## SCIENTIFIC PROGRAM COMMITTEE

Giovanni C. Porzio (chair) (University of Cassino and Southern Lazio - Italy)

Silvia Bianconcini (University of Bologna - Italy)  
Christophe Biernacki (University of Lille - France)  
Paula Brito (University of Porto - Portugal)  
Francesca Marta Lilja Di Lascio (Free University of Bozen-Bolzano - Italy)  
Marco Di Marzio ("Gabriele d'Annunzio" University of Chieti-Pescara - Italy)  
Alessio Farcomeni ("Tor Vergata" University of Rome - Italy)  
Luca Frigau (University of Cagliari - Italy)  
Luis Ángel García Escudero (University of Valladolid - Spain)  
Bettina Grün (Vienna University of Economics and Business - Austria)  
Salvatore Ingrassia (University of Catania - Italy)  
Volodymyr Melnykov (University of Alabama - USA)  
Brendan Murphy (University College Dublin - Ireland)  
Maria Lucia Parrella (University of Salerno - Italy)  
Carla Rampichini (University of Florence - Italy)  
Monia Ranalli (Sapienza University of Rome - Italy)  
J. Sunil Rao (University of Miami - USA)  
Marco Riani (University of di Parma - Italy)  
Nicola Salvati (University of Pisa - Italy)  
Laura Maria Sangalli (Polytechnic University of Milan - Italy)  
Bruno Scarpa (University of Padua - Italy)  
Mariangela Sciandra (University of Palermo - Italy)  
Luca Scrucca (University of Perugia - Italy)  
Domenico Vistocco (Federico II University of Naples - Italy)  
Mariangela Zenga (University of Milan-Bicocca - Italy)

## LOCAL PROGRAM COMMITTEE

Carla Rampichini (chair) (University of Florence - Italy)

Chiara Bocci (University of Florence - Italy)  
Anna Gottard (University of Florence - Italy)  
Leonardo Grilli (University of Florence - Italy)  
Monia Lupparelli (University of Florence - Italy)  
Maria Francesca Marino (University of Florence - Italy)  
Agnese Panzera (University of Florence - Italy)  
Emilia Rocco (University of Florence - Italy)  
Domenico Vistocco (Federico II University of Naples - Italy)

# INDEX

<b>Preface</b>	<b>1</b>
<b>Keynote Speakers</b>	
<i>Jean-Michel Loubes</i> <b>Optimal transport methods for fairness in machine learning</b>	<b>5</b>
<i>Peter Rousseeuw, Jakob Raymaekers and Mia Hubert</i> <b>Class maps for visualizing classification results</b>	<b>6</b>
<i>Robert Tibshirani, Stephen Bates and Trevor Hastie</i> <b>Understanding cross-validation and prediction error</b>	<b>7</b>
<i>Cinzia Viroli</i> <b>Quantile-based classification</b>	<b>8</b>
<i>Bin Yu</i> <b>Veridical data science for responsible AI: characterizing V4 neurons through deepTune</b>	<b>9</b>
<b>Plenary Session</b>	
<i>Daniel Diaz</i> <b>A simple correction for COVID-19 sampling bias</b>	<b>14</b>
<i>Jeffrey S. Morris</i> <b>A seat at the table: the key role of biostatistics and data science in the COVID-19 pandemic</b>	<b>15</b>
<i>Bhramar Mukherjee</i> <b>Predictions, role of interventions and the crisis of virus in India: a data science call to arms</b>	<b>16</b>
<i>Danny Pfeffermann</i> <b>Contributions of Israel's CBS to rout COVID-19</b>	<b>17</b>
<b>Invited Papers</b>	
<i>Claudio Agostinelli, Giovanni Saraceno and Luca Greco</i> <b>Robust issues in estimating modes for multivariate torus data</b>	<b>21</b>
<i>Emanuele Aliverti</i> <b>Bayesian nonparametric dynamic modeling of psychological traits</b>	<b>25</b>

<i>Andres M. Alonso, Carolina Gamboa and Daniel Peña</i> <b>Clustering financial time series using generalized cross correlations</b>	27
<i>Raffaele Argiento, Edoardo Filippi-Mazzola and Lucia Paci</i> <b>Model-based clustering for categorical data via Hamming distance</b>	31
<i>Antonio Balzanella, Antonio Irpino and Francisco de A.T. De Carvalho</i> <b>Mining multiple time sequences through co-clustering algorithms for distributional data</b>	32
<i>Francesco Bartolucci, Fulvia Pennoni and Federico Cortese</i> <b>Hidden Markov and regime switching copula models for state allocation in multiple time-series</b>	36
<i>Michela Battauz and Paolo Vidoni</i> <b>Boosting multidimensional IRT models</b>	40
<i>Matteo Bottai</i> <b>Understanding and estimating conditional parametric quantile models</b>	44
<i>Niklas Bussmann, Roman Enzmann, Paolo Giudici and Emanuela Raffinetti</i> <b>Shapley Lorenz methods for explainable artificial intelligence</b>	45
<i>Andrea Cappelozzo, Ludovic Duponchel, Francesca Greselin and Brendan Murphy</i> <b>Robust classification of spectroscopic data in agri-food: first analysis on the stability of results</b>	49
<i>Andrea Cerasa, Enrico Checchi, Domenico Perrotta and Francesca Torti</i> <b>Issues in monitoring the EU trade of critical COVID-19 commodities</b>	53
<i>Marcello Chiodi</i> <b>Smoothed non linear PCA for multivariate data</b>	54
<i>Roberto Colombi, Sabrina Giordano and Maria Kateri</i> <b>Accounting for response behavior in longitudinal rating data</b>	58
<i>Claudio Conversano, Giulia Contu, Luca Frigau and Carmela Cappelli</i> <b>Network-based semi-supervised clustering of time series data</b>	62
<i>Federica Cugnata, Chiara Brombin, Pietro Cippà, Alessandro Ceschi, Paolo Ferrari and Clelia Di Serio</i> <b>Characterising longitudinal trajectories of COVID-19 biomarkers within a latent class framework</b>	64
<i>Silvia D'Angelo</i> <b>Sender and receiver effects in latent space models for multiplex data</b>	68
<i>Anna Denkowska and Stanisław Wanat</i> <b>DTW-based assessment of the predictive power of the copula-DCC-GARCH-MST model developed for European insurance institutions</b>	71
<i>Roberto Di Mari, Zsuzsa Bakk, Jennifer Oser and Jouni Kuha</i> <b>Two-step estimation of multilevel latent class models with covariates</b>	75
<i>Marie Du Roy de Chaumaray and Matthieu Marbac</i> <b>Clustering data with non-ignorable missingness using semi-parametric mixture models</b>	79

<i>Pierpaolo D'Urso, Livia De Giovanni and Vincenzina Vitale</i> <b>Spatial-temporal clustering based on B-splines: robust models with applications to COVID-19 pandemic</b>	83

**ABSTRACT:** The monitoring of loans' life-cycle has received the increasing attention of the scientific community after the 2008 global financial crisis. A number of aspects of this broad topic have been addressed by means of several regulatory, statistical and economical tools. However, many issues still require further investigation. In this work, we are interested in the monitoring phase of granted loans to anticipate possible defaults and to investigate whether there is evidence of a liquidity contagion effect within a trade network of firms. To this end, we apply a Bayesian spatial model to a proprietary dataset, and assess its out-of-time predictive performance.

**KEYWORDS:** Bayesian modelling, spatial modelling, credit risk, CAR model.

## 1 Introduction

The European Central Bank requires banks to adapt their organization, processes and IT infrastructure in order to give an integrated answer to the non-performing loans problem. Banks can mitigate their credit risk in several steps of the loan life-cycle, for example by foreseeing liquidity problems for those customers which already have a debt to the bank. A timely detection of the transition to financial distress is pivotal, and it will be addressed in this work leveraging on statistical models and bank data.

Recently, a number of contributions (see, e.g., Dolfin *et al.*, 2019) focused on introducing information on the supply chain connections in credit risk models based on the evidence of trade credit use in European markets. The main idea is that liquidity distress can flow along these connections, and a firm experienc-

ing a period of liquidity distress can delay payments towards its commercial partners, that can consequently experience liquidity distress. The supply chain is seen as a complex network in these studies, but it can also be represented as an adjacency matrix with proper assumptions (Lamieri & Sangalli, 2019).

In this work, we set up a predictive model leveraging Bayesian conditionally auto-regressive (CAR) models for areal data (Banerjee *et al.*, 2003). Specifically, inference is based on a sample of firms from a trade network in a given month, and the predictive performance of a CAR model is tested by estimating the probability of default for both a different sample of firms and for the same sample in the future. Although spatial CAR models have been widely used in ecology, environmental science, biology and medicine, to the best of our knowledge they have not yet been fully exploited in econometrics when dealing with hundreds of thousands of data points interacting in a dynamic complex network (e.g., firms or natural persons).

## 2 Methodology

With some due simplifications, the monthly goal for a lending bank is to red flag those borrowing firms that have the greatest probability of default (delay in paying their debts to the bank) in the following 3 months. In this paper, we analyse a proprietary dataset of Intesa Sanpaolo collected in a given month, for a total of  $n = 944$  firms. Our response variable is a binary indicator such that  $Y_k = 1$  if firm  $k$  switches to a liquidity distress state in the next 3 months.

The trade network can be represented as a link matrix  $W \in \mathbb{R}^n \times \mathbb{R}^n$ , with binary entries  $w_{kj} = 1$  if  $k \neq j$  and  $k$  supplier,  $j$  customer in the previous year. The link matrix  $W$  represents a complex network with a scale free structure (Barabási & Albert, 1999). Further, the Bank database stores several credit and trend information on each specific customer firm, but for the sake of simplicity here we only consider two possible covariates  $\mathbf{x}_k$  for each firm  $k$ . The first covariate,  $x_k^1$ , represents the used amount of credit over the granted amount among all Italian financial institutions, while the second,  $x_k^2$ , represents the maximum number of days of payment delay recorded in the past 3 months.

We fit a proper CAR specification (Banerjee *et al.*, 2003) to our data as follows:

$$\begin{aligned}
 Y_k &\sim \text{Bernoulli}(\theta_k) \\
 \text{logit}(\theta_k) &= \boldsymbol{\beta}\mathbf{x}_k + \phi_k \\
 \phi_k | \phi_{-k}, \boldsymbol{\alpha}, \boldsymbol{\tau}, W &\sim N\left(\boldsymbol{\alpha} \frac{\sum_{i=1}^n w_{ki} \phi_i}{\sum_{i=1}^n w_{ki}}, \boldsymbol{\tau}^{-1}\right),
 \end{aligned} \tag{1}$$

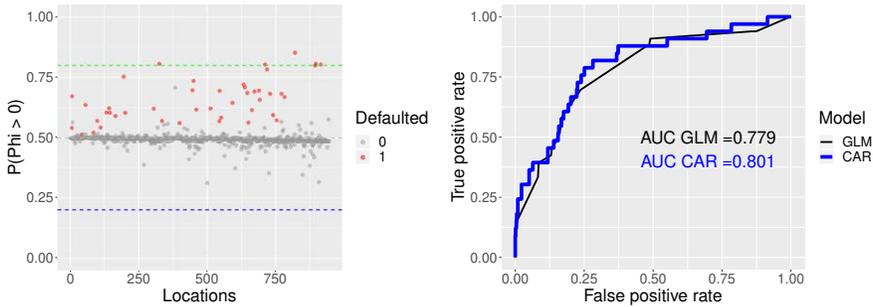

Here  $\phi_k$  is a firm-specific spatial random effect incorporating the information contained in the network of relationships  $W$ . Conditionally on  $W$ ,  $\phi_k$  is modelled as a Markov random field, meaning that the value of  $\phi_k$  only depends on the value of its neighbours. Indeed, we expect the probability of default of firm  $k$  to increase (decrease) if one of more firms connected with  $k$  are (not) in default. Parameters  $\alpha$  and  $\tau$  represent the strength and the precision of the autocorrelation, respectively. The CAR specification is chosen because the information arising from the network (incorporated through  $\phi_k$ ) can help explain those default events that are not ubiquitously captured by the linear covariates. Standard priors are placed on  $\alpha$ ,  $\tau$ , and  $\beta_0, \beta_1, \beta_2$ , and estimation of model parameters proceeds via MCMC (Banerjee *et al.*, 2003).

### 3 Results and conclusions

Testing model (1) on real data, we notice that the posterior distributions of the linear parameters obtained with the CAR model are coherent with those of a standard GLM, which considers covariates  $\mathbf{x}_k$  only. The overlap between the credible intervals of the linear parameters from the two models implies that the spatial random effects estimated by the CAR model contribute to explain a part of the default phenomenon not entirely captured by firm-specific information. Further, we record very good in-sample performance in terms of area under the curve (AUC), as the GLM has a 0.79 AUC while the CAR specification reaches a 0.89 AUC. Furthermore, model (1) helps in identifying defaulted firms through the spatial random effects. Indeed, Figure 1 (left panel) shows that, for most truly defaulted firms (red dots), the estimated probability that the spatial effect is positive, computed as  $\widehat{\mathbb{P}}(\phi_k > 0) = \frac{1}{T-B} \sum_{g=B+1}^T \mathbb{1}(\phi_k^g > 0)$ , is strictly greater than 50%. Here  $T$  is the total number of MCMC iterations, and  $B$  denotes the burn-in.

Further, we test the predictive power of the model on a disjoint sample drawn from the network seen at the same timestamp of the training sample (out-of-sample set composed of unseen firms), and on the training dataset but seen six months later (out-of-time set composed of future observations of the same firms used in training). In line with the original aim of spatial CAR models, which are intended to fit data referring to static maps, the model does not generalise in the out-of-sample case. This is an unfortunate result for our credit risk application, as one can instead expect the liquidity distress contagion dynamics to spread with similar strength ( $\alpha$ ) and precision ( $\tau$ ) in different areas of the trade network. In the out-of-time case, the CAR model shows slightly better predictive performance with respect to the simple GLM, as shown in

Figure 1 (right panel).

**Figure 1.** Left: Estimated probability of a strictly positive spatial effect (i.e.,  $\hat{\mathbb{P}}(\phi_k > 0)$ ) for each firm. Red dots are defaulted firms ( $Y_k = 1$ ) with estimated probability of strictly positive spatial effects greater than 50%. Black dots indicate all other firms. Right: ROC curves and AUC for a GLM considering only covariates  $\mathbf{x}_k$  (black) and CAR model (blue) for the prediction six-months ahead with respect to training.

To conclude, the application of disease mapping methods to a scale free network represents a novelty at present. The encouraging results on the out-of-time set suggest to further investigate spatial modelling of trade networks.
