENT: INDIVIDUAL ABILITIES, PREFERENCES AND STRATEGIES AT WORK

Meneghetti C.*

University of Padova, General Psychology Department ~ Padova ~ Italy

The contribution presents an excursus of empirical evidence of the environment learning and navigation (in real and virtual environment) in relation to individual differences (in term of age and gender) and individual abilities (as mental rotation, working memory) and preferences (in term of wayfinding attitude as pleasure in exploring, self-efficacy).

BUILDING AN AUGMENTED DINING EXPERIENCE: EXPLORING THE ARCHITECTURAL PILLARS FOR THE DEVELOPMENT OF A MIXED REALITY RESTAURANT

Bettelli A.*, Orso V., Costalunga F., Campanini M.L., Mingardi M., Buiatti E., Gamberini L.

Department of General Psychology, Human Inspired Technologies Research Center, University of Padova ~ Padova ~ Italy

Introduction: Dining experiences emerge from intertwined dimensions, including sensory, social, psychological, and environmental factors. Restaurants, as relational and multisensory contexts, exemplify this complexity. While prior research has highlighted the relevance of atmosphere and multisensory cues, the investigation has been limited by the difficulty of manipulating physical-world factors. Extended Reality provides a flexible approach to address this challenge, allowing systematic and controlled variation of environmental factors while preserving ecological validity.

Purpose: This work aimed to identify the critical aspects that need to be tackled for the design and development of a Hybrid Restaurant by involving expert professionals employed in the food sector.

Method: Semi-structured interviews were conducted with 27 professionals (mean age 40) from the restaurant industry, including chefs, store managers, maitre d's, architects, interior and digital designers, and floral designers. The questions explored how the dining area where guests consume meals was arranged and the aspects that were considered more relevant for shaping the experience. A thematic analysis approach was adopted for clustering similar notes.

Results: Four macroareas were identified: the dining area, table setting and mise-en-place, sensory qualities of the dish, and the overall experience. Specifically, the analysis emphasised recurring aspects across roles, such as lighting as a factor in creating atmosphere, the influence of colour in dish presentation, and the relationship between food and the surrounding environment. These insights oriented the development of the Hybrid Restaurant platform, which builds on Mixed Reality (MR). This platform allows for systematic manipulation of several factors and examines how environmental features affect taste, multisensory perception, emotional responses, and dining behaviours.

Conclusions: By building on professionals' perspectives, the Hybrid Restaurant platform establishes an experimental setting that bridges real-world dining practices with controlled manipulations. This approach illustrates the potential of MR as a methodological tool for investigating Human–Environment interaction in dining contexts, with implications for hospitality and design.

PSYCHOLOGICAL AND SOCIAL IMPACT OF COLLABORATIVE ROBOTS IN SMALL WORK GROUPS

Nenna F.*, Nannetti M., Zanardi D., Filippi M., Monteleone G., Mingardi M., Gamberini L.

Università degli Studi di Padova ~ Padova ~ Italy

Introduction. The integration of collaborative robots (cobots) into industrial contexts raises fundamental questions about how human–robot teams organize work, distribute tasks, and maintain social cohesion. Moving beyond performance and production metrics, current research emphasizes the importance of psychological and social factors (e.g., trust, fairness, team cohesion) in determining the success of hybrid human–robot teams. In our research, we explore these dynamics by investigating how the presence of a cobot and the type of task assigned to it shape collaboration quality in small work groups.

Purpose. In this work, we explore these dynamics by investigating how the presence of a cobot and the type of task assigned to it shape collaboration quality and team climate in small work groups. The purpose is to provide empirical evidence on how cobot integration and task allocation affect both individual experiences and collective processes in teamwork.

Methods. In a controlled laboratory experiment simulating an industrial workcell, 26 triads of industrial operators performed assembly tasks. After working in a human-only team, the cobot was integrated as a third team member in the place of one human member, and when present, it was assigned either a logic-based task or a repetitive task. Data collection combined interviews, self-reports, behavioral observations and psychophysiological measures (eye-tracking, HRV, pupillometry), capturing together psychosocial dynamics (e.g., workload, trust, team cohesion) and cobot trust and acceptance.

Results. Preliminary analyses suggest a complex picture: while self-reports and behavioral indices sometimes point in different directions, they highlight that cobot presence and task assignments shape collaboration quality. Initial trends indicate that cobot influences social dynamics and operators' perceptions more than objective task performance.

Conclusions. This work highlights how cobot integration and task assignment critically shape the psychological climate of collaboration. These insights inform the design of

human-centered cobot integration strategies that safeguard both productivity, team climate, and worker well-being.

Abstract 1836

WHEN ROBOTS MOVE LIKE US: PSYCHOLOGICAL AND BEHAVIORAL EFFECTS OF ROBOTS' HUMAN-LIKE KINEMATICS IN INDUSTRIAL COLLABORATION

Orlando E.M., Nenna F.*, Buodo G., Gamberini L.

University of Padova ~ Padova ~ Italy

Introduction: The emergence of collaborative robotics highlights the need to align technological design with human experience at work. In human–robot interaction (HRI), fluency, the smooth, adaptive, and coordinated interplay between partners, is a key determinant of collaborative quality. A critical aspect of fluency is motor coordination, namely the temporal alignment of actions between agents. Despite its relevance, little empirical evidence has examined how robot motion design shapes this coordination in applied settings.

Purpose: This study investigates whether human-like versus machine-like robot movements affect motor coordination with a human partner during collaborative assembly tasks, and whether this effect varies with the degree of interdependence between partners' actions.

Method: Twenty-two participants engaged in assembly tasks with a cobot under four conditions: high/low interdependence × human-like/machine-like motion. Human and cobot joint kinematics were tracked using a machine learning–based pose estimation model, focusing on the human right wrist and the cobot's end-effector. Coordination was assessed via self-reports and behavioral data (i.e., cross-correlation CC and mutual information MI between time series, as indicators of synchronous coupling). Repeated-measures ANOVAs tested the effect of movement style and interdependence on coordination.

Results: Results evidenced significant effects of condition on coordination indices. Post-hoc comparisons indicated that human-like kinematics in high interdependence tended to produce higher coordination than machine-like kinematics or low interdependence conditions, although adjusted contrasts reached only marginal significance.

Conclusions: Human-inspired kinematics foster greater motor coordination, particularly when collaboration requires high interdependence. These results suggest that biologically-inspired movements enhance fluency, and potentially improve trust and acceptance in human–robot collaboration. Future research should assess these aspects and broaden the focus to additional psychological and organizational outcomes, positioning motor compatibility as a key lever for sustainable and human-centered

robotic design.

Abstract 1622

WHO BENEFITS FROM VIRTUAL REALITY TRAINING IN DENTAL EDUCATION? LEARNER CHARACTERISTICS AND LEARNING MECHANISMS

Panico L.M.*[1], Couso--Queiruga E.[2], Chappuis V.[2], Mast F.W.[1]

[1]Department of Cognitive Psychology, Perception, and Research Methods, University of Bern ~ Bern ~ Switzerland, [2]Department of Oral Surgery and Stomatology, University of Bern ~ Bern ~ Switzerland

Providing high-quality surgical training is a central challenge in dental education. Traditional hands-on practice of dental implant placement using plastic or cadaveric models is single-use and limited in availability. Virtual reality (VR) simulations offer a sustainable alternative, but evidence regarding their effectiveness for dental implantology training remains sparse. Research across disciplines has shown that VR may facilitate learning by boosting intrinsic motivation. At the same time, VR may increase extraneous cognitive load, which can hinder learning and counteract the motivational benefit. The aim of this study is to investigate which individual characteristics allow learners to benefit from high intrinsic motivation without experiencing increased extraneous cognitive load in VR training.

Dental implant placement was practiced either in a VR simulation or using actual surgical equipment and plastic models. Implant placement performance on a plastic model and knowledge retention were assessed as learning outcomes. Immersive tendency and prior VR experience were examined as moderators of VR learning effectiveness.

We will present results on how immersive tendency and VR experience moderate the effectiveness of VR versus traditional learning, with particular attention to intrinsic motivation and extraneous cognitive load as explanatory mechanisms.

By investigating learner characteristics alongside intrinsic motivation and cognitive load, this study contributes to the understanding of VR learning mechanisms and introduces a novel psychological perspective into the dental education literature. Knowing who benefits most from VR learning, and why, may help dental clinics tailor pre-clinical training to each learner's needs and characteristics, thereby maximizing learning effectiveness and optimizing educational resource use.

Abstract 1268

PERCEIVED TRUSTWORTHINESS OF REAL VS FAKE NEWS AS A FUNCTION OF REAL PHOTO VS AI-GENERATED ACCOMPANYING IMAGE

Khanna P., Ramdhave A., Gupta M., Jain R., Arora S., Patki S.*

FLAME University ~ Pune ~ India

Concerns regarding vulnerability to misinformation and fake news have been raised by the rapid adoption and emergence of artificial intelligence (AI) in digital media, which has changed the journalism landscape. When juxtaposed against the lack of digital literacy, the spread of fake news across new media platforms poses a more serious challenge. The present study employed the Uncanny Valley effect to evaluate the impact of real photos versus AI-generated images on the perceived trustworthiness of real versus fake news. An experimental study was conducted with 155 participants who were presented with four combinations of stimuli: real news with a real photo, real news with an AI-generated image, fake news with a real photo, and fake news with an AI-generated image, in a randomized order. While the results did not show significant interaction effects between the type of news and the accompanying image, the main effects for the image were found to be significant. Real photos elicited higher trustworthiness compared to AI-generated images in the total sample, irrespective of whether the news was real or fake. The scores of participants across three age groups were also compared to understand how age affects the trustworthiness of news with AI-generated images. Results showed that participants aged between 40 to 50 years showed higher trust in AI-generated images compared to their younger counterparts (18 to 30 years old). The study's findings underscore the impact of accompanying images on determining the trustworthiness of news items. The study has implications for designing media awareness drives and digital literacy curriculum in the context of aspects like vulnerability to fake news and literacy about AI-generated content, especially among the digitally non-natives.

Abstract 1867

DIALOGUE OVER DIRECTIVES: HUMAN-CENTRIC INSIGHTS ON HUMAN-ROBOT COMMUNICATION IN INDUSTRY 5.0

Zanardi D.[1], Nenna F.[2], Gamberini L.[2], Pluchino P.*[2]

[1]Department of Developmental Psychology and Socialisation, University of Padova ~ Padova ~ Italy, [2]Department of General Psychology, University of Padova ~ Padova ~ Italy

Introduction. Recent developments in Cognitive Human–Robot Interaction (CHRI) have shifted the role of collaborative robots (cobots) from simple automated machines to intelligent partners able to interpret human intentions and adapt accordingly. In manufacturing, this transformation enables new interaction paradigms such as dynamic task allocation, where task assignments can be redistributed during work tasks according to user needs. While such dynamic adaptations should rely on equally dynamic communicative exchanges between the robot and the human, existing systems predominantly envision unidirectional communication—either cobot-to-human or human-to-cobot.

Purpose. With this work, we move beyond the robot-centric perspective and compare different human-robot communication protocols, including bidirectional human–cobot (BUC), unidirectional cobot-to-human (U-CU), and unidirectional human-to-cobot (U-UC) communication. We specifically focus on human perspectives and address the system's implications for psychological well-being.

Methods. We run an experimental study involving 34 participants collaborating on an assembly task involving dynamic task allocation in a shared workstation. The experiment took place in our highly ecological lab environment simulating an industrial workcell, where all participants completed the assembly task under three communication conditions (i.e., BUC, U-CU, U-UC). Data collected included explicit and implicit measures of cognitive load gained through self-reports and eye-tracking, perceived and behavioral performance metrics, and self-reported assessments of communication quality and teamwork.

Results. Results show that although BUC required longer communicative exchanges, participants rated it as the least frustrating condition. Task performance remained comparable across communication modalities, while BUC demonstrated the highest scores for perceived teamwork and communication quality. Interestingly, participants in the BUC condition evaluated identical allocation suggestions more positively than U-CU, highlighting the role of reciprocal communication in shaping collaboration quality.

Conclusions. These preliminary findings suggest that human-robot communication

systems envisioning bidirectional communication may promote a human–cobot synergy that sustains performance without losing focus on worker satisfaction and psychological well-being.

Abstract 1547

THINKING ABOUT THINKING: FROM REFLECTIVE CONSCIOUSNESS TO DECISION-MAKING

Hazira S.*

University of Skövde ~ Skövde ~ Sweden

Decision-making is a fundamental function of human cognition, yet existing accounts in cognitive neuroscience often reduce it to neural computations in prefrontal and striatal circuits, overlooking the layered structure of conscious processes. This paper proposes a conceptual framework that positions reflective consciousness as a mediating process between immediate perceptual awareness and deliberate choice. Visual consciousness provides the experiential content of perception, while reflective consciousness, understood as the “thinking conscious mind,” transforms this content through selective attention, inner speech, and conceptual evaluation. In doing so, reflective consciousness enables individuals to classify, compare, and simulate alternative outcomes, shaping decisions in ways that extend beyond automatic or mechanistic processes. It is argued that decision-making is best understood as an interaction between conscious perception and higher-order reflection, with reflective consciousness mediating the transition from seeing to evaluating and choosing. This perspective bridges mechanistic explanations with phenomenological experience, highlighting reflective consciousness as a process that warrants further exploration to clarify its role in adaptive and maladaptive outcomes. The framework also offers testable directions for empirical research and supports the cultivation of responsible choices in alignment with the Sustainable Development Goals.

Abstract 1131

THE IMPACT OF TRAIT ANXIETY ON TASK-SWITCHING EFFICIENCY: EVIDENCE FROM PREDICTABLE AND UNPREDICTABLE CONTEXTS

Chiu Y.*, Wu Y.

Fu Jen Catholic University ~ New Taipei City ~ Taiwan

This study investigated the impact of trait anxiety on task-switching performance during the classification of letters and digits. Based on Trait Anxiety Inventory (TAI) scores, sixty participants (42 females; mean age = 21.70 years) were assigned to low trait anxiety (LTA; n = 30) and HTA (n = 30) groups. The experiment included three phases: a single-task phase (single trials), a mixed-task phase (repeat and switch trials), and a reverse stimulus-response rule phase. The mixed phase consisted of one predictable clockwise mixed block and one unpredictable random mixed block. Performance was evaluated using accuracy and Inverse Efficiency Scores (IES). The study calculated global switch costs (repeat trials versus single trials) and local switch costs (switch trials versus repeat trials). We hypothesized that trait anxiety primarily affects endogenous rather than exogenous control processes. The high trait anxiety (HTA) group was expected to experience greater difficulty in conditions requiring increased endogenous control, such as the random mixed block and reverse rule phases. Results indicated that LTA individuals consistently achieved higher accuracy and faster IES than HTA individuals. This advantage was most pronounced in repeat and switch trials but not in single trials. In predictable clockwise conditions, LTA individuals demonstrated lower global and local switch costs across both original and reverse rule conditions. Although HTA participants could remember reversed rules, they exhibited significantly higher local switch costs in predictable conditions during rule reversal, suggesting reduced efficiency in extracting task sets during switching. LTA individuals were more adept at leveraging predictability to optimize task switching. In unpredictable contexts, both LTA and HTA groups showed similar immediate task-switching costs. These findings suggest that high trait anxiety undermines task-switching efficiency, especially when active cognitive reconfiguration and rule reversal are required.

Abstract 4573

EFFECT OF RESPONSE TYPE DISCRIMINABILITY ACROSS VOCAL, KEYBOARD, AND MICROGESTURE RESPONSES : EVIDENCE FROM A MULTIMODAL STROOP TASK

Lacroux Z.*[1], Jouffrais C.[2], Paubel P.[1], Lemercier C.[1]

[1]Université Toulouse Jean Jaurès ~ Toulouse ~ France, [2]CNRS ~ Toulouse ~ France

When two tasks performed simultaneously share common processing resources at the perceptual, cognitive or response level, they interfere with each other. This interference results in degraded performance in one or both tasks. Beyond the concept of resource sharing, interference at the response level may arise when the tasks share the same or highly similar response types, even within the same modality (e.g., the same key press for both tasks). Recent studies suggest that the Stroop task may in fact be a dual task situation. When the stimulus is a word, the reading process is automatically activated during the color-naming task. Reading and color naming share common resources at perceptual and cognitive levels which contributes to the interference. We hypothesized that greater response type discriminability would reduce the interference of reading on color naming. In total 92 participants completed a Stroop task under one of the four conditions: a baseline with the same hand and keyboard keys for both tasks and three experimental conditions in which response types differed either by hand (right hand and left hand), motor action (microgestures and key press), or response modality (vocal and manual). Subjective workload was assessed with the NASA-TLX at the end of the experiment. 3 repeated measures ANOVAS compared the baseline condition to the three experimental conditions. Results supported our hypothesis: interference was significantly reduced in all three experimental conditions compared to the baseline. NASA-TLX scores did not differ across conditions. These results suggest that, even within the same response modality, the level of discriminability between response types contributes to the interference. These findings highlight the importance of using different response types across tasks in multitasking contexts. Moreover, using multiple distinct response types did not increase subjective workload, further underlining the importance of varying response types between tasks.

Abstract 1239

FEASIBILITY AND EFFECTS OF REAL-TIME FMRI NEUROFEEDBACK TRAINING ON PRECUNEUS ACTIVITY AND THE BRAIN NETWORK CONNECTIVITY

Hsueh J.J.[2], Liu Y.*[1], Kung C.[1]

[1]National Cheng Kung University ~ Tainan ~ Taiwan, [2]I-Shou University ~ Kaohsiung ~ Taiwan

The precuneus, a key hub of the default mode network (DMN), plays a vital role in core cognitive functions, including episodic memory retrieval, self-awareness, and visuospatial imagery. Given its significance, modulating this region holds potential for addressing cognitive dysfunction. Real-time fMRI neurofeedback training (rtfMRI-NFT) offers a promising method for individuals to self-regulate brain activity. While rtfMRI-NFT has demonstrated success across various brain regions, its application and effects on the precuneus remain largely unexplored. This study aimed to investigate the feasibility of rtfMRI-NFT, which modulated precuneus activity, and explore its effects on the brain network connectivity.

Healthy participants (N=20, aged 20-30) were randomly assigned to either an experimental group (n=10) or a control group (n=10). The experimental group received real-time feedback of the precuneus BOLD signal displayed on a visual interface, while the control group received a random signal. Both groups underwent six sessions, each consisting of six 6-minute down-regulation training blocks. Three questionnaires, Beck depression inventory-II (BDI-II), Beck anxiety inventory (BAI), and Pittsburgh sleep quality index (PSQI), were conducted before and after rtfMRI-NFT to evaluate the possible side effects.

The experimental group successfully modulated their precuneus activity, showing a significant decrease in BOLD signal that was not observed in the control group. Furthermore, functional connectivity analysis revealed a significant reduction in connectivity between the precuneus and other DMN regions (e.g., posterior cingulate cortex, medial prefrontal cortex, and middle temporal gyrus) in the experimental group. No significant changes in scores were found in the questionnaires before and after rtfMRI-NFT. These findings confirm the feasibility of our rtfMRI-NFT that modulates the precuneus activity and brain network connectivity, offering a new direction for future interventions targeting DMN-related dysfunction.

Abstract 2050

UNUSUALLY UNNOTICED: HOW CONTEXT AND THE WEAPON FOCUS EFFECT INFLUENCES INATTENTIONAL BLINDNESS

Wynne R.*[1], Klenjyan S.[1], Cullen H.[2], Beanland V.[3]

[1]The University of Newcastle ~ Newcastle ~ Australia, [2]Macquarie University ~ Sydney ~ Australia, [3]Swinburne University of Technology ~ Melbourne ~ Australia

The eyewitness experience is extraordinarily complex, given the influence of attentional-related phenomena, such as the weapon focus effect and inattentional blindness. There remains uncertainty as to how the weapon focus effect might occur in relation to inattentional blindness, and how the unusualness of a weapon might shape these experiences. Therefore, this study investigated the influence of context and the weapon focus effect within an inattentional blindness paradigm. Naive participants completed a dual counting task whilst they viewed a short video of a busy medical centre or classroom setting. During this video, an actor walked into the scene and held out a stethoscope or a gun. Post-video questions revealed that most participants missed the object's presentation, however, the gun was significantly more likely to be noticed than the stethoscope. There was also no difference between rates of inattentional blindness for the stethoscope across the different conditions. Further, eye-tracking data found no statistically significant difference in fixation across the conditions. It did, however, reveal that some participants spent time fixating on the object despite experiencing inattentional blindness. Therefore, this study challenged the role of unusualness in eliciting the weapon focus effect and showed that weapons do not always capture attention during attention-demanding tasks. It also showed that fixations towards the weapon does not always result in conscious recognition. This study has implications for understanding how attention can influence eyewitness testimonies. Future research should consider the role of threat in eliciting the weapon focus effect within this paradigm.

Abstract 2591

RELOCATING MEMORY IN SAFE VIRTUAL SPACES: A NEURO-ART THERAPY FRAMEWORK FOR CHILDREN EXPOSED TO INTERGROUP CONFLICT

Abbasi K.*

PhD ~ Pecs ~ Hungary

Children living in contexts of intergroup conflict often develop fragmented autobiographical memories, emotional dysregulation, and difficulties with narrative coherence. While psychological interventions for trauma traditionally rely on verbal processing, emerging evidence suggests that combining embodied experience, creative expression, and environmental cues may facilitate memory integration. This pilot study introduces an innovative applied framework that uses Virtual Reality (VR)-based spatial memory relocation integrated with neuro-art therapy to support emotional processing and autobiographical specificity in conflict-exposed children.

Twelve children (ages 10–14) from marginalized communities participated in a single-session VR intervention consisting of three symbolic environments: a conflict-coded space representing distress, a safe relational space, and a future-oriented space emphasizing resilience. In each zone, children engaged in creative expression using VR drawing and sculpting tools, visually mapping memories, emotions, and self-identity. Quantitative measures included autobiographical memory specificity tasks, perceived safety, emotional regulation scales, and presence ratings. Qualitative interviews explored subjective experience, symbolic meaning, and feelings of agency.

Preliminary findings indicate increased specificity of autobiographical recall, reduced overgeneral memories, and heightened sense of safety upon transitioning into the safe and future-oriented VR spaces. Children described the virtual relocation as “leaving the bad place behind,” “drawing what I couldn’t say,” and “seeing myself in the future.” The framework was feasible, engaging, and culturally adaptable, with no adverse emotional reactions.

This study offers initial evidence that virtual relocation combined with art-making may help children reorganize traumatic memory into a coherent, self-authored narrative in a controlled and emotionally safe environment. The results lay groundwork for larger controlled trials and suggest a scalable tool for schools, community centers, and post-conflict mental-health programs. The framework contributes to applied, community-focused psychology at the intersection of trauma, technology, and creative healing.

Abstract 2366

IMMERSIVE VIRTUAL REALITY ENHANCES EMPATHY-INDUCED MEMORY BENEFIT

Lo S.*[1], Kuo C.[2]

[1]National Yang Ming Chiao Tung University ~ Hsinchu ~ Taiwan, [2]Feng Chia University ~ Taichung ~ Taiwan

Previous research has shown that empathy can reduce susceptibility to misinformation. Given that immersive virtual reality (IVR) is known to enhance empathy, we hypothesized that experiencing events in IVR —compared to on a computer screen— would increase the user's empathy and thereby protect them from misinformation. In our experiment, participants were assigned to either the IVR or the computer condition, and then watched six videos. After each video, half of the participants received false information, while the others did not. Although IVR did not directly increase overall empathy level, it did influence how empathy affected memory. For each participant, we identified the videos that elicited the highest and lowest levels of empathy, defining "empathy-induced accuracy increment" as the difference in memory accuracy between these high- and low-empathy videos. This empathy-induced accuracy increment was greater in the IVR condition than in the computer condition. Furthermore, this effect was evident among participants exposed to misinformation but not among those in the control group. These findings suggest that empathy can protect individuals from misinformation, and that this protective effect is amplified in immersive virtual environments.

EXAMINING AFFECT AND MEMORY PROCESSES IN HUMAN–ROBOT INTERACTION IN THE CONTEXT OF MIND PERCEPTION THEORY

Saygili D.Y.*

Izmir Bakirçay University ~ Izmir ~ Turkey

Advances in artificial intelligence and robotic technologies have accelerated the proliferation of social robots in fields requiring direct human interaction, such as healthcare, education, and the service sector. Human-Robot Interaction (HRI) examines how people perceive their interactions with robots and how these interactions affect emotional and cognitive processes, beyond the technical and functional structure of HRI. Literature has often focused separately on psychological constructs such as attitude, emotion, trust, and perception; however, experimental research examining processes such as mind perception, affect, and long-term memory performance holistically has been limited. The study will test the hypotheses that robot type and scenario type will affect affect and long-term memory performance, and that mind perception will mediate this relationship. This study is based on a 3 × 2 factorial experimental design. There are a total of six experimental groups, including robot type (humanoid robot, mechanical robot, human) and scenario type (emotion-eliciting, neutral). Participants are randomly assigned to one of the groups and exposed to the relevant scenario. After the scenario presentation, measures of affect were taken using The Self-Assessment Manikin (SAM) and measures of mind perception were taken using the Mind Perception Scale; a surprise recall test was administered 48 hours later to measure long-term memory performance. Additionally, demographic variables and measures of attitudes toward robots and artificial intelligence are included in the analyses. The sample consists of undergraduate psychology students fat Bakırçay University. G*Power power analysis determined that a minimum of N = 120 participants would be sufficient to test the study's hypotheses.The data will be evaluated using appropriate statistical analyses and mediation models. This study is expected to provide experimental contributions regarding the multidimensional psychological processes involving perceptual, emotional, and memory processes in HRI and to focus on the cognitive and emotional outputs of social robots on humans.

Abstract 4929

FROM AI INSTRUCTION TO APPLIED PRACTICE: FIRST AID TRAINING IN COMMUNITY HEALTH EDUCATION

Ciaghi G.*

Seattle Pacific University; in collaboration with the University of Geneva, Switzerland

Suggested ICAP Fit

This proposal connects well with the applied focus of ICAP 2026 by examining a practical training model for community health education in a low-resource setting. It relates to applied psychology through its focus on learning, confidence, feedback, skill development, and the transfer of training into practice. It also reflects the conference theme of New Directions in Applied Psychology by considering how AI-supported instruction can be combined with human-led simulation and train-the-trainer approaches.

Abstract

In low-resource and crisis-affected settings, limited access to health-care services and structured skills training can reduce individuals' ability to respond effectively to medical emergencies. Community health education therefore requires learning models that are practical, scalable, and feasible under resource constraints. Applied psychology can contribute to this challenge by informing how people learn, build confidence, receive feedback, sustain motivation, and transfer knowledge into practice.

This continuing program of work, conducted by Seattle Pacific University in collaboration with the University of Geneva, Switzerland, examines how AI-supported first aid instruction can move from digital learning into applied practice. The program includes two connected components: first, an online basic first aid module supported by AI-powered avatars; second, a human-led simulation and train-the-trainer model designed to strengthen applied skills, local facilitation, feedback, debriefing, and training capacity.

The empirical evaluation of the AI-supported first aid module used a mixed-methods design. Quantitative data included 18 matched pre- and post-training surveys and 43 post-only surveys. Outcomes included first aid knowledge, attitudes toward first aid, perceived learning efficacy, persistence, and learner experience with AI avatar-based instruction. Findings showed small positive trends in first aid knowledge, Cohen's $d = 0.29$; perceived learning efficacy, Cohen's $d = 0.15$; and attitudes toward first aid, Cohen's $d = 0.22$. Persistence showed a slight negative trend, Cohen's $d = -0.15$. These changes were not statistically significant, $p > .05$. Qualitative findings suggested that avatar visualization and interactive demonstrations supported learner understanding and engagement.

The applied implementation component extended this work through human-led simulation and trainer development. An AI-supported avatar lesson provided

standardized foundational instruction, while four local graduates and four Kenyan health professionals participated in trainer development. Trainers learned to facilitate simulations, role-plays, feedback, debriefings, and local adaptation. Across two cohorts, 57 learners started and 38 fully attended and completed the simulation module assessment in Cohort 1; 27 started and 25 fully attended and completed the module assessment in Cohort 2.

Together, these findings suggest that AI can support consistency, access, and scale, but human facilitators remain essential for feedback, trust, contextual adaptation, and skill development. This work contributes to applied psychology by offering a practical model for responsible AI use in health education, emergency preparedness, workforce development, and technology-supported training in low-resource community health settings.

COGNITION IN ACTION: FROM SENSORIMOTOR ENCODING TO SOCIAL INTERACTION

Thursday 23 July 2026 from 08:00 to 09:30

(N-Lorenese)

Cristina Becchio (UKE ~ Hamburg ~ Germany), Chair and Discussant

Contemporary approaches in cognitive psychology and neuroscience show that action is not merely the endpoint of cognitive processing, but a central organizing principle that shapes how humans perceive, predict, and understand others, coordinate with them, and navigate dynamic environments. This symposium brings together complementary perspectives illustrating how action-based mechanisms structure both individual behaviour and social exchange.

Across the four contributions, we highlight how humans learn from and adapt to the statistical structure of their environments, how they communicate and coordinate through movement, and how kinematic cues support real-time social decision-making and collective behaviour. Fiehler and colleagues show that navigation in dynamic environments depends on an adaptive integration of environmental regularities, individual strategy preferences, and sensorimotor decision demands. Knoblich's work demonstrates that joint action coordination is deeply intertwined with communication, revealing how both subtle sensorimotor cues and simple vocalizations can enhance prediction and stabilize collective action. Schmitz and collaborators expand this view to collective decision-making, showing that confidence—a key metacognitive signal—can be encoded and inferred from movement kinematics, thereby shaping the dynamics and accuracy of group decisions. Finally, Novembre and colleagues reveal the geometric and multidimensional organization of interpersonal synchrony in dance, demonstrating how shared sensory input and inter-individual adaptation support distinct but parallel forms of coordination across the body.

Together, these contributions show how action scaffolds both individual cognition and the complex dynamics of social interaction.

Abstract 4365

NAVIGATING THROUGH A DYNAMIC WORLD

Fiehler K.*

Justus Liebig University ~ Giessen ~ Germany

Human navigation requires to learn and exploit spatial regularities through predictive motor adjustments. Using virtual reality, we investigated how humans learn environmental statistics and accordingly adjust their eye and body movements. Participants navigated through a virtual museum and had to find the shortest path to one of two exit doors while avoiding a suddenly appearing virtual guest blocking either the left or right path. We manipulated the expected reward of a path by varying obstacle frequency in a block-wise manner (high frequency-90% vs. low-frequency-10% path blocking). In control blocks, path blocking occurred equiprobably. We hypothesized that participants learn and capitalize on the statistical regularity in the world (obstacle appearance), and as a result predictively adjust their eye and body movements towards the less frequently blocked path in later trials of a block. We found that only around one-third of the participants adjusted their movements to the spatial regularities of the environment. Many of the other participants walked in a straight line until obstacle appearance, delaying their decision until the last moment. While this approach resulted in greater adjustments upon obstacle appearance compared to scenarios where participants had committed to the correct pathway earlier, it minimized the risk to make even larger movement adjustments if the initially chosen path was blocked. In a follow-up experiment, we eliminated the opportunity to employ this strategy by separating the pathways right at the start, forcing earlier decisions. Now, a majority of participants consistently selected the path presumed to be free, however, roughly one-third still chose the wrong path even in later trials of a block. These findings highlight that navigational behavior does not simply arise from the presence of environmental regularities but reflects an adaptive process of sensorimotor decisions shaped by task demands, environmental structure, individual strategy preferences, and learning capabilities.

Abstract 4366

LINKS BETWEEN JOINT ACTION COORDINATION AND COMMUNICATION

Knoblich G.*

Central European University ~ Vienna ~ Austria

When people perform highly coordinated joint actions to achieve common goals, such as playing a duet, hoisting a sail, or handing over an object, they may communicate while the joint action is being performed. I will present recent studies that asked how communication during joint action may improve joint action coordination. The results of these studies indicate that there are different ways in which improvements can be achieved. Causing prediction errors in a joint partner may be used to convey task relevant information unknown to a partner such as where to grasp an object or which path to take (sensorimotor communication, Pezzulo et al. 2019). But there is also a more direct route between basic forms of communication and joint action coordination. Simple utterances, songs, or counting may be used as timing signals that stabilize temporal coordination in joint action by reducing interpersonal variability. This reduction can help with keeping a stable tempo in rhythmic joint action, applying forces at the same time, or maintaining joint actions that require a certain temporal pattern. Further studying the links between joint action coordination and communication is worthwhile because it may provide clues as to how increasing needs for collaborative joint action may have driven the evolution of sophisticated communication systems.

Abstract 4367

CONFIDENT MOTION: READING CONFIDENCE FROM MOVEMENT SHAPES COLLECTIVE DECISION-MAKING

Schmitz L.*

University Medical Center Hamburg-Eppendorf ~ Hamburg ~ Germany

Most decisions in daily life are not made alone but together with others, requiring us to determine when to trust another person's judgment over our own. To do so, we can use the other's confidence as a helpful indicator of accuracy. While verbal communication about confidence has indeed been shown to enhance collective decision accuracy, little is known about whether and how confidence can be transmitted nonverbally—through the observation of others' movements. In this study, we investigate how confidence information conveyed via movement shapes real-time social decision dynamics. Specifically, we test whether two individuals infer confidence information from each other's movements and then use this information to achieve a collective benefit in perceptual decision-making. Our results show that (1) dyads make better perceptual decisions than individuals, (2) confidence information is 'encoded' in movement patterns, and (3) individuals infer and use this information to guide their collective decisions. Moreover, our experimentally inspired modeling demonstrates that integrating a partner's encoded confidence with one's own improves collective decision accuracy compared to when the partner's confidence is not considered. These findings highlight the importance of bodily motion for the social transmission of confidence information in collective decision-making.

Abstract 4368

THE GEOMETRY OF INTERPERSONAL MOVEMENT SYNCHRONY IN DANCE

Giacomo N.*

IIT ~ Rome ~ Italy

Collective synchronized behavior has powerful social-communicative functions observed across several animal taxa. Operationally, synchronized behavior can be explained by individuals responding to shared external cues (e.g., light, sound, or food) as well as by inter-individual adaptation. We contrasted these accounts in the context of a universal human practice—collective dance—by recording full-body kinematics from dyads of laypersons freely dancing to music in a "silent disco" setting. We orthogonally manipulated musical input (whether participants were dancing to the same, synchronous music) and visual contact (whether participants could see their dancing partner). Using a data-driven method, we decomposed full body kinematics of 70 participants into 15 principal movement patterns, reminiscent of common dance moves, explaining over 95% of kinematic variance. We find that both music and partners drive synchrony, but through distinct dance moves. This leads to distinct kinds of synchrony that occur in parallel by virtue of a geometric organization: anteroposterior movements such as head bobs synchronize through music, while hand gestures and full-body lateral movements synchronize through visual contact. One specific dance move—vertical bounce—emerged as a supramodal pacesetter of coordination, synchronizing through both music and visual contact, and at the pace of the musical beat. These findings reveal that synchrony in human dance is independently supported by shared musical input and inter-individual adaptation. The independence between these drivers of synchrony hinges on a geometric organization, enabling dancers to synchronize to music and partners simultaneously by allocating distinct synchronies to distinct spatial axes and body parts.

EFFECTS OF TECHNOLOGY-ASSISTED SUPPLEMENTAL WORK ON SLEEP QUALITY AND QUANTITY: THE ROLE OF WORK-RELATED PERSEVERATIVE COGNITIONS

Menghini L.*, Gamberini L.

Human-Inspired Technologies Center, Department of General Psychology, University of Padova ~ Padova ~ Italy

Introduction: Recent global trends towards work intensification and digitalization, together with increasingly prevalent remote work modalities and cultures of long working hours, are posing emerging threats to employee health and well-being. Particularly, the impact of technology-assisted supplementary work (TASW) – i.e., tendency to perform work tasks with digital devices after regular work hours – on post-work recovery and sleep is increasingly acknowledged. Yet, while TASW has been consistently associated with poor sleep quality, inconsistent evidence has been provided on its relationship with sleep duration, with work-related perseverative cognitions (i.e., affective rumination and problem-solving pondering) having been proposed as possible intervening mechanisms. Purpose: To investigate the role of work-related perseverative cognitions as mediators of the relationship between TASW and sleep quality and quantity. Method: A cross-sectional survey (funded by MUR - Complementary National Plan PNC-I.1 PNC0000002 DARE - Digital Lifelong Prevention, CUP: B53C22006440001) was conducted with a representative sample of Italian workers (n = 1,585; 46% women; 52% remote/hybrid workers; mean age = 46.1 years) that reported working 18+ hours/week and using work-related devices at their home (e.g., smartphones and laptops). WLSMV-based structural equation modeling was used to test the study hypotheses. Results: Affective rumination and problem-solving pondering fully mediated the relationship between TASW and sleep quality, whereas only the latter mediated the relationship between TASW and sleep duration. The potential moderating roles of remote work and chronotype are also explored. Conclusions: Whereas problem-solving pondering is often considered a “positive” form of rumination that improves creativity without harm, our study highlights that it can be not only detrimental for both sleep quality and quantity, but also one of the main mechanisms through which digital overwork impairs overall sleep outcomes. Practical implications for human resources and work-life boundary management are discussed.

Abstract 2459

HUMAN FACTORS IN THE USE OF DIGITAL EARLY WARNING SCORES: AN OBSERVATION STUDY

Moran M.*, Ward M.E., Corrigan S.

Trinity College Dublin ~ Dublin ~ Ireland

Introduction:
Recent digitalisation has driven a rapid shift from paper-based documentation to Electronic Patient Record (EPR) systems. At the same time, Early Warning Systems (EWS), used to support detection of patient deterioration, have become widespread. Integrating EWS into EPRs aims to improve scoring accuracy and ultimately reduce preventable in-hospital mortality. However, digital EWS also introduce new cognitive demands, influencing how clinicians monitor patients, construct situational awareness, and communicate clinical concerns. As such, a human factors psychology lens was utilised to understand how digital EWS tools are interpreted, trusted, and operationalised in everyday clinical practice.

Purpose:
To examine the psychological, social, and organisational processes underpinning clinicians' use of a newly implemented digital EWS system, and to identify how human factors influence uptake, sense-making, and escalation behaviours.

Method:
An ethnographic observation study was conducted in Ireland's largest teaching hospital across acute medical and surgical wards. Using a structured guide based on the Systems Engineering Initiative for Patient Safety (SEIPS) 2.0 model, a leading healthcare human factors framework, we conducted non-participant observations of nurses and physicians across the full EWS workflow: vital sign measurement, data entry, score calculation, and escalation.

Results:
Digital EWS use was shaped by multiple interacting factors across individual cognition and motivation, team hierarchies, task demands, and organisational context. Clinicians' trust, perceived usefulness, and cognitive workload influenced how alerts were interpreted and acted upon, while system usability, workflow integration, and temporal delays in data entry and processing affected responsiveness. These dynamics produced variable outcomes in efficiency, communication, and clinician burden, with users frequently relying on compensatory workarounds to maintain clinical sense-making alongside automated alerts.

Conclusions:
The effectiveness of digital EWS systems depends not only on algorithmic accuracy but on careful alignment with cognitive workflows, professional judgement, and interface usability, making explicit attention to human factors essential for safe and meaningful clinical decision-making.

Abstract 1618

WHY PSYCHOLOGY MATTERS IN MEDICAL TECHNOLOGY: MENTAL WORKLOAD IN DENTAL IMPLANT SURGERY

Panico L.M.*[1], Couso--Queiruga E.[2], Chappuis V.[2], Mast F.W.[1]

[1]Department of Cognitive Psychology, Perception, and Research Methods, University of Bern ~ Bern ~ Switzerland, [2]Department of Oral Surgery and Stomatology, University of Bern ~ Bern ~ Switzerland

In dental implant surgery, surgeons must manage more than the operative task itself: they monitor patients, communicate with the team, and deal with unforeseen complications. Novel computer-assisted surgical guidance systems were designed to support surgeons through real-time visualization of instrument position relative to anatomy and planning. Currently available systems often suffer from high information load, complex interfaces, and off-site information displays that require frequent attentional shifts. These factors may amplify surgeons' mental workload and increase the risk of adverse surgical events. Medical research has focused mainly on maximizing and evaluating the surgical precision (implant placement accuracy) of such systems. By contrast, potential detrimental effects on surgeons' cognitive resources have been largely overlooked.

This in-vitro study highlights the critical importance of psychology in evaluating surgical guidance systems. Surgeons' mental workload was compared across three implant placement procedures: freehand, static (3D printed mechanical guide), and dynamic (real-time visualization). Mental workload was assessed multimodally through subjective ratings, physiology (pupillometry, EEG), and a secondary task measuring spare cognitive capacity.

We will present results on how dynamic guidance influences mental workload and surgical accuracy compared to static and freehand implant placement, with particular attention to the relationship between both outcomes.

By integrating psychological theory and methods into the evaluation of surgical technology, this study shows that the traditional focus on accuracy may conceal excessive cognitive demands, creating hidden risks for patient and surgeon well-being. This underscores the value of a user-centred perspective: addressing surgeons' needs and cognitive resources in medical technology design ensures novel technologies genuinely support – rather than strain – the professionals they are designed to serve.

Abstract 1899

CULTIVATING RESILIENCE AND SATISFACTION THROUGH KAIZEN: A CONTINUOUS IMPROVEMENT FRAMEWORK FOR EMPLOYEE WELL-BEING

Rana N.*, Singh A.

Gautam Buddha University ~ Greater Noida ~ India

In today's fast-paced business landscape, organizations recognize the importance of cultivating a resilient workforce to drive success. Kaizen, a Japanese philosophy emphasizing continuous improvement, offers a powerful framework for enhancing employee satisfaction and engagement. This study explores the impact of the Kaizen approach on employee resilience and satisfaction in the workplace. This approach encourages employees to identify areas for improvement, develop problem-solving skills, and implement changes that enhance workflows and processes. However, there is need to explore its effects on employee resilience and satisfaction to help business organizations.

In this study, the case study approach is utilized, and data analysis is conducted using statistical instruments. Through a mixed-methods approach, this research investigates how Kaizen implementation influences employee attitudes and behaviors. The intended participants are Human Resources professionals and Kaizen team members within the manufacturing organization for the investigation.

As a result, employees feel empowered, valued, and invested in the organization's success. Kaizen's focus on small, incremental changes also fosters a sense of achievable goals, promoting motivation and job satisfaction. Employees who participate in Kaizen initiatives report increased feelings of autonomy, motivation, and engagement, leading to improved overall well-being and reduced turnover intentions. The study's results highlight the importance of organizational culture and leadership support in facilitating successful Kaizen implementation. By fostering a culture of continuous improvement, organizations can promote employee resilience, satisfaction, and growth, ultimately driving business success.

This research contributes to the existing literature on Kaizen and employee outcomes, providing insights for organizations seeking to improve employee resilience and satisfaction through continuous improvement initiatives. The findings have implications for HR practitioners, managers, and organizational leaders aiming to create a positive work environment that supports employee well-being and performance.

A CULTURALLY SENSITIVE MEASURE OF COPING STRATEGIES FOR POTENTIAL VICTIMIZATION IN MÉXICO

Gonzalez Tapia F.P.*

National Autonomous University of Mexico ~ Mexico City ~ Mexico

Crime affects a large portion of the population, leading people to take actions to protect themselves due to fear of victimization. Most existing classifications of these actions lack theoretical background and psychometric evidence. From a psychological perspective, preventive behaviors against victimization parallel coping mechanisms. Therefore, the purpose of this study was to test a measurement model of coping strategies for potential victimization based on coping theory. Data were collected from a non-probabilistic sample of 377 residents of Mexico City, with ages from 18 to 75 years (M = 27.08, SD = 10.73), 68.2% women, 30.2% men, and 1.6% preferring not to specify. Educational levels included basic (6%), middle (65.5%), and higher education (28.6%). Participants came from diverse socioeconomic and geographical areas of the city. Recruitment was conducted online via social media, and participation was voluntary, anonymous, and consistent with international ethical standards. The instrument consisted of 27 items representing six coping dimensions: religious coping, communal coping, cautious prevention, help-seeking, protection of loved ones, and avoidant prevention. Items were rated on a five-point pictorial frequency scale ranging from “Never” to “Always,” indicating how often participants engaged in each strategy. Results from a CFA indicated excellent fit: $\chi^2(309) = 522.71$, $p < .001$; CFI = .97; TLI = .96; RMSEA = .043 (95% CI [.036, .049]). Composite reliability values exceeded .80, and average variance extracted (AVE) values were above .50 for most factors, supporting convergent validity. Discriminant validity was confirmed as AVE values were greater than maximum shared variance. The scale showed strong internal consistency (ω = .91). These findings validate the proposed structure and provide a culturally sensitive tool for assessing coping strategies for potential victimization, enabling future research on crime prevention and coping processes in urban settings.

Abstract 656

ECO-NEURO-REHABILITATION IN A VUCA WORLD: AN INTEGRATIVE MODEL TO ENHANCE PREFRONTAL REGULATION AND RESILIENCE UNDER TOXIC STRESS

Hussein Farraj R.*, Mualem R.

Econeurobiology Research Group, Research Authority, Oranim Academic College ~ Tivon ~ Israel

Introduction:
In today's VUCA world—marked by uncertainty—children are increasingly exposed to toxic stress from war and displacement. Such stress disrupts the balance between bottom-up emotional reactivity and top-down prefrontal regulation, overactivating the limbic system and impairing executive functions. This imbalance undermines resilience, learning, and mental health, posing harm. Toxic stress is linked to epigenetic changes, reduced brain connectivity, and anxiety, depression.
Purpose:
This project introduces the Eco-Neuro-Rehabilitation model, developed through integration of our research with global evidence. It provides a holistic framework that mitigates neurocognitive consequences of toxic stress, strengthens prefrontal cortex (PFC) control, and promotes resilience and brain connectivity in children.
Method:
The model is grounded in an eco-systemic perspective and unites interventions across mind, soul, and body. The Mind (PFC) component integrates movement, nutrition, biofeedback, and non-invasive brain stimulation (NIBS) to enhance executive control. The Soul (Limbic System) component emphasizes nurturing environments, psychotherapy (art, CBT, game), mindfulness, music therapy, faith-based approaches, animal-assisted and horticultural therapy to foster meaning and belonging. The Body (Brain Stem) component focuses on meditation, sleep, and body–brain massage to regulate physiology and stress. Each program is personalized to developmental and cultural needs.
Framework (Expected Outcomes):
By engaging mind, soul, and body, the model is expected to reduce hyper-arousal, improve emotional regulation, strengthen functions and build resilience. Integrating research with clinical observation enhances impact.
Conclusions:
Eco-Neuro-Rehabilitation links mind, soul, and body to brain systems in addressing toxic stress. Embedding these practices in schools fosters recovery. The model also calls for rethinking school schedules and management to align with neurobiology.
Rehabilitation Outcomes:
• Mental health through mind–soul–body care.
• Enhanced PFC function and top-down regulation.

- Improved cognition and executive control.
- Strengthened emotional limbic regulation and resilience.
- Regulated brainstem functions.

This comprehensive model equips children to withstand adversity and thrive in a VUCA world.

Abstract 835

AWE ENHANCES PSYCHOLOGICAL DEPTH IN REFLECTION: CONVERGENT EVIDENCE FROM FIELD AND VR EXPERIMENTS

Perini M.*, Van Schie H., De Groot J., Karremans J.

Radboud University, Behavioural Science Institute ~ Nijmegen ~ Netherlands

Awe has been linked to prosociality, curiosity, authenticity, and meaning, yet a unifying account remains underspecified. We propose that awe's broad effects arise because it promotes psychological depth, operationalized via ratings collected after reflection tasks.

We test this account in naturalistic and virtual reality (VR) experimental settings. Participants completed reflection tasks and a scale assessing experienced depth in the reflection, measuring (a) the depth of evoked ideas and principles and (b) the depth of the reasoning process as a whole.

In our naturalistic study (N=74), each participant underwent two separate reflection tasks on topics chosen before the experiment. Awe was manipulated by counterbalancing the reflection location (top vs. ground floor) in an 88-meter-tall building with a panoramic, awe-eliciting view. Mixed-effects models showed that reflections in the awe condition were experienced as deeper than those in the control condition. Awe also increased state authenticity, reflecting alignment with deeper values and beliefs.

In our lab study (N=79), participants completed reflection tasks under four conditions—neutral control, positive-emotion control, awe-nature, and awe-space—with stimuli presented via a VR headset. Awe reliably increased experienced depth relative to both controls, and this effect was accompanied by higher ratings of emotional engagement, insight, and meaning.

Collected data include manipulation checks, dispositional awe and several other measures (e.g., a 100-item Big Five inventory), writing samples from participants' reflections, and heart rate monitoring.

This research underscores awe's role in promoting reflection and psychological depth, with theoretical and practical implications. Findings support a depth-based account of awe, showing how this emotion can support reflection on personally relevant topics. These results also suggest practical interventions to elicit deeper self-examination in applied settings.

Abstract 326

INTERPERSONAL SENSITIVITY AND THE COGNITIVE-EMOTIONAL DRIVERS OF PROBLEMATIC SOCIAL MEDIA USE IN YOUNG ADULTS

Pradhan R.K.*, Sabu S.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Introduction: Young adults are increasingly vulnerable to excessive engagement with social media, often leading to disruptions in mental health and daily life. While social difficulties are known to influence digital habits, the pathways that connect interpersonal traits to problematic social media use (PSMU) remain underexplored.

Purpose: This study investigates whether interpersonal sensitivity, a heightened tendency to perceive and react strongly to social rejection, is linked to PSMU. It further examines whether this relationship is explained by emotion regulation difficulties and metacognitive beliefs about social media use.

Method: A cross-sectional survey was conducted with 768 young adults aged 18 to 29 years (M=21.89, SD=3.17) from different regions of India. Participants completed validated self-report measures assessing interpersonal sensitivity, emotion dysregulation, metacognitions related to social media and PSMU. Partial least squares structural equation modeling (PLS-SEM) was conducted using RStudio to test the hypothesized mediation model.

Results: Interpersonal sensitivity was found to significantly predict PSMU. The analysis revealed a significant indirect effect through a serial mediation pathway involving emotion dysregulation, positive metacognitions and negative metacognitions. This suggests that individuals with high levels of interpersonal sensitivity may develop emotion regulation difficulties and maladaptive beliefs about social media use, leading to more frequent and problematic engagement.

Conclusion: These findings shed light on the psychological mechanism linking interpersonal vulnerability to digital overuse. Interventions aimed at reducing PSMU in interpersonally sensitive young adults may benefit from addressing emotion regulation challenges and targeting dysfunctional metacognitive patterns tied to social media use.

Abstract 2589

CONTEXTUALIZING FEAR MEMORIES: A NEUROCOGNITIVE AND PEER-SUPPORT APPROACH TO TRAUMA RECOVERY

Kocsor F.[1], Abbasi K.*[2], Arndt B.[1]

[1]Dr. ~ Pecs ~ Hungary, [2]Phd Student ~ Pecs ~ Hungary

Traumatic experiences often generate fear memories—vivid, sensory, and intrusive recollections that remain disconnected from context and contribute to the persistence of post-traumatic stress disorder (PTSD). Contemporary neurocognitive research (Hermans et al., 2017; Mary et al., 2020; Boccia et al., 2022) suggests that trauma impairs the integration of memory systems linking the amygdala, hippocampus, and prefrontal cortex, resulting in fragmented emotional recall. This project explores how peer-support narrative frameworks may help re-contextualize such memories by combining shared storytelling with reflective dialogue. The study employs a mixed qualitative–neurocognitive design: (1) a literature review synthesizing trauma memory and cognitive-affective regulation research; (2) focus-group discussions examining how individuals describe and interpret distress, fear, and recovery; and (3) pre-/post-assessments of intrusive memory frequency, perceived stress, working memory, and emotion-regulation indices. Quantitative data will provide measurable indicators of cognitive-emotional change, while narrative analysis will capture meaning-making processes within group interaction. Preliminary observations indicate that shared reflection fosters decreased distress and greater coherence in trauma narratives. By integrating neurocognitive models of memory reconsolidation with peer-based dialogue, the research aims to develop an accessible, evidence-informed framework for contextualizing fear memories and enhancing resilience across community and clinical populations.

Abstract 2421

INSTRUCTION MODALITY EFFECTS ON EMOTION EVALUATION, DECISION-MAKING, AND VISUAL RECOGNITION MEMORY IN EMOTIONAL AUDITORY AND NEUTRAL FACIAL CONTEXTS

Mavral S.M.*[2], Sisman--Bal S.[1]

[1]Istanbul University ~ Istanbul ~ Turkey, [2]Istanbul Kültür University ~ Istanbul ~ Turkey

Emotional information can influence cognitive processing across sensory modalities, shaping how individuals perceive and evaluate social cues. However, the extent to which the instructional focus modulates this cross-modal interference remains unclear. Building upon previous findings on affective auditory and visual interactions, this study investigates how attentional orientation modulates emotional interference by manipulating the instruction modality (visual vs. auditory) in affective evaluation, decision-making, and recognition tasks. Thirty-two undergraduate students (aged 18–27) were simultaneously presented with 24 neutral faces paired with affective auditory stimuli (positive, negative, or neutral). Participants rated the emotional content of the stimuli on a 5-point Likert scale (1= very negative, 5= very positive) and responded to social decision-making questions (e.g., “Would you be friends with this person?”) while instructed to focus on either the auditory or facial stimuli. After 12 stimuli in the first block, the instruction type changed, counterbalanced across blocks (visual–auditory-focused vs. auditory–visual-focused). In a subsequent recognition task, participants judged whether previously presented faces were “old” or “new.” Emotion evaluation scores were higher under visual than auditory instruction across all categories ($p < .05$). Neutral faces paired with negative auditory stimuli received the lowest ratings, with a greater reduction under auditory instruction ($p < .05$). Although affective auditory stimuli influenced decision-making, this effect did not significantly differ between instruction conditions ($p > .05$). Recognition accuracy was significantly higher under visual instruction across all categories ($p < .05$). These findings suggest that the disruptive effect of emotional valence on cognitive performance is instruction dependent. When attention is directed toward the auditory modality, affective cues exert cross-modal interference on visual memory, whereas visual focus provides relative protection from this interference. These results provide insights into how attentional focus modulates emotional interference and may have implications for instruction-based approaches to supporting attentional control and reducing emotion-driven disruptions in cognition.

Abstract 324

EXPLORING THE PATHWAYS TO PROBLEMATIC SOCIAL MEDIA USE: THE ROLE OF LONELINESS, EMOTION DYSREGULATION AND METACOGNITIONS

Sabu S.*, Pradhan R.K.

Indian Institute of Technology Kharagpur ~ Kharagpur ~ India

Introduction: Problematic social media use (PSMU) is an emerging mental health concern among young adults, often linked to adverse outcomes in emotional well-being and daily functioning. Individuals experiencing loneliness may be more susceptible to engaging in problematic social media behaviors, using these platforms as a coping mechanism to alleviate feelings of isolation and seek social connection.

Purpose: Based on the Interaction of Person-Affect-Cognition-Execution (I-PACE) model of specific internet-use disorders, this study aimed to investigate the underlying mechanisms of PSMU by examining the serial mediating roles of emotion dysregulation and metacognitions in the relationship between loneliness and PSMU.

Method: A cross-sectional design was employed with 768 participants aged 18-29 years (M=21.89, SD=3.17) from various regions in India. Participants completed validated self-report measures assessing PSMU, loneliness, emotion dysregulation and metacognitions related to social media use. Data were analyzed using partial least squares equation modeling in RStudio.

Results: Loneliness was found to predict PSMU significantly. The relationship was partially mediated through a serial pathway involving emotion dysregulation, positive metacognitions about social media use and negative metacognitions about social media use. Specifically, loneliness was associated with greater emotion dysregulation, which was linked to heightened maladaptive metacognitive beliefs about social media. These cognitive processes further increased the likelihood of engaging in problematic use.

Conclusions: The findings highlight a complex interplay of psychosocial, affective and cognitive factors in the development of PSMU. Interventions to reduce PSMU may benefit from addressing emotion regulation deficits and reshaping maladaptive metacognitive beliefs, particularly in lonely young adults.

Abstract 851

SMARTPHONE USAGE AND PHYSICAL ACTIVITY AMONG STUDENTS: MINDFULNESS PERSPECTIVE

Sarkar S.*, Yadav A.

Banaras Hindu University ~ Varanasi ~ India

Mindfulness has been reported in some researches to be influenced by physical activity and
smartphone usage. To further explore the pattern and extent of the relationship between smartphone usage, physical activity and mindfulness among students. The present study employed
112 university students aged 18-25 years. Mindful Attention Awareness Scale (MAAS) was used
to assess trait mindfulness (Brown & Ryan, 2003); Smartphone Use Scale assessed smartphone
usage (SUS; Mukherjee & Dasgupta, 2020) and International Physical Activity Questionnaire –
Short Form (Craig et al., 2003) assessed self-reported physical activity. Correlation analysis was
performed to determine the strength and direction of associations between the variables. Findings
revealed that statistically significant negative correlation existed between smartphone usage and
mindfulness ($r = –0.495$, $p = 0.001$), indicating that higher smartphone usage was linked with lower
mindfulness. However, relationship between smartphone usage and physical activity was found to
be non-significant ($r = –0.131$, $p = 0.324$), suggesting that smartphone usage was not associated
with physical activity levels of the participants. Further, no significant correlation was reported
between mindfulness and physical activity ($r = -0.006$, $p = 0.968$). The current study found an
association between smartphone usage and mindfulness but no significant relationship existed with
physical activity. However, this study was done on a relatively small sample and used only self
reported measures, future researches may include larger sample sets from diverse population and

empirical/qualitative data would provide better insights about smartphone usage, physical activity
and mindfulness.

Abstract 1179

IS THE PROUST PHENOMENON FACT OR FICTION? A META-ANALYSIS OF OLFACTORY STIMULATION IN AUTOBIOGRAPHICAL MEMORY RETRIEVAL

Bobei O.*[1], Cîrneci D.[3], Podina I.[2]

[1]Laboratory of Cognitive Clinical Sciences, Interdisciplinary School of Doctoral Studies, University of Bucharest ~ Bucharest ~ Romania, [2]Laboratory of Cognitive Clinical Sciences, University of Bucharest, Bucharest ~ Bucharest ~ Romania, [3]Faculty of Psychology and Education Sciences, Spiru Haret University ~ Bucharest ~ Romania

Objectives: This is the first meta-analysis investigating the relative efficacy of olfactory stimulation on the quality of evoked memories compared to other modalities of sensory stimulation in order to test the veracity of the Proust phenomenon. Method: Twenty experimental/quasi-experimental studies were included in this meta-analysis. Olfactory stimulation was compared with a variety of stimulation modalities and four key characteristics of evoked memories (specificity, vividness, emotionality and evocativeness) were assessed in these analyses. Results: Olfactory stimulation had a greater effect on emotionality g = 0.18 and evocativeness g = 0.18 of retrieved memories compared to other stimulation modalities. These differences tended to decrease with year of publication for both emotionality and evocativeness. Subgroup analyses showed larger effects of olfactory stimulation in contrast to verbal or label-based stimulation than to auditory or visual stimulation, but these effects varied depending on the outcome analyzed. Conclusions: Although olfactory stimulation has a significantly greater effect on two characteristics of autobiographical memories analyzed, these results did not fully confirm the Proust phenomenon. Future research is needed to further clarify the conditions under which olfactory stimulation has a more pronounced effect on evoked memories relative to other stimulation modalities.

Abstract 396

PERSONALISED, GAMIFIED WORKING MEMORY TRAINING: MACHINE LEARNING-DRIVEN ADAPTATION FOR COGNITIVE GAINS AND TRANSFER EFFECTS

Styk D.*, Davelaar E.

Birkbeck University of London ~ London ~ United Kingdom

An impact of working memory training (WMT) on cognitive performance is being investigated. There has been substantial research undertaken on the effects of WMT on individuals with learning disabilities, ADHD, neurological disorders, as well as typically developing children and healthy adults. The issue of WMT has received a considerable critical attention as results of multiple studies are still inconsistent, studies based on designs that differ in sample composition, training duration, outcome measures, and training paradigm. However, despite a few recommendations, no 'golden standard' has been proposed yet answering still outstanding questions about particular factors that play a role in successful transfer to everyday life abilities (far transfer). Till this day, no known empirical research has focused on exploring machine learning (ML) models that would create more fitted training environment to test whether individual differences play a role in training outcome. A web application of gamified working memory tasks is being developed using Hidden Markov Model to predict a level of difficulty based on individual's performance. Prediction is that the results of studies of this research will reveal what factors are responsible for successful transfer, and also will shed a light on the importance to upgrade current testing methods, as it seems like field of psychology is long overdue with creating new innovations for behavioural testing.

Abstract 681

FALSE MEMORIES IN THE AGE OF AI: THE (IN)EFFECTIVENESS OF WARNINGS AGAINST HALLUCINATED MISINFORMATION

Weeber M.*

University of Amsterdam ~ Amsterdam ~ Netherlands

As generative AI systems like ChatGPT become increasingly integrated into everyday life, concerns have emerged about their potential to influence human cognition. This study investigated whether AI-generated misinformation (AI hallucinations) can induce false memories and whether explicit warnings about AI hallucinations can reduce this effect. A 2×2 between-subjects experiment was conducted, manipulating chatbot type (honest vs. rogue) and the presence of a warning (present vs. absent). Participants (N = 44) viewed CCTV footage of a robbery and were then interviewed by an AI chatbot. In the rogue condition, the chatbot subtly introduced five fabricated details. Memory accuracy was assessed through a subsequent recall questionnaire. Results demonstrated that participants exposed to the rogue chatbot reported significantly more false memories for the manipulated details than those in the honest condition, confirming the powerful influence of AI as a suggestive agent. However, warnings about AI hallucinations had no significant effect on reducing false memory formation. These findings suggest that current warning designs are insufficient to counteract the persuasive effects of AI-generated misinformation and highlight the need for more robust safeguards in human-AI interaction contexts. As one of the first studies to test AI-generated misinformation in a false memory paradigm, this research highlights urgent implications for eyewitness reliability, digital literacy, and the ethical design of AI systems.

Abstract 984

FAKE PHOTOS PROMPT EYEWITNESSES TO REACTIVATE THE DETAILS OF THE ORIGINAL EVENT IN THEIR BRAINS

Zhu B.*

Beijing Normal University ~ Beijing ~ China

Fake photos can create false memories. However, it has been unclear whether witnesses are able to reactivate their representations of original event details when seeing fake photos. This study investigated which brain regions reactivate neural signals of original event details when witnesses see fake photos. Functional magnetic resonance imaging data were obtained from 33 subjects at the original-event stage and the misinformation stage. Half of the subjects saw version A of the photos at the original-event stage and version B at the misinformation stage. The other half of the subjects saw version B of the photos at the original-event stage and version A at the misinformation stage. One day later, subjects completed recognition tests. To examine neural representations of event details shared across subjects at the original-event stage, we computed the neural pattern similarity between subjects who saw the same version and compared it to those who saw different versions. To investigate neural reactivations of event details, we computed the neural pattern similarity between subjects seeing the fake photo at the misinformation stage and other subjects seeing the original photo at the original-event stage. They were computed separately for subjects presented with the same version and for subjects presented with different versions, and the two were compared. When eyewitnesses first see an event, neural representations of the original event details in the visual cortex are shared between eyewitnesses, regardless of whether the later reported memory is true or false. However, when eyewitnesses are subsequently exposed to fake photos, their parietal cortex reactivates neural signals about the original event details, which may help to counteract image-based misinformation and thus report true memory. This finding has practical significance, as it demonstrates both the positive and negative effects that showing fake photos to witnesses can have on their memory.

DIGITAL FRONTIERS IN APPLIED PSYCHOLOGY: INTERDISCIPLINARY INSIGHTS INTO OPPORTUNITIES AND RISKS OF MERGING AI, IMMERSIVE DEVICES, PSYCHOLOGY UNDER EU REGULATION

Friday 24 July 2026 from 08:00 to 09:30

(N-Lorenese)

Silvia Francesca Maria Pizzoli (Pegaso University ~ Milan ~ Italy), Chair and Presenter
Giulia Vilone (Analog Devices International ~ Limerick), Co-Chair

This symposium explores how emerging digital technologies—spanning artificial intelligence (AI), wearable devices, and immersive tools such as Virtual Reality (VR) devices—are transforming psychology, health, and the promotion of well-being. By bringing together experts in AI research, European Union (EU) law, and applied psychology, the session highlights the promise and challenges of integrating technological innovation into applied psychological practices.

The presentations will address multiple, complementary dimensions. Talks on explainable AI will examine how transparency and interpretability can enhance the responsible use of large language models in psychological research, clinical practice, and mental health interventions. Legal scholars will critically evaluate the implications of EU regulations, including the General Data Protection Regulation (GDPR) and the AI Act, with a particular focus on issues of data protection, informed consent, and accountability in psychological contexts. Other contributions will focus on the role of wearable and immersive technologies for stress management, resilience building, and cognitive enhancement, showcasing their capacity to provide real-time feedback while also considering risks of over-reliance and digital exclusion.

The symposium will also address broader ethical and societal concerns, including the reinforcement of biases and stereotypes, the generation of harmful content, and the importance of safeguarding psychological autonomy in an era of pervasive technology.

The topic is highly relevant to the ICAP congress because it addresses a rapidly evolving intersection between psychology and technology. While the integration of AI, wearables, and VR devices into psychological science and practice is advancing quickly, the evidence base, ethical frameworks, and regulatory standards remain under development. By promoting dialogue across disciplines, this symposium will provide novel insights and stimulate debate on how to leverage these technologies to advance health and well-being while upholding the professional and ethical standards of the field of psychology.

Abstract 3367

FROM SELF-TALK TO SELF-COMPASSION: A VIRTUAL REALITY INTERVENTION TO ENHANCE PSYCHOLOGICAL COPING IN SPORTS INJURY RECOVERY

Amadini Genovese L.*, Pizzoli S.F.M., Riva G.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Sports rehabilitation represents a fertile ground for multidisciplinary mind–body interventions supported by emerging technologies. Injuries challenge athletes not only in terms of physical recovery but also by undermining psychological resilience, often leading to frustration, stress, and identity disruption. Traditionally, self-talk has been used to sustain motivation and adherence to rehabilitation. At the same time, self-compassion has gained recognition as a protective factor that supports acceptance and adaptive coping. In this context, Virtual reality (VR) provides an immersive medium to deliver such interventions in an engaging and embodied way. This project examined the feasibility of integrating VR-based self-talk and self-compassion exercises into the rehabilitation of athletes recovering from musculoskeletal injuries. Insights from a pilot study with athletes undergoing physiotherapy participated in a four-week protocol with weekly VR sessions will be presented. The experiences included guided self-talk protocols, compassionate imagery, and perspective-taking exercises. Pre- and post-intervention assessments measured self-compassion, injury-related distress, self-esteem, resilience, sense of presence, and technology usability. Preliminary findings show high acceptability and engagement, along with positive trends in emotional regulation. These results suggest that VR is not only feasible but may also strengthen motivation and resilience by embedding psychological skills training directly into the recovery process. Future directions will involve the use of psychophysiological sensors (e.g., heart rate variability, skin conductance) and AI-driven adaptive algorithms to provide real-time feedback and tailor VR content to athletes' states and needs. Such integration reframes rehabilitation as a biopsychosocial process, opening pathways for preventive mental skills training beyond injury recovery.

Abstract 3368

TOWARDS RESPONSIBLE USE OF LARGE LANGUAGE MODELS IN PSYCHOLOGY: IMPLICATIONS OF THE EU REGULATORY FRAMEWORK FOR PSYCHOLOGICAL PRACTICE

Antoine C.*

Université de Namur ~ Namur ~ Belgium

Large language models (LLMs) can profoundly modify psychological research and practice by providing powerful tools for text analysis, conversational assessment, and mental health support for clinicians and patients. Their capacity to interpret and respond to natural language prompts opens up opportunities for psychologists to enhance psychological diagnostics and therapeutic interventions. Patients and the broader public can, and are already doing so, turn to AI chatbots for affordable, on-demand mental health support and therapy.

However, these applications raise ethical, methodological, and legal challenges. Within the EU context, compliance with the General Data Protection Regulation (GDPR) and the EU Artificial Intelligence Act (AI Act) presents pressing concerns. Issues of data minimisation, informed and explicit consent (where applicable), and transparency of algorithmic processing intersect directly with the sensitive nature of psychological data. Additionally, a key question under the AI Act is whether certain uses of LLMs in psychology - whether by psychologists or by patients themselves - might fall under the “high-risk” category, which would trigger more stringent requirements around transparency, oversight, and safety.

Beyond these considerations, the very design of LLMs raises further concerns for psychological practice. Their complexity and opacity, combined with probabilistic outputs, undermine reliability and accountability in clinical use. The risks of bias, reinforcement of stereotypes, and generation of harmful content could have a profoundly negative impact on vulnerable populations. We will critically evaluate the compatibility of LLM usage in psychology with European regulatory requirements. Ultimately, the discussion will provide a framework for integrating LLM technologies into psychological science and practice under the evolving European legal landscape.

Abstract 3370

GENERATIVE AI FOR PSYCHOTHERAPY: A PROTOTYPE TOOL FOR AUGMENTING MENTALIZATION-BASED THERAPY AND EXTENDING IT INTO DAILY LIFE

Pizzoli S.F.M.*[1], Vilone G.[2]

[1]Pegaso University ~ Milano ~ Italy, [2]Analog Devices International ~ Limerick ~ Ireland

Background and Aim

Generative AI—and large language models (LLMs) in particular—are opening up new opportunities to extend psychotherapy beyond the consulting room. Their ability to generate context-sensitive, linguistically nuanced responses makes them especially relevant for Mentalization-Based Therapy (MBT), a manualized psychodynamic treatment that strengthens reflective functioning and affect regulation. A central challenge in MBT is sustaining patients' capacity for mentalization outside sessions with the therapist. This work presents Mentora, a prototype tool designed to showcase the feasibility of integrating MBT principles with generative AI to deliver ecological momentary interventions.

Methods and Results

Mentora allows for delivering MBT techniques in a responsive, on-demand fashion through: (1) reflective prompts engineered to promote self–other understanding, (2) feedback on recurrent emotional-linguistic patterns, (3) integration of mood and event journaling into daily routines, and (4) manualized, theory-driven psychoeducational micro-interventions aligned with the MBT theory. The system is configured by therapists, who set treatment objectives and calibrate its functions, while patients regulate scope and intensity. Strong privacy safeguards ensure that patients retain full control over what is shared with therapists. To establish technical adequacy, four LLMs were systematically compared as potential trainers of mentalization. Simulated case scenarios, developed under the supervision of a psychotherapist, illustrate how Mentora can generate reflective material between sessions that later enriches therapeutic work.

Discussion and Conclusions

Mentora demonstrates how generative AI can expand the reach of MBT while preserving the centrality of the therapeutic relationship. By embedding MBT-informed reflection into daily routines, it highlights the potential for scalable, personalised, and ethically grounded augmentation of psychotherapy. Future directions include integrating wearable data (e.g., heart rate variability, sleep quality, stress markers) to enrich ecological momentary interventions and tailor them to patients' mentalizing capacities and well-being.

Abstract 3371

VIRTUAL REALITY-BASED COGNITIVE TRAINING: AN INTERVENTION TO ENHANCE DECISION-MAKING IN YOUNG SOCCER PLAYERS

Gala F.C.R.*, Repetto C.

Università Cattolica del Sacro Cuore ~ Milano ~ Italy

Background and Aim. Success and failure in team sports are often influenced by athletes' decision-making skills, which depend on perceptual abilities and higher-level cognitive functions. Virtual Reality (VR) can recreate real-life sporting scenarios, helping athletes prepare for different situations and train their ability to read the game, process information, and make rapid, accurate decisions. This study investigates the effectiveness of VR training on decision-making accuracy and its far-transfer effects on cognitive functions underlying decision-making.

Methods and Results. Thirty youth soccer players participate in a within-subjects study during the competitive season. They are tested at baseline (T0), after 4 weeks of regular practice (T1), and after 4 weeks of additional VR-based cognitive training (T2). The intervention includes three weekly sessions, each presenting 15 in-game video scenarios via a head-mounted display. At decision points, videos pause, and athletes quickly verbalise their choices before visualising themselves performing the optimal action. A total of 56 videos are recorded from a first-person perspective using a 180° GoPro Max to reduce motion sickness; 20 unique videos are used at each time point to assess decision-making accuracy. Neuropsychological tests evaluating inhibitory control, cognitive flexibility, and processing speed are administered to examine far-transfer effects. At T2, participants complete questionnaires assessing embodiment, sense of presence, and the perceived usefulness and ease of use of the technology.

Discussion. This study assesses whether the training suits participants' expertise and is perceived as beneficial. It provides insights into designing effective VR-based cognitive training with a focus on far-transfer effects on cognition. Future research should examine how these effects translate to on-field performance.

Conclusions. VR-based cognitive training shows potential to simulate realistic game scenarios and enhance the key perceptual and cognitive skills that influence decision-making during matches, thereby affecting the final outcome.

Abstract 201

AN EXPLORATORY STUDY OF PERSONALITY TRAITS, NEED FOR COGNITION, AND AI PERCEPTION

Labriola M.*, Vanhara A., Salapska--Gelleri J.

Florida Gulf Coast University ~ Fort Myers ~ United States of America

The rise of artificial intelligence (AI) has sparked discussions on its psychological impact, particularly in relation to cognition and critical thinking. Increased AI use has been linked to cognitive offloading, potentially reducing critical thinking abilities (Gerlich, 2025). This raises concerns about preserving reflective cognitive processes amid AI's rapid growth.

An individual's need for cognition (NFC)—their enjoyment and desire for thinking—may also influence AI engagement. Those with higher NFC tend to critically evaluate AI outputs more effectively (Buçinca et al., 2021). Additionally, NFC correlates with personality traits: positively with Conscientiousness and Openness to Experience, and negatively with Neuroticism (Sadowski & Cogburn, 1997). However, research exploring connections between NFC, Big Five personality traits, and AI-related attitudes/emotions remains scarce.

This study aims to examine these relationships using an online survey of 250 participants aged 18 and older. Participants will provide demographic information and respond to questions about their AI knowledge, opinions, and emotions. The Need for Cognition Scale (Cacioppo & Petty, 1982) will measure NFC, while the BFI-10 (Rammstedt & John, 2007) will assess personality traits.

Pearson correlations will identify links between NFC, personality traits, and AI-related attitudes and emotions. Additionally, a multiple linear regression will determine how NFC and personality traits predict negative attitudes and emotions toward AI, with these serving as the dependent variable. Findings from this study will help clarify how individual differences shape AI use, including the role of critical thinking tendencies and personality in influencing perceptions and interactions with AI.

Abstract 736

AN INVESTIGATION INTO SEMANTIC INFERENCE AND EXPRESSION RECOGNITION

Kashyap B.*[1], Lipp O.[2]

[1]Griffith University ~ Brisbane ~ Australia, [2]Queensland University of Technology ~ Brisbane ~ Australia

Humans are social beings and express a strong and innate need to form interpersonal relationships with others. Face processing and expression recognition play a crucial and communicative role in this process as expressions contain essential information and assist in conveying a person's emotional state. Positive expressions like happiness are recognised faster than negative expressions like anger or fear, the happy face advantage. Character information alters expression recognition in that a larger happy face advantage is observed for faces paired with positive character information than for those paired with negative character information. The present study investigated the effect of pairing faces with positive, negative, or negative health-related words on expression recognition.The training phase consisted of participants viewing neutral faces paired with positive, negative or negative health-related words. During the expression recognition task, they were asked to indicate whether emotional versions of these faces were happy or angry. The present study comprised of two experiments (N= 61; N= 52) that differed in the negative and positive words used in-order to investigate whether stronger word valence would affect expression recognition. Both experiments demonstrated that pairing with negative, positive, and negative health-related words affected the likability of the faces. Faces paired with positive words were extremely liked, faces paired with negative words were extremely disliked. However, faces paired with negative health-related words were not disliked and almost as liked as the faces paired with positive words. However, expression recognition was not affected by face-word pairings although participants had learned the pairings very well in both experiments. Findings from this study offer novel insights for person perception. The increased likability of faces paired with negative health-related words could be attributed to empathy or compassion. Future research could explore how diseases commonly regarded as stigmatised affect face likability and expression recognition.

Abstract 1779

AGENCY IN DECISION-MAKING AND RESPONSIBILITY

Lin C.*, Sjåstad H.

Norwegian School of Economics (NHH) ~ Bergen ~ Norway

This study re-examines the link between agency and responsibility attribution—specifically, whether higher personal agency in decision-making leads to greater responsibility for outcomes. Agency-based attribution of responsibility underlies legal systems worldwide, from historical precedents such as Nuremberg trials to contemporary cases, with previous studies consistently finding that external constraints reduce both agency and responsibility. However, Malter et al. (2021) reported a striking asymmetry through their series of experiments: observers attribute greater responsibility to individuals who make free choices, while actors themselves experience heavier feelings of culpability when they have low agency. This mismatch between external attribution and internal experience of responsibility is theoretically important but has not yet been closely replicated.

We replicated and extended Malter et al.'s (2021) findings through three key innovations. First, we employed a unified 2×3 between-subjects framework manipulating Perspective (self vs. other) and Agency Level (following orders vs. taking advice vs. autonomous decisions), allowing direct statistical comparison of whether perspective determines the direction of the agency–responsibility relationship. Second, we refined measurement by focusing specifically on responsibility attribution as our central construct while also assessing perceived deservingness of punishment and accountability, providing a more nuanced account of attribution. Third, we introduced advice-taking as an intermediate agency condition to test whether observed patterns generalize across a broader spectrum of agency.

Using Prolific Academic, we recruited 1,600 participants (~267 per cell) to have 90% power to detect effects comparable to the original study's smallest reported effect ($\eta p^2 \approx .011$). Data collection is currently underway, with results available for presentation at ICAP 2026. Together, this replication and extension tests the robustness of the agency–responsibility attribution link across perspectives, measurement approaches, and levels of agency, offering both theoretical clarification and methodological advances.

Abstract 848

THE ANXIOUS MIND: EXAMINING THE RELATIONSHIP BETWEEN SOCIAL ANXIETY AND SOCIAL COGNITION

May Craig S.*, Birch S.

University of British Columbia ~ Vancouver ~ Canada

Background: Social anxiety (SA) is an intense fear of social settings that negatively impacts many aspects of an individual's life, including relationships, employment, and mental health. Research suggests an important link between SA and social cognitive processing (i.e., the ability to reason about others). Unfortunately, research in this area has been exceedingly mixed; arguably because of the different aspects of social cognition and social anxiety measured across studies. To gain clarity into the specific nature of the relationships between SA and social cognition, the current study employed multiple measures of both.

Method: A sample of 78 children (Mage = 8.15, SD = 1.61) and their parents participated online through Zoom and Qualtrics. We conducted 4 hierarchical regressions, examining whether higher levels of SA, assessed through social worry and fear of negative evaluation (FNE), would predict poorer performance in 4 different measures of social cognition, and whether levels of social avoidance would provide additional predictive value.

Results and Discussion: Contrary to our expectations, our overall regression model combining measures of social anxiety (both worry and FNE) and social avoidance did not significantly predict performance on any of our social cognitive variables ($p > .05$). Interestingly, however, FNE was a unique predictor of poor basic mental state understanding ($t(69) = -2.28$, $p = .03$, (Holm-Bonferonni corrected $p = .057$) suggesting that children who present poor mental state understanding would benefit from interventions designed to reduce the fear of negative evaluation. Furthermore, we found surprisingly weak correlations among our measures of social cognition ($r \leqq .30$), suggesting social cognition is a multifaceted construct and future research should avoid relying on any single measure to capture children's social cognitive ability. Implications for future intervention approaches and practical applications will be discussed, including how it applies to children impacted by the pandemic.

Abstract 716

THE BRIGHT SIDE OF DARK LEADERSHIP? HOW SUBORDINATES' PERCEIVED PERFORMANCE PROMOTION MOTIVES SHAPE FORGIVENESS AND CITIZENSHIP BEHAVIOR

Chi S.S.[1], Lai H.[2], Wei S.*[3]

[1]Department of Business Administration, National Taiwan University ~ Taipei ~ Taiwan, [2]Department of Business Administration, National Chung Cheng University ~ Chiayi ~ Taiwan, [3]Graduate Institute of Business Administration, National Taiwan University ~ Taipei ~ Taiwan

Drawing upon literature on social account, ethical leadership, and moral justification, we propose that subordinate attributions of supervisors' performance promotion motives play a mitigating role in the negative relationship of abusive supervision with subordinate forgiveness, resulting in a beneficial effect on organizational citizenship behavior (OCB) (i.e., a decreased drop). We conducted three studies to test our hypotheses. Study 1 used a two-wave survey with 188 military personnel in Taiwan. Respondents filled out scales on leadership styles of direct supervisors, and their attributed motives, forgiveness, and OCB. Study 2 employed a 2X2 scenario-based design (i.e., high vs. low abusiveness with supervisory motives of self-centered vs. subordinate-centered) to preclude effects of supervisors' performance promotion motives from supervisors' self-centeredness. Respondents were 160 undergraduates enrolled in a military university in Taiwan. Results of Study 1 and 2 showed that the difference between path estimates of the indirect effect of abusive supervision on OCB via subordinate forgiveness across high and low levels of subordinate-attributed performance promotion motives, and subordinate-centered and self-centered motives, were both significant ([-.04] – [-.13] =.09 and [-.08] – [-.21] =.13, $p < .05$). In Study 3, we obtained a sample of 159 respondents through mTurk in the U.S., with a design similar to that of Study 1. Although the difference between path estimates of the indirect effect of abusive supervision on OCB via subordinate forgiveness across low and high levels of subordinate-attributed performance promotion motives was again significant ([.11] – [.05] =.06, $p < .05$), abusive supervision was found positively (rather than negatively) associated with forgiveness ($b = .11$, $p < .05$). We discussed possible reasons for such a finding at the end. This study contributes to the literature by highlighting the importance of subordinates' attributions in shaping responses to supervisor misbehavior and the transformative power of forgiveness in organizational settings.

Abstract 1141

NOT ALL COPYING WORKS THE SAME: CONFIDENCE AND ATTENTION REVEAL DISTINCT MECHANISMS OF HUMAN MATE COPYING UNDER INDIVIDUAL INFORMATION

Xie J.*, Qi Q., Huang J., Zhang K.

Qingdao University ~ Qingdao ~ China

Mate copying refers to the tendency to adjust one's preferences of potential mates based on others' choices. While the mate copying effect has been shown to be attenuated by individual information, it remains unclear if its influence varies between acceptance and rejection social cues, and what mechanisms underlie these effects. Across two behavioral and eye-tracking studies, female participants first rated the depicted males as potential romantic partners and reported their confidence. They then re-rated them after observing same-sex models' acceptance, rejection, or undecided attitudes, with individual information manipulated as present or absent. Results showed that ratings increased following observed acceptance and decreased after observed rejection, both with stronger effects when individual information was absent. Confidence analyses revealed that, under rejection, absent information reduced confidence, which in turn partly accounted for the increase in copying; in contrast, acceptance copying was not mediated by confidence. Eye-tracking further showed that acceptance cues enhanced visual attention to the photographs and predicted stronger copying, whereas rejection cues did not reliably alter gaze distribution. These findings suggest that, although individual information modulated acceptance and rejection in behaviorally similar ways, confidence and attention revealed distinct mechanisms, providing novel insights into the cognitive foundations of individual and social influence in mate choice.

Abstract 1809

INVESTIGATING THE CREATIVE ABILITIES OF SPATIAL INTELLIGENCE AMONG OMANIS THROUGH TWO CASE STUDIES: USING STARS FOR IRRIGATION AND ALLOCATING WATER SHARES IN THE FALAJ IRRIGATION SYSTEM.

Alkiyumi M.*

Sohar University ~ Sohar ~ Oman

The location and arid climate of the Sultanate of Oman necessitated that its inhabitants utilize their physical and intellectual abilities to the fullest in order to avail the most of its limited natural resources. This study aimed to investigate the creative abilities of the Omani people in two areas related to the management of scarce water resources: firstly, the use of celestial bodies (stars and their positions in the sky) to time irrigation at night; and secondly the equitable distribution of water from traditional irrigation systems (falaj canals) based on precise quotas determined by geographical and environmental factors. These two practices are creative and unique to Oman, reflecting the remarkable spatial intelligence of its people. The researcher gathered data by studying 12 falaj systems and their water distribution methods, interviewing farmers and falaj managers who still rely on star positions for nighttime irrigation, and analyzing numerous relevant documents and recent studies. The study identified several novel spatial abilities not previously documented in the literature on spatial intelligence, including: spatio-temporal measurement, spatial insight, morphological analysis of the shapes, and arithmetic estimation. Each of these abilities encompass several sub-skills.

INTEGRATING SELF, OTHERS, AND SPACE: NEURAL MECHANISMS OF OWNERSHIP IN PERIPERSONAL SPACE AND THEIR APPLICATIONS

Lenglart L.[1], Sampaio A.[2], Coello Y.*[3]

[1]Lucie Lenglart ~ Lille ~ France, [2]University of Minho ~ Braga ~ Portugal, [3]University of Lille ~ Lille ~ France

We interact daily with objects in our peripersonal space (PPS), a region that serves as a motor interface between the body and the environment. Beyond their spatial location, objects may or may not belong to us, potentially leading to a conflict between ownership-related processing and sensorimotor representations. Understanding how the brain resolves this conflict is not only of theoretical interest, but is also relevant to the design of environments that assess the relationship to objects in different contexts. To examine the processes and neural mechanisms involved, participants performed a reachability judgment task on self- and other-owned virtual objects while undergoing functional magnetic resonance imaging (fMRI). Replicating previous findings at the behavioural level, the contrast between objects located in PPS and those in extrapersonal space (EPS)—independent of ownership—revealed bilateral activations in the superior and inferior parietal lobules (SPL, IPL), extending into the supramarginal gyrus and the right cuneus. Further analyses showed distinct activation patterns for self- versus other-owned objects in the PPS: Self-owned objects elicited stronger activations in right-lateralized parietal regions, particularly the IPL and SPL, whereas other-owned objects engaged a smaller cluster in the right parietal cortex and the pre-supplementary motor area (pre-SMA). Multivariate classification analyses further revealed that activity in the ventromedial prefrontal cortex (vmPFC) selectively discriminated self-owned objects in PPS, while the dorsomedial prefrontal cortex (dmPFC) discriminated self-owned objects in both PPS and EPS. Together, these results provide new insights into how the brain integrates sensorimotor and ownership-related signals for goal-directed action, and highlight potential applications ranging from virtual environment development to ergonomic design and clinical interventions.

Abstract 2484

VISUAL AND NARRATIVE SELF-PRESENTATION ON TINDER: A HYBRID CODING FRAMEWORK FOR SOCIO-AFFECTIVE IMPRESSION MANAGEMENT

Garcia--Meraz M.*

Melissa Garcia Meraz ~ Ciudad de Mexico ~ Mexico

Introducion:
Digital dating platforms like Tinder serve as advantageous spaces for impression management, integrating visual cues and textual narratives in self-presentation.Although prior research has investigated motivations and gender disparities, there is a paucity of studies providing systematic frameworks to classify how individuals formulate desire, affect, humor, and status through multimodal self-presentation.
Objective: This study sought to create and validate a coding system for the analysis of narrative and visual self-presentation strategies on Tinder profiles, incorporating theoretical frameworks from Goffman's dramaturgical model, Mead's concept of the social self, and recent empirical research (Ward, 2017; Dunlop, 2018; Jalagat & Yapo, 2021; Lokanan, 2023).

Method: we used a mixed-methods approach.In the qualitative phase, 200 Tinder profiles (text + image) were classified into five theoretically based categories: Seductive, Flirtatious, Humorous, Formal, and Segregating. Every category had operational definitions, language and visual cues, and rules for making decisions in order. In the quantitative phase, factorial stimuli (5 × 2 = 10 conditions: facial expression × socioeconomic status) were developed and validated using eye-tracking and perception tasks with university participants. Reliability analyses (Krippendorff's α) and descriptive statistics guarantee internal consistency.

Results: Initial findings reveal substantial coder agreement (α = 0.86) and unique perceptual patterns among categories. Seductive and flirtatious profiles drew more attention to the eyes and mouth, while formal and funny profiles made people read the text for longer. Segregating profiles led to extreme moral judgments and a lower sense of authenticity.

Conclusions: The suggested framework connects qualitative discourse analysis with experimental assessments of social perception, providing a replicable model for examining moral and aesthetic judgments of self-presentation in digital dating. The findings underscore the influence of impression management strategies on attention,

affect, and desirability in online romantic interactions.

Abstract 2388

OWNING MISTAKES, INSPIRING OTHERS: ETHICAL LEADERSHIP AS A PATHWAY FROM LEADER TO FOLLOWER ERROR SHARING

Chaiamarit N.[1], Ito A.*[1], Cuconato G.[2]

[1]Xi'an Jiaotong-Liverpool University ~ Suzhou ~ China, [2]Case Western Reserve University ~ Cleveland ~ United States of America

In today's complex and fast-paced work environments, open communication about errors is increasingly recognized as vital to learning, ethical leadership, and team effectiveness. While prior field research suggests that leaders who disclose their own errors may encourage followers to reciprocate with similar openness, the causal psychological mechanisms behind this process remain unclear. In addition, the construct of leader error sharing is often broadly defined. In this study, we adopt a focused definition: leader error sharing refers to the extent to which leaders openly acknowledge and discuss their own errors within the team.

Building on social learning theory, we argue that followers observe and internalize behavioral norms modeled by their leaders, especially when leaders take the initiative to openly and transparently communicate their past errors. Drawing on previous research, we focus specifically on leader error sharing involving high-severity, low-visibility errors, which are highlighted as especially meaningful in shaping leader-follower trust.

Across a vignette-based experimental study, we explore followers' understanding of leader error sharing and examine how it influences followers' willingness to disclose their own errors to the leader. Specifically, we examine whether this relationship is mediated by followers' perceptions of the leader's ethical conduct. Sample participants are recruited from Prolific Academic (N=200).

This research addresses a key gap, moving beyond correlational studies to experimentally test the causal impact of leader error sharing and its specific dimensions. Data collection is ongoing; results will be available prior to the conference. Findings contribute theoretically to social psychology at work, specifically focusing on leadership relationships; and practically with insights into how leaders can foster decent work conditions for employees, promoting inclusive cultures of learning and trust through intentional self-disclosure.

Abstract 4600

WHO WE THINK THEY ARE: HOW PRIOR GROUP INFORMATION SHAPES ATTITUDES, ATTENTION AND LEARNING IN INTERPROFESSIONAL EDUCATION

Mousapour Z.*[1], Gee P.[1], Charlesford J.[1], Schenke K.[2], Rae P.[1]

[1]University of Plymouth ~ Plymouth ~ United Kingdom, [2]University of Gloucestershire ~ Gloucestershire ~ United Kingdom

Background
Interprofessional Education (IPE) research has traditionally been grounded in Contact Hypothesis theory (Allport, 1954), with emphasis on improving intergroup attitudes and teamwork. However, less attention has been given to the cognitive mechanisms through which contact influences attention and learning. Drawing on predictive coding accounts, the Integrating Neuroscience and Social Psychology in Researching Interprofessional Education (INSPIRE) Framework (Schenke et al., under review) proposes that prior (implicit) predictions about content, context, individuals, and professional groups shape what learners attend to, how information is interpreted, and what is retained during IPE sessions.
Aim:
To examine whether prior group-based information influences attitudes, attention, and learning during a simulated Interprofessional education session.

Methods:
Psychology undergraduates participated in a dementia-care interprofessional education simulation in which expertise information about professional groups was experimentally manipulated. Visual attention was measured using eye-tracking, attitudes via validated questionnaires, and learning via multiple-choice recall tests.

Results:
In Study 1 (n = 48), attitudes were more positive, and more attention was paid to information purportedly from students with expertise in the topic compared to those without and improved intergroup attitudes, though no significant effect on recall was observed. In Study 2 (n = 74), attitudes were, again, more positive towards ‘expert’ students, additionally more information was recalled from these students than those without expertise in the topic.

Conclusions:
These findings provide the first empirical support for the INSPIRE framework, demonstrating that prior information relating the expertise influenced attention, attitudes and recall. These findings suggest that shaping learners’ expectations before

interprofessional contact may be a practical lever for improving both attitudinal and learning outcomes.

Keywords: Interprofessional education; prior group information; attention; recall; intergroup attitudes

RIGHT INFERIOR FRONTAL GYRUS GRAY MATTER DENSITY MEDIATES THE EFFECT OF TOLERANCE OF AMBIGUITY ON SCIENTIFIC PROBLEM FINDING

Shi J.*[1], Tong D.[2], Liu H.[1], Gu X.[3], Zhang R.[2], Lu P.[2], Zhang Q.[4], Qiu J.[4]

[1]Collaborative Innovation Center of Assessment for Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]School of Psychology, Northwest Normal University ~ Lanzhou ~ China, [3]Center for Educational Science and Technology, Institute of Advanced Studies in Humanities and Social Sciences, Beijing Normal University ~ Zhuhai ~ China, [4]chool of Psychology, Southwest University ~ Chongqing ~ China

Problem finding (PF) is a crucial element of creative thinking. PF facility allows us to manage the rapidly changing world. Tolerance of ambiguity (AT) is a personality variable that plays a vital role in creative thinking. However, few studies have explored PF's brain mechanisms and their relationship with AT. This study aimed to filled this gap using behavioral and voxel-based morphometry (VBM) methods. The behavioral results revealed a significant positive correlation between AT and PF. The VBM analysis found that novel PF positively correlated with the cluster's regional gray matter density (GMD) involving the left dorsolateral prefrontal cortex (DLPFC) and precentral cortex. Additionally, novel and appropriate PF was positively correlated with the GMD of the right inferior frontal gyrus (IFG) and regional white matter density (WMD) of the bilateral thalamus. Further mediation analysis revealed that the rGMD of the right IFG mediated the relation between AT and PF, which showed that the right IFG is associated with inhibitory control and novelty-seeking. Individuals with high AT and regional GMD in right IFG had a greater novel and appropriate PF ability. These findings shed light on the correlation between AT and PF from the brain's structural basis perspective.

Abstract 1417

USE OF VIRTUAL REALITY IN INTERVENTION WITH SCHEMA MODES IN SCHEMA THERAPY

Mansano F., Szupszynski K.*, Oliveira M.

Pontifícia Universidade Católica do Rio Grande do Sul ~ Porto Alegre ~ Brazil

Abstract: Schema Therapy, as an integrative and innovative approach, aims to treat patients with personality disorders, recurrent symptoms, and those considered difficult to treat. Experiential techniques are a major differentiator in this approach, and through the technique of mental imagery, it is possible to characterize Schema Modes. However, some patients who are resistant to the use of mental imagery and have little creative repertoire may have their treatment limited. Thus, the use of technologies such as virtual reality, with its visual and realistic resources, can contribute to and facilitate the self-compassion training suggested in working with the Healthy Adult Mode. Objectives: The objective of this study is to propose the use of a digital tool for working with Schema Modes to evaluate possible facilitation in training practices of expressing and receiving compassion through Virtual Reality. Method: Participants create a personalized avatar that resembles themselves using artificial intelligence software and view it through a virtual reality application. This makes it possible to combine physical characteristics and facial expressions with the Healthy Adult Mode. Results: The research is ongoing. Results from similar studies indicate a significant influence of virtual reality or metaverse-based interventions on the effectiveness of mental health treatment, as well as promoting changes in levels of self-compassion. Discussion: The trend toward using technology for psychotherapy interventions, both online and in person, is a global phenomenon. There is a need to validate its use through scientific research, the results of which are based on scientific evidence and an ethical approach to these procedures. This premise underpins this doctoral thesis, which aims to make an innovative contribution to Evidence-Based Psychotherapy and the application of Schema Therapy.

Abstract 1120

A MULTI-STRATEGY APPROACH TO TACKLING THE MENTAL HEALTH CRISIS

Birch S.*, Kataria A., Rho K., Craig S.M., Zaini P., Torjani D., Flores J., Yau H., Yalcin I., Widjojo I., Nielsen A.

The University of British Columbia ~ Vancouver ~ Canada

Background and Hypothesis: The world is facing a mental health crisis. One in eight people worldwide struggle with their psychological health. With such diverse mental health challenges, the solution needs to be equally diverse. In this talk I present my grant-funded research program examining the efficacy of a novel interactive education program integrating diverse insights from across the psychological sciences to foster well-being. A wealth of evidence shows that biases in how we think, called cognitive biases, profoundly impact our well-being. Still, existing intervention approaches primarily focus on only one debiasing approach, or one facet of well-being. In contrast, my lab adopted, and tested, a multi-faceted approach that combines several well-established debiasing techniques into an easy-to-use online education program. Our driving hypothesis is that integrating multiple evidence-based techniques into an engaging and accessible online program will offer the best results for optimizing social-emotional health.

Methods and Discussion. Pre- & Post-test Battery: Our experiments begin and end with a multi-faceted assessment consisting of well-validated measures of different facets of social emotional health (e.g., anxiety, depression, loneliness, stress, and quality of life indices) as well as measures of cognitive biases. Participants then complete a series of online interactive lessons that distill cognitive science research into short, engaging summaries of evidence-based strategies for minimizing these biases and enhancing well-being. These lessons are grounded in high-quality peer-reviewed research showing effective pedagogical approaches, including interactive learning, self-relevant content, practical examples, and formative feedback. These lessons are accessible to a broad audience and ‘gamified’ (e.g., incorporating visuals, interactive exercises) to enhance engagement and retention. I will review key findings highlighting the efficacy of this work and its many practical applications. I also hope to inspire new practical applications and collaborations and solicit feedback for expanding this initiative globally to improve well-being.

Abstract 731

MENTAL SIMULATION OF POSITIVE FEEDBACK IN EVERYDAY SOCIAL CONTEXTS ENHANCES SELF-BELIEFS

Hu X.*, García--Arch J., Zhang S., Korn C.

Section Social Neuroscience, Department of General Psychiatry, Center for Psychosocial Medicine, Heidelberg University ~ Heidelberg ~ Germany

Self-beliefs are systematically influenced by external social evaluations and often exhibit a positivity bias, preferentially integrating desirable over undesirable feedback. It remains unclear, whether actively generated social feedback through contextualized mental simulation produces a similar effect. Understanding this aspect of motivated cognition is critical, as such insights can inform safe, accessible simulation-based interventions to rehearse social interactions and enhance self-image.

Here, 36 participants first rated themselves on 40 personality traits and then engaged in guided mental simulation, imagining receiving desirable or undesirable feedback from relevant others across everyday social contexts (work, family, friends, strangers). They subsequently indicated the value of the freely simulated feedback and its realism before re-rating the traits.

Linear mixed-effects models showed that participants actively generated larger simulation gaps (i.e., the difference between initial self-ratings and indicated feedback) for desirable feedback than for undesirable feedback, suggesting a motivated inclination to simulate stronger positive evaluations. In turn, simulating desirable feedback elicited greater self-belief updating (i.e., the difference between post- and pre-ratings) than undesirable feedback. Notably, the simulation gap for desirable feedback positively predicted updating, whereas the undesirable one did not, reflecting a robust positivity bias. Moreover, participants rated desirable feedback as more realistic than undesirable feedback. Surprisingly, increasing simulation gaps reduced realism only for desirable feedback, underscoring subjective realism as a key factor in belief revision.

These findings demonstrate that contextualized mental simulation can enhance self-image, advancing the cognitive and motivational mechanisms of self-belief updating. To strengthen these conclusions, a preregistered replication with a larger sample is currently underway. This research highlights the practical benefits of simulation-based interventions, which can be performed individually and avoid the potential risks or negative effects of real social interactions, making them promising tools in clinical, educational, and performance-enhancement domains.

Abstract 689

THE HIDDEN CONFLICT BETWEEN IMPULSE AND CONTROL IN CONSUMER DECISIONS: EXAMINING ONLINE CONSUMPTION BEHAVIOR THROUGH BEHAVIORAL AND EEG EVIDENCE

Lo H.*[1], Hsueh J.J.[2]

[1]National Chung Hsing University ~ Taichung City ~ Taiwan, [2]I-Shou University ~ Kaohsiung City ~ Taiwan

Background. This study examines how live stream shopping stimuli—such as streamer appearance, product preferences, scarcity cues, and gamification—shape purchasing behavior and post-purchase regret. It also explores the roles of cue reactivity, craving, and impulsive buying tendencies in influencing consumer decisions and emotions. Method. Two behavioral experiments and one electroencephalogram (EEG) experiment were conducted. The behavioral studies captured conscious purchasing choices, while EEG measured neural responses, providing insights into the cognitive and emotional mechanisms underlying live stream shopping behavior. Results. Consumers with strong product preferences were more likely to purchase when the streamer's appearance was less prominent, suggesting product-centric presentations are more effective. Cue reactivity and craving predicted regret for high-preference products, whereas emotional responses had less impact on low-preference items. Time scarcity produced a U-shaped effect, with both high and low time pressure increasing purchase intentions, while moderate pressure reduced engagement. Cue-triggered pleasure did not reduce regret, aligning with research on compulsive buying. EEG results showed greater alpha wave fluctuations in the control group than in compulsive and impulsive buyers, indicating stronger internal conflict between desire and self-control. Conclusions and Impact. These findings highlight the complex interaction of product preferences, streamer characteristics, and psychological factors in live stream shopping. Visual cues and scarcity significantly influence purchasing decisions, while impulsive buyers exhibit distinct neural patterns that reveal the emotional conflicts underlying post-purchase regret. This research advances understanding of the neural and psychological drivers of consumer behavior in live stream shopping. By clarifying craving triggers and cognitive conflicts, it provides a foundation for marketing strategies that enhance consumer engagement while reducing post-purchase regret.

Abstract 727

WHY BLACK FACE MASKS ARE LESS PREFERRED IN EAST ASIA: THE MEDIATING ROLE OF CANONICAL MASK COLOR

Miyazaki Y.*[1], Tsurumi S.[2], Park K.[3], Yang J.[1], Ito M.[1]

[1]Chukyo University ~ Nagoya ~ Japan, [2]Hokkaido University ~ Sapporo ~ Japan, [3]Tokyo Metropolitan University ~ Hachiouji ~ Japan

Previous studies have shown that in Japan, individuals wearing black masks are perceived more negatively than those wearing white masks, whereas in Western contexts, black masks are sometimes preferred. However, previous studies differed in stimulus presentation: some presented masks worn by models, while others presented masks alone, leaving it unclear whether impressions of black masks are culturally dependent. The current research presented only the masks and asked participants from Japan, the UK, the US, China, and South Korea to directly evaluate the impressions of the masks themselves. Two web-based experiments were conducted. In Study 1, participants from Japan, the UK, and the US evaluated white, gray, and black masks. A separate group evaluated socks in the same colors to test whether the effect was specific to masks. In Study 2, participants from Japan, China, and South Korea completed the same task. Impressions were measured with items such as willingness to wear and likability, together with a rating of the typicality of each mask color ("How different is this mask's color from the usual mask color?"). Results showed that in East Asian countries, black masks were consistently rated less favorably than white masks, whereas in the UK and the US no such negative impressions were observed. Mediation analyses demonstrated that this cultural difference was explained by recognition of canonical mask color: in East Asia, where white is strongly associated with masks, black masks were judged as non-standard and therefore evaluated more negatively. Importantly, the same pattern did not appear in evaluations of socks in the same colors, suggesting that the effect is specific to the object "mask." Overall, the findings can be interpreted in two ways: as a perceptual deviation from the canonical association of "mask equals white," or as a social deviation from the norm that "white masks are desirable."

Abstract 782

WHERE YOU LOOK MATTERS: SPATIAL PUPIL PATTERNS DISTINGUISH VISUAL PREFERENCES

Shigemune Y.*[2], Midorikawa A.[1]

[1]Chuo University ~ Hachioji ~ Japan, [2]Yamaguchi University ~ Yamaguchi ~ Japan

While eye-tracking simultaneously captures both pupil diameter and gaze position information, traditional research has primarily analyzed these measures separately. This study aims to integrate pupil diameter with spatial gaze information to develop a novel approach for examining preference-related pupil responses during evaluation of daily objects. Participants (N=41) viewed daily object images and rated their preference on a 1-7 scale during eye-tracking recording. Images were presented until button press, followed by a 3-second inter-trial fixation. Trials were divided into low preference (1-4) and high preference (5-7) conditions. We calculated overall mean pupil diameter and created pixel-by-pixel maps of mean pupil diameter for each condition during image viewing. While pupil responses involve physiological delays, defining definite delay times is difficult; therefore, we focused on pupil responses during sustained viewing periods until button press without lag correction. This approach is justified because participants evaluated preference by viewing the image and pressed the button, ensuring active processing is reflected in the image area of the map. We computed two-dimensional kurtosis and skewness measures centered on gaze peaks, and conducted Threshold-Free Cluster Enhancement (TFCE) analysis to identify clusters of differential pupil responses. Paired t-tests compared pupil diameter measures between preference conditions. Overall mean pupil diameter and 2D skewness showed no significant differences. However, 2D kurtosis measures demonstrated significantly higher values for high-preference versus low-preference conditions. Conversely, TFCE analysis identified clusters where low-preference conditions elicited greater pupil responses. These results suggest that while overall pupil diameter is larger in low-preference conditions, pupil dilation is spatially more concentrated around attention focus points in high-preference conditions. This spatial approach opens new methodological possibilities for understanding visual preference and other cognitive mechanisms, potentially revealing integrated localized attentional and emotional responses that separate analysis of pupil diameter and gaze position might miss.

Abstract 490

EMOTION THRESHOLDS: A PSYCHOPHYSICAL APPROACH TO AFFECTIVE TOLERANCE

Rodrigues Arruda Pinto V.[1], Correa Vione K.[2], Gomes Lopes M.P.[1], Geraldo De Azevedo T.[1], Mendonça De Souza L.[1], Vieira Passos J.G.[1], Alvarenga M.*[1]

[1]Federal University of São João del-Rei ~ São João del-Rei ~ Brazil, [2]University of Birmingham ~ Birmingham ~ United Kingdom

Can affective overload be anticipated and prevented? This presentation introduces the Emotion Thresholds Methodology (ETM) for assessing affective tolerance—defined as the point at which a stimulus exceeds an individual's emotional capacity to sustain positive valence or regulated arousal. The model is based on three distinct thresholds: the Unpleasantness Threshold (UT), where valence turns negative; the Arousal Threshold (AT), where stimulation surpasses optimal activation; and the Compromised Pleasure Threshold (CPT), where both dimensions fail to maintain a pleasurable experience. These thresholds do not measure discrete emotions but serve as indirect indicators of affective compromise, identifying when a stimulus becomes emotionally taxing, aversive, or disengaging. Originally developed in sensory science, the model holds strong potential for broader application. In clinical contexts, thresholds can support the monitoring of affective responses in individuals with eating disorders, sensory sensitivities, or emotional dysregulation. In educational and occupational settings, they may inform emotionally sustainable environments. In public health and policy, they provide novel criteria to support psychoeducational strategies that align with emotional well-being. These thresholds are not intended to measure affective tolerance per se, but to enable a better assessment of the personal attitude that shapes one's response to emotional impulses. Although initial studies demonstrate sensitivity in detecting valence shifts (UT, CPT), operationalizing arousal thresholds (AT) remains methodologically challenging—particularly with simplified affective scales or low-arousal stimuli. By identifying the points at which emotional responses become concerning, the model offers a promising tool for shaping environments, guiding adaptive interventions, and promoting emotional agency. The methodology bridges psychophysics and affective science in ways that advance applied psychological research and reinforce its societal relevance.

Abstract 337

INDIGEOUS PSYCHOLOGY: TRADITIONAL HEALING SYSTEM IN NEPAL

Subba U.K.*

Association of Psycholgists in Nepal ~ Kathmandu ~ Nepal

Explore the foundations of indigenous psychology (IP), with a focus on traditional healing practices in Nepal. This lesson highlights how IP is deeply connected to cultural traditions, spirituality, and holistic well-being.In the context of Nepali culture, the expression “traditional healing” may include several
methods that are applied by experts to cure the patients. They may include: (a)
janne/dhami/jhankri, traditional tantric shamanic healers; (b) vaidya/jyotishi/ayurvedic
astrologist; (c) local priest-experts; (d) simple users of herbs and powders.
It emphasizes that socio-cultural context and history is
the source of knowledge and attempts to find and explain both culture-specific knowledge and
culturally shared knowledge by documenting, organizing, and interpreting the understanding
people have about themselves and their world. It emphasizes the use of natural taxonomies as
units of analysis and examines how individuals and groups interact within their sociocultural
context. This information is then used as a tool for discovering psychological invariants.
Indigenous psychology is best suitable to find out native point of view in particular socio-cultural
context and examine how such point of view is constructed.
The majority of Nepal s Indigenous Peoples still rely on forests for their livelihoods and have a
symbiotic relationship with the forest and natural resources, sustainable forest and biodiversity
management is critical for preserving their distinct identity and customary practices, as well as
their ability to pass them down to future generations.
It is the cultural system of shared ideas, concepts, rules and meanings that underlie and are
expressed in the ways that humans live. It is learnt, transmissive, continuous, cumulative,
dynamic and adaptive. Traditional health care system is also part of the cultural system because
it has a cultural origin and cultural meaning acceptable and meaningful for that

particular cultural
group.

Abstract 491

LOST IN AMBIGUITY: WHERE LARGE LANGUAGE MODELS DIVERGE FROM HUMAN LEXICO-SEMANTIC RATINGS

Cheng X.[1], Huang X.[1], Chan Y.[2], Tse C.*[1]

[1]The Chinese University of Hong Kong ~ Hong Kong ~ Hong Kong, [2]Lingnan University ~ Hong Kong ~ Hong Kong

Psycholinguistic norming studies traditionally rely on human participants to rate individual words on lexical variables such as valence, arousal, and concreteness. These ratings enable researchers to control or manipulate lexical variables when examining word recognition processes. Given the time-intensive nature of collecting human ratings, recent research has explored whether Large Language Models (LLMs) can approximate human judgments through conversational probing across various languages (Martínez et al., 2025; Trott, 2024). However, our previous work revealed that LLM-generated ratings for Chinese two-character words showed only moderate correlations with human ratings across several lexico-semantic variables (arousal: r = .62; familiarity: r = .53; concreteness: r = .67; imageability: r = .65; Huang et al., under review).

The present study extends this work by examining whether variable ambiguity moderates the relationship between LLM and human ratings. We analyzed valence, arousal, familiarity, concreteness, and imageability ratings for over 25,000 Chinese two-character words (Chan & Tse, 2024) using two LLMs (GPT-4o-Turbo and DeepSeek-R1-FW). Variable ambiguity was operationalized as the standard deviation of ratings across human raters, reflecting individual differences in word interpretation. For instance, “dog” may evoke positive or negative valence depending on personal experience. We hypothesized that higher variable ambiguity would weaken LLM-human correlations, as LLMs may struggle to capture the contextual and individual variability inherent in lexico-semantic ratings.

Our results revealed significant LLM × ambiguity interactions across both LLM platforms. For valence, arousal, concreteness, and imageability, these interactions were negative, indicating that greater ambiguity indeed attenuated LLM-human correlations. In contrast, familiarity showed positive interactions (with the exception of DeepSeek’s familiarity × familiarity ambiguity term). These findings largely support our hypothesis that variable ambiguity compromises LLMs’ ability to predict human lexico-semantic ratings for Chinese two-character words, highlighting an important boundary condition for using LLMs in psycholinguistic research.

Abstract 1059

SEEING BOTH SIDES: PERCEPTUAL REVERSAL SUPPORTS THEORY OF MIND JUDGMENTS ON AMBIGUOUS FIGURES

Tsuji H.*

Osaka Shoin Women's University ~ Osaka ~ Japan

How do people infer others' perceptions when stimuli afford multiple interpretations? We tested whether perceptual reversal (reporting multiple readings of ambiguous figures) supports Theory of Mind (ToM) and reduces self-projection.

Japanese adults (N = 300; aged 20-70) viewed three bistable figures: Young woman/Old lady, Duck/Rabbit, Man/Rat. After a 5-second preview with replay available, participants completed: (a) untimed free-text "everything you saw," (b) initial percept (forced choice), and (c) what third persons (aged 3/20/75) would perceive (side-1/side-2/cannot determine). Reversal was coded when both interpretations appeared in free text. ToM accuracy, following Carpendale & Chandler (1996), required selecting "cannot determine" as correct. Self-projection was coded when incorrect responses matched own initial percepts.

Binomial GEE models (clustered by participant) included Figure × Target Age, Reversal, demographics, and interactions. Despite unlimited viewing time, reversal remained uncommon: Young woman/Old lady (7%), Duck/Rabbit (23%), Man/Rat (13%).

Model 1: Reversal predicted higher ToM accuracy (OR = 1.54, 95% CI [0.98, 2.42]), improving accuracy by 4–11 percentage points (Duck/Rabbit: +7; Man/Rat: +4–5; Young woman/Old lady: +11). Young woman/Old lady exceeded Duck/Rabbit for ToM accuracy (OR = 1.40 [1.10, 1.77]), except when judging 75-year-old targets (interaction OR = 0.67 [0.49, 0.91]). Older participants endorsed indeterminacy less (60s OR = 0.57; 70s OR = 0.52) than younger people.

Model 2: Among incorrect responses, reversal reduced projection (OR = 0.54 [0.37, 0.78]), decreasing projected errors by 7–14 points. Projection increased for Young woman/Old lady with 20-year-old targets (interaction OR = 2.11 [1.07, 4.15]) and with participant age (60s OR = 1.80; 70s OR = 2.18).

Perceptual flexibility supports ToM-appropriate uncertainty and buffers against egocentric biases. Experiencing multiple visual interpretations helps people recognize that others face similar ambiguity, rather than projecting their own percepts. Limitations include a Japanese-only sample and conservative reversal coding.

Abstract 879

COGNITIVE MECHANISMS ASSOCIATED WITH BODY DISSATISFACTION IN YOUNG ADULTS

Wang Y.L.*

Ming Chuan University ~ Taoyuan ~ Taiwan

Introduction: Body dissatisfaction is a growing concern in young adults. However, the underlying cognitive mechanisms associated with body dissatisfaction remain underexplored. The current gap in the literature limits the ability to develop effective mechanism-focused interventions to alleviate body dissatisfaction.

Purpose: The aim of this study was to examine the cognitive processes associated with body dissatisfaction.

Method: A total of 100 young adults between 18-25 years old without current or past diagnosis of schizophrenia or bipolar disorder enrolled in the study. Participants completed a series of questionnaires pertaining to body dissatisfaction, cognitive flexibility (general and those specific to body image flexibility), perfectionism (general and those specific to physical appearance), and interpretation bias.

Results: Body dissatisfaction was significantly and negatively correlated with less positive interpretation bias and less physical appearance flexibility (but not general cognitive flexibility). Body dissatisfaction was also positively and significantly correlated with general perfectionism, but the association was stronger for physical appearance perfectionism.

Conclusions: This is the first study to investigate a range of cognitive mechanisms related to body dissatisfaction. The preliminary findings suggest that individuals with body dissatisfaction demonstrate greater dysfunction in context specific to physical appearance, but not general cognitive inflexibility or maladaptive perfectionism. With ongoing data collected in the second wave, the directionality of different variables will be further discussed.

Abstract 833

WHAT PREDICTS OUTCOME OF COGNITIVE BIAS MODIFICATION FOR INTERPRETATION (CBM-I) IN STUDENTS? AN INVESTIGATION OF COGNITIVE MECHANISMS

Wang Y.L.*[1], Hughes A.[2], Young K.[2], Hirsch C.[2]

[1]Ming Chuan University ~ Taoyuan ~ Taiwan, [2]King's College London ~ London ~ United Kingdom

Introduction: Past research showed that high levels of worry are associated with the tendency to interpret ambiguous information in a negative way. Cognitive bias modification for interpretation (CBM-I) effectively promotes a more positive (benign) interpretation bias, which reduces worry.

Purpose: As for any intervention, individuals differ in the degree of improvement in symptoms following CBM-I. The purpose of the present study was to identify factors that predict change following CBM-I.

Method: A total of worry-prone students (N = 289) between 18-25 years old were enrolled in the study. At baseline, participants completed a battery of tests that assess individual differences in attentional control, cognitive flexibility, responses to positive affect, and imagery ability. Change in interpretation bias and worry were assessed post training and at 1 month and 3 months follow-up. Participants (n = 106) who completed a full dose of CBM-I training were included in the analysis.

Results: The set of predictors accounted for 18-25% of the variance in changes in interpretation bias and worry from pre to post CBM-I training. Specifically, high worriers with lower dampening of positive affect showed significantly greater increase in positive interpretation bias as well as greater reductions in negative thought intrusions (a behavioural worry task) at the end of the intervention, compared to those with greater dampening of positive affect. However, the set of predictors was unsuccessful in explaining change in trait worry in the longer term (1 month and 3 months follow up).

Conclusions: This is the first study to predict change in symptoms following CBM-I training. However, given the cognitive processes that predicted the outcome at the end of CBM-I intervention did not translate to the prediction of longer-term outcome (1 and 3 months follow-up), further research is needed.

META-REASONING IN ADOLESCENTS AND ADULTS

Friday 24 July 2026 from 15:00 to 16:30

(N-Lorenese)

Meta-Reasoning is a relatively new research domain under the metacognitive umbrella, which focuses on the metacognitive processes which accompany reasoning and problem solving. The Meta-reasoning framework provides a basis for developing concrete research questions in several domains, which will be addressed in this symposium. Specifically, meta-reasoning methods advance the understanding of underlying processing during reasoning, such as monitoring processes during uncertainty (Thompson) and uncertainty monitoring of conflict detection (Handley & Kosourikhina). In addition, these methods also extend our understanding of metacognitive monitoring in applied domains, including medical diagnosis (Ackerman), anticipatory thinking in career decision-making (Ginevra, Rinaldi & Santilli) and examining metacognitive regulation in ADHD (Torres, Ackerman & Toplak).

Abstract 3515

THE RELUCTANT THINKER

Thompson V.*

University of Saskatchewan ~ Saskatoon ~ Canada

All other things being equal, what makes us pause and reflect on some choices but not others? Once reflection has been engaged, how do we decide that we have given the current matter sufficient thought? In this talk, I will use a metacognitive lens to shed light on these issues. Like other models of metacognition (e.g., Nelson & Narens, 1991), the Meta-Reasoning framework (Ackerman & Thompson, 2017) proposes that reasoning, decision-making, and problem-solving behaviours can be understood at both the meta- and the object-level. Processes at the "meta" level are proposed to monitor the quality of our thinking and to trigger control processes as needed. The monitoring processes that I will discuss consist of noetic feelings of certainty or uncertainty, which are measured by asking participants how they feel about a decision they are about to make, are in the process of making, or have made. Monitoring processes inform control processes, which include continuing to think about a problem, changing one's answer, giving up, changing strategies, amongst other behaviours. Perhaps not surprisingly, the data show that it is difficult for people to engage in analytic processes; counter-intuitively, however, the data also show that they are often reluctant to give up when it is appropriate to do so.

Abstract 3516

MEDICAL DIAGNOSIS AS A REASONING AND META-REASONING CHALLENGE

Ackerman R.*

Technion - Israel Institute of Technology ~ Haifa ~ Israel

Metacognition, the ability to monitor and control one's cognitive processes, is crucial in high-stakes medical diagnoses. In two studies, we examined metacognitive processes in radiological and dermatological decision-making, focusing on how confidence and thinking time influence diagnostic accuracy and efficiency. Medical doctors (N = 150) assessed medical images, bone X-rays and skin images, providing diagnoses, confidence ratings, and recommended next steps (e.g., ordering additional tests, consulting experts). Key measures included diagnostic accuracy, monitoring accuracy (calibration and resolution), and strategic allocation of thinking time. As with mundane lab tasks, medical professionals exhibit well-calibrated confidence in easy cases but compromised success accompanied by pronounced overconfident in the time-consuming cases. Senior professionals not only performed better than juniors, but were more reliable in their confidence ratings, and made better next step decisions. Analyses of the misleading cases were done based on domain specific knowledge. These analyses exposed cases especially susceptible to time wastage and overconfidence across expertise levels. Recognizing when confidence is miscalibrated, is key to reducing errors and improving efficient decision-making. Further research should consider interventions to enhance metacognitive skills in medical practice.

Abstract 3517

UNCERTAINTY MONITORING IN REASONING: APPLYING THE SELF-CONSISTENCY MODEL TO BELIEF-LOGIC CONFLICT

Handley S.*, Kosourikhina V.

Macquarie University ~ Sydney ~ Australia

Dual process accounts of reasoning posit that the interactions between automatic Type 1 processes and reflective Type 2 processes are regulated through the mechanism of conflict detection. Conflict detection is thought to be triggered when two or more incompatible responses to a problem are produced. Conflict detection can be viewed as an aspect of metacognition, as both are concerned with monitoring the outputs from the reasoning process as assessing one's certainty in them. In this paper we apply the self-consistency model and the cue-utlisation approach to metacognition to analyse cues that inform confidence judgements in reasoning, to investigate the potential sources of responses to a given problem. In two experiments (total N = 242), we analysed the relationship between confidence and accuracy on the base-rate task and syllogisms, amongst a group of college students. We found that in both tasks, confidence and accuracy were influenced by many cues, rather than belief-logic conflict exclusively. Belief-logic conflict was a significant cue to confidence in the base-rate task, but not in syllogisms. Items identified as eliciting the most uncertainty, based on the self-consistency model, showed greater conflict detection effects. These findings support the uncertainty monitoring account of conflict detection and link it with broader metacognition research.

Abstract 3518

ANTICIPATORY THINKING IN THE CAREER DECISION MAKING PROCESS: A META-REASONING COMPETENCE FOR ADOLESCENCE

Ginevra M.C.*, Rinaldi B., Santilli S.

University of Padova ~ Padova ~ Italy

According to the Organization for Economic Co-operation and Development, in rapidly changing societies of the 21st century, meta-cognitive and meta-reasoning skills are becoming essential for adolescents, as well as socio-emotional skills (OECD, 2018). One of the most important meta-cognitive skills is anticipatory thinking. Anticipatory thinking can be described as the process of acknowledging and preparing for complex situations. Starting from this point, in this context, characterised by continuous changes, anticipatory thinking represents a crucial competence in the Vocational Guidance field to plan future personal and professional trajectories (Thomaes et al., 2023). In fact, by implementing anticipatory thinking, young people can construct future scenarios that are attentive to environmental and social sustainability, and translate them into present actions (Poli, 2010, 2017; Brassett & O'Reilly, 2021; Light, 2021). Thus, this study aims at examining relations between anticipatory thinking and key career-related constructs: career adaptability, future orientation, and decisiveness regarding professional future. A sample of 227 Italian adolescents (M = 17; SD = 1.09) was involved, and measures of anticipatory thinking, career adaptability, future orientation, and career decidedness were administered. The structural equation model run in M-Plus showed anticipatory thinking predicted career decisiveness, directly, and indirectly, through the mediational role of career adaptability and future orientation. Moreover, career adaptability and future orientation acted as mediators. As regards practical implication, the results carried out emphasize the importance to support anticipatory thinking in adolescence, and a specific example of career interventions to promote anticipatory thinking will be provided.

Abstract 3519

METACOGNITIVE EFFORT REGULATION IN ADHD

Torres A.*, Ackerman R., Toplak M.

York University ~ Toronto ~ Canada

Difficulties engaging mental effort during cognitive tasks are well documented in individuals with ADHD and are reflected in the DSM-5-TR inattention criteria, which note a tendency to avoid or dislike tasks requiring sustained effort. The Diminishing Criterion Model (DCM) is a metacognitive framework of effort regulation that integrates objective performance and subjective confidence ratings to predict time investment. Although validated in neurotypical samples, the model has not been applied to neurodevelopmental populations. The present study applied DCM principles to an adult ADHD group (n = 70), a sub-threshold ADHD group (n = 72), and a control group (n = 71) recruited online through Prolific Academic. Groups were formulated using quota sampling to ensure balance across key demographic variables (e.g., age, gender, and education). Participants completed a 40-item word-analogy task that recorded item-by-item response times and confidence ratings. No group differences were found in overall accuracy, mean confidence, resolution, or calibration. However, control participants invested more time overall than the ADHD group. Effort-regulation analyses based on the DCM revealed distinct time-investment patterns: the ADHD group invested the least amount of time regardless of item difficulty. In contrast, the sub-threshold group resembled controls on easier and intermediate items but invested less time on the most challenging ones. These results expand on the limited research on metacognition in ADHD, which has primarily relied on one-shot measures of monitoring accuracy. The present findings provide preliminary evidence that effort is dynamically allocated differently during tasks in neurodevelopmental populations.

Abstract 1209

HOW VOCAL ALIGNMENT SHAPES INTERPERSONAL IMPRESSIONS DURING CONVERSATION

Kitamura M.*

Tokyo University of Technology ~ Tokyo ~ Japan

Spoken interaction conveys more than words: vocal qualities such as pitch, timbre, and rhythm strongly influence how speakers are perceived in terms of warmth, competence, and trust. Although this has been shown in many laboratory studies, most have relied on short, isolated utterances, leaving open how impressions unfold in extended conversations. In addition, emotional expression has typically depended on the speaker's performance, which makes systematic control difficult.

To address these issues, we employed DAVID (Da Amazing Voice Inflection Device; Aucouturier et al., 2016), a real-time transformation system that allows parametric modulation of prosody. Seventy-eight Japanese university students engaged in scripted dialogues in which their voices, and those of their partners, were gradually shifted toward either happy or sad tones. Each dyad completed one session with convergent prosody (both happy or both sad) and another with divergent prosody (mismatched tones).

After each conversation, participants rated their partners and the interaction, while physiological data were collected, including heart rate, inter-beat interval, and electrodermal responses. Linear mixed-effects analyses showed that divergence, particularly when partners spoke with a positive tone and participants with a negative tone, led to higher trust ratings and greater enjoyment of the dialogue in opposite-gender pairs and was also accompanied by elevated autonomic arousal.

These findings indicate that conversational impressions depend not only on whether prosodies converge or diverge, but also on the emotional valence and relational context of the pair. Importantly, the results suggest practical implications: vocal alignment may play a role in counseling and therapeutic dialogue, support rapport-building in workplace communication, and inform the design of voice-based conferencing systems that aim to promote trust and engagement. Studying prosodic dynamics therefore contributes both to psychological theory and to applied settings where effective communication is essential.

Abstract 1332

SOCIAL COGNITIVE SKILLS PROMOTE SOCIAL-EMOTIONAL HEALTH IN CHILDREN AND ADULTS

Birch S.*, Kataria A., Stewardson C., Rho K., Craig S.M.

University of British Columbia ~ Vancouver ~ Canada

This presentation shares our recent research showing how improving social cognitive skills—like understanding others' thoughts, feelings, and perspectives (also known as social perspective taking abilities)—can boost social-emotional well-being in both children and adults.

In one line of research, we examined how these skills relate to different aspects of children's social-emotional development using a multi-faceted, multi-measure, approach. We studied 768 children (ages 3-12) and found that those better at understanding others had stronger friendships, better communication, more cooperation, and were more likely to help others. Social cognition strongly predicted positive traits like communication and cooperation, and also predicted social-emotional difficulties such as conduct problems and hyperactivity-impulsivity.

In other research, we explored whether strong social cognitive skills could protect children during stressful times—specifically, during the COVID-19 pandemic, when many experienced increased stress and fewer peer interactions. Parents of 120 children completed surveys on their child's social-emotional health, social skills, and social interaction changes. For some children, we had data from both before and after pandemic restrictions. As expected, children with fewer in-person interactions during the pandemic showed more emotional and behavioral difficulties showing the importance of social interaction on wellness. However, those with stronger social cognitive skills were less affected, suggesting these skills protect against stress.

In other research, we investigated whether social cognitive skills protect university students' mental health (e.g., reducing anxiety and depression) and whether teaching strategies to enhance social cognition and reduce cognitive biases can improve their well-being.

Together, our findings highlight the value of fostering social cognition in children and adults to promote emotional resilience and well-being. We highlight practical applications of this work for researchers, clinicians, educators, and policymakers.

Abstract 1231

VICTIMS' APPEALS OF AGENCY AND VULNERABILITY AFFECT PUBLIC SUPPORT FOR VICTIMS

Hashimoto T.*

Toyo University ~ Tokyo ~ Japan

Purpose:
The present study investigated public attitudes toward victims and how they are determined by the types of reactions victims exhibit following the transgression. I hypothesized that public support for a victim would decrease when the victim adopts an "agentic" form of response, such as publicly protesting their situation, compared to when the victim displays vulnerability-emphasizing response, such as by making an appeal of the suffering they experience. Based on the discussion that perceptions of target's agency affects people's decision to give aid (Schroeder, Waytz, Epley, 2017), I examined whether the perception of a victim as agentic or vulnerable influences people's judgments on the need and effectiveness of support for the victim.

Method:
Participants (N = 1019) viewed a vignette describing a person being physically injured by another person. The vignette was followed by one of three victim reactions: (1) the victim publicly condemns the perpetrator and suggests legal action (agentic-appeal condition), (2) the victim expresses emotional distress (vulnerability-appeal condition), or (3) the victim neutrally explains her circumstance (control condition). Participants then responded to measures assessing the perceived necessity and effectiveness of emotional and instrumental support.

Results:
Emotional support was perceived as more necessary and effective for the victim in the vulnerability-appeal condition than in the agentic-appeal or control conditions. Conversely, instrumental support was deemed more necessary and effective for victims in the agentic-appeal condition compared to the other two conditions.

Conclusion:
These findings suggest that the way a victim responds to transgression influences public attitudes—particularly perceived appropriateness of support. These results have important implications for understanding the social psychological dynamics of victim perception and support.

Abstract 1585

CAN PEOPLE EMPATHIZE WITH OBJECTS? : EMOTIONAL RESPONSES TO ANTHROPOMORPHIC PRODUCTS AND THE MEDIATING MECHANISM OF ANIMISTIC THINKING

Ikeuchi H.*

Kansai University ~ Suita ~ Japan

This study examined whether people can feel empathy toward inanimate objects, focusing on anthropomorphic products in the form of animal-shaped foods. We conducted two experiments with Japanese university students (Exp.1:n=50, Exp.2:n=55). In Experiment1, participants viewed images of anthropomorphic foods (e.g., panda buns, koala cookies) and non-anthropomorphic foods (e.g., doughnuts, cream puffs) under intact and damaged conditions. Negative emotional responses (e.g., “I feel sorry for them” “I feel their pain”) were rated on a 6-point scale. Results showed that damaged anthropomorphic foods elicited stronger negative emotions than damaged non-anthropomorphic foods, and emotional responses increased with the severity of damage. In Experiment2, participants again evaluated damaged anthropomorphic and non-anthropomorphic foods, and then completed scales measuring empathy for others (Interpersonal Reactivity Index) and animistic thinking (Animism Scale). Mediation analysis revealed that the relationship between empathy for people and empathy for anthropomorphic products was fully mediated by the animistic tendency of “the anthropomorphication of possessions.” These findings indicate that empathy, typically regarded as an interpersonal capacity, arises not only in human-to-human contexts but also toward inanimate objects when they are anthropomorphized. Moreover, this extension depends on individual differences in animistic thinking. By linking empathy to animistic cognition, our study enriches psychological theories of empathy by demonstrating that empathy toward anthropomorphic products is not simply a spillover from interpersonal empathy, but emerges through specific cognitive mechanisms. The results also provide practical implications for marketing and design, suggesting that anthropomorphic features can enhance consumer attachment but may also provoke aversive reactions when such products appear to “suffer.” Future research should test whether these effects are universal or culturally specific, and whether they extend beyond food to other categories of products.

Abstract 1347

A PERFORMANCE-BASED TASK TO MEASURE HINDSIGHT BIAS IN ACCIDENT PROBABILITY JUDGMENTS

Kitamura Y.*, Onoma N., Fujimichi M.

Railway Technical Research Institute ~ Tokyo ~ Japan

Introduction

Hindsight bias, the tendency to believe that one “knew it all along” once an outcome is revealed, is a pervasive cognitive distortion. It makes events seem more predictable than they actually were, influencing probability judgments, causal reasoning, and responsibility attribution. In accident contexts, such distortions may foster unfair blame. As with other cognitive biases, however, individuals find it difficult to recognize their own hindsight bias.

Purpose

This study aimed to develop a performance-based task to measure individual tendencies toward hindsight bias, and to validate this method using both neuroimaging (fMRI) and confidence ratings.

Method

Participants completed a computer task consisting of two stages. In the first stage, they provided both an accident probability judgment for each image and a confidence rating for that judgment. In the second stage, the same images were re-presented together with an expert’s probability assessment, and participants recalled their own initial probability judgment and confidence rating. Hindsight bias was quantified as the reduction in the difference between participants’ probability judgments and the expert assessments when comparing initial versus recalled values (larger reductions indicating stronger hindsight bias). Brain activity during task performance was measured using fMRI, and confidence ratings were further analyzed to clarify whether the observed shifts reflected hindsight bias rather than anchoring.

Results

Preliminary fMRI analyses suggested activity in the medial prefrontal and orbitofrontal cortices during recall, consistent with hindsight-related processing. These neural tendencies appeared dissociable from anchoring, as confidence ratings showed that shifts toward expert evaluations could not explain the observed bias.

Conclusion

These preliminary findings suggest that the task provides a promising approach for measuring hindsight bias. While further validation is needed, the method shows potential applications in accident investigation and bias-aware safety education. Future work will extend this approach to the development of training programs aimed at

reducing hindsight bias and supporting safer decision-making in occupational and industrial settings.

Abstract 1225

BRAIN HEMODYNAMIC ACTIVATION IN A NEW MOTOR LEARNING MEASURED BY NEAR-INFRARED SPECTROSCOPY.

Kojima H.*, Nakano R.

Kanazawa University ~ Kanazawa ~ Japan

Learning of motor control is crucial not only for sports or music, but also for craft production, vocational training, or rehabilitation of patients. Motor learning has been long studied with mirror drawing in psychology. However, the neuropsychological mechanism of the learning process has not been well understood, yet. To this end, the present study used a mirror drawing task to examine the changes in the performance before and after practicing the task, while the changes in cerebral blood flow (CBF) was monitored during the task with a Near Infrared Spectroscopy (NIRS) to evaluate cortical activation underlying the developmental process.

In the experimental sessions, participants performed a star-shape drawing on a PC tablet. We set two conditions of drawing hand and two conditions on the cursor movement of the pen; moving normally or moving like a mirror in which the pen moves to the opposite to the normal direction on the monitor. The 32 students, all right-handed, participated and allotted in the either of the four conditions. They run the drawing trials thirty times a day for consecutive three days. Although the task was difficult at the beginning, they improved their performance as the training session proceeded. Hemodynamic changes were monitored on the first trial of the first day and the last trials on the second and the third days. Hemodynamic activation was observed significantly large in the first trial; especially, strong bilateral activations were observed with non-dominant hand conditions. However, dominant hand drawings did not induce much activation in either mirror conditions.

The results indicated that NIRS can clearly detect hemodynamic activation in a new motor learning such as with non-dominant hand, and that such a new motor learning task induced activation not only in the contralateral motor area but also in the bilateral, broad cortical areas.

Abstract 1542

EFFECTS OF SELF-ASSOCIATION ON TASK SWITCHING AND INTERFERENCE CONTROL

Kuratomi K.*

Gifu Shotoku Gakuen University ~ Gifu ~ Japan

Making choices for oneself is known to enhance memory and improve motivation. However, little research has examined how self-choice influences cognitive processing, particularly the balance between cognitive stability (the ability to maintain relevant information) and cognitive flexibility (the ability to adapt to changing task demands). This study investigated whether linking a choice to the self would affect task switching and interference control. It was hypothesized that self-association would enhance attention to the selected stimulus, supporting its maintenance while making it more difficult to switch between task rules and regulate interference from features previously relevant or irrelevant.

Participants performed a parity judgment task in which digits were presented on two simultaneously displayed geometric shapes. The task included two block types: in the Perseverance block, the shape serving as the target in the initial phase became a distractor later, whereas in the Distraction block, a distractor shape became the new target. The target shape was determined under two conditions: in the simple-choice condition, participants selected a preferred shape; in the self-association condition, they selected a preferred shape and then underwent a procedure linking the shape to the self.

The results indicated that simply choosing a shape did not significantly affect performance. In contrast, in the self-association condition, response times were consistently slower when task roles changed. This suggests that self-association promoted persistence with the chosen stimulus, facilitating its maintenance but increasing the costs of both task switching and interference control.

These findings indicate that it is not choice itself that alters cognitive processing, but rather the link between the choice and the self. While self-association may increase the costs of switching and interference control, it also suggests that merely making a choice is insufficient and that meaningful effects on cognitive processing emerge only when choices are tied to the self.

Abstract 1536

THE PERSON BEHIND PROMPTS. WHY IS AI USED AND WHAT FACTORS INFLUENCE IT?

Sumlinski L.*, Agata S.

SWPS University ~ Department of Psychology in Wroclaw ~ Poland

Artificial intelligence has become part of everyday life, even though it is still being developed. Integrated into popular interfaces such as search engines, it blurs the line between traditional IT solutions and language models. These changes influence daily practices and make the topic worth investigating.

As a part of doctoral project, AI users were asked to answer the question: why do they use these tools, and what motivates them? Focusing on the human perspective rather than the technology itself allows us to capture factors independent of model development but closely tied to their presence in everyday life.

Structured interviews were conducted, which were transcribed, coded, and analyzed thematically. Participant selection was based on grounded theory and the snowball method. Respondents indicated that AI supports everyday tasks, shortens working time, and facilitates information retrieval. It provides comfort and certainty but can also reduce the sense of agency and self-confidence.

AI also raises ethical concerns, from replacing people at work to questions of intellectual property. At the same time, users value its accessibility and ease of use. They often treat AI as a primary source of information, one that can be verified and corrected. A decline in the need for independent learning was noted, alongside recognition of the necessity to keep up with new technologies.

The study highlights the complexity of users' relationship with AI. It is not seen merely as a tool but as part of decision-making, knowledge acquisition, and life organization. From the user perspective, AI offers not only functionality but also emotional and cognitive comfort, reducing uncertainty and increasing control. Yet, it also fosters ambivalence, simultaneously supporting independence while risking dependence and eroding self-directed learning. Understanding these dynamics is vital for assessing AI's long-term cognitive impact and its environmental footprint, including resource use and sustainability.

Abstract 1562

THE ROLE OF TASK SET INHIBITION IN CUED AND VOLUNTARY TASK SWITCHING

Minafra R.*, Zivi P., Ferlazzo F., Sdoia S.

Dipartimento di Psicologia, Sapienza Università di Roma ~ Roma ~ Italia

Task-set inhibition involves suppressing interference from recently performed tasks. Previous research has demonstrated that returning to a recently abandoned task (e.g. ABA) is more difficult than switching to a less recently abandoned one (e.g. CBA), as indicated by slower reaction times (RTs) and higher error rates. Although this mechanism has been consistently observed in cued task-switching paradigms, it remains unclear whether it impacts the decision-making process in voluntary task selection. The present study investigated whether task-set inhibition operates in both cued and voluntary task-switching paradigms, and how it influences task selection processes. Thirty-six participants performed two task-switching paradigms. In the cued version, participants were required to switch between three tasks (parity, size and distance) according to the presented cue. In the voluntary version, participants decided voluntarily the task to perform among one of these three tasks, avoiding consecutive repetitions. Preliminary results showed an inhibitory effect in both paradigms, with ABA sequences being slower than CBA sequences. In the voluntary switching paradigm, differences between sequences persist independently of task type when considering reaction times (RTs), but not when considering 'choice proportion'. In the cued switching paradigm, results revealed a significant interaction between task type and sequence, suggesting a task-dependent control mechanism. These results suggest that task-set inhibition operates as a general cognitive mechanism. However, the differential patterns observed between cued and voluntary conditions highlight the complex interplay between this mechanism and switching processes. Further research could focus on generalizing findings to different settings and populations, and on understanding the impact of representativeness during the decisional process.

TRANSITION, GENERATIONAL IDENTITY AND THE ORGANISATION OF AUTOBIOGRAPHICAL MEMORIES: A STUDY ON THE BANGLADESH INDEPENDENCE WAR GENERATION

Haque S.*[1], Islam A.[2]

[1]Monash University Malaysia ~ Bandar Sunway ~ Malaysia, [2]University of Dhaka ~ Dhaka ~ Bangladesh

The debate remains on how external events, such as life transitions, and internal psychic processes, such as identity formation, influence the recall of autobiographical memories. We investigated the role of national transition and identity in the recall of autobiographical memories by the generation of the 1971 Bangladesh War of Independence. Sixty-four male war veterans and forty-one male nonveterans recalled and dated twenty memories and completed a generational identity scale. Both groups recalled more memories from their age 11 to 20 – a reminiscence bump effect, which also coincided with the period of national transition (1969–1973) marked by Bengalis' protest movements, the war culminating in the independence of Bangladesh, and its aftermath. Veterans recalled more war and political memories from this period and referenced historically defined autobiographical periods (H-DAPs) more often than nonveterans (OR = 5.08, 95% CI [2.29, 11.28] for war memories; OR = 3.35, 95% CI [1.92, 5.83] for H-DAPs). Veterans also exhibited stronger generational identity than nonveterans. Higher generational identity scores correlated with the recollection of more war and political memories. Veterans rated their memories as more important, self-defining, and emotionally intense than nonveterans. We discussed the results in the context of the Self-Memory System and the Transition theory of autobiographical memory.

Abstract 1823

INVESTIGATING THE IMPACT OF WORD VALENCE ON WORKING MEMORY PERFORMANCE

Mishra T.*[1], Tiwari P.[2], Singh P.[1], Das D.[1]

[1]Department of Psychology, Banaras Hindu University ~ Varanasi ~ India, [2]Department of Psychology (North Campus), University of Delhi ~ New Delhi ~ India

Emotional states have been increasingly recognized as key modulators of working memory processes, shaping attentional dynamics and decision-related cognition. The present study utilizes a delayed matching-to-sample task to examine how affective priming influences memory encoding and retrieval performance. The task requires the participants to be exposed to the affective word primes, in the first phase, to induce emotional activation. In the second phase, participants are instructed to encode three words (one valenced and two neutral) presented sequentially. Following a retention interval, a probe phase requires the participants to identify the previously encoded words by matching them with newly presented options. Reaction times (RT) and accuracy serve as the dependent measures. The study anticipates that affective priming will significantly modulate both encoding and retrieval processes. Precisely, participants primed with emotionally valenced words are expected to demonstrate enhanced recall accuracy and faster reaction times compares to neutral priming conditions. The observations consistent with evidence which shows that affective cues facilitate selective attention and memory consolidation. Moreover, negative affective primes may impose greater cognitive load, potentially slowing RTs relative to positive primes. These findings are expected to provide insights into the interaction between affective states and short - term memory processes, contributing to broader theories of emotion-cognition integration.

Abstract 1364

"SINGING NOISE": MULTI-LAYERED, DYNAMIC BAND-NOISE VOICE

Uchida T.*[1], Uchida C.[2]

[1]National Center for University Entrance Examinations ~ Tokyo ~ Japan, [2]Toyo University ~ Tokyo ~ Japan

Two major auditory models have been proposed to explain the perception of sound pitch. For decades, a significant debate has raged between the temporal theory, which asserts the temporal periodicity of sound as crucial, and the frequency theory (place theory), which is grounded in the sensory organs that detect harmonic components. In this study, we attempted to generate new experimental voices that are commonly heard in everyday life to study voice pitch perception. A source-filter type vocoder, WORLD, was modified to generate a multi-layer dynamic band-noise voice with a spectrum extracted from ordinary speech and driven by white noise. This noise has no periodicity, but a dynamic band noise with a harmonic structure-like spectrum. In the evaluation experiment, we used singing voices as materials. We prepared (1) a simple re-synthesized voice, (2) a pseudo-whispering voice with noise-vocoded spectral envelope, (3) a multi-layered dynamic band-noise voice with the harmonic structure preserved, and (4) a band-noise voice based on transposed singing voices. Next, we conducted auditory evaluation experiments on these experimental voices. Two hundred fifty-six first-year university students listened to the generated experimental voices. They rated the following: a) type of vocalization (a1: whispering voice, a2: singing voice), b) perception of melodiousness, and c) naturalness of the voices. As a result, the multi-layered, dynamic band noise generated was perceived as a "whisper," composed of noise, but it sounded like a "singing voice" with a melody. However, considering the real structure of the human vocal organs, this band noise cannot be produced as a human voice. Nevertheless, since it was recognized as a whisper and the melody could also be evaluated, this sound will be effective in pitch perception research. Furthermore, it can be used as material for creating artistic works, such as a whispering voice that sings.

EXPLORING WORKPLACE REINTEGRATION AFTER MYOCARDIAL INFARCTION: A QUALITATIVE INQUIRY

Kohli V.*[3], Banerjee A.[2], Kohli N.[1], Chawla S.K.[2]

[1]Department of Psychology, University of Allahabad ~ Prayagraj ~ India, [2]Department of Liberal Arts, Humanities & Social Sciences, Manipal Academy of Higher Education ~ Manipal ~ India, [3]Independent Researcher

Returning to work after experiencing a cardiovascular disease, such as a myocardial infarction (MI), poses numerous challenges for patients. This study investigated the process of workplace adjustment among employees who resumed work following an MI, emphasizing crucial psychosocial factors, including personal resilience, workplace support, and the broader organizational context. The sample comprised 14 employees (13 males and 1 female), aged 42 to 56 years, all of whom had returned to work after recovery. The findings indicated that economic, social, and cultural factors significantly influenced their decision to re-enter the workplace. Participants highlighted the importance of their beliefs about illness, self-efficacy, and perceived control in shaping their readiness to rejoin the workforce and enhance their well-being, thereby facilitating their adjustment and reintegration into the workplace. The coping strategies employed by participants included both problem-focused techniques, such as actively managing job-related demands, and emotion-focused approaches, which involved efforts to regulate emotional responses to stress. These findings underscore the necessity for workplace practices that foster resilience, establish support networks, and allow for flexible adjustments to promote long-term employee well-being. Future research should explore the interplay between individual coping mechanisms and organizational strategies to improve outcomes related to reintegration.

Abstract 1852

ATTENTIONAL PROFILES IN ADULTS WITH ADHD AND ASD SYMPTOMS

Carreiro L.R., Silva M.M.M., Paes I.T., Gotuzo Seabra A., Teixeira M.C., Blascovi De Assis S.M.*

Universidade Presbiteriana Mackenzie ~ São Paulo ~ Brazil

Introduction: Neurodevelopmental disorders are complex due to early-onset symptoms that persist into adulthood. Autism spectrum disorder (ASD) and attention deficit hyperactivity disorder (ADHD) share common deficits, such as inattention, distractibility, low sustained attention, emotional dysregulation, inhibitory control difficulties, and hyperactivity. Genetic and neuroimaging findings suggest shared pathophysiological mechanisms, with up to 70% of children with ASD also showing ADHD symptoms. Given this variability, a dimensional framework is recommended for their analysis. Purpose: Characterize attentional profiles in adults, comparing performance based on ADHD and ASD symptoms. Different types of attention (voluntary, automatic, and temporal) were assessed to identify similarities and differences from a dimensional perspective. Method: A cross-sectional, exploratory design was applied to a convenience sample of 120 adults (18–59 years) with attentional complaints, inattention, hyperactivity, and executive function problems. Computerized tests assessed attention, while participants completed the Conners Continuous Performance Test (CPT II), the Autism Spectrum Quotient – Adults (AQ 16+), and the Adult Self-Report Scale 18 (ASRS) for ADHD symptoms. The Adult Self-Report (ASR/18-59) evaluated adaptive functioning and emotional, behavioral, and social problems, providing a comprehensive psychological profile. Results: Data were analyzed using descriptive statistics and Latent Profile Analysis (LPA), a categorical approach that identifies latent subpopulations based on selected variables. The best-fitting model revealed three profiles: profile 1 (n = 50), characterized by inattention and hyperactivity/impulsivity consistent with ADHD; profile 2 (n = 27), showing a balance between cognitive skills and social functioning, with attention patterns overlapping with other groups; and profile 3 (n = 43), marked by low social skills and alternating attention. Conclusions: Findings highlight diverse attentional profiles and complex interactions between ADHD, social skills, and attention task performance. These results reinforce the heterogeneity and dimensionality of ADHD and ASD, reflecting altered neurocognitive and neurobehavioral functioning, and provide valuable insights for clinical identification and intervention strategies.

Abstract 2126

FROM PAPER-AND-PENCIL TO EYE-TRACKING TESTS: OCULOMOTOR MARKERS DRIVING NEXT-GENERATION INTERVENTIONS FOR UNILATERAL SPATIAL NEGLECT

Brunet C., Hassaini S., Coello Y.*

University of Lille ~ Lille ~ France

Unilateral Spatial Neglect (USN) is a neuropsychological syndrome characterized by the failure to detect or respond to stimuli in contralesional space, independent of primary sensory or motor deficits. It occurs most frequently after right hemisphere stroke, affecting up to 82% of patients, and manifests with considerable clinical polymorphism. Subtypes such as egocentric, allocentric, and representational neglect disrupt a wide range of daily activities, resulting in prolonged hospitalization and reduced autonomy. Traditional paper-and-pencil assessments, however, lack sensitivity and ecological validity. To overcome these limitations, virtual reality (VR) combined with eye-tracking (ET) has emerged as a promising approach to identify oculomotor markers of USN in realistic environments. In this study, we developed a new multi-task VR-ET battery by analyzing fixation, saccade, and smooth pursuit metrics in static and dynamic tests, and compared these with conventional behavioral measures. A cohort of 24 stroke patients and 29 healthy controls completed standard paper-and-pencil tests followed by a new nine-task VR-ET battery. ROC analyses revealed that oculomotor metrics—particularly number of saccades, refixations, saccadic distance, and cumulative fixation time—achieved excellent sensitivity and specificity (AUC > 0.9), consistently outperforming behavioral metrics. Importantly, a reduced version of the battery reached perfect classification (AUC = 1) and detected cases missed by traditional assessments, highlighting its immediate clinical utility. Overall, these findings demonstrate that the VR–ET battery provides highly sensitive, ecologically valid, and time-efficient diagnostic tools, paving the way for technology-based diagnosis and personalized rehabilitation strategies tailored to patient's oculomotor profile.

Abstract 2066

MOTIVATIONAL DYNAMICS OF SCHOOL SUCCESS: AN EXPERIMENTAL STUDY OF THE RELATIONSHIP BETWEEN COGNITIVE EFFORT WILLINGNESS AND SOCIAL MEDIA USE

Fonó--Holcinger J.*, Kondé Z.

University of Debrecen Institute of Psychology, Dept. of General Psychology ~ Debrecen ~ Hungary

Willingness to engage in cognitive effort, beyond cognitive abilities, significantly influences academic success. Maladaptive media use, i.e., not aligned with learning goals, may alter reward system functioning and thus the subjective evaluation of effort. This study experimentally examined these effects among high school and university students, drawing on the theory and paradigm of cognitive effort. 94 students (17–26 years, M = 18.79, SD = 1.25) participated in an online experiment on the Inquisit Web platform. They solved working memory (N-back) tasks of varying difficulty, then chose between tasks of different load levels (1, 2, 3) for varying rewards in an effort-discounting paradigm. This was followed by a second stage with point rewards. Participants were randomly assigned to one of three experimental groups: task-oriented social media use, cognitively demanding task, or hedonic social media browsing. After the manipulation, both stages of the discounting paradigm were repeated. Subjective devaluation of rewards showed significant differences between load levels (W1=3179, p<.001; W2=2999, p<.001; W3=3172, p<.001), indicating lower valuation of high-effort tasks even with higher rewards. Effort willingness emerged as a stable trait, along which four clusters were identified through hierarchical analysis of discounting patterns, task performance, and subjective load (NASA-TLX). The clusters reflected distinct strategies: Comfortable (low effort, low performance), Goal-oriented (high effort, high performance), Optimists (challenge-seeking, perceiving tasks as less strenuous), and Deliberate (balanced evaluation, lower preference for high load). Experimental interventions did not produce significant differences between clusters (F1(3)=0.72, p=0.541; F2(3)=1.08, p=0.364; F3(3)=1.17, p=0.326). Findings suggest that dispositional preferences shape decision-making strategies and determine the extent to which maladaptive social media use negatively affects cognitive effort valuation, with implications for understanding motivation and academic success.

Abstract 1928

NEUROPSYCHIATRIC SYMPTOMS AS MODIFIABLE MEDIATORS OF GENETIC RISK FOR EXECUTIVE DECLINE

González--Rodríguez E.*, Pérez--Colón J., Arrufat--Pérez D., Rodríguez--Muñoz L., Gómez--Martínez H.

Albizu University ~ San Juan ~ Puerto Rico

Genetic vulnerability such as APOE4 is a well-established risk factor for dementia, but its impact often becomes evident though everyday behavioral changes. Eating disturbances, measured with the Neuropsychiatric Inventory (NPI), are easily observable symptoms. These changes may signal underlying self-regulation difficulties that compromise cognition. Because executive functioning supports independence in daily life, eating disturbances may represent a pathway linking genetic risk to declines in flexibility and planning. This study examined whether appetite/eating disturbance frequency (NPI) mediates the association between APOE4 and executive functioning (TMTB) in older adults at risk of dementia, with the aim of identifying clinically relevant modifiable factors that may be addressed in clinical practice. Cross-sectional data were drawn from the Alzheimer's Disease Neuroimaging Initiative (ADNI; N = 1,729; M age = 80.04, SD = 7.8; 978 males). Diagnoses included Cognitively Normal (n = 592), Mild Cognitive Impairment (n = 977), and Dementia (n = 160). APOE4 was coded as Non-Carrier (0) or Carrier (1). Appetite/eating disturbances were measured with the NPI frequency item (range 1-4; higher scores indicate greater frequeny). Executive functioning was assessed with the Trail Making Test-B (seconds to completion). Analyses were conducted using PROCESS v4.2 (Model 4), controlling for gender and age, with 5,000 bootstrapped samples (95% CI). APOE4 carriers reported more frequent eating disturbances (B = 0.2896, p <.001). In turn, greater disturbances frequency predicted slower TMT-B performance (B = 4.2569, p < .001). The indirect effect of APOE4 on TMT-B via eating disturbances was significant (B = 1.2327, 95% CI [0.3493, 2.4522]), while the direct effect remained significant (B = 18.2194, p < .001). Beyond genetic risk, behavioral symptoms emerge as critical indicators of executive decline. These findings highlight the value of routine behavioral assessment, caregiver education, and early psychological interventions targeting eating patterns to potentially buffer cognitive deterioration in at-risk populations.

Abstract 2083

MOTHERS' ATTENTION FOLLOWING IS LINKED TO LOWER DISTRACTIBILITY IN INFANTS

Koç N.*[1], Uzundag B.[2]

[1]Özyegin University; Istanbul Medipol University ~ Istanbul ~ Turkey, [2]Özyegin University ~ Istanbul ~ Turkey

Focusing attention and resisting distraction are key predictors of later cognitive development, including language (Edgar et al., 2022; Yu et al., 2019). Infants tend to focus longer when caregivers follow their focus, while caregivers' redirecting behavior is linked to shorter attention spans (e.g., Findji, 1998; Wass et al., 2018). However, most studies focus on infants' attention within the context of caregiver interactions or on sustained attention when the caregiver is present and directly visible to the infant, allowing for face-to-face interaction during the task. This study aimed to explore the relationship between maternal behaviors during mother-infant interaction and infants' distractibility using a computer-based task, where infants were assessed independently while their caregivers remained behind them.

Participants included 76 infants (34 girls; age range: 9-16 months, M(SD)=11.9(1.4)) and their mothers. Infants' distractibility was assessed using a task adapted from Salley et al. (2013), where they viewed a video with a distractor appearing midway through the trial. The percentage of trials in which infants looked at the distractor was coded. Maternal behaviors during a 10-minute free play session were categorized as "following" (engaging with the infant's focus), "initiation" (introducing a new object), and "redirecting" (shifting attention) based on Landry and Chapieski's (1989) coding scheme.

A simple linear regression model with infant age and maternal following as predictors and distractibility as the outcome variable was significant, R2=.09, F(2,72)=3.44, p=.01. Infants who showed less distractibility had mothers who engaged in more attention following behaviors (β=−.02, SE=.01, t(72)=-2.61, p=.01). Mothers' initiation (rs=-.02, p=.83) and redirecting (rs=.11, p=.36) behaviors were not significantly associated with infants' distractibility.

While the cross-sectional design limits causal conclusions, these findings carry important applied implications, indicating that encouraging parents to follow their infants' focus could serve as an everyday strategy to foster early attention regulation, which can be integrated into parenting programs.

Abstract 1817

THE INFLUENCE OF RETRACTION ON PEOPLE'S BELIEFS ABOUT RESEARCH FINDINGS

Lee Y.*

National Chung-Cheng University ~ Chiayi ~ Taiwan

People frequently encounter false or misleading information online, and initial exposure can continue to influence beliefs even after corrections are issued. This study examined how retraction affects belief in research findings.

Thirty-six psychology research summaries were drawn from the Retraction Watch Database and randomly assigned to retracted or published conditions. The only difference between conditions was the final sentence, which stated either that the study had been retracted or that it had been made publicly available. To counterbalance the retraction effect, two versions of the study materials were created so that each research summary had an equal chance of appearing in either the retracted or the published condition. Participants rated their agreement with each study's main conclusion before and one day after reading the summaries and also reported their level of comprehension.

Endorsement increased after reading, consistent with a familiarity-as-truth effect. However, among participants with high comprehension, belief change was smaller for retracted studies than for published studies. No such difference appeared among participants with low comprehension.These findings indicate that retraction can reduce the persuasive impact of false research, but only when readers have a strong understanding of the material. Improving public comprehension of scientific content may therefore be critical for the corrective power of retractions to take hold.

Abstract 1760

ADVANCING WORKFORCE COMPETENCIES: COMPARATIVE ANALYSIS OF INNOVATIVE ROBOTIC TRAINING FOR SOFT SKILLS DEVELOPMENT

Nannetti M.*, Nenna F., Gamberini L.

Department of General Psychology, University of Padova ~ Padova ~ Italy

Problem-solving, collaboration, communication, and digital literacy are key competencies for the workforce of the future. The spread of advanced technologies and the demand for adaptability in rapidly evolving professional and personal contexts necessitate a substantial rethinking of training practices. Educators and trainers are therefore challenged to redesign learning systems that can address these emerging needs. This study investigates innovative training strategies, with a focus on the role of Educational Robotics in strengthening soft skills among young professionals. In particular, it examines how a robotics-based educational model contributes to the development of essential soft skills. We implemented Skill-UP!, a structured workshop that included two training approaches: (1) Traditional Training, relying on established methods for soft skill acquisition, and (2) Robotic Training, which utilized LEGO Spike Prime educational robots to provide an experiential, hands-on learning experience. A within-subject experimental design was employed, with quantitative analysis comparing the effects of both modalities on skill development in young adults. To complement this, qualitative data from open-ended responses were thematically analyzed to capture participants' perspectives and experiences. Results show that both training formats effectively improved communication abilities. However, Traditional Training was more effective in building confidence in problem-solving and strategic thinking, while Robotic Training strongly enhanced teamwork, engagement, and overall satisfaction. Moreover, interacting with educational robots fostered positive attitudes toward technology, encouraging creativity and enjoyment. These findings highlight the value of Educational Robotics as a powerful tool for skill development and advocate for its wider integration in preparing an agile, adaptable future workforce.

Abstract 1861

DESIGN AND ASSESSMENT OF VISUAL TECHNIQUES FOR MENTAL IMAGERY AND THEIR USE IN SUPPORTING DECISION-MAKING

Ohmori T.*

Kyorin University ~ Tokyo ~ Japan

Mental imagery is often difficult to express and interpret, especially in educational settings where mismatches in perception—termed “image gaps”—can occur between learners and instructors or among learners themselves. This study proposes a novel method for visually representing mental imagery to make such gaps more transparent and actionable. Traditionally, psychological and cognitive constructs derived from statistical techniques like factor analysis are presented as numerical data or abstract matrices, which are challenging for non-specialists to interpret. To address this, we developed an algorithm that transforms factor analysis results into intuitive graphical representations using Chernoff face graphs. These visualizations allow users to grasp complex latent structures at a glance, facilitating shared understanding and dialogue.

Our approach aims to support decision-making in areas such as course evaluation, career guidance, and learner profiling by making implicit perceptions visible and comparable. Preliminary applications suggest that visualizing image gaps can foster more interactive and empathetic communication between stakeholders in education. By bridging the divide between statistical insight and practical interpretation, this method contributes to both psychological assessment and educational technology.We will present the algorithm, sample visualizations, and explore its potential impact on decision-making in educational contexts.

USE OF DIGITAL TECHNOLOGIES IN SCHEMA THERAPY: SCOPE REVIEW AND ETHICAL ASPECTS IN PSYCHOLOGICAL INTERVENTIONS

Mansano F., Szupszynski K.*, Oliveira M.

Pontifícia Universidade Católica do Rio Grande do Sul ~ Porto Alegre ~ Brazil

Psychological interventions using digital tools are being widely applied both within and outside the methodological parameters of scientific research in the field of mental health, especially since the COVID-19 pandemic. Objectives: The study seeks to investigate which technological resources are being used for innovation in the application of Schema Therapy techniques and to understand the effectiveness of these innovations. It aims to investigate in which Schema Therapy techniques the innovations are being applied, broadening the understanding of their scope and impact. In addition, based on the review, the study aims to propose ethical considerations regarding the use of digital technologies in psychological interventions. Method: A Scope Review is generally used in research in which gaps or greater complexity are identified in defining the conceptual boundaries of a topic, such as the scope of the concepts of 'Technology' and 'Schema Therapy'. Descriptors are defined based on consultation with the Decs/Mesh. The databases consulted are PubMed, PePSIC, and LiLACS, chosen for their relevance and to ensure greater diversity of results. The results will be subject to the following inclusion/exclusion criteria: 1) Technological resources used (based on Virtual Reality and/or Artificial Intelligence and/or Metaverse); 2) Empirical studies in the field of Schema Therapy and the use of digital tools in the techniques of the approach. Results: Initial research shows scarce scientific production focused on theoretical and experimental discussions on the topic. There is evidence of the widespread use of concepts and how this can even influence research methodologically directed toward the use of digital tools in psychological interventions. Discussion: Discussing the ethical aspects of proposing and applying digital technologies in psychological studies and interventions, as well as how these studies can be found in secure databases that are truly focused on Evidence-Based Psychology, is essential for the social commitment of Applied Psychology.

Abstract 2556

DOES MORE COMPATIBILITY IMPROVE PERFORMANCE? COMPARISON OF COMPATIBILITY EFFECT BETWEEN DOUBLE AND SINGLE IRRELEVANT FEATURES CONDITIONS.

Bustos V.*, Wang D.

University of North Florida ~ Jacksonville ~ United States of America

Stimulus-Response Compatibility (SRC) is a major principle in human performance and human factors design. The Theory of Event Coding (TEC) proposed that actions were represented by perceptual consequences called feature codes, which could be activated by perceiving features belonging to external stimuli. SRC effects occurred when perception of external stimuli activated action feature codes, as observed in the Simon Effect, where performance improved when an irrelevant location feature activated the intended action's feature code compared to when it activated the alternative action's code. The TEC model further implied that greater activation of action feature codes increased action execution, suggesting that multiple compatible features might additively enhance performance. This study examined how the number of activated feature codes impacted reaction time and accuracy in a speeded reaction-time task. Participants responded using their left or right thumb to press a left-red button for letter "X" and a right-green button for letter "O" on a touchscreen. Compatibility effects were compared across single- and dual-feature conditions where letter color or location was compatible or incompatible with the button-pressing action. In the dual-feature condition, location and color were presented simultaneously— red "X" on the left was compatible with the left-red button's color and location features, while a right, green "X" was incompatible. In the color-only condition, letters appeared centered with varied colors. In the location-only condition, letters appeared in white with varied locations. Results partially confirmed TEC's prediction that SRC effects were larger for dual-feature than single-feature conditions, driven mainly by incompatible rather than compatible conditions. More compatible features did not significantly enhance performance, while incompatible features significantly interfered with performance in the speeded reaction task.

Abstract 2436

COMPARING VIRTUAL REALITY AND TRADITIONAL TOOLS TO ASSESS MANUAL DEXTERITY AND HAND DOMINANCE

Ielo A.*[1], Sors F.[1], Fantoni C.[1], Craig C.[2], Murgia M.[1]

[1]Department of Life Sciences, University of Trieste ~ Trieste ~ Italy, [2]School of Psychology, Ulster University ~ Belfast ~ United Kingdom

Manual dexterity refers to the ability to handle and manipulate objects precisely using hands and fingers (Backman et al., 1992). Several standardized tools are commonly used for assessing manual dexterity, such as the Box and Block Test (BBT) and the Minnesota Manual Dexterity Test (MMDT). These tests are mainly used to assess the performance of patients with neuropsychological disorders and are not developed to establish hand dominance, which is typically investigated using self-report measures (e.g. Edinburgh Handedness Inventory, EHI; Oldfield, 1971). However, a tool specifically developed to measure behavioural differences between dominant and non-dominant hands in healthy population is missing. In this study, we propose a Virtual Reality (VR) task, called Buzzwire test, with the aim to validate it. Specifically, we will correlate the performance obtained with the Buzzwire test with those observed with traditional tools (BBT and MMDT) and will test the sensitivity to hand dominance comparing the objective measures of these tests with the scores of the EHI. Participants will perform the three tests (BBT, MMDT, Buzzwire test) in a counterbalanced order to control for order effects. The data collection is underway; results of the analyses will be presented at the conference. We expect that the Buzzwire test will have a high correlation with the traditional tools and a higher sensitivity to establish behavioural differences between dominant and non-dominant hands. These findings would highlight the Buzzwire test as a more objective measure of hand dominance, promoting the application of VR into assessment for a healthy population and people with neuropsychological disorders.

EMOTIONAL BARRIERS TO THE PRACTICE “INOCHI-TENDENKO”: AN EMPIRICAL ANALYSIS OF PARENT–CHILD TRIAD DATA IN A HYPOTHETICAL SEDIMENT-RELATED DISASTER SCENARIO

Maeda K.*

Rikkyo university ~ Saitama ~ Japan

Background: The practice of Inochi-tendenko, which encourages individuals to focus on saving themselves to prevent further casualties, has proven extremely effective in saving lives. Although this principle gained significant public attention following the Great East Japan Earthquake on March 11, 2011, the degree to which people comprehend and internalize its rationale remains limited and few empirical investigations examined the psychological and emotional barriers that inhibit its application. In this study, we collected triad data from university students and their parents to identify factors that impede adherence to Inochi-tendenko during hypothetical sediment-related disaster situations.

Methods: A total of 103 female university students, 101 mothers, and 97 fathers participated in the survey. Participants were asked to imagine a situation in which they faced a sediment-related disaster and were unable to contact their family members. In this hypothetical scenario, they indicated whether they would choose to evacuate immediately or attempt to rescue their family members. Additionally, they completed questionnaires assessing emotional reactions and rational evaluations associated with the Inochi-tendenko principle.

Results: In the sediment-related disaster dilemma, a higher proportion of mothers (75.0%) and fathers (80.2%) chose to “rescue their family members” compared to students (46.0%). Their tendency to choose rescue behavior appeared to be driven by intense negative emotional responses toward the concept of self-prioritized evacuation embodied in Inochi-tendenko.

Conclusions: These findings suggest that, in promoting the importance of Inochi-tendenko and similar principles that emphasize self-assistance, it is crucial to frame and communicate these messages in emotionally sensitive ways that minimize moral conflict or misinterpretation. Furthermore, the observed differences in behavioral choices between students and their parents highlight generational and role-based variations in risk perception and moral reasoning. Developing disaster-prevention and mitigation strategies that integrate these psychological and familial perspectives is therefore essential for fostering effective life-saving behavior during disasters.

Abstract 2285

THE INFLUENCE OF TASK-IRRELEVANT MUSIC ON FEATURE BINDING

Padulo C.*, De Crescenzo F., Cascone A., Fairfield B.

University Federico II of Naples ~ Naples ~ Italy

The role of background music in cognitive task performance remains contentious. On the one hand, arguments based on the cognitive capacity model suggest that background music constitutes a distraction as it grabs attention and diverts limited processing resources from the task at hand, resulting in reduced performance. On the other hand, it has been suggested that background music has the potential to increase alertness (arousal), positively influencing attention on the task at hand and thus improving performance. If we consider different types of music, results seem to suggest that: 1) instrumental music is associated with a more positive effect on memory and learning, and 2) faster music is more beneficial than slower music. More specifically, listening to fast tempo music creates a state of elevated mood and arousal that is advantageous to subsequent cognitive task performance. However, the role of valence in supporting cognitive performance remains uncertain. 'Touching' music (described as 'slow' and 'sad') seems to enhance facial memory, while 'joyful' music (described as 'fast') impaires it. Conversely, accuracy in difficult arithmetic tasks is enhanced by both 'joyful' and 'touching' music. In our study we aimed to investigate whether faster vs slower musical tempo and background vs pre-task music listening differentially affect performance in a visuospatial feature binding task. Accuracy and mean reaction times demonstrated differential effects based on musical characteristics and task condition demands. Future research should focus on the interaction between music listening and cognitive performance to support cognition in individuals across the lifespan and from different clinical populations (e.g., developmental and/or neurodegenerative disorders).

Abstract 2515

AWE AFTER MORTALITY SALIENCE: DIFFERENTIAL EFFECTS OF POSITIVE AND THREAT AWE ON DEFENSIVE RESPONSES

Takiguchi S.*[1], Nomura M.[2]

[1]Kyoto University ~ Kyoto ~ Japan, [2]Tokyo University ~ Tokyo ~ Japan

Title: Awe After Mortality Salience: Differential Effects of Positive and Threat Awe on Defensive Responses

Introduction: Death is an inevitable, universal threat that people strive to buffer. Based on Terror Management Theory (TMT), mortality salience (MS)—awareness of the inevitability of death—typically heightens defense of self-esteem and cultural worldviews (e.g., in-group favoritism, out group derogation, strengthened materialism). Awe, a self-transcendent emotion elicited by vast stimuli that update existing cognitive schemas and evoke a “small self,” is known to promote prosociality and social connectedness. Recent work suggests awe after MS might buffer worldview/self-esteem defenses, with a critical distinction between aesthetically induced positive awe and threat-induced awe.

Purpose: This study tested whether awe reduces MS-related defenses and whether effects differ between positive-awe and threat-awe.

Method: Thirty University students underwent an MS induction (e.g., death reminders), then watched video stimuli designed to elicit positive-awe, threat-awe, or serve as a control. materialism and self-esteem were measured before and after as indicators of cultural-worldview and self-esteem defense.

Results: Contrary to predictions, MS did not produce observable increases in worldview or self-esteem defenses. This null pattern was interpreted as potentially shaped by religious/belief systems specific to Japanese participants. Nonetheless, awe after MS showed differentiated effects: the positive-awe group displayed increased self-esteem, whereas the threat-awe group showed heightened materialism. Materialism increases under threat-awe ran counter to prior findings. It may reflect Japanese participants’ tendency to associate threat awe with disasters, or residual MS effects.

Conclusion: Awe following MS does not uniformly dampen defensive processes; its impact depends on awe type. positive awe may elevate self-esteem via a small self pathway that fosters prosociality and humility, while threat awe may intensify materialism, possibly through disaster-linked interpretations or lingering MS. These results highlight culturally situated mechanisms and the importance of distinguishing awe subtypes when examining emotion-based interventions in TMT contexts.

SHAPING PSYCHOLOGY TOGETHER: EFPSA'S STUDENT-LED INITIATIVES FOR SOCIETY AND THE FUTURE OF THE DISCIPLINE

Wednesday 22 July 2026 from 12:30 to 14:00

(M-Lorenese)

Alicja Szmidka (Medical University of Gdańsk ~ Gdańsk ~), Chair and Presenter

In a time when mental health, social inclusion, and trust in science are among Europe's most urgent challenges, the voices of young psychologists are more crucial than ever. The European Federation of Psychology Students' Associations (EFPSA) unites psychology students from 30 countries into the largest and most diverse network of its kind. Since 1987, EFPSA has empowered generations of students to connect science with practice, to advocate for societal change, and to develop the skills needed for the future of psychology. This symposium will present EFPSA's unique structure and mission, illustrating how student-led initiatives can generate measurable impact on communities and the discipline itself. Presenters, coming from different countries and holding diverse roles within EFPSA, bring unique perspectives that highlight the value of cross-cultural collaboration and student-driven innovation. The session will provide an overview of EFPSA's Social Impact Initiative (SII), which coordinates Europe-wide campaigns on mental health (Mind the Mind), inclusivity (Better Together), resilience (A(live!)), sustainability (PlanetA), and the power of kindness (Organised Acts of Kindness). The session will also highlight EFPSA's education opportunities, such as its Training Office, Research Programme, and the Journal of European Psychology Students (JEPS).

The final presentation will synthesise key learning points and outline EFPSA's future plans, including expanding advocacy for psychological literacy, strengthening collaboration with professional organisations, and fostering global engagement of psychology students.

Through these contributions, the symposium will demonstrate how EFPSA applies psychology to societal challenges while preparing the next generation of psychologists to be both scientifically competent and socially responsible - in line with the mission of IAAP and the aims of ICAP.

Abstract 3750

EMPOWERING PSYCHOLOGY STUDENTS FOR SOCIETAL CHANGE: THE SOCIAL IMPACT INITIATIVE

Salajková A.*

University of Innsbruck ~ Innsbruck ~ Austria

Launched in 2013, EFPSA's Social Impact Initiative (SII) transforms psychological knowledge into large-scale societal action. Since its first anti-stigma campaign Mind the Mind, SII has expanded to projects such as Better Together, Organised Acts of Kindness, Planet A, and (A)live!, reaching over 25+ European countries, training more than 1,000 psychology students as volunteers, and delivering thousands of workshops to schools and communities. Campaigns have demonstrated measurable impact (e.g., significant reductions in stigmatising beliefs, d = 0.84) and produced tangible outputs such as position papers, educational kits, and policy advocacy. This overview traces SII's development, its evidence-based approach to tackling stigma and discrimination, and its role in empowering psychology students to create sustainable social change.

Abstract 3754

(A)LIVE! - A CROSS-CULTURAL, PEER-TO-PEER INITIATIVE

Scarlat I.*

Universidade Lusófona ~ Lisbon ~ Portugal

As a complex phenomenon of global interest, suicide has been monitored closely by the scientific community and policy makers alike. Different organisations and governments have taken steps to address this, with one such initiative being SII's (A)live! campaign. The campaign, inspired by a Slovenian project ('A se štekaš?!?'), aims to provide a common foundational framework for psychology student associations across Europe concerning suicide prevention. The campaign's general goal is to extrapolate a general infrastructure from existing successful initiatives to help perpetuate suicide prevention education at an international level. This is achieved by engaging with high school students and gatekeepers on the topic, drawing on EFPSA's wide range of resources (e.g., materials, trainers). This campaign also aims to provide indirect support, by making use of social media networks or by centralising information pertaining to suicide prevention in European countries. The (A)live! campaign will provide invaluable cross-cultural data for research into suicide within youth cohorts, thus aiding in the exploration of relatively uncharted territory when it comes to global mental health.

Abstract 3755

PLANET A - BECAUSE THERE IS NO PLANET B

Bin Qamar R.A.*

Istanbul Rumeli University ~ Istanbul ~ Turkey

PlanetA is the youngest campaign of the Social Impact Initiative of EFPSA. The aim of PlanetA is to recognise and address the psychological effects of the global climate crisis. The campaign is built on three main pillars: (1) Offering Emotional Support, (2) Education and (3) Empowerment. PlanetA debuted during the 'Raising Awareness, Taking Action' webinars in March of 2023. It has since then upheld a relatively stable social media presence, sharing posts on climate change, climate anxiety and eco-related international days and events. The campaign team's focus is not only on the individual, as the campaign is trying to bridge the (knowledge) gap between the individual and the system. Currently Planet A is a digital-only campaign and provides research-based educational posts on social media.

Abstract 3756

EMPOWERING PSYCHOLOGY STUDENTS THROUGH NON-FORMAL EDUCATION: THE EFPSA TRAINING OFFICE

Santos A.J.*

Catholic University of Portugal ~ Porto ~ Portugal

The EFPSA's Training Office is a service founded in 2010/2011, with the aim of meeting the growing need for high-quality, evidence-based training within EFPSA. EFPSA Trainers support the personal and professional development of psychology students by delivering experiential and interactive learning sessions that foster growth, both individually and in groups. The mission is to prepare active EFPSA members for their mandates, support them throughout, and ensure the well-functioning of the organisation, while promoting non-formal education as a key tool for societal change.

EFPSA Trainers are psychology students who combine scientific knowledge with professional training skills, making them highly valued within the international training community. They deliver team-building sessions within EFPSA, soft skills workshops at Universities, and evidence-based trainings for external organisations.

The Trainers' Community offers its members opportunities such as becoming an official EFPSA Trainer, contributing to the development of EFPSA's training system, joining a European network of like-minded peers, and mentoring new Trainer Candidates. Guided by values of quality, transparency, respect, trust, and development, this Training service continues to expand its impact.

EFPSA also offers several training events, such as the Train the Trainers Summer School - an intensive eight-day program that equips participants with the knowledge, skills, and mindset to deliver effective training. Successful graduates are invited to join the EFPSA Trainers' Pool, a community of trainers approved by the Training Office. Once accepted, Trainers can deliver sessions in the name of EFPSA, access training calls, and actively participate in the Training Community.

For experienced trainers, EFPSA offers Train Advanced Trainers (TAT), a nine-day program for 25–30 seasoned trainers from multiple NGOs, focusing on specialised training topics and networking. And the Trainers' Meetings (TRAM) provide additional opportunities for peer-to-peer learning, skill sharing, and professional development.

Abstract 3757

LEARNING POINTS AND FUTURE PLANS

Szmidka A.*

Medical University of Gdansk ~ Gdansk ~ Poland

EFPSA's four-decade history demonstrates that student-led initiatives can be a transformative force for both psychology education and societal change. One of the key lessons is that when students are empowered with structure, resources, and mentorship, they can simultaneously develop professionally and generate measurable social impact.

EFPSA fosters learning, collaboration, and leadership through a series of in-person and hybrid events, including the EFPSA Conference (biennial, 100–200 participants), the EFPSA Congress (annual; 2026 will mark the 40th edition with 400 participants), the Train the Trainers Summer School, the Research Summer School, and the Joint Executive Board & Member Representative Meeting. These gatherings provide hands-on opportunities for skill-building, networking, and cross-cultural exchange, complementing student-led projects across Europe.

Looking forward, EFPSA aims to shape the next generation of psychologists who are not only academically competent but socially responsible and globally engaged. Future plans include expanding advocacy for mental health and psychological literacy, strengthening partnerships with professional and academic organisations, and aligning student initiatives with the Sustainable Development Goals - particularly SDG 3 (Good Health and Wellbeing), SDG 10 (Reduced Inequalities), and SDG 13 (Climate Action). By leveraging its network, events, and educational programmes, EFPSA empowers young psychologists to act as change agents, demonstrating how student-driven initiatives can advance both the discipline of psychology and meaningful societal transformation across Europe and beyond.

Abstract 1510

AVATAR-MEDIATED SELVES IN MASSIVELY MULTIPLAYER ONLINE ROLE-PLAYING GAMES

Baruah A.*

Christ University ~ Delhi NCR ~ India

Background: Digital avatars in Massively Multiplayer Online Role-Playing Games (MMORPGs) serve as dynamic representations of the self, enabling users to perform identity, negotiate social norms, and explore personal aspirations. While prior research has predominantly centered on Western contexts, little is known about how avatar-mediated identity unfolds in culturally distinct environments such as India. Objective: This study explores how Indian MMORPG players construct and interpret their avatars as tools for identity negotiation, cultural expression, and social interaction. Method: Using a qualitative research design, in-depth semi-structured interviews were conducted with 20 Indian MMORPG players. Reflexive thematic analysis was employed to examine the narratives surrounding avatar creation, self-presentation, and symbolic meaning. Results: Three key themes emerged: (1) avatars as ideal selves, where participants projected aspirational traits and mitigated self-discrepancy; (2) gender and role experimentation, involving the playful and strategic exploration of alternate identities; and (3) cultural embodiment, where avatars were infused with traditional aesthetics, mythological references, and symbolic moral values. Participants reported that these digital personas influenced offline perceptions, offered emotional relief, and supported social alignment in virtual communities. Conclusion: Avatars in Indian MMORPGs are not merely cosmetic tools but act as identity mediators embedded in cultural, psychological, and relational processes. Findings offer implications for culturally aware avatar design and deepen HCI's understanding of how digital selfhood is co-constructed in non-Western contexts.

Abstract 2038

ANALYSIS OF STRUCTURAL DIFFERENCES IN CHINESE ADOLESCENT MENTAL HEALTH ACROSS DIFFERENT EDUCATIONAL STAGES ON THE DUAL-FACTOR MODEL: LATENT PROFILE ANALYSIS AND NETWORK COMPARISON TESTING

Chen B.*, Yin S., Liu Y.

Hubei University ~ Wuhan ~ China

Introduction: The dual-factor model underscores assessing adolescent mental health with both negative and positive indicators. The World Health Organization calls for strengthening adolescents' abilities to cope with mental-health risks and for enhanced interventions; building on this guidance, we posit that cultivating positive psychological resources is crucial and that schools are promising settings to implement scalable supports.

Purpose: To identify mental-health profiles across school stages and compare their network structures.

Method: Using a provincial sample of elementary, middle, and high school students from China, we conducted latent profile analysis (LPA) on three negative indicators—loneliness, depression, smartphone addiction—and eight positive indicators—meaning in life, search for meaning, cognition, emotion, willpower, self-regulation, prosociality, transcendence. Network comparison analysis assessed structural differences across profiles.

Results: Three profiles emerged in elementary (vulnerable, troubled, complete health), three in middle school, and four in high school, with an additional "symptomatic but content" profile. Significant network differences appeared only in elementary students: in the complete-health group, positive indicators were tightly connected and strongly negatively associated with negative indicators. In contrast, vulnerable and troubled groups showed looser positive connections and weaker negative links. Interestingly, cognition had high strength in the complete-health group, while prosocial behavior and transcendence were notably stronger in the vulnerable and troubled groups than in the complete-health group. Depression was a central node across profiles. In middle school, cognition and willpower showed particularly high strength and centrality in the complete-health group.

Conclusions: Elementary school appears to be a critical window for structuring positive mental-health systems. Stage-specific supports are warranted—universal programs in elementary years and layered/selective supports thereafter. Strengthening positive psychological resources (e.g., meaning, self-regulation, prosociality) should stand alongside symptom reduction to foster resilience and flourishing.

Abstract 1064

TWO ANALOGICAL GAMES WALK INTO A SOCIAL MEDIA FEED

Florence A.*

University of North Carolina at Chapel Hill ~ Chapel Hill ~ United States of America

Social media provides a steady stream of upward comparisons, but whether these encounters inspire or discourage depends on how similarity is perceived. When similarity is judged narrowly - using superficial characteristics like appearance or possessions - users contrast from upward targets, leading to discouragement or envy. When similarity is construed more broadly - highlighting persistence, growth, or creativity - users assimilate toward upward targets, finding inspiration and motivation. Reframing similarity in this way has the potential to shift social media from a source of alienation toward one of connection and growth.

This study tests two gamified procedural priming modules designed to activate analogical transfer and raise the level of abstraction at which similarities are identified. Drawing on structure-mapping theory, the Matching module adapts a scene comparison task to transfer base–target trait similarity, while the Pursuit module adapts a maze task to transfer base-target approach. Both modules embed structural correspondences that automatically and unconsciously broaden the similarity lens without requiring deliberate training. Undergraduate participants (N = 1,500) will be randomly assigned to Matching, Pursuit, or control conditions. They will complete a buffer task to verify automaticity of transfer, a timed relational-matching paradigm to assess analogical processing, and ten upward comparison vignettes capturing cognitive, affective, behavioral, and quantitative identification responses.

Effectiveness will be evaluated through faster and more accurate relational matching and greater frequency of assimilative comparisons relative to the control. If successful, the interventions provide a scalable means of constructively reorienting digital engagement by targeting the comparison mechanism itself rather than limiting exposure, moderating content, or relying on deliberate reframing. This approach offers transferable tools to reshape online comparison processes to foster resilience, motivation, and growth.

Abstract 1781

• LEADERSHIP BEYOND PRESENCE: LESSONS FROM LEADING A EUROPEAN STUDENT FEDERATION HOW TO EMPOWER AND TRUST YOUR TEAM

Kocmanová V.*

Psychiatric Clinic, 1st Faculty of Medicine, Charles University and General University Hospital in Prague ~ Prague ~ Czech Republic

In the context of increasing global interconnectedness and evolving expectations toward leadership, leadership in international and volunteer-based student organizations presents unique challenges and opportunities. Drawing from my experience as President of the European Federation of Psychology Students' Associations (EFPSA), I will present my personal insight how trust can be intentionally cultivated in cross-cultural, remote, and non-hierarchical teams as the foundation of responsible and empowering leadership.

While my leadership responsibilities included strategic planning, public representation, and team coordination, my presidency was deeply shaped by unexpected personal challenges that made me reflect on what it means to lead in times of personal vulnerability. These events underscored a fundamental truth: effective leadership is not about being everywhere or doing everything. It is about building a resilient team that can operate with autonomy, mutual support, and shared responsibility—even in your absence.

This presentation brings ten practical strategies for building trust and shared ownership within diverse student teams. Particular attention will be paid to the efficient communication, recognizing contributions publicly, balance between leadership and followership, and the importance of creating opportunities for others—core practices aligned with democratic values and participative leadership.

In line with the congress theme, this talk proposes a new direction for applied leadership psychology—one that sees vulnerability not as weakness but as a starting point for authentic connection and distributed leadership. By leading through trust and example, we create environments where individuals are empowered, responsibility is shared, and collaboration becomes truly meaningful.

I invite attendees to reflect on their own leadership roles: How do you create trust in the absence of hierarchy that can be a shared value?

Abstract 1274

THE GOOD AND THE GUILTY- EXPLORING PARENTAL GUILT AMONG INDIAN PARENTS OF YOUNG CHILDREN

Sengupta P.*, Mohanty A.

Indian Institute of Technology (IIT), Kharagpur ~ Kharagpur ~ India

The parenting journey is touted as a conglomeration of positive and negative emotions, especially in the early years, when both parents are transitioning into these new roles. One such challenging emotion is Parental Guilt which occurs in response to the perceived violation of ideal standards of parenthood, resulting in negative mental health consequences. The present research explores the experiences of Parental guilt among eleven participants (six mothers, five fathers) of healthy children aged between 6 months and 5 years. All the participants were recruited using snowball sampling and were in a marital relationship with their current spouses for at least two years. Online semi-structured interviews were conducted, with the questions revolving around the emotional aspects of parenting, the expectations associated with becoming parents and specific experiences of guilt in parenting and what it translates into for these parents. The transcripts were analysed using Reflexive Thematic Analysis, creating four themes- “Being a ‘good parent’”, “Need for constant self-monitoring”, “Pressure of comparisons” and “Balancing the old and the new”, each with sub-themes to understand the internal standards and external social discourses that birth and boost the experience of guilt. The findings highlight the need to acknowledge these challenging emotions of parenthood, especially in the Indian scenario where the emphasis is strongly on celebrating it as a divine gift. Further, the study also adopts a gendered lens to show how cultural expectations shape the experiences of guilt

differently for fathers and mothers. Organizations working with new parents can use these
findings to help them identify the sources of such guilt and protect themselves from it by devising appropriate strategies.

Abstract 1167

BRAINWAVE DYNAMICS IN SHOPPING CRAVING AND DECISION-MAKING: THE ROLE OF ATTENTION AND COGNITIVE CONTROL

Lo H.[1], Wu J.*[1], Hsueh J.J.[2]

[1]National Chung Hsing University ~ Taichung City ~ Taiwan, [2]I-Shou University ~ Kaohsiung City ~ Taiwan

Introduction. In temptation-rich shopping environments, consumers face stimuli that shape their choices. While the AIDA model explains how such cues drive purchase intentions, the neural mechanisms behind decision-making remain unclear. This study investigates how shopping cues affect brain regions and rhythms, focusing on brainwave power during craving and price exposure and brain amplitude in decision-making. The goal is to clarify the cognitive shift from craving to choosing not to purchase under varying stimuli.

Method. Two EEG experiments with the BR8 PLUS eight-channel system examined neural responses across general, impulsive, and compulsive shoppers. Experiment 1 presented product images and prices simultaneously to assess craving-related activity, while Experiment 2 presented them sequentially with decision options to analyze neural dynamics across decision phases and the effect of craving before price evaluation.

Results. The results revealed that shopping craving significantly influenced alpha and beta activity in the frontal and parietal regions, reflecting the allocation of attention and cognitive resources. Price presentation also significantly affected alpha activity in these regions. During the decision-making phase, general consumers exhibited increased beta activity in the parietal lobe when choosing not to purchase, suggesting a more focused and cautious cognitive process compared to consumers with impulsive and compulsive shopping tendencies.

Conclusion and Implications. This study found that shopping craving and price presentation modulate alpha and beta brain activity in frontal and parietal regions, reflecting attention and cognitive processing. Increased beta activity in the parietal lobe during non-purchase decisions suggests that general consumers engage in more cautious and deliberate processing compared to impulsive and compulsive shoppers. These results highlight distinct neural strategies among consumer types and suggest that marketing and intervention efforts should focus on enhancing price awareness to promote more mindful purchasing behavior.

Abstract 1156

DO STUDENTS RECOGNIZE THE VALUE OF GLOBAL CITIZENSHIP AND PSYCHOLOGICAL LITERACY IN PSYCHOLOGY EDUCATION?

Harris R.*, Birtill P., Pownall M.

University of Leeds ~ Leeds ~ United Kingdom

Given the pressing, complex global challenges facing society, it is imperative that students are well equipped to contribute to solving problems in an informed, ethical and meaningful way. This is the basis of a global citizenship approach to education. In psychology education, a global citizenship education may look like “psychological literacy”, which is an approach that considers how students can intentionally apply psychology knowledge and skills to personal, professional and societal goals. However, it is not clear whether students are aware and value this approach to their psychology education. Across three studies, we explored students’ perception of global citizenship and psychological literacy. Study 1 (n = 202) investigated UK undergraduate students’ perceptions of global citizenship education and found that while only 12.8% of students were familiar with the term, students value this approach. Students also identified challenges within the conceptualisation and subject-level implementation of global citizenship. We then focused in on the discipline of psychology; Study 2 (n = 117) demonstrated that 18.0% of psychology students had heard of the term psychology literacy. Despite this, similar to global citizenship, students valued and had the opportunity to develop the attributes that underpin a psychological literacy approach (e.g. the ability to apply psychology understanding to real world problems). Finally, Study 3 (n = 296) explored whether psychological literacy can differentiate students by discipline. We recruited students from psychology, mathematics, humanities, and English and investigated whether psychological literacy is unique to psychology students, or whether it constitutes a set of interdisciplinary outcomes more aligned with global citizenship. This found that most skills did overlap disciplinarily, but some (e.g., ‘understanding mind and behaviour’) uniquely differentiated psychology students from other disciplines. Taken together, these studies indicate that students value education that allows them to apply their psychology knowledge and skills to solving real-world problems.

Abstract 1084

THE IMPACT OF BELIEFS ABOUT LOSING CONTROL ON THE SEVERITY OF THE RELATIONSHIP BETWEEN OBSESSIVE-COMPULSIVE SYMPTOMS AND ORTHOREXIA NERVOSA

Macioszczyk J.*[2], Novara C.[1], Brytek--Matera A.[2]

[1]Department of General Psychology, University of Padua ~ Padua ~ Italy, [2]Institute of Psychology, University of Wroclaw ~ Wroclaw ~ Poland

Introduction: The co-occurrence of orthorexia nervosa and obsessive-compulsive disorder has been highlighted in numerous previous studies. While the associations between these two conditions are well established, the underlying mechanisms of this relationship remain relatively unexplored. The diagnostic criteria for both of those disorders mention the need for control as one of the main factors that play a key role in maintaining their symptoms.
Purpose: This study aims to examine the mediating role of beliefs about losing control in the relationship between obsessive-compulsive symptoms and orthorexia nervosa.

Methods: The sample consisted of 268 participants from the Polish general population, aged 18 to 75 years. We used the Polish versions of the Beliefs About Losing Control Inventory, the Obsessive-Compulsive Inventory-Revised and the Eating Habits Questionnaire.
Results: The results revealed a significant indirect effect of obsessive-compulsive symptoms on beliefs about losing control (b = 0.8792, t = 0.0622). Obsessive-compulsive symptoms turned out to have an insignificant direct effect on orthorexia nervosa (b = 0.400, t = 0.7889). Additionally, beliefs about losing control have shown a significant positive impact on orthorexia nervosa (b = 0.1100, t = 2.9100). Furthermore, the direct effect of obsessive-compulsive symptoms on orthorexia nervosa in the presence of the mediator (beliefs about losing control) was also found to be significant (b = 0.1490, p < 0.001).

Conclusions: The study highlights the significant mediating role of beliefs about losing control in the relationship between obsessive-compulsive symptoms and orthorexia nervosa. These findings may enhance our understanding of the underlying mechanisms of both disorders and offer valuable insights for developing more targeted and effective treatment approaches.

Abstract 1934

HOW PARENTS CULTIVATE TODDLERS' SOCIAL-EMOTIONAL LEARNING: EVIDENCE FROM A 4-YEAR LONGITUDINAL LATENT GROWTH MODEL IN TAIWAN

Lin H.L.*[1], Yu M.[1], Tasi J.[1], Hsu Y.[2]

[1]National Chen-Chi University ~ Taipei ~ Taiwan, [2]HSUAN CHUANG UNIVERSITY ~ Hsinchu ~ Taiwan

Social-Emotional-Learning (SEL) is an empirically grounded and lifelong developmental issue, beginning in early childhood environments and influencing students' mental health, academic achievement, and interpersonal relationships. Empirical research shows that parents' emotions, behaviors, and parenting practices exert profound effects on young children's social and emotional competence. Theoretical perspectives further suggest that children's social-emotional development is closely tied to the growth of their language abilities. Therefore, the present study investigates how parental behaviors—including caregiving, discipline, nurturing, companionship, and educational practices—cultivate children's language competence and social-emotional development.

Based on the Taiwan Kindergarten Panel Study (KIT) dataset (N = 1,668, male= 832), this study analyzed a four-year longitudinal sample of children aged 3 to 6 using latent growth modeling. Using the dataset's item sets, the study verified good reliability and validity, while controlling for family income and gender. Results showed that both paternal and maternal parenting behaviors significantly predicted children's language competence (father: $\beta = .125$, $p < .001$; mother: $\beta = .169$, $p < .001$). In turn, language competence strongly predicted emotional competence ($\beta = .604$, $p < .001$) and social competence ($\beta = .588$, $p < .001$). Importantly, indirect effects confirmed that parental behaviors influenced both emotional (father: $\beta = .081$, $p < .001$; mother: $\beta = .102$, $p < .001$) and social competence (father: $\beta = .073$, $p < .001$; mother: $\beta = .100$, $p < .001$) through children's language ability. However, small negative effects were found on developmental slopes (e.g., father to emotional slope $\beta = –.019$, $p < .001$; mother to social slope $\beta = –.019$, $p < .001$), suggesting ceiling effects in measurement or complex developmental dynamics. Two explanations are considered: (1) the measurement instruments leaded a ceiling effect; and (2)Important theoretical and methodological implications that warrant further clarification and refined research designs in future.

Abstract 1277

"FROM CHUCKLES TO CHEERS": EXPLORING HUMOR STYLES, BELONGINGNESS AND PSYCHOLOGICAL WELL- BEING AMONG INDIAN COLLEGE STUDENTS

Rai V.*[2], Mohanty A.[1]

[1]REKHI CENTRE OF EXCELLENCE FOR THE SCIENCE OF HAPPINESS, IIT KHARAGPUR ~ KHARAGPUR ~ India, [2]Department of Clinical Psychology, GD Goenka University

This study attempts to advance the existing literature on the relationship between humor style
and psychological well-being by investigating the mediating role of belongingness among
Indian residential college students. A sample of 306 students comprising of 129 females and
177 males aged from 18- 35 years completed measures assessing four humor styles (affiliative,
self-enhancing, self-defeating, and aggressive), general belongingness and psychological well-
being. Mediation analyses were conducted using Hayes' PROCESS macro. Findings reveal that
belongingness significantly mediates the relationship between three humor styles—affiliative,
self-enhancing, and self-defeating—and psychological well-being. Specifically, higher
affiliative and self-enhancing humor are associated with greater well-being through enhanced
feelings of belongingness. Conversely, self-defeating humor, often linked to lower well-being,
exerts its effect indirectly by diminishing belongingness. However, belongingness did not
mediate the relationship between aggressive humor style and well-being, suggesting a distinct,
possibly unbuffered, pathway between aggressive humor and psychological outcomes. These
results underscore how humor styles interact with psychological constructs to shape well-being
in diverse populations. Findings emphasize the potential for fostering belongingness to enhance
well-being through adaptive humor styles, with implications for interventions targeting student
mental health.

PSYCHONEURODEVELOPMENT: AN ALTERNATIVE IN HUMAN DEVELOPMENT FOR INTEGRAL CARE

Rodríguez Sánchez J.L.*[1], De La Rosa Díaz B.E.[2], Tenorio Martínez R.[1], Lara Méndez C.A.[1], González Cruz V.G.[1]

[1]Benemérita Universidad Autónoma de Puebla ~ Puebla ~ Mexico, [2]~ Puebla ~ Mexico

Introduction

Our society has great needs for support, guidance, and intervention in the area of psychological and neuropsychological development, which requires professionals with comprehensive and specialized training. This idea is justified observing the need for care for people with developmental problems, as well as those who are at risk or disadvantaged in achieving comprehensive growth, which encompasses the following areas: cognitive, affective, social, and behavioral. The deficiency in assessment, intervention, and prevention actions in human development processes at all age ranges is notable in Mexico and many Latin American countries.

Objective

To implement a new area of psychology, which has the intention, responsibility, and commitment to attend the needs arising from human development, satisfying them from a comprehensive perspective involving psychology and neuropsychology. This area is Psychoneurodevelopment.

Concept

Psychoneurodevelopment refers to an psychology area that addresses human development in all its stages, in a comprehensive manner from psychological and neuropsychological perspectives, to assess, diagnose, prevent, intervene, and research dysfunctions and pathologies, as well as normal development in the cognitive, affective, behavioral, and interactional areas.

Methodology

The work consisted of creating a training program for Psychoneurodevelopment professionals. These professionals must be competent, with a critical, ethical, and humanistic perspective, capable of generating, applying, and disseminating knowledge with scientific rigor. Likewise, they will be committed to leadership and social engagement, focused on addressing and proposing innovative solutions to problems of human development at all life stages.

Results and Conclusions

This program should provide graduates with the knowledge, skills, attitudes, and competencies necessary for clinical and psychoeducational practice at all stages of human development. Likewise, graduates should have the ability to generate knowledge that will impact the wide range of problems that arise in psychological and neuropsychological development.

BEYOND CAREER ADAPTABILITY: CHANGES RELATED TO POSITIVE EXPERIENCES FROM A PRE-POST INTERVENTION STUDY ON CAREER CONSTRUCTION INTERVENTION

Alvarenga M.*[1], Geraldo De Azevedo T.[1], Souza Guilhermino C.[2], Gomes Lopes M.P.[1], Fernandes OlÍmpio K.[1], Torres De Oliveira A.A.[1], Freitas Macedo A.[1], Vieira Passos J.G.[1], Coelho Silva R.H.[1], Ganem Galli M.P.[1], Paula Quites L.[1], Nascimento Silva P.G.[1], Cardoso P.[3]

[1]UNIVERSIDADE FEDERAL DE SAO JOAO DEL-REI (UFSJ) ~ SAO JOAO DEL-REI ~ Brazil, [2]UNIVERSIDADE FEDERAL DE MINAS GERAIS (UFMG) ~ BELO HORIZONTE ~ Brazil, [3]UNIVERSIDADE DE ÉVORA (UE) ~ ÉVORA ~ Portugal

Background: Beyond career adaptability, it is essential to consider other aspects that influence a more positive life experience, such as positive affect, life satisfaction, and resilience. Including these factors broadens the understanding of the effects of career counseling and provides a more integrated view of personal and professional development. Objectives: To investigate the effects of a career construction model not only on career adaptability (Career-Adaptability Scale) but also on positive affect (Positive Affect Scale), life satisfaction (Life Satisfaction Scale), and resilience (Coping Resilience Brief Scale) across different service modalities. Methods: A total of 377 participants (266 women, 110 men, and 1 intersex), aged between 13 and 56 years (M = 20.86; SD = 6.07), took part in the study. The average family income was 4.19 minimum wages (SD = 3.36). Educational levels ranged from high school in progress to completed postgraduate studies. Counseling sessions took place between 2023 and 2025, in based on internet (84.9%), hybrid (9.8%), and face-to-face (5.3%) formats. The intervention followed the career construction model, conducted in 3 to 4 sessions over two months, using a pre- and post-test design study. Analyses included descriptive statistics, group comparisons, effect size calculations, and bootstrap procedures with 1000 iterations to ensure variance homogeneity. Results: Quantitative results indicated significant improvements in positive affect, life satisfaction, resilience, and career adaptability after the intervention ($p < .001$), with effect sizes equal to or greater than 0.50. Qualitatively, participants reported greater clarity in career choices, enhanced self-knowledge, and improved future perspectives. Satisfaction indices showed that more than 80% evaluated the experience positively. Conclusion: Career counseling based on the career construction model promoted improvements not only in adaptability but also in emotional and well-being dimensions, suggesting that brief and structured interventions can positively impact multiple aspects of participants' lives.

THE EFFECTIVENESS OF THE MASTER OF ARTS IN APPLIED PSYCHOLOGY CURRICULUM AT THE AMERICAN UNIVERSITY OF CENTRAL ASIA, KYRGYZ REPUBLIC

Aitkulova K.*, Moldokulova Z.

American University of Central Asia ~ Bishkek ~ Kyrgyzstan

For the last two years, the Committee on Social Policy of the Kyrgyz Republic has been discussing the proposal for the “Law on Advertising,” which restricts the advertising of psychological services by specialists without a relevant degree. Eventually, it might raise the demand for educational programs that adhere to international standards. The Master of Arts program in Applied Psychology (MAPAP) at the American University of Central Asia (AUCA) was established in 2015, and since then, data have been collected to measure the effectiveness of the continuously developing curriculum. The study aims to evaluate and enhance the effectiveness of the MAPAP program to improve the quality of education for mental health professionals who will contribute to strengthening public health in the Kyrgyz Republic. The data collection procedure will consist of two stages. In the first stage, data will be collected through academic records on dropout rates, graduation rates, and student performance. During the second stage, feedback from alumni will be collected through a researcher-made questionnaire to measure perceived outcomes of their study, covering their evaluation of acquired knowledge in relation to their competency and professional values. Participants will be recruited from among all graduate students (N=44) using purposive sampling. Collected data will be analyzed using descriptive statistics in SPSS software. It is expected that the results will provide insight into the strengths and weaknesses of the current program and serve as a guide for further improvement.

GOD, EXISTENTIAL ANXIETY, AND ROMANTIC RELATIONSHIPS: A MEDIATION ANALYSIS OF GOD IMAGE, PARTNER CHARACTERISTICS, AND FEAR OF DEATH

Stefan S.V.*

University of Bucharest ~ Bucharest ~ Romania

Existential anxiety, particularly the fear of death, is a complex phenomenon influenced by psychosocial and spiritual factors. While romantic relationships and spiritual beliefs are often considered buffers against such anxiety, their interaction can produce paradoxical outcomes. Understanding these dynamics is crucial for a comprehensive view of human adaptation to mortality.

This study aimed to investigate the influence of God image and existential anxiety on partner selection and satisfaction in romantic relationships. It was hypothesized that God image would predict relationship satisfaction and mediate the link between positive personal/relational characteristics and the various facets of death anxiety.

A non-experimental, cross-sectional design was used. The sample consisted of 128 participants (107 women, 21 men), aged 18-59, all currently in a romantic relationship. Data were collected via an online survey which included the Inventory of God Image Scales, the Multidimensional Fear of Death Scale, the Relationship Satisfaction Scale, and the Partner Selection Strategies Scale.

God image dimensions significantly predicted 18.5% of the variance in relationship satisfaction ($F(6, 121) = 4.568$, $p < .001$), with a perception of God as Accepting being a strong positive predictor ($\beta = 0.564$, $p < .001$). Counterintuitively, mediation analysis showed that positive psychosocial factors like "Compatibility and Social Integration" were directly associated with an increased fear of the dying process (est. = 0.069, $p = .009$). God image dimensions served as significant mediators; for example, "Stability and Character" increased fear of premature death via the Challenge mediator while simultaneously reducing fear of the body after death via the Providence mediator.

Positive psychosocial resources can paradoxically heighten certain death-related fears, possibly by fostering a deeper awareness of mortality. Perceptions of God are key mechanisms that shape this relationship. The findings reveal the complex and sometimes contradictory nature of existential anxiety, opening new directions for research and clinical applications.

Abstract 739

THE POSITIVE EFFECTS OF EXECUTIVE COACHING ON TRANSFORMATIONAL LEADERSHIP

Vladimirova K.*[1], Ripoll P.[1], Sánchez C.[2], Torres M.[2]

[1]Universitat de Valencia ~ Valencia ~ Spain, [2]Intelema ~ Valencia ~ Spain

Introduction: Today's organizations are dynamic, requiring leaders to adapt to this environment. Executive coaching is one of the most popular interventions to support leaders' development, and yet gaps persist in understanding how structured coaching programs influence transformational leadership over time.
Purpose: The aim of the current study is to use a longitudinal and experimental study design to examine the effects of a coaching intervention on transformational leadership.
Methods: A longitudinal experimental design was used with 92 managers from Spanish organizations, who were randomly assigned to an experimental group (n=48) or a control group (n=44). The experimental group received weekly one-hour coaching sessions, while the control group received no coaching. Both groups completed the Multifactor Leadership Questionnaire (MLQ-5X) to assess their transformational leadership levels before and after the intervention. Repeated measured ANOVAs were used to measure the impact of the coaching intervention on managers' transformational leadership behaviour.
Results: The intervention increased Idealized Influence and Intellectual Stimulation levels, while the Inspirational Motivation and Individualized Consideration levels remained stable.
Conclusion: Short-term executive coaching enhances the cognitive dimensions of transformational leadership but is less effective in improving the emotional/relational dimensions. This study contributes to the literature supporting coaching as a leadership development tool and suggests combining it with other interventions for holistic improvement in transformational leadership.

Abstract 2669

RESEARCH ON THE SYNERGISTIC EFFECT OF POSITIVE LANGUAGE QUOTIENT MODEL AND NON-VERBAL COMMUNICATION

Yan Y.*

YanYan ~ Jingmen ~ China

Abstract: This study, based on an interdisciplinary perspective of psychology, linguistics, and education, systematically explores the synergistic mechanism of the positive language quotient model and non-verbal communication in educational settings. With 36 junior high school students as the experimental subjects, a four-dimensional positive language quotient model was constructed, including language emotional expression ability, language logical ability, language comprehension and expression ability, and body language expression ability. The study deeply verified the significant influence of emotional intelligence level and non-verbal communication strategies on positive language ability. Experimental data showed that intervention methods such as reading aloud and sports/singing were more effective in enhancing positive language expression ability than traditional silent writing training. Among them, the positive language difference value of the sports/singing group increased by up to 49, demonstrating the unique advantages of non-traditional training methods. The study further analyzed the pathways through which non-verbal communication affects language quotient ability: at the cognitive development level, it helps with information processing of positive language by concretizing abstract concepts through gestures (such as simulating particle movement by shaking fingers when explaining "molecular motion" can increase understanding accuracy by 42%) and guiding thinking patterns through spatial layout (round table seating can increase the frequency of innovative problem posing by 63%); at the emotional cultivation level, it lays the emotional foundation for positive language through facial expression feedback (teachers' smiling and nodding can increase students' self-efficacy by 22%) and physical contact (squatting and hugging can accelerate the alleviation of separation anxiety by 50%); at the behavioral shaping level, it optimizes the strategy application of positive language through non-verbal hierarchical intervention systems (gazing and raising eyebrows can bring the attention return rate to 89%) and positive suggestion reinforcement (giving a thumbs-up can increase the repetition rate of helping behavior by three times).

UNESCO CHAIR LIFE LONG GUIDANCE AND COUNSELING- ATTITUDES, LIFESTYLES, PERCEPTIONS OF THE FUTURE OF STUDENTS IN THE CONTEXT OF ANTHROPOCENE: A QUALITATIVE RESEARCH

Wednesday 22 July 2026 from 08:00 to 09:30

(Q-Arsenale)

Valérie Cohen-Scali (INETOp Cnam ~ Paris ~ France), Co-Chair
Jérôme Rossier (University of Lausanne ~ Lausanne ~ Swit), Chair

Our societies are facing unprecedented social and ecological crises, often referred to by the terms “Anthropocene”and “Capitalocene”. Young people around the world are particularly concerned about the impact of these global crises on their futures. The rising awareness of the Anthropocene is reshaping individual’s perspectives on the future (Wallenborst & Pierron, 2019). In this sense, Haraway (2016, in Pereira Savi, 2017), invites humans to be ethically responsible in order to improve the situation, particularly climate change which threatens to end countless lives on earth. The concept of forms of active life (Cohen-Scali et al., 2025) has been gradually developed in the career guidance literature and appears to help figure out the different ways young adults face the challenges associated to the Anthropocene. This symposium will be based on a global research study encompassing several nations including Brazil, France, Iran, Tunisia, and the United States for those presentations are proposed. This exploratory research project seeks to understand how young adults from different regions of the world, regarding their perception of the environmental issues and how these perceptions make their choices, shape their lives and future career plans and develop new forms of life. Researchers from each country have conducted semi-structured interviews using a standardized interview protocol with 10 students aged 18-25, being more or less involved in environmental activism work. Half of them are science majors and half are humanities majors. Consensual qualitative research analysis (Hill, 2012) has be used for this project. Each country has formed a research team that created domains and core ideas and code the interview data. The presentations draw the main lines of the forms of life young adults are developing, main differences and main common aspects between the groups of young people regarding northern and southern countries facing differently the climate crises.

Abstract 3180

PERCEPTIONS OF THE FUTURE AND IDENTITY CONSTRUCTIONS AMONG BRAZILIAN UNIVERSITY STUDENTS IN THE FACE OF THE CLIMATE CRISIS

Ribeiro M.A.*

University of São Paulo ~ São Paulo, SP, Brazil ~ Brazil

The world has been profoundly affected by global crises. Young people have been highly impacted, particularly regarding their future and identity construction. Through in-depth interviews, the study aims to identify, understand, and contrast the career constructions and future working prospects concerning the climate crisis, its characteristics, and its consequences on their life trajectory among ten college Brazilian students using Consensual Qualitative Research. We constructed four categories of analysis with sub-themes. In the first category (impacts of climate change on trajectory and current situation), the sub-themes are life projects marked by the need to make a social contribution and environmental activism as a feeling that there is something very wrong with the world that requires a solution. In the second one (making sense of the climate crisis), they stressed that colonialism, capitalism, people's lack of responsibility and empathy, State and labor market silence and connivance, and greenwashing are responsible for the climate crisis. In the third one, they highlight the main impacts on lifestyles, identity, and the future, on one hand, climate anxiety, feelings of powerlessness, frustration, and climate injustice, and, on the other hand, hope for change and emphasize the importance of collective in life projects. Finally, as the fourth category, they propose the need for radical solutions and action in the entire society, environmental inclusion at education in schools, and the expansion of activist actors generally restricted to the most vulnerable populations as future solutions. Despite these, they highlight young people's distanced relationship with these climatic phenomena and point out that safety and labor issues have been more prominent and urgent in developing contexts such as Brazil, placing climate issues in the backburner. Regarding the implications for practice, career guidance, and counseling should consider including climate issues as central issues for constructing careers and the future of work.

Abstract 3181

BUILDING ONE'S FUTURE AMID ECOLOGICAL CRISES: ENGAGEMENT TRAJECTORIES OF YOUNG TUNISIAN ADULTS

Hafsi A.*

University of Tunis ~ Tunis- ~ Tunisia

Current social and ecological crises, often referred to as the Anthropocene and Capitalocene, are reshaping young generations' perceptions of the future (Wallenborst & Pierron, 2019). In response to these challenges, individuals adopt diverse stances, ranging from active mobilization to more discreet adaptation. In this context, Haraway (2016, in Pereira Savi, 2017) emphasizes the need for ethical responsibility in addressing environmental issues, advocating for renewed forms of engagement.To better understand these dynamics, the concept of active life forms (Cohen-Scali et al., 2025) offers a framework for analyzing the adaptation and action strategies developed by young people in the face of the climate emergency. How do these crises influence their personal and professional trajectories ? This qualitative study, conducted in Tunisia with ten young adults, identifies three distinct profiles : Activists, Sensitized individuals and Engaged individuals: integrating sustainable practices into their daily lives without necessarily adopting a militant approach.

The analysis reveals that activists often adopt collective strategies and integrate their engagement into their professional choices. Sensitized individuals express concerns but hesitate to fully commit. Engaged individuals, on the other hand, favor individual changes aligned with their values. These findings highlight the interactions between ecological engagement, future representations, and professional trajectories. They also underscore the tensions between individual aspirations and collective responsibilities, particularly in a context marked by climate uncertainty and unequal access to action opportunities.

Understanding these dynamics is crucial to supporting young people in shaping their futures and proposing pathways to foster an ecological transition driven by diverse forms of commitment

Abstract 3183

PERCEPTIONS OF THE FUTURE IN THE CONTEXT OF CLIMATE CHANGE AND THE GLOBAL ECOLOGICAL CRISIS: A UNITED STATES PERSPECTIVE

Erby W.*

Teachers College, Columbia University ~ New York ~ United States of America

The United States faces significant challenges related to crises such as climate change and environmental degradation. Given the political climate and social inequalities that are unique to the United States context, it is important to better understand how young adults view these particular challenges and the impact it has on their career plans and their well-being. To explore these concerns, interviews were conducted with 10 U.S. university students, and Consensual Qualitative Research methods were used to analyze the interview data. Some themes that were identified included the participants identity as a climate activist and how that contributes to their sense of belonging, perspectives on causes and solutions to issues of climate change, future plans and perceptions of the future, the psychological impact of climate change and the coping strategies used to address negative effects. The results offer insights into how young adults in the U.S. experience and respond to the ecological crises and underscore the need for supportive career counseling interventions that empower collective action, alleviate, psychological distress, and integrate conversations about how the future of our ecological climate might influence an individual's career choices.

Abstract 3184

FORMS OF LIFE AMONG STUDENTS IN FRANCE: BARRIERS AND FACILITATORS TO DEVELOP INNOVATIVE CAREER COUNSELING PRACTICES

Cohen--Scali V., Rossier J.*

Inetop Cnam ~ Paris ~ France

Countries are affected in different ways by the social and ecological crises often summarized by the term 'Anthropocene', and governments develop actions of varying efficiency to help people cope with them. The philosophical concept of Forms of Active Life (Arendt, 1958; Cohen-Scali et al., 2025 ; Guichard, 2024) allows to understand how individuals and groups produce global, individual and collective strategies to construct their lives in difficult contexts. In order to catch these attitudes, strategies, lifestyles, 10 French students have been interviewed. Consensual Qualitative Research has been implemented in order to identify themes and code them. The results show many common perceptions of the ecological crises and also differences concerning actions and life styles implemented. We have developed a typology with 4 types based on their attitudes, strategies, lifestyles and perception of the future. Two appear as forms of active life. Two others reveal strong tensions and despair generated by the current situation among some students. The discussion will aim to put into perspective the results of the other presentations on other countries in relation to the concept of active forms of life.

NARRATIVE CAREER COUNSELLING: INNOVATIVE APPROACHES IN A WORLD OF CHALLENGES

Wednesday 22 July 2026 from 09:30 to 11:00

(Q-Arsenale)

Mary McMahon (The University of Queensland ~ Brisbane), Chair and Presenter

In a world of rapid change and complexity, many disciplines, including career counselling, have been challenged to reimagine and reposition their practice. This reimagining has largely been influenced by a contextualist worldview and constructivist and social constructionist philosophies and has seen career counselling re-positioned as a narrative practice. Narrative career counselling is emerging as a dominant force and several approaches have been proposed which, in spite of their common foundations, emphasise different constructs and processes.

In keeping with its foundational worldview and philosophies, all approaches to narrative career counselling reposition the role of clients and career counsellors, the counselling relationship, and the nature of career counselling. In particular, clients are viewed as experts in their lives and career counsellors are viewed as facilitators of a respectful and collaborative process that positions clients as storytellers and valuable sources of information. Narrative career counselling draws heavily on the stories clients tell and expects them to take an active role in the career counselling process and in constructing their future stories. Clients tell stories of their experiences in a range of past and present contexts and, together with a career counsellor, attempt to make sense of those experiences in order to construct and enact a future story. In general, narrative career counselling is viewed as inclusive and able to cope with complexity.

Narrative career counselling is the focus of this symposium. Four presentations each overview an approach to narrative career counselling, consider its advantages and disadvantages, provide examples of its research base, and propose future directions. The importance of developing culturally and contextually aware narrative approaches is evidenced in these presentations.

Abstract 3945

STORY TELLING: A SYSTEMS-BASED APPROACH TO NARRATIVE CAREER COUNSELLING

Mcmahon M.*[1], Watson M.[2]

[1]The University of Queensland ~ Brisbane ~ Australia, [2]Nelson Mandela University ~ Port Elizabeth, Eastern Cape ~ South Africa

The story telling approach to narrative career counselling has its theoretical foundation in the Systems Theory Framework (STF) of career development. The STF is a systems map of a wide, but not exhaustive, range of dynamic and recursively interacting influences on career development that is readily applied in research and practice. The story telling approach to narrative career counselling is a holistic, systems-based, narrative approach that takes an individual in context and culture perspective. As a systems based approach, story telling takes account of diversity, complexity, intersectionality, and the dynamic nature of career development. Story telling is presented as two separate words to denote the content and process of this narrative approach to career counselling. Systems thinking is essential to the story telling approach and systems maps may be used to facilitate systems thinking and story telling. Although not essential to the story telling approach, the STF can be personalized and individuals can draw their own map of influences which can then be used as a basis for story telling. The story telling approach is non-directive and career counsellors guide the story telling approach by using deep listening, counselling microskills, and story crafting questions; essentially, career counsellors enter the lifespace of clients and become an influence in their systems of influence. This presentation first overviews the theoretical foundation of the story telling approach to narrative career counselling, the STF, systems thinking and systems mapping, and subsequently describes the approach. The core practice dimensions of the story telling approach, connectedness, reflection, meaning making, learning and agency are outlined and examples of how they manifest in practice are provided as well as examples of story crafting questions. Future directions of the story telling approach are considered.

Abstract 3946

EVERY LIFE DESERVES A NOVEL: NARRATING SELF IN CAREER CONSTRUCTION COUNSELING

Hartung P.*

Department of Family and Community Medicine Northeast Ohio Medical University ~ Rootstown ~ United States of America

Career construction recognizes every person's life is worth a novel and counseling assists to write the next life-career chapter. Career construction as a counseling approach applies narrative methods in an interpersonal process of supporting individuals to author their lives and make purposeful career choices and plans. Career construction counseling (CCC) emphasizes human diversity, uniqueness, and intentionality to support individuals in making choices about current life-career transitions and future career directions. CCC methods of a six-question interview and self-directed workbook elicit small stories about who one is and who they wish to become. These micro-stories are then shaped into a macro-narrative about an individual's perspectives on their current career problem, self-view, preferred work settings, goals, and adaptive strategies. From telling the life story, client and counselor co-construct a life portrait that entails an autobiographical narrative about the person's central life theme. In co-constructing a life portrait, the counselor assists the client to relate the life theme to a career problem or transition currently faced. Counselor and client use the life portrait to prompt the client to move intentionally toward enacting self in a life-career. CCC methods of the interview, life portraiture, and action aim to promote a core counseling goal of increased reflexivity wherein individuals use increased self-awareness and self-understanding to act on their careers with a clearer sense of identity and intentionality. This process assists in authoring a life-career story that increases ability to navigate transitions and make choices with greater clarity and conviction. This presentation describes career construction as a narrative counseling approach that has been adopted and applied worldwide. A case example demonstrates its use, research support for its core methods are described, and future directions considered.

Abstract 3947

ADOPTING RE-AUTHORING CONVERSATIONS FOR NARRATIVE CAREER COUNSELLING OF YOUNG PEOPLE WITH REFUGEE BACKGROUNDS

Abkhezr P.*

Griffith University ~ Brisbane ~ Australia

Culturally and contextually relevant career counselling, such as narrative career counselling, assist young refugees reclaim their lives from the grip of career problems that are often systemic in nature and result in experiences of voicelessness, invisibility, and inaudibility. By centering cultural, communal, and relational contexts of their lives, narrative career counselling helps young refugees re-author career narratives reflecting their strengths and aspirations. It fosters a sense of agency and belonging, supporting people in envisioning and pursuing meaningful pathways that align with their post-migration evolving career identities.

In advancing narrative career counselling as a socially just career practice, honouring cultural, communal, relational and contextual influences that shape people's career development is crucial. Re-authoring conversations help clients construct new meaning from these influences, repositioning young refugees' experiences in new narratives, rendering obsolete those restrictive stories that often marginalise and overshadow cultural, communal and relational aspects of their lives that support their career development. While re-authoring has a strong foundation in narrative therapy, its application in career counselling requires further development and research to realise its potential in addressing systemic barriers in collaboration with clients.

The current research engaged eight young refugees in narrative career interviews. First their career development was explored across their pre- and post-migration journeys. Relying on this generated knowledge, they were engaged in reflective conversations about their career development using questions adopted from the statement of position map two of narrative practice. The scaffold of open-ended questions consisted of seven categories: 'existing knowledge, re-authoring, re-membering, mapping of the effects of a unique outcome, evaluation of the effects, justifying the evaluation, and finally, emergent potential knowledge'. Findings highlight the value of re-authoring conversations in navigating culturally resonant career conversations that assist young refugees with career planning and decision making, while honouring the cultural, relational and communal aspects of their lives.

Abstract 3948

CULTURE-INFUSED CAREER COUNSELLING: EXPLORING CULTURAL AND SOCIETAL NARRATIVES

Arthur N.*

The University of South Australia, UniSA Business ~ Adelaide ~ Australia

Prevailing societal narratives may either align with or contradict those learned within specific cultural contexts. These narratives are communicated both explicitly and implicitly, shaping deeply held assumptions about the self, others, and the world. They influence how people perceive their roles in society, their relationships, and their opportunities. In career counselling, exploring the interplay between societal and cultural narratives provides a window into clients' worldviews and their values, beliefs, and emotions regarding education, career pathways, family and community roles, and notions of career success. Through an exploration and learning process, career counsellors can support clients to gain a better understanding about relevant social and cultural narratives.

A meaning-making process that encourages reflection and dialogue allows clients to critically examine the narratives influencing their career decisions and career development. Through this process, clients can revise existing narratives or construct new ones that are more relevant to their aspirations and challenges. Surfacing narratives through personal experiences fosters self-awareness and empowers clients to re-author their stories in ways that align with their evolving identities. While gaining new perspectives can be liberating, encountering conflicting narratives can also be unsettling. Clients may experience dissonance and resistance as they navigate the tensions between prior understandings and newly emerging insights.

This presentation highlights Culture-Infused Career Counselling and supporting clients to recognize, integrate, and reauthor the narratives that have influenced their careers. Additionally, it emphasizes the importance of career counsellors engaging in reflective practice to examine the societal and cultural narratives that have shaped their own career development. Suggestions will be provided for incorporating ongoing self-reflection into case conceptualization and intervention planning, encouraging career counsellors to deepen understanding about personal assumptions, while guiding clients through career exploration and decision-making.

DECENT WORK AND SUSTAINABLE CAREERS: DEVELOPMENTAL AND CULTURAL PERSPECTIVES

Wednesday 22 July 2026 from 11:00 to 12:30

(Q-Arsenale)

Rachel Gali Cinamon (Tel Aviv University ~ Tel Aviv ~ Israel), Chair and Presenter
David Blustein (Tel Aviv University ~ Tel Aviv ~ Israel), Discussant

Decent work and sustainable careers are increasingly recognized as essential for individual well-being, social inclusion, and societal development. Building on the Psychology of Working Theory (PWT) and the sustainable careers framework, this symposium brings together five empirical and conceptual contributions that illuminate how developmental stage and cultural context shape access to decent work and the pursuit of sustainable careers.

The symposium begins with a study from Costa Rica (Murillo Aguilar et al.), which highlights the critical role of vocational guidance in secondary education as a pathway to learning, employability, and social transformation. Expanding the focus on adolescence, Ran explores the voices of Israeli youth with learning disabilities and ADHD, showing how family support shapes their future perceptions and career aspirations. Continuing with young people in transition, Parada and colleagues present longitudinal data from Finland, on how turning points in goal construction and action-taking influence the post–high school transition and subsequent career sustainability.

Moving to midlife, Gortler Segev and Cinamon examine how temporal dimensions of work–family relations affect teachers' experiences across one academic year, demonstrating the implications of professional stage and organizational cycles for sustainable career paths. Finally, Karacan Ozdemir and Blustein broaden the lens to late adulthood, introducing a Psychology of Working Theory model of decent retirement, which integrates macro-level constraints with psychological resources to address adjustment and life satisfaction in the retirement transition.

Together, these studies provide a developmental arc spanning adolescence through retirement, across diverse cultural contexts—Costa Rica, Israel, Portugal, Finland, Türkiye, and the U.S. By situating individual career pathways within broader sociocultural and temporal frameworks, the symposium advances a more holistic understanding of how to foster decent work and sustainable careers across the life span.

Abstract 3627

TURNING POINTS IN PROCESSES OF CAREER GOAL CONSTRUCTION AND YOUNG PEOPLE'S ACTIONS DURING THE POST-HIGH SCHOOL TRANSITION: WHAT CAN WE LEARN?

Parada F.*[1], Salmela--Aro K.[2]

[1]Lusofona University ~ Porto ~ Portugal, [2]University of Helsinki ~ Helsinki ~ Finland

As they navigate the post-high school transition, young people must decide and act on their decision to continue studying, take a gap year, or enter the labour market. For many, this is a challenging transition requiring them to make a complex set of decisions while determining and making sense of who to become and what to make of their lives and careers (Guichard et al., 2012). The career goals young people set, monitor, pursue, and renegotiate are crucial for how they navigate this transition, thus for the sustainability of their careers (Parada & Salmela-Aro, 2022). The more timely and well-aligned with transition-specific demands are the goals young people set and pursue, the more likely it is for positive transition outcomes to occur (Salmela-Aro, 2009). The study aims to investigate how young people going through the post-high school transition navigate such a process by (a) identifying turning points in the career goals' trajectories, specifically in how young people appraise their goals – i.e., how they think and feel about the goal; (b) verifying the relations these turning points maintain with changes in the goal-related activities they reported. Weekly, for approximately 9 months, 23 participants aged 18-19 years in the last year of high school received a notification on their mobile phones informing them it was time to fill their diary reports. Data collection used AWARE (Ferreira et al., 2015). Besides questions about their weekly career goal, the questionnaire included an open-ended question about three activities the young person was doing relating to the goal, and six self-rating items asking them to appraise the goal (commitment, confidence, difficulty, effort, progress, and stress). Data analysis is ongoing. Preliminary results show that taking action toward the goal may explain turning points, that is, meaningful deviations in time series data that involve discontinuous changes.

Abstract 3628

THE TEMPORAL NATURE OF WORK–FAMILY RELATIONS IN MIDLIFE TEACHING CAREERS

Gortler Segev E., Cinamon R.G.*

Tel Aviv University ~ Tel Aviv ~ Israel

Work–family relations are central to the sustainability of careers, shaping individuals' well-being, productivity, and capacity to remain engaged across the life span. Although career development theories acknowledge their temporal nature, understanding of how these dynamics evolve across time and life stages remains limited. This longitudinal study examined work–family dynamics among midlife teachers, integrating multiple temporal dimensions: professional developmental stage, organizational time perspective, and cultural–historical time.

The sample comprised 288 Israeli teachers, predominantly female (81%), with a mean age of 42.66 years. Participants completed three-wave questionnaires assessing work–family relations across one academic year (beginning, middle, and end).

Repeated-measures analyses of variance revealed significant fluctuations in work–family conflict (WFC) across the school year ($F(1.95, 558.97) = 3.92$, $p < .05$), with lower levels reported in the middle of the year. In contrast, work–family enrichment (WFE) remained stable. Analyses by professional developmental stage indicated that higher work tenure was consistently associated with lower conflict across all three measurement points (T1: $F(5, 279) = 2.88$, $p < .05$; T2: $F(5, 279) = 3.01$, $p < .05$; T3: $F(5, 279) = 2.97$, $p < .05$). Associations between professional stage and enrichment were less consistent.

Findings underscore the importance of temporal dimensions in shaping teachers' work–family experiences. Time functions as an identity shaper, reflecting both personal trajectories (e.g., age, parenting stage) and professional pathways (e.g., tenure, career stage, organizational cycles). Situating these dynamics within the sustainable careers framework highlights the need to address midlife challenges to support teachers' well-being and career longevity. This contribution advances the symposium's broader aim of linking developmental stages and cultural contexts to the pursuit of decent work and sustainable careers.

Abstract 3629

DECENT RETIREMENT: A PSYCHOLOGY OF WORKING PERSPECTIVE OF A DECENT LIFE

Ozdemir N.K.*[1], Blustein D.[2]

[1]Hacettepe University ~ Ankara ~ Turkey, [2]Boston College ~ Chestnut Hill, MA ~ United States of America

Transitioning from an active life of work to retirement is one of the most challenging developmental tasks of aging. For many people, work is a source of accomplishment, achievement, and identity. At the same time, work can evoke considerable hardship in life, including indecent work conditions, harassment, bullying, and ongoing to struggles to attain and sustain decent work (Blustein, 2019). In this presentation, we present a model of decent retirement based on psychology of working theory (PWT; Duffy et al., 2016). This model is based on the premise that the conditions and psychological resources that support satisfying work and well-being are also important in facilitating retirement. We define decent retirement from the perspective of PWT, which is constructed around an integrative view of macro-level factors (economic constraints and marginalization) with relevant psychological factors, which shape the transition from active work to need fulfillment, life satisfaction, and adjustment to retirement. Following a conceptual and developmental review of the model on decent retirement, we then provide directions for future research and public policy. Implications for the retirement transition are also reviewed with a focus on how applied psychologists and counselors can support people entering and managing the transition to retirement.

PRESENT CHALLENGES AND FUTURE DEVELOPMENT OF CHILDREN'S CAREER DEVELOPMENT

Wednesday 22 July 2026 from 14:00 to 15:30

(Q-Arsenale)

Mary McMahon (The University of Queensland ~ Brisbane), Chair and Presenter

Childhood career development is a critical foundational stage of lifespan career development. Yet
the theory, research and applied intervention described in the literature remains consistently
concerned about the lack of an integrative understanding of this foundational stage. The present
symposium considers recent theory, research and applied interventions in relation to the
challenges facing this field and proposes innovative and novel suggestions. The symposium's
topic is relevant to the conference's overall theme and goals. It considers new directions in child
career development from four international perspectives. In particular, it describes novel ways in
which theory and research can be applied in educational settings. In addition, a presentation
considers extant and future challenges in our understanding of children's career development. The
presentations are relevant to the Sustainable Development Goals of Quality Education and
Reduced Inequalities. Professor Oliveira and Paula Barrosa's (Portugal) paper presents a meta
analysis of recent literature and explores contextual influences on children's life experiences.
Importantly, this is considered in relation to later lifespan development, as well as child and pre
adolescent career interventions. Dr McMahon's (Australia) paper focuses on the
interconnectedness of theory, research and practice, and distils theoretical key features that
practitioners need to consider in developing intentional career development learning interventions.
Professor Romero-Rodrigues and Celia Morilla's (Spain) paper is focused on 5- to 7-year-old
children. They consider critical career guidance and qualitative career assessment in promoting
critical awareness in young children, and suggest interventions that develop equity, social justice,
individual and collective activism, sustainability, and culturally sensitive processes. Professor
Sgaramella and Lisa Ferrera's (Italy) paper analyses career education interventions and suggests
an integrative approach across diverse nationalities. Amongstemergentthemesisthatofsustainabledevelopmentgoals.ProfessorWatson's(SouthAfrica)paperdescribesthechallengesthatchildcareerdevelopmentfacedoverthelastdecadeandhowthisimpactedamoreholisticunderstandingoflifespancareerdevelopment.Thepaperconsid

Abstract 3971

CAREER DEVELOPMENT LEARNING IN CHILDHOOD: UNINTENTIONAL AND INTENTIONAL

Mcmahon M.*

The University of Queensland ~ Brisbane ~ Australia

"I want to do what my Dad does." "I'd be good at painting because I like drawing."Statements such as these made by children provide evidence that career development learning begins early in the childhood years. Children observe and try to understand the world around them and begin to imagine themselves in adult life. Career development learning can be unintentional and intentional. Unintentional career development learning, as reflected in the children's statements, is unavoidable as children observe and participate in the world around them that includes seeing adults at work. Intentional career development learning is provided in formal settings such as career education classes. Career development in childhood has received less attention in theory, research, and practice than other lifespan periods such as adolescence. A limited number of career theories offer accounts that inform our understanding of children's career development, yet few of these provide guidance for facilitating intentional career learning for children. This presentation focuses on career development learning in childhood with a view to connecting theory, research, and practice. The aims of this presentation are twofold. First, the presentation will consider examples of statements made by children in a selection of research projects in relation to career theories. Second, it will overview relevant career theories and distil a set of theory informed key features of intentional career development learning that can guide practitioners.

Abstract 3973

CAREER EDUCATION WITH PREADOLESCENTS: PILLARS AND PATHS FROM ADOPTING AN INTEGRATIVE APPROACH

Sgaramella T.M.*[1], Ferrari L.[2]

[1]FISPPA Department University of Padova ~ PADOVA ~ Italy, [2]University of Padua ~ Padua ~ Italy

Complex conditions characterize our time with changes in the economy, technology, work activities and the risks of exacerbating social inequalities and exclusion processes. These complex conditions underline the relevance of preventive career education efforts with preadolescents whose experiences are grounded in the construction of self-identity. An integrative perspective may help address the actual world of work complexities and understand how youth affords meaning to their experiences in the several systems that they live in, their career construction processes (Romero-Rodríguez et al., 2022; Sgaramella, 2022), as well as undertake critical perspectives. A critical analysis of career education interventions based on an integrative approach and proposed to pre-adolescents in diverse international settings is proposed. This will help highlight core themes and intervention efficacy and support an understanding of how challenges and current critical perspectives in career counselling enter in the integrative paths proposed to pre adolescents. Programs implemented by the authors together with the SEEDs Research Group will be used for discussion.
Pillars emerging from the analysis of integrative interventions (Sgaramella & Ferrari, 2024) that guided the review are: considering the domains of development and the mediating role of relevant life contexts; adopting a present- to future-oriented focus in career exploration; considering Psychosocial and Career-Related Assets; and opening to the digital world and Sustainable Development Goals. The analysis suggests that, along different patterns of expression, Integrative Career Education in the school context can take the role of promoting knowledge and skills in the self and others, the educational and professional worlds, and borrowing from recent approaches to career counselling. Additionally, when considering current critical perspectives, it can reveal an effective strategy and an opportunity for career development learning to evolve its focus, address complexities and prepare for unexpected challenges.

Abstract 3974

EVOLVING CHALLENGES IN UNDERSTANDING CHILD CAREER DEVELOPMENT: INTERNATIONAL PERSPECTIVES

Watson M.*

Nelson Mandela University ~ Gqeberha ~ South Africa

A decade ago (2017) the first (and only book to date) was published on child career development. In reflecting on the growing focus of this earliest stage of lifespan career development, the book posed the question of how much our understanding of children's career development has been advanced. In particular, there was concern that, while this foundational stage would provide a more holistic understanding of lifespan career development, the theory, assessment, research and practice of child career development has remained largely 'siloed' in the literature. This siloed literature impacts the development of interventions in this important stage of lifespan career development. There have been resultant calls for greater consolidation, innovation and extension in this critical career developmental stage, and for a more adaptive focus that reflects the constantly changing environments in which children develop today. In the second half of the last decade a special issue of the British Journal of Guidance and Counselling reported on the continuing growth of literature in this field but also identified persistent concerns limiting our understanding of this foundational career development life stage. These include a limited focus on disciplinary perspectives, on systemic factors (e.g., socioeconomic status), on disadvantaged and special needs children, and a limited evidence base of child career development learning interventions. The special issue concluded that career development learning remains largely circumscribed in this critical lifespan career development foundation stage, and that theory, research and practice remain fragmented and limited. The present paper considers the contributions of four international experts in relation to identified challenges over the last decade in the field of child career development. The presentations are also considered in relation to two of the conference's Sustainable Development Goals, i.e. Quality Education and Reduced Inequalities.

Abstract 4926

THEMATIC TRENDS AND EMERGING DIRECTIONS IN CHILDREN'S CAREER DEVELOPMENT RESEARCH (2005–2024): A PRISMA-GUIDED TOPIC MODELING ANALYSIS

Howard K.*[1], Bu Z.[1], Karacan Ozdemir N.[2]

[1]Boston University ~ U.S.A., [2]Hacettepe University ~ Turkey

Professor Howard and colleagues' (U.S.A. & Turkey) paper presents a systematic, AI-driven analysis of thematic trends and emerging directions in children's career development research spanning two decades (2005–2024). Using PRISMA guidelines and topic modeling, the study maps the evolving landscape of the field, identifies prevailing research gaps, and points toward future directions for supporting children's career readiness and development.

SUPPORTING DIVERSE MIGRANT COMMUNITIES TRANSITION TO EDUCATION AND WORKFORCE: INNOVATIVE CAREER DEVELOPMENT RESEARCH AND PRACTICE

Wednesday 22 July 2026 from 15:30 to 17:00

(Q-Arsenale)

Peyman Abkhezr (Griffith University ~ Brisbane ~ Austral), Chair and Presenter
Mary McMahon (The University of Queensland ~ Brisbane), Discussant

Worldwide, migrant and refugee communities encounter systemic barriers to education and workforce transition in post-resettlement contexts, disrupting opportunities for career development. This symposium offers a range of international perspectives on innovative practice and research approaches aimed at supporting diverse migrant communities through critical transitions into education and the workforce. Cycling through entry-level jobs and precarious work traps migrants in welfare dependence, undermining well-being, limiting inclusion and integration, and squandering potential and economic growth. Smooth labour market integration enables migrants to convert their skills into sustainable employment, increasing independence, dignity, and agency while fostering social and civic contributions, bringing stability and purpose to their lives, supporting career development, and contributing positively to host economies. However, supporting migrants and refugees to navigate work-life transitions is context-bound and requires culturally and contextually relevant strategies.

The symposium focuses on practical career psychology and counselling innovations that promote diverse migrants' agency, social participation and partnership, leading to more sustainable employability outcomes in different country contexts. Presentations will explore research-informed, qualitative approaches that illuminate the emotional, relational, gendered, and temporal dimensions of migrant and refugee career development, moving beyond individualised framings toward relational and systemic understandings of career transitions. Through creative and participatory methods, they show how culturally and contextually responsive strategies can reframe challenges, foster agency, and support transitions into education and employment aligned with family and social commitments. These initiatives are grounded in culturally and contextually responsive strategies that address the complex realities of navigating higher education and the labour market within contexts often unfamiliar and culturally alienating. By drawing on diverse regional and national perspectives, the symposium highlights shared challenges and localised solutions that promote inclusion and social justice, ultimately contributing to more equitable policies. Attendees will gain comparative insights, ethically grounded strategies, and practical tools for empowering migrant communities.

Abstract 3111

TRAVELLING WITH EMOTIONS: INTERNATIONAL STUDENTS' FIRST YEAR EMPLOYMENT JOURNEYS

Arthur N.*[1], Woodend J.[2]

[1]University of South Australia (Adelaide University January 1, 2026) ~ Adelaide ~ Australia, [2]University of Victoria ~ Victoria ~ Canada

The emotional dimensions of international students' career development and transition experiences have often been overshadowed by a predominant focus on education as a pathway to employment. Prior research has focused on international students' human capital and competitiveness in the global labour market. Alongside credential-building runs a powerful emotional current, shaping and shaped by career transitions. The constant evaluation of progress toward career and migration goals is often accompanied by a shifting mix of hope, anxiety, pride, and uncertainty.

These emotions are not incidental. They emerge from changing circumstances, fresh feedback, unexpected challenges, and evolving aspirations. For many international graduates, the first year of post-study employment is a high-stakes balancing act, meeting employer expectations, adapting to workplace culture, and pursuing long-term migration plans, while carrying the weight of personal and family hopes.

This presentation explores international students' transition experiences through a secondary analysis of critical incidents, using reflexive thematic analysis to uncover how culture, context, and coping strategies intertwine. The findings reveal three interconnected themes under an overarching metaphor: travelling with emotions along career pathways. Emotions here are not passive reflections of events, but rather active companions that emerge during transitions. By foregrounding emotional experience, this research invites a more holistic understanding of international student transitions, one that accounts for both the actions they take and the feelings they carry. The presentation will offer insights for career services to integrate emotional awareness into support programs and outline new research directions that place emotions at the centre of career development theory and practice.

Abstract 3112

IT TAKES TWO: EXPLORING THE CAREER DECISION-MAKING PROCESS OF INTERNATIONAL STUDENTS AND ACCOMPANYING PARTNERS

Woodend J.*, Begg M.

University of Victoria ~ Victoria ~ Canada

International students are often considered individual agents in migration and educational research. Yet, many international students arrive as part of a couple, making shared career and life decisions for the student to study internationally. Accompanying (non-student) partners play a critical role in the success and well-being of international students, offering emotional, practical, and social support, while frequently experiencing exclusion from research, services, and institutional recognition. Despite many accompanying partners having advanced degrees and established careers before migrating, they often forgo or must defer their own career development due to policy limitations, family demands, and to prioritize the student's career.

This study explored the career decision-making process of international student-accompanying partner couples, one year after their transition to Canada, centring the couple as a unit of analysis. We used interpretative phenomenological analysis using dyadic interviews with international student and accompanying partner couples. Interviews focused on how participants made sense of the decision to pursue international education and the implications of that choice for their identities, careers, and relationships.

Preliminary findings suggest that both individuals made meaningful sacrifices (e.g., career, familial, and financial) in pursuit of a shared goal. Partners' experiences reveal distinct challenges in workforce integration and identity re-negotiation. Across dyads, the decision to migrate for education was understood relationally, and participants framed their aspirations in terms of mutual resilience and future employability. Emerging implications for career services highlight the need for interventions that recognize relational migration contexts versus assumed individual ones.

This study adds to career development, and vocational and counselling psychology by proposing contextually responsive strategies to better support migrant couples navigating complex transitions into education and employment. These insights contribute to broader policy conversations about dignified and inclusive pathways for high-skilled migration.

Abstract 3113

NAVIGATING WORK-LIFE TRANSITIONS WITH MULTIPLE VOICES: SECONDARY-VISA HOLDER MIGRANT WOMEN'S LIFE-CAREER STORIES

Yazdankhoo S.*[1], Abkhezr P.[1], Mcmahon M.[2], Mcauliffe D.[1]

[1]Griffith University ~ Gold Coast ~ Australia, [2]The University of Queensland ~ Brisbane ~ Australia

Migrant women often encounter systemic challenges that not only hinder their participation in paid work but also impact other domains of their lives, collectively disrupting their career development. A great number of women from economically developing countries enter Australia as secondary-visa applicants, accompanying their husbands (i.e., primary applicants). In navigating work-life transitions, secondary-visa holder migrant women (SVMW) face significant uncertainties and constraints, shaped by multiple contexts and systems of influence, that disrupt their career development.

Grounded in the Systems Theory Framework and an ethic of care, this research utilised narrative inquiry to explore life-career stories of former SVMW, now permanent residents or Australian citizens, to retrospectively reflect on their career development at the intersection of gender and migration. Narrative inquiry facilitated storytelling and enabled an exploration of the participants' narrative nuances and voices. Six former SVMW were recruited through purposive sampling to attend a single semi-structured interview.

To keep participants' voices and perspectives alive, the "voice-centred relational method of analysis" (VCRA) was employed as a method of analysis to amplify the participants' unique and contrapuntal voices. The four distinct VCRA stages enabled the researcher to identify the cultural, contextual, and relational voices that operate in participants' life-career stories, and to position these voices within the broader social structures and dominant discourses that surround them.

By attending to the multiple voices of each participant, the findings highlight how SVMW navigate their work-life transitions amid relational, contextual, and structural influences, diversely shaping their career development across pre- and post-migration contexts. This research underscores the importance of co-constructive and participant-centred approaches like narrative inquiry, which prioritise care and amplify the nuanced and often-overlooked experiences of migrant women labelled as "dependents", thereby promoting social justice. Implications for research, practice, and policy that support SVMW's transition to education and workforce will be outlined.

Abstract 3114

EVOLVING FORMS OF SHARED AND NON-SHARED AGENCY IN INVOLUNTARY CAREER CHANGE AFTER MIGRATION: A QUALITATIVE LONGITUDINAL STUDY

Brazier C.É.*, Coquoz R., Masdonati J.

University of Lausanne ~ Lausanne ~ Switzerland

In contexts of forced migration, individuals often face involuntary career changes due to the non-recognition of prior qualifications, legal restrictions, or structural barriers. These transitions are frequently marked by limited opportunities, ruptured professional identities, and the challenge of reorienting one's life course under pressure. Yet, forms of agency persist, even in partial or relational forms, as individuals navigate and respond to these uncertain,
involuntary transitions. Drawing on the work of Hitlin and Elder (2007) and Chang et al. (2022), we conceptualize agency as differentiated (existential, pragmatic, identity, life course), relational (shared or non-shared), and temporal. Shared agency can arise through support, collaboration, or accommodation with professionals and institutions, while non-shared agency emerges when others are disengaged, overly directive, or structurally absent. Agency is also temporally embedded: it fluctuates, accumulates, or recedes depending on changing conditions. While career transitions among people undergoing migration have received increasing attention, most studies tend to focus either on structural barriers or on individual strategies, often neglecting how agency unfolds over time and through relationships.

This presentation builds on a four-wave longitudinal qualitative study (2020–2025) conducted in Switzerland with four migrants who were forced to change professions due to diploma non-recognition and institutional barriers. We conducted semi-structured interviews at yearly intervals and used temporal thematic analysis to trace which dimensions of agency occur and how shared and non-shared agency emerge, evolve, and sometimes erode over time, and across transition phases. We conclude by discussing implications for counseling psychology and vocational guidance. Findings emphasize the need to move beyond individualistic, present-focused interventions. Supporting involuntary career change after migration requires dialogical spaces that honor temporal complexity, identity disruption, and collective dynamics. Counselors should consider agency in its various dimensions, relations, and shifting rhythms to help individuals sequence meaningful, short-term, and long-term steps, even in uncertain conditions.

Abstract 3115

INDIVIDUAL CAREER PROJECTS AND RELATIONAL RESPONSIBILITIES: NARRATIVE CAREER COUNSELLING, RELATIONAL CAREER STORYTELLING, AND REFUGEE-BACKGROUND AUSTRALIAN YOUNG MEN

Abkhezr P.*

Griffith University ~ Brisbane ~ Australia

Narrative career counselling (NCC) positions career support as inseparable from social justice and aims to relocate solution constructions beyond individual choice to the social, relational, communal, and contextual systems underpinning career development. For some young men from refugee backgrounds, systemic barriers to education and employment intersect with collectivist orientations, where work-life transitions are negotiated through responsibilities to family and community, culturally anchored in expectations of masculine provider roles. Attending to cultural and relational landscapes, NCC offers responsive strategies, creating room to reframe problems, thicken alternative stories, and align vocational intentions with individual preferences grounded in communal and relational commitments.

This presentation draws on case study research with three undergraduate university students from refugee backgrounds in Australia, each of whom attended two interviews. The first interview elicited migration, education, work histories, and career support experiences. The second invited relational reflections on steps toward preferred futures, the values and relationships underpinning those steps, their effects across life domains, and future actions.

A cross-case narrative analysis highlights how participants built footholds in education and work through relational and community-recognised understandings of career and work–life transitions, and how redefining progress as relational contribution and future care for others anchored their career decisions in meaningful cultural narratives. NCC facilitated movement from decision-centric framings to relationally congruent progress that felt agentic, sustainable, and accountable to significant others, supporting both personal agency and wider social participation.

The session will illustrate case vignettes, interview questions, and translate these insights into actionable guidance for practitioners and programme designers. Implications include engaging men's collectivist commitments as assets, implicitly inviting family/community audiences into career meaning-making to widen preferred options (utilising re-membering conversations). Findings contribute to international dialogues on socially just, culturally responsive strategies supporting migrant and refugee communities in transitions through higher education and into the labour market.

16 - Division 16: Counseling Psychology

TRANSDISCIPLINARY COLLABORATION AS THE FUTURE OF VOCATIONAL PSYCHOLOGY: INTEGRATIVE DIRECTIONS FOR WORK AND CAREER RESEARCH

Wednesday 22 July 2026 from 17:00 to 18:30

(Q-Arsenale)

Bryan Dik (Colorado State University ~ Fort Collins), Chair and Presenter
Patrick Rottinghaus (University of Missouri-Columbia ~ Columb), Co-Chair
Hang-Shim Lee (Konkuk University ~ Seoul ~ Korea, Repub), Discussant

As vocational psychology looks toward the future, a key opportunity lies in transdisciplinary collaboration. This symposium will examine opportunities, challenges, and practical examples of how vocational psychology research and practice can engage productively with other disciplines to address complex societal systems shaping work and career development. The topic is a strategic priority for the field and aligns directly with one of the four ICAP 2026 themes. Although transdisciplinary collaboration is closely related to (and distinct from) multi-, cross-, and interdisciplinary work, these distinctions will be briefly clarified without detracting from the central message: multiple forms of collaboration can advance vocational psychology's impact.

Following a brief introduction by the co-chairs, Bryan Dik (Colorado State University, USA) will share practical lessons learned from a 15-year journey building deep transdisciplinary collaborations across diverse research and applied contexts. Next, Mary McMahan (University of Queensland, Australia) will highlight vocational psychology's role as a transdisciplinary partner in advancing sustainable development. She will show how vocational psychology can contribute to interconnected solutions aligned with the UN Sustainable Development Goals. Third, Peter McIlveen (University of Southern Queensland, Australia) will explore vocational psychology's contributions to industrial research efforts that strengthen career pipelines for vital occupations facing skill shortages, including examples of influence on curricula and pedagogy. Fourth, Jason Wang (Inflection Points Therapy, Washington, D.C., USA) will describe integrating vocational psychology into private practice, moving beyond traditional career counseling toward an approach that addresses the intersection of career development, well-being, and mental health. Finally, Patrick Rottinghaus (University of Missouri–Columbia, USA) will present transdisciplinary research on elementary STEAM learning through project-based activities involving collaborations with school leaders and community organizations.

Discussant Hang-Shim Lee (Konkuk University, South Korea), Chair of the Society for Vocational Psychology, will synthesize themes, offer conclusions, and outline a path forward for transdisciplinary influence in the field.

Abstract 4522

ONE VOCATIONAL PSYCHOLOGIST'S TRANSDISCIPLINARY ODYSSEY: OPPORTUNITIES, CHALLENGES, AND LESSONS LEARNED

Dik B.*

Colorado State University ~ Fort Collins, Colorado ~ United States of America

In response to evolving interests, unexpected opportunities, and local challenges, I began—approximately 15 years ago—to pursue a series of transdisciplinary collaborations. These efforts have included: (1) co-founding, scaling, and ultimately selling (11 years later) an educational technology company with an I-O psychologist and two entrepreneurs; (2) developing multidisciplinary, international research collaborations focused on meaningful work, work as a calling, and human flourishing; (3) joining a predominantly European, multidisciplinary team that recently established a new research subdiscipline, spiritual knowledge management; (4) transitioning to a faculty position in an I-O psychology doctoral program embedded within the interdisciplinary field of occupational health; and (5) leading a large-scale, multi-institutional study of vocation, calling, and purpose involving students, faculty, staff, and administrators across 36 small, independent liberal arts colleges in the United States.

Collectively, these experiences have yielded significant intellectual richness, unexpected friendships, an expanded scholarly perspective, and opportunities to engage with new research literatures and academic communities. At the same time, sustained transdisciplinary engagement has introduced distinctive challenges, including professional identity ambiguity, a persistent outsider status, and reduced depth of relational and intellectual investment within my home subdiscipline. The presentation will close with reflections on lessons learned from transdisciplinary work, including the necessity of accepting opportunity costs, balancing breadth with depth of influence, and discerning the career-stage timing most conducive to such engagement.

Abstract 4523

VOCATIONAL PSYCHOLOGY AND THE SUSTAINABILITY AGENDA: A CASE FOR TRANSDISCIPLINARY RESEARCH

Mcmahon M.*

The University of Queensland ~ Brisbane, Queensland ~ Australia

Sustainability is a complex and pressing 21st century systems problem. The United Nations Sustainable Development Goals (SDGs) identify 17 areas where focused attention is needed to address issues of rising inequality and poverty globally, entrenched gender inequality, economic growth, and environmental issues related to climate change. Around the world, governments at all levels, corporations, scientists of various disciplines, and individual citizens are finding ways to contribute to the sustainable development agenda. Vocational psychology can also have a role to play. Sustainability however, is a complex systems problem that will not be addressed through simple solutions or single disciplines because of the interconnectedness and pervasiveness of the issues. Transdisciplinary research has the capacity to tackle complex systems problems such as the SDGs e.g., gender inequality because it involves multiple stakeholders, employs systems thinking, and is solution focused. Systems thinking takes a holistic view of issues and considers the interconnectedness of parts of the system. Transdisciplinary research and systems thinking go hand in hand by involving multiple stakeholders including those whose voices are less heard, who bring diverse knowledges to issues and through dialogue and collaboration, co-design solutions. Transdisciplinary research however, is not without its challenges. This presentation will overview the Sustainable Development Goals and identify areas in which vocational psychology could make a contribution. It will introduce transdisciplinary research and systems thinking and consider their strengths and challenges. Examples will be provided of how vocational psychology could contribute to transdisciplinary research related to the Sustainable Development Goals.

Abstract 4524

THE USEFULNESS OF VOCATIONAL PSYCHOLOGY FOR INTERDISCIPLINARY R&D TO ENHANCE CAREER PIPELINES INTO VITAL OCCUPATIONS IN SHORTAGE OF SUPPLY

Mcilveen P.*

University of Southern Queensland ~ Toowoomba, Queensland ~ Australia

Governments and industries are alarmed by vital occupations which are experiencing “skill shortages” due to diminished numbers of new entrants into these occupations and increased numbers leaving (e.g., engineering, agriculture, teaching, nursing). These occupations are literally vital for societies’ survival. Vocational psychology can and should inform research and development which contributes to these vital occupations’ workforce sustainability. Compared to other disciplines (e.g., economics), vocational psychology’s theories and corpus of research evidence, and its applied profession—career development—are relatively absent from efforts to boost efforts to attract people into and retain them in these occupations. This presentation will describe a program of interdisciplinary research which involves collaboration with researchers in the professions of nursing and teaching—literally vital professions suffering workforce shortages across the globe. The presentation will demonstrate how vocational psychology theory, research, and practice has been integrated with the curricula and pedagogical systems of the two professions, and how vocational psychology research has been (increasingly) accepted in their respective disciplinary literatures as bringing new insights to seemingly intractable problems.

Abstract 4526

TRANSDISCIPLINARY PERSPECTIVES ON STEAM LEARNING AND CAREER EXPLORATION

Rottinghaus P.*

University of Missouri-Columbia ~ Columbia, Missouri ~ United States of America

Given the complexity of work and sociocultural contexts, youth require transdisciplinary insights as they plan their careers to meet challenges of the 21st century. In particular, there is great demand for science, technology, engineering, arts, and mathematics (STEAM) skills in today's technological society. By integrating vocational psychology, education, and community perspectives, this study illustrates dynamic solutions for advancing STEAM learning and career exploration.

This presentation describes ongoing transdisciplinary research examining STEAM learning among elementary students through project-based learning activities facilitated by creative collaborations with community organizations in a large city in the midwestern United States. Informed by Social Cognitive Career Theory (Lent et al., 1994), this research examines the experiences of elementary students of color who participate in projects to address real-world problems and explore STEAM while developing critical thinking, problem-solving, communication, collaboration, and creativity skills. Thematic analysis revealed three central themes: self-efficacy development, project-based learning, and contextual factors. Students described how mastery experiences, peer modeling, encouragement, and emotional regulation contributed to self-efficacy, while project-based activities contributed to creativity, collaboration, and problem-solving. Contextual factors (including family involvement, mentorship, school culture, and community partnerships) played a central role in shaping student experiences. This presentation emphasizes the benefits of transdisciplinary approaches to research by describing how pivotal collaborations with educators, artists, and community partners can advance intentional strategies to support students as they prepare to address future societal challenges that require new approaches to learning and career exploration.

16 - Division 16: Counseling Psychology

STUDIES ON CAREER COUNSELING PROCESS AND OUTCOME

Thursday 23 July 2026 from 08:00 to 09:30

(Q-Arsenale)

Paulo Cardoso (University of Évora ~ Évora ~ Portugal), Chair

The study of the counseling process - particularly the experiences of counselors and clients, including their thoughts, feelings, and behaviors during interventions (Hill & Williams, 2000) - provides valuable insights for advancing both theoretical understanding and practical applications. Despite its importance, this area of research remains relatively underexplored, as reflected in repeated calls for further investigation (Heppner & Heppner, 2003; Whiston & Rose, 2015).

This gap is particularly evident in career counseling, where most practices are grounded in theories of vocational behavior and career development. Although these theories are essential for understanding the individuals targeted by interventions, they offer limited guidance on how to engage effectively with clients during the counseling process.

To address this limitation, a significant line of research has emerged through meta-analyses aimed at identifying the critical components of effective career counseling. These analyses draw on studies evaluating outcomes across various modalities (e.g., individual, group, classroom-based, and self-guided interventions). While these findings provide an important foundation, they offer limited practical direction regarding how counselors can implement these components in practice.

Further research is needed to identify the microprocesses that drive client change, which is essential for ensuring the quality and effectiveness of career counseling interventions. In response to the need for a more comprehensive conceptualization career counseling process, this symposium presents four studies on career counseling process and outcome that contribute to advancing career counseling theory and practice.

Abstract 3203

BUILDING SUSTAINABLE FUTURES TOGETHER: HOW CAREER COUNSELING 5.0 CAN ACTIVATE CONSCIOUS CHOICES FOR A BETTER WORLD

Santilli S.*

FISPPA - University of Padova ~ Padova ~ Italy

This contribution presents the preliminary results of a qualitative study involving 20 university students (aged 18–25) who participated in an individual career counseling intervention at the Larios Laboratory, University of Padua. The intervention was developed within an updated Life Design paradigm, grounded in inclusive and sustainability-oriented perspectives (Guichard, 2022; Soresi & Nota, 2023), and aimed to foster not only career adaptability, but also critical thinking, ethical awareness, and future-oriented professional visions in response to current global challenges.

The five-session intervention (1 hour per session) integrated narrative tools such as My Career Story alongside reflective activities (Savickas, 2011; Hartung & Santilli, 2024). These activities supported participants in exploring the intersection between their social and professional identities and the United Nations 2030 Sustainable Development Goals, encouraging them to consider how individual career choices can contribute to social and environmental transformation (Cadenas & McWhirter, 2022). The intervention emphasized the development of critical consciousness and the use of utopian thinking as a strategy to foster socially responsible life design processes (Santilli et al., 2025).

Before and after the intervention, students completed a questionnaire and responded to open-ended questions exploring their motivations, future time perspective, career adaptability, and satisfaction with both the counselor and the counseling activities. The findings highlight the potential of integrative, narrative-based career interventions to empower university students in constructing meaningful, ethical, and sustainability-driven professional pathways aimed at promoting future social justice (Duarte & Cardoso, 2018).

Abstract 3204

PROCESS AND OUTCOME OF A CAREER COUNSELING INTERVENTION WITH UNEMPLOYED INDIVIDUALS

Carvalho C.*

University of Minho ~ Braga ~ Portugal

Career interventions with unemployed populations benefit from mixed-methods approaches, as they allow capturing both objective outcomes and participants' and psychologists' subjective perceptions. This study aimed to evaluate a structured group career intervention, delivered both face-to-face and online, grounded in Social Cognitive Career Theory and the Multidimensional Employability Model, and designed for unemployed adults. Two complementary studies were conducted. The first examined the longitudinal effects of the intervention on employability resources — human capital and career development, social capital and networking, career identity and self-management, and environmental monitoring — with 212 unemployed adults: 85 in the face-to-face group, 58 in the online group, and 69 in the control group, assessed at three time points (pre-test, post-test, and follow-up). The second study explored the intervention process with 153 participants of the program and 18 psychologists who facilitated its delivery, using a qualitative design that combined descriptive statistics from quantitative data with content analysis of written reports. Latent Growth Modeling revealed sustained improvements in participants' employability resources, highlighting the positive impact of the program in both modalities. The process evaluation identified facilitating factors, perceived obstacles, and strategies used to transfer acquired knowledge and skills to real-life contexts. Together, these findings underscore the importance of integrating outcome and process evaluations to achieve a comprehensive understanding of career interventions' effectiveness and to inform the development of practices better suited to the needs of unemployed populations.

Keywords: career intervention, outcome evaluation, process evaluation, unemployment, employability

Abstract 3205

CLIENTS' PERCEPTION OF SIGNIFICANT MOMENTS IN CAREER CONSTRUCTION COUNSELING

Alvarenga M.*

University of São João Del Rei ~ São João Del Rei ~ Brazil

The analysis of significant moments (SM) in counseling highlights critical events that influence the trajectory of client change, either positively or negatively (Pivolusková et al., 2021). This study explores participants' perspectives on significant moments during Career Construction Counseling (CCC). The sample comprised 24 adults (66.7% women; age range = 18–57 years, M = 26.5, SD = 9.5) recruited from a university career service. Outcome measures—career adaptability, vocational identity, and well-being—were collected at pre-test (T1), post-test (T2), and three-month follow-up (T3). The process assessment used the Helpful Aspects of Therapy (HAT; Elliott, 1993), in which clients provided qualitative accounts of significant moments in each session. Quantitative data were analyzed using descriptive statistics, paired t tests, Pearson's r for effect sizes, and bootstrap procedures with 1,000 iterations to improve variance homogeneity. Thematic analysis was applied to the qualitative data. Results revealed significant improvements from T1 to T2 in career adaptability, vocational identity, and life satisfaction, with most gains maintained at T3. Eleven themes were identified in participants' reports, with the most frequent involving support for career problem formulation, exploration of personal experience, development of an interpersonal bond, and the emergence of a new perspective on the self or context. Findings support the effectiveness of CCC in promoting vocational identity, career adaptability, and life satisfaction. Moreover, the significant moments most often reported reinforce the role of CCC in fostering new meanings about self and career, with the interpersonal bond emerging as a key element in supporting meaning-making and the development of new career plans. Future research should involve larger and more diverse samples, explore cultural influences, and examine the predictive value of significant moments in the counseling process.

Abstract 3206

BEYOND PROCESS AND OUTCOME: CLIENT PROFILES IN CAREER COUNSELING INTERVENTION RESEARCH

Levin N.*

University of Lausanne ~ Lausanne ~ Switzerland

Research on career counseling has largely focused on counseling processes and average intervention outcomes. Yet clients seeking counseling differ widely in their initial difficulties, motivations, and goals, which may shape how they benefit from career interventions.

This study aimed to identify distinct client profiles among individuals seeking career counseling and to examine how these profiles are associated with change in career indecision and psychological distress across the course of counseling. Data were collected from clients at a community-based career counseling center. Participants completed measures of career indecision (Career Decision-Making Difficulties Questionnaire; CDDQ), counseling goals (Career Counseling Goals Assessment; CCGA), and psychological distress (Kessler Psychological Distress Scale; K10) at the beginning and end of counseling. Latent profile analysis (LPA) was used to identify subgroups of clients based on their initial levels of indecision. Reliable and clinically significant change indices were calculated to evaluate the meaningfulness of change from the beginning to the end of counseling. Findings revealed that all seven main career indecision types identified by Levin et al. (2024) were represented among career counseling clients. Profiles differed in their initial goals and distress levels. Across profiles, most clients demonstrated meaningful reductions, particularly in career indecision, with many reaching thresholds of reliable and clinically significant improvement. Reductions in psychological distress were also observed, though to a lesser extent. These findings highlight the importance of considering client heterogeneity when evaluating career counseling interventions. By integrating client profiles with outcome data, this study underscores the value of tailoring counseling to individual needs and moving beyond average treatment effects in intervention research.

Keywords: Career counseling, Intervention research, Career indecision, Psychological distress, Latent profile analysis

HOW COULD VOCATIONAL PSYCHOLOGY CONTRIBUTE TO THE NECESSARY TRANSFORMATION TOWARDS A SUSTAINABLE WORLD?

Thursday 23 July 2026 from 09:30 to 11:00

(Q-Arsenale)

Jérôme Rossier (University of Lausanne ~ Lausanne ~ Swit), Chair and Presenter

The IAEVG called in 2023 practitioners and researchers in the fields of educational and career guidance to integrate environmental and ecological issues into their research and interventions. During the last decade, the number of scientific contributions developing models and constructs about how these issues have significantly increased (Di Fabio & Bucci, 2016; Carosin et al., 2021; Plant, 2014). Several recent studies have been published about how young people are considering ecological issues in their vocational choices or adults are considering them when transforming their professional practices (Garin et al., in press; Tacchini et al., 2024). We also observe different initiatives that promote the use of innovative tools to support people in their career transitions towards more sustainable career paths (e.g. Carosin & Canzittu, 2021). Finally, the uncertainty associated with the Anthropocene can generate negative affect, as eco-anxiety, especially among the younger generation (Mark et al., 2021), that need to be considered and addressed. This symposium, we will start with an overall view of the importance to consider ecological sustainability in educational and vocational guidance. Four presentations described below will explore several ways how our field has tried to address sustainability in educational and guidance settings and how this has an impact on our theoretical frameworks and interventions.

Abstract 3382

CAREER GUIDANCE AND COUNSELLING CONSIDERING THE NECESSARY ECOLOGICAL TRANSITION

Rossier J.*

University of Lausanne ~ Lausanne ~ Switzerland

The issue of social justice has been central to the concerns and actions of career guidance and counselling professionals since its creation. Access to education and vocational training, the question of the resources needed to make an appropriate choice, and the ways in which such a choice should be defined, have been theorised by many authors. The study of life and career paths raises the question of life-and career transitions and how an individual can manage them. Educational and vocational guidance has always been seen as a collective resource promoting individual well-being as well as social and professional integration. In an uncertain world, where individuals are facing a fluid and dynamic reality, and where they must face a succession of transitions that are moments of vulnerabilities. Thus, it is important to provide support to help individuals to manage these transitions, by providing them continuous training, lifelong learning, but also lifelong guidance and counselling (Rossier et al., 2020).

Considering the important and numerous contemporary challenges such as global warming and the necessity of an ecological transition, it is important to consider in our practice ecological consideration (Rossier, Tacchini, & Udayar, in press). If career guidance and counselling take ecological justice also into account, it would be important in ensuring that this theme is systematically raised during our interventions. Of course, this can take a variety of forms, from simply discussing the impact of climate change on the job market, to a more ambitious reflection on the ethical aspects of our professional choices. In this regard, we can combine sustainable careers and ecological sustainability (Masdonati & Rossier, 2021). Finally, our profession should also get involved at a more political level to ensure that our educational, guidance and economic promotion policies also consider aspects associated with ecological justice.

Abstract 3383

ENSURING SUSTAINABLE CAREERS OR CAREERS FOR SUSTAINABILITY?

Carosin E.*, Canzittu D., Lothaire S.

University of Mons ~ Mons ~ Belgium

In French speaking Belgium school guidance has been integrated in the school curriculum as a means to ensure lifelong guidance and to equip young people with necessary skills to develop sustainable careers in a VUCA world. Sustainable careers has been defined as a dynamic, cyclical and self-regulatory process that evolves thanks to the interplay between the person, context and time (De Vos et al., 2020). Sustainable careers also depend on the interaction between factors related to health, happiness and productivity (De Vos & al, 2020). However, in current times sustainable careers cannot be limited to ensuring personal development, it also needs to be guided by principles of social justice, decent work and sustainable development (Carosin et al., 2021).

Integrating these principles into school guidance raises complex issues (Ketschau, 2015), not least because of the lack of a holistic and integrated approach in current educational practices (Sinakou et al., 2019), but also because of the limited attention given to careers driven by sustainable development. Although these themes are increasingly present in political discourse and global objectives (Reynaud, 2018), they struggle to be translated concretely into school reference systems and curricula (Canzittu, 2022), especially because school guidance often remains compartmentalised and focused on linear pathways (Hughes et al., 2017), focusing on individual rather than collective development. The communication presents an operational framework that can be used to train teachers (initial training and continuous) while considering the challenges in revising teaching practices and reference frameworks (Canzittu, 2024; Canzittu & Demeuse, 2019; Carosin & Canzittu, 2021; Lothaire & Canzittu, 2020; Pannier & Michaut, 2024). It builds on key concepts, such as green guidance (Di Fabio & Bucci, 2016; Plant, 2014, 2015), the collective model of guidance (Carosin et al., 2021) or the educational approach to guidance (Carosin & Canzittu, 2019).

Abstract 3385

DESIGNING A PERMACIRCULAR CAREER GUIDANCE APPROACH: APPLYING SEN'S CAPABILITY THEORY TO CAREER GUIDANCE PSYCHOLOGY

Garin S.*, Terriot K., Bessonneau P., Cohen--Scali V.

CNAM ~ Paris ~ France

The latest IPBES (2024) report highlights the interconnection between human health and planetary health, known as the Nexus. Meanwhile, research has raised alarms about both the degradation of nature's health (IPCC, 2023) and the mental health crisis affecting young people (HSBC, 2022). Among the numerous benefits of positive mental health, one is its role in fostering informed career choices (Lauzier, Côté, & Samson, 2015).

Sen's Capability Approach (1992, 2000) offers a relevant framework : an individual is free to choose when they have access to an enabling environment (social, material, etc.) that fosters their agency. In this perspective, individuals develop the capability to choose by leveraging their own resources (physical and psychological). Among the ten central capabilities proposed by Nussbaum (2012), the capability to live in symbiosis with other living beings is particularly relevant.

This study adopts a quantitative and systemic approach to analyze the freedom to choose one's future, incorporating the concept of planetary health (Whitmee et al., 2015). A total of 304 high school and university students responded to a questionnaire focusing on their perception of parental support (Dangoisse & Nils, 2019) and decent education (Duffy et al., 2020; Terriot, 2019). Individual resources were examined through the lens of vocational identity (Lannegrand & Perchec, 2016), which refers to self-awareness and personal interests. Finally, self-determination was assessed as an expression of the capability to autonomously choose one's career path (Brasselet & Guerrien, 2019).

An exploratory classification analysis identified five distinct profiles. One group stood out due to its higher scores in integrating planetary health into career choices (V.test = 5.87) and career flexibility (V.test = 5.22). Notably, women were overrepresented in this group.

This study invites further discussion on the freedom of young people in career decision-making, introducing the concept of sustainable commitment, also referred to as eco-generativity (Di Fabio & Svicher, 2023a).

Abstract 3386

"THINK OUTSIDE THE GROWTH" WITH ALTERNATIVES PROFESSIONALS PATH AND NARRATIVES

Tacchini S.*

University of Lausanne ~ Lausanne ~ Switzerland

Many professionals' activities, most of the rich economy, affect dramatically ecosystems (Hickel et al., 2022). The unsustainable societies way of life and work diagnosis is scientifically consensual and shows that we overshooted six to nine planetary boundaries (Persson et al., 2022). At the same time, goals to transform social organization to face these challenges is more or less known. That implies that professional activities are going to change to respect bio-geo-chemical balances.

Scholars involved in the socioecological transformations depict a lack of imagination to create ways and alternatives to revolutionize ways of life and work (e.g. Barrau, 2022). In the vocational psychology fields, many papers claim to consider ecological limits (e.g. Guichard, 2016) but not much works is involved in tools and settings adaptation or transformations to accompagn person (Tacchini et al., 2024). We will discuss about two tools co-build by vocational psychologist that integrate ecological limits in them practices and people that are engaged in alternatives professional paths. This tools will provide alternatives narratives and different professional paths that are more in line with Donut theory (Raworth, 2017), post-growth agenda (Fitzpatrick et al., 2022) and the 21st challenges (e.g.UN goals: food, water cycle, health, etc.).

THE FORMATION AND TRANSFORMATION OF SEXUAL ORIENTATION IDENTITY: PSYCHOLOGICAL PERSPECTIVES FROM THE UNITED STATES, JAPAN, AND TAIWAN

Thursday 23 July 2026 from 11:00 to 12:30

(Q-Arsenale)

Hung Chiao (National Taiwan Normal University ~ Taip), Chair and Presenter

This symposium presents examination of sexual orientation concepts and identity development through three empirical psychological studies conducted in the United States, Japan, and Taiwan. Together, these studies explore how sexual orientation identity is formed, experienced, and negotiated in diverse sociocultural contexts.

The first study, based in the U.S., focuses on the revision and validation of the Sexual Orientation Scale (SOS), offering a multidimensional approach to measuring sexual orientation beyond binary classifications. This research contributes to the development of inclusive assessment tools that reflect the complexity of contemporary sexual identities

The second study investigates sexual orientation identity development and self-recognition processes among Japanese individuals. Emphasizing the intrapersonal dynamics of “coming out to oneself” as a pivotal psychological step, the study carefully describes the trajectory of identity formation in a collectivist society.

The third study, conducted in Taiwan, explores bisexual identity within romantic relationships, focusing on how the emergence of bisexual identity influences couple interactions and impacts both individuals and their relationship as a whole. This research provides new perspectives to seeing the “invisible” bisexual identity and its impact on the monosexual partner in their intimate relationships.

By integrating findings from these three national contexts, this symposium underscores the cultural specificity and universality of sexual orientation identity development. It advances psychological theories of identity by illustrating how measurement, personal meaning-making, and relational dynamics intersect across cultures. The symposium aims to inform both global psychological frameworks and localized practices supporting sexual minority individuals.

Abstract 4085

SEXUAL ORIENTATION IDENTITY DEVELOPMENT AND COMING OUT TO ONESELF IN JAPAN

Kasai M.*, Uchino T.

Naruto University of Education ~ Tokushima ~ Japan

Sexual orientation identity development has been explained through various stage models (Cass, 1984; Troiden, 1989), recognizing the complexity and diversity in how individuals experience attraction (Fassinger & Miller, 1996; Drescher & Byne, 2017; Kasai, 2023). Drescher and Byne (2017) proposed terms such as “closeted,” “homosexually self-aware,” and “coming out to oneself” to describe identity stages. Traditional theories often position identity integration as the endpoint, assuming that those who have not adopted a sexual minority identity are still in development. However, individuals may recognize same-sex attraction without adopting a corresponding identity or acting on their attraction in Japan.

This study explored internal processes of identity development among eight individuals in Japan who reported experiencing same-sex attraction. Using Trajectory Equifinality Modeling (TEM), each participant engaged in three interviews, tracing their experiences from early awareness to current sexual identity expression.

Findings revealed a shared progression: initial unawareness or misperceptions about same-sex attraction, followed by awareness triggered by romantic experiences or external events, leading to diverse forms of self-expression. These personal expressions, termed Equifinality Points (EFPs), varied widely—from clear labels to ambiguous or nonverbal forms of identity.

The analysis identified three phases: unawareness of same-sex attraction, internal recognition of it, and navigating one’s sexuality. Among these, coming out to oneself—the internal acknowledgment of same-sex attraction—stood out as particularly significant. Participants varied in how they ultimately expressed or did not express their sexuality, suggesting identity expression is not uniform. This underscores the importance of coming out to oneself as a pivotal psychological step. For many, it was triggered by romantic feelings or external events, which facilitated internal recognition without requiring public identification. The process varied in pace and sometimes repeated. Notably, recognizing attraction did not always lead to stable identity, highlighting that self-identification and attraction remain distinct yet related.

Abstract 4086

BISEXUAL IDENTITY WITHIN RELATIONSHIPS: COMING-OUT EXPERIENCES OF BISEXUAL-MIXED-ORIENTED COUPLES IN TAIWAN

Shin--Wei Lin B.*, Hung C.

National Taiwan Normal University ~ Taipei ~ Taiwan

Research indicates that bisexuals are not only excluded from the heterosexual community, but also become an excluded minority among sexual minority groups (Eliason, 2000) due to their bisexualities cannot be explained by the binary system. They may face the situation of a “double closet” (Lin, 2013; Chen, 2015). Research has also found that the appearance of bisexuals may be interpreted by their partners as a "threat to the relationship" in mixed-orientation couples (Buxton, 2006).

Building on the Sexual Landscape theory (Gordon & Silva, 2015; Rust, 1996), this study aimed to investigate the relational processes experienced by the bisexual-mixed-oriented couples after the bisexual partner coming out in the relationship, focusing on how the emergence of this identity influences couple interactions and impacts both individuals and their relationship as a whole. This qualitative study employed a dyadic design, and used interpretative phenomenology method (Lee & Lai, 2009) for data analysis. Five closed same-sex or different-sex Taiwanese couples (3 same-sex couples including 1 gay and 2 lesbians’ partners, 2 opposite sex couples including 2 heterosexual men partnered with female bisexuals) in which one partner identifies as bisexual participated in semi-structured interviews. Data collection has been completed, and data analysis will be completed by spring 2026. The findings of this study will contribute to a better understanding of the cultural structures faced by both partners when bisexual individuals come out within a mix-oriented relationship, as well as the intertwined heteronormative cultures in couple dynamics in Taiwan. We can use understanding to help advocacy efforts and enhance counseling services to better address the unique situations of bisexual-mixed-oriented couples.

Abstract 4165

CONFRONTING HETERONORMATIVE SOCIETY: THE JOURNEY TO SELF-UNDERSTANDING IN INTIMATE RELATIONSHIPS

Lee I.*

National Taiwan University ~ Taipei ~ Taiwan

In the symposium, we present quantitative and qualitative evidence to explore people's sexual orientation identity, intimate relationships, and self-understanding. Even though different societies have different social norms and cultural values, the three societies in which studies in our symposium are conducted have assumed individuals' heterosexuality to some degree. According to the findings in these three studies, I will raise several questions to further our inquiries into how individuals come to deeper self-understanding in intimate relationships. For example, what are the benefits and costs of the heterosexual scripts in intimate relationships? How do individuals weigh and use multiple aspects of information (e.g., attraction, fantasy, and behavior) to formulate sexual orientation identity? Through the discussions in the symposium, we are hoping to offer ways for individuals to achieve a better understanding of their sexual being and themselves.

Abstract 4084

EXPANDING MEASUREMENT OF SEXUAL ORIENTATION: REVISION AND VALIDATION OF THE SEXUAL ORIENTATION SCALE (SOS)

Mccarthy M.D.*, Hung--Bin S.

University at Albany, SUNY ~ Albany, NY, ~ United States of America

Introduction: Research on sexual orientation is common in psychology; however, much of the research is reliant on categorical conceptualizations of the construct. This approach reduces the understanding of sexual orientation to a demographic variable, forcing participants to condense experiences into discrete categories. It not only limits our insight into this important aspect of human experience but also slows the advance of scientific inquiry in this area.

Purpose: Since the publication of the Kinsey Scale, researchers have attempted to assess sexual orientation comprehensively. Most measures remain validated only among cisgender people and are not inclusive of sexual orientation towards gender diverse people. The purpose of this study is to further develop and refine one measure of sexual orientation, the Sexual Orientation Scale (SOS), by expanding its item pool and incorporating response options representative of gender diversity.

Method: The SOS consists of three domains: attraction, fantasy, and behavior that manifest across romantic and sexual contexts. The revised SOS (SOS-R) will be created and validated through a pilot and two main studies. The pilot will involve a literature review, expert review, and think-aloud protocol. Main studies will administer the SOS-R to a sample of women, men, and gender diverse adults in the United States.

Results: Descriptive and qualitative findings from the pilot study will be reported. Study one will present findings from a multi-level Exploratory Factor Analysis (EFA). Study two will include results from a multi-level Confirmatory Factor Analysis (CFA) and correlations between the SOS-R score and related psychological constructs (e.g., depression). We expect to complete data collection and preliminary data analyses by spring 2026.

Conclusions: The proposed project will offer evidence for the factor structure of the SOS-R and provide a comprehensive understanding of sexual orientation for individuals of different gender identities. Implications for research, education, and intervention will be discussed.

EMERGING CHALLENGES AND OPPORTUNITIES FOR GRADUATE TRAINING PROGRAMS: ENHANCING PROFESSIONAL COMPETENCIES OF FUTURE MENTAL HEALTH PROVIDERS

Thursday 23 July 2026 from 14:00 to 15:30

(Q-Arsenale)

Chiachih DC Wang (University of North Texas ~ Denton ~ Uni), Chair

Graduate training programs worldwide have encountered many challenges in recent years, including a rapid increase in online therapy, proper utilization of Artificial Intelligence (AI) in clinical work, collaboration between academic programs and practicum sites in the field, the continuous need to enhance multicultural competencies, and supporting trainees with problems in competence. This symposium includes five specific presentations with a shared theme of addressing emerging challenges faced by mental health graduate training programs globally with a goal to enhance the professional competencies of future mental health providers. The presenters of this symposium are faculty members and licensed practitioners from three countries (i.e., Turkey, Taiwan, and USA) who possess extensive training, supervisory, research, and administrative experiences.

Each of the individual presentations addresses a distinct topic, that is imperative to the training quality and outcome of mental health graduate programs that train providers of the next generation. The first presentation focuses on how graduate training programs in psychology can better prepare trainees' online therapy competencies. The second presentation addresses the current state, potential opportunities, and ethical considerations related to utilizing AI in clinical training. The third presents a successful collaborative model between a graduate training program and practicum sites that offer clinical supervision to graduate trainees in Taiwan. The fourth highlights how clinical practicum supervisors may enhance supervisees' multicultural competencies. The fifth discusses strategies and considerations for developing and implementing effective remediation plans to support graduate trainees experiencing difficulties in developing required competencies.

The theme and specific topics of the five presentations in this symposium are consistently aligned with the overall theme of the ICAP 2026 in that the symposium not only explores emerging fields or key topics in applied psychology training but also deliberates societal applications by outlining constructive ways to transform challenges into opportunities for the competency enhancement of future providers.

Abstract 3245

ARTIFICIAL INTELLIGENCE IN CLINICAL TRAINING: OPPORTUNITIES, CHALLENGES, AND ETHICAL IMPLICATIONS FOR FUTURE MENTAL HEALTH PROFESSIONALS

Henderson S.*, Henderson C.

Sam Houston State University ~ Huntsville ~ United States of America

Artificial Intelligence (AI) is emerging as a powerful tool in counseling and psychology training programs, particularly by extending traditional training methods with simulation-based applications that enable students to safely practice and strengthen essential clinical skills (Jeong et al., 2025). Current applications include generative AI programs that create realistic dialogues to simulate counseling sessions for practicing counseling skills through simulated role-plays, offering students opportunities for guided practice (Maurya, 2023a; Maurya, 2023b; Maurya & DeDiego, 2023). Additionally, the use of AI-generated post-session feedback can analyze counselor–client talk ratios, organize session themes for reflection, and produce initial drafts of case notes (Jeong et al., 2025; Maurya, 2023b), all of which have the potential to enhance conventional clinical training.

Researchers have identified several potential benefits of AI in clinical training, including enhanced counselor self-efficacy and skill development (Ellis et al., 2015; Maurya & DeDiego, 2023; Sanz et al., 2025), reduced negative affect (Sanz et al., 2025), and supplemental support for supervision (Maurya, 2023b). However, empirical support for AI in supervision remains limited (Maurya & DeDiego, 2023; Sheperis & Sadeh-Sharvit, 2023). Such training paradigms also encompass significant ethical questions, such as client confidentiality, bias in AI-driven systems, and the risk of diminishing critical thinking and diagnostic skills among trainees. Thus, challenges remain for ethically integrating AI into clinical training and supervision (Maurya & De DeDiego, 2023).

In this session, presenters will share examples of how AI is being integrated into clinical training programs and provide a live demonstration of AI-generated feedback. Discussion will highlight how such tools can complement established training models, while also addressing potential risks and ethical considerations. Ultimately, this session invites participants to critically examine both the promises and pitfalls of AI in clinical training programs, fostering a forward-looking dialogue on how to prepare the next generation of counselors and psychologists.

Abstract 3246

SUPERVISEE-CENTERED COUNSELING SUPERVISION TEAMWORK IN TAIWAN: COLLABORATIONS BETWEEN TRAINING PROGRAMS AND INSTITUTIONS

Chiao H.*

National Taiwan Normal University ~ Taipei City ~ Taiwan

More than 6,000 licensed counselors have been trained and have provided services in education, community, and hospitals since the Taiwan Psychologists Act was established in 2001. All trainees are required to take internship courses in conjunction with on-site clinical training during the practicum and internship years. Thus, the internship course instructor and the internship clinical supervisors serve as key bridges between theoretical and clinical training. Serving as an internship course instructor for more than ten years, the presenter has learned that Taiwanese relational cultural rules play important roles in clinical training and collaboration between the program and various training sites. By recognizing the relational cultural rules and intentionally acknowledging and honoring the relational responsibilities, we can build stronger teamwork in providing training and supervision with accountability. In this presentation, the presenter will share her observations of the key ingredients of cultural factors in training and supervision collaboration dynamics, as well as her culturally sensitive supervision practices with trainees and collaborators in training sites, to build and maintain a good working alliance with all parties. In response to Zhou (2025)'s proposed framework for ethical practice in the majority world, the presenter will share a culturally sensitive supervisee-centered teamwork supervision framework with examples of how it works with both trainees with and without difficulties. The presenter aims to inspire more culturally sensitive supervision practices and teamwork models around the globe.

Abstract 3247

MULTICULTURAL SUPERVISION: A DEVELOPMENTAL, INTERSECTIONAL, AND COLLABORATIVE SUPERVISORY FRAMEWORK FOR PRACTICUM TRAINING

Wang C.D.*, Toyama S.

University of North Texas ~ Denton ~ United States of America

Enhancing supervisees' multicultural orientation is one of the six domains for competency-based supervision in the APA Guidelines for Clinical Supervision in Health Service Psychology (2025). Although several multicultural supervisory models have been proposed, empirical evidence for the effectiveness of different multicultural supervisory models is limited, and the levels to which training programs and practicum supervisors implement multicultural supervision vary greatly (Watkins et al., 2019).

In this presentation, the presenters will share a multicultural supervisory framework for practicum training with specific samples of supervisory interventions and assignments that integrate key components from several existent models and drawn from the 15+ years of supervisory experiences in various training and clinical settings. Essentially, effective multicultural supervision requires the supervisor to integrate topics of cultural identities, personal biases, relational dynamics, and contextual data of the client, supervisee, and supervisor into the supervisory process with the goals of enhancing treatment outcomes for the clients and strengthening the supervisees' multicultural competencies. The supervisor's genuine curiosity in the supervisee's lived experiences and role modeling strong multicultural orientation are among critical factors. This multicultural supervision framework emphasizes a developmental, intersectional, and collaborative nature in which the supervisor's role and intervention should be tailored to maximize trainees' development, depending on the current competency level of the supervisee. If the supervisee is at the beginning level, multicultural supervision may focus on introducing foundational frameworks of multicultural and intersectional approaches in a structured and practical way. When the supervisee has moved into an intermediate level, the supervisor may spend more time initiating conversations related to diversity and intersectionality as well as their impacts on the client, the supervisee, and their therapeutic alliance. When the supervisee is at a more advanced level, the supervisor may encourage the supervisee to consistently and proactively integrate multicultural and intersectional consideration into all their clinical work.

Abstract 3248

SUPPORTING TRAINEES WITH PROBLEMS OF PROFESSIONAL COMPETENCE: RELATIONAL, ETHICAL, AND LEGAL PERSPECTIVES

Henderson C.*, Henderson S.

Sam Houston State University ~ Huntsville ~ United States of America

Supporting trainees encountering challenges to achieving developmental milestones in clinical training is a near-universal experience for training directors and clinical supervisors (Schwartz-Mette et al., 2023). These situations produce high levels of stress for all individuals involved—trainees, trainers, and administrators alike—with potential repercussions for clients receiving services. Further, the situations are rife with relational, ethical, and potentially legal challenges impacting multiple levels of a training-focused organizational system. Schwartz-Mette et al. (2023) have described these situations as trainees with problems of professional competence (TPPC). In this session, we will explore guidelines and discuss strategies to address TPPC from multiple perspectives, relational, ethical, and legal. Individuals involved in clinical training will be encouraged to engage in their own self-reflection and self-assessment with respect to addressing TPPC. Pertinent ethical and legal issues regarding TPPC will be discussed in the competence of maintaining and preserving professional relationships while being cognizant of the gate-keeping responsibility of trainers. Finally, we will apply the guidelines and strategies for addressing TPPC with case vignettes. Applications to practicum, internship, and postdoctoral training will be discussed.

16 - Division 16: Counseling Psychology

DECOLONIZATION AND LIBERATION IN COUNSELING PSYCHOLOGY FOR INTERNATIONAL PSYCHOLOGISTS IN THE GLOBAL CONTEXT

Thursday 23 July 2026 from 15:30 to 16:30

(Q-Arsenale)

Jiyoon Lee (New York University ~ New York, NY ~ Uni), Chair and Presenter
Paul Hartung (Northeast Ohio Medical University ~ Root), Discussant

Internationalization has advanced significantly within counseling psychology over the past several decades (Clinton, 2018; Nilsson, Wang, & Chung, 2019). Exchange programs across borders, increasing enrollment of international students, and cross-national collaborations have expanded counseling psychology's global reach (Bullock, 2014). However, these practices often reproduce Western-centric approaches that may clash with local cultural needs and indigenous knowledge systems. Counseling Psychology, therefore, faces the challenges of moving beyond exporting Western frameworks toward approaches that are culturally grounded and liberatory.

This symposium aims to critically examine internationalization through the lenses of indigenization, decolonization, and liberation psychology. By offering an open forum for dialogue, we invite participants to reconsider assumptions embedded in Western psychotherapy and explore pathways toward more culturally grounded and liberatory practices. Presenters— all international psychologists—will address how these concepts shape their work in diverse cultural contexts, including: 1) reframing Western psychotherapy through critical consciousness in Chinese contexts, 2) indigenization of counseling practice in Malaysia, 3) reflective praxis for inclusive and decolonized practices in Korean sociocultural contexts, 4) decolonial healing and the spirit of Sikolohiyang Pilipino, and 5) implications of internationalization and liberation for Counseling Psychology. Through these perspectives, presenters will highlight the challenges and opportunities of internationalization while emphasizing the importance of culturally responsive and socially just practices. By centering liberation and decolonization, this symposium aims to strengthen global collaboration and support practices that honor diverse epistemologies and promote equity in the field.

Abstract 3690

REFLECTIVE PRAXIS FOR INCLUSIVE AND DECOLONIZED CROSS-CULTURAL PRACTICES

Kim J.*

Dr. Kim Psychology ~ Seoul ~ Korea, Republic of

Guided by decolonized frameworks through intersectional and indigenous epistemological lenses, this presentation will examine how U.S.-based counseling psychology paradigms are transferred internationally and how these models may unintentionally sustain the systems of privilege, power, and oppression. Participants will be introduced to strategies designed to contextualize counseling psychology and support culturally-grounded training and practice. Through storytelling and self-reflection, the presentation will focus on the imperatives of solidarity building and cross-sector alliances. Specifically, attention will be directed to: (1) strategies to integrate the communal bonds and social interest in the development of counseling psychology training program as well as faculty training; (2) methods for mobilizing collective wisdom in cross-cultural therapy to navigate the intricate dynamics of power, privilege, and positionality; and (3) liberation-psychology-infused approaches, including decolonizing assertiveness training through indigenous metaphors explored in specific cultural contexts. The presentation will introduce specific examples of deliberate practices as well as a unique diversity model (e.g., “K-ADDRESSING” model) reflecting Korean sociocultural contexts. Attendees will also gain tools for cultivating transformative perspectives on the use of psychological assessments and inventories through an indigenous-centered framework.

Abstract 3696

WHAT SHOULD WE DO?: IMPLICATIONS OF INTERNATIONALIZATION AND LIBERATION IN COUNSELING PSYCHOLOGY

Tian L.*[1], Lee J.[2]

[1]University of Northern Colorado ~ Greeley, CO ~ United States of America, [2]New York University ~ New York, NY ~ United States of America

Over the past decade, the American Psychological Association (APA) has worked to support the internationalization of psychology by fostering international collaboration, training, and activities (APA Globalization Special Task Group, 2011). As a result, the number of foreign-born international trainees in counseling psychology has grown substantially, with many now working as clinicians, supervisors, and mentors both in the U.S. and their home countries. However, the training of international counseling psychologists in the U.S. has been frequently criticized for operating from a hegemonic and potentially colonizing stance in the global arena (Chung, 2005; Gerstein, 2006; Sue et al., 2024). International trainees are predominantly socialized into Western culture-based psychotherapy regimes, often with the implicit assumption that such practices are more advanced or universally applicable (Gerstein et al., 2009). Within many training programs, cross-cultural variations in counseling approaches and adaptation of counseling practices to local contexts are rarely emphasized or systematically taught (Moodley et al., 2013).

In response to these concerns, Special Task Force (STF) on International Counseling Psychology and Relations, the Division 17 (Society of Counseling Psychology) International Section at APA has taken initiatives to identify alternative ways to foster meaningful cross-cultural engagement, networking, and collaborations with psychologists and scholars in different countries. Using the frameworks of liberation psychology (Morrill & Comas-Díaz, 2025) and critical consciousness (Zamudio et al., 2009), presenters will examine the implications of exporting Western culture-based models of counseling psychology. Suggestions for advancing internationalization from diverse, inclusive, and indigenization perspectives will be provided. These include implementing practical strategies for networking, co-presenting on topics related to internationalization and liberation in counseling psychology, joining the international organizations (e.g., International Congress of Psychology [ICP], International Association of Applied Psychology [IAAP]), and taking on leadership roles within international professional organizations.

COUNSELING AROUND THE WORLD: EDUCATIONAL PERSPECTIVES, PROFESSIONAL PRACTICES, AND EMERGING CHALLENGES

Thursday 23 July 2026 from 16:30 to 17:30

(Q-Arsenale)

LEA FERRARI (UNIVERSITY OF PADOVA ~ PADOVA ~ Italy), Chair and Discussant

In an era marked by global migration, rapid social transformations, and growing inequalities, psychological counseling and career guidance are called to undergo profound renewal. This symposium arises from the need to explore how counselor education and professional practice can respond more sensitively, inclusively, and contextually to the challenges posed by cultural diversity, colonial legacies, and local specificities.

Through four contributions from diverse geographical and cultural contexts—Malta, Japan, South Africa, and China—the symposium aims to offer a space for critical dialogue on key themes such as transculturality, the decolonization of training, methodological innovation, and cultural adaptation. The goal is to stimulate collective reflection on how to build counseling practices that are ethically grounded, culturally relevant, and capable of promoting social justice.

By fostering critical reflection and cross-cultural exchange, this symposium aims to contribute to the development of a more globally aware professional community—one that is capable of learning from difference, embracing epistemological diversity, and co-constructing practices that are both locally meaningful and globally responsible.

Abstract 3557

DECOLONIZING MULTICULTURAL COUNSELING TRAINING IN JAPAN

Suzuki H.*, Suzuki H.

Ritsumeikan University ~ Ibaraki ~ Japan

Legislation on the professional psychology licensure (Certified Public Psychologist) went into effect in 2017, and it was a huge victory in the Japanese psychological world. The Certified Public Psychologists (CPP) are protected by the law and are expected to provide psychological services to maintain and promote mental health of the public. Since the legislation, undergraduate and graduate programs are working together to provide training programs, consisting of broad psychological knowledge from experimental psychology to clinical psychology, including developmental stages, physiological functions, social welfare and legal issues, and intervention strategies, and practicum. Although the law requires the CPPs to provide services to the public, multicultural counseling is not yet a part of the required training program. As Japanese society is becoming aware of the issues around diversity and inclusion, it is particularly crucial that we, psychology professionals, become keener and more sensitive to the social justice issues around those marginalized in our society. Marginalized groups vary with societies and communities; thus, it requires us to investigate our own historical, social, and cultural contexts around the marginalized groups, and merely importing the knowledge from other countries is not sufficient. Decolonization perspectives is key to clinical services because the nature of suffering and recovery depend on the culture, and we need to provide services that are acceptable and beneficial to the local people and community. In this presentation, the presenter will portray multicultural counseling and social justice issues in Japan, the need for identifying the social andm historical situations on diversity and marginalized groups, and the ideas for including the local perspectives and worldviews into training programs and clinical services.

Abstract 4891

A South African contextual and cultural approach to counselling

Marsay G.*

University of the Free State ~ Bloemfontein ~ South Africa

South Africa has been described as a rainbow nation since it boasts a rich diversity of context, culture and language.

Tracing the history of the country, this presentation describes the context of South Africa and the impact of colonialism on education and social dynamics. For most South Africans the social dynamic is collectivist, influenced by the African philosophy of Ubuntu.

Present day reality of the adversities we confront in our post-colonial struggle, include three major challenges, namely poverty, inequality and unemployment. The approach to counseling weighs heavily on building resilience ad hope. Registration of councilors is complex and regulated by the Health Professions Council (HPCSA). There are several levels of training recognised, and several different categories to suit the diverse needs of the population. Major difficulties encountered in providing adequate assistance to those in need are discussed in general. Then the focus turns to the problem of unemployment. The specific need for contextually and culturally appropriate interventions in a country where an informal labor market prevails, is discussed.

The presentation concludes with describing the development of hope and resilience in a country that has endured several adversities. The National Development Policy 2030 will be briefly discussed, as well as the role of non government organisations that provide assistance to people finding hope-filled ways to move forward.

16 - Division 16: Counseling Psychology

PSYCHOLOGY OF SUSTAINABILITY AND SUSTAINABLE DEVELOPMENT FOR CAREER COUNSELING AND RESOURCES: THE FOURTH PARADIGM FOR TWENTY-FIRST CENTURY CAREERS

Friday 24 July 2026 from 08:00 to 09:30

(Q-Arsenale)

Paul Hartung (Northeast Ohio Medical University ~ Root), Discussant
Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Chair

Sustainability Science (Sahle et al., 2025; Takeuchi et al., 2017) has emerged as a transdisciplinary field devoted to understanding the dynamic interplay between natural and social systems in achieving the United Nations' Sustainable Development Goals (SDGs). Within this framework, the psychology of sustainability and sustainable development (Di Fabio, 2017b; Di Fabio & Cooper, 2023; Di Fabio & Peiró, 2018, 2023; Di Fabio & Rosen, 2018, 2020; Hartung & Di Fabio, 2024) offers psychological lens for contributing to these challenges.

Sustainable development as the fourth paradigm for 21st century careers (Hartung & Di Fabio, 2024) expands traditional career models by incorporating attention to life on Earth and future generations. It promotes careers that respect principles of inclusiveness, considering personal well-being and well-being of others and the planet anchored to spatial as well as temporal dimensions.

The symposium presents five contributions aligned with this perspective. Maree integrates career construction counselling and BrainWorking Recursive Therapy (BWRT) enhancing adaptability for meaningful career-life trajectories. De Rosa, Akkermans, Khapova, and Lo Presti answer recent calls by the fourth paradigm exploring how project managers perceive the impact of career shocks on sustainability. De Carlo and La Barbiera propose, through a systematic review, an integrated model combining training, support, and prevention to enhance healthcare workers' safety and psychological well-being for sustainable careers. Giorgi in the framework of the psychology of sustainability and sustainable development examines digital connectivity and smart working as dual forces that can both support and challenge well-being, highlighting the importance of framing digital work as a sustainable practice. Finally, Palazzeschi offers a systematic review on career adaptability and well-being, presenting insights for research and intervention aligned with the fourth paradigm.

As discussant, Hartung will offer remarks on the value of this symposium and on the contributions of the five presentations.

Abstract 4800

The relationship between Prosocial Behavior at Work and Career Sustainability: A Scoping Review

Xiaotian L.*

Department of Psychology of Development and Socialization Processes, Sapienza University of Rome ~ Rome ~ Italy

This scoping review synthesizes evidence on the relationship between prosocial behavior at work and career sustainability. In accordance with PRISMA guidelines, a comprehensive search will be conducted across multiple databases. Records will be screened against predefined eligibility criteria, and studies with diverse designs will be considered. The review will map how career sustainability is conceptualized and operationalized and summarize proposed mechanisms linking workplace prosociality to sustainability-related career outcomes. Key gaps to be examined include variability in definitions and measures, a predominance of cross-sectional designs limiting causal inference, and underexamined contextual and cross-cultural influences. Findings will be organized using the “fourth paradigm” perspective of sustainable development, and a fourth-paradigm, informed framework will be proposed to guide future research and organizational practice.

Abstract 3872

NAVIGATING CAREER SHOCKS AND CAREER SUSTAINABILITY: A QUALITATIVE STUDY ON THE CAREER PATHWAYS OF PROJECT MANAGERS

De Rosa A.[1], Akkermans J.[2], Khapova S.[2], Lo Presti A.*[1]

[1]University of Campania "Luigi Vanvitelli" ~ Caserta ~ Italy, [2]Vrije Universiteit Amsterdam ~ Amsterdam ~ Netherlands

Research shows that careers are becoming increasingly complex and flexible, and the evolving world of work presents new challenges for career sustainability. Project managers' careers are marked by complexity, flexibility, and continuous transitions across projects and companies. Their career progression and long-term career sustainability depend on multiple personal and organizational factors. With evolving project management methodologies and a rising demand for specialized skills, understanding project managers' experiences and career development strategies is crucial.

Responding to recent calls by Hartung & Di Fabio (2024) to integrate sustainable development as a fourth paradigm in career research and to highlight the need for careers that foster both individual well-being and societal sustainability, this qualitative study explores how project managers perceive the influence of career shocks on their career sustainability—defined in terms of productivity, health, and happiness—and on their career progression. It also examines career dynamics by exploring the trajectories and strategies used to maintain and advance their career over time. We conducted in-depth, semi-structured career history interviews to capture both retrospective and real-time accounts of project managers navigating sustainable careers with 50 Italian project managers, with an average duration of 60–90 minutes.

Using a narrative and interpretative approach, we identified three distinct career narrative profiles—shapers, connectors, and plateauers—that reflect diverse expressions of career agency. Our results revealed how individuals balance happiness, health, and productivity over time through context-sensitive career management strategies. We also reveal how career shocks act as catalysts for self-reflection and adaptive sensemaking, shaping career trajectories in different ways.

This study provides fresh insights into how project managers make sense and navigate career shocks and highlights the importance of balancing happiness, health, and productivity to achieve a long-term career sustainability.

Abstract 3873

SUCCESS FACTORS IN PREVENTION ACTIVITIES AND TRAINING INTERVENTION AGAINST WORKPLACE VIOLENCE

De Carlo A.*[1], La Barbiera C.[2]

[1]University of Messina ~ Messina ~ Italy, [2]Magna Graecia University of Catanzaro ~ Catanzaro ~ Italy

Introduction: Workplace violence (WPV), a widespread phenomenon which is particularly visible in the context of healthcare work, represents a significant occupational hazard and is a widespread issue globally. WPV is linked to decreased job satisfaction, commitment, and efficiency among healthcare workers, leading to a poorer quality of life. WPW is also an issue related to the sustainability of work, as it represents a threat to the workers' safety and dignity.

Purpose: Identifying and evaluating effective strategies for the prevention and intervention against workplace violence, therefore, is a crucial activity for allowing organization to implement sustainable practices and improve the quality of life and work for their people.

Method: In order to start an empirical research project aimed at testing effective strategies, a systematic review was conducted using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines to systematize results on this topic. A comprehensive literature search was performed using the Web of Science, PubMed, and Scopus databases. Studies were screened and selected based on predefined inclusion and exclusion criteria using the PICOS framework. Out of 442 initially identified studies, eight met the inclusion criteria and were included in the review.

Results: The findings indicate that training programs incorporating simulations and behavioral economics principles significantly improve workers' ability to manage aggression. The use of validated assessment tools to identify risks of violence and the implementation of effective organizational policies have proven essential in reducing the incidence of aggression, thus enhancing the safety and capability of workers.

Conclusions: Adopting an integrated approach that combines advanced training, organizational support, and preventive policies is crucial for promoting a safe work environment and ensuring the well-being of healthcare workers and sustainable careers. This approach is aligned with the Psychology of Sustainability and Sustainable Development framework, fostering both safety and long-term well-being in organizations.

Abstract 3874

DIGITAL CONNECTIVITY, SMART WORKING, AND SUSTAINABLE WORK DESIGN FOR THE FUTURE OF WORK

Giorgi G.*

European University of Rome ~ Rome ~ Italy

Introduction: The COVID-19 pandemic has accelerated the adoption of smart working and digital connectivity, reshaping organizational dynamics and human interaction. While these innovations enhance flexibility, productivity, and autonomy, they also pose challenges to occupational health, including technostress, burnout, and digital fatigue.
Purpose: This integrated study combines empirical and systematic evidence to explore the dual nature of digital connectivity in modern work environments, emphasizing smart working as a lever for organizational and psychological sustainability in the framework of the Psychology of Sustainability and Sustainable Development.
Method: The first study involved employees from multinational companies operating in Italy, applying the Job Demands–Resources (JD-R) framework to assess how digital connectivity influences work engagement, technostress, and job performance. Complementarily, a PRISMA-based systematic review examined 40 peer-reviewed studies published since 2020 across PubMed, Scopus, Google Scholar, and Cochrane Library, focusing on digital work, remote practices, and well-being outcomes.
Results: Empirical findings revealed moderate digital connectivity and technostress, with high work engagement and job performance. The review corroborated these findings, highlighting that digital tools increase efficiency and flexibility but may also heighten workload, cognitive overload, and mental fatigue.
Conclusions: Answering to the call of the fourth paradigm (Hartung & Di Fabio, 2024), digital connectivity functions simultaneously as a resource and a demand. To ensure long-term sustainability, organizations should adopt structured policies such as “right to disconnect,” offline periods, and mental health initiatives. Smart working should be reframed as a multidimensional sustainability practice—reducing environmental impact through remote work, promoting psychological balance, and fostering inclusive, resilient organizations prepared for the future of work.

Abstract 3875

CAREER ADAPTABILITY AND WELL-BEING FOR SUSTAINABLE DEVELOPMENT: A SYSTEMATIC REVIEW

Palazzeschi L.*

University of Florence ~ Florence ~ Italy

Goal 3 “Good Health and Well-being” of the Agenda 2030 for sustainable development, underscores their role as essential pillars of sustainable development. In the literature, career adaptability (Savickas & Porfeli, 2012) is positively associated with individual well-being, as it facilitates adaptive responses to career-related challenges and promotes psychological resilience during transitions. Within the framework of the psychology of sustainability and sustainable development, career adaptability emerges as a critical resource for promoting career sustainability. Sustainable development as the fourth paradigm for 21st century careers (Hartung & Di Fabio, 2024) also asks for adopting a broad, inclusive approach that respects nature (animals, plants, and the planet) considering the present and the future. In this framework, this contribution will present a systematic review conducted according to the PRISMA standards, considering Scopus, Web of Science, PubMed, and APA PsycArticles databases on career adaptability and well-being. The aim of the review was to systematize recent scientific evidence regarding relationships considering career adaptability and its four dimensions (concern, control, curiosity, confidence) and well-being and its two sides (hedonic and eudaimonic), both in life and at work. The selection and analysis have been taken from 584 records from the four databases. The findings of this systematic review will contribute to delineate future perspectives for research and intervention for sustainable development of careers in the 21st century and Goal number 3.

Abstract 1395

UNDERSTANDING RESILIENCE AND SOCIAL SUPPORT ACROSS DIVERSE PERSONAL LOSSES FACED BY EMERGING ADULTS

Bajpai T.*, Singh T.

Banaras Hindu University ~ Varanasi ~ India

Loss being an inevitable part of human experience, affect individuals across all stages of life and result in bereavement. Bereavement has a significant emotional, psychological, and social impact, challenging an individual's ability to cope and adapt. There is strong evidence to show that social support plays an instrumental role in dealing with loss. Although individuals require time to process their emotions, research demonstrate resilience as a remarkable ability to reconstruct their lives. Resilience often arises from these challenging experiences, enabling individuals to grow and identify new strengths. The present study was an attempt to understand the interplay of resilience and social support in dealing with loss among emerging adults who have experienced loss.

A total of 20 emerging adults with experience of a personal loss (loss of loved one/ parents/ siblings/ close friend) participated in this study. Semi-structured interview were conducted with them to explore their experiences after loss, their coping mechanism to deal with the bereavement and the importance of social support in the development of resilience among them to deal with such personal losses. Content analysis of the interviews highlights the essential connections between resilience and social support and demonstrated that social support plays a crucial role in helping individuals overcome challenges and acts as a buffer to stressors. Results highlight that strong familial connections and peer networks significantly enhance bereavement adjustment by promoting resilience.

These findings are important as they highlight how the type of loss can significantly impact resilience levels of individuals after loss. It also demonstrates that social factors, cultural variability and personal characteristics impacts the interplay between social support and resilience to deal with personal loss. Future research can investigate the underlying mechanisms of social support and how integrating loss into one’s life narrative can empower resilience by helping people grow around their grief.

Abstract 1166

THE RELATIONSHIP BETWEEN SPIRITUAL INTELLIGENCE, PRIMAL WORLD BELIEFS AND QUALITY OF LIFE – A GENERATIONAL PROFILE

Calin M.*, Avram E.

University of Bucharest, Faculty of Psychology and Educational Sciences ~ Bucharest ~ Romania

Introduction.
In the last decade, quality of life (QoL) has seen constant ups and downs. The World Happiness Report 2025 by Gallup registered a fall in wellbeing in Northern America, Western Europe, Australia, and New Zealand with gradual decline over time, remaining under 50% in 2024.
Based on previously established relationships between primal world beliefs (PWBs) and QoL, the strong positive correlation between spiritual intelligence (SI) and QOL in various populations, and the SI - PWBs' convergence on meaning-making, resilience and well-being, higher levels of SI may promote more positive PWBs, improving perceived QoL.

Purpose.
The study aims to explore how the impact of spiritual intelligence on QoL is mediated by PWBs, respective of participants' generation (GenX, GenY and GenZ).

Methods.
We employed a cross-sectional design using data collected through convenience sampling from the Romanian non-clinical population (N = 840) to analyze a moderated mediation model through Multigroup Structural Equation Modelling with Robust Maximum Likelihood Estimation and WLSMV estimator in R.
Latent constructs were measured with Likert scales: SI (Spiritual Intelligence Self-Report Inventory, α = .89), PWBs (Primals Inventory, α = .95), QoL (Quality of life Inventory, α = .79).
Model fit will be evaluated using RMSEA, CFI and SRMR with bias-corrected bootstrapping confidence intervals to test indirect effects.

Results.
Data analysis is underway and will be finalized by the end of 2025. We expect a positive link between SI and quality of life, with SI enhancing positive PWBs. Since life experiences shape primals, it is expected that one's generation will likely influence how SI, primal world beliefs, and quality of life interact.

Conclusions.

Exploring an integrative model of SI, PWBs and QoL on three generations can aid in developing resource-efficient mental health prevention and treatment tools and programmes aimed at mitigating the risk factors which affect quality of life.

ADULT ATTACHMENT, SELF-COMPASSION, EMOTIONAL REGULATION, BURNOUT, AND PSYCHOLOGICAL WELLBEING: COMPARISONS BETWEEN TAIWANESE AND AMERICAN MENTAL HEALTH SERVICE GRADUATE STUDENTS

Wang C.D.*[1], Chao W.[1], Nuth E.[1], Yuanhsien L.[2]

[1]University of North Texas ~ Denton, TX ~ United States of America, [2]Nanhua University ~ Chiayi ~ Taiwan

Graduate students in mental health service training programs are at risk of experiencing burnout (Kaeding et al., 2017). However, limited research has examined how insecure attachment affects burnout of graduate trainees. Guided by adult attachment theory, this study examined a conceptual model depicting the relations among attachment insecurity, selected psychological variables, burnout, and psychological distress. Specifically, this two-tier indirect effect model hypothesized that insecure attachment would be associated with lower self-compassion and more emotion regulation difficulty (the first-tier mediator) which in turn, would result in higher burnout (the 2nd-tier mediator) and eventually greater psychological distress. The final sample included 216 U.S. and 201 Taiwanese mental health graduate trainees. Structural equation modeling (SEM) was used to analyze the data. Findings from the final models best supported by the data revealed that in both cultural groups, attachment anxiety contributed to lower self-compassion which subsequently resulted in greater burnout, but that emotion regulation did not play a mediational role in the models. Results also demonstrated cultural differences in several paths of the proposed model. For the U.S. sample, only higher attachment anxiety indirectly contributed to more psychological distress through low self-compassion, and burnout was best positioned as another psychological distress indicator, instead of being a mediator. However, for the Taiwanese sample, both attachment anxiety and attachment avoidance demonstrated significant indirect effects on higher psychological distress through lower self-compassion and burnout was a 2nd-tire mediator through which attachment anxiety indirectly contributed to higher psychological distress. These findings advance our understanding of the role of adult attachment insecurity in the development of burnout and psychological distress for graduate trainees in mental health fields, as well as the possible cultural differences in the observed variables and their relations. Counseling implications, limitations, and future research directions will be discussed.

CONSISTENCY AND DISCREPANCY IN SUPPORT FROM PARENTS, PEERS, AND TEACHERS ON ADOLESCENT WELL-BEING: LONGITUDINAL MEDIATION BY SELF-ESTEEM AND RESILIENCE

Bian H.*[1], Pu Q.[1], He Y.[1], Luo R.[2], Chen F.[1]

[1]Collaborative Innovation Center of Assessment toward Basic Education Quality, Beijing Normal University ~ Beijing ~ China, [2]State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University ~ Beijing ~ China

According to social support theory, social relationships play a crucial role in individual well-being. Adolescent well-being further prompts their mental health, social functioning, and academic success. Yet it remains unclear whether support from different sources (e.g., parents, peers, teachers) exerts consistent or divergent effects on adolescent well-being. Moreover, the potential mechanisms (e.g., self-esteem, resilience), and whether these processes are consistent or different across various support sources, require further investigation. Longitudinal evidence on these associations also remains limited. To address these gaps, this study employed a four-wave longitudinal design with six-month intervals, following 2,230 adolescents (Age=14.31±1.51, 50.4% boys) to examine the effects of parental, peer, and teacher support on well-being, and the mediating roles of self-esteem and resilience.

Mediation analyses revealed distinct patterns. (1) For parental support, no direct effect on T4 well-being was observed; instead, indirect effects emerged through T2 self-esteem or T3 resilience, and the sequential pathway from T2 self-esteem to T3 resilience. (2) Similarly, peer support showed no direct effect but predicted T4 well-being indirectly through T2 self-esteem and the sequential pathway through T2 self-esteem and T3 resilience, whereas no mediation through T3 resilience alone was found. (3) In contrast, teacher support exerted a significant direct effect on T4 well-being, but neither T2 self-esteem nor T3 resilience, individually or sequentially, mediated this association.

These findings suggest that adolescent well-being develops through both direct and indirect pathways, highlighting the distinct contributions of different support sources. Specifically, parents and peers enhance well-being primarily by fostering internal psychological resources (i.e. self-esteem and resilience), whereas teachers exert influence mainly through immediate external support, such as timely positive feedback. Overall, the results clarify how adolescents draw on diverse social resources to build psychological strengths and achieve positive outcomes, offering practical guidance for designing interventions that optimize adolescent well-being.

Abstract 1871

INVESTIGATING THE RELATIONSHIP BETWEEN CHILDHOOD PHYSICAL ABUSE AND BORDERLINE PERSONALITY DISORDER: ROLE OF PERSONALITY FUNCTIONING

Isik E.*

Ankara Haci Bayram Veli University ~ Ankara ~ Turkey

This study investigated the role of level of personality functioning in the relationship between childhood physical abuse (CPA) and traits associated with borderline personality disorder (BPD). While previous research has consistently found a strong connection between CPA and BPD symptoms, the specific psychological processes underlying this relationship are still not fully understood. To investigate this, 654 participants completed three measures: the Childhood Trauma Questionnaire (CTQ), the Level of Personality Functioning Scale – Self-Report (LPFS-SR), and the BPD subscale of the Coolidge Axis II Inventory Plus (CATI+). A simple mediation analysis was conducted to test the role of personality functioning in relationship between CPA and the development of BPD traits. The analysis revealed a significant total effect of CPA on BPD traits ($b = 0.371$, $p < .001$). When personality functioning was added to the model as a mediator, CPA significantly predicted personality difficulties ($a = 41.024$, $p < .001$), and in turn, personality difficulties significantly predicted BPD traits ($b = 0.006$, $p < .001$). Although the direct effect of CPA on BPD traits remained significant, it was notably reduced ($c' = 0.107$, $p = .020$). A bootstrap analysis confirmed a significant indirect effect through personality functioning ($b = 0.264$, 95% CI [0.191, 0.348]). These findings suggest that the pathway from early physical abuse to BPD traits is largely driven by its impact on fundamental aspects of personality. In other words, CPA may not directly cause specific BPD symptoms, but instead fosters broader personality vulnerabilities that predispose an individual to developing BPD traits. These results highlights the importance of addressing core personality functioning in both prevention and treatment efforts for individuals with histories of physical abuse. Effective interventions must address the core disruptions in personality organization, rather than restricting its focus solely to trauma processing or the symptomatic presentation of BPD.

Abstract 1300

GRATITUDE PRACTICE AS A SOLUTION FOR CONTINGENT SELF-WORTH IN ADOLESCENTS: A TEN-WEEK INTERVENTION STUDY

Boby Ho--Hong C.*

University of Macau ~ Macau ~ Macao

Increasing evidence suggests that contingent self-worth poses a significant risk to adolescents' psychological health, yet few intervention studies have explored ways to mitigate its negative effects. While correlational studies indicate that gratitude may counteract contingent self-worth, experimental research is necessary to establish causality. This study aimed to determine the impact of a 10-week gratitude intervention on reducing contingent self-worth and improving psychological health among 198 adolescents, with both immediate and three-month delayed post-test assessments. Participants were randomly assigned to one of four groups: (a) gratitude, (b) positive events, (c) hassles, and (d) business-as-usual. Results revealed that the gratitude group reported lower levels of academic and appearance contingent self-worth, alongside improvements in emotional instability, psychological flexibility, and symptoms of depression and anxiety, compared to the other groups in immediate post-tests. Although life satisfaction did not significantly differ among groups at the immediate post-test, the gratitude group exhibited higher life satisfaction and lower depression and anxiety levels at the delayed post-test. This study contributes to the literature by providing evidence for the causal relation between gratitude and reduced contingent self-worth with practical implications for interventions.

DREAM PATTERN IN PATIENTS WITH ACUTE MYOCARDIAL INFARCTION: RETROSPECTIVE OBSERVATION FROM THE STEP IN AMI TRIAL

De Angelis R.*[1], Palumbo G.[1], Roncella A.[1], Pasceri V.[2], Pristipino C.[2], Pelliccia F.[4], Allan R.[3], Speciale G.[2]

[1]International Ontopsychology Association ~ Rome ~ Italy, [2]San Filippo Neri hospital ~ Rome ~ Italy, [3]New York-Presbyterian Hospital ~ New York ~ United States of America, [4]Sapienza University of Rome ~ Rome ~ Italy

Background: Sleep influences biological functions and has been linked to cardiac and other major cardiovascular events. Dreams represent an important element of sleep phases. Historically, the clinical significance of dreams has been examined in psychoanalysis, analytical psychology, gestalt therapy, and more recently by other psychotherapy approaches. However, studies on dream organization and structure before and after acute myocardial infarction (AMI) are lacking.

Aim: To investigate dreams before and after AMI using a novel approach by the ontopshychological school.

Methods: We retrospectively examined dream patterns before and after AMI within STEP-IN AMI (Short TErm Psychotherapy IN Acute Myocardial Infarction) trial and assessed whether these patterns changed during a
short-term psychotherapy (STP). We categorized dream symbols as positive or negative according to the ontopsychological dream handbook (Meneghetti 2012).

Results: 47 patients (age 31–70 years; mean 54.89) were analyzed. Dream recall increased from 25/47 (53%) at baseline to 43/47 (91%) during psychotherapy ($p< 0.0001$). Recurrent distressing dreams — characterized by anguish or despair, a sense of being unable to complete an action, or grief over one's mother's early death—were reported by 16/47 subjects (34%) in the year preceding AMI. By the third psychotherapeutic session, no subjects reported recurrent dreams ($p< 0.001$). In the year before AMI, among 25 reported oneiric symbols, 12 referred to acquaintances who had died of cardiac disease and 9 referred to accidents, danger, nightmares, or other distressing themes. Overall, 21/25 dream symbols (84%) suggested a threat to life. Incidence of "negative" symbols declined during psychotherapy from 84% pre-therapy to 32% during the first three sessions and to 9% in the final phase ($p< 0.0001$).

Conclusions: Cessation of recurrent distressing dreams, and marked reduction in negative symbols during psychotherapy suggest that STP acts as a positive stimulus for inner change. Study results and the symbol content analysis method will be discussed.

Abstract 676

A HARM MINIMIZATION APPROACH TO CLIENTS USE OF PLANT MEDICINES AND PSYCHEDELICS

Harness J.*

University of Southern Queensland ~ Ipswich ~ Australia

The recent resurgence of interest in psychedelic-assisted therapy (PAT) combining the mind-expanding benefits of psychedelic substances with the guidance of a trained therapist culminated in July 2023 when Australia became the first country in the world to approve the use of psylocibin for treatment resistant depression (TRD) and 3,4-Methylene dioxymethamphetamine (MDMA) for post-traumatic stress disorder (PTSD). Media attention has seen a surge in public interest; however, people are met with few options due to a dearth of trained professionals. As such, illegally sourced psychedelic use with unlicensed practitioners, facilitators and shamans currently forms the largest sector of the Australian psychedelic landscape. Therefore, from a harm minimisation perspective, it is vital psychologists understand the psychedelic space and be ready and able to support clients. The aim of the presentation is to develop awareness of the use of psychedelics in the community and to provide education about how clients may present. It will focus on building psychologists confidence and knowledge from a harm minimization perspective. There will be particular emphasis on trauma sensitivity and cultural safety as well as working with challenging “bad trip” experiences. topics include:

- Ethics, regulations and the legal landscape
- Client safety and raising awareness of contraindications to PAT
- Socio-cultural implications of PAT
- Trauma informed practice
- The spiritual nature of psychedelic use
- Therapeutic techniques to help stabilise clients

Abstract 1834

SYSTEMIC MODELS OF PERSON-CENTERED PROGRAM THERAPY FOR TRAUMA AND RESILIENCE

Mehrabyan M.*, Grigoryan L.

Psychological center "Zhesture" ~ Yerevan ~ Armenia

Introduction: Trauma-informed therapeutic interventions require comprehensive approaches that prioritize individual client experiences while fostering resilience development. Person-centered program therapy emphasizes the unique needs, strengths, and healing pathways of trauma survivors, integrating systemic frameworks to address complex psychological and social factors that influence recovery outcomes.

Purpose: This study aims to develop and evaluate systemic models of person-centered program therapy specifically designed for trauma treatment and resilience building, establishing evidence-based protocols that enhance therapeutic effectiveness and promote sustainable recovery across diverse populations.

Method: A comprehensive analysis of person-centered therapeutic approaches was conducted through systematic review of treatment modalities, evaluation of client-centered interventions, and assessment of resilience-building strategies. The research incorporated trauma-informed care principles, individualized treatment planning, strength-based assessments, and holistic healing approaches. Data collection involved longitudinal outcome studies, client feedback analysis, and collaboration with mental health professionals, trauma survivors, and community support organizations.

Results: The systemic models demonstrated significant improvements in trauma symptom reduction, resilience capacity enhancement, and overall therapeutic engagement. Implementation showed increased client satisfaction, reduced dropout rates, and sustained recovery outcomes. The models successfully integrated cultural sensitivity, personalized treatment pathways, and community-based support systems while addressing complex trauma presentations and co-occurring conditions.

Conclusions: Systemic person-centered program therapy provides an effective framework for trauma treatment and resilience development, emphasizing individual agency and holistic healing approaches. This model enhances therapeutic relationships, promotes sustainable recovery, and strengthens the integration of trauma-informed care principles in clinical practice settings.

ADVANCES IN CAREER PSYCHOLOGY TO PROMOTE SUSTAINABLE DEVELOPMENT AND SUSTAINABILITY

Friday 24 July 2026 from 09:30 to 11:00

(Q-Arsenale)

Paul Hartung (Northeast Ohio Medical University ~ Root), Chair

Career psychology retains a rich tradition of science and practice concerned with promoting work and well-being in human life. Long focused on work at the individual level, career psychology now broadens its scope to more intentionally emphasize macrolevel factors (e.g., economic conditions, social policies, technological advances, and global challenges) affecting human life-careers. In so doing, distinct lines of work in the careers field attend increasingly to promoting sustainable development programs and proccesses and assisting individuals to achieve career sustainability.

The contemporary integration of sustainable development for sustainability within career psychology: (a) reflects contemporary shifts toward sustainable career models and trajectories; (b) supports emerging theoretical and practical initiatives that emphasize decency, fairness, and ethical practices; and (c) aligns the field with current conceptual and empirical developments across vocational, organizational, and management psychology that seek to advance sustainable careers, work, and workplaces.

Positioning sustainable careers within the field not only affirms its longstanding focus on individual career development and vocational behavior but also extends its reach to broader socioecological systems. This expanded scope offers a framework for career science and intervention that contributes to human health and well-being, social and economic equality, access to quality education, the development of sustainable communities, and the promotion of decent work for all.

This symposium will consider sustainable development and sustainability in career psychology from a variety of perspectives. Presenters will highlight recent initiatives aimed at advancing sustainable development and career sustainability, examine key conceptual frameworks and practical strategies, and identify ongoing challenges and future directions for research, policy, and practice in this evolving domain.

Abstract 4172

MULTICULTURAL CHALLENGES IN CAREER COUNSELING

Cardoso P.*

University of Évora – Department of Psychology ~ Evora ~ Portugal

Multicultural contexts require career counseling practices that are sensitive to clients' racial and ethnic uniqueness to foster their social inclusion and sustainable career development. In this study, the concept of multicultural career counseling is defined as intervention with clients belonging to racial and/or ethnic minorities. However, it is acknowledged that the effects of race and ethnicity intersect with other identity dimensions such as gender, religion, sexual orientation, and physical or intellectual disabilities. This study aims to analyze the challenges faced by psychologists in multicultural career counseling. The identified multicultural challenges are situated within the counseling process to bridge research and practice.

Eighteen psychologists participated in the study, of whom 12 (66.6%) were women. Ages ranged from 26 to 62 years (M = 46.79; SD = 12.73), and professional experience ranged from 2 to 38 years (M = 12.32; SD = 3.48). Semi-structured interviews explored career counseling experiences in which counselors' practice was challenged by clients' cultural backgrounds. The responses were analyzed using thematic analysis.

Multicultural challenges were identified as arising from three main sources: counselor-related factors (e.g., age and knowledge of clients' cultural backgrounds), client-related factors (e.g., socioeconomic status, language, cultural values, and level of acculturation), and contextual factors (e.g., family influence, experiences of discrimination, the educational system, and limited resources). The counseling process itself also contributes to cultural challenges, including the helping relationship - encompassing confidentiality, emotion regulation, acceptance, relational power, and eye contact—and counseling tasks, such as assessing clients' interests and determining whether or not to intervene in emotional issues.

The results highlight the need for career counseling to recognize the complexity of cultural experiences among diverse racial and ethnic groups, to foster inclusive practices that contribute to the social inclusion and sustainable career development of these populations.

Abstract 4173

FOSTERING CRITICAL CONSCIOUSNESS FOR SUSTAINABLE AND MEANINGFUL CAREERS: INTEGRATING ASSESSMENT AND INTERVENTION IN ADOLESCENTS

Santilli S.*

University of Padova ~ Padova ~ Italy

Theories, such as Work as Calling Theory and Psychology of Working Theory, have highlighted that meaningful and sustainable careers require both individual resources and contextual supports. In line with these perspectives, critical consciousness (CC)—the ability to recognize systemic inequalities, reflect on their implications, and engage in transformative action—emerges as a key developmental capacity for fostering purpose, inclusion, and sustainability in career design. This presentation will (a) present the development and validation of a multidimensional instrument for assessing CC in adolescents, and (b) evaluate the impact of a Life Design-based career intervention targeting sustainability, decent work, and social justice.

Study 1 involved development of the Critical Consciousness for Career, Inclusion, and Sustainability Questionnaire (CCC-IS), administered to 1,200 Italian high school students. Exploratory and confirmatory factor analyses tested multiple structural models, with additional analyses of reliability, test–retest stability, and discriminant validity. Study 2 employed a quasi-experimental design with 266 high school students, comparing an experimental group participating in the “Knowing the Present to Imagine a Sustainable and Inclusive Future” intervention with a control group. Pre–post measures assessed career adaptability, critical awareness, and ideas about decent work, with follow-up testing after six months.

Study 1 supported a robust bifactor structure of the CCC-IS, confirming both a general CC factor and specific subdimensions (knowledge, awareness, values, emotional engagement, action tendencies). Study 2 showed intervention participants improved significantly in career adaptability, critical awareness, and sustainable conceptions of decent work, with gains partially sustained at follow-up.

Together, these findings suggest fostering CC—through validated assessment tools and Life Design-based interventions—can bridge the constructs of meaning, calling, and sustainability. In line with theory, CC may represent a crucial mechanism enabling youth not only to pursue meaningful and sustainable careers but also to act as agents of social and ecological change.

Abstract 4176

CAREER CHANGE FOLLOWING JOB LOSS: A THREAT TO SUSTAINABLE CAREERS?

Masdonati J.*

University of Lausanne ~ Lausanne ~ Switzerland

Having to change careers after losing a job can disrupt individuals' paths and aspirations, thus posing a threat to their ability to build sustainable careers. However, little is known about how these individuals navigate the career change and what enables or prevents them from regaining agency over their careers. Drawing on Zimmermann's (2024) agentic model of capabilities to aspire, we conducted qualitative longitudinal research to explore how workers who lost their jobs and had to change careers develop and pursue new aspirations. We carried out abductive temporal thematic analysis on four waves of semi-structured interviews, over four years, with six individuals who were changing careers following redundancy. We examined the participants' trajectories and the conversion factors that facilitate or hinder the realization of their career aspirations. Results show that several intricately linked conversion processes shaped the unfolding of the participants' aspirations. The case of Marie, a bookseller forced to change careers after losing her job in a saturated sector, is emblematic of these evolving dynamics. Four main processes characterized Marie's journey after her redundancy: desynchronization (having to postpone the realization of her life aspirations), fluctuation (coping with an unstable balance between relational support, material constraints, and identity transformation), polarization (positive conversion factors consolidating over time, but negative conversion factors becoming diffuse and unpredictable), and pervasiveness (feelings of uncertainty, marginalization, and stagnation spreading throughout her life). Overall, this study provides a balanced perspective on how agency and structure interact to shape career trajectories, thereby advancing the conceptualization of sustainable careers. In particular, we propose viewing sustainable career transitions as those that increase or preserve individuals' sense of control over their careers while nurturing their capability to aspire—i.e., their freedom and power to design desirable future goals.

Abstract 1009

AN INVESTIGATION OF UNIVERSITY STUDENTS' ONLINE GAMBLING HABITS

Ergun--Basak B.*, Sahin E.E.

Anadolu University ~ Eskisehir ~ Turkey

Today's university students, often referred to as 'digital natives,' represent the first generation to grow up fully immersed in the digital age and demonstrate a high level of familiarity with online platforms. Driven by expectations of instant rewards, the appeal of anonymity, and entertainment value, they tend to show greater interest in online gambling applications and gambling-related content on social media compared to other age groups. This study aims to investigate the prevalence of online gambling addiction among university students and to explore the relationship between online gambling behavior, narcissism, and difficulties in emotion regulation. Ethical approval and research permission for this study have been obtained from a state university (Protocol number: 875994). To this end, answers will be sought to the following research questions:

1. Which online gambling games do university students play?
2. Through which digital platforms do university students participate in online gambling games?
3. How frequently do university students play online gambling games?
4. Does the level of online gambling among university students differ according to gender?
5. Does the level of online gambling among university students differ according to perceived socioeconomic status?
6. What are the relationships between narcissism, difficulty in regulating emotions, and online gambling?

Method: The study will utilize a correlational survey model to examine the relationships between the variables of narcissism, difficulty regulating emotions, and online gambling habits. T-tests and ANOVA tests will be used to determine whether participants' levels of online gambling habits differ according to demographic variables. The mediating relationship between narcissism, emotion regulation difficulties, and online gambling habits will be tested using a structural equation model.

THIRD PARTY EVALUATIONS OF FORGIVENESS MOTIVATIONS: WHICH MOTIVATIONS ARE PERCEIVED MORE APPROPRIATE?

Kim J.*, Garzini K., Gray E., Morgan L., Ramsey H.

Liberty University ~ Lynchburg ~ United States of America

New Abstract

Whether to forgive or not is the choice to be made by the ones who suffered injustice by another with varying motivations for forgiving or not forgiving. However, third parties might have an impact on whether or not those who were hurt by others may consider forgiveness as a viable option as a way to address what they suffered. Some motivations might be evaluated as more appropriate than others, which may interact with various contextual and individual factors. In particular, previous literature found inner peace and maintaining relationships as the two main motivations for forgiveness. To examine how forgiveness motivations are evaluated by third party observers, in Study 1, we conducted a 2 X 2 X 2 factorial study with college students in the United States (N = 386) while utilizing vignettes in which the follow factors were manipulated: motivation (inner peace versus relationship maintenance), severity of offence (less versus more), and gender of the one who offered forgiveness in each vignette (male versus female). Then, in Study 2, we conducted the same study with a social media sample with more diverse demographic characteristics (N = 143) to replicate findings for greater generalizability. For both samples, inner peace as the motivation for offering forgiveness was evaluated as more appropriate. Also, it was found from both samples that female forgivers' forgiveness for maintaining relationships was seen as less appropriate compared to that of male forgivers. Between the two samples, there also was a divergent finding in relation to the gender of the participants who evaluated forgiveness motivations presented through the vignettes. Findings were discussed in light of the demographic characteristics of the United States samples who were predominantly female Christians, and implications for clinical practice and future research were provided.

Abstract 1941

PAINTING THE PSYCHE: A CASE STUDY IN ART-BASED PTSD RECOVERY VIEWED THROUGH JUNG, CAMPBELL, AND ZIMMER

Rockers D.*

Independent Practice ~ Sacramento ~ United States of America

This presentation explores a case study of an intensive care nurse who developed post-traumatic stress disorder (PTSD) and turned to art as a central component of recovery. The study highlights how art became not only a means of expression but also a vehicle for transformation, moving from rigid, perfectionistic painting toward freer, more spontaneous expression. This artistic evolution mirrored his psychological healing: releasing constraint, accessing the unconscious, and engaging in catharsis.

The case is examined through three distinct yet complementary lenses: Carl Jung's depth psychology and the process of individuation, Joseph Campbell's Hero's Journey as a narrative of transformation, and Heinrich Zimmer's symbolic cosmology with its emphasis on polarity and enantiodromia. Each framework offers unique insights: Jung illuminates the integration of shadow material through symbolic expression; Campbell situates the journey within a larger mythic arc of descent, struggle, and return; and Zimmer highlights the cosmological dance of opposites (enantiodromia), illustrated by the Hindu god of Shiva Nataraja, in which destruction and creation coexist as forces of renewal.

Taken together, these lenses demonstrate how applied psychology can expand beyond simple symptom reduction to include transformation. The case illustrates how integrating art therapy with archetypal and mythological perspectives provides patients with new ways of making meaning, accessing resilience, and rebalancing psychic polarities.

By situating clinical practice within broader symbolic frameworks, this case study exemplifies a "new direction" in applied psychology—one that bridges creativity, culture, and clinical care. Attendees will gain insight into how symbolic lenses can enrich trauma treatment and how art can be harnessed as a transformative tool for psychological recovery.

Abstract 940

DECOLONIZING MENTAL HEALTH: RETHINKING THERAPEUTIC PRACTICES FOR SOUTH ASIAN MIGRANT WORKERS IN THE GULF

Salanova M.*[1], Bode S.[2]

[1]Saaya Health ~ Manama ~ Bahrain, [2]Royal University for Women ~ Manama ~ Bahrain

Migrant workers form the backbone of the Gulf Cooperation Council (GCC) economies, yet remain among the most underserved populations in terms of mental health support. Blue- and white-collar workers, particularly from South and Southeast Asia, face isolation, long working hours, poverty, and separation from families, while living in remote labor camps. Saaya Health has been addressing these challenges since 2022 through its Employee Assistance Program (EAP), offering multilingual counseling, workplace stress assessments, awareness initiatives, onsite counseling, and a 24/7 hotline across the GCC, Iraq, and Egypt.

Our field data from 2022–2025, collected through surveys, interviews, ethnographic engagement, and counseling transcripts, reveal that Western therapy models often do not resonate with this population. Designed primarily for middle-class contexts in Europe and North America, these models can pathologize culturally rooted experiences such as belief in Jinns, visions, or spiritual forces, which for migrant workers are normalized aspects of life. By contrast, our culturally adapted approach—grounded in community engagement and socio-discursive methods—treats these beliefs with respect, fostering trust and open dialogue.

Findings indicate that workers prefer group-based and community-oriented interventions, as well as approaches that integrate spiritual and cultural practices. Rather than focusing only on symptoms like anxiety or depression, our interventions situate distress within broader economic and social realities. This model, combining technology-enabled services with decolonized, culturally rooted practices, has proven more effective than applying standard models such as CBT without adaptation.

This presentation highlights how culturally tailored and community-based strategies can address systemic gaps in migrant mental health care in the Gulf, offering lessons that challenge conventional global mental health frameworks while promoting more inclusive and effective practices. It also offers a roadmap for how both the Gulf and the West can learn from each other in designing responsive and inclusive mental health systems for marginalized labor populations.

DECOLONIZING WELL-BEING FROM EXAMINATION OF SOCIOCULTURAL FACTORS: AFRICAN AND ASIAN PERSPECTIVES

Friday 24 July 2026 from 11:00 to 12:30

(Q-Arsenale)

Hanako Suzuki (Ritsumeikan University ~ Osaka ~ Japan), Chair
Yiheng Zhou (University of Iowa ~ Iowa ~ United State), Discussant

The purpose of this symposium is to bring in the perspectives that affect the conceptualization of well-being among individuals, groups, and communities in Africa and Asia, to examine different variables that may relate to the definitions and constructs of well-being, and to propose culturally attuned and ethically sound use of psychological theory, research, and/or practice.

Well-being has been defined as “a positive state experienced by individuals and societies... a resource for daily life and is determined by social, economic and environmental conditions" (WHO, 2021). Attempts to define constructs of well-being has been made in Western countries and those constructs have been widely used in psychological research in non-Western countries; however, whether the Western constructs fully apply and are appropriate to non-Western contexts are not yet clear. The constructs of well-being in Western societies includes individualistically focused self and achievement, such as autonomy, environmental mastery, achievement, and positive emotion (e.g. Ryff, 1989; Seligman, 2011), whereas research in non-Western countries shows that factors related to interpersonal relationships and environments are integral part of individual and community well-being, such as connections to nature and ancestors as well as traditional rituals (e.g. Asatsa et al., 2025; McLachlan et al., 2021).

In this symposium, the presenters will talk about various social, cultural, economic, historical factors to be considered when talking about well-being in Kenya, Malaysia, South Africa, and South Korea. The discussant will tie the presentations with the framework on ‘ethical practice in the majority world (Zhou, 2025)’ to provide critical lens on examining the use of Western-constructed psychological concepts in non-Western parts of the world.

Abstract 3431

WELLBEING IN MALAYSIA: EXPLORING INDIGENOUS AND CULTURALLY-INFUSED CONCEPTS

Ng A.L.O.*

Sunway University ~ Kuala Lumpur ~ Malaysia

Much of contemporary concepts of subjective wellbeing psychology are developed in WEIRD nations. As such, modern measurements of wellbeing may ignore culturally significant aspects of personal values that may also be closely influenced by non-WEIRD nation cultural practices in the community within which the individual lives. This presentation discusses common themes pertaining to cultural practices that are purported to enhance well-being in Malaysia as an attempt to highlight the importance of diversity in cultural narratives towards the understanding subjective wellbeing in a multicultural society such as the Malaysian population. This presentation will provide some nuances of the complexities of Malaysian inter-ethnic relations and multidimensional factors that affect wellbeing that could be seen as unique to the Malaysian population. Points will be drawn from existing literature and the author's personal experiences as a person of ethnic minority.

Abstract 3432

WELLBEING: A SOUTH AFRICAN PERSPECTIVE

Marsay G.*

University of the Free State ~ Bloemfontein ~ South Africa

South Africa is home to young people, many of whom face significant hardship. The nation's complex socio-historical context, coupled with ongoing structural challenges such as unemployment, educational disparities, gender inequality, poverty, and limited access to basic infrastructure, has profoundly impacted the lives and wellbeing of its youth. These adversities not only shape their day-to-day experiences but also influence their outlook on the future and their ability to thrive within their communities. Despite democratic reforms, South Africa struggles with three major challenges: poverty, inequality and unemployment relating to SDG's goals: 1 no poverty; 8 decent work and economic growth; 10 reduced inequalities.

A growing body of indigenous knowledge highlights the role of the African philosophy of Ubuntu—the collective ethos that emphasizes relational well-being as fundamental to human flourishing. The core values of Ubuntu (humanness, caring, sharing, respect and compassion) reflect the collectivist approach to life, engendering wellbeing in each person as members of community. Furthermore, global research emphasizes the role of Hope and Social Emotional Learning skills as fundamental for developing future readiness and wellbeing for youth.

This presentation reviews qualitative studies on multicultural wellbeing among South Africans in educational settings, highlighting key factors identified by youth and adults who work with youth. Three key factors which emerged from several studies are: interpersonal relationships, self-awareness and social awareness. Enhancing wellbeing in South African youth requires holistic multidimensional strategies which are contextually relevant, including psychosocial support structures based on culturally informed conceptions of wellbeing.

Abstract 3433

EXPLORING KOREAN INDIGENOUS WELL-BEING: COMMUNITY, TRADITION, AND RELATIONAL PERSPECTIVES

Lee H.*, Gwak Y.

Konkok University ~ Seoul ~ Korea, Republic of

Well-being in Western research is often conceptualized as an individual-centered construct, emphasizing personal happiness, life satisfaction, and subjective health. While these dimensions are widely studied, they may not fully capture the lived experiences and cultural values that shape well-being in non-Western contexts. In Korea, indigenous well-being concepts have evolved, rooted in traditional philosophy, social norms, and relational frameworks.

A central concept is Yangseng, meaning “nurturing life.” Yangseng emphasizes holistic balance among body, mind, and nature, guiding seasonal lifestyle practices, dietary moderation, physical exercise, and emotional regulation. Unlike Western models that focus primarily on preventive health or psychological interventions, Yangseng integrates physical and mental cultivation with harmony in one’s environment, offering a lifelong framework for flourishing.

Relational and community-oriented values are equally important. Jeong reflects deep emotional bonds and mutual care, while Hyo highlights intergenerational responsibility. These social ties enhance life satisfaction and resilience, underscoring the collectivist dimension of Korean well-being. Additionally, culturally specific mechanisms such as Han (collective sorrow) and Han-puri (its ritualized expression) illustrate how collective emotional processing fosters psychological relief.

Traditional cooperative practices like Dure or Pumsawi, where communities collaborate for mutual support, further demonstrate the role of social networks in well-being. Contemporary applications of these concepts appear in wellness programs, community interventions, and end-of-life care (well-dying), extending well-being beyond individual-centered models to social, cultural, and ecological domains.

This presentation will examine these Korean indigenous well-being constructs, compare them with Western paradigms, and discuss their implications for cross-cultural research, intervention design, and global well-being discourse. Highlighting these culturally grounded perspectives can enrich the understanding of well-being worldwide and emphasize the importance of integrating cultural specificity into psychological practice and research.

Abstract 652

"THEY TAUGHT ME TO SURVIVE, NOT TO PLAN": CHALLENGES FOR CAREER COUNSELLING WITH INFORMAL WORKERS (INVITED KEYNOTE SPEAKER DIVISION 16)

Ribeiro M.A.*

University of São Paulo ~ São Paulo ~ Brazil

Career counselling has traditionally catered to people with socio-cultural and economic advantages and rights. It has proven insufficient for the most vulnerable and disenfranchised populations. We assume career counselling is both personal and political, conceiving it as a practice of advocacy and social protection. Therefore, we state that it needs to expand and diversify its target audiences and strategies. In this sense, informal workers form an invisible but numerous group in the working world. Informal work refers to working without social protection and in potentially vulnerable situations. However, it is not necessarily synonymous with precarious working. Nor is it the opposite of formal working. We propose a continuum that ranges from extreme vulnerability and precariousness to extreme protection, with intermediate levels giving rise to varying degrees of formality and informality. We observe that informality is a structural and constitutional issue in the workplace, especially in the global South. It is not a temporary dysfunction. Therefore, we favour seeking to create dignity and social protection in informal work, rather than proposing the elimination of informality to produce dignified work. To support people in this sector, we should help them build decent and dignified career paths within the informality. We argue that specific, contextualised career counselling is both possible and necessary for informal workers. Interventions should challenge systemic assumptions, reduce individual blame, recognise oppression, and foster critical awareness and action. By strengthening agency, encouraging support networks, and addressing survival needs, we guide clients toward self-determination and access to rights. To conclude, assisting informal workers means giving visibility to the invisible ones, making a paradigm shift to change career counselling strategies towards a more diverse and socially fair practice: from regulation through adaptation to emancipation through transformation, including advocacy and dignity in its role.

Abstract 965

WORKING WITH CLIENTS FACING PRECARITY: A PARTICIPATORY ACTION RESEARCH AMONG CAREER COUNSELLORS IN SWITZERLAND

Borges A.*[1], Kekki M.[2], Lucas Casanova M.[3], Massoudi K.[1]

[1]Institute of Psychology, University of Lausanne ~ Lausanne ~ Switzerland, [2]International Centre of Guidance Studies, University of Derby ~ Derby ~ United Kingdom, [3]School of Education, Polytechnic Institute of Porto ~ Porto ~ Portugal

Contemporary trends such as globalization and social protection erosion have intensified the prevalence of precarity, defined as a state of insecurity and lack of power resulting from intersecting challenges such as financial insecurity and social inequality (Blustein et al., 2024). Providing career counseling services that foster dignified work for clients in precarious situations is demanding because they face an accumulation of adverse psychosocial circumstances, such as caregiving responsibilities, restricted access to education, and precarious work (Choonara et al., 2022). Despite growing academic interest in precarious work, research remains limited regarding the experiences and challenges faced by career counselors when working with clients facing precarity. This gap is critical because social justice-oriented practices represent a crucial support for precarity-prone clients, by helping to mitigate inequalities and promote equitable career development (Hooley et al., 2019). To address this gap, a participatory research project was undertaken, guided by two research questions: (a) how do career counsellors perceive precarity, and (b) which challenges do they face in working with clients facing precarity? Data consists of focus groups conducted over four months with three practitioners who then led a focus groups with four counselors from other institutions to enhance the robustness of the analysis through data triangulation. Preliminary findings suggest that counselors perceive precarity as related to clients' lack of opportunities to either find a job or change occupations due to economic or social vulnerabilities, with psychological effects, which engender greater challenges to practitioners. Counsellors also report the need for more sessions with each client and for interdisciplinary collaboration while navigating structural, institutional, and psychological barriers. The present study contributes to scholarship in applied psychology by exploring the demanding nature of career counseling in precarious contexts through participatory research, thereby fostering critical action among counsellors and institutions to promote well-being and social sustainability.

Abstract 1386

PREPARATORY YEAR PROGRAM FOR REFUGEES ENTERING VOCATIONAL EDUCATION AND TRAINING IN SWITZERLAND: A LOOK AT PERCEIVED WORKPLACE CHARACTERISTICS

Fedrigo L.*[1], Kammermann M.[2], Felder A.[2], Caprani I.[2]

[1]Université de Lausanne ~ Lausanne ~ Switzerland, [2]Swiss Federal University for Vocational Education and Training ~ Renens ~ Switzerland

Introduction: According to the State Secretariat for Migration, 131,605 people in Switzerland are currently in the asylum process. In this context, professional and social integration stands as a major challenge for both newcomers and the resettlement country. Vocational education and training (VET) offers a viable spathway for sustainable labor market integration. However, refugees often face significant barriers to accessing and completing VET programs. To address this issue, the Swiss Federal Council launched the pre-apprenticeship for integration program (PAI) in 2018 to support and prepare refugees for entry into VET.

Purpose: In this study, we aimed to explore workplace characteristics during the PAI by investigating trainers' and PAI trainees' perceptions of affordances–that is, the social and structural resources provided in the workplace–and PAI trainees' commitment, referring to their individual prerequisites for utilizing these affordances.

Method: We conducted a qualitative study, interviewing three former PAI trainees with refugee backgrounds and their in-company trainers in the fields of plumbing, commerce, and horticulture. A hybrid approach combining deductive and inductive analyses was used to perform a thematic analysis.

Results: The findings indicate that the learning environments provided strong support to PAI trainees, reflecting the trainers' active involvement in promoting their integration within both the team and the organization. For their part, PAI trainees reported a high level of commitment, demonstrating motivation, interest, and initiative. However, external factors–such as family or administrative issues related to temporary residence permits–emerged as barriers that hindered their ability to fully concentrate on their training.

Conclusion: Our study emphasizes that the PAI program fosters refugees' learning journeys and support their integration into the Swiss VET system. However, it also highlights the pivotal role–and power–of trainers, as well as the contextual factors that can hinder their journeys.

Abstract 1820

CAREER DEVELOPMENT AS A GATEWAY: EXPLORING SYSTEMIC INFLUENCES IN COUNSELING WITH ADULTS IN VULNERABLE CONDITIONS

Rocca A.*[1], Sgaramella T.M.[2], Pontiggia C.[1]

[1]Centro Gulliver - Società Cooperativa Sociale a r.l. ~ Varese ~ Italy, [2]Università degli studi di Padova ~ Padova ~ Italy

Counseling in contexts of complex life stories—such as recovery from substance use disorders (SUD) and experiences of migration—requires approaches that move beyond individual traits to encompass the systemic influences shaping people's lives. Narrative tools grounded in the Systems Theory Framework provide a reflective process that reveals the interplay of personal, relational, and contextual factors. This approach also opens the way to integrative perspectives that, while starting from a specific need, extend to broader life domains. This contribution draws on two studies that applied the My System of Career Influences (MSCI) to adults in residential rehabilitation for SUD and to adults with migration histories. Despite differences in vulnerability, both groups revealed recurring systemic themes as well as the unique significance of specific influences. Common themes included the central role of family, the importance of interpersonal relationships, the impact of social and environmental conditions, reflections on identity and values, and aspirations for the future. In both contexts, participants engaged in meaning- making and self-reflection that heightened awareness of overlooked influences, strengthened agency, and fostered constructive change. At the same time, context-specific themes emerged: health, stigma, and identity reconstruction were particularly salient among adults in recovery, while cultural background, mobility, and recognition from external authorities (e.g., managers, leaders) played a central role among migrants. Taken together, these findings highlight the potential of an integrative narrative approach to counseling. Moreover, by adopting a systemic lens, both intraindividual dimensions (identity, values, agency) and contextual dimensions (family, networks, structural barriers) can be addressed, providing practical guidance for holistic, inclusive, and effective counselling interventions with individuals experiencing complex transitions.

Abstract 953

A NOVEL PROCEDURE TO SUPPORT MEANING-MAKING AT WORK: COMBINING WORK AND LIFE DESIGN RESEARCH WITH AI-ENHANCED NARRATIVE METHODS

Schreiber M.*[1], Jenny G.J.[2], Hofer D.[2], Ziegler C.[1]

[1]Zurich University of Applied Sciences (ZHAW) ~ Zurich ~ Switzerland, [2]FHNW University of Applied Sciences and Arts Northwestern Switzerland ~ Olten ~ Switzerland

Introduction

It has been postulated that humans have an innate drive to make meaning of everyday experiences and to form a coherent view of the world around them. In the field of work design, occupational health psychologists have addressed this topic with a focus on job crafting, person-job fit, and basic needs satisfaction. In the field of life design, vocational psychologists have researched this topic with a focus on idiosyncratic processes of self-construction and identity narratives within people's vocational development.

Purpose

We are developing a digital platform labelled ‘Meaning@Work’ to support individuals in crafting meaningful work and careers. Hereby we also aim to combine approaches from occupational psychology (such as ‘job crafting’) with approaches from psychological research on career development (such as the ‘career construction interview’).

Method

On the digital platform ‘Meaning@Work’, participants write short stories about themselves. This is self-explanatory and done step by step. At the end, the stories are used to create an ‘identity card’ with a summary of dispositions, motives and life themes, as well as a recommendation to oneself on how to use this insight to create more meaning in one’s career and everyday working live. We also integrate generative artificial intelligence to offer participants creative inspiration when writing and interpreting the stories. Finally, we evaluate both the use and acceptance of the process and its effect on the experience of meaning.

Result

The prototype of the platform and results from the usability testing will be available by the time of the conference and presented to the audience.

Conclusions

This combination of concepts and methods will have an impact on both fields of work and life design research, expanding our repertoire and ways of studying the concept of meaning and meaning-making at work.

Abstract 98

A LONGITUDINAL STUDY OF ENVIRONMENTAL SUPPORTS, POSITIVE ADJUSTMENT, AND RETENTION FOR RACIAL/ETHNIC MINORITY STUDENTS

Sheu H.*

University at Albany, SUNY ~ Albany, NY ~ United States of America

Environmental resources, such as academic support (ASU) and social support (SSU), play a vital role in successful transition and adjustment to college, especially for students of underrepresented racial/ethnic minority (UREM) backgrounds. However, ASU and SSU have often been studied separately and cross-sectionally. To fill these gaps, this longitudinal study examined growth trajectories of ASU and SSU together and explored personality traits as their predictors and positive adjustment and retention as outcomes for UREM college students in the United States.

The sample included 316 first-year UREM students at a public American university (52% males, 48% females; 42% Latinx Americans, 20% multi-racial individuals, 16% African/Black Americans, 14% Asian Americans, 8% other underrepresented minorities). ASU and SSU were assessed in the 1st week (T1), 5th week (T2), and 10th week (T3) during participants' first semester on campus. Extraversion and emotional stability were assessed at T1 whereas academic adjustment, social adjustment, and intention of continuous enrollment were measured at T3. Data were collected using instruments with acceptable psychometric properties.

The hypothesized model produced acceptable fit (CFI = .94, SRMR = .05). Participants perceived similar levels of ASU and SSU at T1. SSU exhibited an upward trend over time while that of ASU was less clear. Extraversion predicted ASU and SSU intercepts and emotional stability predicted ASU intercept, but neither variable was predictive of ASU and SSU slopes. ASU intercept and slope and SSU intercept positively predicted T3 academic adjustment, whereas ASU slope and SSU intercept and slope were positive predictors of T3 social adjustment. ASU slope also positively predicted participants' intention at T3 to enroll next semester. This study offers evidence for the importance of environmental supports gathered over time in facilitating a positive transition into college. Securing resources for academic and social goals should be included in interventions for serving UREM college students.

Abstract 1180

FACTORS ASSOCIATED WITH RETENTION IN ONLINE PSYCHOLOGICAL COUNSELING

Eimontas J.*, Grigutyte N., Paškeviciute P., Stankute V., Laurinavicius A.

Vilnius University ~ Vilnius ~ Lithuania

Introduction. Online psychological counseling is a feasible option for those in need of psychological services, and it saves time, travel costs, and improves accessibility for those living remotely or having mobility difficulties. However, high dropout rates warrant investigating which client, therapist and treatment-related factors are associated with the decision to continue treatment after the initial first consultations.

Purpose. The purpose of this study is to explore the factors associated with retention in online psychological counseling following initial sessions.

Method. In this study, we invited clients and their psychologists of an online psychological counseling service to fill out questionnaires before the first, after first, second, third, fifth, and tenth consultations. Psychologists were asked to fill in questionnaires on their professional experience, working alliance with a given client, and demographic information. Client measures included The Big Five Inventory – 2 (Soto & John, 2017), the Working Alliance Inventory (Hatcher & Gillaspy, 2006), the Milwaukee Psychotherapy Expectations Questionnaire-Brief (Normberg et al., 2011), Therapist Hope for Clients Scale (Bartholomew et al., 2020), Depression Anxiety Stress Scales-21 (Lovibond & Lovibond, 1995), and sociodemographic information.

Results. A review of pilot study data showed that client personality related factors account for a substantial part of retention After completing data collection in February 2026, we will report on the role working alliance, treatment expectancy and personal therapist and client related factors to the retention in online psychological counseling.

Conclusions. Online psychological counseling has a number of advantages when it comes to scaling up and improving accessibility of psychological therapies. However, to improve retention, we need to systematically explore the client, therapist, and therapeutic relationship associated factors that contribute to it and compare it to the evidence from studies on face-to-face psychological counseling.

Abstract 2086

FROM PERSONAL CLARITY TO COLLECTIVE TRANSFORMATION: A MULTI-LEVEL APPROACH TO VALUES WORK IN APPLIED COUNSELING PSYCHOLOGY

Howard K.*

Boston University ~ Boston, MA ~ United States of America

Contemporary society faces unprecedented challenges that threaten the foundations of democratic discourse and institutional trust. In the current U.S. context, workforce disruption is creating widespread career uncertainty, attacks on higher education and scientific inquiry are undermining evidence-based decision-making, pervasive misinformation is eroding shared understanding of reality, and immigrant and international communities are facing systematic targeting. These interconnected crises demand coordinated responses that honor human dignity while fostering constructive engagement across profound differences.

This Division 16 keynote address explores how counseling psychology's evidence-based values interventions can be used to address these societal challenges across individual, organizational, and community contexts. An example of counseling psychology knowledge and skills is the Boston University's "Living Our Values" initiative. As co-leader of this endeavor to identify the BU community's shared values, I will highlight aspects of this collaborative effort to demonstrate how counseling psychology principles can create sustainable change across system levels.

At the individual level, values clarification research spanning career counseling and clinical practice establishes that structured exploration significantly improves decision-making self-efficacy, reduces anxiety during transitions, and enhances psychological well-being. Beyond career planning, values-focused clinical interventions show robust effects for reducing psychological inflexibility and increasing authentic living, helping clients navigate complex personal and social pressures while maintaining psychological integrity.

Organizationally, counseling psychology's process expertise can facilitate systematic values identification and implementation in complex institutions, including higher education. Research demonstrates that participatory values integration processes significantly improve organizational climate, employee engagement, and ethical decision-making behaviors. Our discipline's emphasis on collaborative meaning-making and stakeholder voice has been shown to be superior to compliance-based approaches.

At the societal level, values-centered dialogue facilitation draws from counseling

psychology's multicultural competencies and group process skills. Studies show that structured values conversations across ideological divides reduce prejudice while enhancing capacity for civil discourse, creating pathways for productive disagreement that preserve democratic engagement.

THE LIVED SEXUAL EXPERIENCES OF FILIPINO BISEXUAL MEN AS LENS IN REINFORCING BI-AFFIRMATIVE COUNSELLING AND THERAPY PRACTICE IN THE PHILIPPINES

Geneta A.L.*

DEPARTMENT OF BEHAVIORAL SCIENCES, COLLEGE OF ARTS AND SCIENCES, UNIVERSITY OF THE PHILIPPINES MANILA ~ MANILA ~ Philippines

Bi+ people continue to be interrogated about the nature of their sexual orientation and the behaviors (particularly sexual behaviors) connected to it. I looked into the lives of selected Filipino men about their sexual experiences with women and other men, and the personal meanings attached to these experiences. Through the in-depth interview, these men were able to articulate a hidden yet visceral aspect of their lived experiences, thereby allowing for a more nuanced understanding of their sexual lives. Since studies on male bisexuality are not as popular in the Philippines, this research helps illuminate the complex nature of bisexual feelings often obscured by the highly heteronormative ideology on masculinity in a historically patriarchal culture. With the men I interviewed describing their experiences, we can better understand that they are not “sexual perverts,” as most pervasive misconceptions tend to convey. Appreciating the diversity of sexual orientation is needed to achieve a Bi+ counselling and therapeutic practice that is inclusive and effective. I offer critical suggestions on reinforcing our bi-affirmative practices to help benefit contemporary local and international intervention efforts with the LGBT+.

STRUCTURAL COMPETENCIES IN THE GLOBAL CONTEXT: ADVOCACY FOR MARGINALIZED STUDENTS IN THE U.S. COLLEGE CAMPUSES

Lee J.*

New York University ~ New York ~ United States of America

Counseling Psychologists' role is providing a culturally responsive care, which has been challenged in the current global context because individuals' mental health can be rooted beyond their individual issues. Since the COVID-19 pandemic, global political conflicts and unrest worldwide have impacted college students in the U.S. with their marginalized backgrounds (e.g., family immigration history, racial identity, legal status, and economic hardship). Without recognizing individuals' multilayered challenges such as systemic, cultural, structural, and sociopolitical issues in the current global context, practitioners cannot fully conceptualize individuals' presenting concerns to provide culturally responsive care for them. As Wilcox et al. (2024) argued that a structural competencies model recognized and provided a framework to address how clinical interactions are influenced by social, political, and economic conditions in the U.S. society, Counseling Psychologists in the current global context need to develop their multicultural and structural competencies to provide culturally sensitive care for individuals. The presenter, who is a U.S.-trained international Counseling Psychologist with extensive clinical and training experiences at university counseling centers, can expand this structural competency model in the U.S. to the current global context. This presentation is aimed at 1) improving our recognition of the structures that shape clinical interactions, 2) improving our clinical consciousness and cultural sensitivity, 3) improving our provision of structural intervention, and 4) improving structural humility in the global context. The presenter will share examples of two weekly prevention programs at the university counseling center in the U.S. to practice structural competencies, social justice, and advocacy to help marginalized college students. The presenter will share the process of providing supervision and training for trainees who attempt to improve their critical consciousness and structural humility to provide a culturally response care for their clients at the university counseling center, which can be applicable to other practitioners in the global context.

BARRIERS AND RESOURCES IN SUSTAINED RECOVERY FROM SUBSTANCE USE DISORDER: CLINICAL AND PUBLIC HEALTH IMPLICATIONS

Navsaria K.*, Van Zyl M.

Nelson Mandela University ~ Port Elizabeth ~ South Africa

Introduction: Substance Use Disorder (SUD) remains a critical public health issue due to high relapse rates, substantial individual and community costs, and persistent treatment gaps.

Purpose: This systematic review (2017–2025) examined how motivation, recovery capital, and systemic barriersinfluence sustained recovery from SUD, with implications for clinical practice and public health.

Method: Following PRISMA protocols, peer-reviewed studies were systematically identified, screened, and thematically synthesized. Inclusion criteria required studies that addressed recovery maintenance, relapse prevention, or long-term abstinence.

Results: Three key themes were identified. First, intrinsic motivation (personal growth, self-efficacy, and autonomy) strongly predicted sustained recovery, whereas extrinsic motivation often supported short-term change but lacked long-term stability. Second, recovery capital—spanning social, human, physical, and cultural resources—was consistently associated with resilience against relapse. Supportive networks, access to healthcare, financial stability, and positive self-concept emerged as critical protective factors. Third, barriers such as stigma, economic vulnerability, comorbid mental illness, and structural inequities undermined treatment engagement and long-term recovery. These barriers were especially pronounced in low-resource and high-prevalence contexts, including South Africa.

Conclusions: Findings suggest that recovery is strengthened when motivational enhancement strategies are integrated with asset-based approaches that expand recovery capital. Clinically, practitioners should focus on building intrinsic motivation and leveraging clients' social and community resources. From a public health perspective, reducing stigma, improving equitable access to services, and addressing socioeconomic inequalities are vital to sustainable recovery outcomes. This review highlights psychology's critical role in shaping both individual and systemic responses to SUD.

Abstract 1067

DREAMS AND CORRELATIONS WITH TEMPERAMENT, CHARACTER AND DISTRESS: THE ONTOPSYCHOLOGICAL CONTRIBUTION.

Massimo G.*[1], Palumbo G.[2], Bernabei P.[3]

[1]San Gallicano Dermatological Institute ~ Rome ~ Italy, [2]International Ontopsychology Association ~ Rome ~ Italy, [3]Antonio Meneghetti Scientific and Humanistic Research Foundation ~ Lugano ~ Switzerland

The paper first reviews historical, theoretical, and clinical perspectives on dreaming, from antiquity through Freud and Jung to contemporary frameworks, including Meneghetti's ontopsychological approach (OA). It then proposes an investigation of the OA to dream and its correlations with temperament, character and psychological distress.

In the present study, we first tested whether the OA dream content analysis system correlates with the Hall and Van de Castle (HVDC) system, which is the most accredited and applied coding method of dream content analysis. In the completed first phase of the project- an exploratory analysis of the correspondence between the principal dream content categories in the Ontopsychological Dream Handbook and those identified by the HVDC system – moderate to high correlations were observed between OA and HVDC dream codes in five comparable categories (Spearman correlation test). Characters/Persons or Individuals $r=0.75$ ($p < 0.01$); Activities/Action in Mutation $r=0.74$ ($p < 0.05$); Emotions/Sentiments $r=0.82$ ($p < 0.01$); Settings/Place $r=0.53$ ($p <0.01$); Objects/Objects $r=0.82$ ($p <0.01$). This suggests that the OA coding system has satisfying, although preliminary, convergent validity. Our findings suggest that a universal approach to dream analysis may be feasible across different theories of mind and psychotherapy. Such an approach could yield reliable descriptions of dreams of interest to both scientists, psychologists and psychotherapists (Giuliani & Palumbo, 2024).

The second phase of the OA on dreams study is ongoing. This second phase is looking at correlations between dreams and temperament, character, and psychological distress, using the Temperament Character Inventory (TCI) and the General Health Questionnaire (GHQ) tools. At present, enrollment and data entry have been completed. We recruited 105 subjects. Preliminary data deriving from analysis of correlations between dream content according to the OA and temperament traits, character traits and distress will be discussed.

KNOWING ME, LOVING YOU: EXPLORING HOW IDENTITY SHAPES INTIMACY IN EMERGING ADULTHOOD. A CROSS-CULTURAL, MIXED-METHODS STUDY.

Stecko L.*[1], Pinheiro M.[2], Michiels N.[3], Puente Paesa A.[4], Mirchevska L.[5], Unterweger C.[6], Cabral J.[7]

[1]Wyzsza Szkola Ksztalcenia Zawodowego ~ Wroclaw ~ Poland, [2]Universidade de Lisboa ~ Lisbon ~ Portugal, [3]Universiteit Gent ~ Ghent ~ Belgium, [4]Universitat Jaume I ~ Castellón ~ Spain, [5]University of Ss. Cyril and Methodius ~ Skopje ~ North Macedonia, Republic of, [6]Alpen Adria University Klagenfurt ~ Klagenfurt ~ Austria, [7]Instituto Piaget de Viseu ~ Viseu ~ Portugal

In today's world, many individuals report difficulties in maintaining a sense of connection, both with others and with themselves. Building on classic theories, this connection can be understood as relational: the ability to be intimate with others rests on the ability to know and understand oneself. Identity can be conceptualized far more broadly, encompassing narrative, sociocultural, and developmental perspectives, as well as the dimensions of distinctiveness, continuity, and coherence. Limited research has demonstrated links between identity commitment and intimacy in romantic relationships, yet romantic relationships are central to young adults' well-being, and a key component of an individual's evaluation of their overall quality of life.

To address this gap, a mixed method, international study was conducted in six European countries - Portugal, Spain, Poland, Belgium, Austria, and North Macedonia - with young adults aged 18–40. In Phase 1, structured interviews with 10 participants per investigator were used to refine culturally sensitive measures and generate qualitative insights into the themes, motives, and identity aspects associated with intimacy. In Phase 2, approximately 200 individuals per country will participate in survey-based research, ensuring balanced gender representation. This phase aims to confirm and extend the findings of Phase 1 within a larger sample using complementary methodology.

By integrating quantitative and qualitative findings, this study will advance understanding identity development and relational well-being in emerging adulthood. Importantly, its contributions extend beyond theory: the results will provide insights for psychologists working in counseling, psychotherapy, and relationship education. By addressing identity and intimacy together, and with a cross-cultural scope, the study will contribute to applied psychology's mission of enhancing individual and relational well-being in contemporary Europe.

Abstract 122

COLLECTIVE SELF-ESTEEM: A VARIABLE NEEDED TO EXAMINE ACROSS THE CULTURES

Tiwari R.*

Gandhi Shatabdi Smarak Post Graduate College Koilsa Azamgarh ~ Azamgarh ~ India

Identity and self-esteem are most important aspect of any individual. Self-esteem plays a crucial role in well-being. Human are social being too and the most important expression of this sociality is that we live, and have to live in social groups. Thus social identity and self-esteem belongs to our social group, which called collective self- esteem are also very important aspect of the individual. Studies showed that Collective self-esteem is an important construct which influences Well-being. Available researches indicates that collective self-esteem were studied with psychological well-being in Euro-American Context. However researchers largely ignored to study collective self-esteem with emotional well-being and social well-being; and another important aspect multi-cultural context. The present study examined the relationship between collective self-esteem and well-being in Uni-cultural and Multi-cultural society. The data were collected from 300 adults (age ranges from 25-40 years) from different tribal groups (150 participant; 90 Male and 60 Female) and people from Varanasi and Azamgarh city, Uttar Pradesh (150 participants; 70 Male and 80 Female) which represents Uni-cultural and Multi-cultural society. The self-report measures of the aforementioned constructs were used to collect data. Local assistance were used to collect data from tribal groups. Bi-variate correlation and step-wise regression analysis were done to test the hypothesis. Analysis revealed that collective self-esteem and psychological and social well-being correlated positively in Uni-cultural group (tribal groups) but collective self-esteem and social well-being correlated negatively in Multi-cultural society (Varanasi and Azamgarh). The analysis also revealed that private collective self-esteem and importance to identity play most important role to determine the relationship between Collective self-esteem and well-being. The findings were discussed in the light of existing literature.

INCLUSIVE CAREER COUNSELLING FOR VULNERABLE ADULTS: INTEGRATING TRANSDISCIPLINARY AND NARRATIVE APPROACHES TO WORK AND WELL-BEING

Friday 24 July 2026 from 14:00 to 15:30

(Q-Arsenale)

Nikos Drosos (European University Cyprus ~ Nicosia ~ C), Chair and Presenter
Teresa Maria Sgaramella (University of Padova ~ Padova ~ Italy), Discussant

Adults facing mental health challenges, substance addiction, disability, and other intersecting vulnerabilities often encounter complex barriers when seeking meaningful, sustainable work. Traditional career counselling approaches may not fully address the psychosocial, systemic, and identity-related factors that shape these individuals' vocational journeys. This symposium brings together innovative applied psychology perspectives that integrate transdisciplinary collaboration and narrative, person-centred frameworks to promote inclusion, well-being, and decent work — closely aligned with ICAP 2026's theme of New Directions in Applied Psychology.

Five presentations offer complementary but distinct contributions:

• Athanasiou (Cyprus) explores a transdisciplinary community-based model where career counsellors collaborate with mental health, social, and legal professionals to reduce fragmented services and enhance sustainable work participation.

• Charokopaki & Petrou (Greece) examine work values and career adaptability among individuals recovering from psychotropic substance addiction, providing evidence for tailored counselling and supported employment.

• Drosos (Cyprus) investigates how mental health service users construct meaningful careers, mobilise psychosocial resources, and benefit from supported employment to sustain participation and integrate work into recovery narratives.

• Rocca & Sgaramella (Italy) present a systemic and narrative framework (My System of Career Influences) to help adults with substance use histories reframe life stories and strengthen vocational identity.

• Ferrari, Sgaramella & Zanibon (Italy) give voice to adults with disabilities navigating career change, highlighting personal resources, social factors, and identity reconstruction through qualitative counselling research.

Together, these contributions demonstrate how career counselling evolves beyond traditional vocational matching to support recovery, empowerment, and social inclusion. By combining systemic, narrative, and transdisciplinary practice models, the symposium shows how applied psychology can foster decent and meaningful work (SDG 8 and 10), well-being (SDG 3), and cross-sector partnerships (SDG 17) for vulnerable adults.

Abstract 3677

TRANSDISCIPLINARY CAREER GUIDANCE COUNSELLING: HOLISTIC INTERVENTIONS FOR CLIENTS WITH MULTIPLE NEEDS IN COMMUNITY CONTEXTS

Athanasiou E.*

European University Cyprus ~ Nicosia ~ Cyprus

Contemporary social and economic conditions increasingly confront individuals with complex, interwoven challenges that cannot be effectively addressed by a single discipline. Clients seeking career guidance often present with multiple needs that extend beyond vocational concerns, encompassing mental health, social, legal, and other issues. This presentation theoretically documents the necessity of adopting holistic, interdisciplinary interventions in career guidance counselling, positioning the practitioner as an active member of a transdisciplinary team. The aim is to highlight how community-based collaborations among psychologists, psychiatrists, social workers, career guidance counsellors, and legal advisors can shield clients from fragmented services and instead foster prevention, awareness-raising, and integrated management strategies. A theoretical analysis is conducted, drawing on current literature and practice models of interdisciplinary work, with a focus on their relevance to career guidance counselling. The framework emphasizes both systemic and client-centered perspectives. Findings suggest that career guidance becomes more impactful when embedded within transdisciplinary practice, as it acknowledges the client's broader life context. The practitioner's role evolves from vocational advisor to bridging diverse professional insights and ensuring that interventions are coherent and sustainable. Importantly, the presentation argues that when counsellors work in isolation, not only the process of finding employment but also the ability to retain decent and meaningful work can be sabotaged. In addition, the presentation explores common difficulties in collaboration—such as role ambiguity, communication barriers, and professional silos—while identifying conditions conducive to more seamless exchange, including shared values, mutual respect, and institutional support. Transdisciplinary approaches provide a valuable pathway for addressing complex client needs, reducing service fragmentation, and enhancing community well-being. By situating career guidance counselling within interdisciplinary teams, and by fostering client-centred conditions for collaboration, practitioners can contribute to both individual empowerment and systemic resilience.

Abstract 3678

SYSTEMIC INFLUENCES AND VOCATIONAL PATHWAYS: STORIES WITH ADULTS FACING SUBSTANCE USE CHALLENGES

Rocca A.*[2], Sgaramella T.M.[1]

[1]University of Padova ~ Padova ~ Italy, [2]Gulliver Center; University of Padova ~ Padova ~ Italy

Career counseling with adults who have experienced substance use highlights the importance of viewing career development as a systemic and dynamic process. Rather than being shaped solely by individual choices, career trajectories in this context are strongly influenced by personal resources, family and social relationships, and broader environmental conditions. Using My System of Career Influences (MSCI), group studies and individual case analyses show that work and vocational identity often emerge as central themes. Family and social ties can serve as critical supports but may also present sources of conflict, while contextual factors such as mobility, education, and employment opportunities further shape career pathways.

These insights reinforce the value of systemic and narrative approaches that enable individuals to identify overlooked influences, reframe life stories, and recognize personal strengths. Both have proven especially useful in facilitating reflection on complex influences and in supporting the development of a more coherent and future-oriented vocational identity. By adopting such approaches, counselors can address individual needs in a more integrative manner, foster their agency, and create conditions for a meaningful and positive future. This perspective extends the scope of career counseling to address the multifaceted realities of clients facing compounded vulnerability.

Abstract 3679

WORK VALUES AND CAREER ADAPTABILITY OF PEOPLE WITH PSYCHOTROPIC SUBSTANCE ADDICTION

Charokopaki A.*[1], Petrou M.[2]

[1]University of West Attica ~ Athens ~ Greece, [2]Freelancer ~ Athens ~ Greece

Substance addiction is a complex condition with wide-ranging effects, including profound social and vocational disruption (Volkow & Koob, 2015). This study explores work values and career adaptability among individuals with psychotropic substance addiction—a population rarely examined in career development research. Work values, long recognised as central to career development (e.g., Holland, 1997; Super et al., 1996), guide what people consider meaningful and desirable in a career and influence decisions about work reintegration. Yet their role among socially vulnerable groups, such as people with addiction, remains largely unexplored, particularly in Greece. Understanding these values is vital for supporting occupational recovery and sustainable employment. Career adaptability, a key concept in Career Construction Theory (Savickas, 2013), describes psychosocial resources for coping with career tasks, transitions, and disruptions. It encompasses four dimensions—concern, control, curiosity, and confidence—and helps explain how individuals give meaning to career paths and manage change. Studying career adaptability among people in addiction recovery can inform tailored counselling and vocational support.

This study surveyed 100 participants enrolled in KETHEA Nostos, a nationally recognized residential and community-based rehabilitation program for people recovering from substance addiction in Greece. All had a history of psychoactive substance use (e.g., heroin, cocaine, alcohol, prescription drugs). We examined their work values and career adaptability profiles, as well as relationships between these constructs and demographic or addiction-related factors (such as years of use and time in treatment). Findings highlight predominant work values and patterns of career adaptability in this group, shedding light on how individuals in recovery envision and manage their vocational futures. Results provide practical implications for career counselling and supported employment interventions, emphasising strengths-based, person-centred approaches that foster meaning, resilience, and sustainable work participation during mental health recovery.

Abstract 3681

NAVIGATING CAREER TRANSITIONS: VOICES OF ADULTS WITH DISABILITIES PARTICIPATING IN A CAREER COUNSELING PROGRAM

Ferrari L.*, Sgaramella T.M., Zanibon P.

University of Padova ~ Padova ~ Italy

Career change represents a complex challenge involving emotional, financial, and psychological aspects, and is particularly challenging for individuals who experience disability. Giving voice to these individuals is more necessary than ever to better respond to their specific needs and realise sustainable environments, as well. In this study, four adults with high levels of disability who were participating in a career program to exit unemployment were interviewed. They responded to the Yesterday-Today-Tomorrow interview (Zanibon et al., 2025), designed to encourage participants to reflect on their own resources and capabilities in relation to future work projects. The themes that emerged from the thematic analysis will be presented and discussed with reference to three macro-categories: (a) Changes in their careers and challenges such as complex emotional, financial, and psychological difficulties individuals face when shifting from one profession to another; (b) Personal and social factors used to address work challenges, cope with stress, and adapt to change; (c) Strategies individuals use to interpret life events, construct career paths, and form their professional identities.
Furthermore, attention will be paid to how these aspects change over time, and their relevance during the counseling process, either promoting or hindering the psychological well-being.

Abstract 3683

CONSTRUCTING MEANINGFUL CAREERS IN MENTAL HEALTH RECOVERY: PSYCHOSOCIAL RESOURCES, SUPPORTED EMPLOYMENT, AND SUSTAINABLE WORK PARTICIPATION

Drosos N.*

European University Cyprus ~ Nicosia ~ Cyprus

Work is a central arena for recovery, identity, and social inclusion among people with lived experience of mental health conditions. Yet many face intersecting barriers—stigma, episodic symptoms, precarious jobs, and inadequate workplace accommodations—that threaten both employment access and sustainability. This presentation examines how mental health service users construct and pursue vocational goals while navigating recovery. Drawing on qualitative and mixed-methods research, it highlights:

• Challenges such as disclosure dilemmas, discrimination, and job loss risk;

• Positive psychosocial resources—hope, self-efficacy, career adaptability, supportive networks, and meaning-making—that enable goal setting and resilience;

• The role of supported employment (e.g., Individual Placement and Support) not only in rapid job access but in sustaining participation, fostering identity reconstruction, and aligning work with personal values.

Special attention is given to career construction processes: how users formulate short- and long-term career plans, integrate work into evolving self-narratives, and maintain a sense of purpose despite relapse or systemic barriers. Practical implications include tailoring career counselling and vocational psychology interventions to enhance meaning attribution, strengthen adaptive resources, and provide continuing support for job retention and progression. Framed within the UN SDGs' focus on inclusive and sustainable work, this talk advocates for a strengths-based, person-centred approach that integrates mental health recovery with decent and meaningful employment.

YOUNG ADULTS' CAREER ASPIRATIONS IN THE CONTEXT OF THE ANTHROPOCENE

Cerantola M.*, Borges A., Brazier C.É., Randin O., Masdonati J.

Université de Lausanne ~ Lausanne ~ Switzerland

Young people are increasingly confronted with the existential and societal challenges of the Anthropocene. This study explores how young adults who are concerned with ecological and social issues navigate the present and envision their future, both personally and professionally. Drawing on Guichard's self-construction theory, which conceptualizes identity as a dynamic configuration of tendencies to be, to act, and to construct oneself in the present and future, we investigated the way ecological concerns shape young adults' construction of career and life aspirations. Fifteen semi-structured interviews with students in French-speaking Switzerland were conducted and analyzed using Consensual Qualitative Research (CQR). All participants were either engaged in climate or social activism or expressed strong concern about sustainability issues. Findings revealed that career planning was rarely a priority for participants. Their narratives were often marked by existential questioning, concerns about coherence with personal values, a sense of urgency regarding global crises, and a desire to contribute to ecological or social causes. Our analyses also suggest the existence of three distinct articulations between career planning and ecological concerns: (a) some students envisioned careers that directly address climate or social challenges; (b) others sought to integrate ecological values into their future profession; and (c) a third group chose to dissociate their climate commitments from their career choices and trajectories. These results highlight how existential, social, and ecological considerations can reshape or even take precedence over career aspirations. This research suggests that career guidance and counseling should adopt more holistic approaches, acknowledging how extra-professional concerns, such as sensitivity to global crises, can shape or be negotiated alongside career aspirations.

Abstract 1285

INVOLUNTARY CAREER CHANGE TRIGGERED BY HEALTH ISSUES: CROSSING THE PERSPECTIVES OF CHANGERS AND THEIR SIGNIFICANT ONES

Coquoz R.*, Brazier C.É., Masdonati J.

University of Lausanne ~ Lausanne ~ Switzerland

Research has highlighted the disruptive nature of involuntary career changes resulting from chronic health conditions, also suggesting that this form of transition necessitates substantial adjustments both on the part of the career changers and their social environment. Yet, while the influences of relational processes on careers are well established, the career change literature has focused exclusively on the perspective of individuals in transition, overlooking the experiences of their entourage. Anchored in the Systems Theory Framework, the present study provides an in-depth understanding of the interconnected experiences of individuals undergoing involuntary career change due to chronic health conditions and those of their close relatives. Adopting a dyadic research design, we conducted eight individual semi-structured interviews with career changers and their significant others (e.g., partners, family members, close friends). We performed a Multiple-Perspective Interpretative Phenomenological Analysis to capture participants' meaning-making of their lived experiences. Preliminary results reveal both shared and distinctive features of career change experiences within dyads. On the one hand, for example, career changers and significant others coordinate their adjustments to institutional expectations and elaborate a common vision of a dignified career. On the other hand, they can diverge in their perceptions of the diversity, intensity, and impacts of the support provided by their significant others. Results also suggest that career change experiences are shaped by relational patterns that are either complementary or imbalanced. This includes, in particular, the career changers' internalization of the perspectives and career expectations introduced by their significant others. The present study offers unique insights into the complexity of the relational processes at play and their influence on the career change trajectory, experience, and meaning. Consistent with a systemic and relational perspective of career counseling, results inform the support provided to adults in career transition and their significant others, and advocate for integrative counseling practices.

Israelashvili M.*

Tel Aviv University ~ Tel Aviv ~ Israel

Understanding the nature of adjustment processes constitutes an essential yet underexplored area in applied psychology. As individuals navigate life course transitions, they encounter both challenging and enriching experiences. Regardless of their level of preparedness, people often face moments of negative affect linked to leaving the familiar, heightened ambiguity, and repeated demands to function in novel ways. Concurrently, they may uncover previously unrecognized personal assets—such as resilience—engage in intense processes of meaning-making and self-reflection, and experience the satisfaction of mastering new behaviors.

Existing theories on counseling individuals in transition are largely characterized by fragmented, small-scale, and predominantly linear models. Consequently, a comprehensive and cross-situational framework remains lacking. The Transitional Stress and Adjustment (TSA) model (Israelashvili, 2023) was developed to address this gap, offering both a theoretical foundation and a practical tool for practitioners. The TSA model delineates the universal components of adaptation to life course transitions, situated across both individual and environmental (or organizational) levels. As such, it provides a conceptual and applied framework for supporting individuals and organizations preparing for—or already engaged in—processes of adjustment.

Following an overview of the TSA model, two empirical studies will be briefly presented. The first study, conducted among new immigrants (N = 432), illustrates the model's relevance for understanding and facilitating adjustment during major life course transitions. The second study, conducted among adolescents from Jewish (N = 442) and Arab (N = 331) populations, demonstrates the model's applicability to developmental transitions. Collectively, the findings from these studies highlight the TSA model's utility in elucidating the key concerns that arise during transitional periods and in identifying strategies to prevent maladaptive outcomes. This framework also underscores the importance and feasibility of working with organizations to develop structured protocols for recruiting and integrating newcomers effectively.

Abstract 496

THE ROLE OF SELF-REGULATORY ORIENTATION AND SUPPORT FROM THE FAMILY OF ORIGIN IN THE CAREER CONSTRUCTION OF YOUNG ADULTS

Paszkowska--Rogacz A.*

Institute of Psychology ~ Lodz ~ Poland

The aim of the present study was to examine the relationship between young adults' self-regulatory orientation and the support provided by their family of origin during emerging adulthood in the process of constructing their professional careers. A total of 300 young adults (53% women, 47% men) aged 18–29 years (M = 25.1; SD = 3.1) participated in the study. The respondents represented all levels of education; 90% were currently employed, and 21% were pursuing formal education. The research instruments included the Savickas Career Construction Inventory, the Fouad Family Influence on Career Development Scale, and the Promotion and Prevention Self-Regulation Scale. The results indicated that both preventive and promotional self-regulatory orientations play a significant role in shaping all five aspects of career construction: crystallization, exploration, decision-making, development of professional skills, and transition from school to work. Furthermore, informational support from the family explained variance in environmental exploration and professional skills development. The influence of family values and beliefs on the development of professional skills was also evident. In contrast, financial support and the formulation of expectations by the family of origin did not prove to be significant factors in the career development of young adults.

REFLECTIONS, EXPERIENCES AND CHALLENGES ABOUT SUSTAINABLE CAREERS AND DECENT WORK. A CROSS-CULTURAL COMPARISON.

Friday 24 July 2026 from 15:30 to 17:00

(Q-Arsenale)

Paola Magnano (Kore University of Enna ~ Enna ~ Italy), Chair and Discussant

The concept of a sustainable career has gained significant attention in recent academic literature, extending beyond simple professional success to include aspects of happiness, health, and productivity (De Vos et al., 2020), as well as social empowerment (Russo et al., 2023). In this view of a sustainable career (De Vos et al., 2020), the individual is regarded as the central element—someone who actively manages their own career and adapts in response to other stakeholders and contexts (private life, work environment, job sector, broader labour market, society, and culture; De Vos et al., 2017). In sustainable careers, the concept of decent work is fundamental; initially defined as productive work conducted in conditions of freedom, equity, security, and human dignity (ILO, 1999), its definition has been expanded by Duffy et al. (2016) to include people's experiences of their work lives across five dimensions: "(a) physically and interpersonally safe working conditions; (b) hours that allow for free time and adequate rest; (c) organisational values that align with family and social values; (d) adequate compensation; and (e) access to sufficient healthcare" (Duffy et al., 2016, 130). Recently, the idea of decent work has been connected with sustainable development (Chhabra et al., 2022), highlighting that work can serve as an opportunity not only for the individual but also for creating sustainable contexts (Guichard, 2022; Zammitti et al., 2023a). The symposium will showcase studies carried out across diverse cultural settings, emphasising ways to enhance sustainable careers among university students—exploring their perceptions and representations, using narrative methods in career counselling, and raising awareness of the features of decent work.

Abstract 3354

SUSTAINABLE TRANSITION TO WORK FOR STUDENTS WITH SLD: THE ROLE OF PERCEIVED CHALLENGES AND CAREER BEHAVIOURS

Petruzziello G.*, Russo A.

Department of Psychology "Renzo Canestrari", University of Bologna ~ Bologna ~ Italy

Introduction.
The possibility of pursuing a sustainable career is crucial for students with specific learning disorders (SLD), who often face particular challenges during their academic path, such as social constraints and, at times, limited access to essential resources. These difficulties can hinder a smooth and sustainable transition into the labour market and, consequently, the development of a sustainable career. It is therefore essential to understand the factors that influence the perceived capability to build a sustainable career (Future-Sustainable Career, F-SC) among students with SLD.
Objectives.
Drawing on the Sustainable Career Framework, this study examined a possible psychosocial mechanism underlying the perception of F-SC. We hypothesised that perceived labour market challenges and career behaviours may influence career insecurity and, in turn, F-SC.
Method.
A sample of 224 students with SLD from two Italian universities completed an online questionnaire measuring F-SC, career behaviours, perceived labour market challenges, and career insecurity.
Results.
We tested a mediation model using the PROCESS macro in SPSS. Findings revealed a significant indirect effect of perceived challenges on F-SC, mediated by career insecurity. In contrast, career behaviours did not significantly influence career insecurity, nor did they show any indirect effect on F-SC.
Limitations.
The cross-sectional design prevents causal inferences. Future research should explore additional specific factors that may influence the hypothesised relationships.
Implications.
Our study is among the first to apply the sustainable career framework to students with SLD, contributing to a deeper understanding of the factors that support a sustainable transition into the labour market. At the same time, the study highlights specific aspects to be further scrutinised (e.g., the actual effectiveness of career development behaviours) for interventions and policies aimed at fostering inclusive and, therefore, sustainable career ecosystems.

Abstract 3357

FOSTERING SUSTAINABLE CAREER DEVELOPMENT THROUGH NARRATIVE-BASED COUNSELLING: AN ACTION-RESEARCH STUDY WITH UNIVERSITY STUDENTS

Zarbo R.*, Magnano P.

Kore University of Enna ~ Enna ~ Italy

Introduction

Recent literature in career counselling has increasingly emphasized holistic, contextual, and dynamic approaches to career development. Sustainability, once narrowly conceived as an environmental and economic concern, has increasingly been recognised as a multidimensional framework that integrates social and personal dimensions. Within this paradigm, counselling aimed at sustainable development becomes essential, as building futures aligned with sustainability principles requires the active participation of individuals.

Objectives

The study aims to implement and evaluate career counselling interventions that promote sustainable careers for university students. It focused on the potential of narrative-based methodologies to strengthen students' well-being, academic satisfaction, and capacity to manage labour market uncertainties.

Methods

An action-research design was employed with 100 university students from Enna Kore (Italy) and Évora (Portugal), equally divided into training and control groups. Narrative-based quanti-qualitative methods were used, enabling participants to reconstruct their career stories, articulate barriers and concerns, and reflect on influences shaping their choices. Data collection occurred at three time points: pre-intervention (T1), post-intervention (T2), and follow-up after six months (T3). Within-group and between-group comparisons were conducted to assess effectiveness.

Results

Findings indicated that the interventions enhanced students' academic satisfaction, psychological well-being, and perceptions of career sustainability. Narrative methodologies facilitated greater self-awareness and resilience, while quantitative analyses demonstrated significant improvements in the training group compared to controls.

Limitations

The study presents some limitations. Both groups were predominantly female psychology students, limiting gender comparisons. In addition, self-report measures were used.

Discussion

The results highlight the value of narrative and action-research methodologies in

fostering sustainable career development. By situating individual career choices within broader socio-economic transformations, career counselling can act as a catalyst for well-being, resilience, and responsible participation in sustainable futures.

Abstract 3358

SUPPORTING DISADVANTAGED YOUTH IN PURSUING DECENT WORK IN THE FUTURE: EXPERIENCES AND NEEDS OF DISADVANTAGED HIGH SCHOOL STUDENTS IN TÜRKIYE

Gurbuz Akcay F.*[1], Karacan Ozdemir N.[2]

[1]Department of Educational Sciences, Trakya University ~ Edirne ~ Turkey, [2]Department of Educational Sciences, Hacettepe University ~ Ankara ~ Turkey

Although they constitute a significant portion of society, individuals from disadvantaged backgrounds often face barriers to accessing quality education and the skills required for the labor market. Traditional career development models often overlook the unique needs and experiences of these groups. Therefore, it is important to explore their perceptions of decent work from the Psychology of Working Theory perspective, which provides a more inclusive framework for career development. In the Turkish context, many groups face social exclusion and discrimination due to their socioeconomic status, ethnicity, gender, or disability. The Romani community is a particularly poignant example of a socially marginalized group that contends with poverty and limited opportunities, leading to significant obstacles in labor market entry. Consequently, it is essential to support Romani high school students in their journey toward securing decent work in the future. This presentation will discuss the skills that can be developed to support young people in their pursuit of decent work, with a specific focus on the needs of Romani youth. For the general youth population, key skills include developing a youth purpose, critical consciousness, self-efficacy, and career adaptability. In addition to these, Romani students require an emphasis on general learning-to-learn skills, such as communication, teamwork, and problem-solving. Furthermore, fostering skills like realistic goal setting and self-management is critically important for this group. This discussion draws on preliminary findings from a doctoral thesis currently being conducted with Romani high school students in Türkiye. The research aims to identify their needs at the individual, relational, and systemic levels to facilitate their access to decent work.

Abstract 3360

PSYCHOLOGICAL CAPITAL AND CAREER ADAPTABILITY AS PSYCHOSOCIAL RESOURCES: A SYSTEMATIC REVIEW OF SUSTAINABLE CAREERS AND WELL-BEING IN ARAB CONTEXTS

Mansouri M.*

Department of Psychology and Educational Sciences, Djillali Liabes University of Sidi Bel Abbes. ~ Sidi Bel Abbes ~ Algeria

This systematic review examines psychological capital (PsyCap) which includes hope, self-efficacy, resilience, and optimism alongside career adaptability as psychosocial resources that promote sustainable careers and well-being within Arab contexts, with a particular focus on Algeria. Adhering to PRISMA guidelines, we synthesized 45 empirical studies conducted between 2015 and 2025 from global and regional databases, specifically targeting Arab low- and middle-income countries (LMICs). PsyCap enhances vocational exploration, career commitment, and adaptive coping, thereby increasing life satisfaction and overall flourishing. Career adaptability, which includes concern, control, curiosity, and confidence, serves as a mediator for these effects, supporting the pursuit of decent work in the face of post-COVID labor market volatility and the skill demands driven by digitalization. Youth unemployment remains high in certain countries, influenced by exam-centric education, vocational stigma, and strong familial pressures that shape career pathways. This is especially true for elite university students who are seen as future leaders. The contrast between collectivist norms, which emphasize family and community resilience, and Western individualistic self-reliance underscores the cultural variability in how psychosocial resources impact career outcomes. Many studies predominantly utilize cross-sectional designs (80%), which restricts the ability to draw causal inferences. Additionally, only 15% of these studies focus on interventions, revealing significant gaps in the existing research. This review introduces a culturally sensitive model of psychological capital and career adaptability to address the absence of frameworks specifically tailored to Arab contexts. It informs practical interventions, such as multi-stakeholder collaboration (government, education, and private sector) and culturally tailored curricula, to enhance employability in Arab LMICs. By systematically mapping regional evidence, this study enriches cross-cultural reflections on psychosocial resources for sustainable careers, offering theoretical insights and policy recommendations for navigating volatile labor markets in Arab contexts.

FLOURISHING WITH MISS PAMA: A PERMA-BASED CHATBOT FOR SMARTPHONE OVERUSE AWARENESS AND WELL-BEING

Cheng H.*[1], Tseng Y.[2]

[1]Department of Counseling Psychology, National Taiwan Normal University ~ Taipei ~ Taiwan, [2]Graduate Institute of Library & Information Studies, National Taiwan Normal University ~ Taipei ~ Taiwan

Objective: This study aimed to explore the effects of Miss Pama, a PERMA-based AI chatbot designed to reduce excessive smartphone use and promote daily well-being among university students. Grounded in Positive Psychology, the intervention integrated the five PERMA elements—Positive Emotion, Engagement, Relationships, Meaning, and Accomplishment—into reflective dialogue to enhance self-awareness and behavioral regulation. Participants: Five university students (three females and two males; aged 19–24, M = 21.2) participated in the study. All met the diagnostic cutoff score (≥64) on the Smartphone Addiction Inventory (SPAI), indicating clinically significant smartphone overuse. Method: The study adopted a phenomenological qualitative approach to capture participants' lived experiences and meaning-making processes. Semi-structured interviews were conducted after the intervention, and data were analyzed using thematic analysis to identify essential themes of change. A six-week AI-guided intervention was implemented through text-based conversations with Miss Pama. Semi-structured interviews were conducted after the intervention, and data were analyzed using thematic analysis to identify the effects. Findings: Findings showed that interactions with Miss Pama increased participants' self-awareness of smartphone habits, reduced impulsive usage, and enhanced attention to positive daily experiences. Participants reported greater emotional balance, engagement in meaningful offline activities, and a general sense of psychological flourishing. While Miss Pama provided a safe, supportive, and low-pressure environment, limitations were noted in emotional depth, memory continuity, and conversational authenticity. Conclusions: These findings suggest that a PERMA-based chatbot like Miss Pama can serve as an innovative and supportive digital intervention for reducing smartphone overuse and fostering everyday well-being among young adults.

Abstract 2729

TRAIT ANXIETY AS A MODERATOR OF COGNITIVE AND MINDFULNESS INTERVENTIONS IN A SOCIAL VIRTUAL REALITY STRESS PARADIGM

Eunha K.*

Ajou University ~ Suwon ~ Korea, Republic of

Introduction:
College students frequently experience stress in socially evaluative situations, and individuals with high trait anxiety are particularly vulnerable. Social virtual reality (VR) offers a controlled yet immersive environment to examine stress responses and intervention effects.

Purpose:
This study examined whether cognitive restructuring and mindfulness-based meditation alleviate stress and anxiety induced by a social VR-based Trier Social Stress Test (TSST), and whether trait anxiety moderates intervention effectiveness.

Method:
Sixty university students were randomly assigned to cognitive restructuring, mindfulness-based meditation, or control conditions. All participants completed a social VR-based TSST delivered via the StressMeta platform. Perceived stress and anxiety were assessed before and after the TSST, and trait anxiety was measured using the State–Trait Anxiety Inventory.

Results:
The social VR-based TSST significantly increased perceived stress but did not significantly elevate anxiety. Neither intervention produced overall reductions in stress or anxiety compared to the control condition. However, trait anxiety moderated intervention effects: participants with high trait anxiety showed greater reductions in stress and anxiety following cognitive restructuring and mindfulness-based meditation, whereas those with low trait anxiety showed limited or adverse effects.

Conclusions:
Findings suggest that brief cognitive and mindfulness-based interventions may be particularly beneficial for individuals with high trait anxiety when applied in immersive social VR settings. Social VR paradigms hold promise for stress research and tailored psychological interventions, highlighting the importance of individual differences in intervention responsiveness.

COMPUTERIZED ADAPTIVE MULTIDIMENSIONAL QUESTIONNAIRES: CONCEPTUAL RATIONALE, IMPLEMENTATION CHALLENGES, AND PRELIMINARY EMPIRICAL EVIDENCE

Gati I.*, Faust E.

Hebrew University ~ Jerusalem ~ Israel

Background

A Computerized Adaptive Test (CAT) dynamically adjusts item difficulty, selecting subsequent items based on prior performance. Compared with traditional paper-and-pencil tests, CATs are considerably more efficient, saving time and improving accuracy. Moreover, they provide a more engaging and less fatiguing testing experience, which is significant for Generations Z and Alpha, who often demonstrate lower tolerance for lengthy questionnaires. These characteristics have meaningful implications for assessing multidimensional career-related constructs measured through word-based instruments.

Purpose

To develop a systematic procedure and algorithm for Computerized Adaptive Questionnaires (CAQs) and empirically examine their feasibility using three multidimensional, career-related questionnaires:

1. The Career Decision-Making Difficulties Questionnaire (CDDQ; 10 dimensions and 32 items);
2. The Higher Education Orientation (HEO) questionnaire (5 dimensions and 25 items); and
3. The Work Orientation Questionnaire (WOQ) (5 dimensions and 25 items).

Method

We analysed data from three samples:

1,212 first-year university students who completed the HEO;

605 first-year students who completed the WOQ;

1,484 career-undecided individuals, who completed the CDDQ via the Making Better Career Decisions website.

For each questionnaire, we developed an adaptive algorithm that selected a subset of items for presentation, based on each participant's prior responses.

Results

The median (and interquartile range) of within-participant Pearson correlations between the original and adaptive scores across dimensions were .98 (.95-.99), .97 (.94-.99), and .98 (.97-.99), for the HEO, WOQ, and CDDQ, respectively. Dimension-level results will be provided during the presentation.

Items Retention Overview

Questionnaire	Total items	Items Removed	Retained (%)
HEO	25	13.63	54.53
WOQ	25	12.85	51.42
CDDQ	32	5.83	18.21

Conclusion

Findings demonstrate that adaptive, shorter versions of multidimensional questionnaires are feasible. By improving efficiency and engagement, adaptive methodologies offer strong potential to enhance the quality and accessibility of multidimensional career assessment in both research and applied settings.

Abstract 280

IMAGINING HOPEFUL FUTURES: CLIMATE AWARE CAREER DEVELOPMENT THROUGH PARTICIPATORY ACTION RESEARCH

Hudson Breen R.*[1], Larsen D.[1], Davis A.[1], Nickerson J.[1], Teppan J.[1], Lawrence B.[2]

[1]University of Alberta ~ Edmonton ~ Canada, [2]University of Victoria ~ Victoria ~ Canada

The climate crisis is a major threat to global health, equity, and wellbeing. Most contemporary career education is built on models of career development which uphold capitalist structures of work-life that are contributing to the climate crisis, while also placing responsibility on individuals to cope with increasing inequity and the erosion of decent work. There continues to be a lack of attention to contemporary existential issues of ecological sustainability and its reciprocal relationship with economic uncertainty and associated mental health challenges, particularly in the area of career development and counselling. Hope is the ability to envision and move towards possibility, despite uncertainty, and is an essential resource in supporting mental health and facing difficult circumstances. Hope infused career education involves collaborative learning and re-visioning of work, life, wellbeing, and community, to support both individual career-life development and collective action towards climate justice. In this presentation, we share initial findings and learnings from a participatory action research project on climate-aware, hope-focused career development with students and their teachers in Alberta, Canada. We discuss the process for university team members of collaborating with teachers in local schools, and working with students to define and engage with hope in the context of climate justice and work in their communities. Photovoice data collection was incorporated to present student perspectives on hope and their learning through the project. Implications for climate informed career development education and future research directions will be presented.

Abstract 2655

CBT AND VIRTUAL REALITY INTERVENTIONS TO REDUCE ORAL EXAM ANXIETY: THE ROLE OF UNIVERSITY COUNSELING IN PROMOTING STUDENT WELL-BEING

Mammarella S.*, De Luca D., Gagliardi A., Cicchini E., Pesci L., Roncone R., Giusti L.

University of L'Aquila ~ L'Aquila ~ Italy

Introduction: Exam anxiety is common among university students, negatively affecting academic performance, self-esteem, and psychological well-being. Virtual reality (VR) has recently emerged as a promising tool for managing anxiety and phobic disorders. However, few studies have evaluated whether VR before oral exams can reduce anxiety, improve performance, and prevent prolonged out-of-course status.

Objectives: Within the national multicenter Me.Mo PROBEN project, this study examines the effectiveness of a Cognitive Behavioral Therapy (CBT)-based anxiety management program combined with a VR oral exam exposure module (Cerebrum VR Srl, 2025) in preventing and reducing exam-related anxiety and improving academic performance among university students.

Methods: All students could access the program by registering via QR code. At baseline (T0), participants completed the State–Trait Anxiety Inventory (STAI-Y) and the General Health Questionnaire (GHQ-12), and information on exam difficulties and academic satisfaction was collected. The CBT-based training, adapted from the G. Andrews protocol, included three brief modules: (1) psychoeducation on exam anxiety, (2) slow breathing, and (3) progressive muscle relaxation. This was followed by an immersive VR public speaking session simulating an oral exam, during which students applied the learned techniques. State anxiety was assessed at T1, while academic performance will be evaluated at T2, at semester's end.

Results: At T0, students showed moderate trait anxiety (mean STAI-Y = 46.7, SD = 5.7) and moderate emotional distress (mean GHQ-12 = 21.1, SD = 9.3), mainly due to fear of oral exams. Forty percent were out-of-course students. At T1, trait anxiety decreased (mean = 42.5, SD = 4.3). Data collection for T2 is ongoing. The immersive VR experience was highly engaging and motivating, with an average satisfaction score of 8.7/10.

Conclusion: Brief CBT modules combined with VR effectively reduce anxiety during simulated oral exams and represent a promising preventive tool in university counseling services.

16 - Division 16: Counseling Psychology

POSITIVE PSYCHOSOCIAL RESOURCES FOR CAREER COUNSELLING AND WELL-BEING.

Friday 24 July 2026 from 17:00 to 18:30

(Q-Arsenale)

Paola Magnano (Kore University of Enna ~ Enna ~ Italy), Chair
Ernesto Lodi, Discussant

The uncertainty and instability that characterise current life contexts make it essential in career counselling interventions to develop positive resources that enable clients to adapt actively to this unpredictable environment. One of the goals of career counselling is to understand how to promote the well-being of individuals facing the unforeseen challenges of the changing world of work. The processes of defining and redefining one's personal and professional projects develop through a continuous search for meaning in one's life, socio-cultural context, and the dynamic relationship between person, context, and time. Life design (Savickas, 2012; Savickas et al., 2009) is a nonlinear process that takes the form of a flexible plan of action, open to the opportunities offered by the context, where people can make unexpected discoveries that are integrated into a plan that allows them to provoke or utilise those discoveries. This involves: (1) empowering individuals and strengthening positive psychological resources, such as self-efficacy, optimism, resilience, courage, and hope; (2) building positive and supportive relationships as fundamental to well-being within educational and workplace settings. In fact, the most recent literature on well-being highlights its multidimensional and systemic nature, considering both personal and contextual factors. Career transitions are periods of life involving decisions, changes, uncertainty, and insecurity, which may threaten individuals' subjective well-being. The symposium will present research on psychosocial resources and career development training and programmes—conducted across diverse cultural contexts and with various participant groups—aimed at enhancing subjective well-being and identifying its protective factors.

Abstract 3474

UNIVERSITY STUDENTS' SENSE OF COMMUNITY AS A PROTECTIVE RESOURCE: LINKS WITH WELL-BEING AND RISK OF DROP-OUT

Zarbo R.*[1], Magnano P.[1], Zammiti A.[2], Russo A.[3]

[1]Kore University od Enna ~ Enna ~ Italy, [2]University of Catania ~ Catania ~ Italy, [3]University of Bologna ~ Bologna ~ Italy

Introduction

Psychological well-being is influenced not only by individual factors but also by contextual and social dynamics, especially within university environments where academic achievement and community belonging meet. A key concept in this area is the sense of community, which includes belonging, mutual influence, the fulfilment of personal needs, and shared emotional bonds. Universities, often viewed as small communities, offer a valuable context for exploring how the sense of community affects students' well-being, satisfaction, and persistence.

Objectives

This study aimed to examine the relationships between university students' sense of community, academic satisfaction, and both positive outcomes (life satisfaction, flourishing) and negative outcomes (stress, risk of drop-out).

Methods

A longitudinal design involved 439 Italian university students, who completed online surveys at two time points. Instruments included the University Student Sense of Community scale, the Satisfaction with Life Scale, the Flourishing Scale, and the College Satisfaction Scale. To examine the hypothesised relationships, we proposed that academic satisfaction mediates the relationship between Sense of Community and student outcomes. Mediation models were tested using the bootstrapping method to assess the significance of indirect effects.

Results

The data analysis results enable us to identify factors that protect and promote students' well-being and academic quality of life. Mediation analyses showed that academic satisfaction completely mediates the relationship between the sense of community and life satisfaction, as well as flourishing and thoughts of changing and interrupting; it also partially mediates the relationship between the sense of community and academic stress.

Limitations

Findings are constrained by convenience sampling, geographical imbalance, and reliance on self-report measures, limiting generalisability.

Discussion

The results confirm that sense of community is a multidimensional resource supporting students' well-being, satisfaction, and retention. The current study provides practical

applications for counselling and psycho-educational interventions designed at enhancing students' integration, resilience, and academic trajectories.

Abstract 3475

PSYCHOSOCIAL RESOURCES IN CAREER COUNSELLING ACROSS DIVERSE LIFE PATHS: INTEGRATING MULTIPLE PERSPECTIVES FOR WELLBEING

Sgaramella T.M.*

FISPPA Department, University of Padova ~ Padova ~ Italy

Uncertain and changing life contexts increasingly call career counselling to foster both well-being while navigating uncertain and changing life contexts. Literature highlights the role of positive psychosocial resources as key assets that sustain individuals in career development and life planning. A systems theory–based approach emphasizes that individual resources, such as resilience, future orientation, and socioemotional competencies, are embedded in and co-constructed through interconnected systems spanning family, school, community, organizations, culture, and broader socio-economic structures (Patton & McMahon, 2021; McMahon, 2022).

Drawing from empirical studies, the analysis will explore how personal and career-related resources can be assessed and promoted in a dynamic interplay between psychosocial resources and systemic opportunities or constraints.

In education, recent studies show that school-based interventions fostering positive future self-identity and career exploration strengthen adolescents' career-related assets by mobilizing multiple layers of influence (Patton & McMahon, 2021; Sgaramella & Ferrari, 2024). This may reveal a particular impact in counselling young people facing developmental vulnerabilities (Sgaramella & Bortoluzzi, 2019).

In adulthood, studies show that socioemotional competencies contribute to well-being when reinforced by organizational and societal supports. Studies with individuals experiencing complexities highlight the link between systems influences and psychosocial resources (Maree, 2020; Sgaramella, 2022; Rocca & Sgaramella, 2024). Reconstructing career trajectories often reflects the negotiation of time perspective across interdependent systems as well as contextual opportunities for recognition and inclusion.

These insights converge with broader conceptual frameworks emphasizing access, equity, and authentic choice and highlight the importance of linking personal agency with systemic transformation. A multidimensional model emerges that views individuals and systems as mutually constitutive, and counselling as a developmental, inclusive, and resource-oriented practice that promotes well-being and quality of life across the lifespan.

Abstract 3476

BETWEEN ANXIETY AND AGENCY: THE ROLE OF PSYCHOLOGICAL COURAGE IN CAREER INDECISION

Pajestka G.*[1], Paszkowska--Rogacz A.[2]

[1]Institute of Psychology, University of Opole ~ Opole ~ Poland, [2]Institute of Psychology, University of Lódz ~ Lódz ~ Poland

In recent years, the attainment of key social milestones—such as choosing a career path or securing stable employment—has become increasingly delayed. Both cultural and economic factors contribute to this trend. Rapid socioeconomic changes may heighten uncertainty and anxiety, which in turn could inhibit the transition to adulthood, for example by fostering career indecision. At the same time, individual psychological resources can buffer these effects and reduce the impact of anxiety. One such resource, psychological courage—defined as the willingness to act in spite of fear and internal conflict—remains relatively underexplored. The present study investigated the associations among psychological courage, future-related anxiety, and career indecision in emerging adulthood. Participants were 459 individuals (246 women and 213 men) aged 18 to 29 years. We hypothesized that psychological courage would be negatively, and anxiety about the future positively, related to career indecision as assessed with the Career Decision-Making Difficulties Questionnaire (CDDQ). Furthermore, we expected that psychological courage would account for unique variance in career indecision beyond anxiety, perceived social support, and perceived status, thereby demonstrating its protective role. A series of hierarchical multiple regressions partially supported these hypotheses. Psychological courage was negatively associated with overall career indecision as well as with the subdimensions of lack of readiness and lack of information, but not with inconsistent information. These findings suggest that psychological courage may serve as an important psychological resource that supports motivational processes and promotes an active, agentic orientation toward career development.

Abstract 3478

VALIDATION OF THE CAREER MAXIMIZING SCALE IN ALGERIA AND ITALY: EVIDENCE OF INVARIANCE AND RELATIONSHIPS WITH CAREER ADAPTABILITY AND WELL-BEING

Mansouri M.*[1], Zammiti A.[2], Guerau Valls--Figuera R.[3], Russo A.[4]

[1]Department of Psychology and Educational Sciences, Djillali Liabes University of Sidi Bel Abbes ~ Sidi Bel Abbes ~ Algeria, [2]University of Catania ~ Catania ~ Italy, [3]Department of Research Methods and Diagnostic in Education, University of Barcelona ~ Barcelona ~ Spain, [4]Department of Psychology, University of Bologna ~ Cesena ~ Italy

Career maximizing reflects the desire to identify the best possible career alternative through a careful comparison of available options (Voss et al., 2019). This tendency may have important implications: on the one hand, it can foster more informed and satisfying decisions; on the other hand, it may lead to indecision and stress in the decision-making process (Dahling & Thompson, 2013; Iyengar et al., 2006). The Career Maximizing Scale (CMS) was developed to specifically measure this construct, demonstrating its relevance for career-related outcomes such as satisfaction and self-efficacy (Voss et al., 2019).

The present study aimed to validate the Career Maximizing Scale (Voss et al., 2019) in the Italian and Algerian contexts. The measure was administered to a sample of 403 university students (206 from Algeria and 197 from Italy) aged between 18 and 30 years (M = 20.93; SD = 1.08). Along with the CMS, additional measures were administered: the Career Adaptability Scale, the Satisfaction With Life Scale, and the Flourishing Scale.

Exploratory factor analysis and confirmatory factor analysis supported the unidimensional structure of the CMS, consistent with theoretical assumptions. Contextual invariance between the two samples was demonstrated. The scale also showed good validity evidence, correlating positively with career adaptability, life satisfaction, and flourishing.

Overall, the findings suggest that the CMS is a valid and effective measure for assessing career maximizing across different cultural contexts, offering a significant contribution to the understanding of career decision-making processes. The evidence collected highlights the importance of a culturally sensitive approach to measuring this construct and provides useful implications for both international research and career guidance practice, as the CMS can help professionals and students reflect more consciously on career decision-making strategies and develop more sustainable and satisfying career paths.

Abstract 192

CENTERING DISABILITY JUSTICE IN PSYCHOLOGICAL PRACTICE: IMPLICATIONS FOR GLOBAL, INTERSECTIONAL, AND EQUITABLE CARE

Dispenza F.*

Georgia State University ~ Atlanta, Georgia ~ United States of America

Traditional counseling models often struggle to address the complex experiences of persons with disabilities (PWD), particularly those with intersecting marginalized identities. They often focus on individual deficits rather than societal barriers (Brodt, 2022; Saia et al., 2024). This presentation offers implications of Disability Justice, a framework created by multiply marginalized disabled People of Color, for clinical and counseling psychological practice. Disability justice moves beyond the limitations of the disability rights movement and the medical model by centering principles such as intersectionality, interdependence, collective access, and the leadership of those most impacted (Berne et al., 2018). It challenges the notion that people with disabilities need to be “fixed,” viewing disability as a social construct shaped by ableism and other systems of oppression like racism and capitalism (APA, 2022).

For clinical practice, integrating disability justice means shifting from individual intervention towards addressing the structural violence and systemic injustices faced by clients living with disabilities (Brodt, 2022). It requires psychologists to recognize disability as a political and cultural identity, apply intersectional analyses to understand compounded marginalization, and ensure practice is maximally inclusive and accessible. Approaches like Disability Affirmative Therapy can help fill knowledge gaps and provide culturally sensitive care, along with disability justice principles

From a global standpoint, disability justice highlights how disability is often produced and shaped by transnational forces, including colonialism, racial capitalism, and globalization, particularly affecting communities in the Global South (Dispenza, 2020). A disability justice-informed clinical practice must consider these global-local connections, recognizing the wisdom and experiences of people with disabilities worldwide and advocating for collective liberation that leaves “no body/mind is left behind.” This framework offers a transformative approach to counseling, clinical, community, and health psychology that emphasizes universal interdependence and strives for a more just and equitable world for all.

ADHD AND ROMANTIC RELATIONSHIPS: A QUALITATIVE EXPLORATION OF STRENGTHS AND CHALLENGES IN ROMANTIC RELATIONSHIPS AMONG ADULTS DIAGNOSED WITH ADHD

Modesto O.*, Bacon S.

Australian Catholic Univeristy ~ Sydney ~ Australia

Committed and satisfying romantic relationships are associated with positive mental health
outcomes and well-being. However, previous research suggests that adults with Attention
Deficit Hyperactivity Disorder (ADHD) and their partners face unique challenges within romantic relationships, indicated by lower relationship satisfaction and higher divorce rates.
Yet, little research has focused on the lived experiences of adults with ADHD in romantic
relationships or considered what strengths or strategies they might employ to support their
relationships. Additionally, there is limited research exploring the potentially unique dynamic of having a partner who also has ADHD. This qualitative study interviewed 11 adults with ADHD in romantic relationships. The study aimed to include participants with ADHD partners, but did not exclude other neurotypes, to capture a range of experiences.
Interviews focused on the impact of ADHD within their relationship, focusing on: conflict resolution; communication; strengths; challenges; and strategies. Thematic analysis identifying key themes is in progress. This study contributes to the growing body of neurodiversity affirming research and will provide clinicians with a strengths-informed understanding of how ADHD may impact romantic relationships.

Abstract 980

"CAREER" AND "CAREER DEVELOPMENT": CONCEPTIONS OF MIGRANT WOMEN FROM ECONOMICALLY DEVELOPING COUNTRIES

Yazdankhoo S.*[1], Abkhezr P.[1], Mcmahon M.[2], Mcauliffe D.[1]

[1]Griffith University ~ Brisbane ~ Australia, [2]The University of Queensland ~ Brisbane ~ Australia

The term career development emerged in Western and industrialised contexts. However, it has been adapted and reinterpreted across different cultures worldwide, resulting in a diversity of understandings. Such diversity becomes significant for migrants moving from economically developing to developed countries, where employment structures differ greatly. Given that employment constitutes one of the main predictors of migrants' integration into host societies, supporting them through career development services gains critical relevance. However, economically developed countries' career support strategies often approach migrants as a homogenous group, relying on universal Western frameworks rather than tailored to the varied conceptions of career development by diverse migrant communities (e.g., migrant women from economically developing countries). To design responsive career support, it is essential to understand how diverse migrants conceive of "career" and "career development." This research aimed to explore the conceptions of these terms held by migrant women from economically developing countries.

Guided by an integrative care-justice moral framework, 10 migrant women were recruited through purposive sampling and attended a single semi-structured reflexive interview informed by narrative inquiry. They shared their perspectives about what career and career development signify to them, and reflected on one academic definition of 'career development'. Descriptive content analysis was employed to analyse data, while preserving participants' unique perspectives and contexts.

Findings revealed that participants held varied conceptions of "career" and "career development", often closely associated with upward progression and advancement within their work lives, which only partially aligns with academic conceptions that frame career development as a lifelong-lifewide process embedded in and influenced by personal, familial, social, and environmental-societal factors. The findings underscore the importance of attending to participants' local knowledges, highlighting how their understandings are grounded in lived experiences, cultural and contextual understandings of work, and the unique circumstances surrounding migration. Research, practice, and policy implications will be outlined.

Abstract 1325

PERCEIVED RACISM, DEPRESSION, AND GPA AMONG ASIAN AMERICAN AND PACIFIC ISLANDER COLLEGE STUDENTS: EXPLORING POTENTIAL PSYCHOSOCIAL RESOURCE FACTORS

Cheng H.*, Yeh C., Canlas M.

University of San Francisco ~ San Francisco ~ United States of America

Research has shown that Asian American and Pacific Islanders (AAPIs) report more academic pressure than other racial groups in the United States, and several factors have been proposed to explain this, including high parental expectations, cultural emphasis on academic achievement, and the “model minority” stereotype (i.e., the notion that AAPIs are naturally intelligent and hardworking, and that they are well-to-do and encounter few problems; Sue et al., 2007). Racism has also been speculated as a driving factor behind AAPIs’ high academic stress in that they may see academic achievement as a way to enhance social status and counteract racial ostracization. As high as 76.9% of AAPI students reported experiencing daily racial discrimination (Chen et al., 2014) and experiences with racism and discrimination have been linked to higher psychological distress (Yoo et al., 2010). Given AAPI students’ high academic performance pressure (i.e., obtaining high GPA), racism context, and psychological distress, we examined three aspects of potential psychosocial resource for AAPI students: academic encouragement (potential-focused encouragement; challenge-focused encouragement), peer social support, and university belonging (relations with faculty/staff; university support/acceptance). In a sample of 1072 AAPI college students, we found that higher levels of perceived potential-challenged encouragement, peer social support, and university support/acceptance predicted lower depression, after accounting for the effect of racism on depression. However, higher levels of challenge-focused encouragement predicted higher depression, while relations with faculty/staff did not predict depression. Finally, we found that higher depression longitudinally predicted lower GPA and that relations with faculty/staff and peer social support, respectively, buffered the harmful effect of depression on GPA. Neither dimension of academic encouragement, however, buffered the effect of depression on GPA. The findings highlight the importance of fostering students’ relations with faculty/staff and peer social support as avenues for protecting AAPI college students from low GPA when they experience depressive symptoms.

Abstract 1299

EMOTIONAL, SOCIAL, AND SYSTEMIC CONTRIBUTORS TO DEPRESSIVE SYMPTOMS IN IMMIGRANTS AND REFUGEES

Jin L.*, Yung C., Zamudio G.

University of Calgary ~ Calgary ~ Canada

Background: Immigrants and refugees face disproportionate mental health challenges, including elevated depressive symptoms. However, little is known about the socioemotional and systemic factors that contribute to depression in this population in Canada. Depression risk is influenced not only by individual emotional processes but also by social and systemic factors. Emotional dysregulation and heightened negative affect can increase vulnerability, whereas social connectedness to both mainstream society and one's ethnic community may serve as protective factors. Experiences of race-based traumatic stress, discrimination, and systemic marginalization further exacerbate depression risk. Despite these known risks, few studies have comprehensively examined how these emotional, social, and systemic factors interact to influence depressive symptoms among immigrants and refugees. The present study aimed to (1) identify the emotional, social, and systemic predictors of depressive symptoms and (2) examine their combined contributions to depression in this population.

Methods: A total of 183 immigrants/refugees from Canada (Mean age = 30.89; 45.70% women) participated in this study.

Results: At the emotional level, greater emotional dysregulation (B= .07, p = .037) and negative affect (B= .25; p <.001) were more likely to experience higher depressive symptoms (R2= 21.9%). At the social connectedness level, higher social connectedness to mainstream society (B= -.14, p = .017) and own ethnic minority group (B= -.27, p < .001) were less likely to experience depressive symptoms (R2= 22.4%). At the systemic level, more experience of race-based traumatic stress was strongly associated with depressive symptoms (B= .07; p < .001; R2= 33.6%).

Discussion: These findings underscore the substantial mental health burden experienced by immigrants and refugees in Canada and underscore the importance of addressing both socioemotional and systemic factors that contribute to depression. Culturally responsive interventions tailored to the unique experiences of this population may be essential for mitigating depression risk and promoting improved mental health outcomes.

Abstract 1219

THREE-WAY INTERACTION EFFECTS OF LIVING A CALLING, WORK–FAMILY CONFLICT, AND BURNOUT: MULTI-GROUP COMPARISONS BY GENDER AND MARITAL STATUS

Jung S.*, Park M., Shim Y.

Chungnam National University ~ Daejeon ~ Korea, Republic of

According to Work as Calling Theory (WCT; Duffy et al., 2018), living a calling (LC) may yield benefits, including job satisfaction and performance. Yet, it may also involve risks such as burnout, workaholism, and exploitation, depending on personality traits and psychological climate. Empirical support for these paradoxical aspects remains limited, particularly regarding moderating effects. This study hypothesized that differences in work–family conflict (WFC) would moderate the effects of LC. Because prior studies overlooked demographic factors, we examined moderating effects across marital status and gender.

Purpose: This study examined whether WFC moderates the association between LC and burnout, focusing on three-way interaction effects, specifically contrasting married women with married men and unmarried women.

Method: Participants were 343 Korean employees aged 19 or older with some college education (110 married women, 121 married men, 112 unmarried women). Data were collected through an online survey.

Moderation was tested with the PROCESS macro for SPSS. Model 1 examined moderation separately within each group, and Model 3 tested whether the LC × WFC interaction differed across groups, with married women as the reference group.

Results: In Model 1, the LC × WFC interaction was significant only for married women (B = –.193, p = .023); LC was associated with lower burnout only under high WFC (B = –.294, p = .025). In contrast, for married men and unmarried women, the LC × WFC interaction was nonsignificant; LC was generally associated with lower burnout regardless of WFC level. In Model 3, three-way interactions were significant comparing married women with married men (B = .293, p = .015) and with unmarried women (B = .289, p = .025).

Conclusion: Findings suggest that LC protects against burnout, but patterns differ across sociodemographic factors. Unique moderation among married women

underscores the need for gender- and marital status–sensitive approaches in research and workplace interventions.

Abstract 1766

CULTURAL ADAPTATION IN COUNSELING: A QUALITATIVE STUDY ON THE LIVED EXPERIENCES OF PSYCHOLOGISTS' CULTURALLY ADAPTING TREATMENTS FOR FORCIBLY DISPLACED CLIENTS.

Khalsa G.*, Elazhary H., Nassar L.

American Univesity in Cairo ~ Cairo ~ Egypt

People from displaced communities face significant challenges such as persecution in their home countries, the uncertainty of regaining safety and stability, and the acculturation stress of resettling in a host country (Kirmayer et al, 2011). Psychologists who work with displaced communities are trained and credentialed in modalities which do not always fit the cultural needs of their clients (Hall et al., 2016), requiring an adaptation process to make services more effective. The available literature does not currently reflect the variety of cultural backgrounds, circumstances, and presenting situations that comprise the diaspora of displaced communities throughout the world. Psychologists must implement this adaptation without needed research support (Nickerson et al, 2011), relying instead on personal experience and clinical judgment.

The purpose of this qualitative study is to examine the lived experiences of international and global psychologists who provide counseling services for refugee communities as way to better understand the cultural adaptation process. A better understanding of this phenomenon can help inform global psychologists in their own work with displaced communities.

Through seven semi-structured interviews with doctoral level psychologists from various countries, working with refugee communities from various parts of the world, the process of cultural adaptation of clinical services was explored in depth using Interpretive Phenomenological Analysis qualitative methodology.

Initial analysis of the data resulted in emergent superordinate and subordinate themes, including: clinicians' adapting treatments from their academic training, mentorship and supervision through the adaptation process, personal transformation, experiences of professional siloing, and political advocacy as a part of clinical work.

The results give context to the developmental process participants experienced and insight into the changes in clinical conceptualization and transformative professional identity which emerged from the adaptation process. Suggestions for counseling psychologists, supervisors, mental health professionals, and academic trainers to use in

their work were developed from the results.

Abstract 1081

INTOLERANCE OF UNCERTAINTY AND SOCIAL ANXIETY IN COLLEGE STUDENTS: THE DUAL MEDIATING EFFECTS OF SOCIAL SELF-EFFICACY AND EXPERIENTIAL AVOIDANCE

Kim J.*, Kim S.Y., Lee Y.

Jeonbuk University ~ Jeonju ~ ????

This study examined whether social self-efficacy and experiential avoidance mediate the relationship between intolerance of uncertainty (IU) and social anxiety among college students. A cross-sectional survey was conducted with 394 college students (aged 18–29) from South Korea. Data were analyzed using SPSS 25.0 and PROCESS macro 4.3. Measures included the Intolerance of Uncertainty Scale (IUS-12), the Social Self-Efficacy Scale for College Students, the Korean version of the Multidimensional Experiential Avoidance Questionnaire (K-MEAQ-24), and the Social Anxiety Scale for College Students. Results indicated significant correlations among all primary variables. Both social self-efficacy and experiential avoidance independently mediated the association between IU and social anxiety. Additionally, a significant serial mediation was observed: higher IU was associated with lower social self-efficacy, which in turn predicted greater experiential avoidance and subsequently higher social anxiety. These findings clarify a psychological pathway linking intolerance of uncertainty to social anxiety in college students and suggest that interventions aimed at enhancing social self-efficacy and reducing experiential avoidance may mitigate social anxiety in this population.

Abstract 1208

DEVELOPMENT AND VALIDATION OF THE KOREAN VERSION OF THE 45-ITEM MECHANISMS OF ENGAGEMENT IN THE ARTS AND HUMANITIES SCALE

Kim Y.*, Shim Y.

Chungnam National University ~ Daejeon ~ Korea, Republic of

Introduction: The arts and humanities are vital for mental health and flourishing, with studies linking its engagement to positive emotions, growth, vitality, life satisfaction, civic engagement, and perspective change. However, empirical evidence for the underlying psychological mechanisms, which are potential targets for intervention development, is limited. The Mechanisms of Engagement in the Arts and Humanities Scales (MEAH) is a 70-item scale that measures five psychological mechanisms based on the RAISE model-Reflection, Acquisition, Immersion, Socialization, and Expression. However, given its length, an abbreviated 45-item version (MEAH-45) was recently developed.

Purpose: This study aimed to translate and validate the MEAH-45 in Korean to assess RAISE mechanisms to explain how engagement in the arts and humanities leads to flourishing among Korean adults.

Method: The MEAH-45 was translated, back-translated, and reviewed by a panel of researchers and laypersons experienced in the arts and humanities and finalized as the Korean version (MEAH-45-K). An online panel survey of 500 adults included the MEAH-45-K and the Korean version of the Brief Inventory of Thriving (K-BIT), which assesses overall flourishing. Data were analyzed using SPSS 22.0 to
assess reliability and Mplus 8.1 to conduct confirmatory factor analysis (CFA) for model fit. Criterion validity was examined through correlations with flourishing, and the rwa package in R 4.2.2 was used to analyze the mechanisms contributing to flourishing.

Results: The MEAH-45-K demonstrated high internal consistency(Cronbach's α= .86~.97) and good model fit(CFI= .95~1.00, TLI= .90~1.00, SRMR= .00~.04). Correlation analyses showed that all RAISE mechanisms were significantly and positively associated with flourishing(rs= .52~.62, p< .001). Relative Weight Analysis showed Socialization contributed most in arts engagement, and Acquisition in humanities engagement.

Conclusions: The MEAH-45-K demonstrated reliability and validity, confirming its suitability for assessing the RAISE mechanisms. This scale can be utilized as a tool to provide an empirical basis for arts and humanities-based interventions to promote flourishing.

Abstract 1657

DEVELOPING A METHOD FOR ANALYZING INTERACTIVE FACIAL MOVEMENTS IN ONLINE COUNSELING

Komori M.*[1], Nagaoka C.[2], Tani H.[3], Uneno Y.[4]

[1]Osaka Electro-Communication University ~ Osaka ~ Japan, [2]Otemon Gakuin University ~ Osaka ~ Japan, [3]Osaka University ~ Osaka ~ Japan, [4]Kyoto University ~ Kyoto ~ Japan

In recent years, the demand for remote psychological support has been increasing, and online counseling has emerged as an important setting for clinical practice. Unlike face-to-face sessions, however, the assessment of nonverbal behavior is often more challenging in online environments. In particular, methods for quantitatively describing and analyzing the interactive dynamics of facial movements between therapist and client have not been sufficiently established. The present study develops a novel analytic framework designed to capture these dyadic facial actions during online counseling sessions.

Specifically, video recordings of therapist–client interactions were processed using MediaPipe (Google) to extract facial action units (AUs) frame by frame. The resulting multivariate time-series data of facial actions were subjected to non-negative matrix factorization (NMF), which reduced the complex facial movement patterns into a small number of interpretable components. NMF was chosen because its non-negativity constraint provides parts-based, additive representations that are particularly well suited for decomposing facial movement data into components that retain interpretability in a psychological and behavioral context. The optimal number of factors was determined based on reconstruction error and stability indices.

Subsequently, the temporal dynamics of the component scores were analyzed using vector autoregressive (VAR) modeling, Granger causality testing, and orthogonalized impulse response analysis. These methods enabled the identification of interdependencies between therapist and client facial actions, such as whether a therapist's facial movements systematically precede and predict the client's responses, or conversely, whether the client's movements drive changes in the therapist's behavior.

The proposed framework has the potential to deepen our understanding of nonverbal interaction in online counseling and to contribute to both clinical practice and professional training. In addition, future work may extend the method toward real-time automated feedback systems to support therapists in online environments.

Abstract 1260

THE PROCESS OF MENTAL HEALTH RECOVERY IN AN INTERNATIONAL STUDENT: A SINGLE-CASE QUALITATIVE ANALYSIS

Li C.*[1], Ogura M.[2], Suzuki H.[1]

[1]Ritsumeikan University ~ Osaka ~ Japan, [2]Naruto University of Education ~ Tokushima ~ Japan

The number of international students is increasing globally, yet many faces psychological challenges while abroad. Language barriers, social isolation, and cultural differences can exacerbate distress, while stigma and limited awareness often reduce counseling use. Understanding recovery processes is critical for developing effective support. This study aimed to clarify the mental health recovery process of an international student through a single-case qualitative analysis.

The participant was a Taiwanese exchange student at a Japanese university, who arrived in April 2022 and had studied Japanese since September 2014. A semi-structured interview was conducted in November 2022, lasting about one hour, covering reasons for studying abroad, difficulties, psychological and physical changes, coping strategies, and future impacts. Data was analyzed using the Steps for Coding and Theorization (SCAT) method.

The recovery process comprised four stages: (1) Expectations–Reality Gap: Limited interaction with Japanese peers caused loneliness and alienation. (2) Distress and Awareness: Avoiding the native-language group deepened isolation, and physical decline prompted awareness of distress. (3) Support and Change: Recovery was aided by university counseling and stronger social ties. (4) Growth and Resilience: Coping strategies were learned, fostering self-growth and resilience.

Recovery was a dynamic, non-linear process shaped by cultural expectations, adaptation stress, and awareness of distress. Improving mental health literacy before or early in study abroad may support timely help-seeking. Universities should strengthen counseling, peer support, and mental health education. Future studies with more cases are needed to generalize these findings.

Note: This study reanalyzed part of the data presented at The Japan Association for School Mental Health as “A Qualitative Study on the Difficulties, Concerns, and Academic/Career Decision-Making of International Students during the COVID-19 Pandemic,” and further examined it in line with the purpose of this study.

Abstract 1528

DEVELOPING ONLINE SOLUTION-FOCUSED TEAM MEETING METHOD TO PREVENT ABUSE IN ELITE SPORTS EDUCATION

Ogawa O.*[1], Kemuriyama C.[2], Karimazawa H.[1]

[1]The University of Aizu ~ Aizuwakamatsu ~ Japan, [2]Gifu Shotokugakuen Univerisity ~ Gifu ~ Japan

Introduction:
Abuse in elite sports education—including psychological pressure and coercive communication—is increasingly recognized as a serious threat to the mental health and development of young athletes. Such problems can arise not only during training but also in meetings before and after practices or competitions. Recent advances in counseling and educational psychology highlight the need for interventions that foster psychological safety, constructive dialogue, and relationships based on mutual respect rather than authority.
Purpose:
This project aims to develop an online version of the Solution-Focused Team Meeting Method (SFTMM) tailored for elite sports education. Developed in 2009 by Setsuko Sato for educational counseling, SFTMM integrates solution-focused counseling with facilitation theory from management studies. Its adaptation to sports talent development could prevent abusive practices and facilitate a supportive learning environment.
Method:
Traditionally implemented face-to-face using analog whiteboards, the SFTMM was redesigned as a digital platform. Counseling psychologists, organizational researchers, and sports psychology experts created the initial plan, distinguishing core functions from future functions. Implementation was outsourced to a student-led Information and Communication Technology (ICT) venture; and the completed application was subsequently purchased by the research group for study and practical use.
Results:
The prototype includes solution-focused navigation, collaborative digital whiteboards, and facilitator support tools such as time management. Advanced features—including AI-based facilitation and data analytics—were reserved for future development. The digital format enables experienced facilitators to provide remote support and enhance accessibility and dissemination.
Conclusions:
At the prototype stage, this initiative demonstrates how counseling psychology, facilitation, and ICT can be integrated into a preventive model against abuse in elite sports education, which contributes to global discussions on safeguarding youth in talent development. Further, the findings illustrate how interdisciplinary collaboration transforms psychological theory into practical tools that strengthen educators'

reflections; empower athletes' agency; and foster safe, ethical, and supportive environments.

Abstract 1870

WHEN HEALTHIER IS HARMFUL: THE CONTINGENT BENEFITS OF INTEGRATIVE EMOTION REGULATION IN AN EAST ASIAN SAMPLE

Ran Z.*, Wang Z., Dong H., Xu J.

Beijing Normal University ~ Beijing ~ China

Introduction

Grounded in Self-Determination Theory (SDT), emotion regulation includes three styles: integrative (autonomous exploration of emotions), suppressive (e.g., ignoring emotional information), and dysregulated (being overwhelmed by emotions). While prior work confirmed the independent positive and negative effects of integrative and suppressive styles on goal pursuit, this work has largely treated them as separate predictors.

Purpose

Consequently, it remains unknown if the benefits of an adaptive style like integration are universal or contingent on concurrent maladaptive style tendencies.

Method

Participants were 119 Chinese undergraduate students (82.4% female; age range 18–24), with baseline goal stress and competency assessed. Using an Experience Sampling Method (ESM), we collected 5693 data points over three weeks, each separated by a two-week interval. Following goal-related emotional events, participants' momentary reports on their use of integrative, suppressive, and dysregulated styles were aggregated into overall tendencies. Goal progress was assessed weekly, and a Bayesian three-way interaction model was estimated.

Results

A credible three-way interaction emerged. Overall, the suppressive style promoted goal progress while the dysregulated style hindered it. The effect of the integrative style, however, was highly conditional and paradoxical: while beneficial in most cases, a higher integrative tendency predicted lower goal progress for individuals with high suppression and low dysregulation tendencies. Post-hoc tests confirmed a ‘low integration, high suppression, low dysregulation’ tendency yielded the highest goal progress.

Conclusions

By aggregating momentary behaviors, this study reveals a more ecologically valid, configurational relationship between regulatory styles and goal progress. Our East Asian findings challenge a simple "good vs. bad" view of these styles. The paradoxical

result shows a focused, suppressive style can be functional when individuals are not overwhelmed by emotion, as the resource-intensive process of integration can be disruptive. This implies constant emotional processing is not always helpful for goal attainment. These findings offer new insights into goal pursuit dynamics and call for further cross-cultural research.

Abstract 1920

TRANSGENDER AND GENDER DIVERSE YOUNG ADULTS WHO EXPERIENCE HIGH SOCIOPOLITICAL STRESS AMIDST THE 2025 PRESIDENTIAL ADMINISTRATION IN THE U.S. HAVE INCREASED NEGATIVE MENTAL HEALTH OUTCOMES

Abreu R.*[1], Costa R.[1], Barrita A.[2], Huynh K.[3], Parmenter J.[4], Vazquez T.[1], Sanzi M.[1], Sosa Antunez Y.[1]

[1]University of Florida ~ Gainesville ~ United States of America, [2]Michigan State University ~ Lansing ~ United States of America, [3]University of North Texas ~ Denton ~ United States of America, [4]Arizona State University ~ Tempe ~ United States of America

The temporal intersectional minority stress model describes how social and legal contexts influences the unique experiences of minority stress among LGBTQ+ people (Rivas-Koehl et al., 2023). The negative psychological effects of minority stress may be exacerbated by sociopolitical hostility toward LGBTQ+ people, such as during the 2025 presidential administration in the United States of American (USA). Moreover, there is limited research on the link between sociopolitical stress during the 2025 presidential administration in the USA, as well as on how this association may differ across different minoritized groups. To address these gaps, this study aimed to explore the relationship between sociopolitical stress under the 2025 presidential administration in the USA and three mental health outcomes (i.e., psychological well-being, depression, anxiety) in 470 LGBTQ+ young adults (Mage = 21.9), as moderated by three sociodemographic factors: gender identity (cisgender vs. transgender and gender diverse), sexual identity (monosexual vs. plurisexual), and racial group (does not identify as a person of color vs. identifies as a person of color). Findings show that higher sociopolitical stress was associated with poorer mental health outcomes, and only gender identity moderated this association: the positive association between sociopolitical stress and mental health problems was higher for gender diverse participants compared to cisgender participants. Findings emphasize the importance of contextualizing minority stress against LGBTQ+ people within broader sociopolitical contexts and suggest that interventions with this population should acknowledge the external origins of sociopolitical distress. Findings from this study could be used by clinicians to target multiple sources of resilience (e.g., personal resilience, affirming social support networks, collective action) that may buffer against stressful sociopolitical experiences. Finaly, findings provide some guidance for policymakers on how to best advocate for LGBTQ+ people during hostile sociopolitical climates.

Abstract 2730

EXPERIENCES OF A VIRTUAL REALITY-BASED EMPTY-CHAIR TECHNIQUE AMONG MIDDLE-AGED SOUTH KOREAN MEN

Eunha K.*

Ajou University ~ SUWON ~ Korea, Republic of

Introduction
The empty-chair technique in Gestalt therapy facilitates emotional dialogue with an imagined person or self-aspect. However, for middle-aged South Korean men, cultural norms emphasizing emotional restraint and traditional masculinity often make imagery-based approaches feel uncomfortable or artificial. Virtual reality (VR) may address these limitations by providing an embodied and immersive alternative.

Purpose
This study explored how middle-aged South Korean men experienced a VR-based adaptation of the empty-chair technique, focusing on both its therapeutic benefits and perceived limitations.

Method
Fourteen middle-aged South Korean men (aged 40–59) who reported psychological distress related to childhood relationships with patriarchal fathers participated in a single-session VR-based empty-chair intervention. Participants interacted with a standardized younger-self avatar in a VR environment and subsequently completed in-depth semi-structured interviews. Data were analyzed using Interpretative Phenomenological Analysis to capture participants' lived experiences. Presence, immersion, and realism were also assessed using the I-group Presence Questionnaire.

Results
Three domains of positive experience emerged: emotional reactions from meeting one's childhood self, shifting attitudes toward the self, and advantages of using VR. Participants described intense emotional responses, increased self-compassion, reduced self-blame, and greater self-acceptance. VR facilitated immersion, reduced self-consciousness related to the counselor's presence, and supported vivid recall of childhood experiences. Negative experiences were also identified, including difficulty reconnecting with certain memories, disruptions to immersion due to technical limitations, and challenges related to self-disclosure. Presence and immersion were rated at moderate levels.

Conclusions
The findings suggest that the VR-based empty-chair technique may offer a culturally

sensitive and emotionally accessible alternative to traditional imagery-based approaches for middle-aged South Korean men. While technical and procedural improvements are needed, VR shows promise in facilitating emotional engagement and self-reflection among populations facing cultural barriers to emotional expression.

Abstract 2329

PARENTING AN ADOLESCENT: THE CASE OF THE AVOIDANT HIGHLY SENSITIVE MOTHER

Goldberg A.*

Tel-Hai Academic College ~ Kiryat-Shmona ~ Israel

Being highly sensitive refers to an individual's temperamental trait, genetically based, to tend to process more strongly and deeply a variety of information, such as one's own and others' moods and thoughts. Highly Sensitive Persons (HSPs), who constitute 20%-30% of the population, tend to process and respond to lower thresholds of information and to better detect subtle differences in their environment. HSPs are more likely to experience social phobia, depression, avoidant personality disorder, behavioral inhibition, and attachment insecurity. However, HSPs are not condemned to have "challenging" personalities with associated negative effects. There is some evidence that HSPs are differentially susceptible to environmental factors. Studies on highly sensitive children show that their sensitivity magnifies both positive and negative effects of their early relationships with their significant others as they integrate those experiences into their personality, coping strategies, and behaviors. Thus, it is important to explore highly sensitive parents' adjustment during the challenging period of adolescence.

This research examines parental practices of Israeli highly sensitive mothers toward their adolescent children and the role of attachment avoidance as a moderator between the associations of high sensitivity and parenting practices. One hundred and one mother–adolescent dyads completed self-report questionnaires assessing mothers' degree of high sensitivity, mothers' adult attachment, and mothers' parenting practices. Results showed that highly sensitive mothers were described by their adolescent children as inconsistent and intrusive parents. Further, attachment avoidance was found to moderate the association between mothers' high sensitivity and inconsistent and psychological intrusiveness. Findings suggest that attachment avoidant highly sensitive mothers experience this period of raising adolescents as especially stressful and challenging, which contributes to the practice of negative parenting. Thus, interventions focused on regulating those mothers' emotions to better cope with parental challenges could buffer negative parenting practices.

Abstract 2476

CROSS-CULTURAL VALIDATION OF THE DECENT EDUCATION MODEL: EXPERIENCES OF AMERICAN, KOREAN, AND TURKISH COLLEGE STUDENTS

Kim H.*[1], Buyukgoze--Kavas A.[2], Park J.[3], Han E.[4], Choi Y.[3], Lee H.[3], Lee K.[5]

[1]Texas Tech University ~ Lubbock ~ United States of America, [2]Ondokuz Mayis University ~ Samsun ~ Turkey, [3]University of Florida ~ Gainesville ~ United States of America, [4]George Mason University ~ Fairfax ~ United States of America, [5]Yonsei University ~ Seoul ~ Korea, Republic of

High school education is an essential vehicle to employment, social mobility, and career advancement. Those without adequate educational experience in high school are less likely to attain employment or educational opportunities. And despite the essentiality of education, not everyone in society has access to education that will grant them opportunities to attain decent work. Scholars have developed the concept of decent education and the decent education model (DEM) to highlight the essentiality of education in work prospects, and created the Retrospective Decent Education Scale (RDES) to measure the construct in the U.S.. This cross-cultural study specifically examined decent education across three national contexts (the United States, South Korea, and Türkiye) to see its applicability. The RDES was translated and validated in Korean (RDES-K) and Turkish (RDES-T) samples, followed by a multigroup structural equation modeling analysis to test the cross-cultural applicability of the DEM. In Studies 1 and 2, confirmatory factor analyses supported the six-factor correlational model encompassing physical safety, psychological safety, equitable environment, social belongingness, quality instruction, and vocational preparation. Both the RDES-K and RDES-T demonstrated strong reliability, construct validity, and predictive validity. Study 3 integrated data from the U.S., Korean, and Turkish college students to test the cross-national model. Results indicated metric-level measurement invariance across countries, confirming that the constructs were conceptualized similarly across cultural contexts. Structural modeling revealed that economic constraints negatively predicted decent education, which in turn positively predicted work volition and career adaptability, both of which predicted stronger perceptions of future decent work. While the magnitude of effects varied, decent education consistently served as a mediating mechanism linking early socioeconomic experiences to work outcomes across all samples. Overall, findings provide robust support for the cross-cultural generalizability of the DEM, establishing the RDES as a reliable tool for assessing educational quality and equity across diverse national contexts.

Abstract 2213

FOSTERING PSYCHOLOGICAL WELL-BEING IN ELDER ABUSE VICTIMS: USE OF PERSON-CENTERED THERAPY

Leung L.M.*, Yan E.

The Hong Kong Polytechnic University ~ Hong Kong ~ Hong Kong

Background

Person-Centered Therapy (PCT) emphasizes the client's perspective in facilitating behavioral change. While PCT has been applied in various contexts, its effectiveness in addressing mistreatment of older adults, particularly within Asian cultures, is underexplored. Older adults experiencing abuse often face psychological distress and reduced self-efficacy. Practitioners play a crucial role by guiding interventions and supporting clients through complex challenges. This case study examines how PCT can assist older adults in abusive situations, focusing on a clinical intervention with a 75-year-old woman living with her abusive brother.

Objectives

The primary objectives were to evaluate the effectiveness of PCT in helping the client build motivation for behavioral change and improve self-efficacy through incremental goal-setting. Additionally, the study aimed to assess how the structured nature of PCT enabled the client to confront her abusive circumstances and achieve a greater sense of safety.

Method

This qualitative case study involved a Chinese-speaking client aged 75, identified through community screening for abuse. The intervention included four sessions spanning over two months, focusing on collaborative goal-setting and rapport-building. The initial session emphasized exploring motivations for change, while follow-up sessions assessed progress and reinforced motivation.

Results

The PCT approach effectively enhanced the client's motivation and self-efficacy. By starting with small, manageable goals—such as increasing physical activity—the client experienced success that boosted her confidence. Open dialogue and reflective listening allowed her to identify strengths and pursue social support. By the final session, she reported improved self-efficacy and decided to apply for separate housing to leave the abusive situation.

Conclusion

This case study illustrates that the person-centered approach can effectively promote positive change among older adults experiencing abuse. The structured yet flexible nature of PCT, complemented by practitioners' support, empowers clients to achieve meaningful changes and enhances their sense of safety and autonomy. Further research is needed to explore the application of PCT with older populations affected by abuse.

Abstract 4545

TRAINING MENTAL HEALTH CONSULTANTS IN PROBLEM MANAGEMENT PLUS DURING WARTIME: THE ROLE OF SUPERVISED PRACTICE

Liashenko O.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

The large-scale need for mental health support in Ukraine during the ongoing war has required rapid preparation of psychological consultants capable of delivering evidence-based, low-intensity interventions. This presentation describes a supervised training model for Problem Management Plus (PM+), a low-intensity psychological intervention developed by the World Health Organization, implemented with mental health consultants who themselves continue to live and work under wartime conditions.

Three training cohorts were conducted with consultants from different regions of Ukraine, including Kyiv and western regions, Kharkiv and surrounding areas, and southern regions such as Mykolaiv and Kherson. The training model combined an intensive initial training with structured supervision and guided practice with real clients over a seven-week period. While self-reported confidence and understanding of the PM+ program were assessed following the initial training, the primary focus of this presentation is on the role of supervised practice in supporting meaningful professional integration of the intervention.

Client-level outcome monitoring was used as an indirect indicator of training effectiveness. Across the cohorts, consultants worked with adult clients experiencing high levels of stress and psychological distress related to prolonged exposure to war. Repeated measures included mental health indicators, self-reported functioning, and weekly ratings of problem severity and overall wellbeing. Overall trends indicated gradual improvements across the intervention period, despite contextual challenges such as ongoing insecurity and instability.

The findings highlight that initial training alone is insufficient for preparing consultants to work effectively in complex humanitarian settings. Instead, supervised practice appears to play a critical role in consolidating skills, supporting clinical decision-making, and fostering confidence in real-world conditions where both consultants and clients are affected by shared stressors. The presentation discusses practical implications for workforce development, supervision models, and sustainable implementation of brief psychological interventions in wartime contexts.

Abstract 954

DEVELOPMENT AND FEASIBILITY OF A MOBILE-BASED ECOLOGICAL MOMENTARY ASSESSMENT PROTOCOL ON WELL-BEING AND SUBJECTIVE MEMORY DECLINE AMONG KOREAN OLDER ADULTS

Park M., Jung S.*, Yeseul K., Lee S., Noh S.R., Cho S., Shim Y.

Chungnam National University ~ Daejeon ~ Korea, Republic of

With rapid global population aging, preventing cognitive decline in later life has become a priority. Although well-being serves as a protective factor for cognitive functioning, its components may exert differential effects, underscoring the need for interventions adapted to specific domains. In addition, subjective memory decline (SMD)—a self-assessable early indicator of cognitive impairment—represents a critical focus for timely prevention. Ecological momentary assessment (EMA) offers a valuable approach to capturing the relationships between well-being components and SMD in daily life.

Purpose: This study aimed to develop and evaluate the feasibility of a mobile-based EMA protocol assessing well-being predictors of SMD among Korean older adults.

Method: A preliminary survey of 43 Korean older adults aged 65–85 assessed well-being and SMD; correlations informed EMA survey development. The protocol was developed per EMA guidelines and refined based on feedback from two older adults. The feasibility study involved 10 different participants (six young-old [65-74] and four old-old [75-85]), including daily surveys over 14 days and follow-up evaluations. The protocol was refined through the researchers' synthesis and finalized.

Results: Preliminary analyses revealed negative correlations between SMD, overall well-being, and several of its components. In the EMA feasibility study, one old-old participant missed three surveys, while others completed all surveys. All participants received initial assistance; old-old participants additionally required occasional remote support. Response times decreased from 6.3 minutes on Day 1 to 3.3 minutes on Day 14, and participants rated feasibility highly across five domains—technical convenience, item comprehensibility, schedule appropriateness, support, and engagement (M = 4.58/5). Researchers' synthesis yielded 13 practical considerations for final protocol refinement across survey administration, interface design and item clarity, and participant management.

Conclusions: Findings demonstrate the feasibility of EMA for assessing well-being predictors of SMD. This protocol is practical and may offer a scalable tool for early detection, timely prevention, and targeted intervention in Korean older adults.

Abstract 2297

PROCESS OF SELF-ACTUALIZATION IN ACHIEVING WELL-BEING

Salopek Z.[2], Vuletic G.*[1], Dude K.[1]

[1]Faculty of Humanities and Social Sciences ~ Osijek ~ Croatia, [2]International Institute for Emotional Maturity ~ Zagreb ~ Croatia

Self-actualization was originally defined as the process of realizing one's full potential and pursuing personal growth, described as the highest level of Maslow's hierarchy of needs. However,
Maslow's framework referenced only a few internal needs, leading to a misinterpretation of self-actualization as merely one of the needs rather than an ongoing process. People achieve self-actualization by accumulating experiences, which can be seen as the fulfilment of needs. Nevertheless, self-actualization in the context of meaning and purpose in life is much more complex.
The importance of meaning and purpose in life has long been recognized in the work of Victor Frankl and logotherapy. The aim of this poster is to propose a new conceptual model of self-actualization as a dynamic process that integrates the fulfillment of needs and the accumulation of experiences with the development of meaning and purpose in life. Building on Maslow's and Frankl's theories, the model emphasizes the role of emotional and experiential learning, especially the confrontation of internal fears and challenges, in achieving maturity, well-being and self-actualization skills. Experiences can be categorized as external and internal. All people needs provide the impetus that drives people to seek experiences in the external world, while conscious and unconscious fears give them the opportunity to overcome them and thereby gain internal experiences or self-actualization skills (e.g., responsibility, acceptance, forgiveness). The key to self-actualization and the meaning of life lies in experiential and emotional understanding of what is important and what is not.
This model offers a framework for fostering well-being through real-life experiences and emotional awareness. Through counseling sessions that encourage individuals to confront fears, cultivate acceptance, and find meaning in experience, it offers practical guidance for personal growth and resilience.

Abstract 4767

Promoting University Students' Well-Being Through a Multi-Level Preventive Model: The MOEBIUS 2 Project

Zarbo R.*, Diquattro G., Imbrogliera C., Scalone A., Sinesi S., Schimmenti A., Sgrò F., Magnano P.

Kore University of Enna ~ Enna ~ Italy

Introduction
University students' psycho-physical well-being is an increasingly relevant issue due to rising psychological distress and adaptation difficulties. The MOEBIUS 2 project (funded through Pro-ben-2 by the Italian Ministry of University and Research) promotes healthy lifestyles through an integrated model of primary, secondary, and tertiary prevention, combining psychological support, social participation, and artistic and sport-based activities within a multi-university Italian partnership.
Objectives
The project aims to assess students' needs, implement multilevel preventive interventions, promote well-being and healthy lifestyles, and systematically evaluate the effectiveness of interventions.
Methods
The project is structured into six Work Packages (WP). WP1 involves a longitudinal analysis of university students' needs through survey-based assessment. WP2 focuses on primary prevention interventions, including psychoeducational group trainings; within this framework, the University of Enna Kore has implemented two experiential group programs (UniWell and Next Step Together), designed to promote psycho-physical well-being and reduce psychological distress among students, as well as a physical activity program (Fitness for Wellness). WP3 is dedicated to strengthening psychological counselling services and to the development of standardised protocols for assessment and monitoring. WP4 addresses tertiary prevention by defining structured referral pathways to territorial services for students presenting with more severe levels of distress. WP5 includes seminars and sensitisation activities addressed to the academic community. Finally, WP6 focuses on qualitative monitoring of the project through focus groups to capture participants' experiences and perceptions.
Results
Expected outcomes include improved psychosocial well-being, reduced stress and risky behaviours, increased student engagement and sense of belonging, and strengthened psychological support systems and community networks.
Limitations
Main challenges concern the complexity of coordination across institutions, standardisation of procedures, and variability in intervention delivery and outcome assessment.

Discussion

MOEBIUS 2 highlights the effectiveness of an integrated, multi-level approach to university well-being, emphasising the synergy between psychoeducational, physical, counselling, and preventive interventions, and the importance of collaboration across universities and local communities.

FORMS AND EUROPEAN IMPLEMENTATIONS OF THE LATER LIFE WORKPLACE INDEX - A COST LEVERAGE SYMPOSIUM

Saturday 25 July 2026 from 10:30 to 12:00

(P -Arsenale)

Jürgen Deller (Institute for Mangement & Organization (), Chair and Presenter
Mattea Wehage (Institute for Mangement & Organization (), Co-Chair
Justin Marcus (College of Administrative Sciences and E), Discussant

Global workforce aging has prompted research into organizational practices that maintain older workers' health, motivation, and productivity. However, no comprehensive measurement tool existed to assess all relevant practices, limiting research scope. The Later Life Workplace Index (LLWI) provides a holistic assessment tool enabling researchers and practitioners to evaluate organizational practices supporting older workers.

This symposium addresses a critical methodological gap in applied psychology by introducing a comprehensive measurement tool for age-relevant organizational practices and demonstrating practical application across diverse cultural and sectoral contexts. The research directly supports ICAP 2026's mission to tackle pressing global challenges through applied psychology by examining age-relevant organizational practices supporting older workers during demographic change and labor shortages. The symposium's integration of methodological innovation with cross-cultural studies and real-world implementation exemplifies the congress's emphasis on applied interdisciplinary perspectives.

The first study introduces the theoretical foundation of the LLWI and its three validated forms, original, short, and extra short, along with their contexts of application and the latest methodological developments. Researchers from four countries then present findings on implementing the LLWI in different contexts.
The second study examined Israeli managers' perceptions of older workers and subdomains of age-relevant organizational practices measured by the LLWI. The third study explored age-relevant organizational practices for career sustainability of older Italian teachers across four LLWI domains. The fourth study describes an institutional initiative fostering sustainable careers in academia, using the LLWI to assess older faculty members' perceptions in Portugal. The final presentation provides insights into practical application and strategic embedment through German consulting case examples.

Together, these presentations demonstrate how the LLWI serves as both methodological innovation and a practical bridge between research and application, exemplifying applied psychology's evidence-based solutions to global workforce aging challenges.

Abstract 3468

THE THREE FORMS OF THE LATER LIFE WORKPLACE INDEX: ORIGINAL, SHORT, AND EXTRA SHORT

Deller J.*, Wehage M., Finsel J., Wöhrmann A.

Institute for Management and Organization (IMO), Leuphana University Lüneburg ~ Lüneburg ~ Germany

The employment of older individuals becomes increasingly important in the context of demographic change. To identify organizational practices that foster the motivation, health, and performance of older employees in particular, an efficient, holistic assessment of relevant organizational factors is needed. The Later Life Workplace Index (LLWI) provides such a measure, differentiating nine domains of organizational practices relevant to the aging workforce: organizational climate, leadership, work design, health management, individual development, knowledge management, transition to retirement, continued employment, and health and retirement coverage.

In its original form, the LLWI contains a total of 80 items. The LLWI has been translated and validated across over 17 countries and applied in emerging research in various contexts. More recently, two shorter forms have been developed to enhance the index's applicability both in research and in practice. The short form (LLWI-SF) reduced the original form's scope to 29 items through quantitative and qualitative strategies and has been validated and published across 10 countries. While both measures allow for an in-depth and multi-faceted analysis of organizations' age-friendliness, they remain too lengthy to be applied in large-scale surveys (e.g., Health and Retirement Survey) or organizational screenings. Therefore, an extra-short form was developed by an expert focus group over several discussion rounds. The LLWI-XSF features nine single-item measures, each capturing one LLWI domain, and has so far been validated in German and American English.

The three different forms of the LLWI provide researchers and practitioners with validated instruments to measure organizational practices for older employees. Each instrument provides unique strengths which are leveraged depending on the context of and needs for application, e.g., in-depth analysis or organizational screening. We present and compare all three forms, their development methods, implementation, and implications.

Abstract 3469

AMBIVALENT BIAS AT WORK: MANAGERS' PERCEPTIONS OF OLDER WORKERS ACROSS ORGANIZATIONAL CONTEXTS

Axelrad H.*[1], Lewin--Epstein N.[2], Kalev A.[2]

[1]Aaron Institute for Economic Policy, Tiomkin School of Economics, Reichman University (IDC) ~ Herzliya ~ Israel, [2]The School of Social and Policy Studies, Tel Aviv University ~ Tel Aviv ~ Israel

This study examines managers' perceptions of older workers (aged 55 and above) and the organizational context in which these perceptions are formed. We explore managers' perceptions of older workers along two dimensions: personal attributes and employability. Additionally, we investigate whether workplace structures and processes can predict managers' perceptions of older workers as positive, negative, or mixed.
Ambivalent perceptions are elusive and may serve to justify inequality. However, they also reflect weaker boundaries and might be more changeable in certain contexts. This study examines the prevalence of ambivalent age stereotypes among managers and explores the organizational contexts that either enhance or diminish them. If mixed stereotypes are prevalent, they should be incorporated into theories about the causes of inequality and organizational mitigating factors.

We employed the Later Life Workplace Index (LLWI), focusing on sub-dimensions such as Equality of Opportunity, Image of Age, and Communication. Data were collected from 551 Israeli managers. Using factor analysis, we mapped perception clusters and examined correlates between workplace characteristics and managers' perceptions of older workers through multinomial logistic regression.

Our findings revealed managers hold mixed views: positive perceptions about older people's personal attributes and negative perceptions about their employability. Analysis revealed close connections between workplace structures and managers' mindsets. Holding other variables constant, managers were more likely to report positive perceptions in workplaces with more equal career opportunities, a culture of inclusion, and opportunities for intergroup contact. Negative perceptions were more common in workplaces with local labor unions.

The paradox whereby managers sometimes prefer recruiting younger employees despite positively viewing older workers' traits may be explained by our findings on their positive and negative stereotypes.
Given that mixed stereotypes are common managerial stereotypes about older workers, the findings on organizational structures where age bias intensifies, or declines, make significant advances in age and workplace diversity research.

Abstract 3480

FEP+ ACTIVE LEGACY PROGRAM: SUSTAINING ACADEMIC CAREERS THROUGH STRATEGIC HUMAN RESOURCE FORESIGHT

Oliveira E.*

Centre for Economics and Finance (cef.up), University of Porto ~ Porto ~ Portugal

The FEP+ Active Legacy Program is an institutional initiative designed to foster sustainable careers in academia by strategically addressing demographic shifts among faculty members. The program pursues three interconnected objectives: (i) to recognize and value the strategic contributions of senior faculty members, (ii) to ensure effective human resource foresight in academic staffing, and (iii) to promote productive sustainability during the final stages of academic careers.

Demographic data indicate that a significant proportion of faculty members are approaching mandatory retirement age. This scenario raises critical challenges, including the risk of losing tacit knowledge and weakening the pedagogical and scientific identity of the institution. At the same time, it highlights the urgent need to develop ad hoc mechanisms for generational transition.

The program integrates several components. First, an annual diagnostic phase, based on surveys (e.g., LLWI) and focus groups, will examine older faculty members' perceptions of current and ideal organizational conditions for career sustainability. Second, systematic input will be collected from Scientific Groups and Autonomous Sections to inform decision-making regarding recruitment and succession planning, particularly short-term retirements and strategic staffing needs. Third, the initiative includes voluntary peer-to-peer mentoring and a career reflection group, animated by international experts affiliated with CA22120 – The European Network to Leverage the Multi-Age Workforce (LeverAge).

Expected output includes a formal certification (Mentor FEP) and the annual People Plan, a forecast report outlining one- and three-year staffing scenarios. Sustainability will be ensured through continuous cycles of review and improvement, supported by engagement from faculty members, adequate resources, and recognition in institutional evaluation processes.

By combining foresight, mentoring, and structured knowledge transfer, the FEP+ Active Legacy Program exemplifies how applied psychology and human resource strategies can be mobilized to sustain academic careers and strengthen organizational identity in the face of demographic transitions.

THE PSYCHOLOGY OF LYING FLAT: A CROSS-CULTURAL STUDY ON YOUTH DISENGAGEMENT AND MENTAL HEALTH OUTCOMES

Chang Y.*

Yuan Ze University ~ Taoyuan City ~ Taiwan

Introduction:Across the globe, many young people are rejecting competitive, high-pressure lifestyles through a phenomenon known as lying flat. Lying flat is a voluntary withdrawal from societal expectations of relentless achievement. This movement challenges conventional assumptions about success, productivity, and mental health. For psychologists and counseling professionals, lying flat presents a paradox. While it may appear as a sign of disengagement or dysfunction, it can also function as a strategic coping mechanism for self-preservation, depending on individual circumstances and cultural norms.

Purpose: This study examines the psychological functions of lying flat behavior, exploring its associations with perceived stress, coping styles, and emotional well-being. This study aims to determine whether lying flat represents a self-destructive pattern or a form of adaptive self-care, with particular attention to differences between collectivist and individualist cultural contexts.

Method: The study utilizes a cross-cultural survey methodology (using surveymonkey and amazon M-turk platforms) with participants recruited different countries. Standardized measures assessed lying flat tendencies, perceived stress, coping styles, and emotional distress. Countries were categorized based on Hofstede's cultural dimensions to compare collectivist and individualist orientations.

Results: Preliminary analyses indicate distinct cultural patterns in how lying flat behaviors and coping styles are linked to emotional distress. In some cultural contexts, lying flat correlates with higher psychological strain, whereas in others, it is associated with reduced distress, suggesting a potential self-regulatory benefit. Detailed results will be presented in the conferene.

Conclusions: The findings highlights the need for culturally sensitive interpretations of behavioral disengagement. Lying flat may function as a self-regulatory coping mechanism shaped by social norms and environmental pressures. Counseling interventions should consider the cultural and psychological meanings behind disengagement before labeling it as pathological or unproductive.

Abstract 498

THE EFFECTS OF A NOSTALGIA INTERVENTION ON SELF-CONTINUITY, MENTAL WELL-BEING, AND POSITIVE AFFECT IN EARLY ADULTHOOD: THE MODERATING EFFECT OF AVOIDANT RESPONSE STYLE TO POSITIVE AFFECT

Jeong H., Choi G.*

Department of Psychology, Keimyung University ~ Daegu ~ Korea, Republic of

This study examined whether the avoidant response style to positive affect moderates the effects of nostalgia on self-continuity, mental well-being, and positive affect in early adulthood. 133 adults aged 18 to 29 nationwide were randomly assigned to an experimental group, a comparison group, and a control group, and received treatment or waited without treatment. All participants responded to pre, post, and follow-up questionnaires. The results of this study are summarized as follows. First, nostalgia intervention had a positive effect on self-continuity, but did not significantly affect mental well-being and positive affect. Second, the effects of nostalgia intervention on self-continuity were maintained two weeks later. Third, the avoidant response style to positive affect moderated the relationship between nostalgia intervention and mental well-being, but did not moderate the effects on self-continuity and positive affect. This study confirmed that nostalgia intervention promotes self-continuity and contributes to mental well-being interacting with emotion regulation skills in early adults.

Abstract 758

THE POWER OF COMMUNICATIVE COMPANIONS: CULTURAL PERSPECTIVES ON MENTAL HEALTH AMONG DEAF AND HARD-OF-HEARING ADULTS IN TAIWAN

Jhai Z.*

National University of Tainan ~ Tainan City ~ Taiwan

Previous research has shown that hearing loss alone does not predict emotional functioning or psychological distress. This study adopts a cultural model perspective, viewing disability as a lived experience that shapes distinct cultural and social worlds. For Deaf and Hard of Hearing (DHH) individuals, communication modes—such as the choice of spoken or signed language—define interaction patterns, including who they engage with and how frequently, which in turn influences mental health.

This study categorizes Taiwanese DHH adults into four groups: (1) signers who use sign language but not speech, (2) speakers who use speech but not sign, (3) bimodal users of both sign and speech, and (4) individuals relying mainly on lip-reading and writing. Differences in schooling, caregiver communication, and presence of DHH partners were examined alongside psychological outcomes. A total of 257 adults participated in an online survey, with 240 valid responses (mean age = 39; 61% female). Participants completed either a text version or a Taiwanese Sign Language video version of the Negative Emotion Scale, tailored to DHH life contexts, and a translated Dissociative Experiences Scale-II.

Findings showed that signers tended to live within Deaf communities, while speakers engaged primarily with hearing peers. Bimodal users employed multiple channels, often learning sign through special education or self-choice. Lip-writing participants also used multiple strategies, with writing more frequent than others. Across groups, no significant differences emerged in negative emotions or dissociation scores. However, among signers, growing up with communicative companions—such as Deaf family members, sign-using caregivers, or Deaf schools—was associated with lower dissociation scores, though negative emotions showed no difference. For the other groups, no clear peer effect was observed, possibly due to sample size or individual heterogeneity. These results underscore the importance of communicative companionship in shaping DHH psychological well-being.

CHRISTIAN AND LGBTQ SENSE OF COMMUNITY, FAITH GENERATION, INTRINSIC RELIGIOSITY, BASIC PSYCHOLOGICAL NEEDS, AND DEPRESSION: TESTING A MODERATED MEDIATIONAL MODEL

Lai J.L., Chiao H.*

National Taiwan Normal University ~ Taipei ~ Taiwan

This study examines a moderated mediation model involving LGBTQ Christians' sense of community in both Christian and LGBTQ communities, faith generation, intrinsic religiosity, basic psychological needs, and depression, with participants recruited from Taiwan. It explores whether the relationship between community sense and depression is mediated by psychological needs and whether this effect is influenced by faith generation and intrinsic religiosity. Participants included 355 LGBTQ Christians from Taiwan, with an average age of 30.04 years. The largest subgroup identified as bisexual (28.2%). The study utilized several scales, including the Sense of Community Index, Hoge Intrinsic Religiosity Scale, Center for Epidemiologic Studies Depression Scale, and the Basic Psychological Needs Scale. Key findings include: (1) Belonging and competence needs fully mediated the link between Christian community sense and depression, while belonging needs partially mediated the link between LGBTQ community sense and depression. (2) For first-generation LGBTQ Christians, belonging needs fully mediated the relationship between Christian community sense and depression. For second-generation or beyond, autonomy and competence needs fully mediated the relationship between Christian community sense and depression, while belonging needs partially mediated the relationship between LGBTQ community sense and depression. (3) In individuals with high intrinsic religiosity, belonging needs fully mediated the link between Christian community sense and depression and partially mediated the relationship with LGBTQ community sense. The study concludes with recommendations for further research and practical suggestions for church communities, LGBTQ groups, and mental health professionals.

Abstract 714

PARENT-ADOLESCENT COMMUNICATION AND ACTUAL HELP-SEEKING BEHAVIOR: THE ROLES OF SELF-STIGMA OF SEEKING HELP AND PERCEIVED PEER SUPPORT

Nuth E.*, Wang C.D., Huynh K.

University of North Texas ~ Denton ~ United States of America

Research in help seeking has identified parent-child communication and self-stigma of seeking help as significant predictors. However, much of the research surrounding help seeking has focused on help-seeking attitude or intention, rather than actual help-seeking behavior. To address the gap in literature, the purpose of the present study was to examine the direct effect of parent-adolescent communication regarding mental health issues on actual help-seeking behaviors of young adults as well as exploring its indirect effect through self-stigma of seeking help. Additionally, we examined whether perceived support from peers would moderate the link between parent-adolescent communication on mental health issues and actual help seeking behaviors. Participants included 531 emerging adults from the Southwest U.S. who completed the research questionnaires with selected instruments assessing variables of interest. The results supported a significant indirect effect, b = .034, 95%CI [.012, .061]. Specifically, findings indicated that parent-adolescent communication on mental health issues significantly predicted self-stigma of self-seeking, b = -.159, t = -3.545, p < .001, 95%CI [-.247, -.071], and that both self-stigma (b = -.212, t = -4.313, p < .001, 95%CI [-.308, -.115]) and parent-adolescent communication (b = -.216, t = -4.221, p < .001, 95%CI [-.317, -.116]) were significant predictors for actual help-seeking behavior in the final model. However, the moderator effect was not supported (b = .087, t = 1.126, p = .261, 95%CI [-.065, .238]). Drawing from these findings, a tentative conclusion is that when participants have had better communication with parents regarding mental health issues during adolescence, they are more likely to engage in actual help-seeking behaviors as young adults and that this influence can be explained by participants' lower self-stigma of seeking help. Future research directions, limitations, and clinical implications of the study will be elaborated in the presentation.

Abstract 243

FOUR ENCOUNTERS: THE I CHING AS A SYMBOLIC FRAMEWORK FOR RELATIONAL PSYCHOTHERAPY

Shang Y.*

Pacifica Graduate Institute ~ Carpinteria ~ United States of America

In depth-oriented psychotherapy and psychoanalytic traditions, the notion of relational encounter is recognized as a pivotal site of transformation—where psyche, otherness, and emerging meaning converge. This presentation introduces the I Ching (Book of Changes)—an ancient Chinese system of symbolic transformation—as a living framework for understanding such encounters. Among its sixty-four hexagrams, four naturally stand out, each revealing a distinct relational dynamic. Taken together, they form a symbolic constellation—interwoven patterns that illuminate how relationship unfolds across time, psyche, and culture.

Gou (Hexagram 44, 姤) represents sudden contact—charged, uncanny, and often destabilizing. As in Jessica Benjamin's concept of mutual recognition, this encounter disrupts symmetry and invites a trembling openness. The psyche is stirred, not settled.

Xian (Hexagram 31, 咸) embodies felt attunement—gentle, magnetic, and resonant. Like Lewis Aron's affective field, its change arises not from intervention, but from being moved—emotionally and bodily—in shared presence.

Tong Ren (Hexagram 13, 同人) signifies a shared horizon—clarity in alliance and warmth in difference. It echoes Stephen Mitchell's view that therapeutic meaning is not transferred, but co-created in dialogue, within an evolving field of trust.

Gui Mei (Hexagram 54, 归妹) denotes a tense union—where longing meets asymmetry and desire brushes against the unknown. Carl Jung noted that transformation often begins at the boundary of opposites, in the friction between roles, projections, and the unclaimed.

These four hexagrams trace a relational arc—from encounter to attunement, alliance to rupture—offering a symbolic map of therapeutic intimacy. Rather than mechanistic moments, they reflect meaning-bearing experiences, echoing Jung's insight into synchronicity.

The I Ching offers more than metaphor; it provides a symbolic grammar for sensing the

subtle dynamics of encounter and the contours of what is becoming. In doing so, we cultivate not only insight, but a ritual attention to inner movement—where psyche speaks through image, and time gathers toward transformation.

Abstract 272

WELL-BEING AMONG MULTIRACIAL STUDENTS AND ACADEMIC SUPPORT: A SOCIAL COGNITIVE CAREER THEORY MODEL

Soon K.*, Sheu H.

University at Albany, Department of Educational and Counseling Psychology ~ Albany ~ United States of America

Introduction: Social Cognitive Career Theory (SCCT) posits that self-efficacy is a function of environmental supports; further, that academic self-efficacy then fosters greater life satisfaction. Within this, a number of cultural and contextual are relevant. This study focuses on multiracial students as previous literature has connected multiracial youth in the United States with worse mental health outcomes (Oh et al., 2023).

Purpose: Given this disparity, understanding mechanisms to foster life satisfaction may be helpful for intervention and counseling contexts. Three research questions were considered: 1) what academic supports are important for multiracial students, 2) how do academic supports relate to academic self-efficacy, and is this relationship moderated by independence and interdependence, and 3) how do these variables relate to life satisfaction?

Method: A dataset including the relevant variables for students in the USA who identified as multiracial (N = 208) was analyzed. A factor analysis was used to better understand academic supports. Two regression models were used to assess how different forms of support relate to academic self-efficacy and life satisfaction.

Results: Two factors of academic support were identified, accounting for 62% of the variance in the data: mentor/instructor support and friends/family support. Using a regression model, independence ($\beta = 0.238$, $p < .001$), mentor/instructor support ($\beta = 0.193$, $p = .021$) and friend/family support ($\beta = 0.160$, $p = .048$) all significantly predicted academic self-efficacy, but neither independence nor interdependence moderated the relationships. Rather, independence and interdependence related to life satisfaction. Only friends/family support significantly predicted satisfaction with life ($t = 3.126$, $p = 0.002$).

Conclusions: The data lend to a better understanding of academic self-efficacy and life satisfaction among multiracial Americans. Notably, the two forms of academic supports had different relationships with life satisfaction and career self-efficacy, which has implications for vocational counseling.

Abstract 585

PROACTIVE PATHWAYS: AN INTEGRATIVE THEORETICAL MODEL OF FUTURE-ORIENTED COPING

Tian L.*

University of Northern Colorado ~ Evans ~ United States of America

Future-oriented coping—the proactive process of preventing, preparing for, or mitigating potential stressors before they occur (Aspinwall & Taylor, 1997)—is a core human capacity with critical implications for psychological well-being in today's era of global uncertainty. Encompassing prediction, mental simulation, and preemptive action, this capacity enables individuals to conserve resources, offset potential losses, and pursue desired goals (Bruininks & Malle, 2005; Hobfoll, 1989; Schwarzer & Knoll, 2003).

This presentation introduces a stressor-centric model of future-oriented coping that addresses theoretical gaps in existing frameworks. The model outlines a three-phase process: Identification/Activation, Decision-making, and Action/Maintenance. At the heart of the Decision-Making phase are two central tasks: (a) making a binary decision about whether to engage in future-oriented coping, based on appraisal of five abstract stress characteristics: perceived importance, temporal proximity, clarity, likelihood of occurrence, and required resources; and (b) selecting specific future-oriented coping strategies tailored to a given stressor. During the Action/Maintenance phrase, we propose that four sources of indirect feedback---past experience, feedback from the coping effort itself, external guidance, and verbal encouragement---shape how individuals sustain or modify their coping efforts over time. The overall process is further moderated by contextual factors, including future-oriented thinking, current stress levels, perceived control, and emotional states. The outcomes of future-oriented coping are conceptualized across four categories: Non-Evant (stressor prevented), Mitigation (impact reduced), Amplification (coping backfires), and No Impact (external factors override efforts).

By systematically integrating stressor-specific appraisals and decision processes into proactive coping theory, this framework advances understanding of how individuals navigate potential stressors. It provides a conceptual roadmap for developing targeted interventions that strengthen resilience by leveraging the dynamics of stressor anticipation and appraisal.

Abstract 515

FROM INSTITUTIONAL CARE TO ADULT MENTALIZING: EXPLORING THE LONG-TERM IMPACT OF CHILDHOOD ATTACHMENT EXPERIENCES ON MENTALIZATION

Wu P.*

PEIYU WU ~ Taipei ~ Taiwan

Purpose:
This study investigates the long-term influence of childhood attachment experiences within institutional care settings on the development of mentalization in later life.
Method:
Utilizing a cross-sequence research model, we recruited three groups of participants representing distinct care trajectories: (A) children aged 8–12 within six months of entering care, (B) adolescents aged 12–18 with over five years of institutional placement, and (C) care leavers aged 18 and above. Data collection combined quantitative assessments—including the Wechsler Intelligence Scales, Thematic Apperception Test, Reflective Function Questionnaire (RFQ-54), and mental health inventories—with qualitative semi-structured interviews informed by the Child and Adult Attachment Interviews. Participants were followed at baseline, six months, and one year, with monthly diary entries documenting stress events and self-rated mentalizing and psychological well-being.
Results:
Preliminary findings are expected to reveal distinctive mentalization profiles across groups, shaped by early attachment quality, duration of institutional care, and transitions to independent living. It is anticipated that stable, sensitive caregiving within institutional settings may buffer against deficits in reflective functioning, whereas inconsistent caregiving and disrupted familial ties may exacerbate emotional regulation challenges and interpersonal difficulties. Longitudinal analyses will explore trajectories of mentalizing capacity and psychosocial adaptation, integrating quantitative changes with narrative accounts of self-perception, emotional experience, and relational patterns.
Conclusions:
This research contributes to understanding how early relational environments influence reflective functioning into adulthood, with implications for designing attachment-informed interventions in residential care and post-care support services. The integration of developmental, clinical, and social perspectives aims to inform policy and practice, ultimately promoting resilience and mental health among individuals with institutional care histories.

Abstract 514

MENTALIZATION CHARACTERISTICS IN DRUG-ADDICTED ADOLESCENTS ACROSS RECOVERY STAGES: FINDINGS FROM A TAIWANESE LONGITUDINAL STUDY

Wu P.*

PEIYU WU ~ Taipei ~ Taiwan

Introduction:
Substance use disorder in adolescence is a pressing public health concern linked to developmental trauma, affective dysregulation, and social marginalization. Emerging research identifies deficits in mentalization—the capacity to understand oneself and others in terms of intentional mental states—as a key psychological vulnerability in youth addiction.
Purpose:
This study aimed to explore the mentalization characteristics of drug-addicted adolescents and how these features evolve throughout different stages of recovery within therapeutic communities.
Method:
A mixed-methods longitudinal design was used, involving 20 participants aged 14–20 residing in a residential drug treatment program. Quantitative assessments included the Reflective Functioning Questionnaire (RFQ-54), Adverse Childhood Experiences Questionnaire (ACE-IQ), and the Self-Affliction Tendency Scale (SATS). In-depth semi-structured interviews were conducted at three time points (entry, 6 months, and 12 months) to track changes in mentalization, attachment, and narrative reconstruction.
Results:
Findings revealed that participants exhibited high uncertainty and low reflective functioning at intake, often associated with fragmented self-concept, emotional dysregulation, and interpersonal distrust. Over time, especially among those with stable engagement in therapeutic relationships, significant improvements were observed in emotional awareness, impulse control, and perspective-taking. Notably, recovery was mediated by enhanced affect regulation and the capacity to mentalize distressing experiences, supporting the inclusion of mentalization-based treatment strategies in adolescent rehabilitation settings.
Conclusions:
This study highlights mentalization as both a vulnerability and a developmental target in adolescent addiction recovery. It provides empirical support for integrating trauma-informed, mentalization-based interventions within youth treatment systems to promote sustainable psychological recovery and relational resilience.

Abstract 827

TOWARD A HEALTHY AND JUST ENVIRONMENT: PSYCHOLOGICAL AND STRUCTURAL INTERVENTIONS FOR MIGRANT WORKER WELL-BEING

Wu Y.*, Chen S.

National Tsing Hua University ~ Taipei ~ Taiwan

In recent decades, global migration has become both more extensive and more complex, involving tens to hundreds of millions of people who cross international (and often internal) borders in search of employment, safety, stability, or opportunity. Migrant workers—those who relocate for primarily economic reasons and take up employment in a country or region other than their place of origin—constitute a significant portion of the global migrant population. However, empirical evidence points to elevated risks of depressive, anxiety, and stress-related symptoms among migrant workers globally. For example, a recent meta-analysis of studies from 2015 to 2021 across 17 countries found prevalence estimates of depression (38.99%) and anxiety (27.31%) among migrant workers, with a variety of occupational, environmental, social, and individual risk factors contributing. Thus, this study aims to understand how government and mental health professionals can reach out and provide culturally adaptive services for migrant workers to maintain or restore their psychological well-being.

This research project is conducted based on action study. As we carried out our mental health services plan for 500 migrant workers, we collected quantitative and qualitative data through interviewing 10 service providers and observing the process of mental health services. Based on the our findings, we made some suggestions for future mental health services plan for migrant workers. For examples, with some helping skills training, immigrants from similar countries can play a crucial role in connecting migrant workers and local mental health professionals. Mental health outreach programs are more acceptable by migrant workers especially when it includes their interests like photography and cooking activities. In addition, legal and financial professionals should also be included in the mental health services provider team. Other suggestions for modifying mental health services plan will be presented in presentation.

Abstract 586

A STUDY ON THE COUNSELING PROCESS AND EFFECTIVENESS OF INTEGRATING TELETHERAPY AND CHATBOTS

Yeh P.*

National Pingtung University ~ Pintung ~ Taiwan

Traditional psychology typically explores the relationships between people. The relationships between humans and robots represent a new type of relational pattern for humanity. In addition to the conventional in-person counseling approach, chatbots are gradually being accepted as a valid counseling practice. Many chatbots developed based on psychological counseling theories can be incorporated into the services of remote therapists, indicating that teletherapy and chatbots are gradually being integrated and applied together. This study aimed to understand the effects of chatbot usage on clients' depression, anxiety, working alliance, and technology acceptance in the teletherapy process. This study recruited 15 therapists, who administered four 50-minute teletherapy sessions on 30 clients. Pre- and post-tests on depression, anxiety, working alliance, and technology acceptance scales were employed to statistically analyze the effects of integrating teletherapy and chatbots. In addition, the therapists were interviewed to understand what preparations were made before integrating chatbots into psychological counseling and what the process of chatbot-assisted counseling entailed. The research results revealed that counseling outcomes exhibited no gender or age differences, and that the differences between pre- and post-test scores on depression, anxiety, working alliance, and technology acceptance were only marginally significant. Moreover, the clients exhibited lower levels of depression and anxiety. It is speculated that the small sample size may have made it difficult to achieve statistically significant results, and limitations on the number of counseling and chatbot usage sessions may also have affected the outcomes. Comparing the results of the thematic analysis of the qualitative interview transcripts revealed that clients in this study used Wysa for relaxation training and stress relief, and also used it to discuss their personal concerns and thereby alleviate depression. They maintained a positive and accepting attitude toward chatbot-assisted counseling. It is recommended that future research and psychological counseling practices take these findings into consideration.

Abstract 459

PSYCHOLOGISTS' EXPERIENCES WITH THE WYSA CHATBOT APP AND A COMPARISON OF DIFFERENCES BY THEORETICAL ORIENTATIO

Yeh P.*

National Pingtung University ~ Pingtung ~ Taiwan

An increasing number of chatbot mobile applications have been developed based on psychological counseling theories. However, accumulating sufficient user knowledge remains essential for providing practitioners with concrete application principles and guidance. Understanding more local user experiences is also crucial for achieving comprehensive integration with psychological counseling in the future. Taking into account factors such as empirical research support, privacy and security, anonymity, cost-free access, and accessibility, this study explored psychologists' experiences with the Wysa chatbot and compared the effects of its use across psychologists with different theoretical orientations. This study recruited 40 psychologists as research participants, comprising 20 with a cognitive behavioral theoretical orientation and 20 with a non-cognitive behavioral theoretical orientation. In terms of research design, the quantitative component adopted an experimental method, with the use of Wysa eight times as the intervention. Pre- and post-tests were conducted using four scales—anxiety, depression, working alliance, and technology acceptance—to collect quantitative data, which were analyzed using t-tests and analysis of covariance. The qualitative data collected included interview transcripts and screenshots of the Wysa usage process, and were analyzed using thematic analysis. The research findings revealed that, regardless of whether the psychologists were oriented toward cognitive behavioral therapy, using Wysa significantly reduced anxiety and depression. Moreover, in the technology acceptance scale, significant differences were obsreved between cognitive behavioral therapy-oriented and non-cognitive behavioral therapy-oriented psychologists in both working alliance and technology acceptance. These findings offer a reference for future practice, AI-related curricula in professional training, and related research.

INNOVATIVE MODELS OF TRAINING IN INTEGRATED HEALTH CARE

Friday 24 July 2026 from 08:00 to 09:30

(F-Spadolini)

James Bray (University of Houston College of Medicin), Chair and Presenter

This symposium will discuss innovative models of training that psychologists have developed to provide integrated health care. Integrated health care addresses WHO initiatives for universal mental health care and psychologists have played key roles in designing and implementing these programs. Training to work in integrated healthcare requires specialized skills and knowledge not found in traditional psychology training programs. Current research indicates massive hidden costs to society from mental and behavioural health problems, both economically and in terms of impact on health, wellbeing and relationships. In addition, people with mental health problems often have other chronic medical diseases that increase the burden of the disease and decrease the success in treating them. Evidence-based biopsychosocial approaches, including psychological and lifestyle-factor interventions, are available that empower people and ensure more positive health outcomes. This symposium will discuss programs and innovative methods for training to practice and improve practice in integrated healthcare settings.

Abstract 3320

INTERNATIONAL PERSPECTIVES ON TRAINING PSYCHOLOGISTS FOR PRIMARY AND INTEGRATED HEALTH CARE

Bray J.*

University of Houston College of Medicine ~ Houston ~ United States of America

Integrated health care and primary care psychology are exciting new areas for the profession. In the U.S., primary care medical providers treat over 70 percent of mental health and substance use problems, without assistance from psychologists or any other mental health providers. The opportunities in these areas of practice necessitate additional knowledge of primary care and different skills in caring for primary care patients. This presentation will discuss (1) the present status of psychologists working in integrated and primary care; (2) training opportunities in integrated and primary care in private and public settings; (3) the use of technology and electronic health records in primary care practice; (4) future challenges in developing integrated health care systems and training models for the future of psychology practice.

Abstract 3322

THE CARDINAL FEATURES OF AN INTERNAL COACHING PROGRAM FOR PHYSICIANS AT AN ACADEMIC HEALTH CENTER

Mcdaniel S.*, Decaporale L.

University of Rochester College of Medicine ~ Rochester ~ United States of America

This talk will describe the cardinal features of an internal coaching program for physicians at University of Rochester Medicine in Rochester NY, USA. The program has been unusually successful in its results with individuals, institutional uptake, and shifts in institutional culture. It focuses on communication, professionalism, and leadership development. An early pilot study showed the approach distinguishes between physicians with high patient satisfaction scores from those with low. It also received high scores from the physicians for its usefulness. Our coaching program is individualized and involves direct observation and constructive feedback, with a broad and deep systemic approach. After 12 years of increasing success and demand, we worked to describe the essential elements of the program. Working for two years with two senior, accomplished scholars in academic medicine (a psychologist and a physician). Through iterative conversations, we explored the program to make explicit what makes it work well for those within our health center and describe the cardinal features that make it so for others who wish to implement an effective program in their own institution adapted to their own system and context. This talk will articulate the program's systemic approach and cardinal features and place these features in a broader context. We also will describe its benefits to the individual and the institution, the enabling properties of our institutional home, and suggestions for its fit, scalability, and exportability.

Abstract 3323

HEALTH SERVICE PSYCHOLOGY SUPERVISION WITHIN A GLOBAL CONTEXT: CANADIAN, AMERICAN, AUSTRALIAN, AND IRISH SUPERVISION GUIDELINES

Malone J.*

University of Alberta Educational Psychology ~ Saint Paul ~ Canada

Supervision for applied practice enhances the development of health service psychologists across career lifespan. This presentation compares and contrasts clinical supervision guidelines for four jurisdictions seeking to identify key tenets and areas for ongoing consideration for lifelong career development in psychological practice. Supervision that is competent, regulated, supported, and that occurs over the duration of our professional careers serves our profession and those we serve as practitioners.

Abstract 3324

EMBEDDING LIVED EXPERIENCE IN PSYCHOLOGY EDUCATION: RETHINKING CURRICULUM FOR INTEGRATED MENTAL HEALTH CARE

Gullifer J.*, Johnston K.

Monash University ~ Clayton ~ Australia

Integrated care recognises the importance of addressing the full spectrum of an individual's health and wellbeing needs in collaboration with the person, their carers, and family. Central to emerging policy directions and community practice is the involvement of 'experts through lived and living experience' working alongside interprofessional teams. These partnerships highlight the value of experiential knowledge in shaping responsive and person-centred care. Despite this, psychology education has been slow to meaningfully include lived experience voices in teaching and curriculum design. Integrating lived experience into psychology training can promote a more comprehensive understanding of mental health, challenge stigma, and equip future professionals to work collaboratively and respectfully with those who bring expertise through experience. This presentation explores a series of initiatives designed to embed lived and living experience across undergraduate psychology curricula, guided by the FlipCurric Framework. These include co-designed learning outcomes and assessments, inclusion of peer workers and lived experience narratives in teaching content, collaboration with lived experience agencies for unit review, and curriculum tasks grounded in real-world insights. We also highlight a School-wide initiative that partners with culturally diverse organisations to support student development in cultural safety and to challenge dominant Eurocentric perspectives in psychology. Together, these efforts model authentic partnership, support inclusive practice, and prepare students for integrated care environments that value both professional and lived expertise.

Abstract 3325

SUPPORTING NEW PARENTS: HOME VISITORS ARE BOOTS ON THE GROUND

Prescott D.*[1], Ruddy N.[2]

[1]Hampden Psychological Consultation, PLLC ~ Hampden ~ United States of America, [2]University of Maine-Orono ~ Orono ~ United States of America

This presentation will share how home visitors in Maine in the United States were instructed by a rural practitioner and faculty educator on how to conduct a mental health screening to assess the physical, emotional, and social well-being of pregnant and postpartum individuals. The session will cover how to use screening tools, as well as observation and skilled conversation, to collect relevant health information, recognize potential risks, identify when families may need additional support, and consider strategies for discussing concerns with families. Key considerations such as family medical and mental health history, current symptoms, nutrition, safety, and access to care were discussed. The training highlighted respectful and responsive communication, consideration of different life experiences and personal beliefs. It aimed to equip home visitors with the skills to promote healthy pregnancies, support postpartum recovery, and connect families with appropriate resources and services. Emphasis was placed on ensuring adequate personal self-care for home visitors.

17 - Division 17: Professional Psychology

INNOVATIVE MODELS AND METHODS IN INTEGRATED HEALTH CARE PRACTICE

Friday 24 July 2026 from 09:30 to 11:00

(F-Spadolini)

Robyn Vines (School of Medicine, Western Sydney Unive), Chair and Presenter
James Bray (University of Houston College of Medicin), Co-Chair

This symposium will discuss innovative models and methods of practice that psychologists have developed to provide integrated health care. Integrated health care addresses WHO initiatives for universal mental health care and psychologists have played key roles in designing and implementing these programs. Current research indicates massive hidden costs to society from mental and behavioural health problems, both economically and in terms of impact on health, well-being and relationships. In addition, people with mental health problems often have other chronic medical diseases that increase the burden of the disease and decrease the success in treating them. Evidence-based biopsychosocial approaches, including psychological and lifestyle-factor interventions, are available that empower people and ensure more positive health outcomes. Many mental health conditions can now be treated at relatively low cost, yet treatment coverage remains very low. Huge cost savings can be made in medical and pharmaceutical costs, if psychological treatments are provided in team-based primary and integrated health care settings. This symposium will discuss programs and innovative methods that increase access to care.

Abstract 3305

THE ROLE OF PSYCHOLOGY IN EUROPEAN INTEGRATED HEALTHCARE

Salgado M.[2], Leader J.F.*[1]

[1]University College Dublin ~ Dublin ~ Ireland, [2]~ buenos aires ~ Argentina

Integrated healthcare has emerged as a key approach to addressing the complex and varied needs of patients across Europe. Within psychology, integration with primary care, psychiatry, social services, and community-based supports offers opportunities to improve both access to mental health services and the quality of care provided. This presentation explores the current state of integrated healthcare in European psychology, with a focus on models of collaboration, barriers to implementation, and emerging best practices.

Drawing on recent policy initiatives and empirical findings, the paper examines how integrated psychological services have been embedded in diverse healthcare systems, from countries with long-established national health services to those that remain fragmented. Particular attention is given to the role of social determinants, interdisciplinary teamwork, digitalisation, and the importance of culturally sensitive approaches in diverse populations. Challenges such as funding constraints, workforce shortages, and varying levels of professional recognition for psychologists are considered in relation to their impact on sustainability and scalability.

The presentation also highlights projects that demonstrate how psychologists contribute to integrated care pathways for chronic illness, preventive health, and early intervention in mental health. These case studies illustrate the added value of psychological expertise in improving population health, reducing hospitalisations, and supporting resilience within communities.

It is argued that fully realising the potential of integrated healthcare in psychology requires stronger cross-border collaboration, harmonised training standards, and systematic evaluation frameworks at the European level. By addressing these priorities, integrated healthcare can become a cornerstone of equitable, patient-centred care across Europe, ensuring that psychological services are not peripheral but central to health and well-being.

Abstract 3306

PRIMARY CARE PSYCHOLOGY – PROVISION OF A WHOLISTIC MODEL OF MENTAL AND GENERAL HEALTH CARE 'WHERE IT MATTERS'

Vines R.*

School of Medicine, Western Sydney University ~ Bathurst ~ Australia

In much of the western world, distress and unhappiness are increasingly interpreted and diagnosed as 'mental illness'. A biomedical paradigm still prevails, in which medication is often the first and only treatment of choice. Funding models require formal medical diagnosis as the basis of treatment, with distressed people's problems being conceptualised as illness. This ignores or minimises the complex psychosocial determinants of health and the crucial impact of lifestyle factors on health and wellbeing. In Australia antidepressant use is significant and increasing, with one in seven people using them (i.e. 14%; ~3.9 million people). Statistics indicate that women are prescribed at 1.5 times the rate of men, older adults (65+) are twice as likely to be prescribed and ~26% of those aged 75+ taking them. This represents one of the highest prescribing rates in the world, trailing only Iceland and the USA.

Primary care psychology provides an Integrated, multi-disciplinary model of care involving a collaborative approach where doctors and psychologists work together 'in situ'. Facilitating optimal, multi-faceted treatment for patients' frequently comorbid disorders, it enables early intervention and prevention in the general practice setting. By providing 'the right treatment, at the right time, in the right place', it avoids stigmatization of those seeking and accessing mental health interventions. It highlights the necessity of breaking down the counter-productive 'siloes of care' prevalent in the western world, which result in fragmentation of treatment and sub-optimal outcomes. A simple, accessible and effective way of treating complex presentations will be presented as an alternative.

Abstract 3307

ENHANCING INTEGRATED HEALTHCARE WITH AI AND DIGITAL HEALTH APPS

Bray J.*

University of Houston College of Medicine ~ Houston ~ United States of America

Artificial intelligence and use of digital health apps is expanding rapidly in integrated healthcare. The apps range from virtual counselors based on evidence-based practices, intelligent conversational agents (e.g., chatbots) to virtual reality apps to aid in the treatment of mental health and health problems. This presentation will discuss the state of the art of these apps, how they can be implemented into clinical practice and limitations to consider in their use. In addition, the session will discuss the potential advantages for increasing access to mental and behavioral health care. In the last ten years, both the emergence and utilization of artificial intelligence (AI) tools such as intelligent virtual agents (IVAs) and nonembodied conversational agents (CAs), including chatbots, as well as their use in behavioral and mental healthcare, has rapidly expanded (Holohan & Fiske, 2021). Artificial intelligence (AI) is a rapidly growing field that aims to replicate human cognitive abilities such as perception, reasoning, and problem-solving (Abd-alrazaq et al., 2019). It has garnered significant attention in clinical applications and extends beyond conventional statistical methods to extract relevant information that supports decision-making and research (Abd-alrazaq et al., 2019). More specifically, we are observing these systems administer treatment modalities to patients. The integration of AI technology advancement in health care has paved the way for developers to create new and innovative applications to deliver health care resources. Such applications are now made to execute more advanced, diagnostic, analytical, and therapeutic methods as well, which were previously only available from highly qualified healthcare experts. We will focus on the approaches of what powers AI and the implementation of AI in mental health care and how its advancements garnered the potential of implementation of virtual Screening and Brief Intervention for substance use problems. Dr. Bray will discuss applications and limitations to consider in their use.

Abstract 3308

PARTNERING WITH PATIENTS TO DESIGN AND IMPLEMENT CULTURALLY RESPONSIVE, HOSPITAL-BASED PSYCHOSOCIAL INTERVENTIONS

Kaslow N.*, Dunn S.

Emory University ~ Atlanta ~ United States of America

Culturally responsive psychosocial interventions in hospital settings are essential for addressing the diverse needs of patients and promoting equitable behavioral health outcomes. This presentation explores a patient-centered approach to developing and implementing hospital-based psychosocial interventions that are both culturally attuned and clinically effective. It will draw on principles of participatory design and community-based engagement and over 30 years of experience with the Nia Project, a program for Black women who have histories of interpersonal violence and suicide attempts. Through the Nia Project, Dr. Kaslow and colleagues have been actively involving patients as co-creators in the intervention process—from initial conceptualization through implementation and evaluation.

The presentation will outline strategies for fostering meaningful patient engagement, including focus groups, patient community meetings, and community advisory boards that reflect the cultural backgrounds and lived experiences of the patients to be served. Case examples will be highlighted in which patient input led to significant adaptations in intervention content, delivery methods, and provider training, resulting in improved patient satisfaction, trust, and clinical outcomes.

Special attention will be given to the role of cultural humility among healthcare providers and the integration of culturally grounded practices. The presentation also will address institutional barriers to culturally responsive care and offer practical recommendations for embedding these interventions within healthcare systems.

By centering the voices of patients and recognizing the cultural contexts that shape their experiences, this approach not only enhances the relevance and effectiveness of psychosocial interventions but also fosters a more inclusive and compassionate healthcare environment. Attendees will leave with actionable tools and frameworks to engage patients in the creation, implementation, and evaluation of culturally responsive care and to advocate for systemic change within their healthcare systems.

17 - Division 17: Professional Psychology

PSYCHOLOGY IN EUROPE: STRENGTHENING POLICY, PROFESSIONAL STANDARDS, AND SOCIAL IMPACT IN A CHANGING WORLD

Friday 24 July 2026 from 11:30 to 13:00

(F-Spadolini)

John Francis Leader (European Federation of Psychologists' As), Chair and Discussant

Psychology in Europe is at a pivotal moment, shaped by shifting societal demands, rapid digitalisation, and evolving health policy frameworks.

The European Federation of Psychologists' Associations (EFPA), representing over 400,000 psychologists across 37 countries, plays a central role in aligning professional standards, policy engagement, and organisational transformation.

Mental health has risen on the European Union (EU) agenda, with initiatives emphasising prevention, promotion, and integration across sectors. Psychology's contribution to collective well-being requires stronger recognition of its systemic and ecological dimensions, including considering digitalisation as a social determinant of health.

This is an opportunity for psychologists to inform EU policymaking, where they remain underrepresented despite offering crucial expertise for evidence-based policy and practice.

Professional development is equally critical. EuroPsy provides a common framework for competence, ethics, and education in psychology. Recent revisions to EuroPsy standards and the Metacode of Ethics reflect the profession's adaptation to diverse contexts and emerging fields of practice.

Organisational transformation within EFPA and amongst its members is vital to amplify advocacy, strengthen participatory governance, and equip future generations of psychologists to anticipate and shape societal change.

In this session EFPA leadership will share the Federation's active work in these areas, which underline psychology's unique capacity to advance sustainable health and well-being across Europe.

Abstract 3561

PSYCHOLOGY'S VOICE IN EUROPE: OPPORTUNITIES AND PRIORITIES FOR EU POLICYMAKING

Aparicio I.*

European Federation of Psychologists' Associations (EFPA) ~ Brussels ~ Belgium

The European Union (EU) exerts growing influence on health, education, and social policy, with direct implications for the practice and science of psychology. Yet psychologists remain underrepresented in EU-level debates, risking leaving psychosocial perspectives absent from key legislative and funding frameworks. This gap weakens the visibility and impact of psychology in areas where evidence-based contributions are urgently needed. At the same time, psychology has much to gain: mental health is now firmly on the EU agenda, and the EU provides platforms where collective scientific voices can influence policy directions and support national practices. Psychology, by nature both scientific and societal, is uniquely placed to inform these debates. Speaking with a unified, evidence-based voice allows psychologists to shape European initiatives that protect mental health, advance social well-being, and enhance professional practice across Member States. This contribution will explore why the EU matters for psychology, how engagement at the European level reinforces national efforts, and why it is essential for the discipline to strengthen its presence in EU policymaking.

Abstract 3562

TRENDS AND FUTURE DIRECTIONS IN EUROPEAN MENTAL HEALTH AND DIGITALISATION POLICY

Leader J.F.*

European Federation of Psychologists' Associations (EFPA) ~ Brussels ~ Ireland

European mental health policy is increasingly framed around approaches that are comprehensive, integrative, and responsive to digital transformation. EFPA's Mental Health policy initiatives reflect this by calling for mental health in all policies, a focus on prevention and promotion, and attention to cross-cutting issues such as climate change, crises, workplace wellbeing, and social determinants.

These priorities are consistent with the European Commission's Comprehensive Approach to Mental Health, but it is emphasised that breadth alone is insufficient: integration across member states, sectors, and stakeholders is essential to avoid duplication and inefficiency, and to mobilise the wealth of expertise already present in professional associations, communities, NGOs, and those with lived experience.

The digital dimension of mental health policy requires particular consideration. EFPA's Digitalisation agenda suggests that technology be understood not only as a tool for service delivery, but also as a determinant of wellbeing in its own right. Issues such as algorithmic transparency, online harms, misinformation, digital literacy, and equitable access are shaping how psychological health is experienced in increasingly hybrid environments. Framing these as digital social determinants allows lessons from physical contexts—such as workplace safety, education, and community care—to be transposed into digital and hybrid spaces.

Looking forward, European mental health policy will need to be flexible, resilient, and ethically grounded in order to respond to fast-moving technological and societal change. EFPA advocates that a framework which is both comprehensive, integrative, and cognisant of digital social determinants offers the most sustainable path for supporting population wellbeing across Europe.

Abstract 3563

EUROPSY - RECENT DEVELOPMENTS AND FUTURE PERSPECTIVES

Antoni C.*

European Federation of Psychologists' Associations (EFPA) ~ Brussels ~ Germany

EuroPsy is a common European education and professional standard and certificate for psychologists in 26 countries in Europe. Since its launch 2009, many countries have used EuroPsy to develop academic and professional training programs, to create and adapt legal and professional regulations for the application of psychology by EFPA's full members, and to assess the quality of a psychologist as a professional. EuroPsy Regulations define minimum standards of academic education and supervised practice in specified fields of practice required for independent practice as a psychologist in that field, and more recently based on that for independent practice as a specialist psychologist in that field of practice (Psychotherapy, Work and Organizational Psychology were the first two specialisms). In recent years, these standards and the underlying conceptual competence framework have been revised. The new EuroPsy and EuroPsy Specialist competence framework builds on an adapted cube model, and defines generic functional competences (what a psychologist or a specialist does), generic foundational competences (how a psychologist and specialist psychologist works), and readiness for supervised, independent and advanced or specialized practice as three different stages of professional development. The introduction of Sport Psychology as a further field of practice in EuroPsy and as a specialist degree in 2023, and of the Specialist degree in Clinical Neuropsychology in 2025, has led to intensified efforts from other disciplines to be acknowledged as a field of practice and as a specialist degree. The requests to differentiate more fields of practice for both EuroPsy and EuroPsy Specialists have raised a number of questions for future developments regarding common or differentiated entry-level competence requirements for the different stages of professional development in the respective fields of practice, the assessment of these competences, and the consequences for psychologists working in these fields and their clients.

Abstract 3565

CHALLENGES AND OPPORTUNITIES FOR THE EUROPEAN PSYCHOLOGIST PROFESSION

Tunold O.*

European Federation of Psychologists' Associations (EFPA) ~ Brussels ~ Norway

Since its inception in 1981, EFPA (European Federation of Psychologists' Associations) is dedicated to developing psychology, contribute to society, and serve psychologists.
The EuroPsy certificate is well established in 26 countries. It also defines the professional standard of psychologists to aid legislators and educational institutions. Professional ethics is an integral part of psychological practice. Both the EuroPsy and the Metacode of Ethics have recently been revised and updated to the ever-changing conditions of professional practice.
The practice of psychologists in Europe is one of considerable diversity. Despite the popular stereotype of the psychologist as a provider of individual treatment of mental challenges, psychologists are found in more than 30 well established fields of practice. This professional diversity represents both a strength and a limitation in the further development of the profession. A strength, because the diversity lays the ground for valuable solutions to society's challenges. A weakness, because the stereotype of the clinical psychologist hampers recognition of the profession's potential.
The psychologist community consistently experience that governments turn to political scientists, lawyers, technologists, medical doctors and behavioural economists in search for solutions, but often fail to include psychologists in the selection of experts.
The combined psychologist community invests heavily in improving and refining professional competence. EuroPsy is a very important manifestation of that. Much less effort is directed to developing demand for this competence. The 'product' is continuously refined, but the market and marketing efforts are neglected.
EFPA's aim is to nurture the recognition of psychologists as an instrument to counter many of society's unsolved problems. This requires knowledge of how the profession is perceived, and perceived differently, throughout Europe. EFPA strives to possess a reliable overview of our profession, which goes beyond academic education and practical training, to include what the profession actually does.

Abstract 3566

PSYCHOLOGY AND SOCIAL INTERVENTIONS. STRENGTH AND CHALLENGE OF ONE HEALTH APPROACH

Arcidiacono C.*

European Federation of Psychologists' Associations (EFPA) ~ Brussels ~ Italy

Psychology in a multidisciplinary perspective and for collective social interventions lacks consideration both within the discipline and in interprofessional research and intervention settings. In fact, there is a lack of recognition of how this discipline has specific objectives, methods, and know-how to promote collective well-being. Furthermore, there is also a lack of awareness of how building individual well-being requires a global, systemic, and ecological approach (Prilleltensky, 2008). Consequently, there is an urgent need, assuming this perspective, to consider contextual variables also in individual focused interventions. Psychology has methods and procedures allowing people (at individual and collective level) to give voice to their own needs, to intervene in social interaction and on social determinants affecting the individual and collective life. Its knowledge allows individuals and the whole society to better pursue collective and individual goals in the social arena. Moreover, it is the important to be aware of social factors such as democracy, justice and fairness as determinants of individual and societal wellbeing. Infact, social and organizational variables are key elements in prioritizing intervention and promoting well-being through a value driven approach.

In this same vein, WHO (2022) introduced the One health approach to prevent, predict, detect, and respond to health threats while contributing to sustainable development in an ecological approach.

An Italian best practice promoted in 2025 "Right to Well-Being" is a grassroots legislative proposal for a public, free psychological support network for all, aimed at integrating psychologists into social services and local administrations to promote local health and well-being initiatives.

It is to know that Efpa too, recently recognized in Europsy Community Psychology for social intervention as an explicit field of practice; that will strengthen the whole psychology, consolidating the role of this discipline in wider spaces of research and intervention.

Abstract 3564

STRATEGIC ORGANISATIONAL DEVELOPMENT AND CHANGE IN EUROPEAN PROFESSIONAL ASSOCIATIONS: FUTURE-ORIENTED PERSPECTIVES FOR TRANSFORMATIONAL CHANGE IN PSYCHOLOGY AND BEYOND

Ramalho S.*

European Federation of Psychologists' Associations (EFPA) ~ Brussels ~ Portugal

Strategic organisational development is a key driver of professional, organisational, societal, and policy impact. EFPA (European Federation of Psychologists' Associations), representing over 400,000 psychologists across 37 countries, offers a unique platform to explore how transformation and change can strengthen our collective capacity to act, both regionally and globally.

The discussion will outline how professional organisations can remain fit for purpose in times of uncertainty and complexity. It will examine how to align advocacy efforts and policy strategies with emerging societal needs, demonstrating how associations can effectively influence public mental health policies, digitalisation and AI ethics, social inclusion agendas, emergency preparedness, and democratic resilience — at EU, national, and local levels.

A future-oriented perspective will be presented, describing a vision for agile, evidence-based, and participatory organisations capable of anticipating change rather than merely reacting to it. The presentation will highlight the importance of inclusive governance models, transparent decision-making processes, and meaningful member engagement. It will also emphasise strategies for building organisational capacity through leadership development, project implementation and knowledge exchange, ensuring that future generations of psychologists are empowered to contribute.

Participants will gain insight into actionable strategies to design and implement transformation in their own contexts, strengthening the role of psychology in addressing pressing societal challenges and shaping the future of our profession.

FINDING MY FOOTING: NAVIGATING DUAL IDENTITIES

Eugene D.*

New York University - Abu Dhabi ~ Al Saadiyat, Abu Dhabi ~ United Arab Emirates

This presentation, which focused on experiences at NYU Abu Dhabi campus, examines the critical need for culturally responsive college counseling, particularly for students navigating complex racial dynamics in academic settings. Traditional psychoanalytic theories often overlook the profound impact of social, political, and cultural realities on psychological development, an omission that is especially significant for students of color (Gump, 2010). The academic environment, while a place of growth, can also be a site of psychological distress, where racial dynamics are frequently misunderstood or ignored.

Students from marginalized racial groups, especially Black students, often face a unique psychological paradox: a state of being "hypervisible and invisible" (Karakashian-Jones, 2025). This duality manifests in various forms of psychological strain. It includes the erosion of cultural connectedness and the persistent need for hyper-vigilance against potential threats or bias. These students may engage in masking their true identities, leading to a profound loss of identity and a sense of internalized inferiority. The effects of unconscious bias and excessive scrutiny can lead to feelings of isolation, ostracism, and powerlessness, creating significant barriers to their academic and personal success.

To effectively support these students, college counselors must provide safe and confidential spaces where students can openly process their experiences with racism and microaggressions. This requires a shift from a colorblind approach to one that actively acknowledges and validates racial identity. It is equally essential for counselors to engage in deep self-reflection, becoming more aware of their own biases that may unintentionally contribute to the perpetuation of cultural insensitivity. By integrating an understanding of these complex psycho-social realities, college counseling can become a more equitable and supportive practice for all students.

A CULTURALLY GROUNDED MULTIDIMENSIONAL WELL-BEING SCALE FOR INDONESIAN EMPLOYEES: DEVELOPMENT AND VALIDATION

Anindyajati M.*[2], Dewi M.S.[1]

[1]Syarif Hidayatullah State Islamic University Jakarta ~ Jakarta ~ Indonesia, [2]Faculty of Psychology, Universitas Esa Unggul, Jakarta, Indonesia

The concept of employee well-being is increasingly recognized as a critical factor in organizational sustainability and performance. However, most existing measurement instruments are derived from Western contexts and and may not adequately capture the collectivist cultural values that characterize Indonesia. This study aimed to develop and validate a culturally grounded well-being instrument specifically designed for Indonesian employees.

Data were collected from 220 employees aged 23–55 years across major cities in Java, Indonesia. The instrument comprised five dimensions: financial, physical, social, psychological, and spiritual well-being. Item generation began with an elicitation process involving 30 respondents to ensure cultural relevance, resulting in 45 items (nine per dimension). Confirmatory Factor Analysis (CFA) using Lisrel 8.80 demonstrated satisfactory model fit for each dimension ($\chi^2/df < 3$, $p > .05$, RMSEA < .05, CFI and TLI > .90). All items within the financial, physical, and spiritual dimensions were valid ($t > 1.96$), while three social items and one psychological item were excluded due to low factor loadings. Principal Component Analysis (PCA) indicated that psychological well-being contributed most strongly to overall well-being ($\lambda = 0.935$), followed by physical ($\lambda = 0.788$), social ($\lambda = 0.783$), financial ($\lambda = 0.719$), and spiritual well-being ($\lambda = 0.546$).

Contrary to the common assumption that social and spiritual factors serve as the primary determinants of Indonesian well-being, the findings suggest that psychological well-being—encompassing positive affect, life satisfaction, purpose in life, and adaptive emotion regulation—plays a more central role among Indonesian employees. This study contributes to cross-cultural well-being research by providing empirical evidence that psychological rather than social and spiritual dimensions may underlie well-being in collectivist contexts and introduces a psychometrically robust instrument for assessing employee well-being in Indonesia.

PERSONAL AND PROFESSIONAL PROJECTS OF WORKERS AGED 45 AND OVER

Cournoyer L.*[1], Lachance L.[1], Fournier G.[2], Richer L.[3]

[1]Université du Québec à Montréal ~ Montréal ~ Canada, [2]Université Laval ~ Québec ~ Canada, [3]Université du Québec à Chicoutimi ~ Chicoutimi ~ Canada

Introduction. The aging workforce is increasing the presence of workers aged 45 and over, whose personal and professional projects are redefined throughout the life course. This evolution, far from uniform, varies according to gender and future time perspective, two dimensions rarely studied together. Yet, considering their interrelation appears essential for adapting public policies, reducing gender inequalities, supporting employment retention, and effectively accompanying career transitions. Aim. This qualitative study explores how Quebec adults (Canada) envision their personal and professional projects after age 45 to better understand their needs, aspirations, and resources mobilized to combine personal fulfillment with professional involvement. Method. Semi-structured interviews were conducted with 107 participants (45 men, 62 women) aged 45 and over, from diverse socioprofessional backgrounds, divided into three groups: 45–54 years (n=48), 55–64 years (n=41), and 65 years and over (n=18). Results. A thematic identified three main categories of projects. Intrapersonal projects focus on personal development, health, and the pursuit of serenity. Interpersonal projects emphasize family and friendship relationships as well as transmission and mentoring activities. Finally, extrapersonal projects reflect a desire for social contribution and creative expression. Professionally, participants highlighted projects aimed at impact, coherence, and legacy, while personal project priorities focused on well-being, balance, and close relationships. Conclusion. The findings show that adults aged 45 and over are rethinking their roles and identities through projects that extend beyond merely remaining in employment. Retirement tends to be viewed as an active reorganization, integrating health, relationships, and social contributions. These findings invite researchers, practitioners, and employers to foster inclusive environments and tailored actions that simultaneously support personal fulfillment and continued work participation in this population.

[1]University of Bologna ~ Bologna ~ Italy, [2]University of Genoa ~ Genoa ~ Italy, [3]University of Turin ~ Turin ~ Italy, [4]University of Rome - La Sapienza ~ Rome ~ Italy, [5]Pegaso University ~ Naples ~ Italy, [6]University of Salento ~ Lecce ~ Italy, [7]University of Campania ~ Caserta ~ Italy, [8]University of Bari ~ Bari ~ Italy, [9]University of Palermo ~ Palermo ~ Italy, [10]University of Parma ~ Parma ~ Italy, [11]Università Cattolica del Sacro Cuore ~ Milan ~ Italy, [12]University of Milano-Bicocca ~ Milan ~ Italy, [13]University of Trento ~ Trento ~ Italy, [14]Kore University of Enna ~ Enna ~ Italy, [15]Università di Catania ~ Catania ~ Italy

Introduction.

Starting from the academic year 2023/2024, Master's Degree programmes in Psychology in Italy were reformed to directly qualify graduates for professional practice upon graduation, without a post-degree examination. A key innovation was also the introduction of a mandatory internship (i.e., the Practical Evaluation Internships, or TPVs), to be completed before graduation as a requirement for professional qualification. In this scenario, the MeMos research group of the Italian Psychological Association developed a research project to investigate the impact of this reform on the training for the psychological profession and the career development of future psychologists.

Objectives.
This ongoing project aims to explore the evolution of key career-related resources and personal characteristics of psychology students throughout their academic path within the reformed programmes. In addition, it examines the experience and impact of the new TPVs.

Method.
As of October 2023, the longitudinal design has involved master's degree students from 12 Italian Universities (representing the first cohort of students enrolled in the new programme). Participants are invited to complete an online questionnaire at three time points (T1 = From October 2023; T2 = From April 2025; T3 = From November 2026). Psychometric scales and open-ended questions are used to assess career resources and competences, as well as the experience of the TPVs. A second cohort has been involved since October 2025.

Results.
As the project is still ongoing, preliminary findings are expected in the coming months.

Limitations.
The self-report approach may constrain a comprehensive understanding of the students' experience within the reformed master's degree programmes.
Implications. This project's findings will provide meaningful insights into how psychology students navigate the new master's degree structure. Such evidence can inform universities, professional associations, policymakers, and other stakeholders on strategies to enhance training and support the career development of future psychologists within this reformed educational framework.

THE MENTAL HEALTH OF PROFESSIONAL MUSICIANS IN BELGIUM

Visée M.*[1], Buisseret F.[2], Denis J.[1]

[1]Mons University ~ Mons ~ Belgium, [2]Ceref – Helha ~ Mons ~ Belgium

Background: Music performance anxiety (MPA) is a common and impairing disorder among musicians, with repercussions on both personal well-being and professional careers.
Objective: The present study examined the mental health of professional musicians in Belgium through a cross-sectional survey.
Method: Ninety-five professional musicians (N = 95) completed a questionnaire consisting of seven standardized tests designed to assess job satisfaction, mental health, musculoskeletal disorders (MSD), music performance anxiety (MPA), and attachment styles.
Results: Findings indicated that professional musicians reported greater psychological vulnerability than normative populations. MPA was positively associated with mental health difficulties, MSD, and insecure attachment (avoidant and anxious). Job satisfaction was negatively associated with MPA, mental health difficulties, and anxious attachment. Multiple regression analysis demonstrated that psychological distress significantly predicted MPA.
Conclusions: MPA is not an isolated phenomenon but reflects broader psychological functioning among musicians. These results highlight the importance of adopting an integrated approach to musicians' health, encompassing both physical and psychological dimensions, beginning at the earliest stages of musical training.

ADOLESCENTS AS ARCHITECTS OF AN INCLUSIVE FUTURE: FROM POTENTIAL TO SOCIAL INNOVATION

Sharma J.*

University of Delhi ~ Delhi ~ India

The presentation will examine how adolescents' potential can be identified and cultivated as a pivotal force for social innovation and global well-being. It will position adolescents not merely as learners but as active change-makers, while outlining strategies to foster their intellectual, emotional, and ethical capacities through role modelling, reflective practice, and mentorship. By envisioning a society where the optimization of human potential is embraced as a collective norm, the session will suggest pathways for reconceptualizing adolescent development not as preparation for competition, but as preparation for equity, compassion, collaboration, and cultural acceptance. The discussion will propose a Four-Layer Adolescent Nurturance Framework, moving from potential toward human excellence.

PREGNANT AND POSTPARTUM WOMEN WITH SUBSTANCE ABUSE PROBLEMS: THE PAMPERRS AND MIRRORS+ PROGRAMS

Bray J.*[1], Zaring--Hinkle B.[2]

[1]University of Houston College of Medicine ~ Houston ~ United States of America, [2]Oklahoma Partnership for School Readiness ~ Oklahoma City ~ United States of America

Background: Pregnant and postpartum women who are homeless and near homeless are a highly vulnerable population, especially when their problems are compounded by substance use. The PAMPERRS and MIRRORS+ programs provided evidence-based mental health treatment, case management, and recovery support for women and children through integrated, trauma-informed care and services, strengthened by a comprehensive and coordinated family systems approach. This paper will describe the programs for women and children and provide evaluation data that demonstrates its effectiveness. Clients participated in an inpatient recovery program. In addition, they received trauma informed care that included evidence-based mental health services, family services, and case management. Clients were assessed at intake, discharge and 6-months after intake on family functioning, recovery capitol, stress, parenting and substance use.

Results: Ninety-three percent of the clients discharged successfully from the program, and substance abuse decreased to 5.6% at follow-up. Over 80% of clients reported that the programs enhanced their recovery treatment experience. We examined individual differences in trends over time with multilevel modeling. Within-person trends over time were modeled in the first level, and individual differences in intercepts and slopes were modeled in the second level. Women reported significant improvements in general family functioning, posttraumatic stress symptoms, reductions in perceived stress and parenting risk. Further, participants increased their recovery capital, improved their parental monitoring, and increased social support over time.

Conclusion: Overall, the two programs met the planned goals and successfully helped the women to decrease use and abuse of alcohol and illicit and prescription drugs; reduce related effects of maternal substance abuse on infants and children; improve mental and physical health of themselves and their children; and, improve family functioning and quality of life.

Abstract 971

PARTNER-SCHEMA STRUCTURES IN RELATIONSHIP DISTRESS AND DEPRESSION

Dozois D.*[1], Hicks O.[1], Murphy G.[1], Ying F.[1], Wilde J.[1], Maxwell J.[2]

[1]University of Western Ontario ~ London, Ontario ~ Canada, [2]McMaster University ~ Hamilton, Ontario ~ Canada

Several scholars have advanced theoretical models to explain the complex associations between depression and romantic relationship distress, with much of this work derived from interpersonal and cognitive clinical conceptualizations. Although decades of research demonstrate reciprocal links between romantic relationship distress and depression, this work is often siloed, tackling this issue from either an interpersonal or cognitive-clinical perspective. Because neither approach alone has sufficient explanatory power, our understanding of how and why these associations unfold is significantly limited. In response to calls for greater integration, we advanced the Dyadic Partner Schema Model (DPSM; Wilde & Dozois, 2019). The DPSM proposes that schemas about oneself and one's partner (in particular, the structure or organization of these schemas) help explain the bidirectional and cyclical associations between depression and relationship problems. This presentation outlines the main tenets of the DPSM and describes research that empirically tested the impact of partner-schema structures using video-mediated recall of conflict discussions, behavioral coding of couple interactions, longitudinal designs, and daily diary methodologies. The results indicate that negative partner-schema structures are associated with poorer relationship adjustment, satisfaction, and commitment in coupled individuals. In romantic dyads, these schemas also relate to maladaptive attributions, greater relationship rumination, and dysfunctional communication behaviours, as assessed by both self-report and observer ratings. Partner schemas are also associated with one's own and one's partner's perceptions of worse relationship quality and depressive symptoms. These associations emerge not only in cross-sectional self-reports, but in-vivo lab discussions and more generalizable day-to-day contexts. The implications of these findings for science and practice are addressed, and directions for future research discussed.

BEYOND THE TEXTBOOK: AI'S IMPACT ON TRAINING MENTAL HEALTH PROFESSIONALS

Labriola M.*, Vanhara A.

Florida Gulf Coast University ~ Fort Myers ~ United States of America

The rise of AI-powered tools presents transformative opportunities for training and educating future mental health practitioners. This presentation will include an innovative model for integrating AI into clinical training and education, offering participants a roadmap to enhance learning and professional practice that includes training and processing clinical concepts. Some key areas explored will include case vignette transcriptions utilizing publicly available large language models (LLMs) with discussions on how to analyze these sources as learning opportunities in the classroom and clinical setting. The use of AI role-play for clinical case practice will also be applied. Exploration and processing of different theoretical interventions for practice will be demonstrated with the integration of AI role-play for practice. Additionally, the use of AI for diagnostic review and case conceptualization will also be integrated as areas to be discussed. Ethics will also be outlined as it relates to processing clinical concerns relating to AI in mental health treatment. This presentation will provide a brief live demonstration and engage participants in the use of integration of AI in training and education.

Abstract 4548

ADAPTING MENTAL HEALTH SERVICES FOR WAR-AFFECTED CHILDREN: ORGANIZATIONAL STRATEGIES AND PROFESSIONAL CHALLENGES

Sydorenko S.*

Kyiv School of Economics ~ Kyiv ~ Ukraine

Introduction.
The full-scale war in Ukraine has transformed the mental health system, particularly adapted to the needs of children who have experienced loss, traumatic events, and forced displacement. This study aims to analyze the experience of founders and leading psychologists of three charitable Ukrainian organizations working in the field of children and adolescents' mental health affected by war. The main focus is on organisational barriers, the impact of a multidisciplinary team, and the specificities of psychological support.
Method.
The research uses a qualitative multiple-case study design. Each participating organization was treated as an individual case, with founders and leading psychologists serving as units of analysis. Information was collected through semi-structured interviews. Data were analyzed using thematic analysis, first within each case and then across cases to identify shared and divergent patterns.
Results.
Thematic analysis revealed several interrelated themes. These include the specifics of working with children in the Ukrainian context, structural and resource barriers to psychological services, and ethical dilemmas when working with traumatized children. Other themes include the role of multidisciplinary collaboration in providing comprehensive services and the strategic decisions made by founders. These decisions focus on adaptation, sustainability, and maintaining the quality of care in crisis conditions.
Conclusions.
Findings highlight that psychological care for war-affected children is shaped not only by clinical knowledge but also by organizational demands, contextual pressures, and ongoing adaptation to rapidly changing conditions. Understanding the experiences of those who design and lead such projects provides valuable insights for improving future interventions, informing training and policy development, and supporting the sustainable development of the mental health sector in war and post-war settings. Moreover, by capturing and analyzing the experience of these organizations, this paper contributes to cross-organizational learning about child mental health support during wartime.

Abstract 1741

VIRTUAL REALITY EXPOSURE THERAPY WITH COGNITIVE BEHAVIORAL THERAPY FOR SOCIAL ANXIETY DISORDER: REPORTING QUALITY OF RANDOMIZED CONTROLLED TRIALS

Wang N.*, Pan J.

Department of Social Work, Hong Kong Baptist University ~ Hong Kong ~ China

Introduction:Social Anxiety Disorder (SAD) is a prevalent and debilitating condition marked by intense fear and avoidance of social situations. While cognitive behavioral therapy (CBT) is effective for the treatment of SAD, its accessibility remains limited. Virtual reality exposure therapy (VRET) integrated with CBT or internet-based CBT (iCBT) offers a promising digital alternative. However, randomized controlled trials (RCTs) in this area show variations in methodological reporting, and the technical descriptions could be enhanced.

Purpose:This study aimed to evaluate the risk of bias and reporting quality of RCTs investigating VRET combined with CBT or iCBT for SAD, and to identify common methodological limitations and integration patterns.

Method:Systematic searches were conducted across five electronic databases from inception to August 4, 2025. Eligible studies were assessed for risk of bias using the Cochrane risk-of-bias tool (RoB 2.0), and for reporting quality using the Consolidated Standards of Reporting Trials for Social and Psychological Interventions (CONSORT-SPI).

Results:From 667 identified records, seven RCTs involving 779 participants were included. Overall adherence to CONSORT-SPI guidelines was 64.1%. Notable reporting deficiencies were observed in allocation concealment (0% reported), randomization sequence generation personnel (0% reported), handling of missing data (28.6%), and documentation of unintended effects (42.9%). Three studies raised some concerns regarding RoB 2.0. VR exposure scenarios ranged from 3 to 9 per RCT, with job interview simulations being the most frequently employed (5 studies). CBT was delivered via digital platforms (web or app) in three studies and face-to-face in four, with session counts ranging from 5 to 10, based mainly on Beck or Clark and Wells models.

Conclusion:Current RCTs of VRET combined with CBT/iCBT for SAD show moderate reporting quality and face methodological challenges, particularly in design transparency and bias control. Future studies should improve protocol transparency,

standardize VR descriptions, and adhere to reporting guidelines to enhance validity and clinical applicability.

ADOLESCENT DEVELOPMENT IN A GLOBAL CONTEXT: HIGH ABILITIES, MENTAL HEALTH, AND SOCIOEMOTIONAL PATHWAYS TOWARD SUSTAINABLE FUTURES

Saturday 25 July 2026 from 09:30 to 11:00

(T-Monumentale)

Sheyla Blumen (Pontifical Catholic University of Peru ~), Chair and Presenter

Adolescents today grow up in contexts marked by inequality, cultural diversity, rapid global change, and unprecedented challenges such as the COVID-19 pandemic. Understanding their developmental pathways requires an interdisciplinary lens that bridges mental health, high abilities, socioemotional functioning, and cultural dynamics. This symposium gathers leading scholars from Latin America and beyond to examine how adolescents' potential and vulnerabilities are shaped by their environments, and how psychology can contribute to policies and practices that promote resilience, equity, and sustainable futures.

Abstract 3822

NURTURING HIGH ABILITIES AND WELL-BEING IN ADOLESCENCE: SOCIOEMOTIONAL AND CULTURAL PATHWAYS TOWARD SUSTAINABLE FUTURES

Blumen S.*

PONTIFICAL CATHOLIC UNIVERSITY OF PERU ~ LIMA ~ Peru

This presentation examines the psychological, socioemotional, and developmental challenges faced by adolescents with high abilities in Latin America within a global framework. Drawing on Gagne's Differentiated Model of Giftedness and Talent and regional evidence, it highlights the risks of under identification, cultural biases, and the invisibility of "twice-exceptional" youth. Emphasis is placed on mental health vulnerabilities—including anxiety, perfectionism, and social isolation—that frequently coexist with advanced cognitive potential. Evidence-based strategies for identification, clinical and educational support, and culturally responsive interventions are discussed, stressing the importance of interdisciplinary approaches that integrate clinical, educational, and community psychology. By framing adolescent talent as both a developmental potential and a socioemotional responsibility, this work calls for policies and practices that transform talent recognition into sustainable well-being and social inclusion.

Abstract 3824

MENTAL HEALTH CHALLENGES IN ADOLESCENTS AT RISK FOR SUICIDE: CLINICAL VULNERABILITY FACTORS AND DYSFUNCTIONAL FAMILY DYNAMICS

Pugliese S.*

Universidad N. de Rosario/Universidad del Aconcagua ~ Rosario ~ Argentina

Suicide in adolescence represents a constantly growing public health problem, with profound impacts at the individual, family, and social levels. This complex phenomenon is influenced by multiple biological, psychological, social, and cultural factors, which requires a comprehensive and specialized approach. In this context, psychologists play a fundamental role not only in the detection and treatment of suicide risk, but also in the development of preventive strategies and advocacy for public policies that guarantee an effective response from the health system.

Abstract 3825

BREAKING THE DOUBLE INVISIBILITY: ART AND SOCIOEMOTIONAL DEVELOPMENT FOR GIFTED MIGRANT ADOLESCENTS.

Franco E.*, Alcantara K., Benavides A., Blumen S.

PONTIFICAL CATHOLIC UNIVERSITY OF PERU ~ LIMA ~ Peru

Socioemotional development is a cornerstone of resilience and equity, especially for adolescents navigating contexts of vulnerability. This presentation showcases the results of a study on a short arts-based intervention program, implemented with a sample of Peruvian and Venezuelan migrant adolescents in Peru. The findings reveal that the intervention had a significant positive impact on the general well-being of Peruvian students. However, for Venezuelan migrant students, the benefits were more limited, showing a slight improvement that highlights their profound adaptation difficulties and the precarious state of their current well-being. Critically, within the migrant cohort, gifted youths were identified who face a "double invisibility": as a migrant population and as individuals with exceptional potential that often goes unrecognized. These results underscore the urgent need to redouble our efforts to design and implement more robust and culturally relevant socioemotional support systems in schools, thereby ensuring positive and equitable development for all vulnerable populations.

Abstract 3826

ADOLESCENTS IN TRANSIT: CULTURE, TIME, AND CRISIS IN PERU

Jara L.*

PONTIFICAL CATHOLIC UNIVERSITY OF PERU ~ Lima ~ Peru

Peru is characterized by marked cultural, social, and economic diversity. Within this context, adolescents undergo key developmental processes and gradually consolidate their personalities. This complexity was further intensified by the challenges of experiencing adolescence during the COVID-19 pandemic, under one of the longest lockdowns worldwide. This study compares the psychological functioning of 200 adolescents from Cusco (100 from rural areas and 100 from urban areas), assessed before the pandemic, with that of 100 adolescents from Lima evaluated during the lockdown. Participants, aged 12 to 16, were evenly distributed by sex and age and assessed using the Rorschach Psychodiagnostics Test under the Comprehensive System, which explores multiple dimensions of psychological functioning: cognitive-perceptual processes, impulse control and affective expression, self-perception, and interpersonal perception. The findings examine the differential influence of culture, sex, age, and socioeconomic status on adolescents' psychological functioning, as we

MENTALIZATION AND COHERENT PERCEPTIONS OF NEURODEVELOPMENTAL PHYSICIANS REGARDING CHILDREN AND THEIR PARENTS

Karni--Visel Y.*[1], Sher--Censor E.[2], Zohar O.[2], Klein M.[1], Schertz M.[3]

[1]Bar-Ilan University ~ Ramat-Gan ~ Israel, [2]University of Haifa ~ Haifa ~ Israel, [3]Technion ~ Haifa ~ Israel

Background:
Positive relationships between physicians, children, and parents are essential in neurodevelopmental care. Awareness of the patient's internal world and the ability to recognize and understand their emotional needs are central to establishing a beneficial therapeutic alliance. Studies suggest that mentalization and coherent perceptions in parents and educators reflect supportive relationships with children. However, little is known about these capacities among physicians in triadic encounters with children and parents.
Objective:
This study examined the mentalization and coherence of perceptions regarding child patients and their parents among neurodevelopmental physicians.
Method:
Thirteen physicians were interviewed twice, once regarding a child patient and once regarding one of the child's parents, using the Reflective Functioning Five-Minute Speech Sample procedure (Adkins & Fonagy, 2019). Interviews were coded using eight standard seven-point rating scales. These included one mentalization scale and seven coherence scales, which included six subscales that assess aspects of coherence (focus, elaboration, separateness, concern, acceptance, and complexity) and a global coherence scale.
Findings:
Physicians generally demonstrated high levels of mentalization and coherence, although consistency between their scores regarding children and parents was limited. Two physicians scored high across both, while three scored consistently low. In 26.9% of the interviews, difficulties in separateness, particularly boundary dissolution with the parent, emerged.
Conclusions:
Physicians demonstrate intervariability and intravariability in their capacity to mentalize the internal worlds and construct coherent perceptions of children with neurodevelopmental disabilities and their parents. Specialized training may strengthen these capacities and improve the quality and consistency of neurodevelopmental care.

Abstract 3692

MULTICULTURAL COMPETENCIES AND SOCIAL ADVOCACY IN COMPREHENSIVE MENTAL HEALTH CARE FOR INTERNATIONAL STUDENTS IN THE U.S. COLLEGE CAMPUSES

Lee J.*[2], Weiss D.[1]

[1]New York University ~ Washington, DC ~ United States of America, [2]New York University ~ New York, NY ~ United States of America

The Counseling and Wellness Services (CWS) in the Student Health Center at New York University (NYU)'s NY campuses offers comprehensive care in mental health for students' wellbeing. As a leading host institution of international students in the U.S. (Institute of International Education, 2024), NYU's CWS supports international students with diverse international, cultural, and racial backgrounds to meet their clinical needs. Students have access to these comprehensive mental health care in the structured psychological services (e.g., short-term individual counseling, group counseling, single session counseling, urgent counseling in crisis, wellness workshops for skill building, and psychiatric services). To enhance their utilization of psychological services and to prevent them from premature termination in mental health care, clinicians at CWS make an effort to reduce the stigma of seeking mental health for international students.

The presenters will share their issues and challenges of serving students with marginalized backgrounds including international students in the U.S. campuses by emphasizing the needs of psychologists and practitioners to provide support spaces for the need with marginalized international backgrounds to incorporate their reflections on cultural identity, intersectionality, social/racial justice and advocacy in professional practice (Goodman et al., 2004; Marshall-Lee et al., 2020). Particularly, the second presenter, a Global Wellness Counselor at NYU Washington, DC, highlights the importance of holding an awareness of ever-changing immigration regulations, which has a significant impact on the mental health of students and staff. The Global Counselor must provide a safe and welcoming space for students to grow and process this new, and at times hostile environment. The Global Counselor must possess self-awareness, cultural humility and understand the range of perspectives and levels of mental health literacy of the cohort.

REDESIGNING AUSTRALIA'S PSYCHOLOGY EDUCATION AND TRAINING PATHWAY

Phillips R.*

Psychology Board of Australia ~ Melbourne ~ Australia

The Psychology Board of Australia has been asked by Australian Government to provide recommendations for a redesign of the psychology higher education pathway. There is a need to consider a simpler education pathway that removes bottlenecks in the training pipeline to increase the supply of Psychologists to respond to community need.

The focus of the two-year project is to consider the appropriateness and proposed design of a single, shorter, and more practical course of study to qualify as a registered psychologist in Australia, beginning in the undergraduate years. A secondary consideration will relate to the workforce potential of psychology students who do not complete the full training pathway, such as a psychology assistant workforce.

To achieve the project objectives, the work will involve three streams:
1. Understanding the current training context and levers for change
Using data to understand contextual factors and complexities in the current model.
Uncovering blockers and levers for change.
2. Exploring redesign options that support safe and effective professional practice and workforce, and
Reviewing international models of training.
Developing options for redesign that align with Australian accreditation and regulation requirements, as well as industry, workforce and consumer needs.
3. Developing a clear vision for redesign in collaboration with stakeholders.

The presentation will provide an overview of project and progress to date, the policy levers for change, and learnings that are of international interest.

Abstract 2511

FROM SKILLS DEVELOPMENT TO EMPLOYMENT: HOW PSYCHOLOGICAL LITERACY CONNECTS WORK-INTEGRATED LEARNING AND CAREER DECISION SELF-EFFICACY

Gacasan E.M.*, Tang Y., Ma J., Xu W., Jing L., Liu F., Tan C.

Wenzhou-Kean University ~ Wenzhou City ~ China

The field of psychology is increasingly recognized for its vital role in society's sustainable development, contributing to health and wellness, resilient institutions, and balanced socio-economic progress. As a result, there is a growing attention on the education and training of emerging psychology professionals. In fact, there is a movement to develop a competency model for psychology undergraduates that can serve as a guide in international, local, and regional contexts. Psychological literacy is largely shaped through the curriculum, and this study specifically examines how work-integrated learning (WIL)—such as internships, service learning, and research assistantships—contributes to psychological literacy (PL) and how this, in turn, influences career decision self-efficacy (CDSE) among undergraduate psychology students.

Data were collected from 833 undergraduate psychology students from Chinese universities who participated in structured WIL experiences. The study employed a quantitative, cross-sectional design and used Partial Least Squares Structural Equation Modeling via SmartPLS4. Two models were tested: Model 1, which conceptualized PL as eight attributes, and Model 2, which treated PL as four dimensions, following Harris (2021). Validated Chinese versions of the WIL, PL, and CDSE scales were used.

Results for Model 1 showed acceptable fit (SRMR = 0.050 for the saturated model; 0.091 for the estimated model), with strong reliability and validity. Bootstrapping results confirmed a partial mediation effect: WIL significantly influenced CDSE through specific PL attributes, including scientific understanding, research skills, multiple perspectives, ethical and cultural awareness, and real-world solutions. Model 2 also demonstrated a good fit (SRMR = 0.045 saturated; 0.082 estimated), with strong reliability. Bootstrapping again showed a partial mediation model, indicating that WIL impacted CDSE primarily through the development, confidence, and importance dimensions of PL.

This study provides valuable and actionable insights for educational institutions and professional bodies to ensure the development of psychological literacy competencies that contribute to career-ready psychology professionals.

Abstract 2133

CAREER COUNSELING AND SOCIAL CONSTRUCTIONISM: CONTRIBUTIONS OF A BRAZILIAN RESEARCH GROUP

Knabem A.*[1], Ribeiro M.A.[2], Beliomini L.A.[2], Almeida M.C.C.G.D.[2], Cavalcante M.B.R.[2], Figueredo P.M.[2]

[1]University of Paraná ~ Curitiba ~ Brazil, [2]University of São Paulo ~ São Paulo ~ Brazil

In both Brazilian and international contexts, the interdisciplinary field of Career Guidance and Counseling has been increasingly challenged by social transformations that are reshaping the world of work and careers—indeed, giving rise to multiple "worlds of work." The incorporation of new epistemes, the contextualization of theory and practice, and the development of social technologies to address precarization, flexibilization, and individualization present both opportunities and challenges for researchers and practitioners.Grounded in the contributions of Social Constructionism, this presentation highlights the work of a Brazilian research group based at the Laboratory for Work and Career Guidance Studies at the University of São Paulo, under the coordination of Professor Marcelo Afonso Ribeiro.

Established in late 2021, the group currently comprises six researchers—all psychologists holding master's or doctoral degrees—who aim to advance the understanding of socioconstructionist career counseling through the systematization of its epistemological, theoretical, and technical foundations, along with guidelines and strategies for intervention and process evaluation. Drawing on counseling practices, the group produced a Brazilian adaptation of the LAQuA (Life Adaptability Qualitative Assessment). Following empirical research, analysis, and contextualization, the instrument was revised and renamed AQuARRS (Quali-Quanti Assessment of Adaptability, Reflexivity, and Social Repositioning), with the purpose of contributing to the evaluation of interventions in Career Guidance and Counseling. The group's scholarly contributions underscore the potential of socioconstructionism as both a theoretical and practical framework, offering guidelines for the development of a critical and pluralistic and advancing an agenda to Career Guidance and Counseling committed to the inclusion of all individuals.

Abstract 2101

CAREER DEVELOPMENT FROM THE PERSPECTIVE OF SOCIAL CONSTRUCTIONISM: CONTEMPORARY FORMS OF UNDERSTANDING AND CONSTRUCTING CAREERS IN BRAZIL

Knabem A.*[1], Ribeiro M.A.[2]

[1]Federal University of Paraná ~ Paraná ~ Brazil, [2]University of São Paulo ~ São Paulo ~ Brazil

The research for understanding and comprehension of careers in contemporary times presents academics from different fields of Psychology with an increasing challenge, as labour is becoming increasingly multifaceted and polysemic. Using a social constructionism perspective, the psychosocial concept of career, and a qualitative approach, this study sought to understand the continuity of the professional trajectory and professional life project of graduates of the Administration, Tourism, and Psychology courses, who graduated in 2008 from Federal University of Paraná, Brazil, and participated in a previous study. Data were collected through in-depth and comprehensive interviews with content analysis in the period 2020-2021, as part of postdoctoral research at University of São Paulo. Twenty-one graduates were interviewed, including eight men and 13 women, who graduated in Administration (6), Tourism (6) and Psychology (9). The interview commenced with an open leading question in which participants were asked to express their experience after our last meeting and through a reflective dialogue meeting, the researcher sought to supplement the information or clarify doubts. The results showed a certain stability and continuity in contextualised work and employment movements. Women point to motherhood as a moment of pause or transition to a period in which their professional life can take motherhood into account. For the interviewees, projects for the future are present and for those in a stable relationship they are considered to be joint projects with a certain degree of agreement and consent from their partner. The particular moment of the Covid 19 pandemic is pointed out as an intervening factor for the future project and insecurity about the post-pandemic moment. These results, following the perspective of social constructionism, should not be generalised, since the knowledge identified and produced must be contextualised to contribute to other studies that consider other graduates in different courses in the Brazilian context.

Abstract 1951

DOES ACCOUNT ANONYMITY INFLUENCE EMOTIONAL EXPRESSION IN USER-GENERATED POSTS? – EXAMINING POSTS ON X –

Okamoto K.*

Takasaki University of Health and Welfare ~ Takasaki-city ~ Japan

Anonymity is one of the defining characteristics of computer-mediated communication (CMC), and numerous studies have demonstrated that anonymity influences communication behavior. Furthermore, individuals are motivated to express emotions as part of maintaining interpersonal relationships, and this holds true on social networking services (SNS) as well. However, few studies have directly examined the relationship between anonymity and emotional expression on SNS platforms. Therefore, this study aims to explore whether emotional expression in posts on SNS “X” differs depending on the degree of anonymity associated with the user's account. Data were collected in October 2024 using the Twitter Developer API Ver. 2.2. Based on the emotion word list developed by Miura (2015), 600 posts containing positive emotion words and 600 posts containing negative emotion words were extracted, yielding a total of 1,200 posts. From these, 395 posts were selected for analysis after excluding those from corporate accounts, bots, and reposts. To control for the degree of anonymity, we adopted the typology of personal information on SNS proposed by Sato (2012). Personal information consisted of three types: demographic information, traceable information, and private information. Posts were classified into eight groups based on whether or not these types of information were disclosed. Accounts that disclosed all types of information were considered to have low anonymity, while accounts that disclosed none were considered to have high anonymity. The results of sentiment analysis indicated that posts from accounts with lower anonymity tended to express more positive sentiment. Conversely, posts from accounts with higher anonymity tended to express more negative sentiment. These findings suggest that the degree of account anonymity may be associated with the positivity or negativity of sentiment expression in user-generated posts on social networking sites.

Abstract 2226

EMILIO MIRA Y LÓPEZ AND THE CIRCULATION OF PSYCHOLOGY IN THE BRAZILIAN PRESS (1960-1964).

Degani--Carneiro F.*

Rio de Janeiro State University ~ Rio de Janeiro ~ Brazil

Emilio Mira y López (1896–1964) played a crucial role in the institutionalization and professionalization of psychology in Brazil. Between the 1940s and 1960s, Mira y López actively promoted psychological knowledge and practice and increased its visibility as an emerging professional field in Brazil, particularly amid the country's ongoing modernization, industrialization, and urbanization. He also moved within political, business, and academic elite circles, delivering courses and lectures. Additionally, he was frequently invited by the media as a psychological expert to comment on current affairs and political news. An analysis of archival records of Clio-Psyché Laboratory (UERJ, Rio de Janeiro, Brazil) identified a weekly column written by Mira y López in the Folha de São Paulo newspaper. This column comprised 173 articles published between September 1960 and February 1964, the year of his passing. The reading and analysis of the articles (using Discourse Analysis as a theoretical-methodological framework) led to a thematic classification, highlighting four primary topics: Counseling (n=46), Vocational Guidance (n=30), Psychopathology (n=26), and Family Relations (n=16), among others. Mira y López's professional trajectory demonstrates a commitment to disseminating and popularizing psychology as a science with practical applications across various aspects of human life—not only in the fields of work, education, and healthcare institutions but also in everyday life. His work engaged both micro-level concerns (such as family relationships and personal life) and macro-level discussions (such as national and international political conflicts). Additionally, the growing demand for psychological counseling, literature, and services—particularly among Brazil's urban middle class—suggests that psychology was not only developing as an institution but was also gaining societal relevance. As this research progresses, further investigation will focus on the role of psychological discourse in shaping the regulation and professionalization of psychology in Brazil during this period.

PERSONAL IDENTITY AND AUTHENTICATION: THE CONTRIBUTION OF ANTONIO MENEGHETTI'S ONTOPSYCHOLOGY TO PSYCHOTHERAPY

Fleck Da Silva B.*, Wazlawick P., Rothmann A.R.

Faculdade Antonio Meneghetti ~ Restinga Sêca ~ Brazil

Ontopsychology, developed by Antonio Meneghetti (1936-2013), seeks to restore the psychotherapeutic dialogue using the reading criterion of personal identity—the client's ontic In-itself—aiming for personal authentication. Ontopsychological psychotherapy differs by not focusing on the sphere of action around the symptom but rather by projecting toward the subject's realization, based on the verification of personal identity in an ontological sense. In this way, psychotherapy develops the client's quantum of intelligence, which exists as a potential for realization. To support this application, Meneghetti drew on Aristotelian metaphysics, understanding that historical action, or what he called historical autoctises, is the condition for being to move from potentiality to act. The goal is for the subject, through psychotherapeutic dialogue, to perform a critical review of their own consciousness, which is often shaped by family and social structures. Thus, the accuracy of consciousness allows the client to align their thinking with their being and to take actions that are consistent with their identity. Ontopsychological psychotherapy is based on the connection between Ontology, Psychology, and Phenomenology, positioning itself as an efficient alternative to the challenges of counseling and clinical psychology.

TRACING THE HISTORY OF PSYCHOSURGERY IN INDIA: A RETROSPECTIVE REVIEW FROM MYSORE GOVERNMENT MENTAL HOSPITAL

Ghani S.*[1], Dahale A.B.[2], Basavarajappa C.[2], Ts J.[2], Jain S.[2], Murthy P.[2]

[1]OP Jindal Global University ~ Sonipat ~ India, [2]National Institute of Mental Health and Neurosciences ~ Bangalore ~ India

Introduction: In the early 20th century, psychosurgery, in particular leucotomy, became well-known around the world as a means of treating serious mental disease. This study examines its early implementation in India at the National Institute of Mental Health and Neurosciences (NIMHANS), Bangalore, formerly known as the Mysore Government Mental Hospital (MGMH).

Purpose: To document the clinical characteristics, procedures, and outcomes of patients who underwent psychosurgery at MGMH between 1939 and 1947 and to place these findings within broader historical and ethical debates in psychiatry.

Method: A comprehensive evaluation of hospital registrations and case files from 1939 to 1947 was conducted. Descriptive analysis was used to extract and examine sociodemographic information, diagnoses, psychosurgery types, and reported results.

Results: Out of 2,584 admissions, 107 patients (63.5% male, majority aged 21–40 years) underwent psychosurgery, predominantly anterior prefrontal leucotomy. The most common diagnosis (51.5%) was schizophrenia. Despite inconsistent outcome documentation, 33.7% of patients were described as "improved", 25.2% exhibited no change, and 7.5% passed away upon discharge. Long-term follow-up and side effects were seldom ever documented. A range of clinical trajectories, from limited improvement to repeated treatments, were depicted in case vignettes.

Conclusions: The popularity of contemporary technological treatments, despite a lack of proof and ethical protections, led to the introduction of psychosurgery in India at the same time as it did in the West. Both the promise and the dangers of its use are highlighted by the ambiguity of documented results. Looking at this history from a decolonial lens highlights how Western psychiatric paradigms were blindly imported into colonial India, frequently without informed consent or indigenous adaptation. Decolonising psychiatry and making sure that future interventions are patient-centered, ethically sound, and culturally grounded require a review of these histories.

Abstract 2264

PEOPLE'S RESPONSES TO THE NUCLEAR WEAPONS' THREAT: MAPPING POST-COLD-WAR RESEARCH AND EVIDENCE

Kause A.*

Leuphana University ~ Lüneburg ~ Germany

Nuclear weapon threats increase to levels not seen since the worst periods of the Cold War. There could be value in psychologists documenting and explaining people's responses to nuclear weapons. However, more than three decades have passed since the last major reviews of responses (e.g. Fiske, 1987). We examine how psychologists and researchers from related fields have empirically studied responses to nuclear weapons, since the Cold War ended. A systematic search in Web of Science and SCOPUS identified 18,505 hits. Screening resulted in 256 suitable articles. First, a systematic map reveals that that few articles appeared during the last two decades, with a recent uptick. We also find (2) that author collaborations were scattered and that articles were dispersed across a wide range of journals, from different fields; (3) two dominant semantic themes, with one focusing on beliefs, feelings, and actions, and one on support of nuclear weapon use and nuclear policies. Theories reported ranged widely; (4) relatively few studies employed highly powered and representative samples; and some used validated scales for measuring people's responses. Interest in the field is renewed but there is not yet a coherent research community.

Second, we systematically review articles published between 2000 and 2024. People believe that nuclear war can happen during their lifetime. They are less concerned about nuclear war prevention. Few studies examine feelings: Nuclear anxiety seems prevalent in people living close to Russian borders, in those having experienced false warnings, in those who are approving of progressive parties and in those who worry less about their everyday lives. Few take actions, such as preparing for nuclear terrorist attacks, or engaging politically. This remaining "gap between people's horrific beliefs and their lack of affective and behavioral response" to nuclear weapons (Fiske, 1987) contrasts expert assessments of nuclear weapons threat.

Abstract 2238

THE PSYCHOLOGY OF REVERENCE IN THAI ARCHITECTURE: A CASE STUDY OF THE ROYAL PALACE IN RATTANAKOSIN

Sheewasukthaworn W.*

Faculty of Architecture,Urban Design and Creative Arts, Mahasarakham University. ~ Mahasarakham ~ Thailand

Royal palace architecture in Thailand serves not only as the political and ceremonial center of the kingdom but also fulfills a psychological function as a “space of reverence.” It conveys hierarchical perception through complex spatial organization and symbolic decoration. For example, the clearly defined progression from the outer, middle, to inner royal courts reflects varying degrees of proximity to royal authority. The elevation of the throne hall and the spatial positioning of the royal throne establish a direct correlation between the “level of power” and “spatial hierarchy,” producing psychological effects of solemnity, awe, and respect. Furthermore, the use of gold ornamentation, royal emblems, and Hindu mythological symbols—such as divine animal vehicles—reinforces the perception of the king as a divine representative.

This study investigates the role of Thai royal palace architecture in evoking a “psychology of reverence” by analyzing architectural elements that influence users’ perception, emotion, and behavior. The Grand Palace in Rattanakosin (19th century) is used as a case study. The research methodology combines documentary research with symbolic and spatial analysis, framed within the concepts of environmental psychology and cultural architectural theory.

The findings suggest that Thai royal palace architecture functions as a psychological instrument that subtly shapes the mental states of its users. It effectively integrates the dual authority of the monarch—both secular and spiritual—into a unified architectural expression, positioning the palace not only as a physical site of governance but also as a sacred landscape that governs through spatial reverence.

Christine Roland-Lévy - Risk-Taking and Emotions

Friday 24 July 2026 from 10:30 to 11:00

(B- Spadolini)

The presentation deals with risk-taking from a Social Psychology perspective, based both on fundamental psychology and on applied psychology. The goal is to better understand some of the effect of risk-taking for risk seekers, thanks to two empirical studies. Risk is most of the time described as something negative, dangerous, and with unknown outcomes. Risk-taking implies not knowing what the outcomes will be, but it is also associated with emotions, and they are often negative. Nevertheless, it is not always the case as we will show with a first study which is related to risk-taking in a circus, with circus artists achieving dangerous performances, while the second study is with motorcycles and cars in a rally. Risk-taking implies the tendency to engage in behaviors that have the potential to be harmful, to hurt you, to be dangerous, but, at the same time, there is the final option of obtaining a positive outcome. Indeed, if one engages in risky situations, it's because it is expected that the outcomes will be positive rather than negative, i.e., making the best possible show or winning the rally, but also escaping from emotional difficulties by activating 'controlled' risk-taking.

21 - Round Tables

SUSTAINABILITY AND SUSTAINABLE DEVELOPMENT: BRIDGING ENGINEERING AND APPLIED PSYCHOLOGY

Wednesday 22 July 2026 from 15:30 to 17:00

(U-Monumentale)

Roni Reiter-Palmon, Participants
Patton Garriott, Participants
Hang-Shim Lee, Participants
Giampaolo Manfrida, Participants
Daniele Fiaschi, Participants
Claudio Zuffi, Participants
GIUSEPPE CARRUS (ROMA TRE UNIVERSITY ~ Rome ~ Italy), Participants
Marc Rosen, Chair
Annamaria Di Fabio, Co-Chair
José María Peiró, Discussant

Sustainability Science (Dincer & Rosen, 2013; Komiyama & Takeuchi, 2006; Rosen, 2009, 2017; Sahle et al., 2025; Takeuchi et al., 2017) calls for a strong transdisciplinary integration among humanities, natural and applied sciences, social sciences, contributing directly to the United Nations Sustainable Development Goals.

Applied Psychology plays a crucial role in sustainability and sustainable development and its impact grows even stronger when it is integrated with other disciplines, since this connection allows the design of solutions that are not only technically effective, but also psychologically acceptable (Peiró, 2025).

Within the transdisciplinary approach of Sustainability Science, the framework of the Psychology of Sustainability and Sustainable Development (PSSD) (Di Fabio, 2017b, 2021; Di Fabio & Cooper, 2023; Di Fabio & Peiró, 2018, 2023; Di Fabio & Rosen, 2018, 2020) contributes to the challenges of sustainability and sustainable development using psychological lenses.

The strong collaboration between the PSSD and engineering areas has been very promising in recent years (Rosen & Di Fabio, 2023). This Round Table contributes to underlining the value of this mutual collaboration including the following participants. José Maria Peiró will underline the contribution of Applied Psychology for sustainability and sustainable development, highlighting the importance of the link of applied psychology with other disciplines, considering the valuable collaborations with engineers. Roni Riter-Palmon will present results from studies on engineering students and practitioners. Patton Garriott will contribute focusing on engineering students and evidences emerged by his studies. Hang-Shim Lee will consider engineering students also centering on women. Giampaolo Manfrida will presents an example of concrete collaboration through an Horizon Project including Social Life Cycle Assessment as well as Social Acceptance Analysis. Giuseppe Carrus will delineate studies on sustainability underlining the value of the framework of the psychology of sustainability and sustainable development for the progress in this area.

SUSTAINABILITY AND SUSTAINABLE DEVELOPMENT: BRIDGING ENGINEERING AND APPLIED PSYCHOLOGY

Reiter--Palmon R.*[2], Garriott P.*[3], Lee H.*[4], Manfrida G.*[1], Fiaschi D.*[1], Zuffi C.*[1], Carrus G.*[5]

[1]University of Florence ~ Florence ~ Italy, [2]University of Nebraska ~ Omaha ~ United States of America, [3]University of Denver ~ Denver ~ United States of America, [4]Konkuk University ~ Seoul ~ Korea, Republic of, [5]Uniroma 3 ~ Rome ~ Italy

Sustainability Science (Dincer & Rosen, 2013; Komiyama & Takeuchi, 2006; Rosen, 2009, 2017; Sahle et al., 2025; Takeuchi et al., 2017) calls for a strong transdisciplinary integration among humanities, natural and applied sciences, social sciences, contributing directly to the United Nations Sustainable Development Goals.

Applied Psychology plays a crucial role in sustainability and sustainable development and its impact grows even stronger when it is integrated with other disciplines, since this connection allows the design of solutions that are not only technically effective, but also psychologically acceptable (Peiró, 2025).

Within the transdisciplinary approach of Sustainability Science, the framework of the Psychology of Sustainability and Sustainable Development (PSSD) (Di Fabio, 2017b, 2021; Di Fabio & Cooper, 2023; Di Fabio & Peiró, 2018, 2023; Di Fabio & Rosen, 2018, 2020) contributes to the challenges of sustainability and sustainable development using psychological lenses.

The strong collaboration between the PSSD and engineering areas has been very promising in recent years (Rosen & Di Fabio, 2023). This Round Table contributes to underlining the value of this mutual collaboration including the following participants. José Maria Peiró will underline the contribution of Applied Psychology for sustainability and sustainable development, highlighting the importance of the link of applied psychology with other disciplines, considering the valuable collaborations with engineers. Roni Riter-Palmon will present results from studies on engineering students and practitioners. Patton Garriott will contribute focusing on engineering students and evidences emerged by his studies. Hang-Shim Lee will consider engineering students also centering on women. Giampaolo Manfrida will presents an example of concrete collaboration through an Horizon Project including Social Life Cycle Assessment as well as Social Acceptance Analysis. Giuseppe Carrus will delineate studies on sustainability underlining the value of the framework of the psychology of sustainability and sustainable development for the progress in this area.

21 - Round Tables

THE FUTURE OF PSYCHOLOGY THROUGH THE LENSES OF THOSE WHO WILL BUILD IT: CHALLENGES AND OPPORTUNITIES

Wednesday 22 July 2026 from 17:00 to 18:30

(U-Monumentale)

Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Discussant
Pedro Altungy, Chair
Jaime Martin, Participants
Ana Kraljevic, Participants
Alicja Szmidka, Participants
Kerry Fisher, Participants

The symposium “The future of Psychology through the lenses of those who will build it: challenges and opportunities” positions itself as a forward-looking platform to rethink the role of emerging psychologists in shaping the future of the discipline. In a rapidly transforming world-defined by technological disruption, complex societal challenges, and the growing need for interdisciplinary solutions-early-career researchers are not only adapting to change but are uniquely positioned to drive it.

This session will critically address the structural and ethical challenges that define contemporary psychological science, including navigating highly competitive academic pathways, securing resources for innovative and high-risk research, and responding responsibly to the integration of emerging technologies such as artificial intelligence. At the same time, the shift toward open, transparent, and accountable science is redefining research practices, demanding new competencies while creating opportunities to enhance credibility and societal trust. Increasing expectations for research to generate measurable social impact further challenge early-career psychologists to align their work with urgent global priorities.

Crucially, these challenges coexist with unprecedented opportunities. Advances in digital technologies are revolutionising data ecosystems, enabling scalable, real-time, and more inclusive research. Expanding global networks and digital infrastructures are fostering collaboration beyond geographical and disciplinary boundaries, accelerating the production of knowledge with real-world relevance. Psychology is also gaining visibility as a key driver in addressing major societal issues, opening pathways for transformative, interdisciplinary impact.

Bringing together speakers from Spain, Croatia, UK and Polonia, this symposium aims to activate a new generation of researchers as agents of innovation and change. Through dynamic dialogue, participants will identify actionable strategies to overcome systemic barriers, harness emerging tools, and amplify the societal impact of their work. By cultivating leadership, adaptability, and a global perspective, this session seeks to empower early-career psychologists to not only respond to the future of psychology-but to actively shape it.

Abstract 4789

The future of Psychology through the lenses of those who will build it: challenges and opportunities

PSYCHOLOGY AT THE UN: PRACTICE AND POLICY IN ACTION

Thursday 23 July 2026 from 08:00 to 09:30

(U-Monumentale)

Lori Foster, Co-Chair
Pedro Neves (Nova School of Business and Economics ~), Co-Chair
Judith Kuriansky, Participants
Raymond Saner, Participants
Wolfgang Beiglboeck, Participants
Gabriel Twose, Participants
John Francis Leader (European Federation of Psychologists' As), Participants
Jenna Wettstein, Participants

This roundtable highlights how applied psychology contributes to United Nations priorities through both practice and policy engagement. The session brings together representatives from IAAP's UN teams in New York, Geneva, and Vienna, together with colleagues from APA and EFPA, to illustrate how psychology is translated into action across domains such as mental health, climate, social development, and technology.

The discussion will feature both senior leaders and youth representatives, offering a forward-looking view of how psychology can continue to support the Sustainable Development Goals and the broader UN agenda.

21 - Round Tables

PRESIDENTIAL PERSPECTIVES ROUNDTABLE (IAAP, IUPSYS). PSYCHOLOGY'S ROLE IN AN UNCERTAIN WORLD: STRATEGIC LEADERSHIP FOR A SUSTAINABLE WORLD

Thursday 23 July 2026 from 14:00 to 15:30

(U-Monumentale)

Pedro Neves (Nova School of Business and Economics ~), Panelist
Germán Gutiérrez (Universidad Nacional de Colombia ~ Bogot), Chair
Lori Foster, Chair
Brigitte Khoury (AUBMC ~ Beirut ~ Lebanon), Panelist
Polli Hagenaars, Panelist
Rachana Bhangaokar, Panelist

This roundtable is conceived as a strategic leadership dialogue on how international psychological organizations themselves are responding, at the level of governance, advocacy, and institutional strategy, to increasing global uncertainty. This roundtable asks: How are international psychology organizations redefining their roles, priorities, and modes of action in an increasingly fragmented, unstable world?

Focus: A forward-looking exchange among senior representatives of international psychological organizations, building on the Prague Presidents' Panel. The emphasis is on:

- Leadership under conditions of geopolitical tension, environmental crisis, fast technological change, and threats to democratic ideals
- The unique contribution of applied psychology to sustainability, social cohesion, and global problem-solving
- How international organizations can preserve global perspectives while respecting regional diversity and local realities

Guiding Questions

- What new responsibilities do international psychology organizations face in a world marked by geopolitical instability, climate risk, and rapid technological change?
- How can applied psychology contribute concretely to a more sustainable, peaceful, and equitable world - beyond statements and declarations?
- How can international organizations maintain a genuinely global perspective while avoiding one-size-fits-all solutions?
- What strategic shifts are needed in the next decade for psychology to remain socially relevant and globally credible?

Abstract 4792

Presidential Perspectives Roundtable (IAAP, IUPsyS). Psychology's Role in an Uncertain World: Strategic Leadership for a Sustainable World

This roundtable is conceived as a strategic leadership dialogue on how international psychological organizations themselves are responding, at the level of governance, advocacy, and institutional strategy, to increasing global uncertainty. This roundtable asks: How are international psychology organizations redefining their roles, priorities, and modes of action in an increasingly fragmented, unstable world?

Focus: A forward-looking exchange among senior representatives of international psychological organizations, building on the Prague Presidents' Panel. The emphasis is on:

21 - Round Tables

UNESCO REPORT: ETHICAL CONSIDERATIONS ON YOUTH MENTAL HEALTH IN THE DIGITAL ENVIRONMENT

Thursday 23 July 2026 from 15:30 to 17:00

(U-Monumentale)

Brigitte Khoury (American University ~ Beirut ~ Lebanon), Chair
Brigitte Khoury, Participants
Luis Carrizo, Participants
Grégoire Borst, Participants
Dafna Feinholz, Co-Chair

Children and adolescents are the most digitally connected population globally, with 79% of youth aged 15-24 using the Internet, substantially higher than the general population. As digital environments increasingly shape young people's daily lives, they offer significant opportunities for education, social connection, and access to mental health resources, while also introducing risks such as cyberbullying, harmful content exposure, addictive use patterns, and the amplification of self-destructive behaviours. This roundtable convenes global scholars and experts from diverse regions and disciplines to engage with the UNESCO International Bioethics Committee (IBC) Report on Ethical Considerations for Youth Mental Health in the Digital Environment. The report advances current discourse through a human rights and bioethical framework, moving beyond risk-benefit analyses to critically examine the responsibilities of adults, institutions, and systems to act in the best interests of children and adolescents. The session will be structured around key thematic domains of the report, with invited contributors offering brief, focused inputs on areas such as ethical governance, digital safety, autonomy and protection, and the role of technology platforms. These contributions will serve as a foundation for an integrative, moderated discussion among global scholars addressing shared challenges and context-specific considerations. Particular attention will be given to inequities in digital access and the disproportionate impact of technology-facilitated gender-based violence, highlighting the heterogeneous effects of digital environments across socio-demographic contexts. The roundtable aims to generate actionable, globally informed insights on "safety-by-design," digital literacy, and ethical policy frameworks, contributing to the development of inclusive, rights-based digital ecosystems that support youth mental health worldwide.

SDG 3: Good Health and Well-being SDG 4: Quality Education SDG 5: Gender Equality SDG 10: Reduced Inequalities

Abstract 4790

UNESCO Report: Ethical Considerations for Youth Mental Health in the Digital Environment

Khoury B.*[1], Carrizo L.*[2], Borst G.*[3], Feinholz D.*[4]

[1]IUPsyS President-Elect ~ Beirut ~ Lebanon, [2]IUPsyS Executive Committee, Consultant at the UNESCO Montevideo Regional Bureau for Latin America and the Caribbean; Coordinator of the UNESCO Chair on Social Transformations and Human Condition, [3]IUPsyS Executive Committee, Professor of Developmental Psychology and Cognitive Neuroscience of Education (Université Paris Cité), [4]The Chief of Section for Bioethics and Ethics of Science and Technology Section, at UNESCO, Paris

Children and adolescents are the most digitally connected population globally, with 79% of youth aged 15-24 using the Internet, substantially higher than the general population. As digital environments increasingly shape young people's daily lives, they offer significant opportunities for education, social connection, and access to mental health resources, while also introducing risks such as cyberbullying, harmful content exposure, addictive use patterns, and the amplification of self-destructive behaviours. This roundtable convenes global scholars and experts from diverse regions and disciplines to engage with the UNESCO International Bioethics Committee (IBC) Report on Ethical Considerations for Youth Mental Health in the Digital Environment. THE UNION OF PSYCHOLOGY: INTEGRATING PAST, PRESENT, AND FUTURE TOWARD A GLOBAL DISCIPLINE

Thursday 23 July 2026 from 17:00 to 18:30

(U-Monumentale)

V. Raval Vaishali, Chair
Saba Safdar, Co-Chair
Germán Gutiérrez (Universidad Nacional de Colombia ~ Bogot), Participants
Rainer Silbereisen, Participants
Ole Tunold, Participants
Christine Roland-Lévy, Participants

This roundtable convenes past and current leaders of the International Union of Psychological Science (IUPsyS) to reflect on the evolution of psychology as a truly global discipline. Panelists will examine the historical foundations of the field, current trends and challenges, and emerging opportunities for international collaboration in research, education, and practice.

In a world that increasingly requires a compass to uphold human rights, equity, and dignity, the session will explore psychology's critical role in promoting social justice, ethical conduct, and the well-being of diverse populations. Participants will engage in a forward-looking dialogue on how the global psychology community can foster integration across methodological, theoretical, and cultural perspectives, building a more cohesive, inclusive, and impactful discipline capable of addressing pressing societal and global challenges.

SDG 3: Good Health and Well-being SDG 4: Quality Education SDG 5: Gender Equality SDG 10: Reduced Inequalities SDG 11: Sustainable cities and communities

Abstract 4793

The Union of Psychology: Integrating Past, Present, and Future Toward a Global Discipline

Tunold O.*[2], Roland--Lévy C.*[3], Gutiérrez G.*[1], Silbereisen R.*[1]

[1]Germany, [2]Norway, [3]France

This roundtable convenes past and current leaders of the International Union of Psychological Science (IUPsyS) to reflect on the evolution of psychology as a truly global discipline. Panelists will examine the historical foundations of the field, current trends and challenges, and emerging opportunities for international collaboration in research, education, and practice.

FORMER IAAP PRESIDENTS ROUNDTABLE: PERSPECTIVES ON THE FUTURE OF APPLIED PSYCHOLOGY

Friday 24 July 2026 from 08:00 to 09:30

(U-Monumentale)

Lori Foster, Co-Chair
Pedro Neves, Co-Chair
Christine Roland-Lévy, Participants
Janel Gauthier, Participants
José María Peiró, Participants
Michael Knowles, Participants
Michael Frese, Participants

This roundtable brings together former IAAP Presidents to reflect on the evolving role of applied psychology in addressing global challenges. Drawing on their leadership experience, the discussion will consider how the field can respond to emerging social, technological, and environmental pressures, and how international organizations can continue to shape psychology's contribution in the years ahead.

Co-Chairs: Lori Foster (2022–2026), Pedro Neves (2026–2030)

Participants:, Christine Roland-Lévy (2018–2022), Janel Gauthier (2014–2018), Jose Maria Peiró (2011–2014), Michael Knowles (2006–2010), Michael Frese (2002–2006)

Abstract 4794

Former IAAP Presidents Roundtable: Perspectives on the Future of Applied Psychology

Roland--Lévy C.*, Gauthier J.*, Peiró J.M.*, Knowles M.*, Frese M.*

SUSTAINABLE DEVELOPMENT AND MANAGERIAL PSYCHOLOGY

Friday 24 July 2026 from 15:30 to 17:00

(U-Monumentale)

Carrie Bulger, Participants
Annamaria Di Fabio, Participants
Adam Vanhove, Participants
Carrie Bulger, Chair
Annamaria Di Fabio (University of Florence ~ Florence ~ Ital), Co-Chair
José María Peiró, Discussant

The aim of this round table discussion is to examine the impacts of research and practice in managerial psychology and the psychology of sustainable development. The field of managerial psychology is well situated to contribute to the base of knowledge for research and practice related to decent work, overall well-being, and inequities. The two co-chairs and two presenters have served on the editorial team at the Journal of Managerial Psychology, which is a part of the Publishers Compact to focus on and accelerate research that progresses the UN Sustainable Development Goals.

Panelists will discuss key areas of research and practice in managerial psychology that are contributing to meeting the UN Sustainable Development Goals. Panelists will further discuss the open questions and needs for avenues of inquiry that would be most impactful in meeting the SDGs.

Dr. Peiro, the discussant, will moderate the round table and may offer synthesis of the topics discussed. He will also invite audience members to participate in the discussion.

Division 1: Work and Organizational Psychology SDG 8: Decent work and economic Growth

Abstract 4788

21 - Round Tables

BEARING WITNESS OR REMAINING SILENT? PSYCHOLOGICAL ACCOUNTABILITY IN THE PURSUIT OF PEACE

Friday 24 July 2026 from 17:00 to 18:30

(U-Monumentale)

Polli Hagenaars (Centre for Counseling C5 ~ Amsterdam ~ N), Chair
Susan McDaniel, Discussant
Polli Hagenaars (Centre for Counseling C5 ~ Amsterdam ~ N), Participants
Serdar M Degirmencioglu, Participants
Saths Cooper, Participants

In contexts of conflict, violence, and collective trauma, silence can feel protective—and speaking out can feel dangerous. Yet both carry psychological and ethical consequences. This round table invites reflection on the role of psychological accountability in peacebuilding: What does it mean to bear witness, individually and collectively? When does silence become complicity, and when might it be a form of care or survival? Martin Luther King Jr., Hannah Arendt, and Elie Wiesel have characterised indifference as a moral failure, highlighting the responsibility of everyone, including professionals, to bear witness and take action.
Participants will explore what accountability means for peacebuilding, and whether it is an ethical obligation not to remain silent in the face of injustice.

Abstract 4593

BEARING WITNESS OR REMAINING SILENT? PSYCHOLOGICAL ACCOUNTABILITY IN THE PURSUIT OF PEACE

Degirmencioglu S.M.*[3], Cooper S.*[2], Hagenaars P.*[1]

[1]C5 - Private Practice ~ Amsterdam ~ Netherlands, [2]University of Pretoria, Johannesburg, South-Africa ~ Pretoria ~ South Africa, [3]President Society for Peace Psychology ~ Lucca ~ Italy

In contexts of conflict, violence, and collective trauma, silence can feel protective—and speaking out can feel dangerous. Yet both carry psychological and ethical consequences. This round table invites reflection on the role of psychological accountability in peacebuilding: What does it mean to bear witness, individually and collectively? When does silence become complicity, and when might it be a form of care or survival? Martin Luther King Jr., Hannah Arendt, and Elie Wiesel have characterised indifference as a moral failure, highlighting the responsibility of everyone, including professionals, to bear witness and take action.
Participants will explore what accountability means for peacebuilding, and whether it is an ethical obligation not to remain silent in the face of injustice.

The Round Table discusses 'Relying on biographical knowledge of speaking out against gross human rights violations, silence is not an option. The cost is not merely for the individual, family, group or other configuration. The cost of silence indelibly impacts our common humanity.' ' The invasion of Iraq in 2003 presents a clear example of how silence and complicity operate in mainstream psychology in the Global North and how fault lines in the mainstream get reproduced in the Global South. Two decades after 2003, little has changed.' 'The psychology of the pursuit of wealth has been the subject of empirical research in psychology. They can exhibit characteristics similar to behavioural addiction. Although such patterns can display addictive characteristics, they are not currently classified as addictive disorders in the DSM-5. This raises the question of whether structured interventions, analogous to established recovery programmes, might be conceptually or clinically justified.'

22 - Panel Sessions

ALLIANCE FOR ORGANIZATIONAL PSYCHOLOGY. TITLE: INTEGRATING ISO 45003 INTO I-O PRACTICE: ADVANCING PSYCHOLOGICAL HEALTH AND SAFETY AT WORK

Wednesday 22 July 2026 from 08:00 to 09:00

(A - Spadolini)

Evangelia Demerouti, Participants
Deirdre O'Shea, Participants
Eva Derous, Participants
Pär Löfstrand, Chair
Stig Vinberg, Participants
Daniela Converso (University of Turin, Department of Psych), Participants
M Gloria González Morales, Participants

This panel discussion explores the integration of ISO 45003, the first global standard focused on managing psychosocial risks in the workplace within the field of industrial-organizational (I-O) psychology. With increasing recognition of the impact of job demands, stressors, and organizational climate on employee wellbeing, this session will examine how ISO 45003 can serve as both a framework and a catalyst for advancing psychological health and safety at work.

Panelists will critically assess the standard through an I-O lens, discussing how it intersects with existing theories and practices related to job design, psychosocial work environment, psychological safety, and occupational health and from a diversity perspective. The discussion will highlight areas where I-O psychology offers evidence-based tools and strategies to support implementation, as well as where gaps exist, particularly around operationalizing concepts like psychological safety, addressing chronic job demands, and measuring psychosocial risks.
The session will also draw on insights from interdisciplinary research, including occupational health psychology, organizational behavior, public health, and human resource management, to enrich the dialogue. Real-world case studies and ongoing research projects will be used to illustrate the challenges and opportunities of applying ISO 45003 in diverse organizational contexts.

Abstract 3003

22 - Panel Sessions

THE INTERPLAY OF AI AND WELL-BEING: BREAKING THE CYCLE OF HARM AND REPAIR

Thursday 23 July 2026 from 08:00 to 09:00

(A - Spadolini)

Julia Haas, Participants
Pär Löfstrand, Participants
Tara Behrend, Participants
Susan Niessen, Participants
Luca Pietrantoni, Participants
Julia Haas, Chair
Pär Löfstrand, Co-Chair
Sharon Glazer (Rutgers University-New Brunswick, USA ~), Participants

Organizations are increasingly deploying artificial intelligence (AI) and related technologies to automate and augment work. While these tools can improve efficiency and decision-making, they can also produce unintended consequences, including reduced autonomy, accountability, and intrinsic motivation. Such effects may lead to disengagement, diminished agency, and elevated psychological strain. In response, organizations often introduce additional technologies aimed at supporting well-being, which can inadvertently create a cycle of harm and repair that perpetuates rather than resolves the underlying challenges.

This panel discussion brings together global experts to critically examine the complex interplay between AI and employee well-being. Panelists will engage in dialogue about the paradoxical effects of technology adoption, exploring how automation and “tech-for-well-being” initiatives can both support and undermine psychological health. The discussion will also address the ethical responsibilities of I-O psychologists and organizational leaders in shaping the design and implementation of AI systems, as well as strategies for creating work environments that foster agency, engagement, and sustainable well-being. Drawing on the panelists’ collective expertise, the session will deepen understanding of how I-O psychology can inform more human-centered approaches to technology in the workplace.

Abstract 3001

THE INTERPLAY OF AI AND WELL-BEING: BREAKING THE CYCLE OF HARM AND REPAIR

Haas J.*[1], Löfstrand P.*[2], Behrend T.*[3], Niessen S.*[4], Pietrantoni L.*[5], Glazer S.[6]

Abstract 4906

EVOLVING COMPETENCES IN PSYCHOLOGY: SUPPLEMENTARY COMPETENCES AND A TOOLKIT FOR THE IPCP DECLARATION

Iliescu D.*[1], Burnetti--Atwell M.*[4], Cue M.*[5], Gale N.*[3], Phillips R.*[6], Roland--Lévy C.*[2], Siegel A.*[4]

[1]Romania, [2]France, [3]United Kingdom, [4]United States of America, [5]Philippines, [6]Australia

The International Declaration on Core Competences in Professional Psychology has established a robust foundation for defining essential competences in the field, and thereby also provided a unifying framework for the profession worldwide. Yet, as psychological practice evolves, so do the competences required from psychologists. Emerging trends - such as the increasing digitalization of services, the growing emphasis on the quality of professional practice through developing others by means such as supervision, and the ever-expanding recognition of the importance of underpinning professional practice with continuing cultural competence -
highlight critical areas requiring further attention. This panel focuses on a Supplement that expands the IPCP Declaration with three new competences: (1) Digitally and technologically mediated psychological practice, (2) Supporting the development of others in the working context and (3) Multicultural competence. These competences reflect the profession's response to transformative changes in both the context within which psychologists practice and how psychologists deliver services. It will also discuss a Toolkit that is being created to offer concrete guidelines for applying the Declaration across diverse contexts. The Toolkit is still work in progress, and will contain guidance for educators, practitioners, regulators, policymakers, and the public. Among other goals, the Toolkit is being designed to support curriculum development and accreditation processes; professional development and mobility; licensing and regulation; service provision and quality of care. Panelists will present the Supplement, covering the rationale and development process behind it, and highlight how the Toolkit can transform the Declaration into an actionable resource, helping psychology to advance as a coherent, evidence-based, and globally connected profession.

APPLIED PSYCHOLOGY FOR PUBLIC SECTOR WORKERS: LESSONS FROM GLOBAL GOVERNMENT

Friday 24 July 2026 from 08:00 to 09:00

(A - Spadolini)

Zachary Baker-Salmon, Participants
Marshaley Baquiano, Participants
Troy Brightson, Participants
Zachary Baker-Salmon, Chair
Kursten Jackson, Participants
Patricia Rink, Participants
Mendiola Teng-Calleja, Participants
Alexandra Michel, Participants

This panel of experts will present strategic approaches and lessons learned from challenges faced by governments and public administrations around the world using the principles of applied industrial/organizational psychology and social psychology. Working in the government sector poses unique challenges as well as opportunities, which may not be immediately clear to early-career professionals and even established psychologists working in the private sector. Panelists from three continents will share their diverse knowledge from working within government or as a consultant to government in areas such as public servant engagement, workforce development, human capital strategy, disaster response, environmental resource management, conflict resolution, and transformation of local government in the developing world. Representing the USA, Switzerland, the Philippines, and Guam, the panelists will share their experiences navigating challenges they face in improving the lives of public sector workers and the people they serve through scientific measurement, analysis, and real-world application of psychological research.

The session will reveal roadblocks to implementing change in the public sector and present avenues for overcoming them. Examples include:

Attracting and retaining administrative support for evidence-based interventions
1. Navigating the requirements of organized labor
2. Addressing distrust and mistrust of government by the local population
3. Adapting to changing workforce demographics
4. Facilitating cooperation between government and private sector interests
5. Building sustainable interventions and tools that can withstand changes in executive leadership
6. Incorporating new technology in an ethical and beneficial way
7. Communicating openly and descriptively to stakeholders in their own language(s)
8. Implementing long-term, evidence-based programs to support resilience in the face of unpredictable global challenges in politics, climate, or public health

Key Words (up to 5 key words):

Public policy, workforce development, employee engagement, government transformation, strategic partnership

Abstract 3002

INNOVATIVE INTERCULTURAL EXPERIENTIAL LEARNING: INSIGHTS FROM THE WINTER SCHOOL IN WOP-P

Friday 24 July 2026 from 09:30 to 11:00

(U-Monumentale)

Vicente González-Romá, Participants
Carolina Moliner, Chair
Salvatore Zappalà (University of Bologna ~ Bologna ~ Italy), Participants
Leonor Pais (University of Coimbra ~ Coimbra ~ Portug), Participants
Viky Leady Fajardo, Participants
Milena Guimaraes, Participants
José María Peiró, Interview

This panel presents an overview of the pedagogical model offering of the Winter School. By presenting this multi-voiced and experience-based panel, we aim to share how innovative educational design can prepare future psychologists to address complex organizational problems in globalized contexts. Each presenter contributes with a different perspective to the understanding of the Winter School's educational model. The panel will include an interview with Professor Jose Mª Peiró as a central figure in the design and implementation of the Winter School.

Presentation 1: Competency-Based and Experiential Learning Design in the WOP-P Winter School.This presentation focus the pedagogical architecture of the Winter School within the Erasmus Mundus WOP-P Master. Based in experiential learning, problem-based instruction, and competency-based education, the program aims to bridge academic knowledge with professional intervention practice to develop core professional competencies: intervention design, contextual diagnosis, stakeholder analysis, ethical decision-making, and evidence-based reasoning. The in-residence phase acts as a learning laboratory where multicultural student teams engage with organizational problems, using rapid evidence assessment techniques and interdisciplinary frameworks. This presentation explains how the Winter School's design aligns with international standards for applied psychology training and how it supports the development of cross-cutting competencies required in contemporary organizational practice.

Presentation 2: The core values of the Winter School and the Intercultural Collaboration and Virtual Teamwork Competencies in an International Training Environment. This presentation examines the international and intercultural dimensions of the Winter School as an intentional pedagogical strategy grounded in the core values of the WOP-P Master. Students from multiple continents representing diverse academic backgrounds, cultural perspectives, and professional expectations form collaborative teams for designing organizational interventions. The presentation explores challenges and opportunities inherent in multicultural teamwork. The Winter School's design intentionally pushes students beyond their comfort zones, fostering resilience, adaptability, ethical decision-making, and collaborative problem solving. By integrating intercultural collaboration with explicit value-based professional development, the Winter School becomes a unique international training environment that prepares students for the behavioral, ethical, and relational complexities of contemporary global organizational practice.

Presentation 3: Design thinking methodology applied to WOP-psychologist. This presentation refers to design thinking methodology applied to WOP-Psychology. A human-centered approach aimed at understanding, designing, and improving processes, experiences, and solutions within organizations. It draws on design principles and psychological knowledge of human behavior at work, integrating creative and structured methods to address complex problems while integrating the real needs of employees, leaders, and teams at the core. The resulting solutions are grounded in psychological evidence and in people lived experiences.

Presentation 4: From Classroom to Practice: Professional Socialization Through "Peer-Led Activities". This presentation focuses on the integration and socialization components of the Winter School, and student initiatives. By offering informal, dialogic spaces, the activity encourages open discussion on employability, ethical dilemmas, organizational

challenges, and early-career transitions. The Winter School encourages bottom-up proposals for community-building activities, which promotes well-being, social connection, and work–life balance. This presentation argues that these integration activities are not peripheral but central to the Winter School's developmental value, as they enhance motivation, psychological safety, and readiness for workforce transition.

Presentation 5: Learning by Immersion: Behavioral Expectations and Experiential Challenges in the Winter School. This presentation describes the behavioral expectations of the Winter School's in-residence phase. During two weeks of full-day teamwork, students engage in collaborative tasks, and interact continuously with peers and faculty. This deliberate immersion mirrors real organizational conditions, requiring professionalism, intercultural sensitivity, responsibility, and sustained engagement. Students are encouraged to demonstrate citizenship behaviors, active participation, and resilience. This presentation explains how the immersive context enhances learning outcomes, providing a unique environment where interpersonal, emotional, and professional competencies develop in parallel with technical skills.

This presentation describes the behavioral expectations of the Winter School’s in-residence phase. During two weeks of full-day teamwork, students engage in collaborative tasks, and interact continuously with peers and faculty. This deliberate immersion mirrors real organizational conditions, requiring professionalism, intercultural sensitivity, responsibility, and sustained engagement. Students are encouraged to demonstrate citizenship behaviors, active participation, and resilience. This presentation explains how the immersive context enhances learning outcomes, providing a unique environment where interpersonal, emotional, and professional competencies develop in parallel with technical skills.

The Winter School is designed to be a unique learning experience in the development of professional competences in the design of interventions, along with a networking and socializing experience for personal and professional development. It is structured in three-phases that lasts for five months including a period of two in-residence weeks. It addresses contemporary challenges in applied psychology by integrating multicultural teamwork, virtual collaboration, ethical decision-making, contextual analysis, and rapid evidence assessment. Its distinctive pedagogical strategy combines an immersive international environment, intervention design process, and structured integration activities that foster networking, identity development, and professional socialization. The in-residence phase offers a unique learning ecosystem in which participants live, study, and collaborate under conditions that mirror real-world organizational demands. With a triple aim on (1) developing competences to design WOP-P professional interventions in a GLO-CAL (global-local) environments while considering scientific evidence, contextual and organization factors, (2) create a multicultural experiential-

learning atmosphere in an international environment, and (3) promote virtual and face-to-face practice of teamwork competences, the Winter School offers an internationally recognized training model in applied psychology.

By presenting this multi-voiced and experience-based panel, this panel presents a comprehensive overview of the pedagogical model, and its impact on student professionalisation, offering a inside look at an international training experience as we aim to share how innovative educational design can prepare psychologists to address complex organizational problems in globalized contexts.

Natasha Sutherland, Participants
Alice Maniezki, Participants
Núria Tordera, Chair

Abstract.
The Work, Organizational, and Personnel Psychology (WOP-P) profession has undergone significant transformation in response to rapidly changing workplaces, technological disruptions, and emerging societal challenges. The Erasmus Mundus Master in Work, Organizational, and Personnel Psychology (WOP-P) has played a central role in preparing applied psychologists to navigate these complexities through a rigorous, international, and practice-oriented curriculum. This symposium brings together five WOP-P alumni representing diverse countries, sectors, and years of professional experience to engage in a critical dialogue on the achievements, current challenges, and future directions of the WOP-P profession.
The symposium aims to (1) reflect on the contributions that WOP-P professionals have made in organizational development, employee well-being, research, and policy; (2) examine the evolving professional identity of organizational psychologists working across cultures, industries, and career stages; and (3) explore how WOP-P competencies can address emerging demands such as artificial intelligence integration, sustainable work practices, hybrid and global workforces, and the increasing importance of evidence-based decision-making.
Each panelist will offer a concise presentation drawn from their professional trajectory. Contributions will highlight applied case studies, ethical dilemmas encountered in practice, and reflections on how WOP-P training shaped their ability to design interventions, conduct assessments, and support organizational change. A moderated discussion will integrate themes across talks and encourage audience engagement around the future of WOP-P education and practice.
By presenting diverse and international perspectives, this symposium illustrates the continued relevance and adaptability of the WOP-P profession. It offers valuable insights for practitioners, researchers, educators, and students interested in strengthening the impact of applied psychology in contemporary workplaces and anticipating the competencies required for the next generation of organizational psychologists.

Symposium Description / Rationale
The WOP-P (Work, Organizational, and Personnel Psychology) profession plays a critical role in shaping healthy, productive, and sustainable workplaces. The Erasmus Mundus Joint Master's in WOP-P (EMJMD WOP-P) has trained a generation of applied psychologists with strong theoretical foundations and practical, cross-cultural competence.
This panel brings together five WOP-P alumni from diverse backgrounds (geographic, sectoral, career stage) to reflect on:
1. Achievements – How has the WOP-P profession evolved in recent years, and what contributions have WOP-P professionals made in organizations, research, and policy?
2. Present challenges and practice – What are the current demands, ethical dilemmas, and professional identities of WOP-P psychologists in different contexts?
3. Future directions – Where is the field going? How can WOP-P professionals help address emerging challenges (e.g., sustainability, remote work, diversity, technological disruption)?
By sharing their trajectories and perspectives, the panel will highlight the value of WOP-P

training (especially international and applied), and offer reflections relevant for educators, practitioners, doctoral students, and organizational stakeholders.
This symposium aligns with ICAP's themes of emerging fields, transdisciplinary approaches, and societal applications.

Abstract.

The Work, Organizational, and Personnel Psychology (WOP-P) profession has undergone significant transformation in response to rapidly changing workplaces, technological disruptions, and emerging societal challenges. The Erasmus Mundus Master in Work, Organizational, and Personnel Psychology (WOP-P) has played a central role in preparing applied psychologists to navigate these complexities through a rigorous, international, and practice-oriented curriculum. This symposium brings together five WOP-P alumni representing diverse countries, sectors, and years of professional experience to engage in a critical dialogue on the achievements, current challenges, and future directions of the WOP-P profession.

The symposium aims to (1) reflect on the contributions that WOP-P professionals have made in organizational development, employee well-being, research, and policy; (2) examine the evolving professional identity of organizational psychologists working across cultures, industries, and career stages; and (3) explore how WOP-P competencies can address emerging demands such as artificial intelligence integration, sustainable work practices, hybrid and global workforces, and the increasing importance of evidence-based decision-making.

Each panelist will offer a concise presentation drawn from their professional trajectory. Contributions will highlight applied case studies, ethical dilemmas encountered in practice, and reflections on how WOP-P training shaped their ability to design interventions, conduct assessments, and support organizational change. A moderated discussion will integrate themes across talks and encourage audience engagement around the future of WOP-P education and practice.

By presenting diverse and international perspectives, this symposium illustrates the continued relevance and adaptability of the WOP-P profession. It offers valuable insights for practitioners, researchers, educators, and students interested in strengthening the impact of applied psychology in contemporary workplaces and anticipating the competencies required for the next generation of organizational psychologists.

Symposium Description / Rationale

The WOP-P (Work, Organizational, and Personnel Psychology) profession plays a

critical role in shaping healthy, productive, and sustainable workplaces. The Erasmus Mundus Joint Master's in WOP-P (EMJMD WOP-P) has trained a generation of applied psychologists with strong theoretical foundations and practical, cross-cultural competence.

This panel brings together five WOP-P alumni from diverse backgrounds (geographic, sectoral, career stage) to reflect on:

1. Achievements – How has the WOP-P profession evolved in recent years, and what contributions have WOP-P professionals made in organizations, research, and policy?
2. Present challenges and practice – What are the current demands, ethical dilemmas, and professional identities of WOP-P psychologists in different contexts?
3. Future directions – Where is the field going? How can WOP-P professionals help address emerging challenges (e.g., sustainability, remote work, diversity, technological disruption)?

By sharing their trajectories and perspectives, the panel will highlight the value of WOP-P training (especially international and applied), and offer reflections relevant for educators, practitioners, doctoral students, and organizational stakeholders.

This symposium aligns with ICAP's themes of emerging fields, transdisciplinary approaches, and societal applications.

Duration: 90 minutes. The panel will be followed by a Social Hour (60 minutes).

Chair / Moderator: Núria Tordera. Local coordinator of EM WOP-P at the University of Valencia.

Five Presenters (each 10–12 minutes), plus aprox 30 minutes for discussion/Q&A. Each presenter will contribute a short talk framing their perspective on the profession, followed by a moderated discussion to weave together themes, and audience interaction.

23 - Workshop

Communicating with Impact and Embracing the Early Career Potential in IAAP

Thursday 23 July 2026 from 08:00 to 10:00

(I-Spadolini)

Gabriel Medianero Araúz, Co-Chair
Marija Davcheva, Chair
Kerry Aman Kaur Fisher, Co-Chair
Jaime Martín Fernández, Discussant

Objective 1: Develop professional communication competencies
This objective will be tackled by engaging in workshop exercises of applied psychology research communication for different stakeholders. The activity will allow workshop participants to explore different communication tools and styles to communicate applied psychology research, transfer results and make impactful policy and practical implications for different agents, national institutions and organizations.
Expected outcome of this workshop will serve as a starting point of a template guidebook on communication in applied psychology research that will be a published resource on IAAP Division 15 website.
Objective 2. Increase engagement of early career members in IAAP
This aim will be achieved by networking and relationship building between division 15 members by elaborating a concrete action plan to foster the IAAP Strategic Goal 2. Increase the number and diversity of engaged members by improving the value and accessibility of IAAP. Division 15 Board will guide the workshop to ensure Division 15 members participation in the creation of the action plan. Some of the topics that will be tackled are members needs identification and improvement aspects of the onboarding process, interdivisional collaboration and mentoring initiatives in IAAP.
Expected outcome: an action plan to improve membership engagement and knowledge on how to become active in different ongoing IAAP projects.

Oltre il “gioca responsabilmente”: quali nuove strade per la tutela del consumatore nel mercato del gioco?
Financial literacy, consumer health e salute pubblica tra prevenzione, responsabilità d’impresa e policy

Thursday 23 July 2026 from 13:30 to 15:00

(Z-CASA ITALIA MINDLAB 2)

Il gioco d'azzardo sta attraversando una trasformazione profonda. La digitalizzazione, la crescente accessibilità dei prodotti, l'integrazione con piattaforme mobili, sport, media e sistemi di pagamento hanno modificato le condizioni entro cui il consumatore prende decisioni, gestisce il denaro e tenta di autoregolarsi. Nel panorama internazionale, il dibattito scientifico e istituzionale si sta progressivamente spostando da una lettura centrata sul solo "giocatore problematico" verso una prospettiva più ampia di salute pubblica e consumer health, in cui il danno da gioco viene compreso come esito dell'interazione sistemica tra vulnerabilità individuali, competenze, design dei prodotti, contesti commerciali, strumenti di tutela e responsabilità regolatoria.
In questa prospettiva, le aziende del gioco occupano una posizione centrale e ambivalente. Da un lato, rappresentano uno dei principali nodi critici del sistema, poiché progettano, distribuiscono e promuovono prodotti che possono intensificare accessibilità, continuità di gioco, coinvolgimento emotivo e rischio di perdita di controllo. Dall'altro lato, proprio perché detengono dati, infrastrutture tecnologiche, punti di contatto con i consumatori e capacità operative, possono diventare una risorsa strategica per la prevenzione, a condizione che il loro ruolo venga inserito entro partnership trasparenti, regolamentate ed evidence-based con istituzioni, servizi sanitari, enti di ricerca e policy maker. Questa ambivalenza si estende anche al livello istituzionale, poiché il mercato del gioco è un settore regolato da cui derivano rilevanti entrate pubbliche. Ne consegue una tensione strutturale tra interessi erariali, sostenibilità economica del comparto, responsabilità d'impresa e obiettivi di salute pubblica.
In questo scenario, il paradigma tradizionale del Responsible Gambling appare necessario ma non più sufficiente. Molti strumenti di tutela si fondano infatti sull'idea che il giocatore sia in grado di riconoscere tempestivamente il rischio, definire limiti, monitorare la spesa e interrompere il comportamento quando necessario. Tuttavia, proprio nei contesti di maggiore coinvolgimento, perdita o pressione emotiva, l'autocontrollo può diventare la risorsa più fragile. La domanda diventa quindi cruciale: possiamo continuare a immaginare il gioco responsabile prevalentemente come richiesta di autocontrollo individuale, o dobbiamo costruire condizioni, competenze e strumenti che rendano tale controllo realisticamente possibile?
La tavola rotonda intende affrontare questa domanda ponendo al centro il concetto di consumer health applicato al mercato del gioco. In particolare, verrà discusso il ruolo della financial literacy come competenza preventiva e protettiva: come una capacità integrata di comprendere rischio, probabilità, perdita, budget, aspettative di vincita e conseguenze finanziarie delle proprie decisioni. A partire da evidenze cross-culturali sul rapporto tra financial literacy, percezioni del rischio, autocontrollo e comportamenti di gioco, l'intervento proporrà una doppia logica di azione: da un lato, la prevenzione attraverso lo sviluppo di competenze finanziarie e decisionali; dall'altro, il ripensamento degli strumenti di gioco responsabile affinché non dipendano esclusivamente dalla capacità del singolo di autoregolarsi nel momento critico.

Il confronto coinvolgerà prospettive accademiche, aziendali, istituzionali e sanitarie, con l'obiettivo di discutere come aziende attive nel mercato del gioco, policy maker e sistemi di

cura possano contribuire a un modello di tutela più maturo, evidence-based e orientato al benessere.

Abstract 4951

OLTRE IL “GIOCA RESPONSABILMENTE”: QUALI NUOVE STRADE PER LA TUTELA DEL CONSUMATORE NEL MERCATO DEL GIOCO?
FINANCIAL LITERACY, CONSUMER HEALTH E SALUTE PUBBLICA TRA PREVENZIONE, RESPONSABILITÀ D’IMPRESA E POLICY

Barone C.*[1], Brambilla G.*[2], De Vita S.*[3], Graffigna G.*[1]

[1]Università Cattolica Sacro Cuore, Milano, [2]Open, [3]SISAL

Il gioco d’azzardo sta attraversando una trasformazione profonda. La digitalizzazione, la crescente accessibilità dei prodotti, l’integrazione con piattaforme mobili, sport, media e sistemi di pagamento hanno modificato le condizioni entro cui il consumatore prende decisioni, gestisce il denaro e tenta di autoregolarsi. Nel panorama internazionale, il dibattito scientifico e istituzionale si sta progressivamente spostando da una lettura centrata sul solo “giocatore problematico” verso una prospettiva più ampia di salute pubblica e consumer health, in cui il danno da gioco viene compreso come esito dell’interazione sistemica tra vulnerabilità individuali, competenze, design dei prodotti, contesti commerciali, strumenti di tutela e responsabilità regolatoria.

In questa prospettiva, le aziende del gioco occupano una posizione centrale e ambivalente. Da un lato, rappresentano uno dei principali nodi critici del sistema, poiché progettano, distribuiscono e promuovono prodotti che possono intensificare accessibilità, continuità di gioco, coinvolgimento emotivo e rischio di perdita di controllo. Dall’altro lato, proprio perché detengono dati, infrastrutture tecnologiche, punti di contatto con i consumatori e capacità operative, possono diventare una risorsa strategica per la prevenzione, a condizione che il loro ruolo venga inserito entro partnership trasparenti, regolamentate ed evidence-based con istituzioni, servizi sanitari, enti di ricerca e policy maker. Questa ambivalenza si estende anche al livello istituzionale, poiché il mercato del gioco è un settore regolato da cui derivano rilevanti entrate pubbliche. Ne consegue una tensione strutturale tra interessi erariali, sostenibilità economica del comparto, responsabilità d’impresa e obiettivi di salute pubblica.

In questo scenario, il paradigma tradizionale del Responsible Gambling appare necessario ma non più sufficiente. Molti strumenti di tutela si fondano infatti sull’idea che il giocatore sia in grado di riconoscere tempestivamente il rischio, definire limiti, monitorare la spesa e interrompere il comportamento quando necessario. Tuttavia, proprio nei contesti di maggiore coinvolgimento, perdita o pressione emotiva, l’autocontrollo può diventare la risorsa più fragile. La domanda diventa quindi cruciale: possiamo continuare a immaginare il gioco responsabile prevalentemente come richiesta di autocontrollo individuale, o dobbiamo costruire condizioni, competenze e strumenti che rendano tale controllo realisticamente possibile?

La tavola rotonda intende affrontare questa domanda ponendo al centro il concetto di

consumer health applicato al mercato del gioco. In particolare, verrà discusso il ruolo della financial literacy come competenza preventiva e protettiva: come una capacità integrata di comprendere rischio, probabilità, perdita, budget, aspettative di vincita e conseguenze finanziarie delle proprie decisioni. A partire da evidenze cross-culturali sul rapporto tra financial literacy, percezioni del rischio, autocontrollo e comportamenti di gioco, l'intervento proporrà una doppia logica di azione: da un lato, la prevenzione attraverso lo sviluppo di competenze finanziarie e decisionali; dall'altro, il ripensamento degli strumenti di gioco responsabile affinché non dipendano esclusivamente dalla capacità del singolo di autoregolarsi nel momento critico.

Il confronto coinvolgerà prospettive accademiche, aziendali, istituzionali e sanitarie, con l'obiettivo di discutere come aziende attive nel mercato del gioco, policy maker e sistemi di cura possano contribuire a un modello di tutela più maturo, evidence-based e orientato al benessere.

25 - Advanced Research Training Seminar

Advanced Research Training Seminar (ARTS) Symposium A

Thursday 23 July 2026 from 09:30 to 11:00

(U-Monumentale)

The Advanced Research Training Seminar (ARTS) is a flagship research program organized by the International Association of Applied Psychology, distinguished by its year-long format. Conceived as a capacity-building initiative held every four years in conjunction with the International Congress of Applied Psychology, ARTS has promoted excellence in research training and fostered international collaboration among early career researchers since its first edition in 1992.

The current edition brings together six outstanding international teams composed of early career psychologists and researchers from diverse cultural and academic backgrounds. In this symposium, three teams will present their research projects and key findings. The first presentation, led by Dr. Bada's team, examines the psychosocial barriers to well-being among emerging adults, with a particular focus on coping with depression and uncertainty in a rapidly changing world. The second presentation, by Dr. Iglesias's team, explores how faculty–student interactions influence university students' academic emotions and engagement in learning processes. Finally, Dr. Levin's team will present findings from a cross-cultural study investigating employee turnover, focusing on turnover motivations, leadership styles, and workplace retention.

Together, these presentations illustrate the diversity, international scope, and applied relevance of ARTS research, highlighting contemporary psychological challenges across educational, organizational, and well-being contexts.

25 - Advanced Research Training Seminar

Advanced Research Training Seminar (ARTS) Symposium B

Thursday 23 July 2026 from 11:00 to 12:30

(U-Monumentale)

The Advanced Research Training Seminar (ARTS) is a flagship research program organized by the International Association of Applied Psychology, distinguished by its year-long format. Conceived as a capacity-building initiative held every four years in conjunction with the International Congress of Applied Psychology, ARTS has promoted excellence in research training and fostered international collaboration among early career researchers since its first edition in 1992.

The current edition brings together six outstanding international teams composed of early career psychologists and researchers from diverse cultural and academic backgrounds. In this symposium, three teams will present their research projects and key findings. The first presentation, led by Dr. Ramanathan's team, examines the relationships among social identity, pro-environmental action, culture, and social contexts from a cross-national perspective. The second presentation, by Dr. Sadia's team, presents initial findings on risk and protective factors associated with child trauma and behavioural problems using a cross-cultural sample. Finally, Dr. Yilmaz's team explores the relationship between daily travel satisfaction, health, and well-being, drawing on findings from an international comparative study.
Together, these presentations highlight the diversity and global scope of ARTS research, emphasizing the importance of cross-cultural perspectives in addressing contemporary psychological and societal challenges.
