PEER REVIEWED CONFERENCE PROCEEDINGS

Section 1: Modelling and Simulation

Computational Intelligence Applied to the Mathematical Modeling of the Esterification of Fatty Acids with Sugars	2
Lorenzo G. Tonetti, Ruy de Sousa Jr.	
Numerical Analysis of the Hydrodynamics of Proximity Impellers using the SPH Method	8
Maria Soledad Hernández-Rivera, Karen Guadalupe Medina-Elizarraraz, Jazmín Cortez-González, Rodolfo Murrieta-Dueñas, Carlos E. Alvarado-Rodríguez, José de Jesús Ramírez-Minguela, Juan Gabriel Segovia Hernández	
Surrogate Modeling of Twin-Screw Extruders Using a Recurrent Deep Embedding Network.....	14
Po-Hsun Huang, David Shan-Hill Wong, Yen-Ming Chen, Chih-Yu Chen, Meng-Hsin Chen, Yuan Yao	
Dimple Shape Design to Enhance Heat Transfer in Plate Heat Exchangers	20
Mitchell J. Stolycia, Lande Liu	
Data-Driven Modelling of Biogas Production Using Multi-Task Gaussian Processes	26
Benaïssa Dekhici, Michael Short	
Synthesis of Liquid Mixture Separation Networks Using Multi-Material Membranes	33
Harshit Verma, Christos T. Maravelias	
Transferring Graph Neural Networks for Soft Sensor Modeling using Process Topologies	40
M.F. Theisen, G.M.H. Meesters, A.M. Schweidtmann	
Techno – Economic Evaluation of Incineration, Gasification, and Pyrolysis of Refuse Derived Fuel.....	46
Matej Koritár, Maroš Križan, Juma Haydary	
Dynamic Operability Analysis of modular heterogeneous electrolyzer plants using system co-simulation.....	53
Michael Große, Isabell Viedt, Hannes Lange, Leon Urbas	
High-pressure Membrane Reactor for Ammonia Decomposition: Modeling, Simulation and Scale-up using a Python-Aspen Custom Modeler Interface.	60
Leonardo A. C. Avilez, Antonio E. Bresciani, Claudio A. O. Nascimento, Rita M. B. Alves	
A 2D Axisymmetric Transient State CFD Modelling of a Fixed-bed Reactor for Ammonia Synthesis	67
Leonardo Bravo, Camilo Rengifo, Martha Cobo, Manuel Figueredo	

Kernel-based estimation of wind farm power probability density considering wind speed and wake effects due to wind direction	73
Samuel Martínez-Gutiérrez, Daniel Sarabia, Alejandro Merino	
Thermo-Hydraulic Performance of Pillow-Plate Heat Exchangers with Streamlined Secondary Structures: A Numerical Analysis	79
Reza Afsahnoudeh, Julia Riese, Eugeny Y. Kenig	
Optimisation of Biomass-Energy-Water-Food Nexus under Uncertainty	86
Md Shamsul Alam, I. David L. Bogle, Vivek Dua	
A Century of Data: Thermodynamics and Kinetics for Ammonia Synthesis on Various Commercial Iron-based Catalysts	92
Hilbert Keesstra, Yordi Slotboom, Kevin H.R. Rouwenhorst, Derk W.F. Brilman	
Reaction Pathway Optimization Using Reinforcement Learning in Steam Methane Reforming and Associated Parallel Reactions	98
Martín Rodríguez-Fragoso, Octavio Elizalde-Solis, Edgar Ramírez-Jiménez	
Integration of Yield Gradient Information in Numerical Modeling of the Fluid Catalytic Cracking Process	104
Wenle Xu, Baohua Chen, Tong Qiu	
Hybrid Modelling for Reaction Network Simulation in Syngas Methanol Production	111
Harry Kay, Fernando Vega-Ramon, Dongda Zhang	
Data-Driven Chance-Constrained Mixed Integer Nonlinear Bi-level Optimisation Via Copulas: Application To Integrated Planning And Scheduling Problems	117
Syu-Ning Johnn, Hasan Nikkhah, Meng-Lin Tsai, Styliani Avraamidou, Burcu Beykal, Vassilis M. Charitopoulos	
Diagnosing Faults in Wastewater Systems: A Data-Driven Approach to Handle Imbalanced Big Data	123
M. Zadkarami, K.V. Gernaey, A.A. Safavi, P. Ramin	
Modelling of a Heat Recovery System (HRS) Integrated with Steam Turbine Combined Heat and Power (CHP) Unit in a Petrochemical Plant	129
Daniel Sousa, Miguel Castro Oliveira, Maria Cristina Fernandes	
Integrating Thermodynamic Simulation and Surrogate Modeling to Find Optimal Drive Cycle Strategies for Hydrogen-Powered Trucks.....	135
Laura Stops, Alexander Stary, Johannes Hamacher, Daniel Siebe, Thomas Funke, Sebastian Rehfeldt, Harald Klein	
Wind Turbines Power Coefficient Estimation Using Manufacturer's Information and Real Data	141
Carlos Gutiérrez Ortega, Daniel Sarabia Ortiz, Alejandro Merino Gómez	
Leveraging Pilot-Scale Data for Real-Time Analysis of Ion Exchange Chromatography	147
Søren Villumsen, Jesper Frandsen, Jakob Kjøbsted Huusom, Xiaodong Liang, Jens Abildskov	
Model Based Flowsheet Studies on Cement Clinker Production Processes.....	153
George Melitos, Bart de Groot, Fabrizio Bezzo	
Techno-economic analysis of a novel small-scale blue H₂ and N₂ production system.....	159
Adrian R. Irhamna, George M. Bolas	
A Comparative Evaluation of Complexity in Mechanistic and Surrogate Modeling Approaches for Digital Twins	166
Shreyas Parbat, Isabell Viedt, Leon Urbas	

Co-gasification of Crude Glycerol and Plastic Waste using Air/Steam Mixtures: A Modelling Approach	173
Bahizire Martin Mukeru, Bilal Patel	
Automated Identification of Kinetic Models for Nucleophilic Aromatic Substitution Reaction via DoE-SINDy	179
Wenyao Lyu, Federico Galvanin	
System analysis and optimization of replacing surplus refinery fuel gas by coprocessing with HTL bio-crude off-gas in oil refineries.	186
Erik Lopez-Basto, Eliana Lozano Sanchez, Samantha Eleanor Tanzer, Andrea Ramirez Ramirez	
Surrogate Model-Based Optimization of Pressure-Swing Distillation Sequences with Variable Feed Composition.....	192
Laszlo Hegely, Peter Lang	
Economic Evaluation of Solvay Processes for Sodium Bicarbonate Production with Brine and Carbon Tax considerations	198
Dina Ewis, Zeyad M. Ghazi, Sabla Y. Alnouri, Muftah H. El-Naas	
Application of K-means for Identification of Multiphase Flows Based on Computational Fluid Dynamics	203
Patrick S. Lima, Leonardo S. Souza, Leizer Schnitman, Idelfonso B. R. Nogueira	
A New Method to Assess Performance Loss due to Catalyst Deactivation in Fixed- and Fluidized-bed Reactors	209
M. Andrea Pappagallo, Tilman J. Schildhauer, Oliver Kröcher, Emanuele Moioli	
Enhancing hydrodynamics simulations in Distillation Columns Using Smoothed Particle Hydrodynamics (SPH)	216
Rodolfo Murrieta-Dueñas, Jazmín Cortez-González, Roberto Gutiérrez-Guerra, Juan Gabriel Segovia Hernández, Carlos E. Alvarado-Rodríguez	
Kinetic Modelling and Optimisation of Co₂ Capture and Utilisation to Methane on Dual Function Material.....	222
Meshkat Dolat, Andrew D. Wright, Mohammadamin Zarei, Melis S. Duyar, Michael Short	
Data-Driven Dynamic Process Modeling Using Temporal RNN Incorporating Output Variable Autocorrelation and Stacked Autoencoder.....	229
Yujie Hu, Lingyu Zhu, Han Gong, Xi Chen	
Real-time carbon accounting and forecasting for reduced emissions in grid-connected processes.....	235
Rafael Castro-Amoedo, Alessio Santecchia, Henrique A. Matos, François Maréchal	
Twin Roll Press Washer Blockage Prediction: A Pulp and Paper Plant Case Study	241
Bryan Li, Isaac Severinsen, Wei Yu, Timothy Walmsley, Brent Young	
A Novel Bayesian Framework for Inverse Problems in Precision Agriculture	246
Zeyuan Song, Zheyu Jiang	
Role of process integration and green technologies utilization for the decarbonization of the watchmaking sector.	252
Pullah Bhatnagar, Daniel Florez-Orrego, Vibhu Baibhav, Manuele Margni, Francois Marechal	
Liquid Organic Hydrogen Carriers: comparing alternatives through H₂ equivalent analysis	258
Elvira Spatolisano, Federica Restelli, Laura A. Pellegrini	
Towards the Decarbonization of a Conventional Ammonia Plant by the Gradual Incorporation of Green Hydrogen.....	264
João Fortunato, Pedro M. Castro, Diogo A. C. Narciso, Henrique A. Matos	

Simulation and Experimental Validation of Biomass Gasification in a Spouted Bed Reactor: Troubleshooting Using DWSIM	271
C. Moliner, V. Carozzo, M. Curti, E. Arato	
Identification of Suitable Operational Conditions and Dimensions for Supersonic Water Separation in Exhaust Gases from Offshore Turbines: A Case Study	276
Jonatas de O. S. Cavalcante, Marcelo da C. Amaral, Ewerton E. da S. Calixto, Fernando L. P. Pessoa	
On Optimal Hydrogen Pathway Selection Using the SECA Multi-Criteria Decision-Making Method	282
Caroline Kaitano, Thokozani Majozi	
Energy Integration of an Intensified Biorefinery Scheme from Waste Cooking Oil to Produce Sustainable Aviation Fuel	288
Ma. Teresa Carrasco-Suárez, Araceli Guadalupe Romero-Izquierdo	
A Computational Framework for Cyclic Steady-State Simulation of Dynamic Catalysis Systems: Application to Ammonia Synthesis.....	294
Carolina Colombo Tedesco, John R. Kitchin, Carl D. Laird	
Comparative Analysis of Conventional and Novel Low-Temperature and Hybrid Technologies for Carbon Dioxide Removal from Natural Gas	301
Federica Restelli, Giorgia De Guido	
Development of a virtual CFD model for regulating temperature in a liquid tank	307
Jinxin Wang, Feng Xu, Yuka Sakai, Hisashi Takahashi, Ruizi Zhang, Hiroaki Kanayama, Daisuke Satou, Yasuki Kansha	
Accelerated Process Modelling for Light-Mediated Controlled Radical Polymerization	313
Rui Liu, Xi Chen, Antonios Armaou	
Plantwide Control of a Green Formic Acid Production Process.....	320
Mohammad Mahdi Ghasemi Aliabadi, Alexandros Anagnostou, Francia Gallardo Gonzalez, Shivam Pandey, Farzad Mousazadeh, Anton Kiss	
Energy Water Nexus Resilience Analysis Using Integrated Resource Allocation Approach	327
Hesan Elfaki, Mohammad Lameh, Dhabia M. Al-Mohannadi	
Technoeconomic Analysis of a Novel Amine-Free Direct Air Capture System Integrated with HVAC	333
Yasser M. Abdullatif, Ikhlas Ghiat, Riham Surkatti, Yusuf Bicer, Tareq Al-Ansar, Abdulkarem I. Amhamed	
Exploiting Operator Training Systems in chemical plants: learnings from industrial practice at BASF	339
Frederic Cuypers, Tom Boelen, Filip Logist	
Comparative Assessment of Aspen Plus Modeling Strategies for Biomass Steam Co-gasification	346
Usman Khan Jadoon, Ismael Díaz, Manuel Rodríguez	
Enhancing the Technical and Economic Performance of Proton Exchange Membrane Fuel Cells Through Three Critical Advancements	352
Željko Penga, Jure Penga, Yuanjing Zhao, Lei Xing	
Cell culture process dynamics and metabolic flux distributions using hybrid models	358
Rajiv Kailasanathan, Abhishek Sivaram, Seyed Soheil Mansouri	
Development and Integration of a Co-Current Hollow Fiber Membrane Unit for Gas Separation in Process Simulators Using CAPE-OPEN Standards	364
Loretta Salano, Ilaria Dagna, Mattia Vallerio, Flavio Manenti	

A Comparative Study of Aspen Plus and Machine Learning Models for Syngas Prediction in Biomass-Plastic Waste Co-gasification.....	370
Usman Khan Jadoon, Ismael Díaz, Manuel Rodríguez	
Multiscale Modeling of Internal Reforming in Solid Oxide Fuel Cells: A Study of Electrode Morphology and Gradient Microstructures.....	376
Hamid Reza Abbasi, Masoud Babaei, Constantinos Theodoropoulos	
Process simulation and thermodynamic analysis of newly synthesized pre-combustion CO₂ capture system using novel ionic liquids for H₂ production.....	382
Sadah Mohammed, Fadwa Eljack	
Mechanistic and Data-Driven Models for Predicting Biogas Production in Anaerobic Digestion Processes	388
Rohit Murali, Benaissa Dekhici, Tao Chen, Dongda Zhang, Michael Short	
Dynamic analysis for prediction of flow patterns in an oscillatory baffled reactor using machine learning.....	394
Hideyuki Matsumoto, Yuma Kambayashi, Shiro Yoshikawa, Shinichi Ookawara	
Comparative Analysis of PharmHGT, GCN, and GAT Models for Predicting LogCMC in Surfactants.	399
Gabriela C. Theis Marchan, Teslim Olayiwola, Jose Romagnoli	
Short-Cut Correlations for CO₂ Capture Technologies in Small-Scale Applications.....	406
So-mang Kim, Joanne Kalbusch, Grégoire Léonard	
Numerical Modelling of Carbon Dioxide Adsorption in Dual Function Materials: An CFD approach.....	412
Andrés F. Soto-Cañón, Rodinson R. Arrieta-Peréz, Camilo Rengifo, Martha Cobo, Manuel Figueredo	
Design Considerations for Hardware Based Acceleration of Molecular Dynamics	418
Joseph Middleton, Joan Cordiner	
An Automated CO₂ Capture Pilot Plant at ULiège: A Platform for the Validation of Process Models and Advanced Control.....	423
Cristhian Molina-Fernández, Patrick Kreit, Brieuc Beguin, Sofiane Bekhti, Cédric Calberg, Joanne Kalbusch, Grégoire Léonard	
New Directions and Software Tools Within the Process Systems Engineering Ecosystem.....	430
S. Burroughs, B. Lincoln, A. Adeel, I. Severinsen, A. Lee, O. Amusat, D. Gunter, B. Nicholson, M. Apperley, B. Young, J. Siirola, T. G. Walmsle	
Section 2: Sustainable Product Development and Process Design	
Steady-State Digital Twin Development for Heat and Shaft-Work Integration in a Dual-Stage Pressure Nitric Acid Plant Retrofit.....	438
Stanislav Boldyryev, Goran Krajacic	
Simulation of Decarbonization of Natural Gas to Methanol Conversion Process Using Microwave-Assisted Dry Reforming with Integrated Chemical Looping for Hydrogen Production.....	444
Omar Almaraz, Srinivas Palanki, Jianli Hu	
Modeling and Simulation of a Novel Process that Converts Low Density Polyethylene to Ethylene	450
Xiaoyan Wang, Omar Almaraz, Jianli Hu, Srinivas Palanki	
A global sensitivity analysis for a bipolar membrane electrodialysis capturing carbon dioxide from the air	456
Grazia Leonzio, Alexia Thill, Nilay Shah	

Intensified Alternative for Sustainable Gamma-Valerolactone Production from Levulinic Acid	462
Brenda Huerta-Rosas, Melanie Coronel-Muñoz, Juan José Quiroz-Ramírez, Carlos Rodrigo Caceres-Barrera, Gabriel Contreras-Zarazua, Juan Gabriel Segovia-Hernández, Eduardo Sánchez-Ramírez	
Environmental assessment of the catalytic arabinose oxidation	468
Mouad Hachhach, Dmitry Yu. Murzin, Tapio Salmi	
Green Industrial-Scale Plant Design for Syngas Fermentation to Isopropyl Alcohol and Acetone: Economic and Environmental Sustainability Assessment.....	473
Gijis J.A. Brouwer, Tamara Jankovic, Adrie J.J. Straathof, Anton A. Kiss, John A. Posada	
Energy Efficient Process Designs for Acrylonitrile Production by Propylene Ammoxidation.....	479
Qing Li, Alexandre C. Dimian, Anton A. Kiss	
Optimizing the Selection of Solvents for the Dissolution and Precipitation of Polyethylene.....	485
Riccardo Standish, Jian Yin, Mirjana Minceva, Jakob Burger, Amparo Galindo, George Jackson, Claire S. Adjiman	
Sustainable Downstream Process Design for HMF Conversion to Value-Added Chemicals.....	491
Norbert B. Mihály, Miruna Prodan, Vasile M. Cristea, Anton A. Kiss	
Solar Desalination and Porphyrin Mediated Visible-Light Photocatalysis in Decolouration of Dyes as Biological Analogues Applied in Advanced Water Treatment	497
Evans M. N. Chirwa, Bezza F. Andualem, Osemeikhain Ogbeifun, Shepherd M. Tichapondwa, Wesley Lawrence, Bonhle Manoto	
Technical Assessment of direct air capture using piperazine in an advanced solvent-based absorption process.....	503
Shengyuan Huang, Olajide Otitoju, Yao Zhang, Meihong Wang	
Valorization of refinery fuel gas and biogenic gases from thermochemical conversion into low-carbon methanol	509
Eliana Lozano Sanchez, Erik Lopez-Basto, Andrea Ramirez Ramirez	
System scale design and mesoscale modeling for natural gas dehydration process	515
Zhehao Jin, Zhongde Dai, Yiyang Dai	
Digital Twin supported Model-based Design of Experiments and Quality by Design.....	521
Amy Koch, Jessica Ebert, Isabell Viedt, Andreas Bamberg, Leon Urbas	
Sustainable Development Goals Assessment of Alternative Acetic Acid Synthesis Routes.....	528
Juan D. Medrano-García, Sachin Jog, Abhinandan Nabera, Gonzalo Guillén-Gosálbez	
Synergies Between the Distillation of First- and Second-Generation Sugarcane Ethanol for Sustainable Biofuel Production	534
Luiz M. Costa, Abhay Athaley, Zach Losordo, Adriano P. Mariano, John Posada, Lee R. Lynd	
Superstructure as a Communication Tool in Pre-Emptive Life Cycle Design Engaging Society: Findings from Case Studies on Battery Chemicals, Plastics, and Regional Resources.....	540
Yasunori Kikuchi, Ayumi Yamaki, Aya Heiho, Jun Nakatani, Shoma Fujii, Ichiro Daigo, Chiharu Tokoro, Shinsuke Murakami, Satoshi Ohara	
Integration of renewable energy and reversible solid oxide cells to decarbonize secondary aluminium production and urban systems	546
Daniel Flórez-Orrego, Dareen Dardor, Meire Ellen Ribeiro Domingos, Reginald Germanier, Francois Marechal	
Assessing the economic viability of green methanol production: The critical role of CO₂ purity in green methanol production	553
Franc González-Cazorla, Jordi Pujol, Oriol Martínez, Lluís Soler, Moisès Graells	

Gate-to-Gate Life Cycle Assessment of CO₂ Utilisation in Enhanced Oil Recovery: Sustainability and Environmental Impacts in Dukhan Field, Qatar	559
Razan Sawaly, Ahmad S. Abushaikha, Tareq Al-Ansari	
Sustainable Two-Column Design for the Separation of Ethyl Acetate, Methanol, and Water	565
Prakhar Srivastava, Nitin Kaistha	
Robust Flowsheet Synthesis for Ethyl Acetate, Methanol and Water Separation	571
Aayush Gupta, Kartavya Maurya, Nitin Kaistha	
Environmental Impacts of Trichlorosilane: Process Optimization, Life Cycle Assessment, and the Importance of Processing History	577
Ethan Errington, Deniz Etit, Tom Vinestock, Jaewook Lee, Jerry Heng, Miao Guo	
Sodium bicarbonate production from CO₂ captured in Waste-to-Energy plants: an Italian case-study.....	583
Elvira Spatolisano, Giorgia De Guido, Laura A. Pellegrini, Elena Riva Redolfi, Mauro Corradi, Davide Alberti, Adriano Carrara	
Modelling of the Co-precipitation of Ni-Mn-Co Hydroxides.	589
Erik G. Resendiz-Mora, Solomon F. Brown	
A System-Dynamics Based Approach for Modeling Circular Economy Networks: Application to the Polyethylene Terephthalate (PET) Supply Chain.....	595
Daniel Pert, Ana Inés Torres	
Sustainable production of L-lactic acid from lignocellulosic biomass using an alternative buffer system: Process development and techno-economic and environmental analysis.....	601
Donggeun Kang, Donghyeon Kim, Dongin Jung, Siuk Roh, Jiyong Kim	
Potential of chemical looping for green hydrogen production from biogas: process design and techno-economic-environmental analysis	607
Donghyeon Kim, Minseong Park, Donggeun Kang, Dongin Jung, Siuk Roh, Jiyong Kim	
Decarbonized Hydrogen Production: Integrating Renewable Energy into Electrified SMR Process with CO₂ Capture	613
Joohwa Lee, Haryn Park, Bogdan Dorneanu, Jin-Kuk Kim, Arellano-Garcia Harvey	
Assessing the Synergies of Thermochemical Energy Storage with Concentrated Solar Power and Carbon Capture	619
Nitin Dhananjey R, Ishan Bajaj	
Modelling of Wood Biomass Gasification for Process Optimization.....	625
Yu Hui Kok, Yasuki Kansha	
Optimal Design and Analysis of Thermochemical Storage and Release of Hydrogen via the Reversible Redox of Iron Oxide/Iron.....	631
Richard Yentumi, Constantin Jurischka, Bogdan Dorneanu, Harvey Arellano-Garcia	
Robust pharmaceutical tableting process through combined probabilistic design space and flexibility analysis	637
Ashish Yewale, Xuming Yuan, Brahim Benyahia	
Separation Sequencing in Batch Distillation: An Extension of Marginal Vapor Rate Method.....	644
Prachi Sharma, Sujit S. Jogwar	
Steel Plant Electrification: A Pathway to Sustainable Production and Carbon Reduction	651
Rachid Klaimi, Sabla Y. Alnouri, Vladimir Stijepovic, Aleksa Miladinovic, Mirko Stijepovic	

Conceptual design of energy storage systems for continuous operations in renewable-powered chemical processes.....	656
Andrea Isella, Alfonso Pascarella, Angelo Matichecchia, Raffaele Ostuni, Davide Manca	
Olefins production through sustainable pathways: techno-economic and environmental assessment	662
Oktay Boztas, Meire E. G. R. Domingos, Daniel A. Flórez-Orrego, François Maréchal	
Integrating Chemical Recycling into Brownfield Processes: Waste Polyethylene Pyrolysis and Naphtha Steam Cracking	668
Marc Caballero, Thanyanart Sroisamut, Anton A. Kiss, Ana Somoza-Tornos	
Integrated LCA and Eco-design Process for Hydrogen Technologies: Case Study of the Solid Oxide Electrolyser	674
Gabriel Magnaval, Tristan Debonnet, Manuele Margni	
Assessing Distillation Processes through Sustainability Indicators Aligned with the Sustainable Development Goals	681
Ömer Faruk Karaman, Peter Lang, Laszlo Hegely	
Integrating Direct Air Capture and HVAC Systems: An Economic Perspective on Cost Savings	687
Ikhlas Ghiat, Yasser M. Abdullatif, Yusuf Bicer, Abdulkarem I. Amhamed, Tareq Al-Ansari	
Insights on CO₂ Utilization through Reverse Water Gas Shift Reaction in Membrane Reactors: A Multi-scale Mathematical Modeling Approach.....	692
Zhaofeng Li, Anan Uziri, Zahir Aghayev, Burcu Beykal, Michael Patrascu	
Optimized integration strategies for the PMR-based H₂ production with CO₂ capture process	698
Donghoi Kim, Zhongxuan Liu, Rahul Anantharaman, Thijs A. Peters, Truls Gundersen	
Design and Cost Analysis of a Reactive Distillation Column to Produce Ethyl Levulinate Using Excess Levulinic Acid.....	704
Igor F. Fioravante, Riann de Q. Nóbrega, Rubens Maciel Filho, Jean F. Leal Silva	
Section 3: Large Scale Design and Planning/Scheduling	
Analysis for CFD of the Claus Reaction Furnace with Operating Conditions: Temperature and Excess Air for Sulfur Recovery	711
Pablo Vizguerra Morales, Miguel Ángel Morales Cabrera, Fabian S. Mederos Nieto	
A Transparent Techno-Enviro-Economic Assessment of a Coal-Fired Power Plant: Integrating Biomass Co-Firing and CO₂ Sequestration Technology in a Carbon-Priced Environment	717
N. F. E. Nor Fadzil, N. Abdul Manaf, N. Shah	
Genetic Algorithm-Driven Design of CCUS and Hydrogen Pipeline Networks: Decentralised Expansion with Complex Geographical Constraints.....	723
Joseph Hammond, Solomon Brown	
A Forest Biomass-to-Hydrogen Supply Chain Mathematical Model for Optimizing Carbon Emissions and Economic Metrics	729
Frank Piedra-Jimenez, Rishabh Mehta, Valeria Larnaudie, Maria Analia Rodriguez, Ana Inés Torres	
A Novel Detailed Representation of Batch Processes for Production Scheduling.....	735
Alexandros Koulouris, Georgios P. Georgiadis	
Enhancing Large-Scale Production Scheduling Using Machine-Learning Techniques	741
Maria E. Samouilidou, Nikolaos Passalis, Georgios P. Georgiadis, Michael C. Georgiadis	

Multiscale analysis through the use of biomass residues and CO₂ towards energetic security at country scale via methane production	747
Guillermo Galán, Manuel Taifouris, Mariano Martín, Ignacio E. Grossmann	
Integrating Time-Varying Environmental Indicators into an Energy Systems Modeling and Optimization Framework for Enhanced Sustainability.....	753
Marco P. De Sousa, Rahul Kakodkar, Betsie M. Flores, Saatvi Suresh, Harsh B. Shah, Dustin Kenefake, Iosif Pappas, Xiao Fu, Doga C. Demirhan, Brianna Ruggiero, Mete Mutlu, Efstratios N. Pistikopoulos	
Modular and Heterogeneous Electrolysis Systems: a System Flexibility Comparison.....	759
Hannes Lange, Michael Große, Isabell Viedt, Leon Urbas	
Methods for Efficient Solutions of Spatially Explicit Biofuels Supply Chain Models	765
Phuc M. Tran, Eric G. O'Neill, Christos T. Maravelias	
Integrating Carbon Value Vectors in the Energy and Materials Transition Nexus: A Case Study on Mobility Optimization.....	771
Betsie S. M. Montano Flores, Rahul Kakodkar, Marco P. De Sousa, Shayan S. Niknezhad, Efstratios N. Pistikopoulos	
Assessing Operational Resilience Within the Natural Gas Monetisation Network for Enhanced Production Risk Management: Qatar as a Case Study.....	778
Noor Yusuf, Ahmed AlNouss, Roberto Baldacci, Tareq Al-Ansari	
Minimization of Hydrogen Consumption via Optimization of Power Allocation Between the Stacks of a Dual-Stack Fuel Cell System	785
Beril Tümer, Deniz Sanli Yildiz, Yaman Arkun	
A Novel Global Sequence-based Mathematical Formulation for Energy-efficient Flexible Job Shop Scheduling Problem.....	791
D. Li, T.C. Zheng, J. Li	
Materials-Related Challenges of Energy Transition	798
Fatemeh Rostami, Piera Patrizio, Laureano Jimenez, Carlos Pozo, Niall Mac Dowell	
A Modern Portfolio Theory Approach for Chemical Production with Supply Chain Considerations for Efficient Investment Planning	805
Mohamad Almuoussaoui, Dhabia M. Al-Mohannadi	
Optimization models and algorithms for the Unit Commitment problem	812
Javal Vyas, Carl Laird, Ignacio E. Grossmann, Ricardo M. Lima, Iiro Harjunoski, Jan Poland	
Development of a hybrid, semi-parametric Simulation Model of an AEM Electrolysis Stack Unit for large-scale System Simulations	818
Isabell Viedt, Michel Große (né Mock), Leon Urbas	
Energy system modelling for studying flexibility on industrial sites	824
Jon Vegard Venås, Lucas Ferreira Bernardino, Kasper Emil Thorvaldsen, Sigrid Aunsmo, Sigmund Eggen Holm, Halvor Aarnes Krog, Ove Wolfgang, Ingeborg Treu Røe	
An MIQCP Reformulation for the Optimal Synthesis of Thermally Coupled Distillation Networks	831
Kevin Pfau, Arsh Bhatia, Carl D. Laird, George Ostace, Goutham Kotamreddy	
Multi-objective Optimization of Steam Cracking Microgrid for Clean Olefins Production.....	837
Saba Ghasemi Naraghi, Tylee Kareck, Zheyu Jiang	

Pareto optimal solutions for decarbonization of oil refineries under different electricity grid decarbonization scenarios.....	844
Keerthana Karthikeyan, Sampri Chatto padhyay, Rahul Gandhi, Ignacio E Grossmann, Ana I Torres	
Green Hydrogen Transport across the Mediterranean Sea: A Comparative Study of Liquefied Hydrogen and Ammonia as Carriers	850
Federica Restelli, Elvira Spatolisano, Laura A. Pellegrini	
Integrating offshore wind energy into the optimal deployment of a hydrogen supply chain: a case study in Occitanie	856
Melissa Cherrouk, Catherine Azzaro-Pantel, Florian Dupriez Robin, Marie Robert	
Optimisation Under Uncertain Meteorology: Stochastic Modelling of Hydrogen Export Systems.....	863
Cameron Aldren, Nilay Shah, Adam Hawkes	
Process integration and waste valorization for sustainable biodiesel production toward a transportation sector energy transition	869
Vibhu Baibhav, Daniel Florez Orrego, Pullah Bhatnagar, Francois Maréchal	
Optimization-based planning of carbon-neutral strategy: Economic priority between CCU vs CCS	876
Siuk Roh, Chanhee You, Woochang Jeong, Donggeun Kang, Dongin Jung, Donghyun Kim, Jiyong Kim	
Joint Optimization of Fair Facility Allocation and Robust Inventory Management for Perishable Consumer Products.....	882
Saba Ghasemi Naraghi, Zheyu Jiang	
A two-level model to assess the economic feasibility of renewable urea production from agricultural waste... 888	
Diego C. Lopes, Moisés Teles dos Santos	
Evolutionary Algorithm Based Real-time Scheduling via Simulation-Optimization for Multiproduct Batch Plants.....	894

Flow Simulation of Plastic Life Cycle Considering Carbon Renewability and Environmental Impact	906
Kota Chida, Heng Yi Teah, Yuichiro Kanematsu, Yasunori Kikuchi	
A Digital Scheduling Hub for Natural Gas Processing: a Petrobras Case-Study Using Rigorous Process Simulation	912
Tayná E. G. Souza, Letícia C. dos Santos, Caio R. Soares	
Temporal Decomposition Scheme for Designing Large-Scale CO₂ Supply Chains Using a Neural Network-Based Model for Forecasting CO₂ Emissions	918
José A. Álvarez-Mencheró, Rubén Ruiz-Femenia, Raquel Salcedo-Díaz, Isabela Fons Moreno-Palancas, José A. Caballero	
Agent-Based Simulation of Integrated Process and Energy Supply Chains: A Case Study on Biofuel Production.....	924
Farshid Babaei, David B. Robins, Robert Milton, Solomon F. Brown	
Comparison of optimization methods for studying the energy mix of infrastructures. Application to an infrastructure in Oise, France	930
Julien JEAN VICTOR, Zakaria A. SOULEYMANE, Augustin MPANDA, Philippe TRUBERT, Laurent FONTANELLI, Sébastien POTEL, Arnaud DUJANY	

Integration of MILP and Discrete-Event Simulation for Flowshop Scheduling Using Benders Decomposition ...	936
Roderich Wallrath, Edwin Zondervan, Meik B. Franke	
A Blockchain-Supported Framework for Transparent Resource Trading and Emission Management in Eco-Industrial Parks (EIPs)	942
Manar Y. Oqbi, Dhabia M. Al-Mohannadi	
Section 4: Model Based Optimisation and Advanced Control	
Implementation and assessment of fractional controllers for an extractive distillation system	950
Luis R. Flores-Gómez, Fernando I. Gómez-Castro, Francisco López-Villarreal, Vicente Rico-Ramírez	
Refinery Optimal Transitions by Iterative Linear Programming	956
Michael Mulholland	
Optimization Of Heat Exchangers Through an Enhanced Metaheuristic Strategy: The Success-Based Optimization Algorithm	962
Oscar D. Lara-Montaña, Fernando I. Gómez-Castro, Claudia Gutiérrez-Antonio, Elena N. Dragoi	
Production scheduling based on Real-time Optimization and Zone Control Nonlinear Model Predictive Controller	968
José Matias, Alvaro Acevedo	
A simple model for control and optimisation of a produced water re-injection facility	974
Rafael D. De Oliveira, Edmary Altamiranda, Gjermund Mathisen, Johannes Jäschke	
Design of Process Systems for Flexibility and Resilience Using Multi-Parametric Programming	980
Natasha J. Chrisandina, Eleftherios Iakovou, Efstratios N. Pistikopoulos, Mahmoud M. El-Halwagi	
Learning-based Control Approach for Nanobody-scorpion Antivenom Optimization	986
Juan Camilo Acosta-Pavas, David Camilo Corrales, Susana María Alonso Villela, Balkiss Bouhaouala-Zahar, Georgios Georgakilas, Konstantinos Mexis, Stefanos Xenios, Theodore Dalamagas, Antonis Kokossis, Michael O'donohue, Luc Fillaudeau, César Arturo Aceves-Lara	
Safe Bayesian Optimization in Process System Engineering	993
Donggyu Lee, Ehecatl Antonio del Rio Chanona	
Multi-Model Predictive Control of a Distillation Column	999
Mehmet Arici, Wachira Daosud, Jozef Vargan, Miroslav Fikar	
Optimal Design of Extraction-Distillation Hybrid Processes by Combining Equilibrium and Rate-Based Modeling.....	1005
Kai F. Kruber, Anjali Kabra, Lukas Polte, Andreas Jupke, Mirko Skiborowski	
Advanced Regulatory Control Structure for Proton Exchange Membrane Water Electrolysis Systems.....	1011
Marius Fredriksen, Johannes Jäschke	
Design of Microfluidic Mixers using Bayesian Shape Optimization	1017
Rui Fonseca, Fernando Bernardo	
Probabilistic Model Predictive Control for Mineral Flotation using Gaussian Processes.....	1023
Victor Dehon, Paulina Quintanilla, Antonio Del Rio Chanona	
A Bayesian optimization approach for data-driven Petlyuk distillation column	1029
Alexander Panales-Pérez, Antonio Flores-Tlacuahuac, Luis Fabián Fuentes-Cortés, Miguel Angel Gutierrez-Limon, Mauricio Sales-Cruz	

Accelerating Solvent Design Optimisation with Group-Contribution Machine Learning Surrogate Classifiers	1035
Lifeng Zhang, Benoît Chachuat, Claire S. Adjiman	
Machine Learning-Aided Robust Optimisation for Identifying Optimal Operational Spaces under Uncertainty	1041
Sam Kay, Mengjia Zhu, Amanda Lane, Jane Shaw, Philip Martin, Dongda Zhang	
Enhancing Energy Efficiency of Industrial Brackish Water Reverse Osmosis Desalination Process using Waste Heat.....	1047
Alanood A. Alsarayreh, Mudhar A. Al-Obaidi, Iqbal M. Mujtaba	
Optimization of Heat Transfer Area for Multiple Effects Desalination (MED) Process.....	1053
Salih M. Alsadaie, Sana I. Abukanisha, Amhamed A. Omar, Iqbal M. Mujtaba	
Physics-based and data-driven hybrid modelling and dynamic adaptive multi-objective optimization of chemical reactors for CO₂ capture via enhanced weathering	1059
Yalun Zhao, Jin Xuan, Lei Xing	
Integrating Dynamic Risk Assessment with Explicit Model Predictive Control via Chance-Constrained Programming	1065
Sahithi Srijana Akundi, Yuanxing Liu, Austin Braniff, Beatriz Dantas, Shayan S Niknezhad, Faisal Khan, Yuhe Tian, Efstratios N Pistikopoulos	
Analysis of Control Properties as a Sustainability Indicator in Intensified Processes for Levulinic Acid Purification.....	1071
Tadeo E. Velázquez-Sámano, Heriberto Alcocer-García, Eduardo Sánchez-Ramírez, Carlos R. Caceres-Barrera, Juan G. Segovia-Hernández	
Systematic design of structured packings based on shape optimization	1077
Alina Dobschall, Elvis Michaelis, Mirko Skiborowski	
Enhancing Consumer Engagement in Plastic Waste Reduction: A Stackelberg Game	1083
Chunyan Si, Yee Van Fan, Monika Dokl, Lidija Cucek, Zdravko Kravanja, Petar Sabev Varbanov	
Utilizing ML Surrogates in CAPD: Case Study of an Amine-based Carbon-Capture Process.....	1089
Florian Baakes, Gustavo Chaparro, Thomas Bernet, George Jackson, Amparo Galindo, Claire S. Adjiman	
Evaluation of the Controllability of Distillation with Multiple Reactive Stages.....	1095
Josué J. Herrera Velázquez, J. Rafael Alcántara Avila, Salvador Hernández, Julián Cabrera Ruiz	
Revenue Optimization for Dynamic Operation of a Hybrid Solar Thermal Power Plant	1101
Dibyajyoti Baidya, Mani Bhushan, Sharad Bhartiya	
Control of the WWTP Water Line Using Traditional and Model Predictive Approaches	1108
Gheorghe A. Bodescu, Romina G. Daraban, Norbert B. Mihály, Castelia E. Cristea, Elisabeta C. Timiş, Anton A. Kiss, Vasile M. Cristea	
Optimization of the Power Conversion System for a Pulsed Fusion Power Plant with Multiple Heat Sources using a Dynamic Process Model	1114
Oliver M. G. Ward, Federico Galvanin, Nelia Jurado, Daniel Blackburn, Robert J. Warren, Eric S. Fraga	
Optimization of steam power systems in industrial parks considering the distributed heat supply and auxiliary steam turbines	1120
Lingwei Zhang, Yufei Wang	
Optimisation of a Haber-Bosch Synthesis Loop for PtA	1126
Joachim W. Rosbo, Anker D. Jensen, John B. Jørgensen, Sigurd Skogestad, Jakob. K. Huusom	

Data-Driven Reinforcement Learning for Greenhouse Temperature Control	1133
Farhat Mahmood, Sarah Namany, Rajesh Govindan	
Aotearoa-New Zealand's Energy Future: A Model for Industrial Electrification through Renewable Integration.....	1139
Daniel J S Chong, Timothy G Walmsley, Martin J Atkins, Botond Bertok, Michael RW Walmsley	
Non-Linear Model Predictive Control for Oil Production in Wells Using Electric Submersible Pumps	1145
Carine Menezes Rebello, Erbet Almeida Costa, Marcos Pellegrini Ribeiro, Marcio Fontana, Leizer Schnitman, Idelfonso Bessa dos Reis Nogueira	
MORL4PC: Multi-Objective Reinforcement Learning for Process Control	1151
Niki Kotecha, Max Bloor, Calvin Tsay, Antonio del Rio Chanona	
Extremum seeking control applied to operation of dividing wall column – DWC	1157
Ivar J. Halvorsen, Leontine I.M. Aarnoudse, Mark A.M. Haring, Sigurd Skogestad	
Modeling, Simulation and Optimization of a Carbon Capture Process Through a TSA Column	1163
Eduardo S. Funcia, Yuri S. Beleli, Enrique V. Garcia, Marcelo M. Seckler, José L. Paiva, Galo A. C. Le Roux	
Safe Reinforcement Learning with Lyapunov-Based Constraints for Control of an Unstable Reactor	1169
José R. Torracca Neto, Bruno D. O. Capron, Argimiro R. Secchi, Antonio d.R. Chanona	
Cost-effective Process Design and Optimization for Decarbonized Utility Systems Integrated with Renewable Energy and Carbon Capture Systems	1175
Haryn Park, Joohwa Lee, Bogdan Dorneanu, Havey Arellano-Garcia, Jin-Kuk Kim	
A Subset Selection Strategy for Gaussian Process Q-Learning of Process Optimization and Control	1181
Maximilian Bloor, Tom Savage, Calvin Tsay, Ehecatl Antonio Del Rio Chanona, Max Mowbray	
Optimal Operation of Middle Vessel Batch Distillation using Model Predictive Control.....	1187
Surendra Beniwal, Sujit S. Jogwar	
Perturbation Methods for Modifier Adaptation with Quadratic Approximation.....	1194
Mohamed Aboelnour, Sebastian Engell	
Optimal Energy Scheduling for Battery and Hydrogen Storage Systems Using Reinforcement Learning	1201
Moritz Zebenholzer, Lukas Kasper, Alexander Schirrer, René Hofmann	
Recurrent Deep Learning Models for Multi-step Ahead Prediction: Comparison and Evaluation for Real Electrical Submersible Pump (ESP) System.....	1208
Vinicius V. Santana, Carine M. Rebello, Erbet A. Costa, Odilon S. L. Abreu, Galdir Reges, Téofilo P. G. Mendes, Leizer Schnitman, Marcos P. Ribeiro, Márcio Fontana, Idelfonso Nogueira	
Enhanced Computational Approach for Simulation and Optimisation of Vacuum (Pressure) Swing Adsorption	1214
Yangyanbing Liao, Andrew Wright, Jie Li	
NLP Deterministic Optimization of Shell and Tube Heat Exchangers with Twisted Tape Turbulence Promoters.....	1221
Jamel Eduardo Rumbo-Arias, Fabián Pino, Martin Picón-Nuñez, Fernando Israel Gómez-Castro, Jorge Luis García-Castillo	
Optimizing Methane Conversion in a Flow Reactor System Using Bayesian Optimization and Model-Based Design of Experiments Approaches: A Comparative Study	1228
Michael Aku, Solomon Gajere Bawa, Arun Pankajakshan, Lauren Ye Seol Lee, Federico Galvanin	

A Decomposition Approach to Feasibility for Decentralized Operation of Multi-stage Processes	1237
Ekundayo Olorunshe, Nilay Shah, Benoît Chachuat, Max Mowbray	
Simulation and Optimisation of Cryogenic Distillation and Isotopic Equilibrator Cascades for Hydrogen Isotope Separation Processes in the Fusion Fuel Cycle	1244
Emma A. Barrow, Iryna Bennett, Franjo Cecelja, Eduardo Garciadiego-Ortega, Megan Thompson, Dimitrios Tsaoulidis	
Efficient approximation of the Koopman operator for large-scale nonlinear systems.....	1251
Gajanand Verma, William Heath, Constantinos Theodoropoulos	
Optimal Control of PSA Units Based on Extremum Seeking	1257
Beatriz C. da Silva, Ana M. Ribeiro, Alexandre F.P. Ferreira, Diogo Rodrigues, Idelfonso B.R. Nogueira	
Machine Learning-Based Soft Sensor for Hydrogen Sulfide Monitoring in the Gas Treatment Section of an Industrial-Scale Oil Regeneration Plant.....	1263
Luis F. Sánchez, Eva C. Coelho, Francesco Negri, Francesco Gallo, Mattia Vallerio, Henrique A. Matos, Flavio Manenti	
Principles and Applications of Model-free Extremum Seeking – A Tutorial Review	1269
Laurent Dewasme, Alain Vande Wouwer	
Updated-Absolute Expected Value Solution Approach for multistage stochastic programming problems.....	1275
Yasuhiro Shoji, Selen Cremaschi	
Section 5: Concepts, Methods and Tools	
A Python/Numpy-based package to support model discrimination and identification.....	1282
Seyed Zuhair Bolourchian Tabrizi, Elena Barbera, Wilson Ricardo Leal da Silva, Fabrizio Bezzo	
The Paradigm of Water and Energy Integration Systems (WEIS): Methodology and Performance Indicators...	1288
Miguel Castro Oliveira, Rita Castro Oliveira, Pedro M. Castro, Henrique A. Matos	
Comparison of Multi-Fidelity Modelling Methods for Bayesian Optimization.....	1294
Stefan Tönnis, Luise F. Kaven, Eike Cramer	
AutoJSA: A Knowledge-Enhanced Large Language Model Framework for Improving Job Safety Analysis.....	1300
Shuo Xu, Jinsong Zhao	
Refrigerant Selection and Cycle Design for Industrial Heat Pump Applications exemplified for Distillation Processes.....	1306
Jonas Schnurr, Momme Adami, Mirko Skiborowski	
Companies' Operation and Trading Strategies under the Triple Trading and Gaming of Electricity, Carbon Quota and Commodities: A Game Theory Optimization Modeling.....	1312
Chenxi Li, Nilay Shah, Zheng Li, Pei Liu	
Design of Experiments Algorithm for Comprehensive Exploration and Rapid Optimization in Chemical Space.....	1318
Kazuhiro Takeda, Masaru Kondo, Muthu Karuppasamy, Mohamed S. H. Salem, Shinobu Takizawa	
Multi-Objective Optimization and Analytical Hierarchical Process for Sustainable Power Generation Alternatives in the High Mountain Region of Santurbán: case of Pamplona, Colombia	1324
Nicolas Cabrera, A.M Rosso-Cerón, Viatcheslav Kafarov	

A Comparison of Robust Modeling Approaches to Cope with Uncertainty in Independent Terms, considering the Forest Supply Chain Case Study	1330
Frank Piedra-Jimenez, Ana Inés Torres, Maria Analia Rodriguez	
Introducing Competition in a Multi-Agent System for Hybrid Optimization	1336
Veerawat Udomvorakulchai, Miguel Pineda, Eric S. Fraga	
A Component Property Modeling Framework Utilizing Molecular Similarity for Accurate Predictions and Uncertainty Quantification	1342
Youquan Xu, Zhijiang Shao, Anjan K. Tula	
Phenomena-Based Graph Representations and Applications to Chemical Process Simulation	1348
Yoel R. Corte´s-Pen, Victor M. Zava	
A Benchmark Simulation Model of Ammonia Production: Enabling Safe Innovation in the Emerging Renewable Hydrogen Economy	1354
Niklas Groll, Gürkan Sin	
Bayesian uncertainty quantification of graph neural networks using stochastic gradient Hamiltonian Monte Carlo	1360
Qinghe Gao, Daniel C. Miedema, Yidong Zhao, Jana M. Weber, Qian Tao, Artur M. Schweidtmann	
pyDEXPI: A Python framework for piping and instrumentation diagrams (P&IDs) using the DEXPI information model	1365
Dominik P. Goldstein, Lukas Schulze Balhorn, Achmad Anggawirya Alimin, Artur M. Schweidtmann	
Kolmogorov Arnold Networks (KANs) as surrogate models for global process optimization	1371
Tanuj Karia, Giacomo Lastrucci, Artur M. Schweidtmann	
Redefining Stage Efficiency in Liquid-Liquid Extraction: Development and Application of a Modified Murphree Efficiency	1377
Mahdi Mousavi, Ville Alopaeus	
A Stochastic Techno-Economic Assessment of Emerging Artificial Photosynthetic Bio-Electrochemical Systems for CO2 Conversion	1383
Haris Saeed, Aidong Yang, Wei Huang	
Soft-Sensor-Enhanced Monitoring of an Alkylation Unit via Multi-Fidelity Model Correction	1389
Rastislav Fáber, Marco Vaccari, Riccardo Bacci di Capaci, Karol Lubušký, Gabriele Pannocchia, Radoslav Paulen	
Differentiation between Process and Equipment Drifts in Chemical Plants	1396
Linda Eydam, Lukas Furtner, Julius Lorenz, Leon Urbas	
Enhanced Reinforcement Learning-driven Process Design via Quantum Machine Learning	1403
Austin Braniff, Fengqi You, Yuhe Tian	
Comparative and Statistical Study on Aspen Plus Interfaces Used for Stochastic Optimization	1409
Josué J. Herrera Velázquez, Erik L. Piñón Hernández, Luis A. Vega Vega, Dana E. Carrillo Espinoza, J. Rafael Alcántara Avila, Julián Cabrera Ruiz	
Handling discrete decisions in bilevel optimization via neural network embeddings	1415
Isabela Fons Moreno-Palancas, Raquel Salcedo Díaz, Rubén Ruiz Femenia, José A. Caballero	
Linear and non-linear convolutional approaches and XAI for spectral data: classification of waste lubricant oils	1421
Ruben Gariso, João P. L. Coutinho, Tiago J. Rato, Marco S. Reis	

Unveiling Probability Histograms from Random Signals using a Variable-Order Quadrature Method of Moments	1427
Menwer Attarakih, Mark W. Hlawitschka, Linda Al-Hmoud, and Hans-Jörg Bart	
Sensitivity Analysis of Key Parameters in LES-DEM Simulations of Fluidized Bed Systems Using Generalized Polynomial Chaos	1433
Radouan Boukharfane, Nabil El Moçayd	
An Efficient Convex Training Algorithm for Artificial Neural Networks by Utilizing Piecewise Linear Approximations and Semi-Continuous Formulations	1438
Ece S. Köksal, Erdal Aydın, Metin Türkay	
A combined approach to optimization of soft sensor architecture and physical sensor configuration.....	1445
Lukas Furtner, Isabell Viedt, Leon Urbas	
Flexibility Assessment via Affine Bounds Evaluation.....	1450
Diogo A. C. Narciso, Steven Sachio, Maria M. Papathanasiou	
A Novel Objective Reduction Algorithm for Nonlinear Many-Objective Optimization Problems	1456
Hongxuan Wang, Andrew Allman	
Applying Quality by Design to Digital Twin Supported Scale-Up of Methyl Acetate Synthesis.....	1462
Jessica Ebert, Amy Koch, Isabell Viedt, Leon Urbas	
Tune Decomposition Schemes for Large-Scale Mixed-Integer Programs by Bayesian Optimization.....	1468
Guido Sand, Sophie Hildebrandt, Sina Nunes, Chung-On Yip, Meik Franke	
A Superstructure Approach for Optimization of Simulated Moving Bed (SMB) Chromatography	1474
Eva Sorensen, Dian Ning Chia, Fanyi Duanmu	
Development of anomaly detection models independent of noise and missing values using graph Laplacian regularization	1480
Yuna Tahashi, Koichi Fujiwara	
A Modelling and Simulation Software for Polymerization with Microscopic Resolution	1486
Shenhua Jiao, Xiaowen Lin, Rui Liu, Xi Chen	
Interval Hessian-based Optimization Algorithm for Unconstrained Non-convex Problems.....	1492
Ashutosh Sharma, Gauransh Dingwani, Ishan Bajaj	
Design Space Exploration via Gaussian Process Regression and Alpha Shape Visualization	1498
Elizaveta Marich, Andrea Galeazzi, Steven Sachio, Foteini Michalopoulou, Maria M. Papathanasiou	
Langmuir.jl: An Efficient and composable Julia Package for Adsorption Thermodynamics	1505
Vinicius Santana, Andrés Riedemann, Pierre J. Walker, Idelfonso Nogueira	
Systematic comparison between Graph Neural Networks and UNIFAC-IL for solvent pre-selection in liquid-liquid extraction	1512
Edgar Ivan Sanchez Medina, Ann-Joelle Minor, Kai Sundmacher	
Knowledge Discovery in Large-Scale Batch Processes through Explainable Boosted Models and Uncertainty Quantification: Application to Rubber Mixing.....	1518
Louis Berthier, Ahmed Shokry, Eric Moulines, Guillaume Ramelet, Sylvain Desroziers	
Electricity Bidding with Variable Loads.....	1524
Iiro Harjunkoski	

Nonmyopic Bayesian process optimization with a finite budget	1530
José L. Pitarch, Leopoldo Armesto, Antonio Sala	
Life-Cycle Assessment of Chemical Sugar Synthesis Based on Process Design for Biomanufacturing	1536
Hiro Tabata, Satoshi Ohara, Yuichiro Kanematsu, Heng Yi Teah, Yasunori Kikuchi	
Decision Support Tool for Sustainable Small to Medium-Volume Natural Gas Utilization	1542
Patience B. Shamaki, Pedro H. Callil-Soares, Galo A. C. Le Roux	
Enhancing Batch Chemical Manufacturing via Development of Deep Learning based Predictive Monitoring with Transfer Learning	1548
Hong Yee Hung, Zhao Jinsong	
Prospective Life Cycle Design Enhanced by Computer Aided Process Modeling: A Case Study of Air Conditioners	1555
Shoma Fujii, Yuko Oshita, Ayumi Yamaki, Yasunori Kikuchi	
Solving Complex Combinatorial Optimization Problems Using Quantum Annealing Approaches	1561
Vasileios K. Mappas, Bogdan Dorneanu, Harvey Arellano-Garcia	
A Propagated Uncertainty Active Learning Method for Bayesian Classification Problems	1567
Arun Pankajakshan, Sayan Pal, Maximilian O. Besenhard, Asterios Gavrilidis, Luca Mazzei, Federico Galvanin	
Optimizing Individual-based Modelling: A Grid-based Approach to Computationally Efficient Microbial Simulations	1573
Ihab Hashem, Jian Wang, Jan F.M. Van Impe	
A data-driven hybrid multi-objective optimization framework for pressure swing adsorption systems	1579
Siyang Ma, Jie Li	
Multi-Objective Optimization for Sustainable Design of Power-to-Ammonia Plants.....	1586
Andrea Isella, Davide Manca	
Global Robust Optimisation for Non-Convex Quadratic Programs: Application to Pooling Problems.....	1592
Asimina Marousi, Vassilis M. Charitopoulos	
GRAPSE: Graph-Based Retrieval Augmentation for Process Systems Engineering.....	1598
Daniel Ovalle, Arpan Seth, John R. Kitchin, Carl D. Laird, Ignacio E. Grossmann	
A Fault Detection Method Based on Key Variable Forecasting	1605
Borui Yang, Jinsong Zhao	
Optimizing Industrial Heat Electrification: Balancing Cost and Emissions.....	1612
Soha Mousa, Dhabia Al-Mohannadi	
Assessing Triviality in Random Mixed-Integer Bilevel Optimization Problems to Improve Problem Generators and Libraries.....	1618
Meng-Lin Tsai, Styliani Avraamidou	
Integration of Graph Theory and Machine Learning for Enhanced Process Synthesis and Design of Wastewater Transportation Networks.....	1625
Andres Castellar-Freile, Jean Pimentel, Alec Guerra, Pratap Kodate, Kirti M. Yenkie	
A Framework Utilizing a Seamless Integration of Python with AspenPlus® for a Multi-Criteria Process E valuation.....	1631
Simon Maier, Julia Weyand, Ginif Kaur, Oliver Erdmann, Ralph-Uwe Dietrich	

Section 6: Digitalization and AI

Optimal Design of Process Equipment Through Hybrid Mechanistic-ANN Models: Effect of Hybridization	1638
Zaira Jelena Mosqueda-Huerta, Oscar Daniel Lara-Montaño, Fernando Israel Gómez-Castro, Manuel Toledano-Ayala	
Modelling of a Propylene Glycol Production Process With Artificial Neural Networks: Optimization of the Architecture	1644
Emilio Alba-Robles, Oscar Daniel Lara-Montaño, Fernando Israel Gómez-Castro, Jahaziel Alberto Sánchez-Gómez, Manuel Toledano-Ayala	
Developing a Digital Twin System Based on a Physics-informed Neural Network for Pipeline Leakage Detection.....	1650
Wei-Shiang Lin, Yi-Hsiang Cheng, Zhen-Yu Hung, Yuan Yao	
Rule-Based Autocorrection of Piping and Instrumentation Diagrams (P&IDs) on Graphs	1656
Lukas Schulze Balhorn, Niels Seijsener, Kevin Dao, Minji Kim, Dominik P. Goldstein, Ge H. M. Driessen, Artur M. Schweidtmann	
Thermodynamics-informed Graph Neural Networks for Phase Transition Enthalpies	1662
Roel Leenhouts, Sebastien Jankelevitch, Roel Raike, Simon Müller, Florence Vermeire	
Automated Interpretation of Chemical Engineering Diagrams Using Computer Vision	1670
Maged Eid, Giancarlo Dalle Ave	
Talking like Piping and Instrumentation Diagrams (P&IDs)	1676
Achmad Anggawirya Alimin, Dominik P. Goldstein, Lukas Schulze Balhorn, Artur M. Schweidtmann	
Hybrid machine-learning for dynamic plant-wide biomanufacturing	1682
Shabnam Shahhoseyni, Arijit Chakraborty, Mohammad Reza Boskabadi, Venkat Venkatasubramanian, Seyed Soheil Mansouri	
Leveraging Machine Learning for Real-Time Performance Prediction of Near Infrared Separators in Waste Sorting Plant	1688
Imam M. Iqbal, Xinyu Wang, Isabell Viedt, Leonhard Urbas	
Exploring Industrial Text Data for Monitoring Chemical Manufacturing Processes.....	1694
Eugeniu Strelet, Ivan Castillo, You Peng, Swee-Teng Chin, Anna Zink, Ricardo Rendall, Marco S. Reis	
Optimal Design and Control of Chemical Reactors using PINN-based frameworks	1700
Isabela Fons Moreno-Palancas, Raquel Salcedo Díaz, Rubén Ruiz Femenia, José A. Caballero	
Text2Model: Generating dynamic chemical reactor models using large language models (LLMs)	1706
Sophia Rupprecht, Yassine Hounat, Monisha Kumar, Giacomo Lastrucci, Artur M. Schweidtmann	
Enhancing Fault diagnosis for Chemical Processes via MSCNN with Hyperparameters Optimization	1712
Jingkang Liang, GürkanSin	
Picard-KKT-hPINN: Enforcing Nonlinear Enthalpy Balances for Physically Consistent Neural Networks	1718
Giacomo Lastrucci, Tanuj Karia, Zoë Gromotka, Artur M. Schweidtmann	
AI-Driven Automatic Mechanistic Model Transfer Learning for Accelerating Process Development	1724
Alexander W. Rogers, Amanda Lane, Philip Martin, Dongda Zhang	
Industrial Time Series Forecasting for Fluid Catalytic Cracking Process	1730
Qiming Zhao, Yaning Zhang, Tong Qiu	
A White-Box AI Framework for Interpretable Global Warming Potential Prediction	1737
Jaewook Lee, Ethan Errington, Miao Guo	

Computational Assessment of Molecular Synthetic Accessibility using Economic Indicators.....	1744
Friedrich Hastedt, Klaus Hellgardt, Sophia Yaliraki, Antonio del Rio Chanona, Dongda Zhang	
A Physics-Informed Approach to Dynamic Modeling and Parameter Estimation in Biotechnology	1750
Konstantinos Mexis, Stefanos Xenios, Nikolaos Trokanas, Antonis Kokossis	
Physics-Informed Automated Discovery of Kinetic Models	1756
Miguel Ángel de Carvalho Servia, Ilya Orson Sandoval, King Kuok (Mimi) Hii, Klaus Hellgardt, Dongda Zhang, Ehecatl Antonio del Rio Chanona	
Empowering LLMs for Mathematical Reasoning and Optimization: A Multi-Agent Symbolic Regression System.....	1762
Shaurya Vats, Sai Phani Chatti, Aravind Devanand, Sandeep Krishnan, Rohit Karanth Kota	
Application of Artificial Intelligence in process simulation tool.....	1769
Nikhil Rajeev, Suresh Jayaraman, Prajnan Das, Srividya Varada	
Hybrid Models Identification and Training through Evolutionary Algorithms.....	1775
Ulderico Di Caprio, M. Enis Leblebici	
Physics-Informed Graph Neural Networks for Modeling Spatially Distributed Dynamically Operated Processes.....	1781
Md Meraj Khalid, Luisa Peterson, Edgar Ivan Sanchez Medina, Kai Sundmacher	
Network Theoretical Analysis of the Reaction Space in Biorefineries.....	1787
Jakub Kontak, Jana M. Weber	
Structural Optimization of Translucent Monolith Reactors through Multi-objective Bayesian Optimization.....	1794
Onur C. Boy, Ulderico Di Caprio, Idelfonso B.R. Nogueira, M. Enis Leblebici	
A Novel Symbol Recognition Framework for Digitization of Piping and Instrumentation Diagrams.....	1800
Zhiyuan Li, Jinsong Zhao, Huahui Zhou, Xiaoxin Hu	
Enhancing Predictive Maintenance in Used Oil Re-Refining: a Hybrid Machine Learning Approach.....	1806
Francesco Negri, Andrea Galeazzi, Francesco Gallo, Flavio Manenti	
An Integrated Machine Learning Framework for Predicting HPNA Formation in Hydrocracking Units Using Forecasted Operational Parameters.....	1812
Pelin Dologlu, Ibrahim Bayar	
Optimization of Shell and Tube Heat Exchangers Using Reinforcement Learning	1818
Luana P. Queiroz, Olve R. Bruaset, Ana M. Ribeiro, Idelfonso B. R. Nogueira	
Multi-Agent LLMs for Automating Sustainable Operational Decision-Making	1824
Emma Pajak, Abdullah Bahamdan, Klaus Hellgardt, Antonio del Río-Chanona	
On the role of artificial intelligence in feature oriented multi-criteria decision analysis.....	1830
Heyuan Liu, Yi Zhao, Francois Maréchal	
Selection of Fitness Criteria for Learning Interpretable PDE Solutions via Symbolic Regression	1837
Benjamin G. Cohen, Burcu Beykal, George M. Bollas	
Towards Self-Tuning PID Controllers: A Data-Driven, Reinforcement Learning Approach for Industrial Automation	1843
Kyle Territo, Peter Vallet, Jose Romagnoli	

CompArt: Next-Generation Compartmental Models for Complex Systems Powered by Artificial Intelligence	1849
Antonello Raponi, Zoltan Nagy	
ML-based adsorption isotherm prediction of metal-organic frameworks for carbon dioxide and methane separation adsorbent screening.....	1854
Dongin Jung, Hyeon Yang, Donggeun Kang, Donghyeon Kim, Siuk Roh, Jiyong Kim	
Data-Driven Soft Sensors for Process Industries: Case Study on a Delayed Coker Unit	1860
Wei Sun, James G. Brigman, Cheng Ji, Pratap Nair, Fangyuan Ma, Jingde Wang	
Streamlining Catalyst Development through Machine Learning: Insights from Heterogeneous Catalysis and Photocatalysis	1866
Parisa Shafiee, Mitra Jafari, Julia Schowarte, Bogdan Dorneanu, Harvey Arellano-Garcia	
A Novel Approach to Gradient Evaluation and Efficient Deep Learning: A Hybrid Method	1872
Bogdan Dorneanu, Vasileios K. Mappas, Harvey Arellano-Garcia	
A Comparative Analysis of Industrial MLOps prototype for ML Application Deployment at the edge devices ..	1878
Fatima Rani, Fenin Jose, Lucas Vogt, Leonhard Urbas	
The Smart HPLC Robot: Fully Autonomous Method Development Guided by A Mechanistic Model Framework	1884
Dian Ning Chia, Fanyi Duanmu, Luca Mazzei, Eva Sorensen, Maximilian O. Besenhard	
Predicting Surface Tension of Organic Molecules using COSMO-RS Theory and Machine Learning	1890
Flora Esposito, Ulderico Di Caprio, Bruno Rodrigues, Florence H. Vermeire, Idelfonso B.R. Nogueira, M.Enis Leblebici	
Hybrid model development for Succinic Acid fermentation: relevance of ensemble learning for enhancing model prediction	1896
Juan Federico Herrera-Ruiz, Javier Fontalvo, Oscar Andrés Prado-Rubio	
Reinforcement learning for distillation process synthesis using transformer blocks.....	1902
N. Slager, M.B. Franke	
Physics-informed Data-driven control of Electrochemical Separation Processes	1908
Teslim Olayiwola, Kyle Territo, Jose Romagnoli	
A Novel AI-Driven Approach for Parameter Estimation in Gas-Phase Fixed-Bed Experiments	1915
Rui D. G. Matias, Alexandre F.P. Ferreira, Idelfonso B.R. Nogueira, Ana M. Ribeiro	
Section 7: CAPEing with Societal Challenges (Green Deal, Energy Transition)	
Engineering the Final Frontier: The Role of Chemical and Process Systems Engineering in Space Exploration	1922
Edwin Zondervan	
Green Solvent Alternative for Extractive Distillation of 1,3-Butadiene	1928
João P. Gomes, Rodrigo Silva, Clemente Nunes, Domingos Barbosa	
Modelling and Analysis of CO2 Electrolyzers Integrated with Downstream Separation Processes via Heat Pumps	1934
Riccardo Dal Mas, Andrea Carta, Ana Somoza-Tornos, Anton A. Kiss	
Optimization of Sustainable Fuel Station Retrofitting: A Set-Covering Approach considering Environmental and Economic Objectives.....	1940
Daniel Vázquez, Raul Calvo-Serrano	

Optimizing Heat Recovery: Advanced Design of Integrated Heat Exchanger Networks with ORCs and Heat Pumps.....	1946
Zinet Mekidiche, Juan A. Labarta, José A. Caballero	
CO2 recycling plant for decarbonizing hard-to-abate industries: Empirical modelling and Process design of a CCU plant- A case study.	1951
Jose Antonio Abarca, Stephanie Arias-Lugo, Lucia Gomez-Coma, Guillermo Diaz-Sainz, Angel Irabien	
Techno-economic Assessment of Sustainable Aviation Fuel Production via H2/CO2-Based Methanol Pathway.....	1957
Pierre Guilloteau, Hugo Silva, Anders Andreasen, Niklas Groll, Anker Degn Jensen, Gürkan Sin	
Assessing the Environmental Impact of Global Hydrogen Supply through the Lens of Planetary Boundaries...	1963
Jesmyl-Elisa Cordova-Cordova, Carlos Pozo	
Integration of Direct Air Capture with CO₂ Utilization Technologies powered by Renewable Energy Sources to deliver Negative Carbon Emissions	1969
Calin-Cristian Cormos, Arthur-Maximilian Báthori, Angéla-Mária Kasza, Maria Mihet, Letitia Petrescu, Ana-Maria Cormos	
Towards Sustainable Processing Of Municipal Household Organic Waste: The Role Of Energy Mix Grids.....	1975
Christian Ottini, Gwenola Yannou-Le Bris, Sandra Domeneck, Felipe Buendia	
Repurposing Existing Combined Cycle Power Plants with Methane Production for Renewable Energy Storage.....	1981
Diego Santamaría, Antonio Sánchez, Mariano Martín	
On the Economic Uncertainty and Crisis Resiliency of Decarbonization Solutions for the Aluminium Industry	1987
Dareen Dardor, Daniel Flórez-Orrego, Reginald Germanier, Manuele Margni, François Maréchal	
A Data-Driven Conceptual Approach to Heat Pump Sizing in Chemical Processes with Fluctuating Heat Supply and Demand.....	1994
Thorben Hochhaus, Johannes Wloch, Marcus Grünewald, Julia Riese	
Optimization of prospective circular economy in sewage sludge to biofuel production pathways via hydrothermal liquefaction using P-graph	2000
Safdar Abbas, Paraskevi Karka, Stavros Papadokonstantakis	
Model-based Operability and Safety Optimization for PEM Water Electrolysis	2007
Beatriz Dantas, Sahithi S. Akundi, Yuanxing Liu, Austin Braniff, Shayan S. Niknezhad	
Multi-Stakeholder Optimization for Identification of Relevant Life Cycle Assessment Endpoint Indicators.....	2013
Dat Huynh, Oluwadare Badejo, Borja Hernández, Marianthi Ierapetritou	
Lignocellulosic Waste Supply Chain Network Design for Sustainable Aviation Fuels Production through Solar Pyrolysis	2019
Stavroula Zervopoulou, Stavros Papadokonstantakis, Mika Järvinen, Muddasser Inayat	
Resource and Pathways Analysis for Decarbonizing the Pulp and Paper Sector in Quebec	2026
Marie-Hélène Talbot, Mélissa Lemire	
Methanol and Ammonia as Green Fuels and Hydrogen Carriers: A Comparative Analysis for Fuel Cell Power Generation	2032
Antonio Sánchez, Elena C. Blanco, Mariano Martín	
The Green Hydrogen Supply Chain in The Brazilian State of Bahia: A Deterministic Approach	2038
Leonardo O. S. de Santana, Gustavo S. dos Santos, Fernando L. P. Pessoa, Ana P. Barbosa-Póvoa	

Design of a policy framework in support of the Transformation of the Dutch Industry	2044
Jan van Schijndel, Rutger de Mare, Nort Thijssen, Jim van der Valk Bouman

Introduction

Jan Van Impe, Grégoire Léonard, Satyajeet Sheetal Bhonsale, Monika Polanska, and Filip Logist (eds)

The 35th European Symposium on Computer Aided Process Engineering (ESCAPE|35) was held at KU Leuven/Campus Gent, Belgium, July 6–9, 2025. Continuing a tradition that began in 1991 under the auspices of the EFCE Working Party on Computer Aided Process Engineering (CAPE), the ESCAPE series stands as a premier annual event for the global Process Systems Engineering (PSE) community. ESCAPE returned to Belgium for the second time - following the 1998 edition in Bruges - and took place as part of KU Leuven's 600th anniversary celebrations. The 35th edition was organised jointly by KU Leuven/BioTeC+ and University of Liège/PEP.

The 2025 conference embraced the theme "Closing the Loop 2.0", underscoring the evolving role of PSE in enabling a circular economy. The program highlighted both core process engineering disciplines – such as modeling, control, design, and optimization – and cutting-edge approaches involving artificial intelligence, machine learning, and quantum computing, applied across diverse sectors including energy, chemicals, biotechnology, and advanced materials.

ESCAPE|35 received 673 abstract submissions, of which 563 were invited for a 5-to-8-page full paper or a 2-page short paper after a first review round. Upon rigorous re-review of all papers submitted, 423 full paper contributions have been published in full open access (and LAPSE and DOI indexed) by PSE Press as a separate volume of the *Systems & Control Transactions* series. Another 140 contributions have been made available as two pages short papers published by EUROSIS-ETI.

The scientific contributions were organized into thematic sessions, poster presentations, workshops, and demonstrations, within ten thematic tracks:

- T01: Modelling and Simulation
- T02: Sustainable Product Development and Process Design
- T03: Large Scale Design and Planning/Scheduling
- T04: Model-Based Optimisation and Advanced Control
- T05: Concepts, Methods and Tools
- T06: Digitalization and AI
- T07: CAPEing with Societal Challenges (Green Deal, Energy Transition, ...)
- T08: CAPE Education and Knowledge Transfer
- T09: PSE4Food and Biochemical (*new in 2025*)
- T10: PSE4BioMedical and (Bio)Pharma (*new in 2025*)

Tracks T09 and T10 were introduced in this year's edition to broaden the application scope of PSE methods in food, biochemical, (bio)pharma and biomedical systems - fields of increasing relevance to the community.

We extend our sincere thanks to all authors, reviewers, topic coordinators, plenary and keynote speakers, and members of the Scientific and Organizing Committees. We gratefully acknowledge KU Leuven and University of Liège for their support and express our heartfelt appreciation to our numerous sponsors. This edition also marks the inaugural collaboration with PSE Press as the official publisher of the ESCAPE proceedings (full papers volume) - a milestone in promoting high-quality, open access dissemination of PSE research. Many thanks to EUROSIS-ETI as well for publishing the short papers volume, ISBN indexed.

We hope these volumes capture the scientific excellence, collaborative spirit, and forward-looking vision that defined ESCAPE|35 and continue to serve as a valuable reference for researchers and practitioners in the years ahead.

ESCAPE|35 - European Symposium on Computer Aided Process Engineering

Ghent, Belgium. 6-9 July 2025

Peer Review Policy

TERMINOLOGY

- **Conference Paper:** This is a peer-reviewed research paper describing an **original** research contribution and published in the conference proceedings.

APPLICATION

- All conference papers are subject to peer review.

PUBLICATIONS

- All conference papers which have passed peer review and have been accepted by the conference chairs will be published in the conference proceedings.

PEER REVIEW PROCESS

Initial Screening

The conference chairs will screen the initial submissions (one-page abstracts) of contributed papers. At their option, chairs may choose to reject these submissions for any reason, but the primary reasons for rejection at this stage are (a) subject does not match conference themes and topics; (b) in appropriate, unprofessional, unethical, or dishonest material; (c) duplicate submissions; (d) abandoned submissions; (e) multiple submissions from same presenter; (f) obvious poor quality; (g) reasonable suspicion of machine-generated text; (h) need to limit acceptances because of conference space constraints. Chairs may also transfer papers between sessions at this stage.

Conference chairs will then invite authors of the one-page abstracts that have passed the initial screening to submit a conference paper for peer review.

Conference Paper Peer Review

Conference chairs act as editors. They will assign peer reviewers to assess the quality of the conference papers and manage the peer review process for each paper. Peer reviewers are generally selected from the International Scientific Committee who are scientists, engineers, or researchers with technical expertise in the conference topic. Peer reviewers must be considered technical experts in their field, hold a PhD, and have published peer reviewed scientific works previously. Each work must be reviewed by a minimum of two peer-reviewers.

A “single-blind” peer review system is used, in which the peer reviewers have access to the identities of the authors, but the authors are never given the identities of the peer reviewers. This is consistent with most journal peer-review procedures in our field.

Peer reviewers will be given a set of quality criteria that may include scientific and technical quality, quality of writing, originality and novelty, appropriateness for the conference topic and theme, interest to the community, and other factors of merit. Peer reviewers are expected to be rigorous and critical in their technical assessments and adhere to the highest standards in the field in order to ensure high quality. Peer reviewers are asked to comment on their assigned conference papers and issue a recommendation to the conference chairs based on this quality criteria. Reviewers may recommend one of the following:

- **Accept Paper.** No technical changes are necessary before publication. Only typographical, spelling, grammar, or other minor changes are necessary which do not require technical review.
- **Accept Paper with Minor Revisions.** Some minor technical issues need to be addressed either through technical changes to the manuscript or through rebuttal to reviewer comments. The reviewer does not believe the issues are significant enough to require additional technical review by the reviewers. The reviewer has provided enough commentary such that the editor can decide if the minor issues have been addressed in a future revision.
- **Revise Paper with Re-Review.** Major technical issues need to be addressed either through technical changes

to the manuscript or through rebuttal to reviewer comments. The reviewer believes the issues are significant enough to require that the revised manuscript receive additional review by the reviewers.

- **Reject Without Reconsideration.** The technical issues are so significant that it is unlikely that an acceptable manuscript could be produced by the deadline; or, the manuscript is out of scope, inappropriate, or computer-generated.

Peer reviewers may be asked to provide numerical scores or rankings, as well as provide written comments intended for the chairs and/or the authors. Peer reviewers are encouraged to provide specific and constructive feedback that will aid the authors in improving the work and provide advice to the chairs.

The conference chairs are responsible for making the final decision on each paper and may require several rounds of author changes if necessary to meet quality standards. Conference chairs are not required to follow the recommendations of the peer reviewers in making these decisions. It is possible that conference chairs will choose to not accept some papers that still pass through rigorous technical peer review, especially when limited by available space or when papers do not sufficiently promote conference objectives. Conference chairs may also transfer papers between sessions as desired.

CONFLICTS OF INTEREST AND ETHICAL GUIDELINES

The chairs and peer reviewers must ensure they do not have a conflict of interest that may bias their decisions, such as ensuring that authors are at “arm’s length” and have no financial conflicts of interest. Peer reviewers and chairs must disclose if they have such a conflict of interest with a specific submission, and if so, a different chair and/or peer reviewer should be assigned to handle that submission.

To help determine conflicts of interest, and for all other ethical guidelines, we use the Systems and Control Transactions ethical guidelines described at: <https://psecommunity.org/contributor-guidelines>

ABSTRACT

Green hydrogen is widely recognized as a key player in the decarbonization of the energy system. To transport it efficiently, hydrogen must be converted into a carrier, such as liquefied hydrogen or ammonia, to increase its volumetric density. The supply chain of these carriers includes hydrogen conversion into the carrier, overseas transport, and carrier reconversion back to hydrogen. A case study involving hydrogen transportation across the Mediterranean Sea is used to evaluate the carrier efficiency. The processes involved in the supply chain are simulated in Aspen Plus® V11 to determine material and energy balances, and the "net equivalent hydrogen" method is applied to calculate the equivalent amount of hydrogen needed to supply thermal or electric power. The efficiency, defined as the ratio of net hydrogen delivered (after accounting for consumption and boil-off losses) to the initial hydrogen input, is higher for ammonia than for liquefied hydrogen (73% vs 60%, respectively). This advantage lies in the lower overall hydrogen consumption for ammonia synthesis and cracking compared to liquefaction.

Keywords: green hydrogen, green ammonia, liquefied hydrogen, hydrogen carrier, energy efficiency

INTRODUCTION

Green hydrogen is commonly regarded as a key player in the transition towards a low-carbon future [1]. It can be efficiently produced in regions with abundant renewable resources, which are often remote and distant from major consumption centers. Therefore, the efficient and cost-effective transportation of H₂ from production hubs to end users is essential. However, H₂ has an extremely low volumetric density at ambient conditions. To overcome this issue, hydrogen carriers, such as liquefied hydrogen (LH₂) and ammonia (NH₃), are being explored for its transportation on a large-scale [1].

This study assesses the energy consumption involved in the supply chain of these carriers, focusing on the processes of converting hydrogen into the carrier and reconverting it back to hydrogen. For LH₂, these processes involve hydrogen liquefaction and regasification, while for NH₃, they include ammonia synthesis and cracking. The simulations are conducted using Aspen Plus®

V11 [2] to determine the material and energy balances. The analysis adopts the "net equivalent hydrogen" method, which is analogous to the widely used "net equivalent methane" method [3]. This approach assesses the equivalent amount of hydrogen that would need to be burned to power specific equipment. By using this unified energy basis, the method allows for a fair comparison between different processes.

METHODS

The case study considered is for green hydrogen transportation across the Mediterranean Sea [1]. The feed hydrogen conditions are assigned in terms of temperature ($T_{in} = 25\text{ °C}$), pressure ($P_{in} = 20\text{ bar}$) and flowrate ($F_{in} = 1,800\text{ kg/h}$), which resemble the conditions at the outlet of an alkaline electrolyzer. The H₂ is converted into the considered carrier, transported overseas covering a distance of 2,500 km, and finally reconverted to H₂ at the utilization site. The conditions of the delivered hydrogen

are selected based on the requirements for industrial application. Therefore, the H₂ purity is 99.9 mol% and the pressure is 30 bar.

The energy analysis is based on the “net equivalent hydrogen” (NEH) method, which evaluates the equivalent amount of hydrogen that would need to be burned to power specific equipment. The Net Equivalent Hydrogen Delivered (*NEHD*) is then calculated by subtracting both the Net Equivalent Hydrogen Consumed (*NEHC*) and the hydrogen lost due to the boil-off phenomenon during shipping (*F_{lost}*) from the total hydrogen fed into the plant:

$$NEHD = F_{in} - NEHC - F_{lost} \quad (1)$$

The energy interactions can be categorized in:

- heating below ambient temperature,
- cooling above ambient temperature,
- heating above ambient temperature,
- cooling below ambient temperature,
- supplying of electrical power.

According to the methodology described by Pellegrini et al. [3], heating below ambient temperature (< 25 °C) and cooling above ambient temperature (> 25 °C) do not consume hydrogen since service water can be used to provide or remove heat, respectively. In the studied processes, heating above ambient temperature is achieved, where feasible, by coupling process streams. When this is not possible, heating is supplied by burning the hydrogen carrier (hydrogen, ammonia, and their mixtures) as a fuel with air in a furnace. In this case the Net Equivalent Hydrogen Consumed for heating (*NEHC_{he}*) is related to the hydrogen content of the fuel mixture and is computed as:

$$NEHC_{he} = F_{fuel} \cdot w_{hydrogen} \quad (2)$$

where *F_{fuel}* is the flowrate of the carrier used as fuel, and *w_{hydrogen}* is the weight fraction of hydrogen in the fuel. Cooling below ambient temperature is accomplished through heat exchange with fluids flowing in refrigeration cycles. Therefore, the hydrogen consumed is indirectly linked to the electric power required to operate the compressors in these cycles. The Net Equivalent Hydrogen Consumed for supplying electric power (*NEHC_{el}*), used for driving compressors and pumps, is computed assuming hydrogen utilization in fuel cells with an efficiency *η_{FC}* of 60%:

$$NEHC_{el} = \frac{W}{\eta_{FC} \cdot LHV} \quad (3)$$

where *W* is the electric power consumption, and *LHV* is the lower heating value of hydrogen.

The efficiency of the value chain (*η*) is then computed as the ratio between the *NEHD* and the hydrogen feed flow rate:

$$\eta = \frac{NEHD}{F_{in}} \quad (4)$$

A schematic of the hydrogen carrier supply chain is depicted in Figure 1.

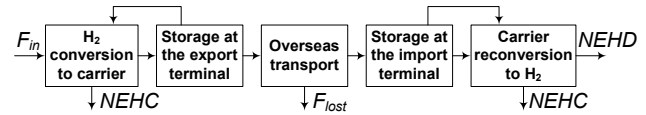

Figure 1. Schematic of the hydrogen carrier supply chain.

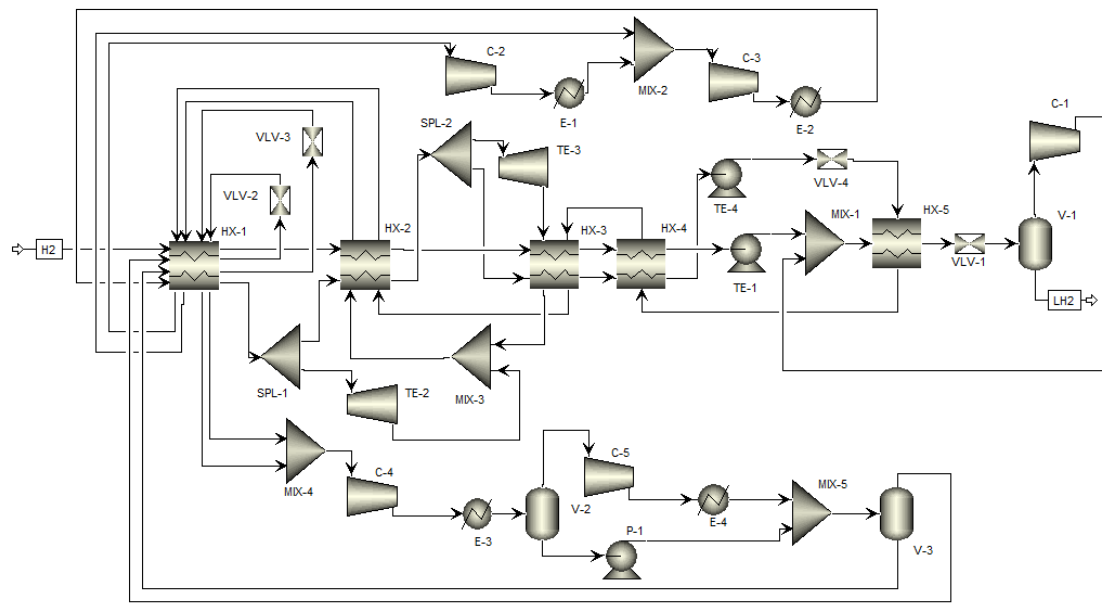

PROCESS SIMULATION

The processes involved in the LH₂ and NH₃ value chains are simulated using Aspen Plus® V11 [2] to obtain material and energy balances, necessary for the NEH assessment. It is supposed that the impurities in the hydrogen feed have been removed before the hydrogen enters the processes. Heat exchangers' pressure drops are neglected. An isentropic efficiency of 0.8 is assumed for pumps, compressors and turbine expanders, unless otherwise stated.

Liquefied hydrogen supply chain

Hydrogen liquefaction process

The hydrogen liquefaction process involves cooling hydrogen gas to extremely low temperatures until it transitions from gas to liquid. This happens at about -250 °C at atmospheric pressure. The process typically includes a precooling section, where nitrogen or other refrigerants are used to remove heat, and a cryogenic section, where further cooling happens using Joule-Thomson expansion or other cryogenic methods until hydrogen reaches its liquefaction point. Various process configurations have been explored in the literature. Among them, the process described by Cardella [4], which employs a mixed refrigerant Joule-Thomson cycle for precooling and a dual-pressure hydrogen Claude cycle for cryogenic cooling, stands out as the most balanced in terms of complexity and specific electricity consumption for the small-capacity plant under consideration [5]. For simulating this process, the Peng-Robinson thermodynamic package, modified as detailed in [6], is used to account for the behavior of equilibrium hydrogen and to model continuous ortho-para hydrogen conversion, which is achieved by packing a suitable catalyst within the tubes carrying the processed hydrogen. The Process Flow Diagram (PFD) is depicted in Figure 2a. The hydrogen stream (H₂ in Figure 2a) undergoes precooling to -173 °C in the multi-stream heat exchanger HX-1, where it flows counter-currently to a mixed refrigerant. The composition of this refrigerant, optimized by Cardella [4] to minimize temperature differences between the cold and hot composite curves in HX-1, is 14 mol% nitrogen, 30 mol% methane, 31 mol% ethane and 25 mol% iso-butane. The mixed refrigerant is

a)

b)

Figure 2. PFD of the processes involved in the LH₂ supply chain: a) H₂ liquefaction and b) LH₂ regasification.

compressed to 25 bar in compressor C-4, cooled to 30 °C in heat exchanger E-3 using service water, and separated in flash vessel V-2 to avoid the presence of liquid at the inlet of the second compressor. The separated vapor is compressed to 50 bar in C-5, cooled to 25 °C in E-4, and mixed with the liquid from V-2 after it is pumped to 50 bar in pump P-1. This mixture is separated in V-3, with liquid and vapor streams sent to the hot side of HX-1. The former is precooled to -110 °C and expanded to 2.9 bar through Joule-Thomson valve VLV-2. The latter is precooled to -193 °C and expanded to 2.9 bar through VLV-3. These low-pressure streams are directed to the cold side of HX-1 and are mixed at its outlet in mixer MIX-4. The design of the dual-pressure H₂ Claude cycle has been optimized by Cardella [4] to reduce temperature differences in the heat-exchangers HX-2, HX-3, HX-4, and HX-5. The low-pressure H₂ refrigerant is compressed to 8.3 bar in C-2, cooled to 30 °C in E-1 using service water, and mixed with the intermediate-pressure H₂ refrigerant in MIX-2. The mixture is compressed to 49.9 bar in C-3, and cooled to 25 °C in E-2. The resulting high-pressure H₂ refrigerant is precooled to -173 °C in HX-1 and then split in splitter SPL-1, directing 38.8 % of the flow to turbine expander TE-2, where it is expanded to an intermediate pressure of 8.3 bar. This stream is mixed with a recycle stream in MIX-3 and routed to the cold side of HX-2. The remaining flow from SPL-1 passes at the hot side of HX-2, reaching an outlet temperature of -213 °C, and is then split in SPL-2. Of this, 73.8 % is directed to TE-3, where it expands to 8.3 bar, then passes at the cold side of HX-3 to cool the processed hydrogen stream. The

remaining flow from SPL-2 passes at the hot side of HX-3, reaching -237 °C at the outlet. The processed hydrogen and the high-pressure hydrogen refrigerant are further cooled in HX-4 to -249 °C. At the outlet of HX-4, the processed hydrogen is expanded in TE-1 to 5 bar, then mixed with the vapor from the flash separator V-1 and cooled in HX-5 to -251 °C. The high-pressure refrigerant is expanded to 3 bar in TE-4 and then to 1.4 bar in VLV-4, then passes as cold stream through HX-5, HX-4, HX-3, HX-2, and HX-1. The processed hydrogen is finally throttled to the storage pressure (1.3 bar) in VLV-1. A minimum approach temperature of 3 °C is maintained in all heat exchangers, except for the exchanger where hydrogen undergoes a phase change (HX-5), where the minimum approach temperature is set to 1 °C.

Liquefied hydrogen storage and transport

The produced liquid hydrogen is stored in properly insulated tanks. The boil-off gas is assumed to be reliquefied at the export terminal and sent to the regasification process at the import terminal. During overseas transport, the boil-off gas is lost with a rate of 0.2 % per day [1]. The total hydrogen loss during transport is calculated based on the travel distance and an average shipping speed of 30 km/h [1].

Liquefied hydrogen regasification process

Regasification involves converting liquid hydrogen back into its gaseous state. This process is relatively straightforward, involving the pumping of liquefied hydrogen followed by heating it to ambient temperature.

The PFD of the process is depicted in Figure 2b. The discharge pressure of the pump (P-1) is set to 30 bar to meet the pressure requirements for industrial application. The pump is assumed to have an efficiency of 0.6, and service water is used as the heating medium in the vaporizer (E-1).

Ammonia supply chain

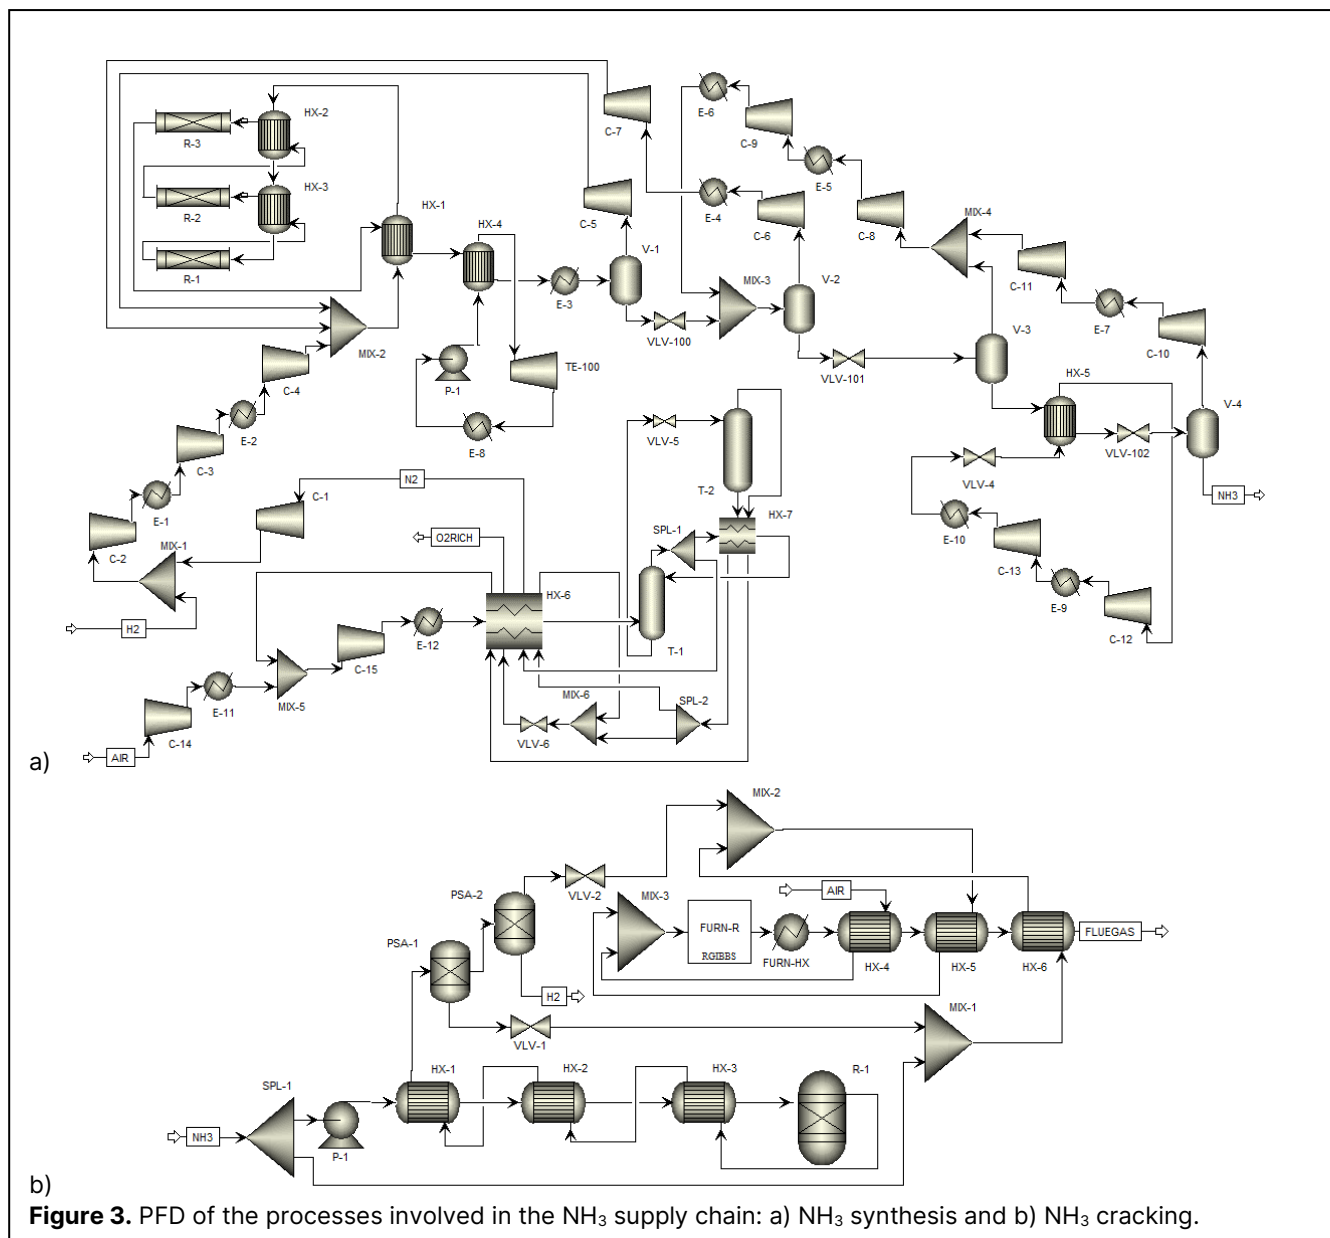

Ammonia synthesis process

NH₃ is synthesized from nitrogen and hydrogen, according to the reaction:

The simulation utilizes the Redlich-Kwong-Soave equation of state with the alpha function modification proposed by Boston and Mathias (RKS-BM). The PFD of

the process is shown in Figure 3a. The nitrogen required for the synthesis is determined by the stoichiometric ratio given in Eq. (5). Nitrogen is produced from air using the process scheme proposed in [7]. Air (AIR in Figure 2a) is compressed to 9.9 bar and then precooled to its dew point in the multi-stream heat exchanger HX-6. The resulting stream is sent to the high-pressure rectification column T-1, which consists of 50 theoretical stages. This column separates the air into two streams: a nitrogen-rich vapor (residual oxygen content of 2 ppm) as the top product and a bottom product comprising an approximately equimolar mixture of oxygen and nitrogen. The bottom stream is expanded to 3.3 bar and fed into the low-pressure stripping column T-2, which separates the feed into a top stream resembling the composition of air and an oxygen-enriched bottom stream. The oxygen-

enriched stream is routed through process exchangers HX-7 and HX-6 and exits as a product (O2RICH in Figure 3a). The top stream also passes as a cold stream in HX-7 and HX-6 and is then recycled to mixer MIX-5, where it mixes with the incoming air feed. The cooling required to condense part of the nitrogen-rich vapor from the high-pressure column, providing reflux, is achieved by evaporating the bottom product of the low-pressure column. HX-7 operates with an approach temperature difference of 1 °C. The produced nitrogen stream (N2 in Figure 3a) feeds the ammonia synthesis section. The hydrogen stream (H2 in Figure 3a) is mixed with N2, after being compressed to 20 bar, and then compressed to 200 bar in a three-stage compressor with intercooling. The resulting stream is mixed with the recycle streams, the vapors exiting the V-1 and V-2 separators, suitably compressed, and heated to 347 °C using a series of process-process heat exchangers (HX-1, HX-2, HX-3), which recovers heat from the streams exiting the reactor beds, before being sent to the first catalytic stage R-1. The reaction section comprises three adiabatic catalytic beds (R-1, R-2, R-3) with intermediate cooling. Iron-based catalysts are used to enhance the conversion (Haber-Bosch process). The stream exiting the last reactor stage R-3 contains ammonia along with hydrogen and nitrogen. The unconverted reagents must be separated and recycled to the reactor. The goal is to produce liquid ammonia at near-ambient pressure (1.3 bar), with a purity exceeding 99.95%, as defined by legislation [8]. To achieve this, the stream is first cooled to 50 °C in HX-4, transferring heat to a steam Rankine cycle, and further cooled to 30 °C in heat exchanger E-3 using service water. The resulting biphasic stream is separated in the V-1 separator: the vapor phase is recycled to the reaction section, while the liquid phase undergoes further purification through downstream expansion and cooling stages. Specifically, flash vessels V-2, V-3, and V-4 operate at pressures of 40 bar, 7 bar, and 1.3 bar, respectively. Cooling is achieved in HX-5 using an ammonia refrigeration cycle.

Ammonia storage and transport

Liquefied ammonia storage takes place in properly insulated tanks. The boil-off gas is assumed to be reliquefied at the export terminal and directed to the cracking process at the import terminal. During overseas transport, a boil-off gas loss rate of 0.024 % per day is considered [1].

Ammonia cracking process

The dissociation of ammonia is a highly endothermic process, described by the following reaction:

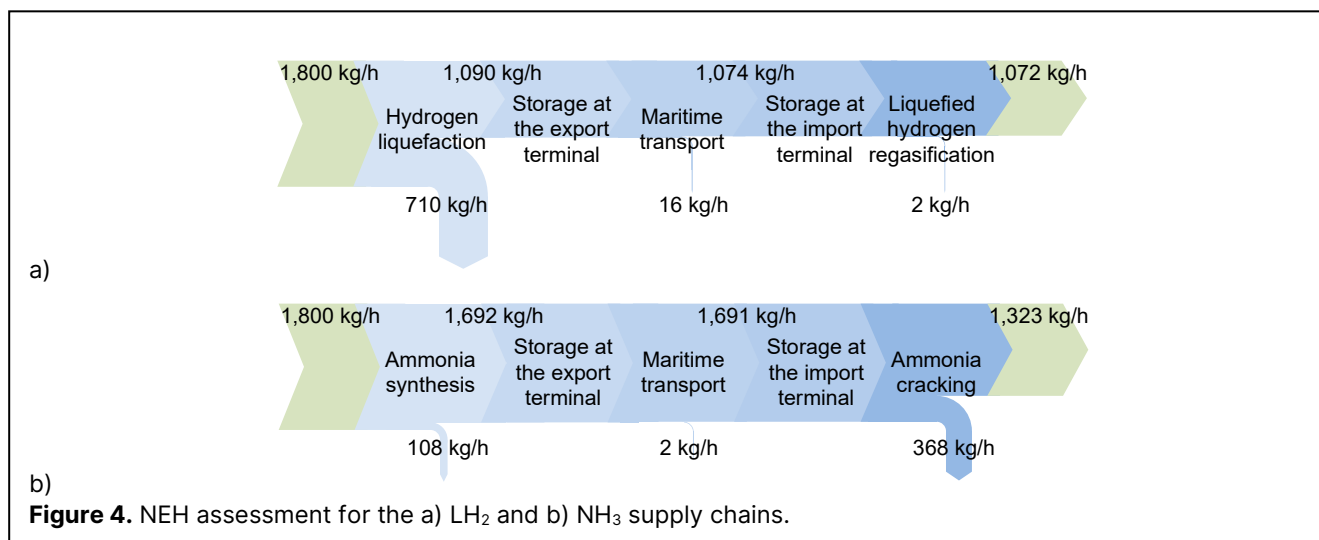

Commercially, small-scale ammonia cracking reactors (capacities ranging from 1 Nm³/h and 1,000 Nm³/h), operating at temperatures between 800 and 1,000 °C

with Ni-based catalysts are available. The endothermic reaction is supported by electricity.

The simulation of the ammonia cracking process assumes the use of the thermocatalytic technology with Ni-based catalysts, as this is the most mature technology. Figure 3b illustrates the PFD of the process. Upon reaching the utilization site, ammonia (NH3 in Figure 3b) is pumped to 30 bar, preheated through a series of heat exchangers (HX-1, HX-2 and HX-3) that recover heat from the reaction products, and fed into the cracking reactor (R-1). The reactor is modeled using Aspen Plus's RGibbs module due to the lack of sufficiently detailed kinetic data. As a result, the ammonia conversion is assumed to follow thermodynamic equilibrium at the reactor's operating conditions of 30 bar and 900 °C. The heat required for the endothermic cracking reaction is supplied by burning a portion of the ammonia, which is mixed with hydrogen-rich waste streams from the purification section. Air (AIR in Figure 3b), used as the oxidizer, is added slightly above the stoichiometric ratio to ensure complete combustion. Following the reaction stage, hydrogen is separated from the unconverted ammonia and nitrogen via pressure swing adsorption units (PSA-1 and PSA-2).

RESULTS AND DISCUSSION

The Net Equivalent Hydrogen Consumed is calculated from the material end energy balances obtained from process simulations using Eqs. (2)–(3), then the Net Equivalent Hydrogen Delivered is computed using Eq. (1). Figure 4 presents the results through Sankey diagrams, which are particularly effective for visualizing where hydrogen is consumed or lost within the supply chain. Processes characterized by a low efficiency must be the primary targets for future research efforts. The *NEHD* for LH₂ is 1,072 kg/h, reflecting an overall efficiency of 60% for the supply chain. Among the processes, hydrogen liquefaction exhibits the highest equivalent hydrogen consumption, with approximately one-third of the hydrogen input being consumed during the process. This highlights the need to focus research on optimizing the process to minimize electricity consumption. One potential solution is the use of refrigerant mixtures in both the precooling and cryogenic cooling stages, with their composition optimized to achieve a close match between the hot and cold composite curves of the heat exchangers, while ensuring that no components precipitate as solid at the operating temperature of the refrigeration cycle. Another approach is to explore energy integration opportunities with processes that require low-temperature heat, such as liquefied natural gas regasification. The *NEHD* for NH₃ is 1,323 kg/h, corresponding to an overall η of 73% for the supply chain. Ammonia cracking accounts for the highest equivalent hydrogen consumption, utilizing approximately one-fifth of the total hydrogen input during the

process. Therefore, research efforts should focus on improving this process by exploring alternative and sustainable methods for supplying the heat of reaction.

The *NEHD* is higher for NH₃ than LH₂ because the combined hydrogen consumption for ammonia synthesis and cracking is lower than that required for the liquefaction process. The difference in *NEHD* between the two carriers is 251 kg/h, meaning that hydrogen liquefaction would need to consume 459 kg/h, equivalent to one-fourth of the total hydrogen input, to break even with NH₃. In addition, hydrogen losses due to boil-off during maritime transport are smaller for NH₃, even if their contribution does not significantly impact the overall results. Therefore, NH₃ is the most efficient hydrogen carrier for hydrogen delivery considering the final hydrogen application to the industrial sector.

CONCLUSIONS

The processes involved in the liquefied hydrogen and ammonia supply chains for hydrogen overseas transportation have been analyzed from an energy consumption perspective. The ammonia supply chain is more efficient than the liquefied hydrogen supply chain, with efficiencies of 73% and 60%, respectively. This is because the combined equivalent hydrogen consumption for ammonia synthesis and cracking is lower than that required for the liquefaction process. Ammonia would become even more attractive if it could be used directly by end consumers, eliminating the inefficiency associated with its reconversion back to hydrogen.
